| 12097 | 5 | 42 | 19 | 42 | 21 | "The theoretical potential for efficiency improvements is thus very large, and current energy systems are nowhere close to the most efficient levels suggested by the Second Law 21 of Thermodynamics." This claim is unreferenced - please add this text and reference from IEA. "For instance, as the International Energy Agency (IEA) reported in 2006, The energy intensity of most industrial processes is at least 50% higher than the theoretical minimum determined by the laws of thermodynamics. Many processes have very low energy efficiency and average energy use is much higher than the best available technology would permit." Reference - International Energy Agency (2006) Energy Technology Perspectives 2006: Scenarios and Strategies to 2050, IEA, Paris | Accepted. Both the IEA and GEA reports will be cited. The later refers directly to the exergy potentials. |
| 9359 | 5 | 43 | | | | Good figure. It would be more useful for readers to explain in more depth how the developed contries such as Japan have managed to improve its energy intensity /GDP per capita. | Noted with appreciation. It is difficult to add new explanatory text due to sever |
| 14519 | 5 | 43 | 1 | | 15 | This is a example that makes my underlying problems with the analyses in this chapter quite clear.<br><br>There seems to be a confusion between the concepts that are assumed to influence any of the parameters, intensities or other variables and the way these are measured. I'll try to explain using figure 5.6.4.<br><br>The figure presents historic recordings of Energy Use per Gross Production as a function of Gross Production per capita. These indeed are two important parameters in the Kaya approach. Apparently data are available in two different measures of Gross Production (PPP and MER). What I would expect is that the authors would choose one of the two or even a combination, that would best reflect what is expected to be the underlying concept, rather than presenting both. I have no idea how exactly this figure now could be interpreted and why it is here.<br><br>What probably could be done is concluding that the relation between (E/G) and (G/P) could be approximated by a straight line (total production only?) on a double logarithmic plot with all of them more or less the same slope. It would then be very interesting to find explanatory variables or proxies for the different intercepts of the straight lines. This would help quantifying the parameters in the Kaya approach application in scenarios.<br><br>I would expect that any relation would be with the total energy use and not with "commercial" only. Use of energy in production processes (in TJ) will be largely independent of the original source of the energy fossil or something else! The processes need a certain amount of energy but in many cases the process equipment can be relatively easily chosen to take into account the different origins of the energy. | Rejected. It has been an explicit decision of the writing team to use both measures of GDP, namely MER and PPP. The use of one or the other makes a big difference. IPCC has been vehemently criticized in the past for not making this clear. |
| 15930 | 5 | 43 | 11 | 43 | 12 | This is a poor, or at least a very incomplete explanation of the differences in accounting methods. Please expand or delete. | Accepted and reworded. |
| 5778 | 5 | 43 | 9 | 43 | 14 | It is not clear what is meant here. The description of the "direct" method does not make sense. | Accepted and reworded. |
| 16003 | 5 | 44 | 25 | | | Might be intersting to mention that EI in China (at least when measured in PPP) has increased after having reached global level in the early 2000s, see e.g. Steckel et al. 2011 | Partially accepted. EI in China did experience an increase between 2002 and 2004, but EI has continued to decline since then (Enerdata, 2012). Furthermore, Steckel et al., 2011 state |

| 4351 | 5 | 44 | 37 | 44 | 40 | introduction of risk of substantial souorces of CO2 from forests is reasonable but enphasys of the risk may confuse the readers of this chapter who want to understand mitigation potential of forest ecosystem. | Accepted and reworded. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 8425 | 5 | 45 | | | | Please explain better what is included in both numerator and denominator of every data.<br>“All PE carriers and CO2 emissions” means that CO2 from biomass combustion is included in the numerator and GJ of biomass primary energy is included in the denominator.<br>“Without biomass CO2 (but incl. biomass PE)” means that CO2 from biomass combustion is not included in the numerator but GJ of biomass primary energy is included in the denominator.<br>For the sake of clarity, I suggest to add the line of carbon intensity of only fossil fuels (CO2 from biomass combustion is not included in the numerator and GJ of biomass primary energy not included in the denominator).<br>It must be also underlined that the assessment of the amount of biomass primary energy use is very uncertain, far more than fossil fuels PE. | Accepted. A new line added. This will be done next week. |
| 4178 | 5 | 45 | 26 | | | It is not clearly mentioned how "energy intensity" and "energy efficiency" differently work as a driving force. It seems to me that the latter is a driving force while the former is an outcome of structure changes. | Rejected. The section is about carbon intensities. However, the statement is not supported by appropriate references |
| 14520 | 5 | 45 | 32 | | 40 | I propose to build this text on the information and explanations in the 2006 IPCC Guidelines, Energy Volume's introductory chapter. This presents tables with default values of energy per mass/volume of all relevant fuels (NCVs, if needed you can also find an explanation of the difference with GCVs) and of carbon contents, leading to default emission factors.<br><br>I would expect IPCC to use their own publications if possible. | Accepted. The IPCC publications now cited, both the WGII SAR as well as 2006 Guidelines. This will be added next week. |
| 13033 | 5 | 45 | 34 | 45 | | This sentence indicates that oil is now the dominant fossil fuel, replacing coal. However, coal is still by far the dominant fossil fuel in terms of total electricity production. See p. 24: http://www.iea.org/textbase/nppdf/free/2010/key_stats_2010.pdf | Rejected. This is factually correct – oil is still the major energy source worldwide. However, it is also true that coal is the major source of electricity even though |
| 8423 | 5 | 45 | 37 | 5 | 43 | I would generalize, using “renewables” instead of hydropower. | Accepted and reworded. |
| 9360 | 5 | 45 | 38 | 45 | 43 | It should be deleted because the shift mentioned here seems to be caused by the aspect of the energy security rather than the increase of energy conversion.<br>In the UK nuclear power station was introduced with a view to improve energy security as a main motivation.(Adam Corner et al,2011) | Rejected. The sentence provides a phenomenological statement and does not provide causality as suggested by the comment. There are many reasons |
| 8424 | 5 | 45 | 44 | 46 | 2 | I found this paragraph (and the following Figure 5.6.5) very difficult to follow.<br>Usually, CO2 emissions from biomass (biogenic Carbon) are not counted in emission inventories, so if CO2 from biomass is accounted must be clearly stated.<br>It is hard to believe that “biomass, like fossil fuels, has also contributed significantly to increases in atmospheric concentrations of CO2”, because CO2 levels in the atmosphere in the last 10.000 years, before 1750, have had very small variations (see figure SPM1 in AR4-WG1). | Rejected. Biomass resulting from deforestation associated with expansion of global land-use (mostly for agriculture) has been the major source of carbon emissions until fuel wood has been substituted by coal; see the estimates of |
| 7461 | 5 | 45 | 48 | 46 | 2 | “Historically, emissions related to land-use changes (deforestation) have far exceeded carbon releases from energy-related biomass burning, which suggests that in the past, biomass, like fossil fuels, has also contributed significantly to increases in atmospheric concentrations of CO2 (Grübler et al., 2012)”. If wood etc. is not burnt for energy, then it will rot and release CO2 and CH4 etc. Therefore, energy related biomass burning should be discounted. It is land clearing for agriculture that is the main cause of CO2 release from woody biomass etc. However, some will have been used in construction etc., this is a long-tem store of C. | Rejected. Biomass burning related to energy uses (e.g. cooking or ore smelting) would result in CO2 emissions if associated with deforestation or not based on sustainable agricultural practices where the CO2 uptake through |
| 17439 | 5 | 45 | 5 | 45 | 5 | Fuel mix may not determine energy use but I would argue that by definition it determines CO2 emissions. Perhaps historically the correlation has been fairly weak, however in future it would be expected to be stronger e.g. With a greater share of renewables. | Accepted. “Fuel mix” deleted. |

|---|---|---|---|---|---|---|---|
| 5351 | 5 | 45 | 44 | 46 | 7 | Given the caveat at the bottom of page 45 about it not being approproiate to assume biomass in the past was carbon neutral, please consider taking out that line in Figure 5.6.5. This might be a case where it would be better to note use the same exact graphic that was in the paper that is being referenced if it causes difficulties communicating the points in Chapter 5. | Rejected. Instead an new line has been added in response to Comment 8425/595. This will be done next week. |
| 9297 | 5 | 45 | 27 | 47 | 30 | In order to facilitate sustainable development, the cement industry in Japan has developed co-processing technologies for energy mix. The reference shows a case study to utilize municipality wastes as alternative fuels and materials. (MORIMOTO, NGUYEN, CHIHARA, HONDA and YAMAMOTO; Journal of Life Cycle Assessment, Japan, Vol.2 No.4 October 2006 "Proposals for Classification and an Environmental Impact Evaluation Method for Eco-Services: Case study of Municipal Waste Treatment in Cement Production") and (Makoto HOKI and Hideto MASHITA, Journal of the Japan Institute of Energy, Vol. 87, 749 -752, (2008), "Trend of Biomass Use in the Southeast Asian Countries") | Rejected even though an important point. The reason is that it is too specific and given the server page limitation there is no obvious way of including the reference by adding just a word or two. |
| 14872 | 5 | 46 | | | | The figure could be quite misleading, implying that a carbonization occur since 1850. It would be useful if you could add another line excluding not only CO2 emissions but also PE from biomass | Accepted and changed, also see Comment 8425/595. |
| 9089 | 5 | 46 | 16 | 46 | 17 | Decarbonization by nuclear seems to be quite difficult due to Fukushima for the future. At least not easy than before. Authors are recommended to prudently correct the sentence. | Accepted and reworded. |
| 5780 | 5 | 46 | 19 | 46 | 25 | Delete footnote - it is just "the Kaya Identity explanation" repeated again. | Accepted and deleted. |
| 11736 | 5 | 46 | 8 | 46 | 21 | Pacala et al. showed 15 options to reduce the emissions in which 5 are the near-zero emission technologies. And also 0.3% of 2.0% can not be ignored. These indicates that existing low carbon technologies are expected to play a major role in the long-term stabilization of carbon emissions. Last Phrase should be amended to [This means higher carbon emissions compared to historical experience, so it gets more and more important to accelerate the decarbonaization by using low carbon technologies.]<br>1.Pacala et al.:[Stabilization Wedges: Solving the Climate Problem for the Next 50 Years with Current Technologies], send attachment by another e-mail. | Accepted, last sentence reworded. |
| 16004 | 5 | 46 | 8 | | 11 | plus: carbonization has mainly been driven by coal (e.g. Steckel et al. for a decomposition of carbon intensity in a Kaya framework) | Accepted and reworded. |
| 8426 | 5 | 47 | 11 | 47 | 11 | “presently stand at $80” It is better to show the average price in 2010 and 2011, because what is “present” is not clear for an IPCC report | Accepted and rewritten to reflect the suggestion. |
| 2574 | 5 | 47 | 15 | 47 | 17 | Mention to the infrastructure lock-in by the use of shale gas, World Energy Outlook 2011 | Accepted, but lock-in refers to many infrastructures not only to shale gas ones. |
| 5781 | 5 | 47 | 30 | 47 | 30 | Footnote from "conventional Uranium" is missing. | Accepted. Footnote added. |
| 16005 | 5 | 47 | 5 | | 6 | What does that tell us about GHG emissions? If oil is getting scarce i.e. more expensive, that would probably make coal to liquid more attractive; this should be discussed in this respect | Rejected. The page limitation is severe and adding new arguments is not possible especially as the suggested one refers to the future possibilities and not |
| 5352 | 5 | 47 | 10 | 47 | 14 | This sounds a lot like "peak oil." Please be careful here. There are many potential reasons for the observed trends. Suggesting that there is no more oil that can be had "working at maximum capacity" seems to be a real strech. Humanity has a very poor track record of prediciting peak oil but an amazingly strong track record of innovation that moves previous uneconomic or technically impossible to produce oil into oil that is flowing into global markets. | Accepted. The intention was not to rephrase the “peak oil’ arguments. Text has been revised. |
| 5353 | 5 | 47 | 15 | 47 | 17 | Cant cite the truly pesimistic Howarth et al 2011 article for a basic fact like shale gas production is growing. It would be far better to cite something that speaks directly to the narrow point being made here which is shale gas production is growing. Consider replacing the Howarth citation here with IEA, Golden Rules for a Golden Age of Gas, 2012, International Energy Agency: Paris. p. 150. EIA, World Shale Gas Resources: An Initial Assessment of 14 Regions Outside the United States 2011, Energy Information Administration, US Department of Energy: Washington, DC. DOE, Modern Shale Gas Development in the United States: Primer, 2009, Office of Fossil Energy, US Department of Energy: Washington, DC. p. 116. | Accepted and additional references added. |

| 10748 | 5 | 5 | 7 | 5 | 7 | The wording "...global GHG emission in GWP100 has increased.." should be changed. The emissions are weighted by GWP-100. | Accepted: We are revising the text. |
| 7845 | 5 | 5 | 7 | | | Emissions in GWP 100 is not a very common and scientific langauge. It is suggested to refer to CO2e. | Accepted: We are revising the text. |
| 4520 | 5 | 5 | 8 | 5 | 30 | This executive summary names as a driver “consumption” as well as “economic growth” in line 8 and “output” in line24. Why are different terms used; I do not understand the reason? Suggest that the same terms be used or that the difference be explained and motivated. Shortening and avoiding discussing overlapping drivers several times would help the summary. The discussion of consumption-based accounting come up later; suggest that consumption be discussed at that point. | Accepted: The ES is being revised. |
| 17442 | 5 | 50 | 1 | 50 | 1 | "1990s" not "1900s" | redrafted |
| 5783 | 5 | 50 | 12 | 50 | 15 | Please add a reference sustaining the attribution "The cause of the greenhouse gas emissions in buildings is largely attributed to electricity use." If you include cooking (for example), you include a substantial amount of households using gas or "biofuels". The same holds true for heating purposes. | redrafted |
| 9981 | 5 | 50 | 12 | 50 | 15 | The cause of GHG emission in buildings is attributed to not only electricity use but also fossil fuel use such as natural gas. In addition, this part should explain that "heat pump technology" has potential to reduce GHG emission from electricity use in buildings, as described in (IEA, 2011, page16). This literature is listed in the No51 line of this table. | redrafted |
| 3089 | 5 | 50 | 14 | | | is it largely electricity use? Certainly in countries with a high heating demand (e.g. central and northern Europe) it's actually fossil fuels for heating. Worth making the distinction here, may be supported with a few examples. | redrafted |
| 17443 | 5 | 50 | 14 | 50 | 15 | Reference needed for statement about electricity use | noted-redrafted |
| 4181 | 5 | 50 | 14 | 50 | 14 | Air-conditioning is partly given by gas-based equipment. | redrafted |
| 11286 | 5 | 50 | 16 | 50 | 22 | We suggest including also "Building design" (buildings that are not properly designed according to the local climate and use wrong building materials, tend to consume more energy than environmentally friendly architecture). Majority of existing modern buildings were designed and built when energy was cheap, as a result, they rely heavily on electricity for lighting, cooling and heating. | redrafted |
| 11529 | 5 | 50 | 16 | 50 | 27 | The number of causes and drivers for emissions from houses are far from complete. I miss reference to factors such as changes in climate (in many places of the world some warming has occured resulting in lower heat demand and in some places to higher cooling demand), behaviour (e.g. driven by energy prices), family size and heating systems. | redrafted |
| 3087 | 5 | 50 | 2 | | | is this supposed to read 1970s and 1980s (instead of 1900s)? Need to explain why economic decline in the EIT affected buildings emissions - is it about falling service sector emissions? Energy prices increased in the EIT and that may have had an impact on residential sector emissions. Plus there's been quite a lot of retrofitting of buildings and district heating systems which were notoriously inefficient. | noted will be considered |
| 11737 | 5 | 50 | 28 | 50 | 31 | IEA shows that heat pomp is one of key technology in building sector. Adding [such as introducing heat pump technology] after [an opportunity to deploy GHG mitigation options] would be better.<br>1.IEA:[Technology road map], http://www.iea.org/papers/2011/buildings_roadmap.pdf | now in Chapter 9 |
| 17444 | 5 | 50 | 28 | 50 | 35 | References needed | Accepted (References added) |
| 3088 | 5 | 50 | 3 | | | Chapter 9 says buildings account for 32% of global final energy and 23% of global primary energy use. Where does the 40% come from and does it refer to primary or final energy use? Which figures are correct?There needs to be consistency between chapters! | noted-to be reconciled |
| 2222 | 5 | 50 | 3 | 50 | 7 | The three sentences are very very hard to understand. The 40% in sentence 1 are clear (though the chart on the previous page shows only direct emissions (no electricity)), then the breakdown in sentence 2 does neither add up to 40% not to 100%. Finally, in sentence 3, 110% of what are they growing to? | noted will be adjusted |
| 14873 | 5 | 50 | 3 | 50 | 5 | In chapter 9 it is mentioned "In 2009 buildings accounted for 32% of total global final energy use (IEA, 2012)". Here, the share of buildings is "more than 40% of global energy used". I suggest using the most recent reference (that is IEA 2012) | noted-to be reconciled |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 3090 | 5 | 50 | 35 | 50 | 36 | Need to have a date and clarify potential here, i.e. 30% is cost-effective potential by 2030 (see chapter 9). Technical potential is much higher. For which year is the IPCC (2007) potential? | only considering historical trends |
| 11842 | 5 | 50 | 35 | 50 | 35 | This statement needs a reference. | noted/redrafted |
| 5784 | 5 | 50 | 35 | 50 | 36 | These two sentences are redundant, please delete one. | noted/redrafted |
| 16024 | 5 | 50 | 35 | 50 | 36 | redundant. And the potential is much higher. | redrafted |
| 10384 | 5 | 50 | 35 | 50 | 36 | the number is inconsistent (29% and 30%) | redrafted |
| 17445 | 5 | 50 | 43 | 51 | 1 | suggest re-naming "manufacturing industries and constrauction" as "Other manufcaturing industries and construction" (i.e. other than chemicals etc, given that on p.51 lines 7-16 chemicals (and others) are then described as being part of manufacturing). The reason that this category is the largest contributor is presumably just because it is more aggregated? | correct/indicated in new draft |
| 2224 | 5 | 50 | 45 | 50 | 45 | Check if not rather CO2e, given a lot of non-CO2 in industry | taken care of in new draft |
| 4985 | 5 | 50 | 5 | 50 | 6 | Sentence: of this 21 % …….10 % from Industrial buildings. The sum of this is only 48 %, what is the source of remaining 52 %? | redrafted |
| 13515 | 5 | 50 | 5 | 50 | 6 | Sentence: of this 21 % …….10 % from Industrial buildings. The sum of this is only 48 %, what is the source of remaining 52 %? | redrafted |
| 3085 | 5 | 50 | 8 | 50 | 11 | Why has the US been singled out here? Other countries have interesting emission statistics for buildings too. Would be more interesting to have e.g. some OECD or EU figures vs developing country figures here. The fact that US building emissions exceeds the combined emissions of Japan, France and the UK doesn't necessarily tell the reader much - the population of those three countries is about 60 mill lower than those of the US and there's a lot of difference in all sectors. Emissions per m2 would be more interesting. | redrafted |
| 16023 | 5 | 50 | 8 | | | In the US buildings account for …. | redrafted |
| 10383 | 5 | 50 | 8 | | | "GHg" should be "GHG" | noted and corrected |
| 4383 | 5 | 50 | 3 | 50 | 5 | Contradictory with fig 5.2.2 which indicates 15.3% of emissions attributed to buildings | redrafted |
| 12098 | 5 | 50 | 38 | 50 | 39 | "energy efficiency in homes has become more prevalent in the past several years, largely in the OECD countries." An example would be good | Noted will be considered |
| 12099 | 5 | 50 | 38 | 50 | 39 | Coverage here regarding energy efficiency in residential buildings here does not address issues for energy efficiency in residential homes for the global poor, yet it is here that the largest energy efficiency potential exists. Please see Mills, E. (2005) 'The specter of fuel-based lighting', Science, vol 308, pp1263–1264 and Weiszakcer et al (2009) Factor Five:Transforming the Global Economy through 80% Improvements in Resource Productivity. | 6531 | 5 | 50 | 1 | | | "1980s" instead of "1900s"? | redrafted |
| 7463 | 5 | 51 | | | | Lime production is a reversible reaction and does not lead to and increase in CO2. CaCO3 (heat) = CaO + CO2. When used in the soil in absorbs CO2 and increases the pH. Ca(OH)2 + CO2 = CaCO3 + H2O. Similarly with lime in cement, some CO2 is reabsorbed when it sets. | noted- basing on IPCC 2006 industrial processes sources. |
| 17447 | 5 | 51 | 17 | 51 | 18 | should this sentence go before lines 15-16? (I think it would make more sense that way) | noted |
| 17446 | 5 | 51 | 2 | 51 | 2 | does the 16% growth refer to the period 1970 - 2002? | removed |
| 17448 | 5 | 51 | 21 | 51 | 24 | More accurately "The drivers for growth of GHG in industry....." ? Discussion is rather brief - could more space be devoted to it? | noted but allocated space limits also |
| 11738 | 5 | 51 | 25 | 51 | 29 | Nuclear power should be put into example of GHG mitigation options. | now in sectior chapter |
| 9361 | 5 | 51 | 25 | 51 | 30 | It should also add nuclear power as one of the potential mitigation measures.<br>Besides the voluntary action should be added as one of the policies because it is effective in the Japanese industry. Okazaki et al (2011) showed the effecitve example of the Japanese steel industry. | noted-mitigation options in Sector chapters |
| 10385 | 5 | 51 | 25 | 52 | 6 | There exist many spelling mistake as 'feedstocj', 'anf' and so on | noted will spell check |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 9423 | 5 | 51 | 25 | 51 | 30 | ・ Addition is needed for the description of the use of nuclear energy and for voluntary actions.<br>・ It would be appropriate to add, to the list of mitigation options, the use of nuclear energy that has an effect similar to or greater than that of measures which use renewable energy as described in FOD.<br>・ The draft stipulates that the technological options for GHG mitigation must be coupled with policies. However, voluntary actions should be treated equally to policies and added, since there are voluntary actions of the industry achieving significant effects as reported in Japan.<br>・ Refer to the following documents.<br><br>Okazaki et al. [1] showed that the Japanese steel industry responded to the Kyoto target by launching a voluntary action plan in 1996 a year prior to the adoption of the Kyoto Protocol with challenging quantitative target: 10% reduction of energy consumption in 2010 compared to 1990. Since then, the steel industry has made stead progress toward achieving these goals. As a result, the energy consumption in 2008 was 11.5% less in comparison to the 1990 level (equivalent to 12.1% reduction in CO2 emissions).<br>[1]Teruo Okazaki, Mitsutsune Yamaguchi (2011)<br>Accelerating the transfer and diffusion of energy saving technologies steel sector experience—Lessons learned<br>Original Research Article<br>Energy Policy, Volume 39, Issue 3, March 2011, Pages 1296-1304<br>http://www.sciencedirect.com/science/article/pii/S0301421510008827<br><br>[1]page 1296 right column line15-23 | noted- will see what is applicabnle and what goes to sector chapters |
| 9323 | 5 | 51 | 3 | | | Please add 'in' after 'realized'. | noted-whole text redrafted |
| 11994 | 5 | 51 | 31 | 51 | 33 | Looking at the number of registered projects is giving the wrong pictures as these 0.6% actually represent more than 50% of the actually issued CERs!!! In other words, the CDM has already had an enormous impact and there is still a huge potential to use the CDM to reduce emissions in the industry sector. Please look at the large amount of research performed under the High Level CDM Policy Panel on their dedicated webpage at cdmpolicydialogue.org. | noted and will be reviwed. |
| 13694 | 5 | 51 | 31 | 51 | 33 | Replace "CDM has … another 0.6%" by "CDM has been highly successful as an instrument to reduce emissions from industry, as large-scale options in Brazil, China, India and South Korea to reduce the industrial gases HFC-23 and N2O were mobilized rapidly (see Michaelowa and Buen (2012) for an account of this process). By August 2012, two thirds of the one billion isued CDM credits came from these project types (UNEP Riso Centre 2012). CDM has also mobilized waste heat recovery in heavy industry; the over hundred projects of this type have generated more than 50 million credits to date (ibid.)". References: Reference: Michaelowa, A.; Buen, J. (2012): The CDM gold rush, in: Michaelowa, A. (ed): Carbon markets or climate finance?, Routledge, Abingdon, p. 1-38; UNEP Riso Centre (2012): CDM pipeline, download at www.cdmpipeline.org. (Data should be updated at the time of finalization of AR5.) | not included in new version |
| 10978 | 5 | 51 | 25 | 51 | 29 | A one of the examples of mitigation measures, it is suitable to add the use of nuclear energy. | belongs to Chapter 7 |

| 6532 | 5 | 51 | 31 | | 32 | Modify the description, as CERs issuance up to 2012 for the industry projects including Cement, EE Industry, HFCs, N2O, PFCs and SF6 are expected to dominate 65% of the total issuance, according to UNEP RISO Center. | noted and excluded |
| 12863 | 5 | 52 | 18 | 52 | 18 | Add "Forests cover approximately 30% of global land area (FAO 2010)." Food and Agriculture Organization (FAO). 2010. Global forest resources assessment 2010. FAO, Rome, Italy. | Accepted |
| 4986 | 5 | 52 | 19 | 52 | 20 | Sentence: Forest fires-post burn decay was the largest contributor …….(23.5%). The sum of % ges is almost 100 (99.8 %). Does that mean, contribution of FOLU to GHG emission consist almost only from these three items? | Taken into account: New data have been presented |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 13516 | 5 | 52 | 19 | 52 | 20 | Sentence: Forest fires-post burn decay was the largest contributor …….(23.5%). The sum of % ges is almost 100 (99.8 %). Does that mean, contribution of FOLU to GHG emission consist almost only from these three items? | Taken into account: New data have been presented |
| 12861 | 5 | 52 | 2 | 52 | 3 | Say instead "Agricultural lands, including croplands and rangelands, occupy 40–50% of the ice-free land surface of the Earth and are expanding (Bartholomé and Belward 2005, Ellis et al. 2010)." Bartholomé, E. and A.S. Belward. 2005. GLC2000: A new approach to global land cover mapping from Earth observation data. International Journal of Remote Sensing 26: 1959-1977. Ellis, E.C., K.K. Goldewijk, S. Siebert, D. Lightman, and N. Ramankutty. 2010. Anthropogenic transformation of the biomes, 1700 to 2000. Global Ecology and Biogeography 19: 589-606. | Accepted |
| 17415 | 5 | 52 | 37 | | | Recommend a citation for this statement: "Consumption of livestock and aquaculture products is increasing because of increased income and production." | Taken into account: The sentence has bene deleted |
| 7464 | 5 | 52 | 39 | 52 | 42 | “The world population is expected to increase to 9.3 billion in 2050 causing greater demand for food but per capita land availability will be reduced to 0.152 ha (UNFCCC, 2012). This will necessitate intensification of agriculture and influence GHG emission”. Tempering population increase must be given prominence! | Noted |
| 12864 | 5 | 52 | 43 | 52 | 43 | For industrial agriculture as the main cause of tropical deforestation, cite Gibbs et al. 2010. Gibbs, H.K., A.S. Ruesch, F. Achard, M.K. Clayton, P. Holmgren, N. Ramankutty, and J.A. Foley. 2010. Tropical forests were the primary sources of new agricultural land in the 1980s and 1990s. Proceedings of the National Academy of Sciences of the USA 107: 16 732-16 737. | OK |
| 7465 | 5 | 52 | 43 | 52 | 47 | “Large-scale agro-industrial expansion is the dominant driver of deforestation. Across the tropics the total net increase in agricultural area was more than 100 million ha between 1980 and 2000, and more than 55% of new agricultural land came from intact forests, 28% from disturbed forests and 8% from shrub land (Gibbs et al., 2010). Land-use change for production of biofuel and livestock expansion is another driver of agriculture influencing GHG emission” The population in developing countries increase by about 75% between 1980 and 2000. In my opinion, this is the dominant driver of deforestation. I examined the rate of deforestation in every sub-Saharan African country between 1980 and 1990, and compared it to the increased demand for arable land based on the productivity for grain crops and population increase. This accounted for over 90% of deforestation. It is written up as Chapter 11 in Climate Change and Africa (2005). Ed. Pak Sum Low, Cambridge University Press, England U.K. | Noted |
| 12862 | 5 | 52 | 7 | 52 | 27 | Due to uncertainties in quantification of greenhouse gas emissions and removals, use appropriate precision by reporting results with only two significant figures. For example, say "30%" rather than "29.9%." Otherwise, the results imply a precision of measurement that current estimation methods cannot reach. | Accepted |
| 10969 | 5 | 52 | 7 | 52 | 17 | This comment about the agricultural contribution should specifically note that it is based on the 100-year GWP as the way of comparing GHGs, and that there are an increasing number of papers suggesting alternative metrics as more appropriate for use in the context of a stabilisation scenario. | Noted |
| 5786 | 5 | 52 | 9 | 52 | 18 | Please rework this paragraph. Not all water bottles end up in the ocean and it does not become clear why garbage is collected and what is done with it that warrants comparison with biomass. In addition, biomass can be garbage, too, depending on the definition of garbage / waste. | Noted. Not clear what was intended, but the section has been rewritten. |
| 3528 | 5 | 52 | | | | In principle, 'Fisheries and Aquaculture' is included in 'Agriculture' sector and the title of the section 5.7.4 should simply be 'Agriculture, Forestry, and Other Land Uses (AFOLU)' to be consistent with chapter 11. Otherwise, please justify why 'Fisheries and Aquaculture' is treated separately. | Accepted |
| 3529 | 5 | 52 | | | | The analyses of emissions trends between 1970-2008 need to be improve by including the interannual variability of emissions for the sector (AFOLU) and the categories (for e.g. enteric fermentation, rice cultivation, forest fires) during the period. It may be useful to include a graph showing the trend and thus the interannual variability. This will help to better see what happened during that period. | Accepted |
| 4182 | 5 | 52 | | | | The contribution of fertilizer and other chemicals in agriculture sector to the GHG emission should also be touched upon. | Accepted |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 8600 | 5 | 52 | 2 | 52 | 2 | Other reference than UNFCCC (2012) (ie. the original study) should be citing the statement that "Agricultural lands occupy about 40–50% of the Earth's land surface and are expanding" | Taken into account: The reference of FAOSTAT 2012 has been included and |
| 5355 | 5 | 52 | 43 | 52 | 46 | Is there an IPCC definition of "large-scale agro-industrial"? That sounds like jargon here in Chapter 5. It might make sense in the paper that is cited here but the authors of Chapter 5 should rephrase this so readers don't have to hunt down this Gibbs et al 2010 paper to learn what is and what is not within the bounds of this term. | Taken into account: The text has been modified |
| 5785 | 5 | 52 | 1 | 53 | 8 | This section is rather weak. You do not include any information on fisheries (besides two sentences on aquaculture), statements are not backed by references (e. g., lines 43, 47) and with all the numbers given in the first three paragraphs - did you consider putting them in a table? | Taken into account: The text has been deleted |
| 10386 | 5 | 53 | 1 | 53 | 2 | the unit for economic potential is hard to read | Accepted, will be clarified |
| 17449 | 5 | 53 | 17 | 53 | 18 | This sentence appears rather randomly | Accepted, the sentence will be revised |
| 10387 | 5 | 53 | 19 | 53 | 21 | the numbers are misspelt where the dot '.' punctuation appears to be ',' | Accepted, the numbers will be revised |
| 13217 | 5 | 53 | 21 | 53 | 21 | What is meant by "with an increment of 193, 5 %(" ? The relative increase from 734 to 1400 is 90% consistent with a relative share of a total emissions iicreasing by 80% evolving from 2.6 to 2.9 % | Accepted, the numbers will be revised |
| 5787 | 5 | 53 | 25 | | | I suggest to put this in a figure as the content would become much easier to understand. | Accepted, will be analyzed the form |
| 17416 | 5 | 53 | 6 | | | "Because of scarcity of land andavailability of new technologies many of the underperforming or waste lands will be rehabilitatedcontributing towards enhanced food production and influencing GHG emission." This also seems highly optimistic and lacks a citation. Strongly recommend reframing this as a recommendation rather than a prediction for the future. | Accepted. The text has been revised. |
| 18540 | 5 | 53 | | | | Much of the text and data in this section may be more aptly placed in the excursus section on Waste in Chapter 10. Please liaise with Ch 10 CLAs on this point. | Accepted, the liaison with Chapter 10 was realized in Vigo |
| 12102 | 5 | 53 | 10 | 54 | 26 | This entire waste summary offers no estimate of the potential GHG mitigation potential of the strategies summarised. This paper provides such an estimate. Bahor, B (2009) Integrated waste management as a climate change stabilization wedge. Waste Management & Research http://www.seas.columbia.edu/earth/wtert/sofos/wmr_nov09_p839.pdf This peer reviewed paper has calculated that integrated waste management offers an entire Socolow/pascala Wedge of GHG mitigation. | Accepted, the reference will be revised |
| 5356 | 5 | 53 | 13 | 53 | 16 | What is the citation and more importantly what is the significance for Chapter 5 of the following passage? "For example, 89 billion plastic water bottles are sold every 13 year throughout the world, and as garbage these bottles and other residues go to the ocean forming 14 the denominated ¨garbage island ¨ as the constituted by 6 millions tones of plastic between 15 California and Japan, or form accumulations in the coasts, rivers, lakes, and others." | Accepted, will be delated |
| 4384 | 5 | 53 | 15 | 53 | 15 | I am not an expert in that area, but 6 millions tons seems way under current estimates seen or heard in the news recently, a source should be cited | Accepted, will be delated |
| 5357 | 5 | 53 | 19 | 53 | 21 | The authors of this section of Chapter 5 might want to look at Kuo et al 2011 for an example of how high MSW collection rates can be and the contribution of WTE facilities ....Kuo, J.-H., et al., Emission of carbon dioxide in municipal solid waste incineration in Taiwan: A comparison with thermal power plants. International Journal of Greenhouse Gas Control, 2011. 5(6): p. 1443-1453. DOI:10.1016/j.ijggc.2011.03.001 | Accepted, the reference will be revised |
| 3530 | 5 | 54 | | | | I would suggest that you merge Figures 5.7.4 and 5.7.5 and include emissions from Waste incineration. Please clarify whether the emissions are expressed as CO2-equivalent. | Accepted, maybe the figure change |
| 5788 | 5 | 54 | 11 | | | Footnote "1A" is not related to the text, can be deleted. | Accepted, wii be deleted |
| 7320 | 5 | 54 | 7 | 54 | 10 | These lines cite numbers from the TS for the AR4.WGIIIand thus have not been updated for the AR5. Moreover, it would be better to reference the specific studies Monni et al. (2007) and EPA (2007) cited in Chap. 10.AR4.WGIII which were the basis for these numbers. | Accepted, we will revise the reference and try to improve the data |
| 17450 | 5 | 54 | 7 | 54 | 10 | would this be better represented in a chart? | Accepted, we think about the best |
| 17451 | 5 | 55 | 12 | 55 | 16 | does not appear to follow from earlier part of the paragraph | Accepted, we will move in the text or |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 15291 | 5 | 55 | 21 | 55 | 22 | It is stated that waste incineration is a method for mitigation. This is true for degradable waste but not for plastics where incineration with energy recovery is causing more emissions than landfilling, at least in a time perspective of a century (Eriksson, O. and Finnveden, G. (2009): Plastic waste as a fuel – CO2-neutral or not? Energy and Environmental Science, 2, 907-914). | Accepted, we will revise the reference and try to improve the text |
| 15292 | 5 | 55 | 24 | 55 | 25 | The statement could be modified to "Recycling is in general an effective means…". A reference could be added, e.g. Tyskeng, S. and Finnveden, G. (2010): Comparing energy use and environmental impacts of recycling and incineration. Journal of Environmental Engineering, 136, 744-748 or some of the references in this metasynthesis. | Accepted, the reference will be revised and the statement modified |
| 4183 | 5 | 55 | 24 | 55 | 24 | Recycling does not always result energy saving. Usually, especially in waste plastic recycling, recycling needs more energy than once-through production but contributes to conservation of land-fill space and resources. | Accepted, will be written more clear and exact utilizing other references |
| 10899 | 5 | 55 | 28 | | | Energy intensity as behavioural change? I guess aspects could be, but not all aspects. Energy intensity as framed in the Kaya or IPAT is often Energy/$. Energy intensity may have a strong technology aspect to it. I am not sure why you want to call this behavioural change, but perhaps explain in more detail. | Accepted (new additional text and figure on drivers and factors has been brought in to link behaviour to the Kaya identity) |
| 13555 | 5 | 55 | 28 | | | The section on behavioral change is a bit an open door. No real analysis of successful policies, quantified assesssment of what is possible in terms of reductions of impacts, etc. Should be expanded if the section aims to provide avenues for consumptoin oriented emission reductions. | Accepted (text has been revised majorly; additional examples proposed to be added by Michael) |
| 18707 | 5 | 55 | 39ff | | | Cite at least one or two of the "various studies" mentioned here | Noted |
| 5789 | 5 | 55 | 41 | | | Footnotes 2 and 2A are misplaced. Please move to where they belong. | Noted. Removed |
| 5358 | 5 | 55 | 1 | 55 | 26 | There is a significant literature that speaks to the benefit of combusting MSW in terms of CO2e that really ought to be referenced here. There are many issues surrounding waste to energy facilities but whether they reduce GHG compaired to landfills isn't one of them. This body of knowledge should be cited here in this Section of Chapter 5. Luckow et al 2010 summarizes some of this literature... Luckow, P., et al., Large-scale utilization of biomass energy and carbon dioxide capture and storage in the transport and electricity sectors under stringent CO2 concentration limit scenarios. International Journal of Greenhouse Gas Control, 2010. 4(5): p. 865-877. doi: DOI: 10.1016/j.ijggc.2010.06.002 Cleary, J., Life cycle assessments of municipal solid waste management systems: A comparative analysis of selected peer-reviewed literature. Environmental International, 2009. 35(8). Consonni, S., M. Giugliano, and M. Grosso, Alternative strategies for energy recovery from municipal solid waste Part B: Emission and cost estimates. Waste Management, 2005. 25: p. 137-148. | Accepted, we will revise references , and introduce the theme of MSW combustion - waste for energy production |
| 18153 | 5 | 55 | 24 | 55 | 26 | The statement "Recycling is an effective means to reduce energy use, CO2, NH4, N2O emissions and waste at the source at the same time" is inaccurate and wrong. Emission taxes, emission permits or direct emission regulations represent efficient measures to reduce emissions. Recycling is generally a costly instrument to reduce emissions, and the effects is highly unclear. Further, waste as such does not represent a clear problem in the GHG context. The important focus is on the methane and CO2 emissions from waste, and how these are handled. Such emissions can be reduced and even eliminated, even if the waste amounts increase. | Accepted, will be written more clear and exact utilizing other references |
| 18152 | 5 | 55 | 9 | 55 | 12 | Sentence needs rewording. | Accepted, will be written more clear or |
| 8956 | 5 | 56 | 1 | | 5 | Hard to grasp without some detailed case studies of consumption patterns. | Accepted (text revised) |
| 5790 | 5 | 56 | 10 | 56 | 10 | Is this a "lack of real or imaginary opportunities" or does the theory indicate an imaginary lack of opportunities (what may only be conceived, not real, while imaginary opportunities are not existent in reality). | Accepted (this text has been deleted) |
| 18709 | 5 | 56 | 14 | | | Would be useful to get an example of the institutional and physical structures that influence or constrain behavior. | Noted (to include an example where possible from peer reviewed literature) |
| 10901 | 5 | 56 | 15 | 56 | 17 | What is the citation for "several studies". Also, the data is in emissions while the sectio is about energy intensity. It is no surprise that countries have large co2 per capita differences given different energy systems and resources, but you need data on energy consumptino per capita. | Accepted (text modified to reflect variation in energy consumption per capita; Citation added accordingly) |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 18710 | 5 | 56 | 16f | | | There are regional differences of the same magnitude within countries as well, e.g., NY and CA have much lower CO2 emissions than other US states, for reasons similar to those given in lines 17 and 18. | Accepted (original text deleted and modified) |
| 17417 | 5 | 56 | 20 | 56 | 28 | This chapter begins talking about energy choices, but then invokes an example of eating choices. Recommend caution in conflating all GHG-emitting activities under the category of energy. | Accepted (text modified to link emissions to dietary choices) |
| 18711 | 5 | 56 | 22 | | | what are "inherent behaviors"? | Noted (Inherent behaviour refers to behaviours that are historically/culturally |
| 10900 | 5 | 56 | 23 | 56 | 28 | Some references would be good. And this is in terms of "emissions" and vegetarian vs meat is not so much about energy intensity (in the fossil sense). This example does not really fit in this section, at least without rewording considerably to make it an energy efficiency issue. | Accepted (Reference added and text reworded) |
| 18712 | 5 | 56 | 23 | 57 | 6 | All the results mentioned in this passage should beprovided with references to the studies from which the results come. I have at least 6 instances where i would have liked to see the paper that substantiated a claim made, from vegetarianism and CO2 emissions to rebound effects. | Accepted (References added) |
| 5303 | 5 | 56 | 32 | | | ADD; In 2012, the French government announced a new law imposing progressive tariff on energy (gas, electricity) beyond a basic necessity threshold (under which the cost is decreased by between 3% and 10% from present tariff). The problem is finding clear and quantifiable criteria for the threshold. Three levels are to be taken into account according to the number of occupants and the region. But there is concern as poor people tend to live in energy inefficient housing and thus, could pay a high tariff just to remain in the basic comfort zone. | Rejected (does not fit in with the context in this section and not strongly supported by literature) |
| 17452 | 5 | 56 | 32 | 40 | | References needed | Accepted (Reference added) |
| 17453 | 5 | 56 | 48 | 49 | | References needed | Accepted (References added) |
| 18713 | 5 | 56 | 48 | 57 | 6 | It may be better to move this important distinction to the beginning of the section, and to perhaps organize the section around the distinction. | Accepted (text revised) |
| 18708 | 5 | 56 | 9f | | | Can the label "ipsative theory" be explained or defined? And what are imaginary opportunities and why do they matter? Should it be "imagined"? | Accepted (text deleted) |
| 17454 | 5 | 57 | 1 | 6 | | References needed | assmbled will be added to Zotera. |
| 10903 | 5 | 57 | 15 | | | "annihilated" is perhaps not the best word to use here. Referneces also. Will there be another section in WGIII discussing technological change? Point to that. | Accepted, word will be changed to "reduced". |
| 3041 | 5 | 57 | 26 | | 28 | I believe the AEEI concept was originally due to Manne & Richels [Manne, A.S., Richels, R.G., 1992. Buying greenhouse insurance—the economic costs of Co2 emission limits. MIT Press, Cambridge.] | Accepted, add original ref |
| 10902 | 5 | 57 | 5 | | | Some references for the "rebound effect" would be good. Is there a section in WGIII which covers this in detail? Link to that. | Accepted (text of both the behaviour section and technological change |
| 10905 | 5 | 57 | | | | What is "technocal change"? Perhaps needs a definition. How is technology change seperated from efficiency improvements (which were earlier classes as behavioural). It can be argued that the definition is somewhat arbitrary depending on the sector detail Weber, C.L., 2009. Measuring structural change and energy use: Decomposition of the US economy from 1997 to 2002. Energy Policy 37, 1561-1570. | Accepted, will be added to the Glossary. Chapter introduction will include a figure clarifying term. |
| 3296 | 5 | 57 | 7 | 61 | 19 | This is a strong, informative section and should be retained as is. | Thank you. |
| 16025 | 5 | 58 | 16 | 58 | 17 | to much sources | Rejected, we felt these sources were |
| 12039 | 5 | 58 | 24 | 58 | 47 | The importance of subsidies and state-led programs in R&D for technological change as well as investment should be mentioned, e.g. Energy Transition Policies in Germany towards renewable energy sources. | Accepted, will search for references |
| 8957 | 5 | 58 | 37 | | 40 | Where have exceptional R&D efforts been undertaken, how have they succeeded, and how can they be expanded? | Accepted, if literature can be found. See also 12039 and 5360. |
| 3264 | 5 | 58 | 45 | 59 | 30 | The de la Tour 2011 paper is cited heavily, and yet it is only one paper on the Chinese PV industry (and one that many experts in this field believe took a rather superficial look at technology transfer in the industry). Suggest citing a much broader body of evidence on the Chinese PV industry, or would be even better to use other industries and other countries in this section to build a broader case. | Accepted, other references will be looked up and text will be changed accordingly |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 10904 | 5 | 58 | | | | Earlier sections of this chapter also discuss historic patterns of energy change, but draw on different literature. Structural and Index decomposition analysis is relevant here. The CLA (Sangwon Suh) should be able to point to the literature, or see earlier sections in the chapter | Accepted, Suh will be asked |
| 5360 | 5 | 58 | 24 | 58 | 47 | For what it is worth, Dooley identified a number of these historical drivers that are discussed here in 1998. Dooley, J., Unintended consequences: energy R&D in a deregulated energy market. Energy Policy, 1998. 26(7): p. 547-555. | Accepted, although reference is relatively old so we will need to see whether to include it. |
| 5359 | 5 | 58 | 30 | 58 | 40 | The work of Alpanda, S. and A. Peralta-Alva 2010 is a useful example of how a step level change in an economy's energy efficiency has happened and might be worht citing here. Alpanda, S. and A. Peralta-Alva, Oil crisis, energy-saving technological change and the stock market crash of 1973-74. Review of Economic Dynamics, 2010. 13(4): p. 824-842. DOI: 10.1016/j.red.2010.04.003 | Accepted, thank you for the reference |
| 13556 | 5 | 59 | | | | I would have expected a discussion of rebounds in the consumption section | Noted - however they were allocated |
| 5791 | 5 | 59 | 1 | 59 | 30 | Please rework this section. It is not paramount WHO found something, but what has been found and what is still not understood or included. As it is a statement like in lines 10 to 17 leaves the reader with the question "And what does this imply?" as you offer no insights beyond a mere description. Please give some more thought to what are the core findings regarding system aspects and concentrate thereon. | Rejected. Unclear what the comment refers to. WHO is not quoted on this page. |
| 3265 | 5 | 59 | 10 | 59 | 17 | The discussion of Technological Innovation Systems repeats what is already discussed at more length in Chapter 4. Suggest deleting from this chapter. | Noted |
| 4184 | 5 | 59 | 26 | 59 | 30 | The acquisition procedure of skills and know-hows in industry should be documented based on broader literature. For instance, it is well understood in Japan that the retired engineer and managers were broadly hired by Chinese companies and taught them. | Rejected. Impossible to provide such detail and no peer-reviewed references suggested. |
| 17455 | 5 | 59 | 29 | 30 | | Meaning not clear to me | Agreed, sentence has been removed as |
| 2225 | 5 | 59 | 31 | 60 | 12 | This is a super interesting and very tricky topic, very limited literature. 1) Check out the work from Steve Sorrell at UKERC (http://www.ukerc.ac.uk/support/tiki-index.php?page=0710ReboundEffects), 2) it would be really helpful to get NUMBERS on this from the equilibrium models, isn't there anything? e.g. if one would reduce fuel efficiency by 30% in all new cars, would they actually drive more? | Noted - now been included |
| 15065 | 5 | 59 | 43 | | | this is a problem on citation. | Noted |
| 3043 | 5 | 59 | 43 | | 45 | The backfire condition is slightly subtler than stated here: for a CES function, the elasticity of substitution between energy and other inputs need only be greater than one minus the energy value share [H.D. Saunders, "Fuel conserving (and using) production functions," Energy Economics 30 (2008) 2184 2235] | Saunders work now included |
| 3044 | 5 | 59 | 45 | | 49 | Actually, a response to Howarth showed his result depended on an extreme assumption of Leontief (fixed factors) production. A number of researchers (e.g., Sorrell) seem to treat this rebuttal as definitive. [H.D. Saunders, "Does predicted rebound depend on distinguishing between energy and energy services?" Energy Policy 28(6-7) (2000b) 497 500.] | Saunders work now included |
| 9255 | 5 | 59 | 10 | 59 | 15 | Does the TIS approach take into account recent developments in social media as informers and influencers? 2008 is 5 years old; we should be looking 5+ years ahead. | TIS is not incompatible with social media, and this chapter looks at |
| 10906 | 5 | 59 | | | | This is drawing on quite old literature. What has happened since AR4? What does the latest literature say? | Accepted- considerable number of new references have been added |
| 6517 | 5 | 6 | 1 | | 2 | Modify the description after "while", as it contradicts with the descriptions of P.31 line 27-28, P.32 line 11-12, and P.32 line 27. | Accepted. The sentence has beeen rephrased. |
| 16015 | 5 | 6 | 1 | 6 | 2 | Why is this efect not clear? Decline of household size cause more squere meter living space, more waste, more furniture and electric domestic products more energy use, more cars etc.) | Rejected - Because that's what the literature says - see Section 5.4. |
| 16900 | 5 | 6 | 14 | | 16 | Seems to contradict lines 3 through 8 on page 7? | Rejected: There is no contradiction. Page 7 says that changes in energy intensity are affected by structural change, p6 says that they are less |
| 16016 | 5 | 6 | 14 | 6 | 16 | sometimes is it more and sometimers less important that depends of the special situation | Accepted: The ES is being revised. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 7642 | 5 | 6 | 14 | 6 | 14 | What is meant by "sector shifts". Increase in output in one sector at the cost of another sector? It might be worth mentioning that the effect of such shifts are deemed to be less important because the amount of embodied (life-cycle) emissions are not strongly affected (if this is what the argument is trying to say). | Accepted: The ES is being revised. |
| 8815 | 5 | 6 | 17 | 8 | 41 | There appears at least a tension between page 6 '17 Economic growth, in turn, is related to the level of consumption of goods and services; once the level of consumption is isolated as an individual driver of emissions, it is by far the most significant driver in both developed and developing countries (high agreement, robust evidence). This is the conclusion of numerous studies that have undertaken a structural decomposition analysis to identify the role of different drivers.' and page 8 '41 In view of this assessment, technological change and individual behaviour becomes key aspects for future efforts on climate change mitigation.' Given the acknowledgement of the rebound effect on page 7 this tension appears profoundly ideological, as if the authors of this chapter cannot question consumerism which is the institutionalised driver of unsustainable consumption and CO2 production by individuals and organisations. Simplifying here for brevity the causal chain of this consumerist driver of emissions goes via two routes to most likely one source. (1) Conventional economics is based on the utilitarian ethical assumption that more consumption is good - effectively turning greed from a classical vice (cf. Aristotle, etc.) into a virtue 'greed is good' - this is recognised JM Keynes among others. This is then closely linked to politician in 'liberal' 'representative' 'democracy' effectively buying votes by forever promising better material standards of living to all, as the politician have bought into the utilitarian ethical assumptions embodied in economic practice (2) As Kevin Anderson (2009, Climate change in a myopic world, Tyndall Briefing Note No. 36 – May 2009, http://www.tyndall.ac.uk/sites/default/files/bn36.pdf) writes 'Do we continue to pay lip service to the issue of climate change, and hope future generations will understand our preference for barely-veiled hedonism over stewardship?' In similar but much stronger terms Wenz argues that consumerism harm everybody, societies the Earth System specially that it implicated in suffering of the global poor including increases in some causes of malnutrition, health effects of pollution, greater inequity, unjust displacement from traditional neighbourhoods resulting in poorer living and working conditions, family break up and child prostitution. Indeed, he then compares selfishness and indifference in rich consumers with German citizens in Nazi Germany (Sandler R and Cafaro P (Eds.) (2005, 199-207) Environmental virtue ethics, Lanham, Md.: Rowman and Littlefield). I shall not dwell on if there is truth in what Wenz argues what this makes ideologues who promote consumerism. Perhaps the most important analysis of the causes of consumerism as the cause of environmental stress is Tim Jackson's 2002 'Consumer Culture as a Failure in Theodicy' (in Consumption, Christianity and Creation - Proceedings from an Academic Seminar held on 5th July 2002, Sheffield: Centre for Sustainable Consumption) most notably the lack of understanding of philosophical ideas of virtue by authors in Jackson including Malthus and Nietzsche. See MacIntyre A (1990, Three Rival Versions of Moral Enquiry. London: Duckworth) for a philosophical discussion of the problems Nietzschean ethics. So it can be argued that ultimately the causal chain of wanton climate change emissions can be traced back to the hedonism justified by poor theology by Rev. Malthus. | Noted |
| 12290 | 5 | 6 | 17 | 6 | 21 | Should this important finding on the role of consumption be included in the SPM? | Accepted: The SPM is being written. |
| 16017 | 5 | 6 | 17 | 6 | 21 | redundant | Accepted: The ES is being written. |
| 12291 | 5 | 6 | 22 | 6 | 25 | Please state confidence or agreement in statement on effect of trade. Also, should this statement be included in the SPM? | Taken into account: Implying cause to trade related emissions is not easy and this uncertainity has now been reflected in the re-write. Additional references, including Jakob and Marschinski (1012) |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 12533 | 5 | 6 | 24 | | | While gross trade volume has certainly grown as the global economy has grown, the pattern in the relative proportion of traded goods and services to global GDP over the last 150 years is more mixed. This raises interesting questions concerning whether terms of trade are a real driver or instead a consequence of deeper structural shifts in global economic systems, relative costs of primary inputs, and patterns of population growth and demographic transition. This may have important implications for policy structure to affect production and consumption patterns aggregated to a global scale. | Accepted - in an atempt to recognise the complexity of international emissions transfers, additional text has been added to recognise the causes and not just describe the current situation. The text does still not provide a comprehensive assessment of how each driver affects |
| 16901 | 5 | 6 | 26 | | 32 | Good! Manufacturing is linked to emissions with the existing energy system/technologies. Manufacturing needs energy, which creates emissions. Trade lets manufacturing move from developed to developing countries, providing benefits to both countries. | Noted |
| 13763 | 5 | 6 | 28 | 6 | 30 | I would dispute the evidence classification. Is there any evidence that points in the other direction? Some industrialized countries, such as Canada, Australia, and until a decade ago, Norway, have predominantly high emissions intensity exports, i.e. natural resources. For these countries, consumption-based emissions are hence lower than territorial ones. However, this does not contradict the statement presented here. It just needs to be made clar that not all developed countries have low emissions intensities. | Taken into account - covered with the addition in figure in section 5.5.3 |
| 7643 | 5 | 6 | 31 | 6 | 32 | I think this has been said previously. | Noted - Section is rewritten. |
| 12534 | 5 | 6 | 33 | | | It is asserted that trade is not a driver of global emissions per se, but an argument to the contrary can be made, because trade may privilege luxury, “high value” or high-embedded carbon production and consumption over subsistence. This may be a useful avenue for research. | Accepted - in an attempt to recognise the complexity of international emissions transfers, additional text has been added to recognise the causes and not just describe the current situation. The text does still not provide a comprehensive assessment of how each driver affects |
| 7458 | 5 | 6 | 39 | 6 | 42 | “Long-term statistical records show improvements in energy intensities of economic outputs (measured by GDP) by more than a factor of five since 1800 when traditional biomass fuels are included in the measure of energy inputs, corresponding to an average decline of total energy intensity of about 1% per year”. For 210 years at 1% increase per year will give an 8 fold increase not 5! | Accepted. The mistake must have occurred during the shortening of FOD text. I will provide the correction next week with relevant references. |
| 2252 | 5 | 6 | 9 | 6 | 9 | "The OECD showed considerable growth levels" which have now ceased. | Rejected: First, the chapter refers to economic growth over the 1970-2010 period. While GDP did fall in most countries in the 2008-9 recession, the |
| 13557 | 5 | 60 | | | | I miss in the section on lock in of infrastructure a reference to a very insightful Science 2010 paper of Davis and Caldeira, who caclulated how much CO2 emission still will be emitted by infrastructure available in 2010 during its normal still remaining economic lifetime | thanks, ref added. |
| 5923 | 5 | 60 | 23 | | 32 | I find it slightly strange that coal-CCS for developing countries is mentioned in a negative sense. In reality, for instance Germany is at the moment building 19 GW of new fossil capacity, largely due to the decision to abandon nuclear power. This is new fossil capacity without any CCS, a good example of lock-in to the worst options with regard to climate change. Shouldn't this be mentioned as well ? | accepted. Changes made |
| 12618 | 5 | 60 | 29 | 60 | 32 | Bioenergy and CCS is a very valid technology but may be constrained by the availability of sustainable biomass. This must be taken into account when estimating the infultration of bio CCS into any overshoot scenario. | accepted, changes made |
| 12661 | 5 | 60 | 29 | 60 | 32 | Bioenergy and CCS is a very valid technology but may be constrained by the availability of sustainable biomass. This must be taken into account when estimating the infultration of bio CCS into any overshoot scenario. | accepted, changes made |
| 17456 | 5 | 60 | 31 | 32 | | worth mentioning possible constraints on large scale BECCS (availability of resources/land etc; fact that emissions may actually increase if appropriate land use controls are not in place) | accepted, changes made |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |

|---|---|---|---|---|---|---|---|
| 9424 | 5 | 61 | 15 | 61 | 19 | ・ Addition is needed for the description of voluntary actions.<br>・ The draft claims that absence of policy intervention leads, through the lock-in effect, to loss of consumption and of welfare. However, voluntary actions should be treated equally to policy intervention and added, since there are cases of voluntary actions of the industry achieving significant effects as reported in Japan.<br>・ Refer to the following documents.<br><br>As examples of successful voluntary actions, Wakabayashi has analyzed the case of decreasing the standby power of devices in Japan and the case of PFC emission reduction in the global semiconductor industry [1] [2]. The program for decreasing the standby power of devices in Japan set the goal of lowering the standby power of every major device to 1W or less by the end of fiscal 2003, the most ambitious goal in the world, and strong commitment of the industrial association achieved this goal for all devices. The semiconductor industry successfully reduced PFC emission through voluntary actions as the participating corporations shouldered burdens greater than those dictated as the norm by business standards, in order to mitigate global warming.<br>The evaluation report for fiscal 2011 of the third party committee on the Japan Business Federation's voluntary action plan on the environment, released on April 23, 2012, reported that CO2 emission from the industry and from the energy conversion sector (34 categories of business) in fiscal 2010 was 443.47 million tons, which was a 5.3% increase over fiscal 2009 and 12.3% decrease from fiscal 1990, the basis year, and evaluates this result highly as the result of persistent efforts of the industry to achieve the goal in accordance with its voluntary action program [3].<br>Okazaki et al. [4] showed that the Japanese steel industry responded to the Kyoto target by launching a voluntary action plan in 1996 a year prior to the adoption of the Kyoto Protocol with challenging quantitative target: 10% reduction of energy consumption in 2010 compared to 1990. Since then, the steel industry has made stead progress toward achieving these goals. As a result, the energy consumption in 2008 was 11.5% less in comparison to the 1990 level (equivalent to 12.1% reduction in CO2 emissions).<br>[1] Masayo Wakabayashi<br>"Success case study of voluntary actions in Japan, 1: Action to decrease standby power of devices," Socio-Economic Research Center, Central Research Institute of Electric Power Industry, Discussion Paper<br>（SERC Discussion Paper）：SERC11035<br>http://www.climatepolicy.jp/thesis/pdf/11035dp.pdf<br>[2] Masayo Wakabayashi<br>"Success case study of voluntary actions in Japan, 2: Semiconductor industry's actions to reduce PFC emission to mitigate global warming," Socio-Economic Research Center, Central Research Institute of Electric Power Industry, Discussion Paper<br>（SERC Discussion Paper）：SERC11041<br>http://criepi.denken.or.jp/jp/serc/discussion/download/11041dp.pdf<br>[3] Evaluation report for fiscal 2011 of the third party committee on the voluntary action plan on the environment<br>http://www.keidanren.or.jp/policy/2012/029.pdf<br>[4]Teruo Okazaki, Mitsutsune Yamaguchi, (2011) | rejected, as voluntary actions are not linked to locked in effect assessments. |

|---|---|---|---|---|---|---|---|
| 16943 | 5 | 61 | | | | This is not an area I have much expertise but I have had cause to review some of the literature recently. I was struck by the apparent scale of local air pollution impacts and apparent “co-beneifts”, despite the big reductions in eg. sulphur referred to (eg. p.62 lines 14-23). I’d suggest that this section should look more closely at the environment / health co-benefits including the efforts to put quantitative values on these, to which we refer in Chapter 1 of Grubb, Hourcade and Neuhoff (section 1.4); see most notably the US data we cite from NY-NAS and AER.<br>The IPCC chapter cites the OECD study Bollen (2009) and it might be worth including their core diagram on relationship between CO2 abatement costs and LEP co-benefits (also discussed in Chapter 6 of Grubb, Hourcade and Neuhoff). In that chapter we also note that the biggest co-benefits may be due to reducing the level of energy subsidies. | noted, incorporated |
| 9063 | 5 | 61 | 20 | 67 | 42 | 5.10. Co-benefits and trade-offs of mitigation actions can be deleted due to limitations on the nos of pages, and it is also covered in chapter 6 | noted, will communicate |
| 11843 | 5 | 61 | 27 | | | A little introduction of how these cobenfits were identified and selected would be good. I assume that there are more co-beneifts possible, which are mayb not documented yet or may not be included for other reasons. | accept |
| 12100 | 5 | 61 | 27 | 62 | 47 | The current text is a good start but would be much more effective if it included all the other numerous important co-benefits of climate change mitigation including, to name a few a) many energy efficiency measures also deliver water efficiency savings (Ref - Retamal, M.L., Abeysuriya, K.R., Turner, A.J. & White, S. 2009, 'Water energy nexus literature review', Institute for Sustainable Futures, UTS, Sydney, Australia. at http://www.isf.uts.edu.au/publications/retamaletal2009wenlitreview.pdf) b) biodiversity co-benefits from investing in reafforestation and habitat restoration for carbon biosequestration (Ref - Dickson, B., Dunning, E., Killen, S., Miles, L. & Pettorelli, N. Carbon Markets and Forest Conservation: A Review of the Environmental Benefits of REDD Mechanisms. United Nations Environmental Programme — World Conservation Monitoring Centre, 2009; available at http://www.unep-wcmc.org/medialibrary/2010/10/05/d26fb1d3/Environmental%20Benefits%20from%20REDD.pdf.) c) increasing soil carbon improves soil productivitiy (Ref - d) integrated waste management and higher levels of recycling - save energy, reduce GHGs and reduce waste to landfill. (Ref - Bahor, B (2009) Integrated waste management as a climate change stabilization wedge. Waste Management & Research http://www.seas.columbia.edu/earth/wtert/sofos/wmr_nov09_p839.pdf) e) Recycling organic waste streams from cities and using them to restore nutrients to the soil and soil productivity in peri-urban areas. f) Many mitigation strategies also help with adaptation - eg: energy/water efficiency nexus opportunities reduce both energy and water demand, insultating buildings, improving soil productivity, investing in natural capital to name a few. More co-benefits and more refs can be sent if interested. | accepted, changes made |
| 5920 | 5 | 61 | | 62 | | Only health-benefits have been mentioned. Also benefits to other air pollution problems (acidification, eutrophication, ground-level ozone) could be mentioned. Suitable references are e.g. Syri S., Karvosenoja N., Lehtilä A., Laurila T., Lindfors V. & Tuovinen J.-P. 2002. Modeling the impacts of the Finnish Climate Strategy on air pollution. Atmospheric Environment 36: 3059-3069. , Syri S., Amann M., Capros P., Mantzos L., Cofala J. & Klimont Z. 2001. Low-CO2 energy pathways and regional air pollution in Europe. Energy Policy 29: 871-884. | rejected, not mitigation policy |
| 10907 | 5 | 61 | | | | There is a larger literature to draw upon. Maybe some is covered in WGI, but otherwise the work of Shindell et al should point to the relevant recent literature http://www.sciencemag.org/content/335/6065/183.abstract. But, it is worth noting that there is a large literature on climate and health co-benefits that does not seem to be captured here. | noted, will consider and coordinate with sectoral chapters |

|---|---|---|---|---|---|---|---|
| 4031 | 5 | 61 | | | | After the second paragraph, suggest adding the following text: "Implementation of selected measures to mitigate black carbon and tropospheric ozone could help avoid 0.6–4.4 and 0.04–0.52 million annual premature deaths globally in 2030, while more than 80% of the health benefits are estimated to occur in Asia (Anenberg et al. 2012)." The full reference: Anenberg, S.C., J. Schwartz, D. Shindell, M. Amann, G. Faluvegi, Z. Klimont, G. Janssens-Maenhout, L. Pozzoli, R. Van Dingenen, E. Vignati, L. Emberson, N.Z. Muller, J. Jason West, M. Williams, V. Demkine, K. Hicks, J.C.I. Kuylenstierna, F. Raes, and V. Ramanathan. Global Air Quality and Health Co-Benefits of Mitigating Near-Term Climate Change through Methane and Black Carbon Emission Controls. Environ Health Perspect 120:831–839 (2012). http://dx.doi.org/10.1289/ehp.1104301. The authors should also amend Table 5.10.1, accordingly (the Health Impacts section). | accepted, changes made |
| 5362 | 5 | 61 | 16 | 61 | 18 | Not sure the point(s) being made in this sentence are as policy relveant as the authors of this section of Chapter 5 might think they are. The world we live in today is being compared to an idealized world that has perfect foresight and has the ability to share costs equitably over time. Not sure this comparison helps policymakers all that much. | acceted, changes |
| 11740 | 5 | 62 | 1 | 62 | 5 | Deleate all. Refer to No.25. | accepted, deleted |
| 9982 | 5 | 62 | 1 | 62 | 3 | This part should be deleted totally because SOx/NOx emission can be technically decontaminated by installing SOx/NOx removal equipments into coal power plants, as shown in (Margaret, 2005, page369-370, Fig9) and (Sonia, 2005, page3 and 6).<br><br><Reference><br>[1] Margaret R. Taylor, Edward S. Rubin, and David a. Hounshell (2005).<br>Regulations as the Mother of Innovation: The Case of SO2 Control LAW & POLICY, Vol.27 No.2 April 2005<br>[2] Sonia Yeah, Edward S. Rubin、Margaret R. Taylor, and David A Hounshell (2005). Technology Innovations and Experience Curves for NOx Control Technologies<br>Journal of Air Waste Management Association 2005 Dec.;55(12):1827-38. Available at: http://gsppi.berkeley.edu/faculty/mtaylor/taylor_expcurvenox.pdf | accepted, deleted |
| 9363 | 5 | 62 | 1 | 62 | 3 | It should be deleted because the emissions of SO2 are already tightly controlled by implementing SO2 removal system. | accept, delete. |
| 4032 | 5 | 62 | 10 | 62 | 13 | The last sentence represents a controversial statement. Yes, it's correct to say that introducing modern cook stoves would deliver huge health benefits. However the benefit for radiative forcing is not that much obvious. The improved stoves often reduce emissions of organic carbon more that those of black carbon. Emissions of organic carbon in general lead to cooling thus cancelling out the climate benefit of the black carbon mitigation (see discussion in section 2.4.5 of "Integarted Assessment of Black Carbon and Tropospheric Ozone", UNEP/WMO 2011, available at http://www.unep.org/dewa/Portals/67/pdf/BlackCarbon_report.pdf). Therefore the wording could be as follows: "One study has suggested that in India around two million premature deaths, particularly in women and children, could be averted by introducing 150 million improved efficiency cook stoves over a decade (Wilkinson et al., 2009). However as regards to the sign of the resulting radiative forcing the uncertainty is particularly large for this mitigation option because biomass combustion emits significantly more organic carbon, which produces a cooling effect on the atmosphere, compared to black carbon, which is a warming agent. The improved stoves often reduce emissions of organic carbon more that those of black carbon (UNEP/WMO 2011)." | accepted, changes made |
| 17462 | 5 | 62 | 14 | 62 | 43 | not clear to me how this relates to health benefits | accepted, deleted |
| 12619 | 5 | 62 | 3 | 62 | 5 | 30% is the upper range currently. Some estimates are as low as 20-25%. This range should be presented. | noted, deleted. |
| 12662 | 5 | 62 | 3 | 62 | 5 | 30% is the upper range currently. Some estimates are as low as 20-25%. This range should be presented. | noted, deleted. |
| 17463 | 5 | 62 | 32 | 62 | 39 | not clear to me how this relates to transport safety/economic co-benefits (most of it seems more relevant to the health co-benefits section) | accepted, changes made |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 3626 | 5 | 62 | 40 | 62 | 46 | Employment co-benefits can also be lost, e.g. if they are dependent on government subsidies and subject to strong international competition such as in the solar energy industry. In Germany, competition with Chinese producers led to bankruptcies in this industry after the feed-in tariff was reduced. | rejected, this is not relevant as international trade applies to all the sectors, not just to solar pv |
| 9364 | 5 | 62 | 40 | 62 | 46 | It should be deleted because what is happening in Finland does not necessarily apply to other countries. Employment creation is realized as a result of the policy tradeoff.(Berndes and Hansson,2007) | accepted, rewrite |
| 5793 | 5 | 62 | 41 | 62 | 46 | Please rework this paragraph as "labor markets may recover" is somewhat redundant to "employment may recover". | accepted rewite |
| 9298 | 5 | 62 | 24 | 62 | 39 | The reference shows economic co-benefit for both of the cement plant and local government to treat municipality wastes in the cement kiln as well as reduction of GHG emissions. (Susumu Sano, Akira Kato, Tomoyuki Iino, Nobuo Kasiwazaki, Toshihiko Matsuto and Nobutoshi Tanaka, Journal of the Japan Society of Material Cycles and Waste Management, Vol.16, No.5, p.341, 2005 “Effects of CO2 Emissions from the Utilization of Municipal Solid Waste as Alternative Fuel and Raw Materials in Cement Production”) | accepted, changes made |
| 5363 | 5 | 62 | 1 | 62 | 5 | This entire paragraph is missing a number of citations to the underlying peer reviewed literature. These points need to be substantiated with references to the peer reviewed literature and not just asserted. | accepted, will add |
| 10908 | 5 | 62 | | | | I guess this is quite a small sample, I would imagine there are many other economi co-benefits. For example, taking the MAC discussed in Chapter 3 I think shows there are many economic win-wins. | noted, will assess |
| 4386 | 5 | 62 | 24 | 62 | 24 | improper title, economy is not dealt with in this section | rejected. Economic is different from |
| 5364 | 5 | 62 | 25 | 62 | 31 | This entire paragraph about "energy security" is technically very weak. Need to have citations to back up the points being made here. Moreover, what is the science or technical literature that substantiates benefits of energy security as described here? If a nation still imports any oil then it is still susceptable to price shocks and the resulting economic damage. Having a Strategic Petrolium Reserve and a storng military are arguably the best energy security tools that are employed by the United States. Neiher one of those are very GHG friendly. If there are sound technical points to be made about energy security then please make them in a sound technical fashion (i.e., drawing on a broad body of high quality peer reviewed literature). Otherwise, delete this policitical sloganeering about "energy security." The US could in the name of energy security exploit its large unconventional hydrocarbon resources but that would likely result in the opposite of a "co-benefit" (see for example Dooley, J., R. Dahowski, and C. Davidson, The potential for increased atmospheric CO2 emissions and accelerated consumption of deep geologic CO2 storage resources resulting from the large-scale deployment of a CCS-enabled unconventional fossil fuels industry in the U.S. International Journal of Greenhouse Gas Control, 2009. 3(6): p. 720-730.) For a more general discussion about the lack of technical meaning of the concept of energy security and its related concept of energy independence see Council on Foreign Relations, National Security Consequences of U.S. Oil Dependency Report of an Independent Task Force, 2006, Council on Foreign Relations: New York. p. 90. | rejected. It is co-benefit, not for the sake of energy security |
| 4387 | 5 | 62 | 32 | 62 | 39 | paragraph more relevant with section 5.10.1.1 | accetped, changes made |
| 4033 | 5 | 62 | | | | After the second paragraph suggest adding the following text: "Food security: Implementation of selected measures to mitigate black carbon and tropospheric ozone would increase annual crop yields of wheat, rice, maize, and soy combined by 30 to 135 million tonnes due to ozone reductions in 2030 and beyond (Shindell et al. 2012)." The full reference: Shindell, D., J.C.I. Kuylenstierna, E. Vignati, R. van Dingenen, M. Amann, Z. Klimont, S.C. Anenberg, N. Muller, G. Janssens-Maenhout, F. Raes, J. Schwartz, G. Faluvegi, L. Pozzoli, K. Kupiainen, L. Höglund-Isaksson, L. Emberson, D. Streets, V. Ramanathan, K. Hicks, Kim Oanh N. T., G. Milly, M. Williams, V. Demkine, and D. Fowler. Simultaneously mitigating near-term climate change and improving human health and food security. Science, 13 January 2012: Vol. 335 no. 6065 pp. 183-189 DOI: 10.1126/science.1210026. The authors should also amend Table 5.10.1, accordingly (the Economic section). | accepted, changes made |

| 17464 | 5 | 63 | 14 | 63 | 14 | what does the 77% refer to? | accepted, changes made |
| 9268 | 5 | 63 | 15 | 63 | 20 | The IPCC draft report is correct in regard to impacts on water consumption, SOx, NH3 and NOx in regard to post-combustion capture using current generation amine solvents.<br><br>A key reason for the increased water consumption is the relatively high heat release when CO2 is absorbed into the current generation of amine solvents, which then requires significant quantities of cooling water to take away the heat in the absorber, and high quantities of steam in the stripper to release the absorbed CO2. The use of high quantities of steam then significantly reduces the amount of power generated in the host power plant.<br><br>The new generation of post-combustion capture solvents (such as hindered amines and potassium carbonate) have a much lower heat release when CO2 is absorbed, meaning cooling water requirements are either significantly reduced or can be replaced in part or in full by air cooling. The quantity of steam used in the stripper to release the absorbed CO2 is also reduced, meaning that more power is generated relative to the current generation amine solvents. | accepted, changes made |
| 12620 | 5 | 63 | 17 | 63 | 18 | Studies have shown that CCS can be done with little to no increase in water consumption. See the study IEA GHG WATER USAGE AND LOSS ANALYSIS OF BITUMINOUS COAL FIRED POWER PLANTS WITH | accepted, changes made |
| 12663 | 5 | 63 | 17 | 63 | 18 | Studies have shown that CCS can be done with little to no increase in water consumption. See the study IEA GHG WATER USAGE AND LOSS ANALYSIS OF BITUMINOUS COAL FIRED POWER PLANTS WITH | accepted, changes made |
| 4185 | 5 | 63 | 18 | 63 | 20 | Does this sentence on CHP emission mean NOX or other air pollutant? In terms of GHG, the distance between the cite and consumers does not matter. | accepted, changes made |
| 5921 | 5 | 63 | 18 | | 22 | The side-impacts of CHP have been written in a biased and untrue way, which does not represent reality in most countries with a cold climate, which utilise CHP. In these countries, building extensive, large CHP systems in cities has replaced traditional house-size or block-size heating systems, using coal, oil or wood. Thus CHP has resulted in dramatically improved air quality ! Today, large CHP plants in Europe mostly have very efficient flue gas cleaning systems, required by EU LCP directive and national legislation. A hypothetical shifting to e.g. smaller-size biomass-based systems as a climate change mitigation measure would significantly damage air quality in these cities. | accept, changes made |

|---|---|---|---|---|---|---|---|
| 5298 | 5 | 63 | 19 | | | ADD: At least two important social dimensions need to be taken into account.<br>The first is that there is a movement away from individuals being strictly consumer and they are potentially becoming producers of energy: solar on the roofs, small wind power, geothermal. In addition, due to new energy technologies and market liberalisation, consumers can choose form different energy producers/distributors and even from different types of energy (carbon based or RE), or finally, even the time of day at which they may consume more energy.<br>The second relates to the social un/acceptability issue. As regards wind power, it is often rejected by local communities, even after a communication campaign and thus cannot always be implemented even when the other technical and natural conditions exist, mostly for aesthetics and NIMBY reasons.<br>What we do not know yet is the impact of the level of unacceptability on the different energy measures and effective renewable deployment. The same argument applies to solar panels for example, judged to be often too expensive (or the return on investment is considered too long) by families or small firms, as there are issues with adding isolation to existing habitat, while dams are for local environmental impacts. Without state subsidies the development of these forms of energy may well be under optimal in the short term, until costs diminish. With sufficient development, this may even in the middle run, play a role on grid equilibrium especially large scale ones, such as the emerging European. Even when these measures are successfully implemented, one has to take into account the rebound effect. □ | partialy accepted: tradeoffs part only. The other part is not related to risk tradeoff issues |
| 9498 | 5 | 63 | 23 | 63 | 27 | delete this paragraph - There is no explanatory reason why these challenges can be overcome at a cost | accept, delete |
| 9425 | 5 | 63 | 23 | 63 | 27 | · Deletion or addition is needed as shown below.<br>· The draft claims that the challenges imposed by the deployment of intermittent generation can be overcome at a cost. However, it is inappropriate to use the word 'cost' without specifically describing what it represents. Either this sentence should be deleted, or the nature and magnitude of the cost should be specifically described. | accept, delete |
| 9256 | 5 | 63 | 28 | 63 | 40 | Biofuels combined with CCS have the ability to reduce atmospheric CO2, and this should be mentioned (along with the negative aspects) to give balance. | noted, but this is not the place to address such issue. Therefore, rejected |
| 4186 | 5 | 63 | 29 | 63 | 32 | This statement is applicable only to the crop-based ethanol cases. Cellose based fuel and sugar cane residual based fuel are not the cases. | accept, changes made |
| 17418 | 5 | 63 | 29 | | | Missing from this discussion is the GHG emissions that are associated with clearing new land for food production. This is an important potential perverse outcome of unsophisticated biofuels policies. | reject: meaning implied and clear |
| 5794 | 5 | 63 | 7 | 63 | 40 | What is a "negative co-benefit"? Sorry, this sounds like an invention to hurt no-one by hiding the truth. I suggest to use "side effect" or "secondary effect" as neutral words instead. | accepted and changes made. glossary and X-cutting |
| 5365 | 5 | 63 | 13 | 63 | 17 | There is a large body of literature about the life cycle impacts of CCS. There are even a couple of meta analysis of this literature. This is a complex issue and needs to be dealt with more carefully than what is here in the FOD. There is a critical difference between increases in non-GHG emissions on a perkwh basis and the total impact in a basin, a region, a nation or the planet. That difference is whether or not the climate policy is depressing the total amount of coal that is being used. One also needs to consider the impacts associated with not using CCS and / or not addressing cliamte change for many of the LCA impact categories. Lastly the point about CCS using more water is true for post combustion capture systems on (again!) a per kwh basis. However any climate policy stringent enough to cause large scale adoption of CCS systems probably also changes many other aspects of the energy system and therefore it is not clear for a basin or a region if there is more or less water consumed. Also there is no technical rationale for assuming that only post combustion capture systems will be used for the rest of time. Many advanced CCS power systems have very different water use patterns than a post combustion capture unit does.IEAGHG, Water Usage and Loss Analysis of Bituminous Coal Fired Power Plants with CO2 Capture, 2011, IEAGHG: Stoke Orchard, Cheltenham, UK. p. 816. | accepted, changes made |
| 11742 | 5 | 64 | | | | Employment effects(local) on the table shoud be deleted. Refer to No.27. | noted, table to be deleted |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 9257 | 5 | 64 | | | | What's an FE (add to caption)? CCS should appear under Carbon Efficiency rather than infrastructure efficiency? Why will CCS increase water consumption? - pressure relief wells will produce water (though it will in many cases be saline to some degree and need treatment). Under capacity building, oil/gas knowledge and technology can be used for storage of compressed air (banking green energy), and CCS. Under Technological Risks, the danger of spills stems not so much in consumption and trade as from exploiting more difficult reserves. The biggest risks are development of cheaper technology in CCS, renewables and energy efficiencies being too slow. | noted, table to be deleted |
| 10645 | 5 | 64 | | | | The same as my previous comment. | noted, table to be deleted |
| 6533 | 5 | 64 | | | | Make Table 5.10.1. more comprehensive and precise. For example, whereas it puts productivity increase as a co-benefit of carbon efficiency, productivity almost always decline if carbon efficiency is increased by political intervention. Otherwise, delete the table so as not to create a biased view on the balance of co-benefits and trade-offs. | noted, table to be deleted |
| 7466 | 5 | 64 | | | | Social. Employment effects. The trade in biomass energy is a large (rural) job creator worldwide. | noted, table to be deleted |
| 5795 | 5 | 64 | | 66 | | In the text, there is no reference made to this table. "Options": You mean "Electrification of Transport"? What does "FE" stand for? This abbreviation is not explained. "Impacts on energy access & affordability": consumer spending will only go down if BF, RE etc. are competitive in monetary terms. And CCS has technological risks, too. | noted, table to be deleted |
| 15931 | 5 | 64 | | 64 | | RE (esp wind and solar) will have a definite + co-benefit on water consumption when compared to conventional power generation. | noted, table to be deleted |
| 9269 | 5 | 65 | | | | See comments made on same issue (reference: Chapter 5, page 63 lines 15 to 20). In the table, row "Water Consumption" and column "System/Infrastructure Efficiency", should note that the extent of water increase will depend on the type of capture process used. Prospective technologies (i.e. hindered amines and potassium carbonate) can substantially reduce this impact. | noted, table to be deleted |
| 7467 | 5 | 66 | | | | Land use. Bioenergy use. By using more of the annual net primary production, bio-energy use could have a positive effect. Biodiversity. By reclaiming degraded land for bio-energy, it could have a positive effect on biodiversity. | noted, moaterials removed |
| 4034 | 5 | 66 | 24 | | | after "IPCC 2007" add "Shindell et al. 2012, Anenberg et al. 2012" | accept, add. |
| 16944 | 5 | 66 | | | | Its very good to have this section on the complexities of using co-benefits. However, two points not fully recognised here: (i) the idea of “separating” policies to deal with each issue individually makes apparent sense economically but not if either solutions may be integrated, or policy responses involve new investment (as is often the case) in which case integrated investment to deliver multiple benefits is often the most cost-effective response. (ii) it is entirely possible that “higher domain” concerns (like climate change) can help to motivate welfare-improving policies at lower domain levels, which would otherwise not be tackled (subsidy reduction may be a classic case). This theme is developed in the concluding chapter (12) of Grubb, Hourcade and Neuhoff. Grubb, Hourcade and Neuhoff, Planetary Economics and the three domains of sustainable energy development, Taylor and Francis (forthcoming), Chapters 1 (submitted), 6 and 12 (drafts available from authors). | noted, will incorporate |
| 4187 | 5 | 67 | | | | I would point out two; first this table says that the outcome of mitigation is global, long-term and uncertain while cost and benefits are near and clear. Second, the term "development benefit" is unclear. I don't think this table is needed in this report. | accept, delete |
| 15932 | 5 | 67 | | 67 | | I am not sure - what prompts the authors to classify 'Mitigation Benefits' as 'Uncertain' / the para above the table also just mentions and excerpt from the original paper without any clear explanations. | deleted |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 5796 | 5 | 67 | 6 | 67 | 10 | I disagree. Mitigation benefits are not global only. WG II has chapters on local impacts which could be mitigated by emission reduction measures, so instead of "global" you have indirect effects. In some regions, mitigation can have adaptation (or: reduced need for adaptation) as opportunity costs, while in other regions benefits from an CC may dominate. Only here you have ex situ - effects. | accept, change |
| 17465 | 5 | 67 | 7 | 67 | 8 | Meaning not clear to me | accept, clarify |
| 17919 | 5 | 67 | 28 | 67 | 31 | This rather general statements should be replaced by a cross-reference to Chapter 8 and 11 that explicitly deal with these issues on the basis of a comprehensive literature assessment. | accept, materials removed |
| 17920 | 5 | 67 | 36 | 67 | 37 | If you want to use the example of LPG here, please supply a reference and examples for the "negative co-benefits" (please use other term instead; see my comment on Section 5.10.2) of production and transport of LPG. Preferrably, examples of the distributive implications of aggregate co-benefits/co-costs results should be taken from the sector chapter assessment. | accept, table removed and changes made |
| 5797 | 5 | 68 | 1 | 70 | 23 | Please shorten this section. You can delete everything used to explain the Kaya-Identity, for example. Just give the results. I also suggest to give within-chapter references. Without any reference this section appears to be of little scientific quality. | Accepted: The section is being revised. |
| 10438 | 5 | 68 | | | | Rewrite the entire section in terms of negative and positive externalities | Accepted: The section is being revised. |
| 9064 | 5 | 68 | 1 | 71 | 26 | 5.11. The system perspective: linking sectors, technologies and consumption patterns can be deleted to limitations on the nos of pages | Rejectes: Section 5.11 ca not be deleted. It is being revised and shorten. |
| 9258 | 5 | 69 | 24 | 69 | 26 | Key to this are social perceptions and their tipping points, and that's probably related more to extreme climate events (ECVs) than background climate change, as well as the use of social media. ECVs aremore likely during sunspot peaks, so 2025-ish could be significant. | Noted |
| 5300 | 5 | 69 | 43 | 70 | 48 | Take out, other chapters cover this | Rejected: Chapter 5 has to deal with this, although the text is being revised |
| 3046 | 5 | 69 | 5 | | 12 | The third term of the Kaya Identity is dependent on so many things--factor prices, factor substitution elasticities, factor technology gains--that it makes a poor tool for projection purposes, even while it allows interesting and useful historical comparisons. The problems in using this measure for projections are at least four:<br>- a minimum degree of further disaggregation is needed, to permit distinctions between industrialized and developing countries, and between productive and end-use energy consumption (which have differing microeconomic optimizations driving them: profit-maximization vs. consumer utility maximization); further disaggregation is required to comprehend sectoral shifts;<br>- real output, Y, is more directly related to energy use than GDP (the real output of an economy is greater than its GDP); real output is a better measure of (energy-using) economic activity; GDP is a value-added measure;<br>- output, or GDP, is not independent of the E/GDP ratio: both terms are driven by common drivers such as multi-factor technology gains; the terms of the identity are not independent and so cannot be independently forecast;<br>- the multiplicity of drivers means intensity is fundamentally difficult to project, and can give counterintuitive results such as that intensity can go down even while total energy use is increased (a backfire situation with declining intensity) | Accepted: The section is being revised. |
| 16903 | 5 | 7 | | 8 | | The story you seem to tell here is one of austerity -- Do we intend to suggest people should stop consuming? No consumption, no production, no job. No paycheck leads to no policy action. Decarbonizing our energy system and being more efficient does not mean austerity. Please emphasis that the least cost and most desirable lever to pull is new techs that need what appears in all modeling to be relatively affordable incentive of a CO2 price. | Rejected: we don't suggest austerity as solution. |
| 12292 | 5 | 7 | 12 | 7 | 13 | Please consider to include this key finding in the SPM | Accepted: The SPM is being written. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 13764 | 5 | 7 | 12 | 7 | 16 | This must be incorrect. Where do you find a rising carbon intensity? Not in any of the regions depicted in Fig. 5.2.5! However, as I know the story, the increase in global average carbon intensity is due to the disproportionate rise in the energy consumption of emerging economies,e specially China, which have a much higher carbon intensity to start out with. | Accepted. This is clearly a mistake – not even global energy intensity is increasing (nor that of China). |
| 15978 | 5 | 7 | 12 | 7 | 16 | however, when looking at the period from 1970 - today, coal has been a major driver of carbonization; while nuclear energy has been a driver of decarbonization ... see steckel et al. (2011) | Accepted. Coal has been indeed the major driver of carbonization, or rather a barrier toward faster decarbonization worldwide. Nuclear and other zero-carbon options such as new renewables |
| 15977 | 5 | 7 | 2 | 7 | 2 | regarding China: which has however shown an increasing EI after 2000; also results hinge critically on whether to look at GDP in MER or GDP | Rejected. This cannot be correct. The rate of energy intensity decline in China has slowed down from historical records of some 4 percent per year during the |
| 16902 | 5 | 7 | 20 | | 21 | But mass changes in behavior without incentives? A few lines later (bet'n 26 - 28) if people change behaviors in fairly large way, but we are still stuck with the same energy system techs, we are still stuck. | Noted |
| 7846 | 5 | 7 | 20 | 7 | 21 | This sentence only makes real sense if "future" is inserted before "emissions" at the end of the sentence. | Accepted (insert word "future" before |
| 7644 | 5 | 7 | 30 | 7 | 30 | Besides behaviour, there are other social forces that act as barriers. For example, the inertia of institutions. | Noted |
| 14387 | 5 | 7 | 35 | | | I disagree that the literature calls for a reduction in consumption, not the mainstream climate economics literature. That is all premised on continued increases in consumption, and indeed rising consumption is implicit in the use of positive discount rates. | Rejected (literature exists to support this view) |
| 4764 | 5 | 7 | 36 | 7 | 43 | I fullt support this statement regarding the "rebund effect". It is not always the final product that becomes cheaper, but rather the cost of the total quantity that is cheaper (for instance, thaks to energy efficiency measure, you will decrease your energy consumption, the unitary energy price is the same, so your global purchase decreases ... wil may lead to extra-consumption ...) | Noted |
| 12535 | 5 | 7 | 42 | | | A summary of the recent literature suggests the rebound effect is at the lower end of the 10-30% range for the power sector and passenger vehicles, and that the effect has likely been declining over decades. Stephen Nadel, 2012. "The Rebound Effect: Large or Small," American Council for an Energy Efficient Economy, http://aceee.org/files/pdf/white-paper/rebound-large-and-small.pdf | Taken into account - additional references have been added from the comprehensive review to date of rebound effect, namely Sorrell (2009). |
| 14386 | 5 | 7 | 9 | | | Not very helpful except as background to talk about declining coal since 1880; rise of China /coal in last couple of decades. Memo: for major-country decomposition of Kaya equation in last couple of decades, see Cline (2011), pp. 10-11. | Rejected. Historically, coal has declined since the peak of its global energy share in 1920. The share has been increasing during the past decade particularly |
| 5348 | 5 | 7 | 20 | 7 | 21 | Why not say that there is "high confidence" that behavior is an important aspect of anthorprogenic emissions? I can't imagine there being much serious debate about whether behavior is important or not. | Accepted (can be changed in Executive summary) |
| 10909 | 5 | 70 | | | | I do not know who came up with that FAQ, but that is hard to answer. The first sentence, whilst perhaps true, is a rather significant assumption. History did not tell us much about the 2009 financial crisis. If countries take positive mitigation measures, then history may fast become irrelevant. Future emissions are about choices we make today, and if we make no choices, then history may repeat. | Accepted: Sentence reworded so it poses the question in a way that can be answered from the information in the chapter |
| 13558 | 5 | 70 | | | | I like the FAQ, a nice way of condensing the key messages of the chapter. | Noted |
| 8959 | 5 | 70 | 1 | | | Conclusion could start here since the immediate preceding pages are repetitive. | Accepted: The section is being revised. |
| 11743 | 5 | 70 | 21 | 70 | 22 | Existing low carbon technologies are important as mentioned in No.22. This sentence should be amended to [In view of this assessment, technological change and individual behavior with accelerating the decarbonaization by using low carbon technologies becomes key aspects for future efforts on climate change mitigation.]. | Accepted: The section is being revised. |

| 4035 | 5 | 70 | 43 | 70 | 44 | delete "and economies in transition". In fact the population of these countries is decreasing. See the Population Division of the Department of Economic and Social Affairs of the United Nations Secretariat for statistics. | Accepted: The section is being revised. |
| 4987 | 5 | 71 | 15 | 71 | 16 | Sentence: Agriculture accounts for 11.5% of global GHG 15 emissions. This should not be Agriculture only but should be FOLU ( See same chapter page 52, Line 18 -19) | Accepted: Sentence changed as proposed. |
| 13517 | 5 | 71 | 15 | 71 | 16 | Sentence: Agriculture accounts for 11.5% of global GHG 15 emissions. This should not be Agriculture only but should be FOLU ( See same chapter page 52, Line 18 -19) | Accepted - duplicate comment |
| 17419 | 5 | 71 | 16 | | | "Technology has some scope to reduce the carbon footprint of food production, and substantial scope to reduce the carbon footprint of food distribution, however, consumer choice will play a large role in taking advantage of these food-related opportunities." This is a large and important topic, with a large and growing literature, that should be developed much more robustly in the document. | Noted |
| 8817 | 5 | 71 | 24 | 71 | 24 | The use of the term 'wise' is welcome and points to a virtue epistemology which incorporates the predictive elements of 'scienctistic' epistemology but also incorporates more humble elements such as precaution. | Noted |
| 5302 | 5 | 71 | 31 | 72 | 8 | Take out, other chapters cover this | Rejected: Chapter 5 has to deal with this, although the text is being revised |
| 10390 | 5 | 71 | 6 | 71 | 7 | [section7 5.6.1 and 5.6.2 still not available] should be substituted by the real content | Accepted: The sections missing when the FAQ was prepared have since become available and the figures were |
| 5301 | 5 | 71 | 9 | | 16 | Take out, other chapters cover this | Rejected: Chapter 5 has to present the overall picture with regard to drivers, trends and mitigation, setting the stage |
| 6534 | 5 | 71 | 9 | | 10 | Replace "not dependent on fossil fuels" with "less dependent on fossil fuels", to be more reasonable. | Accepted: sentence revised as proposed |
| 12865 | 5 | 75 | 37 | 75 | 40 | Delete one of the duplicate references to Ehrlich and Holdren (1971) and change citations in the text to read "1971" (rather than "1971a" or "1971b.") | Editorial |
| 13561 | 5 | 78 | 31 | | | Hertwich and Peters referenced twice | Editorial |
| 11838 | 5 | 8 | 10 | | | From my reading of other parts of this report and of WG2, I had the feeling that co-benefits are usually perceived as being positive and if negative are rather termed trade-offs. Here it is unclear what are trade-offs then, if co-benefits can also be negative. Later in the text (section 5.10) this is clarified but to me it seems more intuitive to talk about co-benefits with a positive and about trade-offs with a negative connotation (although of course the authors rightly point out that positive co-benefits for one persone/group maybe negative for another ("winners and loosers") | Accepted: A definition of co-benefits was agreed in Vigo for the whole WGIII and what Chapter 5 should do about it was also defined. |
| 4158 | 5 | 8 | 17 | 8 | 19 | I agree that "many" cobenefits are short-term, but the promotion of renewable energy sources would contribute to the long-term sustainability. This sentence sounds that long-term co-benefits have only minor effects. | Accepted: A definition of co-benefits was agreed in Vigo for the whole WGIII and what Chapter 5 should do about it was |
| 4765 | 5 | 8 | 20 | 8 | 25 | Is it possible to have qualitative values for this statement? % or numbers associated? | Accepted: The texts are being revised. |
| 12294 | 5 | 8 | 20 | 8 | 23 | Please consider to include this key finding in the SPM | Accepted: The SPM is being written. |
| 16204 | 5 | 8 | 20 | | | decreasing trend in efficiency' is misleading; there is a decrease in the RATIO used to embody efficiency, however, efficiency itself is improving (see point up above on 1.17.27) | Accepted: The texts are being revised. |
| 6518 | 5 | 8 | 20 | | | Replace "the decreasing trend in energy efficiency" either with "the increasing trend in energy efficiency" or "the decreasing trend in energy intensity". | Accepted: The texts are being revised. |
| 5296 | 5 | 8 | 27 | 8 | 37 | Take out part on other chapters, summarise what 5 does and no mention of what the other chapters do not do | Accepted: The texts are being revised and coodinated with other Chapters |
| 8942 | 5 | 8 | 31 | | 36 | Use of imperatives must and we have to seems overly directive. | Accepted: The texts are being revised. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 11199 | 5 | 8 | 32 | 8 | 42 | The summarised conclusion of the assessment does not mention the vital need to combat emissions through governance, land tenure and rule of law measures that are essential for tackling land use changes related to direct and indirect drivers. Improved governance and equitable tenure regimes in line with international obligations are needed to stem unregulated land acquisitions and conversion of habitats by agricultural, forestry, infrastructure and energy sector developments (biofuels, foods, fibres, veg oils, mining, oil and gas, roads, dams, forced displacement, expropriation and fragmentation of communal lands and destruction of community-based sustainable land use systems). In other words, tackling emissions is not just about individual behaviour, technological change, trade and consumption patterns (though these are also key), but also about upholding the rights of indigenous peoples and other customary resource owners and users to own and control their lands and resources and thus stem uncontrolled land use change | Rejected: Chapter 5 does not deal with mitigation options. Please refer to sectoral as well as policy chapters in WGIII for detail assessment of mitigation options. |
| 13213 | 5 | 8 | 35 | 8 | 36 | This is a major conclusion which should be highlighted. However, to be not policy prescriptive, the second sentence should be rewritten, e.g. in the followind way: " Such a shift implies to reduce energy per output, or to decarbonise energy supply, or both | Accepted: The texts are being revised. |
| 7645 | 5 | 8 | 36 | 8 | 36 | Probably better to avoid 'we'. 'We' can mean different things and is not well defined. | Accepted: The texts are being revised. |
| 12293 | 5 | 8 | 41 | 8 | 42 | If possible please include what role leadership has in order to mitigate emissions. | Rejected: Chapter 5 does not deal with mitigation options. Please refer to sectoral as well as policy chapters in |
| 16904 | 5 | 8 | 41 | | 42 | But the question then is how do we change behavior and technology? Education campaigns, shaming? Or create an incentive that points producer and consumer behavior in the same direction (consumers prefer techs that have lower emissions and producers move fast to create and produce). | Noted |
| 4159 | 5 | 8 | 42 | 8 | 42 | becomes -> become | Editorial |
| 4028 | 5 | 8 | 9 | 8 | 10 | Suggested wording: "Co-benefits and other trade-offs have also influenced the implementation of mitigation policies and measures and, therefore, the GHG emissions. Side effects of implementation of mitigation policies can be positive or negative." | Editorial - text has changed |
| 15979 | 5 | 8 | 9 | | 14 | it's not immediately obvious to me why co-benefits need to be discussed in a chapter on drivers and trends | Accepted: A definition of co-benefits was agreed in Vigo for the whole WGIII and what Chapter 5 should do about it was |
| 5299 | 5 | 86 | 21 | | | ADD: A recent socioeconomic study undertaken by CEPS indicates that domestic users in different countries demonstrate notable different preferences for the characteristics ascribed to the reliability of electricity supply. For example, respondents in France are willing to pay for the certainty of knowing the seasons during which a power cut would take place and to avoid power cuts occurring in the evening. But French respondents are not willing to pay to reduce the frequency or the duration of power cuts. By contrast, respondents in the UK and Italy are willing to pay to reduce the number of power cuts and their average duration. UK households are willing to pay to avoid a cut during the daytime whilst those in France are willing to pay to avoid a cut in the evening. Respondents in Italy, however, prefer knowing in which season a blackout would occur, whilst the time of day at which it occurs is not important. There are thus national differences that seem to be in part explainable by the national energy structure (France's energy is based on nuclear and is thus very stable throughout the seasons. Gas supply stability and prices do raise issues in individuals' perceptions on their willingness to pay and when they prefer a power cuts to occur or how long it would be. But on these points, there are also national differences which are yet to explore. C. Wan-Jung, A. Hunt, A. Markandya, A. Bigano, R. Pierfederici, S. La Branche. Consumer Valuation of Energy Supply Security: an analysis of Survey results in three EU countries, Centre for European Policy Studies Policy Brief. 2010. | Noted |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 15556 | 5 | 9 | 1 | 11 | 11 | The whole Introduction seems to adress GHGs only, not other minor substances, in particular aerosols of quite different origin, composition, and substantial contribution to radiative forcing, in particular to cooling via their clouds effects. This causes a bias in the whole Chapter, which (almost, except in 5.2.2) ) neglects the particles in the atmosphere. | Rejected - the introduction cannot be comprehensive. |
| 5764 | 5 | 9 | 1 | 11 | 11 | This section is too long. If written in a more concise, less prosaic manner it could be shortened down to about one page length. | Taken into account - revised and shortened. |
| 15057 | 5 | 9 | 10 | | | what is the unit of gross world product, Monetary or physical value? Need specify for non-expoert | Noted: text is rewritten |
| 8943 | 5 | 9 | 13 | | | Overreliance on Kaya Identity which is crude at best. Similar to Drake Equation in astronomy, with no predictive, dynamic power | Noted. SOD is clearer on use of decomposition. |
| 14459 | 5 | 9 | 13 | | | In mathematical terms this is indeed an identity, not explaining anything. It might confuse mathematician and physicist and other scientists.<br><br>A better representation would represent (G/P), (E/G) and (CO2/E) as parameters rather than as quotients. For many scientists it could help if all of these were explicitly shown as dependent on time.<br><br>In my view the Kaya identity as presented here seems to be a bit naive and simplistic, probably too close to economic modelling. A birt more mathematical rigidity could help to make the reasoning in the chapter better understandable and better describing causes and effects. | Noted. SOD is clearer on use of decomposition. |
| 4160 | 5 | 9 | 14 | 10 | 9 | These sentences could be reduced, if we seriously have to squeeze pages. | Taken into account - Section rewritten. |
| 14460 | 5 | 9 | 14 | | 16 | If the (G/P) etc are represented as parameters, the identity is no longer so obvious, and the equation will better represent the different influences on the emissions.<br><br>Actually, this is done in the equations (1) and (2). | Noted. SOD is clearer on use of decomposition. |
| 12295 | 5 | 9 | 2 | 9 | 6 | It seems like the WGIII is doing the analysis themselves, and not referring to published material, please consider rephrasing. | Taken into account - rephrased to make clear we assess the literature |
| 2253 | 5 | 9 | 2 | 71 | 26 | Trends in 40 years since1970s are a good way of concealing what is actually happening, before, during and after these years | Taken into account - we explain our time frame |
| 13765 | 5 | 9 | 2 | 9 | 29 | I think it should be pointed out already here that the identity can be expressed in terms of production (we are really talking about value added in a country) and consumption. The two perspectives are complementary but offer different interpretations. | Taken into account - we explicitly mention production and consumption in the introduction, but don't want to |
| 15980 | 5 | 9 | 2 | | | the ipcc might want to think about how appropriate it is to work with trends until the late 2000s when it's released in 2014. i'm aware that literature today uses data until 2008 or 2009 but many analyses in the chapter can be easily replicated with newer data (thinking e.g. at the Raupach paper) ... maybe it would be possible to do some analyses that includes latest data in a later process of the AR5, maybe also collaborating with e.g. the IEA in order to get access to the most recent trends | Taken into account - data are updated to 2010. |
| 14461 | 5 | 9 | 24 | | 28 | Further on the above comments: this could read that this chapter tries to identify and understand the underlying causes for the time dependence of the variable and parameters of the equation. | Noted. SOD is clearer on use of decomposition. |
| 14462 | 5 | 9 | 30 | | 33 | This indeed implies that the chapter is trying to find ex-post explanations of why the emissions of greenhouse gases have changed over time, rather than trying to find the reasons why emissions change as a consequence of general and specific changes in the major variable (population) while at the same time the wealth and energy intensity of the society and the production processes changes as a result of many other variables. And whether or not these changes explain the (observed) changes in emissions.<br><br>I feel that this is a consequence of the choice to start from a mathematical identity, rather than from a (causal) relation between changes in the society and economy worldwide and the resulting global emissions. | Noted. SOD is clearer on use of decomposition. |
| 11840 | 5 | 9 | 30 | 11 | 11 | This (very topical) part of the report could be shortened | Taken into account - Section rewritten. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 15981 | 5 | 9 | 30 | | | I agree it's a good structure, but it might be a little misleading: for example thinking of energy intensity, it comprises both, energy efficiency improvements and structural changes ... maybe it makes sense to explain this somewhere .. | Noted - lack of space does not allow for extensive explanation of all elements. |
| 14463 | 5 | 9 | 41 | | 42 | "Attributed to" is quite similar to "causality", isn't it?<br><br>Throughout the chapter there seems to be some confo=licting use of terms like "causality", which is sometimes said not to be looked for and the use of the term "driver". A "driver" drives something and therefore would have some causality implicitly in it. Actually, the analyses seem to look for correlations, be it in a rather confusing way. | Taken into account - we pay more attention to explaining what we mean by 'drivers', and its relation to causality and correlation. |
| 14464 | 5 | 9 | 43 | | 45 | What probably is meant here that the chapter merely wants to look at correlations. But, are production and consumption not correlated. If so, the two approaches are not independent, but again correlated! | Noted. Not clear what the referee is after. |
| 12854 | 5 | 9 | 6 | 9 | 6 | Because this chapter relies so prominently on the Kaya identity, it should provide a citation here to a peer-reviewed reference. The reference list, however, does not give a peer-reviewed reference. | Taken into account - reference provided in Section 5.3 |
| 12855 | 5 | 9 | 6 | 9 | 6 | Becase this is the first methion of the IPAT identity in the main text, cite here the peer-reviewed reference (Ehrlich and Holdren 1971). | Taken into account - reference provided in Section 5.3 |
| 13766 | 5 | 9 | 6 | 9 | 11 | The way I have learned about IPAT - from John Holdren - A was already expressed at GDP, and further decompositons were possible. | Taken into account - Section 5.3 will provide the literature reference. |
| 18140 | 5 | 9 | 2 | 9 | 3 | Justification required as to why 1970 has been chosen as the start point of this historical analysis. For example, would the start of the industrialisation period (1850s) not be a better choice? | Taken into account - we explain our time frame |
| 12621 | 6 | | | | | I am concerned by the heavy reliance of BECCS in teh overshoot scenarios without any analysis of the availability of such significant amounts of sustainable biomass. | Accepted. We intend to better highlight the role of BECCS and associated |
| 12664 | 6 | | | | | I am concerned by the heavy reliance of BECCS in teh overshoot scenarios without any analysis of the availability of such significant amounts of sustainable biomass. | Accepted. We intend to better highlight the role of BECCS and associated |
| 6401 | 6 | | | | | In my version, this figure is really screwed up. Regardless, I'm not sure how much this shows. The x-axis is "degree of international cooperation" but it appears to really only show two locations on the x-axis that are close to each other. | There was an editing problem in the creation of the figures for the FOD. We will make sure this doesn't happen again |
| 6394 | 6 | | | | | Is the CO2 budget in GT? | The figure shows total radiative forcing from all agents (CO2, other gases, non-gas agents such as aerosols) in Watts |
| 6404 | 6 | | | | | I really like this figure. But I think it needs more description. | The author team is working on ways to clarify the description of this graphic. |
| 6405 | 6 | | | | | It is not clear what Low30 and High30 refer to. | The author team is working on ways to |
| 6406 | 6 | | | | | The figure is screwed up. | There was an editing problem in the creation of the figures for the FOD. We will make sure this doesn't happen again |
| 17277 | 6 | | | | | The way of presenting the ranges has become more or less the standard in IPCC report. It provides median results with a band-with that looks like an uncertainty bandwith. However, it hides that all these are individual modelling results that show great variety. In the text, more attention should be paid to explaining the differences in outcomes between the various models. | The comparison of sectoral and integrated mitigaiton studies is still work in progress and therefore the entire Section 6.8 is under revision with more information from both sets of studies becoming available. This includes a revision of figure formats that more adequately represent the fact that a large number of studies are included in such summary figures. Also pointing out |
| 17278 | 6 | | | | | Next to presenting ultimate emissions, it would be also useful to present emission reduction efforts compared to a reference development. | Comment is noted and will be considered as the text is adjusted for the |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 2421 | 6 | | | | | I found the discussion of SRM and CDR, although necessary, to be piecemeal. It is not clear for instance why SRM is discussed in two different places. My suggestion would be to discuss negative emissions and BECCS in section 6.3 because these are already considered in some of the existing stabilisation scenarios but defer the discussion of SRM to section 6.9. This separate section on geoengineering should rely much more on the assessments already made in WGI (chapter 7) and WGII and focus on aspects that are directly relevant to WGIII. What is the potential for CDR (beyond BECCS) and SRM to modify the existing framework of stabilisation scenarios? The comment on cost-benefit vs risk-benefit is interesting, but can nothing more be said in that respect? Can we / should we differentiate temporal scales when discussing SRM (ie a few decades vs a century vs several centuries)? The termination issue needs to be discussed in the context of stabilisation scenarios. | Noted. Although it might be valuable to split the discussion of CDR and SRM into two subsections, the outline for the section has already been approved and it would be difficult to change at this time. The SOD will discuss CDR and SRM implications for emisisons pathways in 6.3 and then discuss technologies in 6.9. |
| 2182 | 6 | | | | | Thetitle of the Emissions level relative to 2005 should give units (%). | Editorial |
| 13761 | 6 | | | | | What is % NPV? You mean NPV as % of GDP? The etire following discussion of this aspect is confusing | Taken into account. The text and figure |
| 13135 | 6 | | | | | This is over 400 scenarios, how many models have been used for creating these? Are all models approximately similarly represented, or are some models strongly overrepresented? Elaborate here or elsewhere (section 6.2.5?), so that the intra vs inter model differences become clearer. Would be good to have statistics on models vs targets (i.e. a matrix that shows climate categories on one axis and model names in another, then populate with numbers of targets run by given models), I think this would be very important for understanding the sources of variation. | We will add a statistics on model. Overrepresentation of certain models is indeed an issue. |
| 13148 | 6 | | | | | What explains the below one index for cat 1 mitigation costs for the partial equlibrium models? Is it because most (in comparsion to the cat 3 scenarios) of their costs occur post-2050? | Taken into account. Figure revised. |
| 13155 | 6 | | | | | Figure not readable. | There was an editing problem in the creation of the figures for the FOD. We will make sure this doesn't happen again |
| 13158 | 6 | | | | | See previous comment, I suggest the figure is removed. | Figure 6.24 has been replaced by a figure that relates climate targets to the use of fossil fuels to link the discussion |
| 13160 | 6 | | | | | See the previous comment, I suggest the figure is removed and replaced with a short explanation. More detailed results on low carbon technologies follow in any case. If it seems absolutely necessary to include a figure, I'd rather see a single figure showing (for 2050) the low carbon share (or absolute numbers, if this otherwise get too close to the figures that follow later) on one panel and total primary energy in another. | Figure 6.25 is kept in the section to illustrate that the absolute level of low-carbon energy deployment is not fully determined by the climate target. A |
| 13161 | 6 | | | | | This figure, while very nice in theory, is not readable in its current form. The letters, especially, are nearly impossible to read, make the figure very messy and I would therefore strongly recommend removing them (it's also impossible to read any colours for the letters). An option might be to just indicate the base year and final year of each transition path (with climate target dependent markers?), so that the time element could be kept in the figure. | Figure will be reworked. |
| 13162 | 6 | | | | | As with the previous figure, the letters are not visible and make the figure messy. I don't think they're really necessary either, as it doesn't seem that important to know which model has produced a certain path. Finally, might be worthwhile to consider some alternative division of fuels as currently most of the figure is empty (because solids having such low shares on the end use level). | Figure will be reworked. |
| 13163 | 6 | | | | | Also here I would suggest removing the letters and replacing them with simple markers. Especially if it's expected that more scenarios will be included for the SOD. | Figure will be reworked. |
| 13165 | 6 | | | | | The definitions for the technology variation scenarios need to be explained already here. Currently they are included in the following figure (6.30) | Figure 6.29 has been removed due to space constraints. However, an explanation of the numbers at the |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 13168 | 6 | | | | | This figure is mostly empty space and therefore mainly communicates that there are a couple of outlier scenarios in which land use related CO2 mitigation is especially strong. If this is not the only message that the reader should get from this figure (especially the left panel), I would recommend altering the figure. | Figure revisited. |
| 13169 | 6 | | | | | I don't think it's necessary to show explicitly the results for individual models; the figure gets very messy and difficult to read. Show specific ranges instead, for the three milestones years and for the two scenarios. | Figure revisited. |
| 13171 | 6 | | | | | This figure doesn't seem very necessary: The logic of the emission trajectories doesn't differ significantly from those of delayed participation scenarios (which are included in the previous figure), even if they are produced differently (and may have more/less optimal emissions in the short term). Add also these scenarios to figure 6.34, or alternatively create two figures, one with full where and when flexibility and one with non-optimal mid term emissions (delayed participation, myopic, stochastic etc scenarios) | The author team is working on ways to improve this graphic and better distinguish it from the previous figure. |
| 13173 | 6 | | | | | Figure not readable. | There was an editing problem in the creation of the figures for the FOD. We will make sure this doesn't happen again |
| 13185 | 6 | | | | | Figure not readable. | Accepted. Replaced with other figure. |
| 13189 | 6 | | | | | Cross reference this with what's said on page 45, lines 19-22 (and shown in figure 6.26?). Presumably the difference could be explained by the different time horizons (2100 vs 2050) and/or by significant differences in total final energy use between the climate categories? Please clarify, in any case. | A better integration of Section 6.2.7.2 (in SOD 6.3.4.2) and Section 6.8 is planned, including cross-referencing |
| 13138 | 6 | | | | | How do you explain the wide range of cat 4 cumulative emissions for 2000 to 2100? The range, in terms of forcing, should be only 1 W/m2 for this category (4-5 W/m2), but the cumulative emissions can almost triple and climate consequences would still be consistent with cat 4? Surely non-CO2 gases alone can't explain this and the significant overlap with cat 5? Please elaborate. | Differences in carbon cycle representation of models; timing; etc. We will elaborate the overlaps for sure. |
| 11246 | 6 | | | | | · I am missing something like “no regret options”. This could be an interesting framing, e.g. no matter which delay we face, no matter which stabilization target should be achieved, technology X is always important and is required at a deployment level of Y. | Noted. We have not decided whether to use the notion of "no-regrets" options as part of the framing of the story in the chapter. We are considering alternnative framings for explaining the sorts of |
| 11260 | 6 | | | | | Fig. 6.10 is one of the key figures for me, this should come in the executive summary, because it shows the effect of CCS and Bio+CCS availability on the emission profiles. If a figure with the new model results can be provided where one can see from one model the differences of “w CCS”, “w/o CCS” and “w or w/o bio-CCS” this would be extremely interesting | We will try to do so. |
| 11266 | 6 | | | | | Fig. 6.13: I cannot agree to the message that “the costs are highly dependent on the level of stabilization”. From Fig. 6.13 I can only see that there is a slight, but mainly linear increase. Only CGEs are differnt, this should be explained. The x-axis is probably misleading with equidistant part between the categories | Noted. Now the figure provides separate bars for different cost metrics and the text is adjusted. |
| 16690 | 6 | | | | | When discussing "transformation pathways" are we talking about transformation of the energy system technologies, or transformation of the emissions trajectory over time? This is sometimes unclear. | Noted. The next version will at least introduce the notion of a transformation |
| 9066 | 6 | | | | | premature to comment as results are still preliminary | Noted |
| 10970 | 6 | | | | | This is the best of the four chapters that I have read. | Noted. |
| 17476 | 6 | | | | | what do the diagonal lines represent? | The lines have no meaning and were not part of the original document. There seems to have been a conversion error |
| 17477 | 6 | | | | | what do the diagonal lines represent? | The lines have no meaning and were not part of the original document. There seems to have been a conversion error |
| 17807 | 6 | | | | | The transformation pathways does not take into account an indepth social and political analysis - linkages with chapter 3 are missing and societal issues that could be dealing as drivers | Noted. Efforts will be made to reference Chapter 3 as appropriate. |
| 17808 | 6 | | | | | are not described. | Nonsensical |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 13737 | 6 | | | | | Figure 6.12 should differentiate solar radiation management (SRM) and carbon dioxide removal (CDR) rather than putting the umbrella term Geoengineering twice in the chart, which confuses the reader even more as one needs to figure out what type of technology is meant. In Addition 'sequestration technologies' is inacurate here: If it said carbon dioxide removal (CDR) it were more clearly differentiated from both CCS (which belongs in the Mitigation technologies category then) and from SRM (which interferes in the link denominated C in the graph). | Taken into account--figure and text deleted |
| 8100 | 6 | | | | | This figure contains a very strange choice of percentile ranges for which no argumentation is provided. Suggestion: use 90% range (5 to 95 percentile), interquartile range (25 to 75 percentile), and median | We will harmonize this in the chapter |
| 3047 | 6 | | | | | The model comments below may apply to some or all of the models listed in Table 6.1, but the model list differs from that in Table 1.8 and documentation for the new models listed in Table 6.1 is apparently not available for this review cycle. Accordingly, comments are listed as being attached to Chapter 1. | Noted |
| 2981 | 6 | | | | | As far as I know, Message is a partial equilibrium model (instead of a GE model). In addition, the issue of dealing o intertemporal optimization is quite complex in it. Please see Ilkka Keppo and Manfred Strubegger (2010). Short term decisions for long term problems – The effect of foresight on model based energy systems analysis. Energy 35, 2033-2042 . Actually, as precisely discussed in this paper, one major challenge behind optimization models simulation is to incorporate uncertainty and asymmetric information to their run. As Keppo and Strubegger said, “While the traditional optimization framework provides the globally optimal decisions for the modeled problem, the framework presented here may offer a better description of the decision environment, under which decision makers must operate… the operation of the model is demonstrated using a moving window of foresight, with which decisions are taken for the next 30 years, but can be reconsidered later, when more information becomes available. We find that the results demonstrate some of the pitfalls of short term planning, e.g. lagging investments during earlier periods lead to higher requirements later during the century. Furthermore, the energy system remains more reliant on fossil based energy carriers, leading to higher greenhouse gas emissions…”. | Noted |
| 2989 | 6 | | | | | Why does deployment in 2010 present a range of values, being it a data and not a forecast? Figures for oil, nuclear, coal cannot show this range of uncertainty for 2010. | Noted. The ranges shows the model spread in this year. |
| 2985 | 6 | | | | | It is not clear | There was an editing problem in the creation of the figures for the FOD. We will make sure this doesn't happen again |
| 2987 | 6 | | | | | It is not clear | There was an editing problem in the creation of the figures for the FOD. We will make sure this doesn't happen again |
| 2988 | 6 | | | | | It is not clear | Accepted. Replaced with other figure. |
| 14449 | 6 | | | | | Overall Chapter 6 is well organized and clearly written. | Noted |
| 14450 | 6 | | | | | Overall Chapter 6 figures and tables are well formatted. | Noted |
| 10398 | 6 | | | | | The categories about the characteristic of IAM are very good but it loses some important items such as whether climate feedback to economy exits and how the technology progresses, ect.The table 6.1 mainly contains models of gerneral equilibrium models. Gerneral equilibrium models such as CGE models have a great advantage to show deitals in sectors and regions, however, it is difficult to reflect the innovation of technology progress and difficult to combine with the carbon circle system and as said in this section, CGE models lack of foresight of the level of investment in the long run. As the problems listed above exist, macroeconomic models as RICE2007,DICE2010,MRICE(Wang, Zhang, Wu, 2012) have great advantages in dealing with those problems.I recommend to biuld another table incorporating these important models to make the categories better. | Taken into account--section revised and details eliminated. Table deleted due to space constraints |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 15427 | 6 | | | | | This figure is confusing. First, the graphic has the effect of suggesting that geoengineering IS a climate change response strategy on par with mitigation and adaptation. It is fundamentally flawed and unethical to treat adaptation on par with geoengineering vis-a-vis mitigation and in the overall policy landscape -- i.e., to play down real, on-the-ground adaptation strategies. Adaptation is the only option for many developing and least-developed countries, and geoengineering has a highly debatable role in the overall climate policy anywhere. Though one point of the graphic seems to be that geoengineering would compete with R&D and investment resources, the "competition" aspect is not apparent in the graphic, as is -- it appears as if the point of the graphic (and the accompanying text) is to elevate geoengineering to the level of mitigation and adaptation -- which would be a radical and controversial position for the IPCC to take. | Taken into account--figure and text deleted |
| 9957 | 6 | | | | | Please specify the units for items in Table6.2. | Will be added |
| 9959 | 6 | | | | | Units are missing. And please introduce the economic and technological projects in each model, so that readers can understand well what the role of radiative forcing play in emission pathway. | Will be added |
| 9954 | 6 | | | | | Unlike Figure 6.7 there is a range for emission in different RCP scenarios, the emission is definite in this figure, so based on which model you get the trajectory or just an average number based on models AR5 adopted. | The data shown in the figure is from the published RCP results (Van Vuuren et al, 2011). This reference will be clarified |
| 9961 | 6 | | | | | When compare the pathway without BECCS in Figure 6.10 with pathway of category 1 in Figure 6.7, it can be found that negative emissions don't occur in Figure 6.10. Does it mean that there are BECCS for emissions reduction in pathway in Figure 6.7? So maybe it's necessary to make it clear which reduction measures are taken for pathways in Figure 6.7. | We will clarrify this. |
| 9956 | 6 | | | | | The target stabilization level is not demonstrated in Figure 6.2. | The data shown in the figure is from the published RCP results (Van Vuuren et al, 2011). This reference and the figure |
| 9958 | 6 | | | | | This figure is intersting to show emission pathway in different categories, but since emission reduction measures, which are implict to reach such pathways, are unknown. It is believed that any IAM can produce such pathways, but the feasibility must be focused on otherwise those pathways just don't make any sense. | There is a discussion on the word feasability in the context of models in the tekst. The technologies are discussed |
| 12607 | 6 | | | | | Would be good to write on the text the concept of transformation pathway | Noted. The next version will at least introduce the notion of a transformation |
| 8101 | 6 | | | | | The description of the scenario ensemble used in the assessment is lacking (as also indicated by the Authors). Because much of the transformation pathway discussion, and in particular sections 6.3.2 and 6.4, will depend strongly on how scenarios were selected and constructed, it is critical that the scenario ensemble is clearly described and its limiations highlighted in sections 6.3.2 and 6.4 | Accepted. The scenario ensemble will be described early in the chapter. |
| 13191 | 6 | | | | | Considering the enormous uncertainties of such an economy wide, decades long transitions, I would think there's more "gap" than what we do know for certain. This isn't really a "proper" gap, of course, as it is not possible to acquire information or data that would be able to fully fill this gap. I still think it's important to make this clear, i.e. what is currently listed here are gaps for incrementally improving the modelling of the scenarios, but they will in no way remove the enormous uncertainties that make specific and concrete modelling based, non-obvious recommendations difficult. | Noted. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 3376 | 6 | | | | | This is at the core of the AR5 report and should be expanded to allow a more careful interpretation of chapter 6's results. For example, the two following studies detail the limitations of integrated assessment studies with respect to dealing with the uncertainties of future development:<br>A) Ackerman, F., DeCanio, S. J., Howarth, R. B. & Sheeran, K. Limitations of integrated assessment models of climate change. Climatic Change 95, 297–315 (2009).<br>B) Cullenward, D., Schipper, L., Sudarshan, A. & Howarth, R. Psychohistory revisited: fundamental issues in forecasting climate futures. Climatic Change 104, 457–472 (2011).<br>Epistemological challenges related to scenario analysis and uncertainty should not be ignored. Scenario analysis does not follow the scientific gold standard of falsification and there is risk of systematic bias, e.g. due to herd crowding, in e.g. integrated assessments. Discussion of this point seems to be absolutely crucial. One important study on this issue is: "Betz, G. (2009),Underdetermination,Model-ensemble,andSurprises | Rejected--space constraints |
| 10392 | 6 | | | | | Because the uncertainty has a clear definition in science, it is not properly to explian the uncertainty by different results across the IAM models. | Noted |
| 5326 | 6 | | | | | This section does a poor job in explaining how an integrated assessment model differs from a normal CGE-model. According to my understanding, an important issue of an IAM is that it tries to model, explain and calculate the losses and damages caused by human action via the channel of global warming endogenously. | Taken into account--we have added text on cost-benefit analysis which tries to make this distinction |
| 8102 | 6 | | | | | On the one hand this section states that there is no unique definition of greenhouse gas concentrations, on the other hand it doesn't provide yet insight in how the radiative forcing in Table 6.2 was determined. In absence of a unique definition of greenhouse gas concentrations, an explicit definition of what is included in the radiative forcing is crucial. Linking the budgets, concentrations and radiative forcing estimates to the WGI assessment n this issue would make this table much stronger. | Correct. Will be added |
| 8110 | 6 | | | | | Also the issues with regard to the time scales of the reversibility of possible temperature overshoots might be interesting to highlight. For example based on: Lowe, J. A. et al. How difficult is it to recover from dangerous levels of global warming? Environmental Research Letters 4, 014012 (2009). | Good point. We will add this. |
| 9963 | 6 | | | | | If possible, please give some temperature stabilization pathways as those shown in former sections. | A new section on climate will be written |
| 12542 | 6 | | | | | The discussion of SRM is bound to be controversial. This portion in particular is problematic: “Absent SRM, near term decisions may be strongly contingent on the low-probability high-consequence “tail” of the probabilistic distribution of climate sensitivity and climate impacts. Because SRM can be implemented quickly (decades) whereas reduction in concentrations takes place on century-timescales it might, in principle, be implemented after uncertainty is partially resolved. This attribute of SRM makes it valuable in managing climate risk even if the costs and damages of SRM were comparable to the costs of mitigation and the damages climate change.” There is no evidence, only conjectiure, on what time scales SRM can be implemented. It is not logical to claim that an attribute of SRM “makes it valuable in managing climate risk,” since value must relate to evidence-based and not conjectural performance. There may be conceivable pathways toward testing SRM and other geoengineering approaches and evaluating them for deployment without making specific claims as above based on present knowledge. Please stick with those assessments. | Several papers address timescale for implementing SRM. |
| 9965 | 6 | | | | | Since carbon cycle and climate is so important that we have to spend more words on introducing more about the details and characteristics of carbon cycle model in IAM. For examples, how many carbon reserviors are included in carbon cycle model in each IAM that AR5 concerned. For your reference, the paper named 'the benefits of climate change mitigation in integrated assessment model: the role of the carbon cycle and climate component'(Hof, 2012) is really good about this issue. I will submit it to the TSU. | We agree and discuss the climate part in greater detail |
| 10397 | 6 | | | | | Although consumption is very important to anlysis the economy cost in the view of welfare, GDP is also an important index for economy cost which cannot be ignored because of its strong relationship with employment and its reflection of nations' economy which is the mian concern of most governments. | Taken into acount. Cost figures now show both consumption and GDP changes where appropriate. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 11256 | 6 | | | | | Evaluation of the costs: there is so much said on the costs in chp. 6.3.4.2. But then comes the surprise in chp. 6.3.7.3 telling us that "mitigation costs are heavily influenced by the nature of the available mitigation technologies". If this is the case, what is the reason to overstress the cost figures e.g. in Fig 6.13. It should be contrasted directly. By the way, on my option the spread of the costs in Fig. 6.29 is rather low. Only the "no CCS" case is a bit different, but I would not interpret this figure as if the technology choice had large influence. Model differences seem to be much larger. | Noted and will be considered as we adjust the text in the next draft. |
| 2982 | 6 | | | | | The section minimizes the uncertainty of crude oil price as one major source for the uncertainties in mitigation scenarios and its costs. The same is valid for the different assumptions found in the scientific literature for supporting the choices of discount rate. | Noted. The role of discount rate is addressed explicitly now. |
| 2983 | 6 | | | | | The effect of the learning curve on the evolution of the abatement costs of mitigation options and even on the choice of the least cost path should be highlighted in the document. Please see: Blyth, W., Bunn, D., Kettunen, J., Wilson, T., 2009. Policy interactions, risk and price formation in carbon markets. Energy Policy 37 (12), 5192-5207.Broek, M., Hoefnagels, R., Rubin, E., Turkenburg, W., Faaij, A., 2009. Effects of technological learning on future cost and performance of power plants with CO2 capture. Progress in Energy and Combustion Science 35 (6), 457-480. Rochedo, P., Szklo, A., 2012. Minimum Work of Separation and Learning Curves for Carbon Capture based on Chemical Absorption. To be presented at 7th Conference on Sustainable Development of Energy, Water and Environment Systems, Ohrid, Macedonia. | Noted and will be considered as we adjust the text in the next draft. |
| 2984 | 6 | | | | | As I proposed for Section 6.3.4.2 to include the analysis of the effects of learning curves (innovation) on the least cost abatement paths, I suggest including in section 6.3.5. policies oriented toward anticipating investment in abatement options with higher learning rates (i.e. those with experience curves that justify the previous incentivized investment). | The issues related to innovation are considered in other sections. |
| 17284 | 6 | | | | | The RECIPE project (Luderer et al., 2012; Jakob et al., 2012) analyzed the implications of delayed and fragmented climate policy. Their results should be included in this discussion. | We are aware of this study and will take into account, though it is already |
| 11255 | 6 | | | | | The sectoral analysis is not shown in a consistent way, it is spread over different subsections in the chapter. Chp 6.3.7. should say something on sectors, but I do not see what chp 6.3.7.3. contributes to this. | The discussion of sectoral developments at a disaggregate level will be taken care of in Section 6.8 while Section 6.3.7 (in SOD 6.3.4) will address the interdependence between energy supply and demand at a more aggregate level |
| 13172 | 6 | | | | | Stochastic scenarios, with uncertain long term targets, should also be mentioned, as they explicitly investigate the relationship between mid and (uncertain) long term targets. Already the TIAM family of models alone has published at least 3 papers on such scenarios and there must be other models that have been used in similar fashion (refereces to the TIAM papers: Syri, Lehtilä, Ekholm, Savolainen, Holttinen and Peltola. Global energy and emissions scenarios for effective climate change mitigation—Deterministic and stochastic scenarios with the TIAM model, International Journal of Greenhouse Gas Control, 2(2), 2008, pp 274-285, ISSN 1750-5836, 10.1016/j.ijggc.2008.01.001. ; Loulou, Labriet and Kanudia. Deterministic and stochastic analysis of alternative climate targets under differentiated cooperation regimes, Energy Economics, 31 (Supp 2), 2009, pp S131-S143, ISSN 0140-9883, 10.1016/j.eneco.2009.06.012. ; Keppo and van der Zwaan. The Impact of Uncertainty in Climate Targets and CO2 Storage Availability on Long-Term Emissions Abatement, Environmental Modeling and Assessment, 17(1-2), 2012, pp. 177-191, DOI: 10.1007/s10666-011-9283-1 ) | The author team will work on adding references to studies explicitly examining stochastic control and will incorporate the notion into the introduction section. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 3629 | 6 | | | | | Delete or massively reduce to save space as overlaps with chapters 4.1.3.2, 4.6.1, 4.6.2. | The structure of the chapter is being revised to best cover the material within the prescribed outline. However, we likely need to keep some or most of the material in this section. Every effort will |
| 2986 | 6 | | | | | For most of the technologies I do agree with the idea presented in this section, which expresses that “the benefit of beginning to create and improve technologies today and to develop institutional capacity is that it creates opportunities to make early and mid-course corrections.” However for some options, usually the least mature ones, the choice of a technology route may cause lock in problems. The case of CCS is emblematic. See Markusson, N., Haszeldine, S., ‘Capture readiness’–lock-in problems for CCS governance, Greenhouse Gas Control Technologies, Vol. 1, Issue 1, pp 4625-4632, 2009 | We address different types of lock-in but can add a reference here to the specific issue mentioned. |
| 17234 | 6 | | | | | The study below is useful in the context because it shows that short-term technology policy helps to overcome the time of delayed carbon pricing. The study shows that short-term investments help to moderate future CO2 prices in achieving a given atmospheric stabilization target. Bauer N, Baumstark L, Leimbach M (2012): The REMIND-R model: the role of renewables in the low-carbon transformation—first-best vs. second-best worlds. Climatic Change, online first. DOI 10.1007/s10584-011-0129-2 | We will include the reference. |
| 3630 | 6 | | | | | Delete or massively reduce to save space as overlaps with chapter 4.3.4. | We have written this section more concisely, but there was broad agreement in the author team that this section should be kept in this place; |
| 6411 | 6 | | | | | I really like sustainable development and I think it is extremely important. But this section seems to not fit the rest of the chapter. The rest of the chapter tends to focus on IAMs and quantitative results. This section seems more qualitative or "fluffy" in comparison. Again, I'm nit saying that this is not important, but it seems as though the content isn't as quantitatively rigorous as the rest of the chapter. | Rejected. The first level headings have been decided by the IPCC plenary and need to be adhered to by the author team. |
| 3377 | 6 | | | | | This section is very interesting. It powerfully argues for taking sustainable development scenarios as benchmark for assessment. The scenarios discussed before look at "climate change mitigation only". Conceptually, 6.6. should not appear as an add-on to the other sections, but rather as a benchmark for overall evaluation. Of course, the main challenge is that only very few scenarios so far explicitly address SD. But one could frame the importance of SD scenarios as benchmarks in the introduction of chapter 6. | Noted. The relation of SD to IAMs is discussed in the new version, but otherwise this section is conceptualized as being complementary to the other sections focussing on IAMs linking to / |
| 16252 | 6 | | | | | It is important to be more specific about aspects or indicators of sustainable development included in the assessment of the transformation pathways, and which ones are omitted, particularly since several aspects (such as materials (resource depletion) or stocks (standard of living) are not just additions, but may change the nature of the results due to feedbacks or delays). In addition, it might be useful to point out critical gaps in the modeling approach in order to better capture essential links with sustainable development. | Noted. This is in parts covered in Section 6.2.1 (Key characteristics of integrated assessment models) and Chapter 3. Further, also this section is used to link IAMs to SD. |
| 11679 | 6 | | | | | As shown in the text, transformation patyways can have a strong impact on broader societal policy objectives relating to sustainable development, such as energy security, food security and water security. When describing sustainable development and climate stabilization, the trade-offs and synergies between two issues should be reviewed as well. For example, Akimoto et al. (forthcoming) conduct a complehensive assessment on these trade-offs and synergies. Reference: K. Akimoto et al., "Consistent assessments of pathways toward sustainable development and climate stabilization", Natural Resource Forum (forthcoming). | Noted. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 17921 | 6 | | | | | Although the section relates to a large part to SD, SD concepts and SD goals, I have found no cross-reference to Chapter 4 although Chapter 4 is supposed to provide the framing for any SD discussion in the WGIII AR5. For this Section, this is particularly relevant, since SD and the related concepts are not sufficiently explicated. The same applies to the discussion of co-benefits/co-costs and the respective framing in chapters 3 and 4 (which has been nascent in the FOD). Please liaise with the relevant chapters in the cross-cutting meeting to determine a viable labor division and synthesis of results with respect to the co-benefits/co-cost assessment and the relation to SD across chapters. | Accepted. Reference to Ch.4 have been added in the new draft. |
| 3631 | 6 | | | | | Delete or massively reduce to save space as overlaps with chapter 4.5. | Accepted. Section 6.4 has been significantly restructured with the new |
| 3632 | 6 | | | | | Delete or massively reduce to save space as overlaps with chapters 4.2.1 and 4.5. | Accepted. Section 6.4 has been significantly restructured with the new |
| 3633 | 6 | | | | | Delete or massively reduce to save space as overlaps with chapter 4.2. | Accepted. Section 6.4 has been significantly restructured with the new |
| 17925 | 6 | | | | | Please consider to incorporate more results from the IAM community (e.g. IMAGE and MESSAGE) - particularly from Chapter 17 of the Global Energy Assessment (CLA Keywan Riahi). This could also prove to be useful for a more in-depth analysis of "regional considerations and differences". At the moment, however, the first four paragraphs of the sub-section rather describe political implications which I would personally place in the policy chapters (e.g. 15.7.1). Please liaise with Navroz Dubash. | Noted. |
| 9259 | 6 | | | | | An additional risk comes from inferred migration patterns, as these may alter societies and energy etc use considerably over decades. I'm not sure how well that could be modelled though. I think this whole chapter provides a wide-ranging and balanced view of things - well done (for this draft anyway!). | Migration patterns due to mitigation policies has not been covered in the mitigation scenario literature, and therefore will not be taken up as a risk |
| 17928 | 6 | | | | | In order to facilitate coordination between section 6.7 and the sector chapter discussions on technical risks (see agreements reached in Wellington, p. 36), the classification of different types of risks provided by this section would be very helpful (apart from the framing of environmental side-effects as risks, see my next comment). Please liaise with the relevant chapters in the cross-cutting meeting to determine a viable labor division and synthesis of results with respect to the co-benefits/co-cost assessment and the relation to different types of risks across chapters. | This was done at LAM3 (see Responses to Comments 933 and 953) |
| 17931 | 6 | | | | | The topics discussed here are not framed as risks elsewhere in the report but rather as additional policy objectives to which co-benefits/co-costs might accure. While the examples given might be redundant to existing text in other chapters (land-use change in chapter 11, institutional capacityfor and distributional consequences of mitigation policies in chapter 4 and the policy chapters), the section does not discuss the societal risks due to the speed of transformation as advertised in the beginning of the section. | The discussion of potential adverse side-effects has been moved to Section 6.6 Sustainable Development where it will be discussed together with co-benefits. This will include the discussion of societal risks due to the speed of |
| 13190 | 6 | | | | | This section is currently rather generic, but still rather long. In light of the fact that the authors suggest there will be a number of additions for the SOD, I would suggest cutting down text that overlaps strongly with other chapters (or even sections within this chapter, e.g. some of energy conversion, land use related text). | The comparison of sectoral and integrated mitigaiton studies is still work in progress and therefore the entire Section 6.8 is under revision with more information from both sets of studies |
| 13188 | 6 | | | | | Most of this section discusses AR4 approach to sectoral analysis, which doesn't seem necessary, especially to the extent that it's currently done (i.e. over a page) AND taking into account the length of the current draft. | Discussion of comparison between sectoral and integrated studies in AR4 will be shortened. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 17475 | 6 | | | | | good synthesis of the sectoral analyses but some sub-sections lack comparison with transformation pathways. Specifically "Energy Conversion", "Transport" and "Human Settlements" sub-sections | The comparison of sectoral and integrated mitigaiton studies is still work in progress and therefore the entire Section 6.8 is under revision with more information from both sets of studies |
| 14336 | 6 | | | | | The chapter should build on more recent comprehensive studies such as Williamson, P., Watson, R.T., Mace, G., Artaxo, P., Bodle, R., Galaz, V., Parker, A., Santillo, D., Vivian, C., Cooper, D., Webbe, J., Cung, A. and E. Woods (2012). Impacts of Climate-Related Geoengineering on Biological Diversity. Part I of: Geoengineering in Relation to the Convention on Biological Diversity: Technical and Regulatory Matters. Secretariat of the Convention on Biological Diversity. Montreal, Technical Series No. 66.<br>The results of the 2004 EIFEX experiment were recently published as: Victor Smetacek, Christine Klaas et al. (2012): Deep carbon export from a Southern Ocean iron-fertilized diatom bloom. Nature doi:10.1038/nature11229. According to a press release, "Unlike the LOHAFEX experiment carried out in 2009, EIFEX has shown that a substantial proportion of carbon from the induced algal bloom sank to the deep sea floor" (see http://www.awi.de/en/news/press_releases/detail/item/current_study_in_the_scientific_journal_nature_researchers_publish_results_of_an_iron_fertilisation/?cHash=1886c469c164291f685e617fe741c704) | Agree that the Williamson et al reference should be included. |
| 9242 | 6 | | | | | Please refer 'IPCC expert meeting on geoengineering - meeting report' (2012) for the definition of geo-engineering. It discusses the difference between CDR and mitigation in terms of total storage potential and the impact beyond atmospheric CO2 reduction. | Question: I would assume that IPCC's guidelines suggest that we should cite peer-reviewed literature before reports |
| 9245 | 6 | | | | | Please mention that cost range of CDR and SRM is uncertain in general. | It's not clear we have room to discuss costs here, if we do we will certainly |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 15438 | 6 | | | | | This section fails to convey the speculative nature of SRM -- the current draft exaggerates the state of scientific (and public) understanding, which, in fact, is very poor. We propose that THIS SECTION BE DELETED, OR EDITED to more accurately reflect the state of knowledge. We propose the following edits, which retain much of the information in the current draft, but better convey the speculative nature of SRM, so that the section reads:<br>SRM's possible role in climate policy is shaped by two working assumptions. First, SRM is expected to produce effects soon after deployment, i.e., on a timescale less than a decade (Shepherd et al. 2009); (Keith, 2000; Swart and Marinova, 2010). A further assumption is that SRM could temporarily but imperfectly mask the effects of climate change that arise from the accumulation of long-lived greenhouse gases such as CO2 (though only the reduction in long lived GHGs can reduce the long-run climate risk).<br>Interest in SRM is growing (Shepherd et al. 2009); (Mercer et al., 2011). The notion that SRM could reduce the impacts of anthropogenic climate change dates back to the 1960s (Keith, 2000), but little scientific research has been done. There are now several government-sponsored research programs related to SRM as well as a formal project to systematically compare climate model responses to SRM (Kravitz et al. 2011).<br>Any potential effectiveness of SRM in counteracting anthropogenic climate change is inherently limited by the fact that the radiative forcing produced by SRM techniques (insofar as they exist in theory) is substantially different from the radiative forcing from GHGs (Govindasamy and Caldeira, 2000; Robock et al., 2008). It is therefore impossible for SRM to produce a climate response that precisely compensates for the climate response due to GHGs. Thus while a level of SRM could, in theory, compensate for some of the effect of GHGs on a single climate variable, such as the globally averaged surface temperature, it cannot do so on all variables at once. For example, if SRM is employed in an attempt to halt the increase in globally averaged surface temperature over some period during which GHG concentrations rise, then the global hydrological cycle as measured by average evaporation and precipitation rates will decrease (with potentially significant effects in some regions that will see changes in weather patterns and reduced rainfall).<br>Few studies have attempted to quantitatively evaluate the extent to which SRM could counteract the effects of anthropogenic climate change on a regional basis. The first study to do so concluded that SRM would do a poor job reducing climate damages, and that that damages from SRM might be significant (Robock et al., 2008). More recent studies also assert that (a) SRM cannot accurately reverse GHG driven climate change and that (b) the divergence is larger at regional scales that it is on a global means basis (Ricke et al., 2010), but (c) one study of the potential effectiveness of geoengineering in compensating for temperature or precipitation changes on a regional basis suggests that SRM could compensate for increased GHGs even at a regional level. Using analyses of 22 regions Moreno-Cruz et al concluded that a single (optimal) choice of SRM forcing could reduce the population-weighted mean squared deviation in temperature by 99% and in precipitation by 85% but both cannot be achieved simultaneously (Moreno-Cruz et al., 2012).<br>All modeling studies to date have focused on compensation as measured by a climate variable such as temperature and precipitation; understanding of the effectiveness—or lack thereof—of SRM in reducing climate damages would require understanding of the interactions among the climate variables.<br>Ozone depletion as a consequence of the introduction of geoengineering aerosol into the stratosphere is by far the best studied risk. For sulphate aerosols the primary mechanism of action is that additional aerosol reduces NOx | It is not clear exactly what edits are being proposed here |
| 8960 | 6 | | | | | Please avoid the temptation to present geoengineering as a real option for policy makers, since the testing of scenarios is only being done on very limited GCMs and the technology is not just not ready to deploy, but it is dangerous in ways detailed in my work. | Answer: there is no question that SRM is dangerous; however there seems little doubt that some forms could be deployed within a decade or two. This is not a statement that deployment would be wise; rather, it is simply a statement of technical capability. The job of the IPCC is to present a thorough analysis of physically possible options to decision-makers. We are happy to respond to |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 11259 | 6 | | | | | Fig. 6.10 is one of the key figures for me, this should come in the executive summary, because it shows the effect of CCS and Bio+CCS availability on the emission profiles. If a figure with the new model results can be provided where one can see from one model the differences of “w CCS”, “w/o CCS” and “w or w/o bio-CCS” this would be extremely interesting | Noted. |
| 11253 | 6 | | | | | Concerning the technologies: there is a discrepancy concerning the evaluation of single technologies. In the Executive Summary it is said that “there is no single dominant technology” whereas in the FAQ at the end the importance of Bio-CCS is highlighted. But this importance is not clearly carved out in the chapter. | Accepted. The notion of the importance of a portfolio needs to be made more clearly differentiated from the importance |
| 9949 | 6 | | | | | The executive summary is too long to get the most important points of this chapter. Please make it conciser. Maybe tables and figures can be removed from ES. | Accepted. The ES will be shortened. |
| 8899 | 6 | 0 | | | | When it comes to economic impacts the study concentrates on outputs GCE and partial equilibrium models that often include only one economic sector. I could not find a section that explains the shortcomings of these model types and how the outcomes are impacted by the theoretical underpinnings of these models nor giving a reasoning why these types of models should be preferred. And there is no explanation of why other model types were excluded. In one place the chapter concentrates on describing the results of only one most recent study and omits all others. This all is hardly justified and makes the chapter look biased and open to critisism. The employment effects of the transition pathways are also ignored. | Noted. We are revising the section on the modeling tools used in this analysis. At the same time, space constraints prevent a thorough treatment of model strengths and weaknesses. Readers are encouraged to read the supporting papers. |
| 6393 | 6 | 0 | | | | This chapter clearly needs further editing in many ways, with plenty of places stating that the SOD will contain new text or new results of analyses. That's fine, but I think the text could be decreased by about 5% by making the writing more direct. In a lot of places there are extra and unnecessary words. For example, page 20 line 33 could be reduced from "A crucial question with respect to long-term emission reductions is the timing of emission reductions," to "The timing of emission reductions is important for long-term reductions." Or line 8 on page 28, "There is a limited number of studies that..." could be "A limited number of studies..." Or line 34 on page 30, "It is valuable in that it leads to..."could be "it leads to...". Or lne 1, page 31, "A first observation is that there is..." could be "There is..." Or Line 28, page 31, "A further observation is that..." could be, "Further, the costs..." Or page 33, line 31 and 32, "It has been shown that the impact..." could be "The impact..." or page 46, line 6, "The other important role of end use sectors in climate mitigation is to reduce energy demand..." could be, "End use sectors are also important because they reduce..." And so on, throughout the chapter. | Noted. We are working to be more efficient. |
| 6395 | 6 | 0 | | | | There are references to "the literature" in a number of places without referring to or citing the relevant literature (e.g., p. 40, line 30; p. 60, line 7; p. 60, line 23) Is this an intentional decision? References as such without specific citations seem vague and nonspecific, as if the author(s) are saying, "trust us, the literature says this." | Noted. We will continue to expand our citations of the literature. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 16945 | 6 | 0 | | | | It is some time since I look at the “Stabilisation Scenarios” literature and will confine my comments to the following general points.<br>Though it is carefully worded, Chapter 1 comes close to saying that 2 deg.C is now almost impossible: does Chapter 6 analysis support this? Consistency is important.<br>It would be great – albeit difficult – if Chapter 6 could make more connection between the sectoral chapter studies and the global scenarios. Does bottom-up meet top-down? I have suggested in my general AR5 comments that there might be various “meso-level” ways into this; one obvious one would be in relation to the Urbanisation chapter (12), given the enormous influence of urban carbon footprints; and / or the regional chapter (14), which gives a finer-grained understanding of regional trends and possibilities.<br>I’d also like to suggest a third “meso-scale” way of illuminating this challenge. Is it possible to give any indications of how the scenarios might break down in terms of different domain processes, and associated estimates of potentials? Eg. the bottom-up evidence is that First Domain processes (analytically closely tied to the System 1 framing of the FOD Chapter 2) are sizeable in Buildings and maybe Transport efficiency; how much emission reduction might these deliver by mid Century? Does the analysis of “Domain 1” processes shed much light on how much would be taken up in BaU trends, versus requiring policy action? How does this compare to reference scenarios?<br>Similarly, Section 6.5 would be the natural place to integrate the significance of Third Domain potentials – innovation, infrastructure etc - and associated issues (Third Domain effects are only very weakly affected by carbon prices, depending more on strategically motivated investment). Sectoral transformation studies could be other inputs to this. This could be useful as it may help to suggest how much stabilisation scenarios would in practice depend on the different pillars of policy - regulation and 'engagement'; pricing and market structures; or strategic investment for innovation and infrastructure.<br>For clarifications, see Grubb, Hourcade and Neuhoff, Planetary Economics: the Three Domains of Sustainable Development. Chapter 2 (submitted to the Secretariat) clarifies the key distinguishing features of the different domains, Chapter 3 outlines how the main structural components of energy systems seem to relate to each domain, Chapters 4 & 5 detail the evidence and theory around First Domain issues, and Chapters 9-11 explore Third Domain effects; Chapter 11 seeking to offer some integrating insights between meso-sectors and global.<br>The interpretation of information on future scenarios is notoriously subject to “framing” effects. I think it important that IPCC considers the lessons on the importance of these effects and presentation (see eg Mizuno and Klinsky, 2012). This chapter in fact seems extremely good in presenting the physical material in transparent accessible forms. However this is much less so for the economic data (from section 6.3 onwards). Once they have established “baselines”, the modelling community almost entirely thinks in terms of changes from these baselines (or NPV loss). Normal people think in terms of absolute changes: are we going to get richer / poorer etc. Somehow it should be made clear that the aggregate economic difference between most mitigation scenarios and baseline is so small as to be hard to see on a graph. Another way of looking at this is the simple exercise of plotting absolute GDP (eg. in 2050) against emission levels: as a “thought experiment” we do this for the entire EMF-22 database in Grubb, Hourcade and Neuhoff (Chapter 11); there is almost no discernible relationship.<br>A final remark: I would guess I am not the only one to find the “negative emission” scenarios with BECCS to be a modelling fantasy which is very hard to relate to the real world. Progress on CCS has been anaemic compared to | Noted. Treatment of the following issues are being revisited in the SOD: linkage to temperature goal such as 2 degrees C; linkages to sectoral chapters; economic results; and negative emissions scenarios. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 9819 | 6 | 0 | | | | In order to enhance the readibility of chapter 6, and, moreover, to reduce its length by at least some of the needed 20 pages by eliminating repetition, we would like to suggest the following reorganization of the arguments:<br>1. Background relating to AR 4: especially the terms "forecasts" and "scenarios", and their underlying methodological concepts and relevance to AR5, should be differentiated. In order to help the readers to link the two reports (AR4 and AR5), the methodological development of AR5 should be described in somewhat more detail than the current draft does. Thus, the new RCP methodology should be described in this section.<br>2. Model structure and the underlying theoretical framework for each type of model: in order to enhance readibility the basic model structures could be explained in terms of input variables, assumptions, calculational approach, and linkages between sub-modules.<br>3. Input assumptions: as the underlying assumptions are crucial for the getting the results, and because different assumptions will lead to different results, the major types of assumptions should be made transparent, and perhaps some numerical values should be given for key variables for different RCP scenarios. Also, the need for different types of input assumptions depending on model structure should be discussed. Following the example of scholarly journals, which often allow the reader to upload supplementary materials, a list of all the major assumptions could be made available for the readers in an electronic appendix.<br>4. Results: in this section, the broad scope of results could be presented in as neutral and objective way, as possible, with little commentary. For example, don't say things like "consumption is good".<br>5. Discussion: Separated from the results section, the subjective evaluation of the results could follow, with emphasis on comparing results only between comparable models and scenarios. In order not to oversell results, qualify all results as appropriate.<br>6. Conclusions for decision/policy makers: Following the results and discussion sections (4 and 5), government and NGO policy makers, and corporate representatives, should be provided conceptual guidance as to how to understand the various kinds of policy implications of the scenarios run thusfar, and how to develop relevant scenarios for their own use.<br>For example, one problem with the current version of Chapter 6 is that there is fairly detailed discussion of some results first, without the proper preparation for the reader, and then some other results are discussed again later, and there is some repetition. Also, consider reducing or eliminating the geo-engineering material which was not really incorporated into existing transformation pathways. | 1. Accepted. We will attempt to link to the RCPs. 2. Rejected. We simply do not have sufficient space to go into the details of every model. Readers will be encouraged to look at the underlying literature. In addition, the scenarios database will include informatiion on key drivers such as GDP growth and population growth. 3. Rejected. Readers will be encouraged to look at the underlying literature to find input assumptions. It is beyond the task of this exercise to collect all the input assumptions for every model.In addition, the scenarios database will include informatiion on key drivers such as GDP growth and population growth.4. Noted. 5. Noted. 6. Noted. We continue to refine the storyline for Chapter 6 and will attempt to make it more transparent in the SOD. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 9820 | 6 | 0 | | | | 1. Many of the results need further qualification stating more transparently under what assumptions the stated conclusion is valid, or not. Two important examples for many conclusions are: "given the limits on the amount of incremental energy efficiency modelled…." , or " given that oil prices were assumed to remain under $100 per barrel forever, the cost results are.....". 2. The types of parameters and their numerical values which are input to the various IA models for different scenarios is, basically, never discussed. This is a major omission. The transparency of scientific research requires that key input assumptions be provided in parallel with all results. This is particularly important for the kinds of scenarios cited in this chapter, because many of the differences between results from model to model are not due to structural differences in the models, but are due to DIFFERENCES IN THE VALUES OF THE SAME INPUT PARAMETERS. 3. Again, the constraints on energy efficiency improvements on the demand side over time input to each IAM must be cited in the text, since the improvement of energy efficiency on the demand side is one of the key technology options to mitigate climate change. Even conceptually, the issue is barely discussed, another omission. 4. The fact that fossil fuel prices are either endogenously computed or exogeneously input to every model is not discussed in any detail. Yet the resulting prices for fossil fuels in any given future year in each scenario might be the single most important factor determining most results. These price assumptions must be presented and discussed in the context of the "peak oil", "peak natural gas", and "peak coal" theories. Fortunately, the peak oil hypothesis is mentioned in the early chapters of this report, but it must be further elaborated relative to its impact on the scenario results presented in Chapter 6. 5. The fact that most if not all the IAMs assume that almost infinite supplies of liquid fuels from "backup" technologies will be available must be discussed and justified, since it is a highly controversial assumption. | 1, 2., 3. Rejected. It is not possible to provide all the assumptions associated with every scenario reviewed in this chapter. Readers will be encouraged to explore the scenarios database, which will include information on key drivers such as population and GDP and to review the underlying literature. 4. Noted. All the models include resources for fossil fuels and calculate the associated prices and influence on the nature of the energy system. This information manifests itself in the baseline scenarios and the mitigation scenarios. 5. Noted. The chapter will note the needs for these fuels to meet particular goals. Sectoral chapters will address the technical details of developing these fuel sources. |
| 9821 | 6 | 0 | | | | The chapter talks about the "costs" of mitigation, by which "net costs" seems to be meant. But no hint is given that depending on the input assumptions there could be "net benefits" for some scenarios in the long run. By thinking and calculating longterm life cycle costs can reveal positive benefits of shortterm costs. For example, this could happen if the long run prices for fossil-fuels were much higher in the reference cases than in the RCP 2.6 cases, where the demand for fossil=fuels would be much lower than in the reference cases. Thus, the wording which seems to imply that the net costs of mitigation would always be positive must be revised and qualified to allow for the possibility of net negative costs. The bottom-line, of course, is that pursuing strong climate mitigation as in the RCP 2.6 type of scenarios might improve other aspects of the economy and consumption, if, indeed consumption is always good. | Accepted. We will mention the issue of negative costs. At the same time, the literature we are reviewing overwhelmingly indicates that there will be positive costs. |
| 9822 | 6 | 0 | | | | As hinted at in the above comments, the whole scenario "infeasibility" discussion, which repeats itself too often, forgets to mention that one major cause of apparent infeasibility for some scenarios for some models is probably the overly limited level of end-use energy efficiency improvements. IAMs and their outputs aside, the RCP2.6 greenhouse gas trajectories required are not infeasible given existing energy efficiency technologies and given renewable supply technologies, even with CCS and nuclear power. This must be made clear to the reader. Again, this is another situation where the results are not properly qualified based on model limitations or input assumptions made. Moreover the reader should be aware, that assumption can be changed by decision-makers. | Noted. We are refining the discussion of situations in which models are unable to produce particular scenarios. |
| 9823 | 6 | 0 | | | | For decision makers a conversion of the RCPs to degrees Celsius could be valuable: Rogelj, J; Meinshausen, M.; Knutti, R. (2012) Global warming under old and new scenarios using IPCC climate sensitivity range estimates. In: Nature Climate Change, DOI: 10.1038/NCLIMATE1385) | Accepted. A section is being added that will provide a crosswalk between concentration and temperature goals. |

|---|---|---|---|---|---|---|---|
| 9404 | 6 | 0 | | | | When discussing transformation/transition pathways, it is also important to discuss and focus on shor-term/mid-term targets for reducing GHG emissions as well as long-term GHG emission projections. These following papers can provide useful information on GHG emissions by region (e.g. Japan, China, India, All Asia, USA, EU27, Russia, Annex I , Non Annex I and world) and by technological mitigation cost (e.g. 0, 25, 50, 75, 100, 125, 150, 175, 200 US$/tCO2) in the year 2020 and 2030, based on bottom-up analyses. Hanaoka, et al, 2012 also provides technological mitigation potentials by region, by cost and by sector in the year 2020 and 2030. These discussions may be fit into section 6.4, but these papers are missing in this chapter. Dr. Hanaoka can help providing data for this chapter.<br>1) Hanaoka, T., Kainuma, M. (2012) Low-Carbon Transitions in the World Regions: Comparisons of Technological Mitigation Potentials and Costs in 2020 and 2030 by bottom-up analyses. Sustainability Science, 7(2):117-137, DOI:10.1007/s11625-012-0172-6<br>2) Akashi, O., Hanaoka, T. (2012) Technological feasibility and costs of achieving a 50 % reduction of global GHG emissions by 2050: Mid- and long-term perspectives. We appreciate the reviewer offering additional literature for citation. We will use if appropriate. |
| 9405 | 6 | 0 | | | | Main discussions in this chapter are features of CO2 emissions that are of course important. However, in discussions on transformation pathways, it is also important to take into account non-CO2 GHG emissions, not only Kyoto gases but also air pollutants such as BC, OC (short-lived gases) and Montreal gases such as CFCs and HCFCs (long-lived gases). As for CFCs and HCFCs, these are long-lived gases with very high global warming potentials that the policy makers were aware of and there will be still large amount of emissions in CO2 equivalent in the next 10 -20 years which are difficult to be reduced even regulated under the Montreal Protocol. Thus, it is also important to be mentioned when discussing the short-/mid-term emissions pathways. The following papers are just examples which provide new findings after the IPCC AR4, and authors can review various other papers and reports by UNEP, WMO etc.<br>1) Velders, Guus J.M., Stephen O. Andersen, John S. Daniel, David W. Fahey, and Mack McFarland. 2007. The importance of the Montreal Protocol in protecting climate, PNAS 104(12): 4814–4819.<br>2) Velders, Guus J.M., David W. Fahey, John S. Daniel, Mack McFarland, and Stephen O. Andersen. 2009. The large contribution of projected HFC emissions to future climate forcing. PNAS 106(27):10949–10954.<br>3)Wan, Dan, Jianhua Xu, Jianbo Zhang, Xuanchang Tong, and Jianxin Hu. 2009. Historical and projected emissions of major halocarbons in China. Atmospheric Environment 43: 5822–5829 | Accepted. We will include more discussion on short-lived species in the SOD. |
| 16909 | 6 | 0 | | | | There needs to be more synergy and consideration of cross-cutting issues between the chapters. For example, chapter 4 has a constructive discussion about the need to distinguish subsistance emissions, development emissions and luxury emissions. Yet in the all scenario studies in chapter 6, there is no indication that any one of the scenario projections make the distinction between survival emissions vs. Luxury emissions. | Noted. |
| 13147 | 6 | 0 | | | | It's a bit unfortunately that the dataset, and therefore most of the analysis, was not finalized for the FOD. There are findings across the chapter that would in their current form require some clarifications/explanations, but it doesn't seem useful to ask for such at the moment, when there is always a caveat close by, suggesting that the analysis so far shouldn't be taken too seriously. | Noted. |
| 13156 | 6 | 0 | | | | More references should be added, throughout the chapter, to results that are currently referenced using a project name (e.g. EMFXX, RECIPE etc) only. | Accepted. We will continue to add references as the process proceeds. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 13166 | 6 | 0 | | | | The scenario ensemble used for the chapter appears to somewhat dominate the discussion, especially in some sections. This is also demonstrated by the fact that in certain sections a proper literature review is almost completely missing and the references mostly focus on the few large studies that also feed in to the database (and in which a number of the authors have been involved). While this is a useful approach in terms of giving detailed information about a large set of scenarios, it also creates an impression that nothing else has been done within this field during the past years. I would recommend that the database related results are balanced with literature reviews, so that it's ensured that the large model comparison studies are not represented as the only forum in which research has been done (and if it turns out there actually are few relevant studies beyond the comparison projects, so be it, at least it can then be stated as a justification for the approach taken). Also, small, individual studies may well bring in additional, alternative approaches that could enrich the scenario space (i.e. relying on model comparison studies (e.g. 10 models run 5 different scenarios) provides useful information about differences across the models, but less information about the heterogenuity of the possible scenario space (compared to 50 different scenarios, each run by 1 model alone)). | Accepted. We will continue to add references to a broader swath of literature as the process proceeds. |
| 11242 | 6 | 0 | | | | The chapter is full of very interesting details, but it has no clear message. Is there a story of decarbonization? Is every model telling its own story? | Noted.We are continuing to refine the story of the chapter heading into the |
| 11245 | 6 | 0 | | | | In the headings of the sections 6.3.4. and 6.3.4.2 the “idealzed context” is mentioned, but there is no chapter that is called “non-idealized context”. On my opinion these two viewpoints “idealized vs. non-idealized” have to be contrasted. It is somewhere hidden in the text, but it is not told and sold as a story. I think that this could give a framing for the whole chapter. | Accepted. We will explain the distinction more clearly in the SOD. |
| 11247 | 6 | 0 | | | | I am missing something like “no regret options”. This could be an interesting framing, e.g. no matter which delay we face, no matter which stabilization target should be achieved, technology X is always important and is required at a deployment level of Y. | Noted. We have not decided whether to use the notion of "no-regrets" options as part of the framing of the story in the chapter. We are considering alternnative framings for explaining the sorts of |
| 11248 | 6 | 0 | | | | Will there anywhere in the report be a translation of the RCP forcings to temperatures? If it is in WG1, it should be repeated here just for information. | Accepted. Yup. We're working on that for the SOD. |
| 11249 | 6 | 0 | | | | There is no reference to the 2Deg target and also the discussion of 1.5 vs. 2Deg is missing. But this has been requested by the UNFCCC. It would be important to come up with some messages on this issue. | Accepted. While the chapter will focus on stabiliization of greenhouse gases, consistent with Article 2, we will include a linkage between those goals and |
| 11251 | 6 | 0 | | | | There is a clear bias in the whole chapter to overstate the importance of nuclear. Often it is mentioned “technologies such as CCS and nuclear”. There is no single indication that nuclear is as important as CCS from this chapter. Quite the contrary, Figs e.g. 6.29, 6.30 etc clearly show that CCS has a big effect on the cost, but not nuclear. It is quite striking that in the whole chapter there is nearly no reference to the individual technology “nuclear” but it is only mentioned in one breath with coal+CCS. A standard sentence in chp. 6 is “….particular technologies such as nuclear power or fossil energy with CCS”. But your cost figures clearly indicate that there is a huge difference between the importance of CCS and nuclear. This is not stressed at all. | Noted. We will be adjusting the text of the chapter and will continue to refine the discussion of different technologies. |
| 11252 | 6 | 0 | | | | Something similar to Figure 13.3. (FOD, chp. 13) would be extremely useful in the Executive Summary. On the x-axis should be e.g. the technology setting is given, indicating the interplay between technology choice and emissions. You have the figure for the costs, but the according figure for emissions would be helpful. | Noted. |
| 11254 | 6 | 0 | | | | I miss a discussion on energy efficiency. This is one of the most important options, already in the basline in some of the models (and coming as a free lunch) but it is not discussed as an important option. | Noted. We have a discussion on end use efficiency. We expect to refine that discussion in the SOD. In addition, a more refined discussion in the section on |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 11262 | 6 | 0 | | | | There should be some assumptions given on the CCS use. What do the models assume when CCS is available? What is the assumed storage capacity? Leakage rate etc. The same for biomass? Is there a limit on biomass use? This is important for interpreting the results. | Rejected. This synthesis does not have the space to consider all the assumptions of all the scenarios used in the analysis. Readers will be encouraged |
| 11267 | 6 | 0 | | | | Are the carbon prices shown? If not – why? | Noted. We have included carbon prices in one parrt of the chapter only. We are considering whether to include them in other parts as well or whether to remove them entirely given space constraints. |
| 11015 | 6 | 0 | | | | The Chapter explores the implications of stabilizing atmospheric GHG concentrations. An effort to implement such a goal, were it ever to be attempted, would constitute global social engineering on a completely unprecedented scale. There is little evidence that such an effort will be made.<br>Indeed, on page 26, the Chapter notes "…no cost-benefit study finds an optimal level of mitigation that stabilizes atmospheric concentrations within the modeling period." While one should be mindful of the optimization models' limitations, surely the point represents a significant caveat to the analysis. Giving the point more prominence in the Chapter would seem, therefore, to be appropriate.<br>The caveat seems especially apposite in that IAMs ignore institutional constraints on the choice and implementation of mitigation policies. Based on current experience with global mitigation efforts, institutional constraints deter many countries from acting on mitigation and induce others to use policies with poor cost-effectiveness. The inference seems to support the conjecture that the scenarios described in the Chapter would diminish global welfare.<br>Many governments, however, have at least formally embraced some version of stabilization goal. Thus, a discussion of its implications is may be useful. In this regard, the chapter makes many welcome points. It is particularly welcome that the Chapter notes that a capacity for solar radiation management (SRM) might be an important tool in coping with low probability high impact events. Previous IPCC reports have slighted the potential importance of SRM, and in this regard, Chapter 6 makes a valuable new contribution. The Chapter discusses the subject in a fair and balanced manner. | (1) The discussion of cost-benefit analysis is being moved to a distinct box. We do not intend to treat such analysis at length in this chapter and instead will focus on stabilization, consistent with Article 2 of the UNFCCC. (2) We agree with the reviewer about institutional constraints. However, the purpose of this chapter is to highlight what would need to happen to meet particular goals, with later chapters assessing how hard or easy it might be to make that happen given institutional and other constraints. (3) Comments on SRM noted. |
| 16349 | 6 | 0 | | | | Please consider using the following paper in your assessment:<br>The world at a crossroads: Financial scenarios for sustainability<br>Jofre Carnicer and Josep Peñuelas<br>Energy Policy 48, 2012p 611-617 | Noted. |
| 16351 | 6 | 0 | | | | The structure of this chapter may benefit from a revision:<br>The current section 6.3 is very long and includes a lot of different issues. It discusses costs of mitigation before sustainable development and transformation pathways (6.6.) - if this remains in that order, efforts are needed to avoid treating costs without sufficiently taking into account their context (baselines, including level of sustainable development, may strongly influence costs). | Noted. Unfortunately, the outline handed down by the plenary places an enormous amount of material in one section (6.3) with an absurdly long title. At this point, the strategy is simply to |
| 15717 | 6 | 0 | | | | A general point. The RCPs assume a considerable phasing out of aerosol emissions by the end of the century. These are 'best guesses' but the radiative forcing of aerosols contain large uncertainties. Particularly in the high-end RCPs, that could lead to an under-estimation of the aerosol cooling from SOx, NOx , sulphates and nitrates and hence an overestimation of the increase in temperature by 2100, which would make IPCC an easy target for critism. Of course there are uncertainties both ways ( black carbon and troposperic ozone have a positive forcing). However, as the RCPs are the source for climate model projections I recommend to take this issue up with WG I and see if such critisim can be prevented ( nb aerosols are addressed in 8.2.2 but not in the context of RCPs) | Noted. Additional dicussion of aerosols and their relationship to transformation pathways will be included in Chapter 6. |
| 18624 | 6 | 0 | | | | Results are preliminary and the chapter is far from complete | Noted. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 18627 | 6 | 0 | | | | A failure to include land use change emissions into the mitigationregime could dramatically increase the difficulty of meeting long term goals, and it could potentially lead to dramatic changes in the global land surface.<br><br>The ability to store CO2 using bioenergy with CCS or other CDR technologies facilitates overshoot pathways…. | Noted. Both of these points are in the chapter. |
| 18628 | 6 | 0 | | | | The pathway discussion lacks a clear subject, a pathway to whom? It also suffers from a more general knowledge gap; we don't know what innovation and tech will bring. | (1) Noted. The pathways are leading to stabilization of GHG concentrations or RF. (2) Noted. The chapter addresses |
| 18629 | 6 | 0 | | | | I lack a more "philosophical" discussion on how to approach the future, how do we get from here to there. The approach is rather mechanical. At the same time we know that we don't have or can gain full knowledge. Even more important, choices made will have a crucial effect on how different options develop (keeping everything open isn't hardly a real option. | Noted. The framing chapters are intended to address these broader issues. |
| 18630 | 6 | 0 | | | | Our knowledge about the future is and will be limited. Different approaches possible. Predict, "calculate" or choose directions. It is unclear what the ambition really is but for time perspectives over decades it can't be correct to look into parts and assume that all other things are equal. Wouldn't it be more interesting to compare different directions and where they will lead in terms of capabilities that will develop? | Noted. The chapter includes a discussion of the relationship between sort-term actions and long-term goals. This discussion will be refined in the |
| 18631 | 6 | 0 | | | | Decarbonisation is a learning process (for society), different platforms should be compared. | Noted. |
| 18636 | 6 | 0 | | | | Transformation to atmospheric stabilization is best understood as a process of sequential decision-making and learing. | Noted. The chapter includes a discussion of sequential decision- |
| 18637 | 6 | 0 | | | | Near-term emissions need not necessarily be in the optimal range for a long-term goal to be met. | Noted. The chapter makes this point. |
| 18638 | 6 | 0 | | | | While it is clear that some mitigtion effort in the near-term is crucial to preserve the option of achieving low stabilization targets, whether these targets are met in the long-run depends to a greater extent on the potential for deep emissions reductions several decades from now. Thus efforts to begin the transformtion toward stabilization must also be directed toward developing the technologies and institutions that will enable deep future emissions cuts rather than exclusively on meeting particular near-term targets…. The benefit of beginning to create and improve technologies today and to develop institutional capacity is that it creates opportunities to make early and mid-course corrections. | Noted. The chapter includes a discussion of this issue. |
| 18639 | 6 | 0 | | | | Flexible market-based policies with maximal sectoral and geographic coverage are most likely to deliver emissions reductions at the lowest economic cost. Although the added cost of inefficient policies in the near-term may be smaller than in the long-term when mitigation requirements wil be much larger, their implementation now may lead to "institutional lock-in" if policy reform proves difficult. Thus a near-term focus on developing institutions such as domestic and international emissions trading markets (as in the European Union's ETS), as well as political structures to manage the large capital flows associated with carbon pricing, could provie substantial dividends in he coming decades when mitigation efforts reach their ful proportions. | Noted. The discussion policy regimes and institutional lock-in is left to the policy chapters. This chapter makes clear that costs are lowest under idealized, price-based policies. |
| 9029 | 6 | 0 | | | | 1. The Chapter is a work in progress. Its approach of classifying the results of different models into six categories is useful for summarizing the variety of approaches and results. 2. The draft has clearly marked loose ends, where it points to simulations that are not yet completed. 3. The chapter should be commended for surwewing the literature on sustainable development (6.6). Unlike standard economics approaches this approach recognizes the developmental gaps (in incomes, employment, and technology) that characterizes developing countries. In contrast, Chapter 3 which surveys economic analysis frameworks leaves to Chapter 4 the consideration of sustainable development. | 1. Noted. 2. Noted. 3. Noted. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 9030 | 6 | 0 | | | | Chapter authors mights consider being more accurate and circumspect about statements to the effect that developing countries will bear greater mitigation costs. Assessment models do reflect the fact that the future mitigation potential will be greater in developing countries because BAU assumptions assume that development will occur (despite the variety of assumptions on per capita income, energy intensity, China and India prospects - see lines 9-10 p. 18). Mitigation potential is different from the bearing of mitigation costs. There are two things that must be taken into account. First, the Framework Convention provides that the incremental costs of mitigation wil be provided by the developed countries. Secondly, development might not occur for many reasons, including perhaps due to the fact that developing countries are unable to achieve the presumed investment, trade, growth regimes because of the climate regime or the international economic regime in general. | Noted. The chapter will make clear that a requirement for the assertion of higher costs in the developing regions is continued growth in those regions. In addition, a section on burden-sharing is being added to the chapter. |
| 9033 | 6 | 0 | | | | A fundamental weakness of the chapter is in presenting scenarios is that it does not start with a differentiation of mitigation potential and emission flows in developing countries. Achieving the mitigation potential in developing countries will require the availability of means of implementation. | Noted. |
| 9034 | 6 | 0 | | | | A fundamental weakness of the chapter is in presenting scenarios is that it does not start with a differentiation of mitigation potential and emission flows in developing countries. Achieving the mitigation potential in developing countries will require the availability of means of implementation. | Noted. |
| 9035 | 6 | 0 | | | | An important fundamental inaccuracy in the chapter is that it estimates cost of climate policies but these costs are not netted against the economic costs of climate change itself. The scenarios appear not to incorporate the net costs of climate change. | Rejected. This chapter is not addressing the benefits of mitigation. The chapter will recognize the lack of inclusion of climate impacts into stabilization |
| 9036 | 6 | 0 | | | | The scenarios presented in the Chapter include the possible impact of incomplete or late participation in climate change policies. However, these simulations appear to only have developing countries as lagging participants. There should be scenarios in which the impact of incomplete, delayed or non-participtiption by developed countries, notably the United States, are reported. | Noted. This chapter is synthesizing whatever literature is available. The available literature focuses on full global delays or delays by developing regions. The basic insights can be extrapolated to scenarios in which the developed |
| 9037 | 6 | 0 | | | | The scenarios chosen for presentation in the Chapter are incomplete and do not reflect or straddle the full range of possibilities, including the potential for a serious implementation of sustainable development framework. Among the scenarios that appear to be “missing” are the following: (1) (1) a scenario based on improving distribution of income through time, and its impact through changing lifestyle, reduced consumption in the rich countries; (2) a scenario showing the impact of no or inadequate climate financing for developing countries against a scenario of adequate financing for climate change ; (3) the current scenarios assume that carbon taxes are the only source of climate finance; there should simulations which assume other sources for financing for climate change. | Noted. Such scenarios will be included if they can be found in the peer-revieiwed literature. |
| 9038 | 6 | 0 | | | | Many, if not the overwhelming majority of the scenarios, assume negative emissions in the out years. What are the implications of these global numbers for burden sharing across countries? What are the implicit assumptions or implications of these scenarios about financing and technology transfer of negative emissions scenarios? | Noted. This chapter will highlight the needs for technologies. A later chapter will explore financing issues. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 8604 | 6 | 0 | | | | 1. Many of the results need further qualification stating more transparently under what assumptions the stated conclusion is valid, or not. Two important examples for many conclusions are: "given the limits on the amount of incremental energy efficiency modelled…." , or " given that oil prices were assumed to remain under $100 per barrel forever, the cost results are.....". 2. The types of parameters and their numerical values which are input to the various IA models for different scenarios is, basically, never discussed. This is a major omission. The transparency of scientific research requires that key input assumptions be provided in parallel with all results. This is particularly important for the kinds of scenarios cited in this chapter, because many of the differences between results from model to model are not due to structural differences in the models, but are due to DIFFERENCES IN THE VALUES OF THE SAME INPUT PARAMETERS. 3. Again, the constraints on energy efficiency improvements on the demand side over time input to each IAM must be cited in the text, since the improvement of energy efficiency on the demand side is one of the key technology options to mitigate climate change. Even conceptually, the issue is barely discussed, another omission. 4. The fact that fossil fuel prices are either endogenously computed or exogeneously input to every model is not discussed in any detail. Yet the resulting prices for fossil fuels in any given future year in each scenario might be the single most important factor determining most results. These price assumptions must be presented and discussed in the context of the "peak oil", "peak natural gas", and "peak coal" theories. Fortunately, the peak oil hypothesis is mentioned in the early chapters of this report, but it must be further elaborated relative to its impact on the scenario results presented in Chapter 6. 5. The fact that most if not all the IAMs assume that almost infinite supplies of liquid fuels from "backup" technologies will be available must be discussed and justified, since it is a highly controversial assumption. | Please see the response to comment 9820, which appears to be a duplicate of this comment, despite being submitted by another reviewer. |
| 8605 | 6 | 0 | | | | The labels on each figure and table need to be made more clearly understandable in many cases. | Accepted. |
| 8606 | 6 | 0 | | | | The chapter on talks about the "costs" of mitigation, by which "net costs" seems to be meant. But no hint is given that depending on the input assumptions there could be "net benefits" for some scenarios in the long run. For example, this could happen i | Noted. It is made clear in the section on tools of analysis that input assumptions and model structure can have an |
| 8607 | 6 | 0 | | | | The discussion of the net cost results from each model run for scenarios is fairly weak because while there is some discussion of the aggregate type of costs produced by different types of models (e.g. GDP vs. other aggregates), the discussion does not state what function kinds of costs are included in each model, e.g. investment costs, operating costs, O&M costs, capital additions. Similarly, the reader is not told if, for the energy system, the incremental costs of energy efficiency are included (I think not), or transaction costs, or infra-structure costs, etc. | Noted. The discussion of cost metrics and their pros and cons is being moved to the metrics annex. To the degree possible, the chapter will highlight the use of different metrics. |
| 8608 | 6 | 0 | | | | The chapter on talks about the "costs" of mitigation, by which "net costs" seems to be meant. But no hint is given that depending on the input assumptions there could be "net benefits" for some scenarios in the long run. For example, this could happen if the long run prices for fossil-fuels were much higher in the reference cases than in the RCP 2.6 cases, where the demand for fossil=fuels would be much lower than in the reference cases. Thus, the wording which seems to imply that the net costs of mitigation would always be positive must be revised and qualified to allow for the possibility of net negative costs. The bottom-line, of course, is that pursuing strong climate mitigation as in the RCP 2.6 type of scenarios might improve other aspects of the economy and consumption, if, indeed consumption is always good. | Please see the response to comment 9821, which appears to be a duplicate of this comment, despite being submitted by another reviewer. |
| 8609 | 6 | 0 | | | | As hinted at in the above comments, the whole scenario "infeasibility" discussion, which repeats itself too often, forgets to mention that one major cause of apparent infeasibility for some scenarios for some models is probably the overly limited level of end-use energy efficiency improvements. IAMs and their outputs aside, the RCP2.6 greenhouse gas trajectories required are not infeasible given existing energy efficiency technologies and given renewable supply technologies, even with CCS and nuclear power. This must be made clear to the reader. Again, this is another situation where the results are not properly qualified based on model limitations or input assumptions made. | Please see the response to comment 9822, which appears to be a duplicate of this comment, despite being submitted by another reviewer. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 8610 | 6 | 0 | | | | The chapter could be organized more logically. I suggest the following order: introduction with discussion of scenarios vs. forecasts; model structure; input assumptions; neutral presentation of results; discussion of results and overall conclusions regarding transformation pathways; policy issues that arise and policy implications of the results. | Noted. |
| 5427 | 6 | 0 | | | | The Chapter focusses on scenarios and models created by or for vested interests, and proceeds to make the usual error of looking at the area with most dense scenario forecasts. This is false, because the data employed are all in this "dont rock the boat" category. The more extreme scenarios are few because of the way scenario data were collected, but may well hold the most interesting suggestions for policy implementation. | Noted. We might note to the reviewer that the scenarios required to meet 450 ppmv CO2 appear to include some rather dramatic changes from historical trends. |
| 3145 | 6 | 0 | | | | chapter 1 needs an iconic figure from chapter 6 that would help us illustrate the cost (and infeasibility) of some emission pathways and goals. Can the Chapter 6 team advise us on that—we need to replace figure 1.8, which is an old EMF chart and does not illustrate the key point.) ONe option would be to move figure 6.11 plus a figure that shows infeasibilty/costs into chapter 1. TSU PLEASE HELP ADVISE.<br><br>BECCS plays a huge role in the IAMs that can meet goals like 2 degrees. Given that, why not use BECCS as a case study/box in chapter 3 since that would help tie together the issues discussed there with the large role that is assumed for BECCS in some scenarios.<br><br>As a general matter, this chapter has lots of terrific material and almost no connection to the rest of WG3. Discussions of financial transfers have no bearing on chapter 16 (which is on finance). (Chapter 16, itself, is a mess.) Discussion of LUCF seems disconnected from the land use chapter and from WG1. The TSU needs to help figure out which connections are most important, and if the transition work discussed in this chapter is pivotal (it is really mainly EMF work) then the TSU might want to help move a few figures from here to other chapters to tie the WG3 together to a greater extent. (one of the notable exceptions to the above comment is chapter 9.9.1, which uses info from chapter 6 to discuss the size of the mitigation challenge in the buildings sector.) | 1. Noted. We're working on it. 2. That is an issue for Chapter 3 to consider, but it seems like a good idea. 3. Agreed on connections. Efforts will be made to brinng in more connections in the SOD. |
| 18459 | 6 | 0 | | | | This is a fine draft by an excellent author team. My concern is that, by very largely limiting the chapter's scope to issues that have been incorporated in Integrated Assessment Modeling (IAM) scenarios, they open themselves up to criticisms that there are other knowledge bases related to transition pathways that are being overlooked. One example would be literatures related to the HOW of transition pathways, as distinguished from the WHAT: i.e., institutional implications and requirements. The chapter has a bit of this (e.g., pp. 53-54, 64, and sections 6.7 and 6.8.3), but these discussions generally just note the issues but then back off from discussing them because they are not embedded in IAM scenarios. I would suggest adding a couple of experts on institutional aspects of transition pathways, at least as contributing authors, in order to fill this kind of (possible?) gap. Regarding chapter length, it is clear that the problem is section 6.3, which runs nearly 40 pages. A good deal of this might be summarized from the available literature, referring readers to the original reports if they want more detail. | Rejected. We agree with the reviewer about the need to think about the challenges in making the sorts of transformations diiscussed in this chapter. But those discussions are not intended in this chapter, but are rather the purview of later chapters, such as Chapter 15 on national and sub?national policies and institutions and Chapter 13 on international policies policies and institutions. We will, however, provide more linkages to these other chapters |
| 6504 | 6 | 0 | | | | Both US$ and $ should be unified.<br>Because they are used thoroughout Chapter 6. | Editorial. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 18993 | 6 | 0 | | | | Main comment: The chapter needs to clearly communicate the feasibility of the 2° target and outline possible pathways to reach it and the costs and consequences associated with it. Likewise the chapter also needs to cover "enhancing mitigation options" (UNFCCC), i.e. mitigation targets more stringent than 2°, also including costs and consequences. This will require a clearer discussion about peaking, not-to-exceed and overshoots. Also trade-offs between different pathways should be discussed. | Noted. The chapter will now do a better job of linking the RF stabilization scenarios to temperature goals. |
| 18994 | 6 | 0 | | | | Main comment: The chapter needs to focus on the exploration of different transformation pathways and their institutional requirements. Carving out different characteristic classes of pathways will require a deeper analysis and clustering of the scenarios. | Noted. |
| 18995 | 6 | 0 | | | | Main comment: The chapter needs to communicate clearer that different scenarios/pathways are not representing a wide range of statistical uncertainty but are rather demonstrating different technological, energy efficiency, etc. options/strategies and structural uncertainty (represented through differences in models and their assumptions). | Noted. Text to this effect was included in the FOD, but it will be refined for the SOD. |
| 18996 | 6 | 0 | | | | Main comment: The chapter should aim to inform policy makers about no-regret options, crucial technologies and robust strategies. | Noted. The chapter will continue to be refined to bring out the major insights about actions needed to meet various |
| 18997 | 6 | 0 | | | | Main comment: The chapter mentions in the ES that dramatic changes are needed, but does not convey in the chapter why the presented options/pathways are dramatic and what their implications are. This has to be communicated in a manner understandable for policy makers. | Noted. More effort will be made to communicate the scale of changes required to meet different goals. |
| 18998 | 6 | 0 | | | | The chapter should give stabilization targets (in degrees) rather than (or in addition to) forcing targets | Rejected. There is too much uncertainty in the relationship betwee RF and temperature to use temperature as the defining characteristic of different pathways. Instead, the chapter will now |
| 18999 | 6 | 0 | | | | The discussion of technologies required for certain pathways also needs to cover technology risks. Possible these issues could be covered by the respective sectoral chapters and referenced from Chapter 6. | Noted. Risks will be covered in the sectoral chapters and summarized in |
| 19000 | 6 | 0 | | | | The possible renaissance of coal should in our view be centrally discussed in the chapter. | Rejected. A possible "renaissance of coal" as well as a range of other key drivers are embodied in the baseline scenarios section. With limited space, this section will address the overarching |
| 19001 | 6 | 0 | | | | The chapter should cover the historic context, i.e. transformation pathways in AR4 and SRREN and focus on what is new in recent scenarios (e.g. BECCS) | Accepted. The chapter will now be framed more in the context of what is |
| 19002 | 6 | 0 | | | | The chapter should highlight the role of energy efficiency and how it is (implicitly) covered in IAMs. | Accepted. More effort will be made to clarify the role of end uses in mitigation. |
| 19003 | 6 | 0 | | | | The chapter should further pursue the process of linking scenario data ("top-down") with sectoral data ("bottom-up"). | Accepted. The SOD will include a more extensive treatment of the linkage between top-down and bottom-up |
| 19004 | 6 | 0 | | | | Figures on deployment of technologies are needed, as this is of great interest to policy makers. Consider Chapter 6 summarizing this from the sectoral chapters. | Noted. Figures on total deployment will be found in this chapter, but deploymetn of individual supply technologies will be |
| 9031 | 6 | 0 | | | | The bases and the implications of model infeasibility is one of areas where the chapter is incomplete in terms of analysis and simulations. There are references to sections 6.2.5, 6.2.7 that are not in the first draft. One of the key issues the drafters seem to require a clear agreement on is the treatment of technologies that make possible negative emissions. An analytical approach and clearer view of the role of these technologies is important because of its potential role in creasing development space and the greater responsibility that developed countries could bear in the use of these technologies. | Rejected--space constraints |
| 9032 | 6 | 0 | | | | The chapter confines its survey to integrated assessment models. | Noted |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 18635 | 6 | 0 | | | | Section 6.4 contains an interesting reasoning on how to integrate different time perspectives (relates to some of the issues that I have raised above). | OK. |
| 9192 | 6 | 1 | | | | ch6 needs coordination with "service industry" sectin of ch9 (building) | Rejected. This is beyond the scope of |
| 9193 | 6 | 1 | | | | the risk management perspective of mitigation, adaptation, and geoengineering should be described here with coordination with ch 1& 2 | Accepted in part. Chapter 6 will not be addressing adaptation. However, it will include discussion of how to think about |
| 9191 | 6 | 1 | | | | footnote should be added that says the frequency (number of scenarios ) is not probability. | Footnote has been added |
| 14030 | 6 | 1 | | 99 | | As the theme of transformation is receiving increased attention both in scientific and policy discourses, we see that the concept takes on multiple meanings and uses. In the SREX report of the IPCC (2012) transformation is defined as “The altering of fundamental attributes of a system (including value systems; regulatory, legislative, or bureaucratic regimes; financial institutions; and technological or biological systems.” And it chapter 8 of the SREX report the personal, cultural, institutional and systems levels changes are discussed in more detail.<br>Ch 6 looks at transformation of the energy system, both on production and demand. It discusses what stabilization levels are possible, how we can get to these stabilization levels and how decisions today will influence future stabilization paths. In this chapter, transformational change is limited to the goal of stabilization of greenhouse gas concentrations, and it is very much focused on the energy systems, using large-scale integrated models to capture the interaction between different processes and systems. Even though the chapter points to the larger social context, it does not discuss what personal, cultural, institutional, and systems transformations are needed in the face of climate change. It does not say anything about what a well-adapted global society would look like, or the transformations that are needed to address vulnerability or adapt to inevitable impacts associated with different stabilization pathways. In fact it actually sees little role of adaptation in a transformative pathway.<br>There is a broad literature that argue that climate change responses require far more than technical solutions, they also call for transformations in the systems and structures, at different scales, and in different contexts and settings, that currently promote undesirable outcomes. These may include transformation in energy systems as covered in this chapter, but it also call for transformation in agricultural systems, financial systems, governance and development paradigms, power and gender relations, production and consumption patterns and lifestyles, knowledge production systems, or values and worlds views.<br>My worry is that the reader of AR5 will be left confused of what transformation actually means for society and the environment, given its multiple meanings and uses in this report. Chapter 6 is about stabilization pathways, and I’m curious why this term is not used instead of transformational pathways. This would be an important clarification to be made upfront together with a definition of transformation. | Accepted. The SOD will include more references to later chapters that address these elements of the transformation. Chapter 6 will focus most heavily on the nature of the physical transformations. |
| 13560 | 6 | 1 | | | | There seems a significant overlap between chapter 5 and 6 in terms of driver analysis, trends, emission reduction options…. | Noted. |
| 10399 | 6 | 1 | | 99 | | The parameters about the discount rates are not so clear. And functions are lacked for the technology progress. As the greater and greater role the technology plays in the abatment of carbon and the new technology achieved these years, it cannot be ignored for the medium and long run models. Maybe there is a few papars talked about this issue, but papars on this issue indeed exist,such as Zwaan,Gerlagh,et al(2002),Buonanno, carraro, Galeotti(2003),Wu, Zhu, Wang(2012),Wang,li, Wu(2010). | Noted. More discussion of discounting assumptions are needed. Readers will be directed to Chapter 3 for a more extensive discussion of discounting issues. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 5853 | 6 | 1 | 1 | 99 | 40 | At several places in the text you refer to "carbon-free" or "zero-carbon electricity sources". These do not exist. Nuclear power installations cause emissions during construction, maintenance, operation, intermediate and / or final waste storage, fossil energy with CCS just reduces efficiency to capture and store C which "is still there" (and this source also has emissions from construction, operation and maintenance), and "renewables", especially biomass-based, of course also have C emissions! Low or "zero" emissions during the "electricity generating phase" have to be related to the life-cycle emissions of the "electricity generating device" to get the complete assessment. Speaking of "carbon-free sources" just promotes "emit now, save later", or in case of nuclear waste: "emit now, save a little later, emit for generations to come" and thus I strongly suggest to avoid the use of terms like "zero carbon" or "carbon-free". | Noted. It may be wise to move to a nomenclature on low-carbon technologies. |
| 14036 | 6 | 10 | | | | Would it also be appropriate to say that the model only covers limited criterias for transformation, as non-market factors are not considered. Raskin and collegues (2002) for example find that critical events/disasters define what decisions are made and what pathway society gets on (Raskin, P. et al. 2002. Great Transition: The Promise and Lure of the Times Ahead. SEI,Tellus Institute). | Noted. |
| 13129 | 6 | 10 | 13 | 10 | 15 | This contradicts what was said previously about feasibility being subjective (beyond the biogeophysical constraints). If it's truly subjective, how could this chapter provide information about near term actions that prevent certain long term goals (except for the near term actions that break the long term goals already in the near term, of course)? And to follow the logic of the previous paragraph, does this chapter discuss perceptions of feasibility, rather than actual feasibility? | Noted. The manner in which near-term actions interact with options to meet long-term goals will be revisite in the SOD. |
| 4193 | 6 | 10 | 44 | 11 | 10 | Tradeoff between "detailed formulation" and "intutive understanding" or "flexibility to represent uncertainties" would be also touched upon. | Noted |
| 16689 | 6 | 10 | 7 | | 15 | Very important point -- suggest this be moved forward in the document. | Noted. |
| 4192 | 6 | 10 | 32 | | | Progress of model development since TAR or AR4 should be touched upon. In my view, the role of CGE has increased and contributed to the assessment of near to middle term impacs of climate measures. | Rejected--space constraints |
| 10983 | 6 | 10 | 44 | 10 | 44 | The term of "IAMs" is not defined. | Accepted |
| 9838 | 6 | 11 | 11 | 11 | 15 | Chapter 6.2.2 talks about the uncertainties. This is a limitation that should be discussed later, the same argument holds as mentionned for feasibility. I am not sure the word "prediction" should be used here unless it is made clear that the modeling efforts described do not involve making predictions or forecasts. The text is just discussing scenarios. Therefore, I don't think that the discussion of uncertainty in this sub-section 6.2.2 is really needed or relevant if one is not discussing forecasting. It certainly can be shortened. | Taken into account--we have added a footnote explaining differences in connotations between scenarios, projections, predictions, and forecasts and have added a citation that discusses |
| 4194 | 6 | 11 | 11 | 11 | 35 | The interpretation of the model emsemble in this chapter should be compared with those in WG-I, the case of GCMs. The latter represents the ranges of parameterization of climate science based on the similar theoretical formulations while the former often includes the variety of social context as well as the uncertainties in technological assessment. | Rejected--space constraints |
| 8624 | 6 | 11 | 15 | | | I am not sure the word "prediction" should be used here unless it is made clear that the modeling efforts described do not involve making predictions or forecasts. The text is just discussing scenarios. Therefore, I don't think that the discussion of uncertainty in this sub-section 6.2.2 is really needed or relevant if one is not discussing forecasting. |---|---|---|---|---|---|---|---|
| 13130 | 6 | 11 | 26 | 11 | 35 | This is extremely vague and not convincing. Using two scenarios instead of one would "contain information" about uncertainty , a truism, but would tell little about what uncertainties the differences between these two scenarios reflect, how complete is the coverage of uncertainties, how the differences can be interpreted and what interpretation are clearly out of reach. Or in other words, if there is full, formal information about uncertainty in one end of a range and no information at all in the other end, this statement only says that we are not in the "no information at all" part of the range, without suggesting what that means for using the scenario ensemble to represent uncertainties (in some form). Also, nothing guarantees that the distribution of scenarios has anything to do with "actual" distributions of uncertainties. On the contrary, most modelling teams are likely to aim at "best guess" parameter values, suggesting that tails of parameter distributions are likely to be under represented (the huge amount of possible parameter combinations guarantees heterogeneity for results even in this case). I suggest that any uncertainty related conclusions that are drawn from the scenario ensemble are worded extremely carefully throughout the chapter. | Taken into account--we have added a footnote and citation that discusses this point (Morgan and Keith, 2008) |
| 7671 | 6 | 11 | 3 | 11 | 4 | The text says "[…] these models typically assume market behavior […]". Perhaps a remark should be made that markets are virtually always assumed to be efficient. IAM's take rarely (if at all) e.g. information asymmetry, search frictions or market power into account. | accepted--text revised |
| 9839 | 6 | 11 | 36 | | | Here we return to discussing model "infeasibility" again - it is repetitious and over-emphasized as an issue. | taken into account--infeability discussions in other sections have been |
| 8625 | 6 | 11 | 36 | | | Here we return to discussing model "infeasibility" again - it is repetitious and over-emphasized as an issue. | taken into account--infeability discussions in other sections have been |
| 16691 | 6 | 11 | 4 | | | Make explicit that the market behavior, with the policy cases frequently employing a price on GHG emissions as the incentive. | Rejected--we make this point later in the section |
| 9840 | 6 | 11 | 46 | | | Again, the discussion of model infeasibility should NOT be allowed to "arise repeatedly". And it has very limited, not important, implications for "our understanding of real world feasibility." For example, one reason why some modeling groups stress scenario infeasibility for the RCP 2.6 scenario is because they limit the rate of efficiency improvements far too strongly on the demand-side; I think to less than 1.5% per year. If 3-4% per year efficiency improvements were allowed, then no scenario might have been infeasible..... | taken into account--infeability discussions in other sections have been shortened and blended into this section |
| 8626 | 6 | 11 | 46 | | | Again, the discussion of model infeasibility should NOT be allowed to "arise repeatedly". And it has very limited, not important, implications for "our understanding of real world feasibility." For example, one reason why some modeling groups should scenario infeasibility for the RCP 2.6 scenario is because they limit the rate of efficiency improvements far too strongly on the demand-side; I think to less than 1.5% per year. If 3-4% per year efficiency improvements were allowed, then no scenario might have been infeasible..... | taken into account--infeability discussions in other sections have been shortened and blended into this section |
| 10984 | 6 | 11 | 6 | 11 | 8 | In this sentence, the year 2020 is illustrated as a turning point from the medium-term to the long-term. Why is the year 2020 considered as such a turning point? It should be clarified. | Accepted--2020 deleted from sentence. |
| 7672 | 6 | 11 | 11 | | | On interpreting scenario ensembles, the risk for systematic bias should be also noted. Many IAM's share the same theoretical backgrounds and solution concepts. If a real-life feature (market inefficiency, non-market factors, uncertainty/limited foresight etc.) is not captured by the models, the whole ensemble is biased to some extent. (This is actually mentioned briefly in the end of section 2.3.6.2.) | Taken into account--model shortcomings discussed in section 6.2.1 |
| 16692 | 6 | 12 | | | | Can model descriptions be moved to an appendix? Does the policymaker need this? It is interesting and important, but a bit of detail that most will gloss over. | Accepted--section condensed |
| 16693 | 6 | 12 | | 13 | | Have you answered the following questions clearly enough: 1) Are models "valid"? 2) Do the results make sense? 3) How do the model results compare to our understanding or experience of the real world? | Taken into account--we try to address these, but due to space constraints are perhaps unable to elaborate to the |
| 9842 | 6 | 12 | 11 | | | This sub-section should be moved forward so that the structures of the models are discussed before results. | Taken into account--this section does come before the results in section 6.3 but comes after the executive summary |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 13131 | 6 | 12 | 11 | 14 | 4 | As the chapter is currently some 20 pages longer than it should be, I suggest this section on the tools is cut down considerably. The descriptions on the trade, foresight etc dimensions of the models should be summarized much more concisely and more references could be given instead. I don't see why it would be necessary to give this much detail when the results are anyway analysed mostly on the level of the full scenario ensemble. I also suggest removing table 6.1. completely - similar information could be given together with the concise descriptions, naming model examples and giving references. Finally, if the authors insist on keeping the table in, it needs to be clarified and made consistent. For example, for two models there is trade in "primary energy, secondary energy and energy goods". How are energy goods defined, if they don't fall under primary or secondary energy? The different options for model flexibility are also unclear, potentially also to the authors as different interpretations appear to exist (i.e. models that are rather similar, and should include the same flexibility options, don't). This also applies to cost measures. | Agreed--section condensed |
| 8628 | 6 | 12 | 11 | | | This sub-section should be moved forward so that the structures of the models are discussed before results. | Taken into account--this section does come before the results in section 6.3 but after the executive summary which |
| 9843 | 6 | 12 | 20 | | | One implication of their being two kinds of models with two very different kinds of macro-economic outputs seems to me to be that economic results can not be compared validly at all between the two types of models. Yet, I believe at many points later in the chapter, cost results from these two different types of models are compared and even placed in the same figures. Furthermore, to the extent that different model runs assume different discount rates, it is a simple conceptual point that these results can not be compared either. Please check if different discount rates were ever used in the results that you lump together. | Noted--we agree that the model ensembles from which we take these scenarios involve very different models, but it is outside of the chapter's scope to conduct a comprehensive comparison across all the models included in these |
| 8629 | 6 | 12 | 20 | | | One implication of their being two kinds of models with two very different kinds of macro-economic outputs seems to me to be that economic results can not be compared validly at all between the two types of models. | 9849 | 6 | 13 | 18 | | | "nested CES structure" is not explained. In general, this parts needs to be expanded so that the economic modeling approaches can be explained better, or eliminated. | Taken into account--section condensed and details eliminated |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 8635 | 6 | 13 | 18 | | | "nested CES structure" is not explained. In general, either is page or two needs to be expanded so that the economic modeling approaches can be explained better, or eliminated. No one but an economist will be able to understand this section entitled "model flexibility". In fact, I am not sure it would be clear to anyone, especially the last few sentences. At the very least, please re-write - I don't know what is saying about fossil fuel constraints and their impact. | Taken into account--section condensed and details eliminated |
| 9090 | 6 | 13 | 20 | | | Why "uranium in the case of nuclear" is cited as example in this context ? And what is the specific meaning of "in the case of nuclear" ? Detailed explanation is required. | Taken into account--section condensed and details eliminated |
| 9567 | 6 | 13 | 26 | | | Please, delete the before how. | editorial |
| 9850 | 6 | 13 | 28 | | | First of all, the first sentence as stated in economist's terminology obscures the huge importance of this assumption in some models - that the entire economy (presumably net of the energy sector, and others(?)) can be represented by just one or a few CES production functions. The text should make it clear that this means one can not distinguish between economic activity in the household, commercial, government, transportation, or industrial sectors, or within each sector. It is all one big aggregate "glob". Yet, the next few sentences makes is sound like a model with just one economic sector, implicitly assuming perfect substitutability across the economy, has some advantage relative to allocating factors of production. Of course, just the opposite is true. The more aggregate the economy as modeled, the more unrealistic and, therefore, inaccurate the results of calculations will be. This is particularly true for the cost of mitigation results. I believe that these highly aggregated economic models will dramatically underestimate the costs of climate change mitigation for the same reasons the text cites. If I am right, this weakness of these models must be honestly described. In their defense you might also mention the problems with running models with more highly disaggregated economic sectors. The same is true for lack of sufficient regional disaggregation. The related point that should be mentioned is that not having sufficient end-use or demand-side detail means that the degree of possible substitutability between many demand-side technologies will be greatly overestimated (implicitly). Also, more aggregation raises very serious issues about how to project changes in the economy into the future relative to possible changes in culture and lifestyles. | Taken into account--section condensed and details eliminated |
| 8636 | 6 | 13 | 28 | | | First of all, the first sentence as stated in economist's terminology obscures the huge importance of this assumption in some models - that the entire economy (presumably net of the energy sector, and others(?)) can be represented by just one or a few CES production functions. The text should make it clear that this means one can not distinguish between economic activity in the household, commercial, government, transportation, or industrial sectors, or within each sector. It is all one big aggregate "glob". Yet, the next few sentences makes is sound like a model with just one economic sector, implicitly assuming perfect substitutability across the economy, has some advantage relative to allocating factors of production. Of course, just the opposite is true. The more aggregate the economy as modeled, the more unrealistic and, therefore, inaccurate the results of calculations will be. This is particularly true for the cost of mitigation results. I believe that these highly aggregated economic models will dramatically underestimate the costs of climate change mitigation for the same reasons the text cites. If I am right, this weakness of these models must be honestly described. In their defense you might also mentioned the problems with running models with more highly disaggregated economic sectors. The same is true for lack of sufficient regional disaggregation. The related point that should be mentioned is that not having sufficient end-use or demand-side detail means that the degree of possible substitutability between many demand-side technologies will be greatly overestimated (implicitly). Also, more aggregation raises very serious issues about how to project changes in the economy into the future relative to possible changes in culture and lifestyles. | Taken into account--section condensed and details eliminated |
| 9952 | 6 | 13 | 28 | | | The title for the paragraph should be "…and GHG detail". | Agreed--text revised |

|---|---|---|---|---|---|---|---|
| 7676 | 6 | 13 | 3 | 13 | 44 | The text's level of technicality might be reconsidered. Discussion on coverage and foresight is relatively accessible, but the paragraphs on trade, flexibility and detail dive into how production functions are nested. Moreover, production functions and nesting are explicitly applied only in GE models. Perhaps the text should be on a more general level, and focus on how different assumptions relate to the real world and what implications the assumptions have. | Taken into account--section condensed and details eliminated |
| 12308 | 6 | 13 | 44 | 13 | 44 | Please consider to explain the column "Optimization/Simulation" similar to the other columns in Table 6.1. | This table has been removed |
| 9851 | 6 | 14 | | | | How did you select the models? Please provide search terms and information on the selection process in a footnote. Moreover regional scenario models are left out. On page 10 you mention that regional models are left out, but climate change is relevant for most of the decision makers on a regional scale only because their individual influence is restricted to a specific region, be it as a politician or a business practionner. | This table has been removed |
| 9403 | 6 | 14 | | | | As for explanation of the AIM-Enduse model, please write "6 GHGs" instead of "5 GHGs". In addition, please remove information of (energy-related) when counting sectral numbers. Anyway, this table is unclear, for example, definitions of model flexibility and how to count sectors and regions are unclear. Please carefully check information of original models in Table 6.1. | Taken into account--all model information was provided by the individual model teams in a questionaire included as part of their submission to |
| 13760 | 6 | 14 | | | | Please provide references for the different models. Why is IMAGE not included - it is explicitly included in Fig. 6.26? | Taken into account--only model results that were submitted to the AR5 data base were included in the table. This |
| 9953 | 6 | 14 | | | | Please give more details about the models including values of key parameters, such as the value for economic growth rate, so that others can follow the work. At least, papers which introduce the detailed structure of each model should be listed. Why those models are selected for scenario generation? Maybe it's better to explain the criterion for model selection. | Taken into account--all model information was provided by the individual model teams in a questionaire included as part of their submission to the AR5 data base. Due to space |
| 7677 | 6 | 14 | 1 | | | The model comparison tabe is good, but the data in the flexibility and detail-level columns can be interpreted so loosely that the information loses its meaning. From what I know of the MESSAGE and TIAM (though not of the ECN's version) models, they should have roughly the same amount of flexibility and covered sectors. From what I understand, MESSAGE is here assumed to cover one large energy sector, while TIAM differentiates between energy subsectors. (If ECN's model is heavily reformulated from the original TIAM, this comment does not necessarily apply.) | Taken into account--all model information was provided by the individual model teams in a questionaire included as part of their submission to the AR5 data base. This table has been removed. |
| 8348 | 6 | 14 | 1 | | | There are other models such as LEAP and MARKAL/TIMES model. I suggest a paper. Bhattacharyya S.C. and G.R. Timilsina, (2009). Energy Demand Models for Policy Formulation - a comparative study of energy demand models. The World Bank, pp.91-92. | Taken into account--all model information was provided by the individual model teams in a questionaire included as part of their submission to |
| 8637 | 6 | 14 | 1 | | | I don't think that Table 6.1 is filled in in a consistent way across models. For example, check the column headed "sectoral, regional…" It should be clear how many sectors are represented for the energy sector separately from the non-energy sectors in the same format. Similarly, some terms are not clear e.g. "energy system cost markups". I never saw that phrase used before. | Table has been removed |
| 16694 | 6 | 15 | | | | It would be helpful to discuss scenarios/model results that examined the OECD making aggressive reductions now while developing countries continued with BAU emissions until 2040, at which time they reduced. Do we achieve safe stabilization levels? This would be helpful for people to understand. | There are many delayed participation scenarios in the literature, which are indeed an important component of the story. These will be discussed in the chapter, but likely not in the baseline section. At this stage we are still |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 6906 | 6 | 15 | | | | Please check RCP discussion, especially figure content etc., to be consistent between WGs. | The data shown in the figure is from the published RCP results (Van Vuuren et al, 2011). This reference will be clarified in the chapter. Every effort will be made to ensure consistency across working |
| 9217 | 6 | 15 | 1 | 15 | 1 | It should be notd that the "concentration stabilization" is not a likely future and this has implication on the scale of emission reduction policies. In (T. Matsuno, K. Maruyama and J. Tsutsui “Stabilization of atmospheric carbon dioxide via zero emissions-----An alternative way to stable global environment”. Part 1 and 2 In Proceedings of Japan Academy Ser. B, Vol. 88, No.7 (July, 2012),p 368-395.), the authors critically examine the traditional “stabilization” concept in which the atmospheric CO2 concentration and corresponding temperature are held constant for many centuries to a millennium. They claim that such long-term constancy of concentration and temperature is not a likely future state. Instead they propose “zero-emissions stabilization” in which emissions will be diminished close to zero, and after that the concentration will decrease approaching the final equilibrium state for which the temperature rise can be made much lower to avoid the risk of sea level rise. Another advantage of the zero-emissions stabilization strategy is that emissions in the near future can be made larger compared with ordinary stabilization pathways under the same temperature rise constraint. This would be beneficial to respond to current socio-economic needs. These points are shown by simple model calculations for illustrative cases. | In the baseline section of this chapter we are summarizing what is assumed in the literature about the evolution of emissions in the absence of policy. In subsequent sections we describe stabilization scenarios. It is the mandate of the chapter and indeed of WGIII to describe the implications of stabilization as outlined in the UNFCCC in terms of concentrations / forcing. However, it is an important point that this not the only way to formulate a policy goal. A scenario in which emissions are required to be reduced to zero in the long run would indeed have different results, although it should be noted that many scenarios in the literature have negative |
| 9853 | 6 | 15 | 21 | | | The mean of RCP should be explained. Also, the text should explain how the RCP trajectories on Figure 6.1 were computed. Then I think a full paragraph is required to explain why there is such a vast range even for the set of baseline scenarios in Figure 6.1. Perhaps this could be illustrated by providing a partial or representative table showing how different many of the key input parameters are from model to model. This is where a fairly complete list of the types of input assumptions and drivers should be provided so the reader can understand why the results even for the baseline scenarios can be so different from each other. Otherwise, I find a figure like Figure 6.1 to be a fairly meaningless way of presenting results. The naive reader would say to themselves "these modeling teams can not even agree on a reasonably similar baseline scenario for comparison purposes to the mitigation scenarios. I wonder what a huge spread will be represented by mitigation scenarios". Therefore, if net costs are calculated by comparing the total cost of a baseline scenario to a type of mitigation scenarios, those differences will be "all over the map", and, therefore, may be seen as meaningless. Perhaps making comparisons between baseline and mitigation scenarios in a more disaggregated fashion would help convince the reader that the net costs that result are meaningful. | The data shown in the figure is from the published RCP results (Van Vuuren et al, 2011). This reference will be clarified in the chapter. As for the wide variation across model scenarios in the baseline emissions path, this is a key observation. The intent of Section 6.3.1 is to illustrate the drivers of the spread (as discussed in 6.3.1.3 and shown in Figure 6.5, these are per capita income growth rates and energy intensity parameters) and to emphasize that uncertainty about these two drivers, as well as other aspects of the baseline, are an important component of uncertainty |

|---|---|---|---|---|---|---|---|
| 16345 | 6 | 15 | 4 | | | The concept of "baseline" needs to be explained in more detail with regard to the inclusion of policies related to sustainable development. There are 2 related issues:<br>- it needs to be made clear that baselines may include policies that contribute to mitigation as long as these are not directed at climate change mitigation alone, in particular policies and measures designed in a broader context of sustainable development are included in baselines. This is not a future "with no policy intervention or with only specific policies" (as currently suggested in 6.3.1.1.); I would rather understand baselines in AR5 as a future with "no new policy addressing climate change alone". If it is not so, a clarification is even more important.<br>- The limitations of the use of baselines should also be explained. I would indeed expect that there are scenarios in which efforts to tackle climate change and its impacts are so strongly integrated with other socio-economic objectives that it is hardly possible to find an appropriate baseline - that is, to remove the climate policies and have all the other policies remain unchanged. The reasons for such an integrated thinking of sustainable development and climate change have been described in several papers, and it has even been argued that "sustainable development may offer a significantly more fruitful way to pursue climate policy goals than climate policy itself" (Robinson et al., Ambio, vol 35, pp 2-8, 2006). I think that this is not just something that can be noted in a separate chapter, but a real limitation to the "baseline + climate policy" approach. | This is an important point. While different models may frame their baselines differently, the cleanest conceptual definition in the context of integrated assessment of climate stabilization is a scenario in which the GHG externality is neither implicitly nor explicitly priced. It is true that policies with other objectives (such as reducing local air pollution or increasing energy security) will influence GHG emissions. The extent to which such non-GHG policies are incorporated into climate scenario baselines is model-specific. The author team is working on ways to better incorporate the concept of sustainable development integrated with climate policy into the discussion. |
| 16348 | 6 | 15 | 21 | | | I noticed that scenario data is preliminary, but I think that the text will need to be adapted to the additional data, especially regarding low emission baselines. The emissions currently shown are way above the lowest cases shown in IPCC SRES (B1). Would this mean that such scenarios are absent from the recent literature ? I think that the text will need more emphasis on the role of sustainable development in achieving low emissions (how these low baselines may help achieving stabilisation). | This section is focused on an objective assessment of the results in published baseline scenarios. The author team is considering whether to include the SRES scenarios on the graphic as a reference point, but in any case it is true that in the assessed literature there are no so-called "low-emissions baselines." It can be difficult to ascertain, both as an author and reader of the assessment, whether particular instances (such as indirect GHG reductions due to non-climate SD policies) don't appear in the literature because they are unlikely or because they were simply neglected. As for scenarios in which GHGs are reduced due to combined climate-SD |

| 15219 | 6 | 16 | | | | Figures 6.1 and 6.2 are difficult to understant due to too many lines. | The author team is working on ways to optimize the visual representation of scenario data. In some cases the "spaghetti" format is the "least bad" approach: in this format, particularly with all scenarios shown in the same color, the point is not to display the characteristics of individual data series (which is indeed very difficult) but rather to display the characteristics of the ensemble as accurately as possible. In this sense it is superior to a shaded range or "box and whisker" alternatives because it conveys to the reader the true frequency of reported data. This is potentially important in the context of baseline emissions paths because the distribution is not uniform (e.g. the upper end of the range has only a few |
| 4195 | 6 | 16 | | | | Interesting for researchers in this field, but very difficult for other readers to get the information from this. Almost no relationship is observed between energy intensity and per capita income, even in USA. I think the convergence of EI of countries along the time horizon would give useful information, if it exists. | The author team is considering dropping this figure due to its limited added value to the chapter. In fact countries do not converge in EI over time: EU and Japan are much lower than USA and Canada, due to a variety of factors. A key |
| 9410 | 6 | 16 | 17 | | | Instead of drawing this figure in fossil and industrial CO2 emissions, it is recommended to draw in GHG emissions in order to keep it consistent with Figure 6.2. | The author team is considering what the best metric is for displaying emissions paths. CO2-e including Kyoto gases converted using GWPs is more inclusive (but not totally consistent with Figure 6.2 and 6.3 since the non-gas forcing agents |
| 6263 | 6 | 16 | | 16 | | Remove "ORNL" from both graphics and replace with "History" who compiled these data are not the important point to convey in this graphic. | Agreed. |
| 9411 | 6 | 17 | | | | This figure is not informative. It is too difficult to see consistency between non-OECD and OECD within the same scenario. For example, the scatter-plot figure (OECD in X-axis and non-OECD in Y-axis) in different years is much meaningful. | The author team is working on ways to improve this graphic. A scatter plot format could indeed be a good |
| 13132 | 6 | 17 | 15 | 17 | 17 | Or more precisely, there is evidence that *incremental* change may not be enough, if all the other assumptions remain in place. One can easily imagine baseline scenarios in which emissions would dip due to, for example, a revolutionary, low cost carbon free technology emerging. As the baselines are often created as a reference point for mitigation scenarios (as was pointed out earlier in the draft), such a baseline would be somewhat purpose defeating (and optimistic, of course) and it's therefore unsurprising that no such baselines have been observed in the literature. This also indicates that the lack of such baseline can't by itself be considered an indication of it being impossible (or even less likely than other baseline) - that would suggest taking the assumption of the analyst (i.e. that it's not worthwhile to create such a baseline scenario) and presenting it as a conclusion. | It is one of the key messages of this section that among published baseline scenarios, notional forcing targets are not achieved. The author team is working on ways to emphasize this point while also being clear that the range of assumptions made in published baseline scenarios likely under-represents the true range of uncertainty in key input parameters (both related to growth and technology costs). A clearer discussion |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 16695 | 6 | 17 | 15 | | 17 | This is very important point and should be given emphasis somehow. | It is one of the key messages of this section that among published baseline scenarios, notional forcing targets are not achieved. The author team is working on ways to emphasize this point while also being clear that the range of assumptions made in published baseline scenarios likely under-represents the true range of uncertainty in key input parameters (both related to growth and technology costs). A clearer discussion |
| 8640 | 6 | 17 | 15 | | | Again, the sentence starting "Thus there is strong evidence…" is a very important conclusion which comes out of the blue, since the kinds of technological change refered to is never described in any detail. And the term "policy intervention" on line 16 should be explained also. Finally, because the "strong evidence" refers to the wide range of baseline results in Fig. 6.1, the reader will likely be somewhat unclear as to the basis for this sweeping conclusion. (I agree with the content of the conclusion, of course.) But a reader might also ask the question, are there other reasonable input assumptions for a baseline case that would make the emissions trajectory more compatible with RCP4.5, for example, if oil prices were $500 per barrel in 2100, etc.... | It is one of the key messages of this section that among published baseline scenarios, notional forcing targets are not achieved. The author team is working on ways to emphasize this point while also being clear that the range of assumptions made in published baseline scenarios likely under-represents the true range of uncertainty in key input parameters (both related to growth and technology costs). A clearer discussion |
| 5857 | 6 | 17 | 18 | 17 | 21 | Please delete "other" preceding "developing countries" else you mean Russia, China or India to be DCs, too. | The labeling of countries in terms of categories of development, etc. will be made consistent throughout the report. |
| 8641 | 6 | 17 | 18 | | | Does the phrase "over the century" mean the cumulative amount, the annual amount, or both? | Cumulative. Text will be clarified. |
| 12610 | 6 | 17 | 18 | 17 | 27 | Into the discussion the authors present as non OECD countries only China, Russia, Brazil, India, South Africa and other countries. Which ones? . For the trayectories shown into the figure of these countries, in the future their future emission will be greater than the OECD countries. Countries like the SIS would not be included, never their future emissions would be similar to the OECD countries. | The non-OECD category includes all countries not explicitly in the OECD. While it is true that SIS emissions by themselves would likely not exceed OECD in any baseline projection, they are included in the non-OECD total in |
| 11417 | 6 | 17 | 18 | 17 | 27 | The assertion that in all baseline scenarios, the majority of emissions over the 21st century will come from non-OECD regions and countries needs to be explained more clearly in terms of what the assumptions are underlying such assertion. Absent a clear explanation of the assumptions for this assertion, such a bare assertion could be used in a non-scientific and political way in order to push specific policy agendas or approaches in the context of international policymaking discussions and negotiations on climate change that could effectively absolve developed countries of any further mitigation commitments and increase the pressure on developing countries to undertake increased mitigation actions. Furthermore, this paragraph does not fully nuance the assertion - what it seems to do is to project the current rates of population growth and economic growth of non-OECD regions in a linear fashion into the future and then concludes that because of these, non-OECD countries will therefore be the biggest contributors to future emissions. | The statement is an objective assessment of the results in published baseline scenarios. As discussed in the section, the key drivers for these projections are per capita income growth rates and energy intensity parameters. Models use a variety of methodologies for country-level baseline projections, which are in nearly every case more sophisticated than simply assuming current growth rates persist indefinitely. For example, Figure 6.5 shows how the |
| 12609 | 6 | 17 | 2 | 17 | 4 | Does x axis represent the total emissions on billions tons of CO2 or the increment on total emisssions of CO2 for OECD and non OECD countries? Please clarify. | The x axis represents time. The y axis represents total emissions. The author team is working on ways to improve this |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 9854 | 6 | 17 | 5 | 17 | 17 | It should be explained, why the unit the W/m2 is chosen and how it is correlated to ppm and also oC. It is not familiar to many of the potential readers. | W/m2 is the unit for radiative forcing. We can add a reference to WGI for a definition of this quantity. The targets refer to total radiative forcing from all agents (not just CO2), hence the comparison is given to concentrations of CO2-equivalent. We can also add a reference to WGI defining CO2-equivalent concentrations. Neither |
| 10391 | 6 | 17 | 8 | 17 | 8 | There is a mistake for the unit about the radiative forcing "2.6 W.m2". | Noted. |
| 16696 | 6 | 18 | | | | The graph seems to suggest that economic growth is the biggest variable or determinant of CO2 emissions -- therefore if we want to lower emissions we need to lower economic growth. This is obviously wrong but unless this is clarified, the misunderstanding will persist. Should therefore explain the graph is a baseline and if policy is enacted which creates incentive for low emitting technology this relationship (econ & emissions) can be significantly changed. We know this from experience. | In fact the graph refers to rates of change, not overall contributions to emissions. The observation is that uncertainty about economic growth is a major driver of uncertainty about baseline emissions. The graph does not suggest that carbon intensity is unimportant as a driver of emissions, only that it does not change much over time in published baseline scenarios. Still, it is an important point that mitigation chiefly involves reducing |
| 9855 | 6 | 18 | 10 | | | Note that while there is a reasonable discussion of the carbon intensity issue between models, one might think that the exception noted on lines 14-16 would be the norm. | This section is focused on an objective assessment of the results in published baseline scenarios. The author team is working on ways to clarify that the range of assumptions made in published baseline scenarios likely under-represents the true range of uncertainty in key input parameters (both related to growth and technology costs). It can be difficult to ascertain, both as an author and reader of the assessment, whether particular instances (such as very cheap renewables) don't appear in the literature because they are unlikely or because |
| 13133 | 6 | 18 | 10 | 18 | 11 | I think it's noteworthy that there is not a single documented "degrowth" baseline scenario, not even on the regional level. This is noteworthy also in terms of how well the existing baseline scenario ensemble might capture the "full", relevant baseline scenario space. | This section is focused on an objective assessment of the results in published baseline scenarios. The author team is working on ways to clarify that the range of assumptions made in published baseline scenarios likely under-represents the true range of uncertainty in key input parameters (both related to growth and technology costs). It can be difficult to ascertain, both as an author and reader of the assessment, whether particular instances (such as "degrowth") don't appear in the literature because they are unlikely or because |

| 14396 | 6 | 18 | 17 | | | does the statement about fossil carbon intensity reflect the new situation for natural gas with the development of fracking? | Most models have taken into account the latest information about resources and extraction technology. This can be clarified here or perhaps better |
| 9412 | 6 | 18 | 19 | | | Findings between fiture 6.5 and 6.6 are overlaping. To save space, these figures can be incorporated | The author team is considering dropping Figure 6.6 due to its limited added value |
| 7678 | 6 | 18 | 20 | | | Insert an axis label. The caption might be improved: "[…] growth rates of Kaya decomposition indicators between 2010 and 2050 […]" (i.e. swap the order of indicators and years). | OK. |
| 9856 | 6 | 18 | 20 | | | Figure 6.5 shows that some models decrease in energy intensities per $ of GDP at more than 3% per year, and some at more than 4% per year. I was not aware of any team or model result in this range. Please check and document and discuss which teams do this for the full 40 year period discussed. If these numbers are accurate to what extent is this net result, as discussed on page 19, the result of end-use efficiency improvements, and to what extent are these dramatic results (compared to history) the result of "structural changes in the composition of energy demand"? Given that most IAMs can only project structural change at a very aggregate level, as you say on line 18-19, are the rates of structural change shown as outliers in figure 6.5 reasonable? You say this is discussed in section 6.7, but I don't see such a discussion there. That section discusses risks and not the relationship between top down and bottom up assessments of energy intensity. | The reported data is accurate. The results refer to "net" declines, i.e. inclusive of both autonomous and price-induced effects and both structural change and end-use efficiency improvements. Many models do project faster rates of decline in "net" energy intensity for countries such as China and India than were observed in those countries in the past. It is not the goal of the chapter to report and diagnose results at the level of individual models, and unfortunately there is not space to delve into a decomposition of the various effects (nor is there typically sufficiently |

| 8644 | 6 | 18 | 20 | | | Figure 6.5 shows that some modeling teams (input?) decreases in energy intensities per $ of GDP at more than 3% per year, and some at more than 4% per year. I was not aware of any team or model result in this range. Please check and document and discuss which teams do this for the full 40 year period discussed. If these numbers are accurate to what extent is this net result, as discussed on page 19, the result of end-use efficiency improvements, and to what extent are these dramatic results (compared to history) the result of "structural changes in the composition of energy demand"? Given that most IAMs can only project structural change at a very aggregate level, as you say on line 18-19, are the rates of structural change shown as outliers in figure 6.5 reasonable? You say this is discussed in section 6.7, but I don't see such a discussion there. That section discusses risks and not the relationship between top down and bottom up assessments of energy intensity. | The reported data is accurate. The results refer to "net" declines, i.e. inclusive of both autonomous and price-induced effects and both structural change and end-use efficiency improvements. Many models do project faster rates of decline in "net" energy intensity for countries such as China and India than were observed in those countries in the past. It is not the goal of the chapter to report and diagnose results at the level of individual models, and unfortunately there is not space to delve into a decomposition of the various effects (nor is there typically sufficiently |
| 16347 | 6 | 18 | 21 | | | I am surprised that Africa is not included at all. As it represents a substantial part of the World population, it could be a useful addition. | Reporting of regional results is constrained to a significant extent by the regional definitions used in individual models. Unfortunately many models do not separate Africa as a single region, |
| 8642 | 6 | 18 | 3 | | | Good news - again a few key input assumptions are mentioned. But, again, this discussion should be consolidated with the previous discussion of input assumptions, and moved forward in the chapter so it appears before the results for baseline scenarios, not after. | This subsection is intended to be the place where discussion of input assumptions is consolidated. The |
| 2226 | 6 | 19 | 25 | 22 | 21 | 1) From a policy maker or a business view this is very (too?) complicated for one of the most essential questions (stabilization) (acknowledged that the topic is very complicated!). Now, would there be a possibility of linking the radiative forcing values/categories to temperature increases. Why? First, most people want to link mitigation to stated temperature increase targets like in the Copenhagen Accord. Second, a lot of people can translate temperature increases better to impacts of warming (see Stern chart on what happens at which temperature increase) | Text on the link between RF and temperature will be added. |
| 2227 | 6 | 19 | 25 | 22 | 21 | 2) Is there ANY possibility to create and use CO2e stabilization pathways? Climate change is caused by all GHGs plus other climate forcers, so in a "simple" world you want to compare BAU and mitigation target in the same unit, namely CO2e. A use of CO2e stabilization pathways would also reduce communication complexity compared to a pure CO2 stabilization pathway (where you only can refer to CO2 emissions, and consequently different values) | We will aim to show CO2e pathways. |

|---|---|---|---|---|---|---|---|
| 11418 | 6 | 19 | 26 | 20 | 1 | The reference to the goal of international climate policy as defined in UNFCCC Art. 2 rewrites the treaty provision, is not complete, and therefore presents an incomplete and textually inaccurate picture of what this particular treaty provision actually provides. If reference to a treaty provision has to be done, it should be done faithfully and accurately. UNFCCC Art. 2 reads in full as follows: "The ultimate objective of this Convention and any related legal instruments that the Conference of the Parties may adopt is to achieve, in accordance with the relevant provisions of the Convention, stabilization of greenhouse gas concentrations in the atmosphere at a level that would prevent dangerous anthropogenic interference with the climate system. Such a level should be achieved within a time-frame sufficient to allow ecosystems to adapt naturally to climate change, to ensure that food production is not threatened and to enable economic development to proceed in a sustainable manner." Hence, the objective of the UNFCCC is not simply the stabilization of GHG concentrations at a level that would prevent dangerous anthropogenic interference with the climate system contained in the first sentence of the provision, but also that achieving such a level should be achieved in a way that also meets the objectives laid out in the second sentence of UNFCCC Art. 2. The second sentence is an important qualifier that has to be read integrally together with the first sentence in relation to how the stabilization goal is to be achieved. These two parts of UNFCCC Art. 2 cannot be separated from each other, whether conceptually or in practice. | Will consider to remove literal citation of UNFCCC. |
| 6096 | 6 | 19 | 27 | 20 | 1 | The text says "The goal of international climate policy as defined in UNFCCC art.2 is to stabilize greenhouse gas concentrations at a level that avoids dangerous anthropogenic interference of the climate system". This does not cover the whole meaning of the Article 2 of UNFCCC. Article 2 continues to say "Such a level should be achieved within a time-frame sufficient to allow ecosystems to adapt naturally to climate change, to ensure that food production is not threatened and to enable economic development to proceed in a sustainable manner". AR4 interpretes the article as "The criterion that relates to enabling economic development to proceed in a sustainable manner is a double-edged sword. Projected anthropogenic climate change appears likely to adversely affect sustainable development, with adverse effects<br>tending to increase with higher levels of climate change and GHG concentrations. Conversely, costly mitigation measures could have adverse effects on economic development. This dilemma facing<br>policymakers results in (a varying degree of) tension that is manifested in the debate over the scale of the interventions and the balance to be adopted between climate policy and economic development" (Chapter 1, p.99). The latter part of the Article 2 have something to do with Sections 6.3.3 and 6.3.4 of Chapter 6. Therefore, when discussing the goal of climate policy, the latter aspect should be definitely touched upon. | Will consider to remove literal citation of UNFCCC. |
| 9857 | 6 | 19 | 9 | 19 | 12 | As you state, structural changes can work in both directions, representing the aggregate level problem. You should further elaborate on this topic, as this is vital for the assumption and thus for the results of the model. How did you consider this issue in the report'? | Unfortunately there is not space to delve into a decomposition of the circumstances under which stuctural change increases or decreases energy service demand per unit output (nor is |
| 6264 | 6 | 19 | | 19 | | Given that this chapter is significantly over its alloted page limit, difficult choices are going to have to be made in terms of what to keep and to delete. Figure 6.6 (while a very nice and very informative graphic) might be a candidate for deletion as the previous graphic which uses the Kaya Identity speaks to these data. The text keeps making the point that the models used in this chapter are all different and produce different points. That is important and worth saying more than once. But perhaps this point is being repeated too much,i.e., keeping both Figure 6.5 and Figure 6.6. | The author team is considering dropping Figure 6.6 due to its limited added value to the chapter. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 10985 | 6 | 19 | 10 | 19 | 12 | Does this sentence mean that dispersed power sources such as PV develop while countries become wealthier and demand for energy-intensive services increase? | The example of shifts to less energy-intensive industries as countries become wealthier refers to the nature of economic activity: post-industrialized economies typically have a greater share of services (financial, legal, retail, etc.) |
| 11746 | 6 | 20 | | | | If you distinguish how the table was developed in the next draft, remark should also be added that policy makers could understand the number of scenarios wasn't a matter. | We have added a note on the meaning of the number of scenarios |
| 9413 | 6 | 20 | | | | How much did you count historical CO2 budget and non-CO2 budgets from 2000 to 2010? These amounts should be mentioned in a footnote of this table. | Will be done. |
| 13759 | 6 | 20 | | | | What are the units? | unit will be added, thanks |
| 6758 | 6 | 20 | | | | It shoud be specified that t h e number of scenarios is not important. Cautions are required that the amount of the number of scenarios does not mean feasibility. □ | We have added a note on the meaning of the number of scenarios |
| 10646 | 6 | 20 | | | | It is necessary that IPCC put some remarks so that negotiators would not be misled by the big numbers of Cat. 1 and that they understant that the number is not a matter | We have added a note on the meaning of the number of scenarios |
| 5858 | 6 | 20 | | | | Please do not forget to add units of measurement to the table and to explain what your definition of a "CO2 budget" is. | Units have been added, thanks |
| 9983 | 6 | 20 | | | | This table should include an explanation in the footnote that each scenario and its result is only calculated example and the number of scenario itself is not important for appropriateness of a scenario. Interpretation of the same type of table articulated in the AR4 has been incorrectly recognized and misused. | We have added a note on the meaning of the number of scenarios |
| 8041 | 6 | 20 | | | | When introducing the new RCP scenarios (RCP 2.6, 4.5, 6, 8.5) it is helpful for a lay reader to mention the 'rule od thumb' deviated from the climate sensitivity that a radiative forcing of 4 W/m2 leads to a 3 K warming. With that the reader can translate the abstract radiative forcing of a scenario to a temperature increase. | We have added a complete new section that links to temperature. |
| 8042 | 6 | 20 | | | | Most of the data from table 6.2 are at least as instructive that those of table 6.3 which appears in the Ex Sum. as ES.1 . I suggest to export them to the Ex Summary, e.g. expand table ES.1 | Many thanks. Will suggest to CLA |
| 13134 | 6 | 20 | 11 | 20 | 11 | I assume this is meant to say that there's no unique definition for representing concentration targets in the models? If correct please rephrase, if incorrect please explain. | We have added more text here. |
| 16355 | 6 | 20 | 27 | | | I noticed the intention to "distinguish overshoot scenarios", which could go in a very useful direction. This table is very important due to its potential to provide a high profile synthesis. However, the scenario categories are currently very close to those from AR4, which ignored the potential for "overshoot scenarios" and failed to provide a sufficiently complete view of the potential for stabilisation.<br>A lot of care will need to be taken to avoid oversimplifications that might be misleading (for example, how is it possible that there is only one value for the CO2 concentration in 2100 per category? to improve from AR4, it might be needed to take more data directly from WGI and/or from scenarios; uncertainty is another issue that needs attention) | It is very challenging to find a categorisation that captures all dimensions. We will do our best. The lack of uncertainty range to the CO2 numbers was an oversight. |
| 7391 | 6 | 20 | 32 | 24 | 28 | A key policy-relevant conclusion from these sections, currently missing, is that drivers for abatement of short- and long-lived GHGs are different. Policymakers need to understand to what extent transformation pathways are driven by physical earth-system properties, and to what extent by their own choices and more intermediate goals. Abatement of short-lived gases is driven primarily by economic efficiency and non-climate co-benefits (and perhaps a desire to limit rates of change), but is not absolutely necessary to achieve stabilisation (which currently is the only formally agreed long-term goal under the UNFCCC process). By contrast, abatement of long-lived gases to zero is an absolute must if stabilisation is to be achieved and only the pathway is driven by cost-effectiveness. Drawing this distinction out more clearly would be an important policy-relevant conclusion from these sections that affects the timing of peak emissions as well as overshoot as well as the balance of abatement between gases. | We will try to add some conclusions, without being policy descriptive. Problem is partly that there are very different views, even in science, on these issues. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 7392 | 6 | 20 | 32 | 24 | 28 | The discussion of the role of GHG metrics (GWPs, GTPs, optimisation etc) in these sections is incomplete. Recent work has shown (Reisinger et al 2012, accepted for Climatic Change; contact me for pre-print) that alternative metrics affect not only the allocation of mitigation across different gases, but also the timing of CO2 emission peaks and overshoot relative to a defined long-term goal. These findings, and the (relative un-)importance of metrics in a first-best policy context, should be reflected in this section as they address a key policy interest about metrics expressed by Parties to the UNFCCC. Also earlier studies that clearly demonstrate the impact of metrics on the timing of CH4 abatement (e.g. van Vuuren et al 2006) should be cited here. We know a lot more from the current literature about the influence of metrics on transformation pathways than is apparent from the current draft. | Text has been adapted and references added. |
| 7679 | 6 | 20 | 4 | 20 | 4 | Change "stabilization of greenhouse gases" -> "stabilization of greenhouse gase concentrations"? | Wording has been corrected. |
| 7680 | 6 | 20 | 4 | 20 | 5 | Change "there are types" -> "there are other types"? | Typo has been corrected. |
| 6907 | 6 | 20 | 11 | 20 | 11 | This statement is confusing -- "GHG concentrations" is clearly defined in, e.g., the Glossaries of all three WG contributions to AR5 (and in AR4, SREX, SRREN). I assume you meant to say that indiviudal models differ in the way which and how concentrations of GHG concentrations are being prescribed. | Text has been changed. |
| 6908 | 6 | 20 | 17 | 20 | 18 | Please also refer to WGI Chapter 7 regarding aerosol statement. | Reference has been added. |
| 6909 | 6 | 20 | 22 | 20 | 25 | Note that models run with an interactive carbon cycle and assessed in WGI AR5 will be run with prescribed emissions, calculating CO2 concentrations and radiative forcing interactively. Comparison with the numbers provided in Table 6.2 might thus no longer be straightforward. We also note that carbon cycle and carbon cycle climate feedbacks will result in a range of year 2100 CO2 concentrations (and radiative forcing values) for a particular scenario depending on model, climate sensitivity, carbon cycle setup etc. A lot of this information will be presented in WGI AR5 Chapter 6 (and 12). Please refer to these Chapters of WGI AR5. | Useful remarks. We will ensure consistency. The lack of ranges for the CO2 numbers was just an oversight. |
| 6266 | 6 | 21 | | 21 | | It is clear that a decision was made to use these labels "Category 1", "Category 2"… and that decision is unlikely to change at this point in the AR5 writing process. Please consider repeating (by for example inserting a column in Table 6.3) that repeats the information that translates Category 1 into an equivalent W/m^2 or ppmv everyonce in a while. It is too much to ask readers to continue to flip back to Table 6.2 throughout the course of this long chatpter. Since Figure 6.7 and Table 6.3 are on the same page it seems that repeating this information here in the Table would take care of the "translation" for both the graphic and the figure. | We will discuss how to best do this. |
| 11419 | 6 | 21 | | | | There should be an explanation of why 2005 is selected as the emissions level base year rather than 1990, especially considering that 1990 is the base year that, up to now, has been agreed to at the multilateral policy level under the UNFCCC as the base year to which emissions levels would be compared. | We just chose the level used as base year in most model calculations to date. But we could add a footnote with some |
| 13136 | 6 | 21 | 17 | 22 | 1 | There's something wrong with the sentence starting "Cumulative…". Neither table 6.3 nor figure 6.7 shows cumulative emissions either. | Text has been changed. |
| 8105 | 6 | 21 | 18 | 22 | 1 | Be aware that both Allen et al 2009. and Meinshausen et al. 2009 are discussing peak temperature targets, and not end-of-century targets as discussed in this section. | Correct. Will improve text. |
| 8103 | 6 | 21 | 3 | 21 | 5 | Specifying that here an overshoot of forcing is meant (and not necessary temperature) would be helpful to avoid misunderstanding. | Text was strongly rewritten. |
| 14397 | 6 | 21 | 4 | | | Negative emissions through BECCS is important, and could be mentioned earlier (especially if anything like the current language on zero emissions is kept). Need to clarify: CCS is by definition zero; it is the BE part that turns it negative. Memo: here, as several other places, the analysis cries out for more information on the likely prospects of CCS. | We make sure to improve the BECCS coverage |
| 5232 | 6 | 21 | 4 | | | Two different abbreviations are used for bioenergy CCS, namely bioCCS and BECCS. Please use just one. | We will choose BECCS. |
| 8104 | 6 | 21 | 5 | 21 | 5 | Insert "net negative emissions" in the long-term. As "negative emissions" are already assumed to materialize rather soon (in the next decades) in most scenarios with BECCS in the portfolio. | Correct. We have changed this. |
| 9414 | 6 | 22 | | | | Findings are overlaping with Table6.2 and 6.3. To save space, these tables and figures can be incorporated | We are considering to merge these. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 9858 | 6 | 22 | 10 | 22 | 12 | This is crucial to the whole chapter: "Models differ" and reflects the assumption issue raised earlier. Please be more specific here to give the reader an insight into the model and especially stressing the intersubjectivity of the models. | We have tried to be transparent. However, there are severe page constraints. |
| 8106 | 6 | 22 | 10 | 22 | 18 | This paragraph can benefit from a statement explaining that, unless all scenarios were constructed for the under the same protocol, the wide ranges of the scenarios also depend on which question was analysed by the modeling teams. | We have added this. |
| 9859 | 6 | 22 | 12 | | | I don't see a discussion of the economic consequences of climate policy I section 6.2.4. What do you mean? You don't mean to refer to damage costs, do you? | Noted. This section was substantially rewritten, sentence is no longer |
| 8645 | 6 | 22 | 12 | | | I don't see a discussion of the economic consequences of climate policy I section 6.2.4. What do you mean? You don't mean to refer to damage costs, do you? | Same comment as comment no 9859, see there for answer. |
| 9860 | 6 | 22 | 19 | | | The numbers for the cumulative carbon dioxide budgets allowed for Category 1 scenario at around 1400 GtCO2 (mid-range) seem too high, because that gives an average of about 28 GtCO2 per year for 2000-2005, or about today's level of emissions. Please check. | We will check - probably cause is negative emissions |
| 8646 | 6 | 22 | 19 | | | The numbers for the cumulative carbon dioxide budgets allowed for Category 1 scenario at around 1400 GtCO2 (mid-range) seem too high, because that gives an average of about 28 GtCO2 per year for 2000-2050, or about today's level of emissions. Please check. | We will check - probably cause is negative emissions |
| 14454 | 6 | 22 | 20 | | | Label graphs for clarity. | Done |
| 8107 | 6 | 22 | 22 | 23 | 3 | Another reason is that for shorter-lived forcers (like methane) the rate of emissions at the time of maximum forcing/temperature is more important than the cumulative emissions over time. See Smith, S. M. et al. Equivalence of greenhouse-gas emissions for peak temperature limits. Nature Clim. Change 2, 535-538, doi:10.1038/nclimate1496 (2012). | Reference has been added. |
| 13139 | 6 | 22 | 27 | 22 | 27 | The reference should be to figure 6.9, I believe. | We will check. |
| 13140 | 6 | 22 | 29 | 22 | 31 | There's nothing about non-CO2 gases in section 6.2.1. Correct the reference. | We will check. |
| 11420 | 6 | 22 | 3 | 22 | 3 | There should be an explanation of why 2005 is selected as the emissions level base year rather than 1990, especially considering that 1990 is the base year that, up to now, has been agreed to at the multilateral policy level under the UNFCCC as the base year to which emissions levels would be compared. | 2005 is the base year of most model runs. |
| 13137 | 6 | 22 | 7 | 22 | 9 | Does this mean that the baselines are not included in any of the categories? I would have thought that category 6, for example, would mostly have baseline scenarios in it (forcing being above 7 W/m2). | No they are discussed in the previous section. |
| 13142 | 6 | 23 | 17 | 23 | 17 | Write out GTP. | Will be done. Also reference to relevant |
| 5859 | 6 | 23 | 17 | 23 | 17 | Please explain "GTP" and include the term in the glossary. | Will be done. Also reference to relevant |
| 10753 | 6 | 23 | 18 | 23 | 24 | The possibility of a multi-gas policy that uses a multi-basket approach should be discussed (see last para of section 8.7.1.5 in WGI SOD). | We have one sentence now. Would need CA to take care of this. |
| 8108 | 6 | 23 | 18 | 23 | 24 | This paragraph would also need to acknowledge the publications that show that action short-lived pollutants might be detrimental or hamper CO2 abatement. For example see: Berntsen, T., Tanaka, K. & Fuglestvedt, J. Does black carbon abatement hamper CO 2 abatement? Climatic Change 103, 627-633, doi:10.1007/s10584-010-9941-3 (2010). AND Myhre, G., Fuglestvedt, J. S., Berntsen, T. K. & Lund, M. T. Mitigation of short-lived heating components may lead to unwanted long-term consequences. Atmospheric Environment 45, 6103-6106, doi:10.1016/j.atmosenv.2011.08.009 (2011). | We have added some text already. |
| 4036 | 6 | 23 | 21 | | | Missing reference - (UNEP and WMO, 2011). Should have been "UNEP and WMO (2001). Integarted Assessment of Black Carbon and Tropospheric Ozone. Available at http://www.unep.org/dewa/Portals/67/pdf/BlackCarbon_report.pdf | Corrected. |
| 8109 | 6 | 23 | 27 | 24 | 2 | Be aware that both papers discuss peak temperature targets, and not necessary the long-term impact. Therefore, in case negative emissions do not scale up quickly enough so that they do not significantly influence the temperature peak, the findings of the above studies would still be valid. | Thanks you are correct. |
| 9962 | 6 | 23 | 3 | | 15 | If CDR technologies and BECCS are main measures for negative emissions, maybe we have to introduce to what extent these measures should be implemented to reach negative emissions. | Text added. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 8967 | 6 | 23 | 40 | | 42 | SRM by muliple actors may be more confusing than it is effective. I.e. what is background, what has been modified. | Noted. There is no reference to SRM on page 23, let alone lines 40 to 42. It is not clear to us what this statement refers to. |
| 10752 | 6 | 23 | 7 | 23 | 24 | This para contains important information and could be expanded to assess what the effect would be of using a different metric than GWP. An assessment of how suitable the GWP100 is in a context of a stabilization goal would be useful (see WGI chapter 8 and references there). | No definitive conclusion is possible. But we provide some of the considerations. |
| 10971 | 6 | 23 | 7 | 23 | 24 | This paragraph covers GWPs and GTPs but does not seem to cover the point that neither of these is consistent with climate stabilisation. Shine et al 2007 is a very good paper. But an example showing that comparisons of CO2 and methane should be rather different for stabilisation is: Manning, M., and A. Reisinger, Broader perspectives for comparing different greenhouse gases Philosophical Transactions of the Royal Society A, 369, 1891-1905, 2011 - which brought Tom Wigley's Forcing Equivalence Index into the context of stabilisation. And then: Lauder, A., I.G. Enting, J.O. Carter, N. Clisby, A.L. Cowie, B.K. Henry, and M.R. Raupach, "Offsetting methane emissions --- an alternative to emission equivalence metrics", International Journal of Greenhouse Gas Control, (submitted), 2012 - have taken that further and shown that a one-off sequestration of CO2 can be a credible offset for continuous emissions of methane. | We have added some text. |
| 10751 | 6 | 23 | 9 | 23 | 9 | It should be made clear that this is GWPs for a 100 year time horizon. | Done. |
| 13141 | 6 | 23 | 9 | 23 | 9 | Write out GWP. | Done |
| 6267 | 6 | 23 | 13 | 23 | 17 | Here is another example of where there is a need for specific references to peer reviewed papers rather than an implicit reference to the database assembeled for Chapter 6 or the collective wisdom of the authors of Chapter 6 "There are also models that determine the relative reduction of different gases based on the overall cost optimization across time. If the latter approach is applied toward long-term radiative forcing goals, the emissions of short-lived gases tends to be postponed compared to models using GWPs." | Done. The text was deliberately formulated in a more generic sense. But we now added some examples. |
| 6910 | 6 | 23 | 27 | 23 | 29 | Please refer to WGI AR5 Chapter 12 which assesses the physical science basis of the emissions-CO2 concentration-radiative forcing-climate change relationship. | Done. |
| 9415 | 6 | 24 | | | | Effects of BECCS in the latter half of the century have a large impact on emissions pathways in the first half of the century. This figure is the new finding since AR4 and very informative. However, it will be more informative if authors can add information how much BECCS are considered in each scenario or a range of BECCS among scenarios. | text has been added. |
| 10393 | 6 | 24 | 10 | 24 | 11 | The author may mistake Figure 6.10 for Figure 6.9. | Corrected. |
| 9960 | 6 | 24 | 11 | | 15 | The sentence "Net negative emissions…..2050 emission reductions" is duplicated at the end of this paragraphy. | Corrected. |
| 8043 | 6 | 24 | 3 | 24 | 15 | BECCS is still highly speculative especially in the light of the negative development on CCS in many countries (see e.g. the projects the EU had planned and what is now). This should be reflected in this paragraph. | Agree. text has been added. |
| 9099 | 6 | 24 | 39 | 24 | 39 | "wastes" might be revised as "unused biomass" | text was rewritten. |
| 13758 | 6 | 24 | 43 | 24 | 45 | Does this refer to Fig. 6.11? Note that neither the figure nor the text are clear. I am confused. What do you mean? Is the objective of the climate model runs to end with a specific temperature or a specific concentration? | Paragraph was totally rewritten |
| 6396 | 6 | 24 | 5 | 24 | 5 | Bioenergy with CCS is referred to in at least three different ways in the chapter. Here it is BECS. On page 53, line 99 it is BioCCS. | We have replaced it with BECCS |
| 14398 | 6 | 24 | 5 | | | Is BECS different from BECCS? | We have replaced it with BECCS |
| 8049 | 6 | 24 | 7 | 24 | 7 | the reference should be (also) to chapter 6.9 which covers geoengineering | Yes. Reference is made. |
| 2418 | 6 | 24 | 9 | 24 | 9 | Note that SRM has not been introduced in the chapter yet at this point. | We will make sure that this is done. |
| 10986 | 6 | 24 | 24 | 24 | 28 | Fundamentally, CDR must be substantially one of the effective technologies for mitigation. Therefore, this paragraph should be deleted. | We do not agree. There is a difference in the way these technologies are covered |
| 6911 | 6 | 24 | 6 | 24 | 7 | Please refer to WGI AR5 Ch6 and 7 for the most up-to-date assessment of the physical science basis of CDR and SRM technologies. | We will do so. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 6269 | 6 | 24 | 29 | 25 | 9 | This section on Temperature Stabilization Scenarios feels out of place here. Can this be made into a footnote? This seems tangential to the core of Chapter 6. | We have shortened the text. |
| 6912 | 6 | 24 | 29 | | | Please refer to WGI AR5, Chapter 12. | We will do so. |
| 4344 | 6 | 24 | 32 | 24 | 34 | Response of temperature and CO2 concentration in climate system was investigated in detail and new concept of stabilization scenarios are proposed (Matsuno, Maruyama and Tsutsui, 2012a.b.)<br>(see : https://www.jstage.jst.go.jp/browse/pjab)<br><br>Papers are ;<br>2012a : T. MATSUNO, K. MARUYAMA and J. TSUTSUI ; Stabilization of atmospheric carbon dioxide via zero emissions—An alternative way to a stable global environment. Part 1: Examination of the traditional stabilization concept, Proceedings of the Japan Academy, Series B Vol. 88 No. 7, pp.368-384<br><br>2012b : T. MATSUNO, K. MARUYAMA and J. TSUTSUI; Stabilization of atmospheric carbon dioxide via zero emissions—An alternative way to a stable global environment. Part 2: A practical zero-emissions scenario, Proceedings of the Japan Academy, Series B Vol. 88 No. 7 pp.385-395. | References have been considered for reference. |
| 10972 | 6 | 25 | 10 | 25 | 35 | You will not be able to cover this in the chapter but it is time that some of us who know about atmospheric chemistry submitted a paper showing that reduction in the incoming solar radiation would reduce the hydroxyl radical which is not only doing more to reduce radiative forcing by all the greenhouse gases than the carbon cycle does - ( as shown in Manning, M., and A. Reisinger, Broader perspectives for comparing different greenhouse gases Philosophical Transactions of the Royal Society A, 369, 1891-1905, 2011) but it is also the reason that we do not much higher levels of carbon monoxide and other toxic gases in the atmosphere. The idea sounds like a classic example of maladaptation where people focus on fixing just one problem and end up making the combination of all problems much worse. | Reviewer encouraged to submit paper. |
| 13730 | 6 | 25 | 11 | 25 | 13 | Rephrase " Another concept to affect climate variables such as temperature or precipitation is by directly altering radiative forcing (solar radiation management or SRM) for instance by adding aerosols at specific heights in the atmosphere to reflect a share of the incoming sunlight." | Thanks. |
| 6397 | 6 | 25 | 13 | 25 | 13 | I think this should reference Section 6.9, not 6.8. | Thanks. |
| 13731 | 6 | 25 | 15 | 25 | 18 | Rephrase "The predominant reason is due to the different decision rationale: SRM requiring a risk-balancing approach, whereas mitigation strategies share similar levels of risk and are thus addressed by the cost-effectiveness rationale that currently forms the focus of most IAM analysis (Barrett, 2008)." | We will consider this wording. |
| 13143 | 6 | 25 | 18 | 25 | 18 | This reference is not in the bibliography. | Will be added |
| 8111 | 6 | 25 | 20 | 25 | 22 | Although not necessarily wrong, this statement is not very relevant in view of what was written earlier in this chapter. On Page 19, line 27, which refers to article 2 of the UNFCCC. Firstly, the convention mentions concentrations to be stabilized, not necessary forcing. Secondly, it also aims at avoiding dangerous anthropogenic interference with the climate system. In line with the latest results from the earth system modelling community with regard to solar-radiation management, injection of stratospheric aerosols can in itself be considered dangerous anthropogenic interference with the climate system, and as such be ruled out as a mitigation option. See: Ricke, K. L., Morgan, M. G. & Allen, M. R. Regional climate response to solar-radiation management. Nature Geosci 3, 537-541, doi:http://www.nature.com/ngeo/journal/v3/n8/suppinfo/ngeo915_S1.html (2010). AND Schmidt, H. et al. Solar irradiance reduction to counteract radiative forcing from a quadrupling of CO2: climate responses simulated by four earth system models. Earth Syst. Dynam. 3, 63-78, doi:10.5194/esd-3-63-2012 (2012). | We will consider the article. We will obviously also ensure that the discussion on SRM is balanced. Finally, it is questionable whether the objective of UNFCCC was written in a way to rule out SRM; probably avoiding dangerous climate change is the key part of the objective. In Chapter 3 there is a more elaborate discussion on the priciples related to SRM/Geoengineering. |

|---|---|---|---|---|---|---|---|
| 8112 | 6 | 25 | 20 | 25 | 22 | Although not necessarily wrong, this statement is not very relevant in view of what was written earlier in this chapter. On Page 19, line 27, which refers to article 2 of the UNFCCC. The "climate system" under the UNFCCC is defined as (see article 1, definitions) "the totality of the atmosphere, hydrosphere, biosphere and geosphere and their interactions.". Currently global warming is at the core of the debate (and this could theoretically be coutnered by solar-radiation management), but other dangerous anthropogenic interferences because of rising greenhouse gas concentrations are not excluded. For example, ocean acidification (part of the hydrosphere and with strong impacts on the biosphere), will not be halted with solar-radiation management which reduces forcing but not greenhouse gas concentrations. A statement higlighting this might be useful. | We will obviously also ensure that the discussion on SRM is balanced. Finally, it is questionable whether the objective of UNFCCC was written in a way to rule out SRM; probably avoiding dangerous climate change is the key part of the objective. In Chapter 3 there is a more elaborate discussion on the priciples related to SRM/Geoengineering. |
| 13732 | 6 | 25 | 23 | 25 | 35 | Political moral hazard and lock-in need to be mentioned here! Also the inherent threat of SRM due to the impossibility to test it on significant scales other than actually deploying it! The following is an attempt to bring this consideration to the point. Rephrase line 30 "This attribute of SRM makes it attractive to the present day decision maker in managing climate risk even if the long-run costs and damages of SRM were comparable to the costs of mitigation and the damages of climate change (Moreno-Cruz and Keith, 2012). At the same time though the possibility to avoid investments in near term emission reductions create a strong incentive to deploy SRM without investing in the long-term optimal level emission reductions. This incentive structure could prevail over decades resulting in both increasing GHG levels and a need for further SRM efforts (Klepper et al., 2012)." | We agree that some mention of the risk of policy and technical lock-in is important. The statement that it is impossible to test SRM at sales short of deployment is false and not backed up by the literature. The proposed revised text assumes that optimal policy somehow should not reduce emissions in mitigation if SRM was feasible, this is not backed up by literature |
| 2420 | 6 | 25 | 26 | 25 | 26 | "Absent SRM" should read "In the absence of SRM" | The usage is correct (though |
| 8971 | 6 | 25 | 30 | | 31 | There is no attribute of SRM that is "valuable." It is a thoroughly untested prospect. | SRM may work less well than studies now suggest or may have larger risks but the statement that there is no aspect of it that is “valuable” seems hard to defend given that (to our knowledge) all |
| 8044 | 6 | 25 | 31 | 25 | 34 | The idea 'SRM cannot precisely counteract the radiative forcing from greenhouse gases' should come at the beginning and not at the end. | Yes, good suggestion. |
| 16697 | 6 | 25 | 38 | | | Define RCP. | Will be defined earlier in the chapter |
| 9861 | 6 | 25 | 40 | | | Please briefly explain the relevant differences between IAM models and the "complex climate models" refered to here. In what ways are the complex climate models better? | We will avoid the word complex models. We will refer to WG-1 model. If space |
| 8647 | 6 | 25 | 40 | | | Please briefly explain the relevant differences between IAM models and the "complex climate models" refered to here. In what ways are the complex climate models better? | We will avoid the word complex models. We will refer to WG-1 model. If space |
| 13144 | 6 | 25 | 43 | 25 | 43 | Figure 6.11, instead of 6.8 | Thanks |
| 10394 | 6 | 25 | 43 | 25 | 43 | The same problems as the fomer. It's Figure 6.11 not figure 6.8. | Thanks |
| 9964 | 6 | 25 | 43 | | | "Figure 6.8" should be "Figure 6.11". | Thanks |
| 13145 | 6 | 25 | 46 | 25 | 47 | Is there a reference for this analysis? | Noted. This section was completely rewritten in the new draft. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 7681 | 6 | 25 | 8 | 25 | 9 | The section ends with "[…] temperature target needs to be expressed in terms of a probability […]". Although the cited papers might emphasize such, it is not generally true. The emission pathway doesn't have to be decided at one instant, as e.g. most IAM's assume. We can observe the temperature increase later during the century, and adjust the emission pathway recurrently so that the temperature target will be ultimately met. Scenarios with a temperature target and risk-hedging through sequential decision making include:<br>* Syri, S., Lehtilä, A., Ekholm, T., Savolainen, I., Holttinen, H. & Peltola, E. (2008), 'Global energy and emissions scenarios for effective climate change mitigation - deterministic and stochastic scenarios with the TIAM model', International Journal of Greenhouse Gas Control 2(2), 274–285.<br>* Webster, M., Jakobovits, L. & Norton, J. (2008), 'Learning about climate change and implications for near-term policy', Climatic Change 89(1-2), 67–85.<br>* Johansson, D. J. A., Persson, U. M. & Azar, C. (2008), 'Uncertainty and learning: Implications for the trade-off between short-lived and long-lived greenhouse gases', Climatic Change 88(3-4), 293–308.<br>* Ekholm, T. (submitted), Hedging the climate sensitivity risks of a temperature target. Submitted to Resource and Energy Economics in Feb. 2012. | This is to some degree correct and we will make sure that we refer better to sequential decision making literature (this is done already further in the Chapter). Nevertheless, to get an idea of the overall size of the problem NOW it matters a lot what probability we are thinking of. Moreover, inertia will always imply some interpretation. |
| 2419 | 6 | 25 | 10 | 25 | 35 | This section should cross-reference Chapter 7 of WG1 assessment, which deals specifically with the physical aspects of SRM. The reference to section 6.8 at the end of the section should be 6.9 in fact. | Yes, good suggestion. |
| 2422 | 6 | 25 | 10 | 25 | 35 | A key aspect of SRM is that it has to carry on until the concentrations of greenhouse gases have gone down (either because of natural sinks or artificial CDR) or until society can better adapt to a warmer climate. This characteristics of SRM, usually referred to as the "termination issue", ought to be discussed in the context of stabilisation scenarios. | We know of no published argument that shows why SRM "must" be continued until concentrations of greenhouse gases have gone down. It is widely understood that many climate impacts depend on the rate of change of climate. SRM could |
| 6268 | 6 | 25 | 10 | 25 | 35 | Delete Section 6.3.2.6 as a standalone section and fold any key points into the previous page's discussion of CDR. At this early point in the chapter the key points that need to be made are CDR and SRM might open up the policy space, are not represented in IAM models and will be discussed later. That can be combined into a couple of sections. This chapter is too long as it is. Here is a plce to cut back and save half a page. | Might make sense. |
| 6913 | 6 | 25 | 13 | 25 | 13 | Please refer to WGI AR5, Chapter 7. | Will be done |
| 4196 | 6 | 25 | 25 | | | Reference is insuffficient. Sprecial Report of IPCC and others should be quoted. | Will be done |
| 6270 | 6 | 25 | 38 | 25 | 47 | I do not think that "complex models" is a generaly used scientific term. If these "complex models" are General Circulation Models, please use that term. I don't think the reader is helped by creating a new term "complex models." | Agree. We change the wording. |
| 6914 | 6 | 25 | 41 | 25 | 43 | We suppose this should be turned around -- the IAMs are consistent with the results from complex climate models for, e.g., temperature etc. and not vice versa. | Agree. We change the wording. |
| 11265 | 6 | 26 | | | | if temperature profiles from WG1 could be added here this would be very useful | We will add a totally new section on |
| 18632 | 6 | 26 | | | | Page 26: No cost-benefit study finds an optimal level of mitigation that stabilizes tha atmospheric concnetrations I question if decarbonisation really is an optimisation problem | Noted |
| 6915 | 6 | 26 | | | | Please provide source of this figure. | Figure will be removed |
| 10973 | 6 | 26 | 12 | 26 | 24 | This is a good paragraph and helps to offset some of the problems in chapter 3's appearing to over-emphasise the relevance of discount rates. | Noted |
| 9862 | 6 | 26 | 15 | 26 | 16 | Climate feedbacks don`t occur on the individual company level directly, i.e. companies might have the possibility to manage their CO2-emissions, but are not impacted by climate change and vice versa. The causal link on the company level is via external effects. | Noted |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 14399 | 6 | 26 | 16 | 26 | 21 | But cost-benefit models do show the extra cost of stabilization at a given target level, above and beyond what their optimal level is, and there is very important information in the fact that the additional cost tends to be small. | Noted |
| 6097 | 6 | 26 | 16 | 26 | 30 | The text says because, in all cost benefit analysis, concentrations continue to rise throughout the modeling period, studies that focus on cost-benefit are not appropriate for the discussion of transformation pathways in this chapter. If this is the real reason of not taking up CBA in this chapter, then, what can be done in this chapter is to show cost and benefit for typical (given) transformation pathways. You can find this kind of CBA, for example, in many books and papers of Nordhaus where Nordhaus calculated cost and benefit for several given targets, such as limiting temperature increase by 2 degrees. As a matter of fact, the text in this chapter describes as "mitigation, impacts and adaptation are interlinked in several important ways and should be considered jointly in the context of achieving stabilization targets (page 26, lines 27-29). I am not quite sure what the relationship between this sentence and CBA. | Taken into acccount--text added and reference given to other parts of the report that discuss CBA |
| 8648 | 6 | 26 | 18 | | | The logical conclusion that one would draw from the statement that begins "no cost benefit study finds an optimal level of mitigation…" is that the damage costs used in such studies are probably too low, because it seems non-sensical to allow greenhouse gas concentrations to rise until at least 2100. If this is true, please say so. In fact, while this section does not discuss the reasonableness of the damage cost estimates used in such modeling exercises, again a naive reader might think that it is impossible to estimate the damages from climate change since the natural and human systems impacted are far too complex. Thus, I think it would reasonable to have a short critique of the reasonableness of damage cost estimates here, if you are going to introduce the topic of cost-benefit studies at all. The point that these studies are not relevant when developing stabilization scenarios as with using the RCP methodology is a good one, and should be highlighted more. | Taken into account--but due to space constraints, we are unable to add a discussion of damage function estimates. We have added references to chapters 2 and 3 which provide a larger discussion of CBA. |
| 10395 | 6 | 26 | 18 | 26 | 19 | There are some models can find an optimal level of mitigation as while as stabilizing atmospheric. Such as RICE and MRICE model etc. | Taken into account--text added |
| 6098 | 6 | 26 | 31 | 27 | 4 | It is hard to understand how climate impacts, mitigation and adaptation responses in integrated assessment are meaningfully interlinked without knowing cost of impact and adaptation. Please rewrite. | Taken into account--figure and text deleted |
| 8972 | 6 | 26 | 35 | | | Geoengineering is not a form of adaptation! It is intervention. So please delete such language. | Taken into account--figure and text |
| 8507 | 6 | 26 | 35 | 27 | 1 | It is impossible “to decouple GHG concentrations from climate variables such as temperature”. It is possible to compensate the GHG effect on temperature. | Taken into account--figure and text deleted |
| 15428 | 6 | 26 | 35 | 27 | 1 | DELETE: "(a form of adaptation)" This cannot remain in the text because there is no agreement within the IPCC that geoengineering is a form of adaptation. Further, there must be acknowledgment of the ambiguous, controversial and speculative nature of geoengineering. To include this parenthetical statement obscures and minimizes -- in fact, denies -- the ambiguity, controversy and speculation surrounding geoengineering. | Taken into account--figure and text deleted |
| 11421 | 6 | 26 | 8 | 26 | 10 | It is good that this sentence is present, recognizing that most mitigation pathway studies typically do not factor in climate impacts and adaptation. This is the reason why having a correct and accurate reflection of UNFCCC Art. 2 is important - doing so allows, and in fact would encourage, having a more holistic and scientific approach to mitigation pathway studies by requiring the integration of other factors such as climate impacts, adaptation measures, etc on human and natural systems that could have synergistic effects on various mitigation pathways and scenarios. | Noted |
| 6271 | 6 | 26 | 18 | 26 | 22 | Again, I think you need to identify these studies on cost benefit that are said to not be appropriate for the analysis in Chapter 6. Need to cite these papers. Cant just assert that these papers exist and they are not appropriate for what is discussed in this chapter. | Accepted--citations added |
| 4307 | 6 | 26 | 35 | 26 | 35 | delete „(a form of adaptation)“ because there is no consensus that geoengineering is either mitigation or adaptation. moreover, some actors (BMBF 2011) argue for a „MAG-approach“, seein geoengineering as the third leg of climate policy | Taken into account--figure and text deleted |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 6272 | 6 | 26 | 5 | 28 | 26 | Because of how much this chapter is already over its alloted page limit, serious consisderation should be given to radically reducing the length of section 6.3.3. The key point is that IAMs (which are the heart of what Chapter 6 is about) do not handle adaptive responses very well. That point is made over and over and over again. Figure 6.12 is not needed and there is no need to introduce the terminology about adaptive responses Type 1, Type 2 and Type 3. Just make the key points and move on. This might be important research but it doesn't need to be treated at this level of detail in an already over page lenght limit Chapter 6. | Taken into account--figure and text deleted |
| 14335 | 6 | 27 | | | | This figure and the corresponding text are not clear on how to classify geoengineering technologies, i.e. as mitigation, adaptation or something else (cf also chapter 1 page 25 line 39-40). The text should make clear that this is an unresolved issue in the geoengineering debate. The classification as mitigation, adaptation or something else can matter, in particular in a normative context such as the UNFCCC (Bodle, Ralph, “Climate and Geoengineering”, in: Hollo, Erkki, Kati Kulovesi and Michael Mehling (eds.), Climate Change and the Law: A Global Perspective, Berlin: Springer, forthcoming 2012 (submitted May 2012), section 3.5). | Taken into account--figure and text deleted. Geoengineering now discussed elsewhere (6.3.3.2) |
| 4197 | 6 | 27 | 18 | | | Ciscar et al (2011) does not appear in the reference. | Accepted--reference added |
| 9864 | 6 | 27 | 25 | | | Again, I would emphasize the point much more strongly that "there is a desperate lack of data…." In particular, as far as I know there is absolutely no empirical basis for the type of damage cost functions that models like DICE include in them. | Noted |
| 8649 | 6 | 27 | 25 | | | Again, I would emphasize the point much more strongly that "there is a desperate lack of data…." In particular, as far as I know there is absolutely no empirical basis for the type of damage cost functions that models like DICE include in them. | Noted |
| 6399 | 6 | 27 | 26 | 27 | 26 | can remove a fair amount of discussion of what does not exist. Also, "necessitates heroic efforts" is colloquial. Suggest changing to something like "requires a lot of effort" | Editorial |
| 9416 | 6 | 27 | 28 | | | This flow-chart and its explanation is not easy to understand | Taken into account--figure and text |
| 5860 | 6 | 27 | 30 | 27 | 32 | This is a careless use of the word "heroic" for a work that is - although not easy and not done within hours - business as usual for a lot of modellers: brigding gaps in data sources and correlations. Please delete. | Editorial |
| 13733 | 6 | 27 | 33 | 27 | 36 | Rephrase "As represented by the blue dashed lines in Figure 6.12, these strategies and responses compete for political attention, investment and R&D resources, leading to potential trade-offs as discussed further below. Also, as captured by the red dashed lines, physical feedbacks will affect the set of available mitigation and adaptation options, ..." | Taken into account--figure and text deleted |
| 15429 | 6 | 27 | 33 | | 34 | Again, this sentence explicitly declares (and the accompanying Figure 6.12 suggests) geoengineering to be a type (one of three types) of adaptation -- this is unjustified. Further, there was NO AGREEMENT on this point at the Joint Expert Meeting on geoengineering held in Lima in June 2011. According to the Meeting Report, SRM "does not fall within the usual definitions of mitigation and adaptation." (IPCC, IPCC Expert Meeting on Geoengineering, Meeting Report, p. 2.) | Taken into account--figure and text deleted |
| 13734 | 6 | 27 | 36 | 27 | 36 | Insert "Some geoengineering strategies (solar radiation management approaches) attempt to decouple GHG concentrations from climate variables, …" | Taken into account--figure and text deleted. Geoengineering now discussed |
| 9866 | 6 | 27 | 37 | 28 | 26 | For decision makers the conclusion of these very important paragraphs could be that finding a solution is very complex and might even lead into the wrong direction. So I would add a paragraph how these biases can be overcome. Applying scenario thinking and the scenario technique would be an appropriate tool for organizations. | Taken into account--space constraints limit our ability to elaborate on this point |
| 11422 | 6 | 27 | 37 | 28 | 26 | This paragraph should be further expanded to explain the ways in which omission of climate impacts and adaptation responses could skew and provide inaccurate projections with respect to mitigation pathways. The authors should make a greater effort to search for literature - perhaps from non-OECD countries - that could provide approaches or ways in which such factors could be reflected in mitigation projections and scenarios. | Taken into account--space constraints limit our ability to elaborate on this point |

| 11747 | 6 | 27 | 39 | 27 | 41 | If such significant water shortage is occuer, not only nuclear and hydro but also thermal powers are affected that might force industry sectors to ristrict their production. This instance is so extreme that it should be deleted. | Accepted---text revised |
| 9568 | 6 | 27 | 39 | 27 | 41 | Please, reflect the following fact; in some regions such as Japan, seawater is required for thermal cooling for nuclear power plants. | Accepted---text revised |
| 9091 | 6 | 27 | 39 | 27 | 41 | Which countries will be suffering from water shortage for cooling nuclear reactor ? Appropriate references should be shown to validate this sentence. | Taken into acccount--text revised |
| 12018 | 6 | 27 | 39 | 27 | 41 | Regional water shortage may be severe and may affect particular site of any facilities which need water for cooling. However, it is misleading to generalize the statement without quantitative analysis. Some reservois may benefit from more rains. Facilities which use sea water for cooling are unlikely to be affected much. Balanced statement should be needed. | Taken into account--text revised |
| 11748 | 6 | 27 | 41 | 27 | 42 | The words [Also,] and [anothoer] aren't needed. Refer to No.33. | Editorial |
| 13735 | 6 | 27 | 41 | 27 | 41 | Use term "low-carbon" (instead of carbon-free) | Accepted |
| 5861 | 6 | 27 | 41 | 27 | 41 | Again: "there is no free lunch" and no such thing as a "carbon-free energy source" if there have been and are C emissions during facility construction, maintenance and operation. | Accepted--text revised |
| 13736 | 6 | 27 | 42 | 27 | 42 | Use "affect" (instead of negatively impact) ... another source of low-carbon energy (instead of carbon-free). | Editorial |
| 8045 | 6 | 27 | 43 | 27 | 46 | The intelligence in 'Unfortunately, there are no published modeling studies that account for the effects of climate impacts and adaptation responses on the set of viable mitigation strategies to reach stabilization targets' is very important and is worth to be mentioned prominently in the Exec. Summary. Same for 'Therefore, there is little information by which to judge how the omission of impacts and adaptation responses would alter the results reviewed in this chapter.' | Noted |
| 9863 | 6 | 27 | 5 | 27 | 10 | Is their an empirical study that comes to this conclusion? How are the three types differentiated? | Taken into account--figure and text |
| 6398 | 6 | 27 | 9 | 27 | 9 | "further down the chain" is colloquial. Suggest changing to "that propogate through the system" or something like that. | Taken into account--figure and text deleted |
| 10987 | 6 | 27 | 38 | 27 | 41 | The sentence of "water required for thermal cooling in the case of nuclear power and stream flow required for hydroelectric power could face severe shortages as a result of climate change" seems to be a little exaggerated. It is logically leaping that mitigation option by using nuclear power or hydro would be restricted due to the assumption mentioned above. For example, nuclear power stations in countries like Japan are basically built along seaside; therefore, there are no worries about the scarcity of water. | Taken into account--text revised |

|---|---|---|---|---|---|---|---|
| 4772 | 6 | 27 | 39 | 27 | 41 | The statement "For instance, water required for thermal cooling in the case of nuclear power and stream flow required for hydroelectric power could face severe shortages as a result of climate change" is true. However it could be interesting to note that storage provided by reservoirs associated to dams are very important for climate change adaptation. | Noted |
| 5862 | 6 | 28 | | | | Is there no relation of GE effects and Investment & R&D resources? Or does the figure - which lacks a legend, by the way - only show influences on and by the distribution of I & R&D-Resources? | Taken into account--figure and text deleted |
| 6099 | 6 | 28 | 1 | | | Interlinkage of the text itself (from lines 5-32, page 27 ) and Figure 6.12 is not so clear to at least ordinary readers. Much more simple way of explanation without this Figure could be possible. | Taken into account--figure and text deleted |
| 8651 | 6 | 28 | 12 | | | I would not say that the implications for transformation pathways are ambiguous. Most feedback loops due to climate change impacts are negative, as far as I know. (Are there any positive ones of significant magnitude?) Therefore, the implications for transformation pathways are highly negative. | Accepted--text revised |
| 13738 | 6 | 28 | 14 | 28 | 15 | Rephrase "Finally, mitigation strategies will need to compete with adaptation and possibly even SRM strategies for political attention, scarce investment and R&D resources. In accordance to the considerations in …" | Noted--will be considered in revision |
| 8652 | 6 | 28 | 14 | | | The paragraph that begins on line 14 I would suggest omiting. It goes too far in the direction of describing work that has never been done at all properly. | Noted--will be considered in revision |
| 10974 | 6 | 28 | 2 | | | Something that is not covered in a figure like this is the response time for the connections. Emissions affect concentrations directly, but there is a lag of decades for change in the climate variables, in many cases we find another lag of 20 years or so for development of defense to things like increasing flood risk, and at the same time there is expected to be a delay of several decades in the deployment of mitigation technologies. I think that the Fisher-Vanden report is a good one, but it admits that it is not covering everything. So if you are modifying the figure can you say something about lag times. | Taken into account--figure and text deleted |
| 14037 | 6 | 28 | 4 | | 13 | Potential conflicts between stabilization goals and adaptation goals are in fact very much the case when local plans are made. One example is the densely populated city vs a city that has a natural buffer against, for example, extreme heat or extreme rainfall. | Noted |
| 4308 | 6 | 28 | | | | Table 6.12. implies a somewhat natural order of counter measures (mitigation - geoengineering - adaptation). Other sources see geoengineering more as a third way apart from the two „traditional“ ones. (see Rickels, W.; Klepper, G.; Dovern, J.; Betz, G.; Brachatzek, N.; Cacean, S.; Güssow, K.; Heintzenberg J.; Hiller, S.; Hoose, C.; Leisner, T.; Oschlies, A.; Platt, U.; Proelß, A.; Renn, O.; Schäfer, S.; Zürn M. (2011): Gezielte Eingriffe in das Klima? Eine Bestandsaufnahme der Debatte zu Climate Engineering. Sondierungsstudie für das Bundesministerium für Bildung und Forschung. ) | Taken into account--figure and text deleted |
| 6273 | 6 | 28 | 14 | 28 | 21 | I'm not sure I am willing to agree that society's response to climate change is a strict zero sum game. This might be the way it has been modeled in the studies cited here but that does not mean that is the way this has to play out. | Noted |
| 10988 | 6 | 28 | 21 | 28 | 26 | Examples of "other expenditures" should be illustrated in order to grasp how they are important in estimating the "actual" economic cost of climate damages. Without knowing them we cannot assume the real scale of crowding out expenditures. | Noted--will be considered in revision |
| 2228 | 6 | 29 | 1 | 33 | 14 | ESSENTIAL: The IPCC should consider to contrast the sum of three cost elements to society when presenting this UNDER DIFFERENT SCENARIOS: 1) Mitigation, 2) Adaptation, 3) Damage cost. Then it will get obvious, that with more money invested in mitigation the TOTAL cost to society can actually be kept lowest. (Dentist analogy). The current representation of JUST showing cost for mitigation only, has of course the consequence that the more mitigation you are doing, the more cost you will incur. Consequently, mitigation is seen as MAIN cost to society, while the other cost elements will likely be bigger and will have much higher uncertainty. | The IPCC discusses the costs of climate impacts and adaptation in WG2 reports and the costs of climate mitigation in WG3 reports. Cost benefit analysis integrating costs and benefits of climate policy is explicitly discussed in the WG3 report, in Chapter 3 and Section 6.3.3 of Chapter 6. Section 6.3.4 focuses on mitigation costs. The introduction |

| 2229 | 6 | 29 | 1 | 33 | 14 | Rethink the graphs in this section (6.13, 6.14, 6.15) - very hard to understand and interpret. Are consumption losses and abatement costs additive? At minimum have a concise description in the text WHY you chose those metrics and elaborate HOW those are calculated (e.g. example), i.e. define the metrics | Taken into account - Figures revised |
| 6400 | 6 | 29 | 12 | 29 | 17 | These points seem to be reinforced earlier in the chapter. Might want to consider removing or condensing here. | The paragraph has to keep a balance between providing the necessary context for the mitigation cost results and avoiding a general discussion of cost measures provided already in Chapter 3 |
| 9870 | 6 | 29 | 12 | | | This paragraph starting on line 12 has some good discussion of other factors to consider other than costs OR BENEFITS. But I would also add that more consumption should not always be taken as a "good". It depends on what is being consumed. Consuming more military weapons, or coal-fired power plants, or doctors visits are not good, if the result is more war, climate change, or sickness. You should acknowledge, therefore, that many people are seriously questioning whether or not GDP is at all a good measure of social benefits (see for example the Sen, Stiglitz, Fitoussi Commission in France oder the UN Human Development Index). Other indicators of social progress are being proposed frequently now. These comments also apply especially to the discussion from lines 29 to 45 below. | The paragraph has to keep a balance between providing the necessary context for the mitigation cost results and avoiding a general discussion of cost measures to be provided in Chapter 3 (see Comment 515 which asks for condensing the material) |
| 8656 | 6 | 29 | 12 | | | This paragraph starting on line 12 has some good discussion of othe factors to consider other than costs OR BENEFITS. But I would also add that more consumption should not always be taken as a "good". It depends on what is being consumed. Consuming more military weapons, or coal-fired power plants, or doctors visits are not good, if the result is more war, climate change, or sickness. You should acknowledge, therefore, that many people are seriously questioning whether or not GDP is at all a good measure of social benefits. But even if you have the annual cost results in current dollars for every scenario reported (do you?), the pathway is computed using the original discount rate, so there would be an inconsistency in reporting the results of an optimization using one discount rate in discounted dollars using a different discount rate, no? | Taken into account. Yes, we have the annual cost for every scenario in the database. Information on the sensitivity of costs to choice of discount rate is now provided. |
| 9966 | 6 | 30 | 22 | | | Please make a reference to Table 3.1. It's helpful to know different values on discount rate. | Taken into account. Information on the sensitivity of costs to choice of discount |
| 4199 | 6 | 30 | 23 | | | When GDP is discussed as a cost indicator, the issue about GDP in current price, GDP in constant price and GDP-PPP should be touched upon, in my view. | Rejected. GDP losses are not discussed here. If GDP losses are included in future versions, we will clarify that they |
| 6502 | 6 | 30 | 30 | 30 | 36 | This sentence should be eliminated.<br>Because supporting evidence is not clear. | Rejected. An idealized policy scenario is definition, not an empirical finding. |
| 9874 | 6 | 30 | 34 | | | Remove the word "improbable" from this sentence - these scenarios are not forecasts - we can not assign probabilities to their occurrence, since they depend on future human decision making. | Taken into account. Changed to implausible. |
| 8660 | 6 | 30 | 34 | | | Remove the word "improbable" from this sentence - these scenarios are not forecasts - we can not assign probabilities to their occurrence, since they depend on future human decision making. | Taken into account. Changed to implausible. |
| 9984 | 6 | 30 | 37 | 30 | 39 | This part should be deleted completely because it is considered that IPCC should be policy irrelevant and has not recommended any integrated carbon markets until now. | Rejected. It is a misunderstanding that the discussion of idealized implementation scenarios is an endorsement of this approach or a policy |
| 16703 | 6 | 30 | 40 | | 44 | This should be deleted -- is based on the terrible misunderstanding that a lower carbon price is a demonstration of a lower cost policy set. In fact, a policy that requires additional deployment of a more costly resource regardless of the carbon price will act to lower the carbon price only because these more costly resources remove emissions -- the market could have achieved those same emission reductions at a slightly higher carbon price, but lower overall total costs to the economy. Read the 1st paragraph on page 30. | Rejected. Some models show a significant reduction of mitigation costs due to, e.g., revenue recycling from a carbon tax (Waisman et al., 2012, Climatic Change 11(1)). The rest is a misunderstanding. We do not discuss the lowering of the carbon price, but that |
| 9872 | 6 | 30 | 5 | | | In fact, here you state clearly my point above, which is that emissions prices are not representative of total costs because they represent marginal costs. | Noted |
| 8658 | 6 | 30 | 5 | | | In fact, here you state clearly my point above, which is that emissions prices are not representative of total costs because they represent marginal costs. | Noted |
| 9417 | 6 | 30 | 33 | | | Policy makers and researchers will be also interested in discussions on mitigation costs, however it is not easy to understand Figure6.13 & 6.14 & 6.15 and their explanations. It is recommended to restructure this section. | Taken into account - Figures revised |
| 11257 | 6 | 31 | | | | I was wandering about the discretization of the x-axis in the cost figures. It is shown as equidistant, but is it equidistant in terms of forcing? In terms of CO2 budget? It is shown for the categories, but in what sense are they linear (as suggested on the x-axis)? | Noted. No linear relation of forcing between climate categories should be implied by the use of climate categories |
| 5863 | 6 | 31 | | | | It is not clear what categories you refer to. Categories are given in 6.3.2.1 and 6.3.2.2, not 6.2.2. There are also more than 4 categories given there, and the numbers given in brackets with the categories in this figure do not match any numbers given with the categories in 6.3.2.1. and 6.3.2.2. Please clarify. | Taken into account. Use of categories will be harmonized. Categories 5&6 basically summarize baseline scenarios w/o climate policy, so discussion of |
| 12019 | 6 | 31 | | | | The chozen discount rate of 5% looks a bit too high considering the current economic situation and future prospect. The costs can significantly by the value of discount rates. Higher discounts rates underestimate future costs. Therefore, sensitivity analysis of costs over discount rates should be included. | Taken into account. Information on the sensitivity of costs to choice of discount rate is now provided. |
| 10396 | 6 | 31 | | 31 | | The categories mentioned in this figure does not coincide with table 6.2. And the definition of the categories is given in section 6.3.2 not section 6.2.2. | Taken into account. Use of categories will be harmonized. |

|---|---|---|---|---|---|---|---|
| 11423 | 6 | 31 | 1 | 31 | 12 | Further explanations and clarifications should be provided to ensure that the use of an idealized implementation framework for mitigation will not be taken by readers as an implicit or explicit endorsement of such framework as a policy recommendation on the part of the IPCC AR5. | Taken into account. Explanation added. |
| 13146 | 6 | 31 | 11 | 31 | 12 | it would also be important to acknowledge that cost estimates are already such a specific indicator that the large uncertainties visible in the model outcomes are probably dwarfed by the uncertainties that are unavoidable, when complex systems (e.g. global economy, innovation and technology development etc) are projected far into the future (i.e. level of knowledge concerning, not only probabilities, but also possibilities. Modelling of disruptive surprises, which are almost certainly going to take place, but the nature and timing of which is unknown). In other words, it is very unlikely that the range in model outcomes is a good representation of the actual uncertainties. At best it may show how relatively small differences in assumptions can already lead to large variations (i.e. presumably most modelling teams have tried to pick parameter values and trajectories that represent a "best guess" estimates of some kind). | Noted. Will be considered as we adjust the text in the next draft. |
| 16704 | 6 | 31 | 12 | | | you mention the uncertainty of the benefits of climate mitigation -- where do we estimate the value of the benefits? This would be a good time to point the reader to that work. | Taken into account. Reference to WGII is provided. |
| 5864 | 6 | 31 | 16 | 32 | 15 | It is not clear why you show two panels here. Why do you show two time frames? It has to be expected that longer periods of time - when included in an analysis - result in higher absolute or discounted costs. Please explain or delete one frame. In addition, figure 6.14 can be deleted as the content is included in 6.13 -the explanation in the text is sufficient. | Rejected. Information on a medium term and a long term time frame is both relevant. Figure 6.14 is not redundant, because it describes consistent cost increases between scenarios from single |
| 8662 | 6 | 31 | 16 | | | I hope these two figures do not mix the two or more kinds of cost outputs from different kinds of models together. If they do, please create separate figures for comparable types of cost calculations. | Taken into account. Different cost measures are provided explicitly now. |
| 9876 | 6 | 31 | 29 | | | Again, mitigation costs will not necessarily increase significantly with the stringency of climate stabilization. This result will depend on many assumptions, especially the costs assumed for fossil fuels as a function of the demand for such fuels. With a steep enough fossil fuel cost of supply curve, mitigation costs could decrease with greater climate change mitigation. Please make it clear that the runs done by modeling teams may have shown this result because of the cost assumptions and trajectories input to the models. Or, the statement could be modified to be "with any given set of input assumptions, the net costs of mitigation will increase (or become less negative) with the stringency of climate stabilization". Then the statement becomes a mathematical truism. Moreover life style changes and the mentionned Kaya decomposition components have to be considered, too. | Noted. It is already stated that the result of an increase in costs with stringency holds "in general". The figures and the statements are revised. |
| 8663 | 6 | 31 | 29 | | | Again, mitigation costs will not necessarily increase significantly with the stringency of climate stabilization. The text is re-arranged and the implications of technology portfolios is discussed in the consecutive section. |
| 12103 | 6 | 31 | 28 | 31 | 28 | This statement "A further observation is that the costs of mitigation are highly dependent on the level of stabilization; that is, mitigation cost estimates increase significantly with stringency of climate stabilization" - is not true as shown by Figure 1 in Schneider, S. and Azar, C. (2002) 'Are the costs of stabilising the atmosphere prohibitive?', Ecological Economics, vol 42, issues 1–2, pp73–80. http://stephenschneider.stanford.edu/Publications/PDF_Papers/EconomicCostsOfStabilizingClimate.pdf They showed that there was very little actual difference in "cost" irrespective of the stabilisation target. To understand why they explain " Top–down (economic) models typically suggest that the cost of a 50% reduction of global CO2 emissions from baseline by 2050 would cost some 1–4% of global GDP, and a 75–90% reduction by 2100 would cost some 3–6%. But since these studies also assume that global income grows by 2–3% per year, this abatement cost would be overtaken after a few years of income growth. Thus, the cost of 'climate insurance' amounts to 'only' a couple of years delay in achieving very impressive growth in per capita income levels. To be ten times richer (than in 2000) in 2100 AD versus 2102 AD would hardly be noticed and would likely be politically acceptable as an insurance." . Rather, as shown in IPCC AR5 Chapter 3, page 48, the Costs of Mitigation depend completely on the assumptions made in the modelling of the costs of climate change mitigation. For instance, if you accept that there have been historically alot of barriers to implementing energy efficiency opportunities.....as outlined in other parts of this assessment, then addressing those and requiring higher 2020 targets can actually lead to greater investment in energy efficiency by 2020 rather than less. This can have significantly positive economic effects as it leads to such large demand reductions that new power plants do not need to be built. For instance the 2011 Potsdam Institute for Climate Impact Research (PIK) study shows that it is more economically efficient, not less to for the European Union to aim for a 30 percent of greenhouse gas reduction by 2020 instead of the current 20% reduction target. A new study, led by the Potsdam Institute for Climate Impact Research (PIK), shows that a shift from 20 to 30 percent of greenhouse gas reduction by 2020 would boost the European economy and create 6 million jobs. The full study is available from http://www.european-climate-forum.net/fileadmin/ecf-documents/Press/A_New_Growth_Path_for_Europe__Synthesis_Report.pdf | Noted. The models that submitted their results to IPCC database show the described increase. |
| 12105 | 6 | 31 | 4 | 31 | 6 | "This difference in costs may be traced back to a range of assumptions embedded in the structures of the individual models,." Does not have a reference - suggest also refencing this point as it is a crucial one - Weyant, J. (2000) An Introduction to the Economics of Climate Change Policy, Stanford University, Repetto, R. and Austin, D. (1997) The Costs of Climate Protection: A Guide for the Perplexed, World Resources Institute, Washington, DC. | Noted. A reader is alerted to a discussion in the consecutive text. |

No linear relation of forcing between climate categories should be implied by the use of climate categories |
| 12020 | 6 | 32 | | | | same as above. | Noted. No linear relation of forcing between climate categories should be implied by the use of climate categories |
| 13149 | 6 | 32 | 16 | 32 | 22 | As mentioned previously, I would expect the the energy (and other) systems of 2100 to look quite different from the ones today, no matter whether a mitigation target is assumed or not. Also mentioned previously: It's hardly surprising that there's less variation when the absolute distance from the reference point (i.e. the baseline) is smaller, especially if one expects, as was suggested, the costs (as a function of the target) to increase faster than linearly.A lower variation for more stringent targets would imply significantly differently shaped implicit MAC curves for the models. Therefore, an increasing variation with more mitigation could be interpreted as "magnitude uncertainty" dominating (which seems to be the case, also based on figure 6.15) and larger variation with low targets as "shape uncertainty" dominating the variation across the models (with the previously mentioned strong caveats concerning the how complete this description of uncertainty can be expected to be). | Noted and will be considered as we adjust the text in the next draft. |
| 16705 | 6 | 32 | 21 | | 22 | Suggest replacing last sentence with this: "Stringent scenarios require a more rapid replacement of existing plant and equipment as well as the deployment of some technologies before their costs have declined through a more gradual early stage deployment." [explanation: requiring 100 MW of solar in 2002 would cost a great deal more than requiring 100 MW of solar in 2012. Trying to go very fast pushes deployment at a time when much more could be achieve at a much lower costs if we had simply waited a little while longer.] | Noted and will be considered as we adjust the text in the next draft. |
| 8666 | 6 | 32 | 31 | | | The possibility that total net abatement costs could be linear with respect to cumulative levels of abatement seems somewhat strange for any given model. It would seem to only occur if there was one basic technology at a constant unit cost that could be relied on for abatement throughout this range. If more than one technology was called on for abatement over the range cited, then one would expect an increase in the slope of the cost curve when the penetration of the first and cheaper technology was saturated, reflecting higher marginal costs for the second technology. Presumably, such a change in slope would happen many times for any given scenario. Thus, a general linear trend as displayed in figure 6.15 must be an artifact of having outputs for many different models with many different sets of assumptions, and probably has no significance. | Taken into account. The rates of increase in costs are different among different classes of the models. |
| 16706 | 6 | 32 | 33 | | | insert after 2010-2100 "delaying the achievement of the 2100 consumptions levels in the no policy case by X months." | Comment is noted and will be considered as we adjust the text in he |
| 8665 | 6 | 32 | 7 | | | I find figure 6.14 confusing if the main point is to show cost variation with increased stringency across modeling groups. Again, the cause of these variations are many fold, different model structures, and different sets of input assumptions being two key causes. It is not clear to me that it is necessarily the case that the variability of costs will always increase with stringency for any set of input assumptions. | Taken into account - Figure will be beefed up with additional information or removed. |
| 6537 | 6 | 32 | 20 | | 21 | Replace "bring greenhouse gas emissions toward zero" with e.g. "reduce greenhouse gas emissions significantly" in accordance with AR4 WG1 Report Figure 10.22, or give a reference paper. | Taken into account. The text is adjusted. |
| 6274 | 6 | 32 | 7 | 32 | 15 | Delete Figure 6.14 and the text under the graphic. Keep the text at the bottom of page 31 and top of 32 that explains the take home point from this graphic. The text is far easier to interpret and digest than this graphic and its unit of measure of "mitigation costs relative to CatIII cliamte policy." Here's the rare case where a couple of sentences are better than a graphic. This will save about half a page. | Taken into account - Figure will be beefed up with additional information or removed. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 16707 | 6 | 33 | 16 | | 26 | This discussions is extremely important because of how is frequently interpreted -- it creates a barrier for negotiators. It presumes no efforts are possible to address the regional disparities through the allocation of CO2 endowments which can be used to facilitate trade. The trade in this endowment, which can be based on BAU emissions until a country achieves a level of per capita GDP, can create the financial flows and ability to buy technology needed by developing countries. See work by Bossetti and Frankel http://belfercenter.ksg.harvard.edu/files/bosetti-frankel-dp-46-final-1.pdf . | Noted and will be considered as we adjust the text in the next draft. |
| 11424 | 6 | 33 | 21 | 33 | 26 | The assertion that the majority of emissions reductions in the 21st century will be borne by because their emissions are projected to be larger than those of developed countries needs to be explained more clearly in terms of what the assumptions are underlying such assertion. Absent a clear explanation of the assumptions for this assertion, such a bare assertion could be used in a non-scientific and political way in order to push specific policy agendas or approaches in the context of international policymaking discussions and negotiations on climate change that could effectively absolve developed countries of any further mitigation commitments and increase the pressure on developing countries to undertake increased mitigation actions. Furthermore, declarative formulations such as "the majority of emissions redutions over the coming century will be borned by the currently developing countries" should be avoided in order to prevent the use of such declarative statements in a political setting, particularly since such declarative statements might be construed by eventual readers as an implicit policy recommendation on the part of IPCC AR5 with respect to how future emissions reductions responsibilities should be allocated. This would bring the IPCC AR5 conclusions into the realm of policymaking rather than science. | Noted. The statement is supported by projections from a vast majority of the models. |
| 16708 | 6 | 33 | 27 | | 35 | Very important -- highlight or move forward in document. Include ref to work by Bossetti and Frankel. | Noted and will be considered as we adjust the text in the next draft. |
| 13150 | 6 | 33 | 31 | 33 | 34 | Isn't this a bit too self evident to count as a finding? | The reference is provided to support the |
| 17233 | 6 | 33 | 34 | | | Lüken et al is not found in the reference list. The reference makes sense here, though. | Taken into account. |
| 14400 | 6 | 33 | 6 | | | Need a more complete explanation of why the red dot studies are so different. Why are they included at all (rather than just mentioned in a footnote) if they are so unrepresentative? If this is the McKibben et al model only, I'd be reluctant to feature it as much as is done here. (See the doubts in Cline, 2011, p. 50-51). I think it is mixing short-term monetary issues in with long-term climate and technology issues. | Noted. The text is already edited and will be considered for further adjustments in the next draft. |
| 4200 | 6 | 33 | 8 | | | Very interesting figure. However, the non-linearity between cummulative carbon emission and cost in NPV is not so clear. Isn't log-scale graph better? | Noted. Log-scale will compromise comprehensibility of the figure for the lay person, and is not necessary, since only |
| 9571 | 6 | 34 | | | | Please, don't cap new nuclear capacity as explicit factors in the model in the case of no new nuclear case. When it is difficult to remove cap for it, please explain models' capacity prerequisite for no nuclear case in the text. | The comment needs clarification. |
| 16709 | 6 | 34 | | | | Line 7 of description -- you mention compensation mechanisms. You should help define or explain somewhere in the report what these compensation mechanisms could be -- in particular the assignment of an allowance or CO2 endowment along a BAU pathway for developing countries. Very helpful if you could highlight this. | Taken into account. The text on burden sharing regimes and financial transfers is now in the new Section 6.3.6.6. |
| 12021 | 6 | 34 | | | | The amounts of GHG reductions by marginal costs should be given before presenting this kind of analysis. | Figure 6.16 shows total costs rather than marginal costs. There is no Table 6.16. |
| 9280 | 6 | 34 | 14 | 34 | 15 | This table is duplicative of Table 6.ES.2 (Chapter 6, page 7 line 6). | Noted. The text will be adjusted in the |
| 14401 | 6 | 34 | 2 | | | See Cline (2011) estimates, p. 84. If cuts are to equal per capita emissions, the percent cuts are greater for industrial countries. Costs are broadly similar between the two groups. | Noted and will be considered as we adjust the text in the next draft. |
| 11749 | 6 | 34 | | | | The condision of new nuclear should be described in this section or added the remark on the table 6.4. Refer to No.40. | Noted and will be considered as we adjust the text in the next draft. |
| 3146 | 6 | 35 | 1 | | | SECTION 6.3.5 on policy design overlaps with other chapters that cover similar material. TSU NEEDS TO ADVISE ON WHERE POLICY DESIGN ISSUES WILL BE HANDLED CENTRALLY. | Noted. The text is adjusted and most of the description is now in Chapter 3. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 6100 | 6 | 35 | 15 | 35 | 17 | In view of the importance of technology in mitigation, effect of a policy to promote technology innovation/diffusion shoule be included as one of the criteria. However, as I know that this matter should be discussed in Chapter 3, I have already made a comment for the Chapter 3 text. | Taken into account. Policy design issues are moved to Chapter 3. |
| 6101 | 6 | 35 | 17 | 35 | 18 | The explanation of economic efficiency here seems to be the same as cost-effectiveness. Actually, economic efficiency has something to do with the concept of optimization where marginal cost equalizes to marginal benefit. | The concepts of economic effciency and cost effectiveness are different. Concept definitions are now moved to Chapter 3. |
| 8667 | 6 | 35 | 25 | | | This sentence does not require a reference since it is a simple logical truth. | Noted. |
| 7682 | 6 | 35 | 34 | 35 | 34 | The text "implications are discussed in Section 6.2.6" should probably refer to Section 6.3.6? | Taken into account. The sections are re- |
| 13278 | 6 | 35 | 35 | 35 | 37 | This sentence is unclear - the 20% reduction would lead to 0.5-2.0% of what? Presumably change in welfare; if so, please spell this out in the text | Taken into account. The reference is to welfare cost. |
| 13151 | 6 | 35 | 36 | 35 | 37 | Does "the lowest possible cost" here refer to using a single carbon price? If yes, make sure the terminology agrees with what is on page 30, lines 40-44. | Yes. The statement is qualified by adding "in the absence of other |
| 9877 | 6 | 35 | 37 | | | 0.5 - 2.0% of what? GDP? Again, this result depends on input assumptions. It could be negative with sufficiently high fossil fuel prices in the base case. | The reference here is to welfare (not GDP). The intent is to show the impacts of expanding emission trading, rather |
| 8668 | 6 | 35 | 37 | | | 0.5 - 2.0% of what? GDP? Again, this result depends on input assumptions. It could be negative with sufficiently high fossil fuel prices in the base case. | The reference here is to welfare (not GDP). The intent is to show the impacts of expanding emission trading, rather |
| 16711 | 6 | 35 | 40 | | | Insert at end of line: "These figures demonstrate the significant economic penalties that can be created as market structures deviate from the ideal or are over-engineered to satisfy other policy objectives." | Noted. The text is adjusted and some figures are deleted. |
| 16710 | 6 | 35 | 5 | | | suggest insert at end of sentence, after the word "market" the following: "participants as they operate to maximize utility." | Noted and will be considered as we adjust the text in the next draft. |
| 7686 | 6 | 35 | 6 | 35 | 12 | The introduction mentions that the subsection considers economic rents, but the word is not used in the rest of the subsection. Please ensure that the introduction is in line with the rest of the 6.3.5.x subsections. The text "[…] something that economists call a scarcity rent [...]" is too didactic for a review text. Also, the use of "we" (lines 10-12) feels inappropriate for IPCC assessment report. | Taken into account. The text is revised. |
| 7685 | 6 | 35 | 1 | | | The subsection (pp. 35-37) is very fragmented, and doesn't give a comprehensive view on different policy structures and their possible implications. The underlying problem is that the chapter is based on scenario modelling studies, and a IAM's have limited capacity to actually model different policy structures. The topics covered in the subsection are too narrow to warrant such a broad title. From the title I would e.g. expect a discussions on carbon tax vs. quantity targets, multilateral agreements and national policies, flexibility mechanisms etc. Policy agreements are covered more comprehensively in Chapter 13. Do the section's figures support the text and conclude the main findings? The section has some overlap with section 6.3.6, and also probably with various sections in Chapter 13. Perhaps this section could be merged with 6.3.6, as Chapter 6 requires shortening. | Taken into account. Policy design issues are moved to Chapter 3 and the current section is re-arranged. |
| 6275 | 6 | 35 | 35 | 36 | 6 | Consider deleting Figure 6.17 and the text under the graphic but keep the paragraph on Page 35 that starts with the bold face "Figure 6.17." That is indeeed a good example of the point being discussed in the third paragraph on page 35. The text in the short paragraph at the bottom of page 35 nicely states what the experiment was and the key results and insights. Figure 6.17 doesn't add much and in fact raises more issues that dont need to be dealt with here (e.g., what is DART, what is No. N+1, ...) | Noted and will be considered as we adjust the text in the next draft. |
| 12309 | 6 | 35 | 1 | | | In this section it is also important to look at how to handle risk sharing in a situation where there is a need for a shift in technology. There is more risk and higher cost involed for the early movers. Hence, this might create a need for other policies, especially in the transformation phase. This perspective is not necessarily taken care of by economic instruments, as the section seems to focus mainly on cap-and-trade and carbon text. It is important to convey the findings which is relevant for policy makers when developing the policy instruments. | Noted and will be considered as we adjust the text in the next draft. |

|---|---|---|---|---|---|---|---|
| 13152 | 6 | 36 | 11 | 36 | 12 | Figure is missing (6.17 shows something completely different, as does 6.18) | Taken into account. The figures are re- |
| 9878 | 6 | 36 | 12 | | | The 90% increase cited must depend on very specific input assumptions. If so, I would suggest carefully qualifying the statement as it appears to undermine the idea of establishing RPSs at any regional level. | Noted and will be considered as we adjust the text in the next draft. |
| 8669 | 6 | 36 | 12 | | | The 90% increase cited must depend on very specific input assumptions. If so, I would suggest carefully qualifying the statement as it appears to undermine the idea of establishing RPSs at any regional level. | Noted and will be considered as we adjust the text in the next draft. |
| 9879 | 6 | 36 | 16 | | | Again, the sentence that starts "it underscores the potentially large costs.. " seems quite politically explosive to me, and I am quite skeptical that it is generally true. If you want to make such powerful and sweeping statements I think more research needs to be described as to under what conditions a statement like this is true or not. Even if you reveal the underlying studies, I would avoid such a term, as it is too vague. This conclusion could be cited to oppose any type of sector specific policy and decisions on the company level. Yet, sector specific policies are usually much easier to implement and much more successful than "broad policies" like a carbon tax, if that is what is meant. | Noted and will be considered as we adjust the text in the next draft. |
| 13153 | 6 | 36 | 16 | 36 | 17 | I'm not entirely sure I understand this; to me all the CAT scenarios appear to have similar costs (i.e. circle areas), no matter what is assumed for FES. Or does this conclusion refer to the size of the "non-mitigation" circle vs "mitigation" circles, in order to point out that just reducing gasline use with FES, without achieving significant emission reductions, would cost ~ quarter of what it would cost to achieve at least as significant gasoline use reductions AND more meaningful mitigation outcomes? Elaborate a bit, so that it's clear what one should conclude from the figure. | Taken into account. The figure is deleted. |
| 8670 | 6 | 36 | 16 | | | Again, the sentence that starts "it underscores the potentially large costs.. " seems quite politically explosive to me, and I am quite skeptical that it is generally true. If you want to make such powerful and sweeping statements I think more research needs to be described as to under what conditions a statement like this is true or not. This conclusion could be cited to oppose any type of sector specific policy. Yet, sector specific policies are usually much easier to implement and much more successful than "broad policies" like a carbon tax, if that is what is meant. | Noted and will be considered as we adjust the text in the next draft. |
| 5865 | 6 | 36 | 23 | 37 | 7 | Including emissions from land-use is a delicate topic because most studies I am aware of do not reflect e.g. a "bug" in the reporting guidelines, but assume their assessment scheme to be correct. Losses of C in biomass are attributed to harvest activities and would have to be paid for by e.g. farmers and foresters. They in turn would have to raise prices to be remunerated. Thus prices for agricultural crops and timber will raise and, especially with timber, uses which generate more C emission reduction by replacement / substitution may be offset because of reduced harvests. | Noted. The challenges are mentioned and discussed in the provided references. |
| 8671 | 6 | 36 | 23 | | | Addressing land-use related abatement will only reduce overall abatement costs if the marginal costs of land-use abatement measures are lower than the marginal cost of the last abatement technology that would have otherwise been relied on. This is another example of how conclusions need to be properly qualified. | Noted. There is a range of emission abatement options from land-use change. With a certain carbon price, |
| 7687 | 6 | 36 | 7 | 36 | 9 | The text statest rather blatantly that "The most economically-efficient climate policy remains cap-and-trade policy or carbon tax", with a single reference at the end of the statement. While I'm certainly not against this statement in itself, I think the tone is rather arrogant and unbalanced. I order to prove the point, it is better to cite results from studies that have compared the efficiency of market-based to other regulatory measures. | Taken into account. The statement is re-arranged and additional references to EMF studies are considered. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 11750 | 6 | 36 | 7 | 36 | 9 | Disagree. Some says volantay acions are effective and C&T, tax are not necessarily effective.The sentence [The most economically-efficient ....] should be deleted.Refer to Okazaki et al.,Wakabayashi et al., Montgomery et al.<br>1.Okazaki et al.:[Accelerating the transfer and dissusion of of energy saving technologies steel sector experience], send attachment by another e-mail.<br>2.Wakabayashi et al:[Case Studies and Its Effectiveness of Environmental Taxation], http://criepi.denken.or.jp/en/serc/research_re/download/09005dp.pdf<br>3.Wakabayashi et al.:[A Review on Effectiveness of Emissions Trading Schemes: Empirical Evidences of Their Implementation], send attachment by another e-mail.<br>4.Montgomery et al.:[Price, Quantity and Technology Strategies for Climate Change Policy], http://crai.ca/uploadedFiles/RELATING_MATERIALS/Publications/Consultant_publications/files/pub_4141.pdf | Noted. Distorted implementation of carbon tax and cap-and-trade may increase costs. The qualified is added. |
| 16712 | 6 | 36 | 7 | | 17 | These points are very important and should be moved directly to the executive summary. | Noted and will be considered as we adjust the text in the next draft. |
| 10647 | 6 | 36 | 7 | 36 | 9 | There is a lot of arguments that volantary actions are more effective. Please see Okazaki et all, Wakabayashi et al and Montgomery et al. 1.Okazaki et al.:[Accelerating the transfer and dissusion of of energy saving technologies steel sector experience], send attachment by another e-mail.<br>2.Wakabayashi et al:[Case Studies and Its Effectiveness of Environmental Taxation], http://criepi.denken.or.jp/en/serc/research_re/download/09005dp.pdf<br>3.Wakabayashi et al.:[A Review on Effectiveness of Emissions Trading Schemes: Empirical Evidences of Their Implementation], send attachment by another e-mail.<br>4.Montgomery et al.:[Price, Quantity and Technology Strategies for Climate Change Policy], http://crai.ca/uploadedFiles/RELATING_MATERIALS/Publications/Consultant_publications/files/pub_4141.pdf | Noted. The literature on effectiveness of voluntary actions for stringent emission reductions is non-existent. |
| 9985 | 6 | 36 | 7 | 36 | 9 | This part should be deleted completely because there are successful examples of "voluntary target scheme" in the world. Each industry in Japan has voluntary target and the voluntary target scheme has played a big role, as described in (Yamaguchi, 2012, page35 and 154), (Manuel, 2010, page 6 and 13), and (Yamaguchi, 2010, abstract). In addition, there is also a successful example of "voluntary target scheme" in Netherlands, as shown in (Martijin, 2002, page162). These literatures are listed in the No63 line of this table.<br>On the other hand, market-based mechanism such as emission trading has several problems. Volatility of emission permit prices affects volatility of product prices as evidenced by fluctuating price developments in the EU-ETS. Therefore, the market-based policy tools of cap-and-trade cannot provide credible incentives for the technological change, as described in (Montgomery, 2005, abstract) and (Baldursson, 2009, page29). These literatures are listed in the No62 line of this table.<br>In addition, CO2 leakage caused by the implementation of the ETS happened actually through international transfer of industry , as shown in (Rosendahl, 2011, abstract), (Aichele, 2012, page336), and (Peters, 2011, page1). These literatures are listed in the No50 line of this table. | Noted. The literature on effectiveness of voluntary actions for stringent emission reductions is non-existent. |
| 9365 | 6 | 36 | 7 | 36 | 9 | It should be deleted because there is a successful example of the voluntary action of the Japanese steel industry. Also carbon tax does not always seem to be effective. Wakabayashi et al showed that the difficulty to keep tax rate in reality because of the price competitiveness in industrial sector.(Wakabayashi and Sugiyama ) | Noted. The literature on effectiveness of voluntary actions for stringent emission reductions is non-existent. |
| 6498 | 6 | 36 | 7 | 36 | 9 | This sentence should be eliminated.<br>It is hard to mention that the most economical-efficient climate policy is cap-and-trade policy or carbon tax. Because the supporting evidence is not clear and the problems are pointed out in 6.3.5.2 | Noted. Distorted implementation of carbon tax and cap-and-trade may increase costs. The qualified is added. |
| 16713 | 6 | 37 | 20 | | 21 | Sentence beginning with "different allocation schemes …" is very important. These points should be moved forward and included in the executive summary. | Noted and will be considered as we adjust the text in the next draft. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 16714 | 6 | 37 | 23 | | 26 | This lacks context -- how big will the changes be and what will be their impact? | Noted. We consider deleting this discussion for limited space reasons. If kept, we consider adjusting the text in |
| 8046 | 6 | 37 | 27 | 37 | 38 | a reference to chapter 6.3.6.2 is helpful | Noted and will be considered as we adjust the text in the next draft. |
| 13154 | 6 | 37 | 31 | 37 | 31 | Same effects as what? | Same fuel and emission reduction. The |
| 8672 | 6 | 37 | 31 | | | "same effects" as what??? | Same fuel and emission reduction. The |
| 9880 | 6 | 37 | 33 | | | Again, I think that the estimate of 2-10 times the cost (of what scenario? A cap and trade system?) should be very carefully justified and qualified, because otherwise it can be mis- used by opponents of almost any climate policy that is not a cap-and-trade system or carbon tax. Cost multiples at this high a magnitude are suspect to me because they are produced by economic modules that have very aggregate treatment of each economic sector. It is not clear, therefore, what kinds of sectoral-specific climate mitigation policies they could even model reasonably accurately. | The text is edited. |
| 8673 | 6 | 37 | 33 | | | Again, I think that the estimate of 2-10 times the cost (of what scenario? A cap and trade system?) should be very carefully justified and qualified, because otherwise it can be mis- used by opponents of almost any climate policy that is not a cap-and-trade system or carbon tax. Cost multiples at this high a magnitude are suspect to me because they are produced by economic modules that have very aggregate treatment of each economic sector. It is not clear, therefore, what kinds of sectoral-specific climate mitigation policies they could even model reasonably accurately. | The text is edited. |
| 11425 | 6 | 37 | 43 | 37 | 45 | The assertion that developing countries "are new responsible for the majority of greenhouse gas emissions moving forward" is similar to assertions made elsewhere in the chapter about the potential future role of developing countries as the main contributors to such emissions and hence should have the main future responsibility for reducing emissions. As with such other assertions, this assertion should also be clearly explained in terms of what the assumptions were, so as to avoid the IPCC AR5 being read or construed in this instance as providing a policy recommendation with respect to the allocation of future emission reduction commitments. | Will take this into account and rephrase in a way that it is clear that no policy reccomandation is made |
| 6103 | 6 | 37 | 45 | 37 | 45 | The word "especially" should be added before "at the international level". This situation also happen domestically. | noted |
| 6102 | 6 | 37 | 8 | 37 | 26 | Very important message that distributional impact affects feasibility of a policy instrument is missing. | Noted and will be considered as we adjust the text in the next draft. |
| 7688 | 6 | 37 | 8 | | | Distributional impacts are likely to be a huge global issue. Starting with a study on US households seems very biased. Perhaps the text could start by stating that impacts vary by policy, region and individual, with references to each. With cap-and-trade and taxes with transfers, the economic impacts can be adjusted. There is a large amount of literature on burden sharing (or effort sharing), but this is covered with merely a short note on allocation schemes. | The text of burden sharing and financial transfers is now in the new section 6.3.6.6. |
| 7689 | 6 | 37 | 27 | | | This important topic deserves much more comprehensive treatment. The whole subsection has been written from a viewpoint of an economist, althought it is more in the field of a policical scientist (not political economist). Anecdotal evidence from the US seems inappropriate. Is there any literature on e.g. the UNFCCC process and what kind of mandates the negotiators there have? | The text is re-arranged. The sub-section is removed. |
| 7690 | 6 | 37 | 39 | | | The subsection (pp. 37-42) deals mostly with scenario studies on international participation to the global climate policy, but this is a very narrow scope compared to the subsection's broad title. Policy agreements are covered more comprehensively in Chapter 13. The subsection is also quite heavy on figures relative to the amount of text. In addition, some of the figures are not referenced in the text. Are the figures representative of the literature on the covered topics, and do they conclude the main findings from scenario studies on international strategies for mitigation? Perhaps section 6.3.6 could be merged with section 6.3.5 as there is some overlap between them. | This chapter deals with modeling and the issue of international agreements is covered inso far models have addressed it in the literature. Chapter 13 does not provide quantitative estimates of the role of international participation, so there in our view value of keeping this section |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 16715 | 6 | 38 | 10 | | 30 | These points are extremely important -- need greater emphasis and should be included in exec summary -- they are buried in body of report and risk being overlooked. | The chapter will be reorganized so as to give this section more visibility. |
| 9499 | 6 | 38 | 12 | 38 | 21 | good issue - All of the countries should take part in climate stabilization activities | thanks |
| 5924 | 6 | 38 | 12 | | 30 | This could be added as well. It supports the overall message given in this chapter. Ekholm T., Soimakallio S, Moltmann S., Höhne N, Syri S., 2010. Effort sharing in ambitious, global climate change mitigation scenarios. Energy Policy 38(4), 1797-1810. | noted |
| 7691 | 6 | 38 | 16 | | 20 | There is no need to elevate EMF22 above other participation studies in an IPCC assessment report ("one of the most comprehensive assessment of this issue"). Please reformulate the text so that it states the main findings of EMF22, and include also results from other participation studies that are referenced. | More studies will be added in the SOD. |
| 11426 | 6 | 38 | 20 | 38 | 24 | The bases and assumptions for why "many models were not able to produce scenarios with delayed participation of large developing countries for the more stringent long-term goals" should be further explained and clarified. Furthermore, a more balanced framing of the argument should be used. For example, instead of stressing only that "half of models found it impossible to meet the 550 Co2-e target with delayed participation", an additional phrase could be added to say to present the other side of the picture such that "on the other hand, half of the models deem it possible to meet such target with delayed participation from developing countries" (that is, if the literature would allow such an assertion to be made). | noted |
| 7692 | 6 | 38 | 26 | | 27 | Please clarify/elaborate "model cannot be solved" and the "high initial price". | We will add more information on the |
| 8674 | 6 | 38 | 29 | | | Again, the second two reasons for apparent infeasibility may also reflect the overly constrained amount of energy efficiency improvements allowed per year in these models, as well as other input constraints that are not absolutely firm. | We will add more information on the notion of infeasibility |
| 6692 | 6 | 38 | 10 | | | Good text.All nations should make efforts to control too rapid climate change. So, It is effective to construct a framework under which all nations, including developing countories, have a responsibility to reduce carbon emission. | thanks |
| 6276 | 6 | 38 | 10 | 38 | 30 | The material discussed in section 6.3.6.2 is very important and is one aspect of what is new that is in the literature that wasn't probably addressed in AR4 in detail. It is concerning to this peer reviewer that this information is 38 pages in this chapter. Serious consideration needs to be given to condensing the many pages of important caveats about what IAM models can and can not do so that insights like this are not lost. The sentence about not being able to get to 550 if large regions stay out is a potential candidate for the executive summary or an FAQ at the end of the chapter. | The chapter will be reorganized so as to give this section more visibility. |
| 15220 | 6 | 39 | | | | Figure 6.19 needs to be revised to make it clear for understanding. | There was an editing problem in the creation of the figures for the FOD. We will make sure this doesn't happen again |
| 4201 | 6 | 39 | | | | hard to read! | There was an editing problem in the creation of the figures for the FOD. We will make sure this doesn't happen again |
| 6538 | 6 | 39 | | | | Complete Figure 6.19 and give a reference paper. | There was an editing problem in the creation of the figures for the FOD. We will make sure this doesn't happen again |
| 5866 | 6 | 39 | | | | Rework, not legible. | There was an editing problem in the creation of the figures for the FOD. We will make sure this doesn't happen again |

| 7683 | 6 | 40 | 1 | | | The figure lacks y-axis label. The NPV/maximum loss should also be noted in the x-axis label to improve readability. | There was an editing problem in the creation of the figures for the FOD. We will make sure this doesn't happen again |
| 9986 | 6 | 40 | 32 | 40 | 33 | This part should be completely deleted. Market-based mechanism such as emission trading has several problems. Volatility of emission permit prices affects volatility of product prices as evidenced by fluctuating price developments in the EU-ETS. Therefore, the market-based policy tools of cap-and-trade cannot provide credible incentives for the technological change, as described in (Montgomery, 2005, abstract) and (Baldursson, 2009, page29). These literatures are listed in the No62 line of this table.<br>In addition, CO2 leakage caused by the implementation of the ETS happened actually through transfer of industry from one country to others. Market mechanisms at least under Kyoto-like international scheme, where the condition of all countries' meaningful participation is not met, does not work well, as shown in (Rosendahl, 2011, abstract), (Aichele, 2012, page336), and (Peters, 2011, page1). These literatures are listed in the No50 line of this table. | Market based schemes are discussed in so far they can induce cooperation, not techhnical change. |
| 16717 | 6 | 40 | 33 | | | Suggest insert before sentence that begins with "The financial transfers that would result …" the following text: Emissions pathways for developing countries in a cap and trade system fore example need not immediately decline, but rather can follow a business as usual pathway until an agreed level of per capita GDP is achieved." Ref work by Bossetti & Frankel. Many do not understand this and highlighting it could be helpful. | noted |
| 4202 | 6 | 40 | 9 | 40 | 29 | The expression of these paragraphs seems slightly ambiguous for the readers. Are there some examples of such partial coalition and its inefficient outcome? What is important in this chapter is, to me, the need for the incentives for the participation. | More discussion will be added |
| 11659 | 6 | 40 | | | | From the figure, GDP loss of fragmented participation seems to be smaller for other DCs than that of full participation in NPV terms, which means that the delay in participation is beneficial for other DCs. The rationale behind this result should be mentioned. | noted |

| 13157 | 6 | 42 | 20 | 42 | 33 | As the chapter is currently too long, I suggest this paragraph and the figure 6.24 that follows is cut. It's hardly surprising that emissions from fossil fuels strongly correlate with non-CCS related primary energy use of fossil fuels, nor that both go down with mitigation (or that there still can be variations across the scenarios). Sacrificing nearly a page to this does not seem necessary. | Figure 6.24 and the surrounding discussion has been replaced by a figure that relates climate targets to the use of fossil fuels. |
| 4203 | 6 | 42 | 20 | 42 | 24 | Resource availability and cost issues should be touched upon here. | Fossil fuel use under different climate targets is discussed more explicitly. Note that Section 7.4 in Chapter 7 deals with |
| 9882 | 6 | 42 | 25 | | | This section briefly mentions "limits on the use of… fossil energy…", but does not really put the future of energy systems and technologies in its proper context which must include some discussion of the peak oil, peak gas, etc. debates. Even Chapter 1 of the WGIII report discusses this issue, and it should be picked up here because it could have a major impact on the prices assumed in each IAM for fossil fuels in the future, as a function of demand. My sense of the history of IAM modeling is that the modeling teams have not paid sufficient attention to this issue, and continue to model fossil fuel supplies and prices in much the same way as they did for the fourth IPCC assessment, even though the IEA and many other organizations have changed their views dramatically on the peak oil issue. Many claim that peak conventional oil production has already peaked in 2006, with important implications for the price of oil and other fossil fuels in the future. Thus, there needs to be a discussion in this section of how oil supplies are modeled by the various IAM teams, and back-up technologies for liquid fuels, etc. | Fossil fuel use under different climate targets is discussed more explicitly. Note that Section 7.4 in Chapter 7 deals with resource availability in more depth. |

|---|---|---|---|---|---|---|---|
| 8677 | 6 | 42 | 25 | | | This section briefly mentions "limits on the use of… fossil energy…", but does not really put the future of energy systems and technologies in its proper context which must include some discussion of the peak oil, peak gas, etc. debates. Even Chapter 1 of the WGIII report discusses this issue, and it should be picked up here because it could have a major impact on the prices assumed in each IAM for fossil fuels in the future, as a function of demand. My sense of the history of IAM modeling is that the modeling teams have not paid sufficient attention to this issue, and continue to model fossil fuel supplies and prices in much the same way as they did for the fourth IPCC assessment, even though the IEA and many other organizations have changed their views dramatically on the peak oil issue. Many claim that peak conventional oil production has already peaked in 2006, with important implications for the price of oil and other fossil fuels in the future. Thus, there needs to be a discussion in this section of how oil supplies are modeled by the various IAM teams, and back-up technologies for liquid fuels, etc. | Fossil fuel use under different climate targets is discussed more explicitly. Note that Section 7.4 in Chapter 7 deals with resource availability in more depth. |
| 11427 | 6 | 42 | 3 | 42 | 13 | This particular section seems to take the view that the current international climate policy regime is fragmented. This is not accurate considering that the UNFCCC actually provides for a coherent and comprehensive policy regime with respect to various aspects and actions that countries are supposed to do together in a cooperative manner, including on mitigation, adaptation, finance, and technology transfer. In the UNFCCC policy regime, roles and responsibilities are clearly demarcated and outlined. The problem lies not so much with the design and architecture of the UNFCCC policy regime itself but rather with how the various responsibilities and commitments arising from the policy regime have been fully or not fully implemented. | noted |
| 10990 | 6 | 42 | 9 | 42 | 11 | Why does "the long-term constraint enforces a degree of mitigation discipline" mean "to speed up mitigation efforts for the early entrants and delay them for the late entrants"? Why does such a situation happen? It is a little logically complicated, so it should be clearly explained. | will clarify |
| 12106 | 6 | 42 | 18 | 43 | 26 | As a general comment - Chapter 6 "Energy Sector Technology Transitions" is about technical system transformation - it ignores completely 2 key technical system transformation ideas - 1) That Whole of System Optimisation will achieve more cost effective end use energy efficiency than isolated technical stratgies - eg: As IPCC 2007 AR4 Building Chapter stated "Energy efficiency strategies focused on individual energy-using devices or design features are often limited to incremental improvements. Examining the building as an entire system can lead to entirely different design solutions. This can result in new buildings that use much less energy but are no more expensive than conventional buildings. The systems approach in turn requires an integrated design process, in which the building performance is optimized through an iterative process that involves all members of the design team from the beginning." REF (Stasinopoulos, P., Smith, M., Hargroves, K. and Desha, C. (2008) Whole System Design: An Integrated Approach to Sustainable Engineering, Earthscan, London, UNESCO and WFEO at http://www.naturaledgeproject.net/Whole_System_Design.aspx ) 2) There is a cross sector "energy" system synergies that will bring down the costs of transformation eg: namely the synergy between the transport sector (innovations in electric cars + batteries) and their potential to, through "Smart Grids", work with and enhance the transition the distributed renewable electricity supply. [Refs IEA (2011) Smart Grid Technology Roadmap. IEA at http://www.iea.org/papers/2011/smartgrids_roadmap.pdf + IEA (2011) Electric and Plug-In Hybrid Electric Vehicle Technological Roadmap. IEA http://www.iea.org/papers/2011/EV_PHEV_Roadmap.pdf ] I have published on this and can send a summary through if interested. | As discussed in Section 6.2, the entire Chapter 6 is dealing with integrated analysis of mitigation and by construction deals with the intercation between energy demand and supply, but in addition also aims at capturing key interactions between the energy system and other human and natural systems. |
| 10958 | 6 | 42 | 18 | 45 | 16 | Confer: Torvanger, Lund, Rive, Carbon capture and storage deployment rates: needs and feasibility, Mitigation and Adaptation Strategies for Global Change, DOI: http://dx.doi.org/10.1007/s11027-012-9357-7 | Reference will be included in SOD. |
| 9418 | 6 | 43 | | | | Strong relations between fossil primary energy supply and energy-related CO2 emissions are obvious. Thus figure6.24 is not something new since AR4. However, amounts of energy supply and CO2 emissions in different categories are informative. Thus, it is recommended to revise this figure, maybe in time-series trend or to incorporate with Figure6.25 ? | Figure 6.24 and the surrounding discussion has been replaced by a figure that relates climate targets to the use of fossil fuels. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 16719 | 6 | 43 | | | | What is significance of these graphs? Unclear. | Figure 6.24 and the surrounding discussion has been replaced by a figure that relates climate targets to the use of |
| 11751 | 6 | 43 | 10 | 43 | 18 | Delete the sentence [and therefore with the long-term stabilization goal]. Figure 6.25 shows only the uncertainity for deployment of low-carbon energy in the future. The importance of low carbon energy itself never change. (refer to No.22). | There is a clear trend that low-carbon energy deployment increases with the stringency of the long-term climate target (and the decrese in emissions levels in specific years). However, given that the overall final energy use depends on the extent of energy service demand response and energy efficiency |
| 10648 | 6 | 43 | 10 | 43 | 18 | fossil fuel use and industrial processes (Figure 6.25) consists of a lot of uncertaities. It does not seem correlated but it is sure that the low carbon technologies still play an important role. | There is a clear trend that low-carbon energy deployment increases with the stringency of the long-term climate target (and the decrese in emissions levels in specific years). However, given that the overall final energy use depends on the extent of energy service demand response and energy efficiency |
| 4204 | 6 | 43 | 19 | 43 | 26 | The cost and the quality (convenience) of energy form issues should be important. | This point has been emphasized in SOD |
| 13159 | 6 | 43 | 7 | 43 | 26 | Like the preceeding paragraph on fossil fuels, I find also these paragraphs (and the figure that follows) rather trivial and unnecessary. If must be possible to make in less than nearly two pages the rather simple point that mitigatio reduces the use of fossil fuels, increases the use of low carbon energy and, all else being equal, increases low carbon use even further if demand is high. | Comment is noted and will be considered as the text is adjusted for the next draft. |
| 11263 | 6 | 43 | | | | I do not see the kind of information that Fig 6.24 provides, I think they are trival and therefore useless. | Figure 6.24 and the surrounding discussion has been replaced by a figure that relates climate targets to the use of |
| 10991 | 6 | 43 | 10 | 43 | 13 | It is understandable that the use of low-carbon energy is far less well correlated with the CO2 emissions from fossil fuel use and industrial processes. However, the low-carbon energy could be rather far more well correlated with the long-term stabilization goal. Therefore, the expression of "and therfore with the long-term stabilization goal" should be deleted.<br>Reference: S. Pacala and R. Socolow, Stabilization Wedges: Solving the Climate Problem for the Next 50 Years with Current Technologies (2004). | There is a clear trend that low-carbon energy deployment increases with the stringency of the long-term climate target (and the decrease in emissions levels in specific years). However, given that the overall final energy use depends on the extent of energy service demand response and energy efficiency |
| 14684 | 6 | 430 | 46 | 431 | 1 | It is not clear here what the intent of the comment on geoenegineering is in this case. What sort of reference will be made to geoengineering at this point? | Comment is unclear |
| 16720 | 6 | 44 | 21 | | | Suggest inserting: Modeling indicates that the cost of CCS technology is an important determinant in the price of CO2 in cap and trade policy scenarios. If CCS is expensive, the CO2 price under tight CO2 caps will be high. If CCS is relatively inexpensive, the CO2 price will be lower. While it may be possible to achieve transformation by relying solely on renewables and reductions in demand, modeling exercises suggest that the cost of such technology limitations is much higher than those scenarios that allow the use of all low carbon technologies, including CCS and nuclear energy. reference page 36 in this chapter. | The costs of CCS technologies is typically only one among many indicators that have an influence on the CO2 price. The overall portfolio of available options - on the supply and demand side as well as in other sectors |

|---|---|---|---|---|---|---|---|
| 6278 | 6 | 44 | | 44 | | Of the two figures, 6.24 is clearly more informative and is more important to retain in this chapter than is the information in Figure 6.25. The text that describes Figure 6.26 adequately makes the point. If low carbon energy doesn't have emissions then the amount of low carbon energy that can be used could vary considerably across the models and the different climate sceanrios. That's a pretty straightforward point that doesn't need a half page graph and figure caption to communicate to the reader. | Figure 6.24 has been replaced by a figure that relates climate targets to the use of fossil fuels to link the discussion of climate targets with that on fossil fuel scarcity. |
| 11264 | 6 | 44 | | | | the information of this figure is very limited, it could only be useful if you separate between CCS, RES and nuclear. I do not understand why this figure is in the Executive summary. | There is only limited scope for dealing with individual energy supply technologies within Chapter 6. A more detailed breakdown of low-carbon energy |
| 10992 | 6 | 44 | 11 | 44 | 16 | Why could it be said "it is particularly tightly linked to the importance of fossil CCS in a specific pathway"? Even if we see the figure 6.26, we cannot find any concrete figure which supports the importance of fossil CCS. It should be explained more concretely. | Sentence has been removed. |
| 14685 | 6 | 449 | 35 | 449 | 35 | Is it fair to say that all proposed geoengineering strategies constitute adaptation? I'm not sure this is such a clear association | Any implication that geoengineering is equivalent to adaptation will be removed. |
| 9575 | 6 | 45 | | | | Please, describe model's prerequite for nuclear deployment in the text as while the chart (b) moves towards top in renewables, IEA analysis shows generation by hi REN and hi NUC case in 2050.They seem to be different from results of chart (b) (ETP 2010, Table 3.1, IEA). | The scenarios assessed in Chapter 6 include high and low nuclear or renewable variants similar to those from |
| 5868 | 6 | 45 | | | | Please rework the figure and shorten the text. There are no green or black letters legible, there are too many models (the different trajectories are not distinguishable) and using letters in the same colour as for shadings does not help to read a figure, too. | Figure has been reworked to highlight main points rather than showing individual model behavior. |
| 8349 | 6 | 45 | 1 | | 7 | How about making two figures in a same axis? For example, coal, oil and gas are summed to fossils and Non fossils are divided to renewables and nuclear in (a) figure like (b) figure | Two primary energy ternary plots have been included in the SOD, one with the original split coal, hydrocarbons, non-fossil energy and another that splits low- |
| 16721 | 6 | 45 | 17 | | 25 | Very important point -- make sure this is part of executive summary. | The point that electrification is a robust part of a mitigation strategy has been |
| 9180 | 6 | 45 | 17 | 45 | 25 | It is very important, concrete policy relevant message to policy maker hence should be put in the exec summary. | The point that electrification is a robust part of a mitigation strategy has been |
| 9179 | 6 | 45 | 17 | 46 | 8 | good argument. Also mention that the well-to-wheel efficiency is high for eletricity in many cases (heat pumps, EVs , etc) | The point that electrification is a robust part of a mitigation strategy has been |
| 11753 | 6 | 45 | 21 | 45 | 25 | It is reasonable analysis. | The point that electrification is a robust part of a mitigation strategy has been |
| 10649 | 6 | 45 | 21 | 45 | 25 | This is a good analysis. | The point that electrification is a robust part of a mitigation strategy has been |
| 9366 | 6 | 45 | 22 | 45 | 25 | It raises an important point thus should be remained. | The point that electrification is a robust part of a mitigation strategy has been |
| 6500 | 6 | 45 | 22 | 45 | 25 | This sentence should be left.<br>Because it is described easily to understand that electrication of the end-use sectors is effective as a way of reducing GHG emissions.<br>Even further description is needed. | The point that electrification is a robust part of a mitigation strategy has been emphasized. |
| 11752 | 6 | 45 | 8 | 45 | 10 | [public acceptance issues and other] should be amended to [some] because they aren't problem only for low-carbon technologies. | Sentece has been adjusted. |
| 9576 | 6 | 45 | 8 | 45 | 10 | Please, replace here with following as public acceptance is an issue for all types of generation; electricity generations, including low-carbon technologies, face public acceptance and other barriers that may limit or slow down deployment. | Sentece has been adjusted. |

|---|---|---|---|---|---|---|---|
| 10993 | 6 | 45 | | | | In this figure, Electricity Generation Shares should be also classified in primary energy resources in order to analyze fairly. | The electricity figure has been removed and a more detailed discussion of electricity generation can be found in |
| 4773 | 6 | 45 | 8 | 45 | 16 | It is true that some technologies, even low CO2 emission ones, are controversial, as all technologies have an impact on the environment. It is therefore important to develop those technologies under a sustainable way (i.e. in addition to pure technic issues, it is mandatory to identify and ahve support from stakeholders, deeply consultations, appropriate communications, etc.). I can provide examples on request, on the way to develop renewables or other technologies under a sustainable way. | Sentence has been adjusted. Section 6.6 includes a more detailed discussion of sustainable development in this context. |
| 6279 | 6 | 45 | 8 | 45 | 8 | To maintain consistency, replace "CO2 storage" with "CCS" | Language will be consolidated toward |
| 12104 | 6 | 45 | 18 | 46 | 20 | "Energy end use sectors along transformation pathways" misses a key point - the focus should be first on end use energy efficiency and demand management. Energy efficiency and demand management are critical to reducing electricity demand so that renewabel energy investment does enable overall GHG reductions in the electricity sector. If demand keeps rising, no matter how fast renewable energy is implemented, GHG will not be reduced fast enough to avoid dangerous climate change. As California has shown electricity demand can be flattened. The flattening of electricity demand changes the economics of electricity supply and makes the economics of distributed renewables much more favourable.... . This is because<br>- Renewable energy systems are smaller than large centralised fossile fuel power plants and thus have both lower up front costs and shorter construction time reducing the cost of tying up capital unproductively or needing to rely on loans from banks. renewable energy systems can be built quickly enabling income to start flowing much more quickly than large centralised power plants which can take many years to build. (ref Lovins, A.B. et al (2002) Small is Profitable: the hidden economic benefits of making electrical resources the right size, Rocky Mountain Institute, Colorado, p 173. Available at www.smallisprofitable.org/ )<br>- Renewable Energy systems also also overcome the main financial risk of large centralised fossil fuel power stations namely that demand will not match the new level of supply. In cases when future demand fails to meet expectations, additional scheduled increments of renewable energy capacity can be foregone, avoiding the cost of overbuilt centralized capacity. (Ref Hoff, T.E. and Herig, C. (1997) 'Managing Risk Using Renewable Energy Technologies', in Awerbuch, S. and Preston, A. (eds)The Virtual Utility: Accounting, Technology and Competitive Aspects of the Emerging Industry, Kluwer Academic, Boston. Available at www.cleanpower.com./research/riskmanagement/mrur.pdf) □ | In the literature both efficiency focused and supply-side focused approaches have been analyzed which is described here. A statement that prioritizes one over the other cannot be supported from the available literature. |
| 6280 | 6 | 45 | 21 | 45 | 25 | There are many papers going back many years that make this point. It is fine to cite the Sugiyama 2012 paper but there should be a number of other papers cited here as well. The value in citing more than one paper for a point like this is to clearly communicate to the reader that this is a well established point and is not something that can be dismissed as a fluke result that came from only one model. | Other papers have been added. |
| 5869 | 6 | 46 | | | | Please rework the figure and shorten the text. There are no green or black letters legible, there are too many models (the different trajectories are not distinguishable) and using letters in the same colour as for shadings does not help to read a figure, too. | Figure has been reworked. |
| 9883 | 6 | 46 | 11 | | | When you say "economically efficient" do you mean that the net benefits are positive (negative net costs) or do you just mean that the net cost of the energy efficiency related demand reductions if less than the marginal costs of other mitigation supply-side technologies? Please clarify and explain. This might also be a good place to explain the basis for the levels of energy demand reductions allowed in most models. | This interpretation is correct. We will consider clarifying this statement further within space limitations. |
| 8679 | 6 | 46 | 11 | | | When you say "economically efficient" do you mean that the net benefits are positive (negative net costs) or do you just mean that the net cost of the energy efficiency related demand reductions if less than the marginal costs of other mitigation supply-side technologies? | 8678 | 6 | 46 | 17 | | | The fact that the carbon intensity declines faster than the energy intensity may also be a sign that the rate of energy efficiency improvement has been constrained to be too low in most IAMs, even though these two issues are not directly related. | Given that emission levels ultimately have to reach zero under climate stabilization, carbon intensity of energy use will eventually have to go down to zero as well while there are limits on energy intensity reduction. A revised figure shows time-dependence of energy vs. carbon intensity improvements and indicates that energy intensity improvements typically dominate over |
| 9884 | 6 | 46 | 18 | | | The fact that the carbon intensity declines faster than the energy intensity may also be a sign that the rate of energy efficiency improvement has been constrained to be too low in most IAMs, even though these two issues are not directly related. | Given that emission levels ultimately have to reach zero under climate stabilization, carbon intensity of energy use will eventually have to go down to zero as well while there are limits on energy intensity reduction. A revised figure shows time-dependence of energy vs. carbon intensity improvements and indicates that energy intensity improvements typically dominate over |
| 9885 | 6 | 47 | 1 | | | It is noteworthy that the highest level of incremental energy reductions relative to the baseline scenario for just a couple of models is about 40% over 45 years, since the base year 2005. Clearly, that is less than 1% per year (it is 0.75%) on an incremental basis. Given the extensive literature on how rapidly incremental energy efficiency could be phased in if there was the political will to do so, 1% per year is very low. An incremental 2-3% per year could probably be achieved if need be, relative to the baseline. For many model runs the incremental level of efficiency improvement is only 20% over 45 years. These results clearly illustrate my concern that energy efficiency improvements have almost always, if not always, been overly constrained, and these facts ought to be discussed in a single section on scenario infeasibility. | It should be noted that energy and carbon intensity improvements were shown compared to baseline, i.e. in addition to the calculated energy intensity improvements another 1-2%/yr which are embedded in the baseline need to be added. In hte revised figure version an index compared to 2010 is shown which eliminated this baseline dependence. Some of the assessed |

| 9887 | 6 | 47 | 15 | | | This line cites various studies including EMF27 that the text relies on. However, it is my understanding that the EMF27 material is not yet published, and is not even accessible yet to the public. Yet, I thought that the IPCC assessments were supposed to include only results already in the scientific literature. Is there a problem, then, with including EMF27 results even though they might be interesting. One scenario study that was not included in this chapter or its references was the Tellus Institute study entitled "The Century Ahead: Searching for Sustainability", which is already published (Sustainability 2010, 2,2626-2651;doi:10.3390/su2082626). This study has four scenarios that represent an even greater range than most studies in terms of energy efficiency improvements and total final energy demand in 2100, etc. It also has two scenarios roughly consistent with RCP2.6. While it does not produce costs for scenarios, it has far more disaggregated information about all sectors of the economy than any other IAM reported on in this chapter, and thus its results would provide interesting contrasts and/or similarities with the results presented in Chapter 6. | The suggested publication will be considered for inclusion in the SOD. The reason for relying on results from the EMF27 study is that it includes a large set of integrated models which allows distilling robust elements of technology strategies. The EMF27 study has been completed in the meantime and submitted papers have been made available to the WGIII TSU for the SOD review. |

| 9888 | 6 | 47 | 22 | | | The first three sentences here are to some extent repeats of prior material presented earlier in the chapter, and I have already commented on those. The first is obviously true and does not require research to support. The second needs to be either re-written to make it interesting, or eliminated as being unclear as what is really meant. The third needs to be clarified also - does it simply mean that constraining the amount of mitigation technologies that can be deployed in one scenario relative to another raises the costs? If so, it is a mathematical truism, as I said before. And to the extent that it means that for any given model and input data set mitigation costs will rise, or become less negative, as the stringency of mitigation increases, that is also a mathematical truth and does not need to claim research support. If somethng else is intended it must be stated clearly. | Comment is noted and will be considered as the text is adjusted for the next draft. |

| 6759 | 6 | 49 | | | | The treatment of nuclear power in this model analysis should be specified in Figure 6.30. □ | Given space constraints of IPCC reports it will unfortunately not be possible to describe the underlying assumptions of each and every result, but the |
| 10650 | 6 | 49 | | | | The 450 ppm No Nuclear case is similar to the 550 ppm No Nuclear one. It is strange. There may be some conditions on the cases. Please provide the remarks on the conditions. | The figure shows the cost increase of technology constrained scenarios relative to scenarios with a default technology portfolio. Therefore, the similarity of the ranges presented for nuclear indicates that the technology |
| 5870 | 6 | 49 | | | | Please clarify: The numbers are shares of 7 (or more) scenarios each and not numbers of models using reduced technology portfolio scenarios and - of these - number of feasible scenarios? Else the number of feasible scenarios exceeds the number of reduced technology portfolio scenarios which does not make sense. | Figure 6.29 has been removed due to space constraints. However, an explanation of the numbers at the bottom of the figures has been added to |
| 9987 | 6 | 49 | | | | In this figure, there should be an explanation about the reason why the ratios of nuclear power generation are same in the 550 ppm case and the 450 ppm case. It seems that the capacity and/or generation of the nuclear is intentionally limited and set as the same in both cases. Many assessment models assume the limitation of nuclear power capacity and/or generations considering the public acceptability. It seems that the results are based on this assumption. If so, the results underestimate the contribution of nuclear power in terms of mitigation costs. | The figure shows the cost increase of technology constrained scenarios relative to scenarios with a default technology portfolio. Therefore, the similarity of the ranges presented for nuclear indicates that the technology |
| 9891 | 6 | 49 | 14 | | | Finally, here it is stated that the costs for implementing energy efficiency have not been taken into account "by all models". It should say which models do take it into account, and it should try to estimate the approximate size of the certain "downward bias" this creates in many results presented in this chapter. This major omission must be clearly labeled and identified in each relevant section of this chapter. It is not a "bias", it is a weakness in the structure of the models that omit these types of costs. | Given space constraints of IPCC reports it will unfortunately not be possible to describe the underlying assumptions of each and every result. The point here is that the cost estimate of the low energy intensity case might not be completely |
| 8687 | 6 | 49 | 14 | | | Finally, here it is stated that the costs for implementing energy efficiency have not been taken into account "by all models". The point here is that the cost estimate of the low energy intensity case might not be completely |
| 13280 | 6 | 49 | 17 | 49 | 23 | A wide range of energy system models include the possibility to switch parts of the transport system to electricity and/or hydrogen. Rather than citing one integrated model that does incorporate this possibility, would it not be more sensible to say that the rest tend to overstate the costs of mitigation because they ignore such important options? | Other studies that have explicitly explored the relevance of a transition to electricity/hydrogen in transport have been added. |
| 8688 | 6 | 49 | 18 | | | How do demand-side efficiency measures facilitate the use of low carbon fuels? This point is not clear, and the explanation offered is not clear. Generally, the two issues seem to be independent of each other. | The statement does not refer to efficiency measures, but to demand-side measures more generally. This includes fuel switching which is one important optionto facilitate the use of low-carbon |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 6693 | 6 | 49 | 2 | | | With its cost-effectiveness, Nuclear energy will play an important role in reducing mitigation costs than CCS and renewable energies. However, in this figure, an increase in mitigation costs due to constraints of technology availability of nuclear enegy is underestimated, compared with the other energies. It is probably because these estimations are based on the assumptions for the analysis in many models. Many models assume the exogenous scenario or limitation of nuclear power capacity or generations considering the public acceptability. Given such assumptions, the role of nuclear energy to mitigation costs tends to be underestimated. The nuclear energy capacities are inherently limited in the original modeling set-up, which leads to little change in nuclear power generation under different levels of emission reductions. Such assumptions lack a scientific basis and are often determined by modelers on an ad-hoc basis. They bring underestimation of the benefit of nuclear energy. So, the additional explanatory remarks of the figure discussed above should be added in the body text in order to avoid misunderstandings. | Those options that are largely confined to the electricity sector (e.g., wind, solar and nuclear energy) tend to show a lower technology value, because there are a number of low-carbon electricity supply options available that can generally substitute each other. |
| 9892 | 6 | 49 | 24 | | | Again, infeasibility is discussed from lines 24-32. Consolidate and move to end. | The discussion of infeasibility has been consolidated in the SOD. |
| 8689 | 6 | 49 | 24 | | | Again, infeasibility is discussed from lines 24-32. Consolidate and move to end. | The discussion of infeasibility has been consolidated in the SOD. |
| 6503 | 6 | 49 | 29 | 49 | 32 | This sentence should be left.<br>Because it is described briefly that strict CO2 equiv-target does not produce scenarios with limited technology portfolio. | The section has been restructured, but the statement has been retained. |
| 10994 | 6 | 49 | | | | In this figure, mitigation cost is not so different from 550 ppm to 450 ppm in the case of no nuclear. Why is such a result conducted? In comparison with other means, nuclear energy is seemed to be underestimated for mitigation. | Figure 6.30 shows the relative increase of mitigation costs in the absence of specific technologies compared to a case with the full (model-specific) technology portfolio. Given that costs in the full portfolio case increase from 550 to 450 ppm, this means that the cost |
| 6262 | 6 | 5 | | 11 | | While this introductory material is well written, there is substantial repetition of text as well as ideas. Streamlining this introductory material (the Executive Summary, Section 6.1 and Section 6.2) is one way to reduce the number of pages in this chapter. | Editorial. |
| 6265 | 6 | 5 | | 21 | | There is a real dearth of citations to the peer reviewed literature in this early material. There is certainly more than one paper that looks at the increased flexibility that is had from including multiple gases rather than just CO2 (there are too many examples to try and list them all here). An important aspect of AR5 is to survey the existing peer reviewed literature. It is clear that a tremendous effort has gone into putting together the database that CHapter 6 uses but there still is a need to have citations to specific aspects of the peer reviewed literature in the text when a specific point is being made. In the FOD, it seems that the "reference" for much of what is stated is the database. I'm not sure that is sufficient and this is something that the authors of this chapter might want to address as they prepare the SOD. | Accepted. The referencing will continue to be enhanced as the process moves forward. |
| 7849 | 6 | 5 | | 84 | | It is noted that this chapter does not consider the amount of fossil fuels that have already been explorated and which already own e.g. to a company. These resources correspond to significant amount of economic value and any scenario has a significant impact on its market value. The potential loss of market value should be considered as a major driver of policy decisions that finally will translate into the actual emission pathway. | Rejected. This is a topic for the finance chapter. |
| 14388 | 6 | 5 | 1 | | | “many pathways” is a bit at odds with the seeming pessimismistic tone of Chapter 1, which comes close to saying 2° is impossible | Noted. |
| 8056 | 6 | 5 | 1 | 8 | 21 | In the Ex Summary I would like to see more what was said on linkages of mitigation and adaptation (and or knowledge gaps): Compare with page 27, lines 43 - 46 | Rejected. This chapter is focused on mitigation, not on adaptation. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 8057 | 6 | 5 | 1 | 8 | 21 | In the Ex Summary I miss the clear language on the necessary great transformation like in page 83, line 45 to page 84 to line 5: 'Within this context, research indicates that efforts to meet a 2.6 W/m2 will be challenging under all strategies, but extraordinarily challenging without the option to overshoot this goal temporarily, substantial, near-term global emissions reduction, coordinated action to achieve these reductions, and a full complement of available technology options including CCS and nuclear power. Indeed, studies indicate a global emissions peak prior to 2020 to meet this goal, with associated dramatic near-term transformations in the energy system and social and institutional infrastructure for producing and consuming energy.' This fits to page 8, line 7 | Noted. The language to describe the requiremments to meet long-term goals is being refined. At the same time, efforts are being made to strike value judgments like "extremely challenging" from the text. |
| 8058 | 6 | 5 | 1 | 8 | 21 | Also 'At the same time, these idealized circumstances are unlikely to materialize. Studies indicate that delays in global action or fragmented action regimes in which mitigation is not undertaken where and when it is least expensive or in which policy structures are not designed to minimize costs can all increase costs dramatically, more than XX% in some circumstances' (p85, line 9 - 12) is worth for being in the Executive Summary. | Rejected. The subjective assessment of what policy structures are or are not likely will be removed from the chapter. |
| 14031 | 6 | 5 | 10 | | | Some of these other societal priorities would also be economic growth and job security | Noted. |
| 14032 | 6 | 5 | 12 | | | Add "cultural change" | Noted. |
| 8612 | 6 | 5 | 13 | | | American pioneers | Noted but not understood. |
| 4767 | 6 | 5 | 17 | 5 | 27 | Yes I agree, but the difficulty is to monetise (give an economic value) to those services (first thing is to recognise all those services, and second to monetise them) | Noted. |
| 6094 | 6 | 5 | 18 | 21 | | Executive summary is excellent. I hope other chapter follow the lead. | Noted. |
| 9825 | 6 | 5 | 19 | | | Here, and throughout the chapter, the economic costs of climate change mitigation are refered to. However, the possibility of net benefits, not costs, must also be included as an appropriate balanced approach. I do not know why the authors think that net costs is the only possibility, even though all runs of existing IAMs might yield that result. They yield that result, in part, because reference case scenarios may not have been run with fossil fuel prices sufficiently above those in the mitigation scenarios, due to the higher prices that might result from higher demand for fossil fuels in the reference cases. Please please rewrite all the economic cost sections acknowledging the possibility of net benefits resulting from mitigation compared to reference cases. Net benefits could also result in renewable energy was much cheaper than fossil-fuel energy, etc. | Noted. The notion of negative costs will be mentioned in the SOD. |
| 8613 | 6 | 5 | 19 | | | Here, and throughout the chapter, the economic costs of climate change mitigation are refered to. However, the possibility of net benefits, not costs, must also be included as an appropriate balanced approach. I do not know why the authors think that net costs is the only possibility, even though all runs of existing IAMs might yield that result. They yield that result, in part, because reference case scenarios may not have been run with fossil fuel prices sufficiently above those in the mitigation scenarios, due to the higher prices that might result from higher demand for fossil fuels in the reference cases. Please please rewrite all the economic cost sections acknowledging the possibility of net benefits resulting from mitigation compared to reference cases. Net benefits could also result in renewable energy was much cheaper than fossil-fuel energy, etc. | Please see the response to comment 9825, which appears to be a duplicate of this comment, despite being submitted by another reviewer. |
| 4766 | 6 | 5 | 2 | 5 | 16 | I fully support this statement, the target is important, but the path to ii is even more | Noted. At the same time, the ES is being revised for the SOD, and this statement may be removed for space |
| 2254 | 6 | 5 | 2 | 5 | 3 | Since there is no evidence that increases in greenhouse gases have a harnful effect on the climate the whole exercise of this chapter appears to be futile, inless there are other "abthropogebic" effects which are considered "dangerous" | Please see WGI and WGII |
| 3628 | 6 | 5 | 2 | 5 | 3 | Please refer to Article 2 of UNFCCC. | Noted. This phrase may not longer be found in the ES in the new revisions. Regardless, whether it remains or a similar statement remains in the introduction, we will no longer include a |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 7847 | 6 | 5 | 2 | 5 | 3 | It would be very interesting to know the basis of this statement made in the first sentence. Such statement is only possible if there is a common understanding about that level of climate change that does not yet represent a dangerous interference with the climate system. For the time being there is no real political agreement on such level, expressed as temperature increase compared to earlier levels. The following wording is suggested: There are many transformation pathways to stabilization of greenhouse gas concentrations at a given level. | Noted. This phrase may not longer be found in the ES in the new revisions. Regardless, whether it remains or a similar statement remains in the introduction, we will no longer include a reference to dangerous anthropogenic |
| 11367 | 6 | 5 | 22 | 5 | 22 | The term 'good decisions' is a bit vague and probably too open. Please reconsider that and specify. | Noted. |
| 12622 | 6 | 5 | 26 | 5 | 27 | I see no reason to single out any technologies here. All technologies include trade offs, CCS, Nuclear, Wind, Solar, etc. | Noted. The questiion of when to single out technologies as examples is being |
| 12665 | 6 | 5 | 26 | 5 | 27 | I see no reason to single out any technologies here. All technologies include trade offs, CCS, Nuclear, Wind, Solar, etc. | Noted. The questiion of when to single out technologies as examples is being |
| 11744 | 6 | 5 | 26 | 5 | 27 | Other low carbon technologies like wind and geothiermal have also environmental problems to resolve and CCS isn't only for coal-fired power. It is strange only nuclear and coal-fired CCS are included as examples of other environmental factor. [nuclear power] should be amended to [low carbon technologies] and [coal-fired] should be deleted. | Noted. The questiion of when to single out technologies as examples is being considered for the SOD. |
| 9563 | 6 | 5 | 26 | | | Please, delete examples of nuclear and CCS, or add examples of wind power and geothermal as they involve bird-strikes (wind power) and sources of mercury contamination (geothermal power). | Noted. The questiion of when to single out technologies as examples is being |
| 9564 | 6 | 5 | 27 | | | Please, remove coal-fired from coal-fired CCS as we need any types of CCS in terms of negative and positive emissions. | Noted. The questiion of when to single out technologies as examples is being |
| 7848 | 6 | 5 | 27 | | | The term "coal-fired CCS" might be technical jargon but should be substituted by a more complete term such as: coal-fired power plant with CCS | Editorial |
| 13120 | 6 | 5 | 28 | 5 | 29 | The wording is a bit courageous. Surely not ALL countries MUST bring their emissions "toward zero" for meeting ANY stabilization goal? Reformulate. | Noted. This phrase may not remain in the SOD. If it remains, it will be made |
| 4188 | 6 | 5 | 28 | 5 | 29 | The expression ".. all countries must ultimately bring their emissions toward zero to meet any stabilization goal." seemes to be exaggerated, since equilibrium still allows some emission. | Noted. This phrase may not remain in the SOD. If it remains, it will be made |
| 7390 | 6 | 5 | 28 | 5 | 29 | This is demonstrably incorrect for short-lived gases, where constant emissions still result in stabilisation. It is only true for very long-lived gases. As this is a very policy relevant issue, please make clear that abatement of short-lived gases helps reduce costs but is not a physical necessity, whereas reduction to zero of long-lived gases, particularly CO2, is an absolute physical necessity to meet stabilisation goals. | Noted. This phrase may not remain in the SOD. If it remains, it will be made more clear. |
| 14389 | 6 | 5 | 29 | | | Bring “toward zero”?? My figure is 1.4 tCO2 per person per year | Noted. This phrase may not remain in the SOD. If it remains, it will be made |
| 3070 | 6 | 5 | 29 | | | “all countries must ultimately bring their emissions toward zero to meet any stabilization goal”. This is wrong scientifically (if GHG have a constant finite atmospheric residence time they will stabilize at some elevated level for any emission rate). It is also clearly a fantasy---no country is going to give up vehicular or air travel, for example, or heat all its buildings with electricity (very expensive, even if nuclear power comes back into fashion). | Noted. This phrase may not remain in the SOD. If it remains, it will be made more clear. |
| 6535 | 6 | 5 | 29 | | | Replace "bring their emission toward zero" with e.g. "reduce their emissions significantly" in accordance with AR4 WG1 Report Figure 10.21, or give a reference paper. | Noted. This phrase may not remain in the SOD. If it remains, it will be made |
| 3071 | 6 | 5 | 3 | | | “dangerous anthropogenic interference with the climate” is advocacy, not science, and ignores the fact that the extensive scientific effort devoted to climate modeling has not been matched by any significant effort devoted to determining whether warming or climate change will, on balance, help or harm humanity. The Medieval Climate Maximum was a time of prosperity, at least in northern Europe, and the Little Ice Age a disaster. This may not be extrapolatable to modern anthropogenic warming, but the question has hardly been asked, much less answered. | Noted. This phrase may not longer be found in the ES in the new revisions. Regardless, whether it remains or a similar statement remains in the introduction, we will no longer include a reference to dangerous anthropogenic |
| 9826 | 6 | 5 | 30 | | | Not all countries must undertake substantial reductions in emissions, some can maintain their level or even increase their level in a decent way. | Noted. This phrase may not remain in the SOD. If it remains, it will be made |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 13121 | 6 | 5 | 30 | 5 | 32 | I'd suggest moving this conclusion later in the paragraph - currently mitigation quantities and costs are brought up before they are properly defined (i.e. only after the conclusion it's explained that costs and quantities are calculated against a baseline, not, for example, the base year) | Noted. The ES is being substantially revised and the ordering and nature of points that it makes will be different in |
| 14033 | 6 | 5 | 30 | | 42 | I wonder how useful it is to distinguish between developing and developed countries when talking about where the largest cuts in emissions will need to take place in the future. If this is brought into the executive summary and is meant to inform the need for coordinated international action to meet global goals, there should be more discussion on where the largest emissions will take place, for example in Asia. | Noted. |
| 11416 | 6 | 5 | 31 | 5 | 35 | The assertion that developing countries will have to undertake greater levels of emission reductions because their emissions are projected to be larger than those of developed countries over the coming century needs to be explained more clearly in terms of what the assumptions are underlying such assertion. Absent a clear explanation of the assumptions for this assertion, such a bare assertion could be used in a non-scientific and political way in order to push specific policy agendas or approaches in the context of international policymaking discussions and negotiations on climate change that could effectively absolve developed countries of any further mitigation commitments and increase the pressure on developing countries to undertake increased mitigation actions. | Noted. The basis for this assertion, continued economic growth in the developing countries, is discussed in greater length in the chapter. |
| 14390 | 6 | 5 | 33 | | | Should clarify that cutting emissions to a low uniform level would be smaller percent cut for most developing countries. (India is currently at about 1tCO2 per capita.) | Noted. |
| 13122 | 6 | 5 | 43 | 6 | 5 | The conclusion here seems to suggest that the scenario results can be used as proof for when emissions need to peak. I don't find this convincing, as this depends completely on the assumptions that have been used when constructing the models (which is acknowledged in the table caption that follows, but not in the text). For example, if a break through for cheap air capture technologies was assumed in the models, the peak could presumably be later. At the very least I would like to see this conclusion supported by a purely carbon budget related argument before I would call the evidence "robust". | Noted. An attempt is being made to distinguish between scenarios with and without negative emisisons technologies and then with different levels of overshoot and delayed action. Regardless, this table will no longer be |
| 11368 | 6 | 5 | 43 | 5 | 47 | This statement needs careful reading . It should be reformulated or cut into several sentences to achieve better reading and reasoning. | Accepted. Sentence needs work. Regardless, the ES is being substantially revised and the ordering |
| 14391 | 6 | 5 | 48 | | | It is annoying when this chapter frequently uses the W/m2 metric rather than the more familiar degrees C or ppm. | Accepted. The chapter is moving to the ppmv CO2-e notation. |
| 9824 | 6 | 5 | 9 | | | also lifestyles and the moral values we hold should be included in the list of choices we must make | Noted. |
| 8611 | 6 | 5 | 9 | | | "the treatment of land use" sounds like a modeling issue - perhaps you mean "how land is used"; also lifestyles and the moral values we hold should be included in the list of choices we must make | Noted. |
| 11243 | 6 | 5 | | | | The executive summary is so far only an introduction how to read scenarios, but there is nearly no content. Fig 6.ES.1 e.g. does not contain an important message, it is trivial (or did I miss something?). I also find Table 6.ES.1 not very informative because it is not clear if this is meant for the idealized scenarios or for a mean over all scenarios. | Noted. The ES is being substantially revised and the ordering and nature of points that it makes will be different in the SOD. |
| 11244 | 6 | 5 | | | | A historical context is missing: there is no reference to AR4 and even not to the SRREN. It would be interesting to know what happened with the models since AR4? How have models developed (e.g. including now BECCS)? What has been learned from the SRREN? What is new in the political discussion that chp. 6 should be able to answer? | Noted. We intend to provide a greater link to AR4 in the next version of the ES. The ES is being substantially revised and the ordering and nature of points |
| 7712 | 6 | 5 | | 7 | | Too much repetetion for describing why this chapter is not complete. The senario models are mostly too premature and they need much time to be established. All the descriptions on 'uncertainty of the models' are very much troublesome for readers. Reconsiderations for the structure would be highly appreciated. | Noted. |
| 16683 | 6 | 5 | | 8 | | Should bring forward and highlight the point made on page 36 of chapter 6 about the benefits of policies that put a price on CO2 emissions -- they provide by far the most efficient, least cost means to reduce emissions. Policymakers should be reminded of this in the context of transformation of the energy system in the executive summary. | Noted. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 10979 | 6 | 5 | 19 | 5 | 22 | What's the role of "measures of macro-economic costs such as GDP losses or changes in total personal consumption" if it were "far from the only characteristics about transition pathways that matter for making good decisions"? Is it a supplementary factor? | Noted. The ES is being substantially revised and the ordering and nature of points that it makes will be different in |
| 12608 | 6 | 5 | 1 | 8 | 21 | On the Executive Summary. Woud be good to change to a different letter font the principal message or bullets. | Editorial |
| 9893 | 6 | 50 | 1 | | | It seems to me that land-use issues, and how they interact with other mitigation issues, are so complex and so important, that they deserve more extensive treatment. More material should be presented and the entire topic should be explained relative to how land-use is taken into account in some of the most important IAMs, including the Tellus Institute scenario model Polestar. (See reference above.) Land-use issues should be integrated into each sub-section of this chapter where appropriate. For example, land-use issues should be discussed when discussing model structure, input assumptions, results, policies, etc. | Author team agrees that land-use needs to be better integrated throughout chapter, e.g., reference emissions, model descriptions. Will consider the Polestar publication and how it fits into the chapter. |
| 8690 | 6 | 50 | 1 | | | It seems to me that land-use issues, and how they interact with other mitigation issues, are so complex and so important, that they deserve more extensive treatment. More material should be presented and the entire topic should be explained relative to how land-use is taken into account in some of the most important IAMs, including the Tellus Institute scenario model Polestar. (See reference above.) Land-use issues should be integrated into each sub-section of this chapter where appropriate. For example, land-use issues should be discussed when discussing model structure, input assumptions, results, policies, etc. | Same as previous comment. |
| 7468 | 6 | 50 | 16 | 50 | 19 | “Uncertainty about land-related baseline CO2 emissions and sequestration is significant historically (Houghton et al., 2012; Pan et al, 2011) and in projections. The latest baseline projections for land related CO2 emissions show an enormous range across integrated assessment models, which begins with historical years (Figure 6.31)”. Some of the annual et primary production (NPP), an estimated 53.2 Gt C, may be sequestered. However, the annual use of NPP for energy and non-energy purposes is of the order of 3.5 Gt C, (see general comments in Ch.7). Therefore, there is a considerable surplus of the annual growth of biomass. Thus, the various lines in figure 6.31 may be an over estimate of CO2 emissions from biomass. | Fig 6.31 is supposed to be projections of NET LUCF emissions. We are verifying that that is the case. All of the projections should be either net or gross, and we prefer for the former for this purpose. |
| 14405 | 6 | 50 | 26 | | | Explain the sink. Adoption of ambitious afforestation programs? | Comment pertains to Fig 6.31. We clarify that in the long-run a terrestrial |
| 6916 | 6 | 50 | 2 | | | Refer to WGI AR5, Chapter 6, for mechanisms and quantitative assessement of sources/sinks from carbon and other biogechemical cycles. | Reviewing WG1 AR5 Ch6 and will cite accordingly. |
| 14687 | 6 | 502 | 24 | 502 | 26 | It is worth qualifying this sentence with the preface "if it was to be effective in practice, the net effect would be to accelerate...etc....". | We could not figure out which part of the chapter this comment is referring to. Neither in the single chapter PDF version nor in the full FOD PDF file is |
| 14688 | 6 | 502 | 28 | 502 | 30 | It is important that the boundaries of this cost estimate are made explicit, i.e. does this simply include the cost of the iron, or also the cost of transporting, deploying, monitoring imacts and effectiveness, etc. Costs depend on so many factors that it is important not to prejudge cost of what remains an abstract concept. | We could not figure out which part of the chapter this comment is referring to. Neither in the single chapter PDF version nor in the full FOD PDF file is |
| 14689 | 6 | 502 | 43 | 502 | 43 | It is probably worth noting here that ocean fertilisation activities are now controlled under the London Convention/London Protocol Resolutions LC-LP.1(2008), which disallows all ocean fertilization activities other then legitimate scientific research, and LC-LP.2(2010), which established the assessment framework to determine whether proposed ocean fertilization activities constitute legitimate scientific research (http://www.imo.org/blast/mainframemenu.asp?topic_id=1969). It is also worth noting that , because of concerns over impacts, the direct disposal of CO2 into the water column or on the seabed has been prohibitted in some regions, most notably the North-East Atlantic region under the OSPAR Convention (OSPAR Decision 2007/1 to Prohibit the Storage of Carbon Dioxide Streams in the Water Column or on the Sea-bed, http://www.ucl.ac.uk/cclp/pdf/OSPAR2007-Annex-5.pdf). | We could not figure out which part of the chapter this comment is referring to. Neither in the single chapter PDF version nor in the full FOD PDF file is there a page 502 that is part of Ch.6. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 14690 | 6 | 502 | 46 | 503 | 1 | Proposals for alkalinity management do not strinctly accelerate weathering but rather aim to mimic the effect of such enhanced weathering through artificial addition. In addition to concerns regarding impacts of mining, processing and trasmporting on land, the Expert Group report for the CBD SBSTTA on "IMPACTS OF CLIMATE-RELATED GEOENGINEERING ON BIOLOGICAL DIVERSITY" (UNEP/CBD/SBSTTA/16/INF/28, http://www.cbd.int/doc/meetings/sbstta/sbstta-16/information/sbstta-16-inf-28-en.pdf) noted that "While the theoretical chemistry of the processes of enhancing ocean alkalinity is relatively straightforward, the impacts on those processes on biodiversity (if the technique were to be deployed) are much more uncertain. In particular, the biological effects of temporarily enhanced Ca2+ ions and dissolved inorganic carbon are not adequately known". It may be worth including some reference to this | Risks are already mentioned and we believe this is more detailed than can be accommodated in a space allocated. |
| 14686 | 6 | 502 | 4 | | | This entire section would benefit significantly from greater consideration of potential adverse impacts of commonly proposed geoengineering methods, drawing perhaps on the recent report of the Expert Working Group on impacts of geoengineering on biodiversity under the CBD (http://www.cbd.int/doc/meetings/sbstta/sbstta-16/information/sbstta-16-inf-28-en.pdf) | I think this is a reasonable suggestion, one way to deal with it would be to include a table of adverse impacts along with potential benefits. |
| 14691 | 6 | 503 | 17 | 503 | 21 | There are also significant concerns regarding the potential environmental impacts of the most commonly used or proposed amine-based capture chemicals, e.g. Padurean, A., Cormos, C.-C., Cormos, A.-M., Agachi, P.-S. (2011) Multicriterial analysis of post-combustion carbon dioxide capture using alkanolamines. International Journal of Greenhouse Gas Control 5: 676-685 . | There are many proposed approaches to direct carbon capture which are only briefly mentioned in this section. Section 6.5.3 covers these in more detail but does not raise this particular issue. |
| 14692 | 6 | 503 | 23 | 503 | 23 | It is unwise at this stage to state in an unqualified way that SRM has a role in shaping climate policy as it is not clear that it would be effective in any manner, or acceptable as a policy approach. It may be expected to act relatively quickly in reducing solar radiation reaching the Earth's surface, but the speed, uniformity and effectiveness of action remains unknown. | The existence of geoengineering may shape policy outcomes even though it is uncertain and may not be used. |
| 14693 | 6 | 503 | 26 | 503 | 27 | once again this is a highly theoretical treatment and should be explicitly so - it cannot yet be said that SRM 'CAN' temporarily and imperfectly maskclimate change - these are, of course, theoretical modelled prediction,s not empirical observations. | The literature on solar geoengineering now spans many hundreds of papers published over many decades. That literature in turn rests on a body of scientific knowledge of climate that is substantially the same as the body required to understand the climate impacts of greenhouse gases and aerosols. This understanding in turn rests observations as well as theory. It is certainly true that the literature on geoengineering is smaller than the total literature on many other topics, but |
| 14694 | 6 | 503 | 34 | 503 | 34 | In fact, there is little evidence that public understanding of SRM is growing 'rapidly' - without stressing that public awareness understanding is starting from (and remains at) a very low baseline, this statement could be misinterpreted as implying commen knowledge and perhaps even widespread acceptance. | We will edit the text to ensure that we are not implying anything about acceptance of SRM. |
| 14696 | 6 | 504 | 21 | 504 | 29 | This paragraph is also currently quite unclear in significant parts and will need to be reviewed in detail once the text has been redrafted and the meaning is clear | text completely revised, comment no longer applies |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 14695 | 6 | 504 | 6 | 504 | 16 | This paragraph is currently very unclear, with some sentences being very long and others incomplete. It also implies once again that SRM is demonstrably able to compensate for changes in temperature or precipitation, without making clear that these are 'in principle' theoretical statements based on limited modelling. In some cases, the model outputs have been tuned by specfici inputs in order to compensate, and it is vital that model parameters and outputs are also distinguished clearly. | The literature on solar geoengineering now spans many hundreds of papers published over many decades. That literature in turn rests on a body of scientific knowledge of climate that is substantially the same as the body required to understand the climate impacts of greenhouse gases and aerosols. This understanding in turn rests observations as well as theory. It is certainly true that the literature on geoengineering is smaller than the total literature on many other topics, but |
| 7469 | 6 | 51 | 13 | 51 | 16 | "GHG mitigation opportunities in land are of one of three types: emissions reductions, terrestrial carbon stock enhancement, or biomass displacement of fossil-fuel based energy. Bio-based products are also a possibility, but one not yet modeled. For a more complete discussion of mitigation technologies, as well as mitigation supply potential, see Chapter 11". The accessible NPP is at least 13.4 Gt C. Thus with improved management , some of this annual growth of biomass could be sequestrated and/or used for energy and non-energy purposes. Most if not used, returns to the atmosphere. | No reference provided. However, there were similar comments on chapter 11. The results reflect the economic costs of mitigation. Technical potential is much larger, but is not cost-effective, as cheaper mitigation options across the |
| 3380 | 6 | 51 | 17 | 51 | 25 | The numbers on bioenergy mitigation potential reported here are high. Here is the following concern: A number of carbon GHG dynamics, e.g. carbon stock dynamics, soil emissions, N20 emissions (high uncertainty), ILUC, but also non-GHG issues, such as albedo tend to make assessment of the global warming impact of bioenergy deployment quite complex and challenging. I am relatively sure that most IAM models used for producing these numbers are relatively ignorant of these effects (see Creutzig et al., 2012). Sometimes, effects point to a positive effects on the global warming impact. Mostly, however, these dynamics seem to compromise the mitigation potential of bioenergy. These dynamics are also relevant for advanced bioenergy sources, e.g. energy crops, but also forest residue use. etc. I am not saying that such high numbers as reported here are not possible. I am saying that the models used are focussing on one set of scenarios, mostly optimistic, and that under plausible other model assumptions, the potential could be significantly lower. A note of caution when interpreting the numbers presented here would hence be appropriate from my perspective.<br>F. Creutzig, A. Popp, R. Plevin, G. Luderer, J. Minx, O. Edenhofer (2012)<br>Reconciling top-down and bottom-up modeling on future bioenergy deployment.<br>Nature Climate Change 2: 320-327 | Agree that it is important to properly characterize the state of modeling and caution about potential bias in results. Existing text does to a degree, but will consider the citation provided to incorporate missing aspects. |
| 9894 | 6 | 51 | 18 | | | If such high proportions are correct, then this implies that land-use issues and modeling must be fully integrated in all sections of chapter 6, as I suggested above. | See previous reply line 766. |
| 8691 | 6 | 51 | 18 | | | If such high proportions are correct, then this implies that land-use issues and modeling must be fully integrated in all sections of chapter 6, as I suggested above. | Same as previous comment. |
| 7470 | 6 | 51 | 26 | 51 | 30 | "More generally, transformation pathway studies have produced total global land-use CO2 emissions reductions of up to 5 and 6 GtCO2/year [ 1.4 – 1.6 Gt C] in 2030 and 2050 respectively (Fisher et al., 2007); L. Clarke 27 et al., 2009), with up to 10 GtCO2/year [2.7 Gt C] having also been estimated (Wise et al., 2009), in scenarios in which terrestrial carbon is subject to the same immediate and global price as fossil and industrial emissions". As stated above, the accessible NPP is at least 13.4 Gt C, with present use estimated to be 3.5 Gt C. Therefore there is a considerable surplus of accessible annual growth of biomass, to more than satisfy the above forecasts. Most of the traded biomass is very competitive when compared to fossil fuels. In fact fossil fuels and electricity are subsidized in many countries. | See previous reply line 770. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 13167 | 6 | 51 | 36 | 51 | 38 | This message doesn't come through very strong from the figure and I wouldn't add a reference to it in this sentence. It would be much more appropriate later, for example for the sentence on lines 39 and 40 ("However…") | Good suggestion. |
| 18634 | 6 | 52 | | | | Page 52 contains an interesting reasoning on the need for policy coordination (but shouldn't that be discussed in the policy chapters?) | It is here because it affects cost and net effectiveness of land based mitigation. Coordination should be in policy chapter |
| 9895 | 6 | 52 | 19 | 52 | 29 | The same can be said for bioenergy and it´s interaction with land-use | Couldn't figure out the meaning of this |
| 7471 | 6 | 52 | 19 | 52 | 23 | "To understand bioenergy's transformation role, it is important to understand bioenergy's role within the energy system. The research results surveyed in (Rose et al., 2012) found bioenergy contributing up to 15% of cumulative primary energy over the century during stabilization. Figure 6.33 shows more recent annual results, where bioenergy is projected to provide 20 to 250 EJ in 2050 (10 to 30% 22 of total primary energy) and 10 – 330 EJ in 2100 (20 to over 40%) for immediate global action scenarios". While bioenergy may contribute up to 15% of the primary energy system, the accessible annual growth of biomass is of the order of 500-515 EJ, and the total terrestrial NPP is an estimated 2000 EJ. The accessible NPP is much greater than the figures estimated on lines 19-23! Again, the estimates in Figure 6.33 are on the low side. | See previous reply line 770. Note that cost is a consideration. So, while there may be substantial NPP or EJ of biomass available it may be costly to access and to convert (not to mention net emissions and coordination issues). |
| 6402 | 6 | 52 | 37 | 52 | 40 | All of these acronyms or abbreviations are confusing. The reader doesn't know what they refer to, and what they mean. When I got to this, I naturally wanted to gloss over this and skip this part. | Thank you for pointing this out. |
| 5871 | 6 | 53 | | | | Not legible, enhance / rework or delete. 3 x 15 colums along the x-axis is too much! | Agree. A different figure needed. |
| 6403 | 6 | 53 | 15 | 53 | 15 | Abbreviation of BioCCS is inconsistent with other abbreviations in the chapter (BECS, BECCS) | Standardizing to BECCS |
| 9587 | 6 | 53 | 15 | 53 | 17 | Please, describe the reality of BioCCS here as it may have limitation to deploy and uncertainty as follows; Rhodes and Keith in a 2008 peer-reviewed commentary on biomass with capture noted that while the high end of estimates for potential biomass availability support the view that biomass could provide the central mechanism for managing global climate and energy challenges, it is doubtful because [1] of the deep uncertainty in the feedstock supply estimates; the environmental implications of maximizing production; the complex social and ethical issues arising from the required re-organization of global land use; and the potentially high costs of such a strategy.<br>They further note that [2] relatively large allocations of land in the developing world would be required to support the scales of bio-energy development implied by globally-aggressive biomass-based strategies. For example, land availability estimates indicate that 84% of arable land not in commercial use is in tropical regions of the world. Local food production capacity, which likely represents a more immediate concern in the developing world than carbon emissions, could be displaced. More generally, rural populations could be forced to adapt to radically changed local environments, including environmental consequences from large-scale biomass production. The notion that these disruptions should be absorbed by the developing world in order to mitigate carbon emissions in industrialized nations raises complex ethical issues of "biomass justice".<br>[1] J.S. Rhodes and D.W. Keith (2008) Biomass with capture: negative emissions within social and environmental constraints: an editorial comment, Climatic Change, 87, p. 323, lines 9-14.<br>[2] J.S. Rhodes and D.W. Keith (2008) Biomass with capture: negative emissions within social and environmental constraints: an editorial comment, Climatic Change, 87, p. 323, lines 31-41. | Need a clear statement that all indications are that realities of bioenergy are complex and challenging. Sustainable bioenergy, if it exists, has yet to be identified. Cross-referencing bioenergy x-cut as well. |
| 13170 | 6 | 53 | 19 | 53 | 21 | This should also be mentioned on page 48, lines 17-23. Currently bioCCS is mentioned as one of three reasons why CCS is important for 450 ppmCO2eq, but this text here suggests that the three reasons mentioned are unlikely to be equally significant. | Thank you. Coordinating on text across sections. |

|---|---|---|---|---|---|---|---|
| 7472 | 6 | 53 | 28 | 43 | 31 | “There are significant challenges to accessing the potential estimated above. Among other things, there are large fundamental historical scientific uncertainties about terrestrial carbon stocks and fluxes (e.g., (Henry et al., 2011); Houghton et al., 2012) that combined with uncertainty about economic behavior, complicate estimation of mitigation potential, as well as actual mitigation ---“. I have estimated the above-ground stock of accessible woody biomass to be an estimated 544 Gt wood, 9272 Gt C – over 10000 EJ). Accounting for below-ground woody biomass (150 Gt C) and soil carbon below the trees (600 Gt C), the total stock of C is in the region of 1020 Gt C. Then of course there is a carbon store in inaccessible forest and in grassland and some in crops, plus the store in the soils beneath these land use types. | Unfortunately, no reference provided to properly evaluate and address comment. Appears to be similar to previous comments, so please see those replies (e.g., line 770 and 778). |
| 8692 | 6 | 54 | 15 | | | Section 6.4.1 is very good. You might want to add at the end that the implication of this section is that IAM modeling and scenario creation is for the purpose of achieving certain climate and social targets in the future, as knowledge of the earth/climate system increases. Because the mitigation trajectory actually followed by the world will be evolving based on new information, it makes no sense to talk about the probability as of today of any climate mitigation scenario occuring. And uncertainties in our current knowledge base will get reduced over time as we learn more, and as we take corrective action when the chosen mitigation trajectory gets off course. To me this should be the major theme of the entire chapter 6, and this material might best be put up front in the introduction to the chapter. | Agreed, the notion of sequential decision-making is an important theme. The author team will work on adding references to studies explicitly examining stochastic control and will incorporate the notion into the introduction section. In addition, a clearer discussion of how to interpret scenarios in the context of uncertainty about input parameters will |
| 9897 | 6 | 54 | 33 | 54 | 34 | "models or scenarios that assume the future availability of a negative emissions energy conversion technology" should be presented more in detail or at least a reference should be made. Otherwise I doubt how decision makers might perceive this statement. They might see this as a call for non-action. | The statement is an objective assessment of the results in published stabilization scenarios. It is an important characteristic of the ensemble of published scenarios that pathways with the possibility of negative emissions in the future can have higher emissions in the near-term while meeting the same target at the end of the century (the |
| 9067 | 6 | 54 | 14 | 58 | 7 | 6.4 Integrating long term and short term perspectives can be deleted due to limitations on the nos of pages | The structure of the chapter is being revised to best cover the material within the prescribed outline. However, we likely need to keep some or most of the material in this section. Every effort will |
| 6917 | 6 | 54 | 16 | 54 | 20 | Suggest to refer to the WGI AR5, Chapter 12 assessment for long-term climate change considerations. | We will include the reference. |
| 10995 | 6 | 54 | 24 | 54 | 26 | In this sentence, what does "the most relevant decisions" actually mean? It should be clearly stated. | "Most relevant" meaning those most important for analysis to inform. We will |
| 6918 | 6 | 54 | 40 | 54 | 42 | Refer to WGI AR5, Chapter 11 for an assessment of uncertainty in near-term forcings and of near term climate change. | We will include the reference (both here and above in Figure 6.3). |
| 6281 | 6 | 55 | | 55 | | Remove "ORNL" from the graphic and replace with "History" who compiled these data are not the important point to convey in this graphic. | Agreed. |

|---|---|---|---|---|---|---|---|
| 6105 | 6 | 55 | | | | In Figure 6.34, there is a red dot in 2050 showing G8 target. As far as I know, G8 always declared between 2007, at Heiligendamm and 2011, at Deauville on the need to reduce global emissions by 50% by 2050. But throughout its declarations, leaders never say from when. In 2007 at Heiligendamm, declaration stipulates "49. In setting a global goal for emissions reductions in the process we have agreed today involving all major emitters, we will consider seriously the decisions made by the European Union, Canada and Japan which include at least a halving of global emissions by 2050". At that time some countries thought the base year should be 1990 and others thought it as 2005. This was the reason why the base year remain unclear. I have checked Declaration in 2008 Toyako Summit, Japan, 2009 L'Aquilla Summit, Italy, 2010 Muskoka Summit, Canada, 2011 Deauville Summit, France and 2012 Camp David, USA. The wording is almost same as that in Toyako Summit in 2008 that "We seek to share with all Parties to the UNFCCC the vision of, and together with them to consider and adopt in the UNFCCC negotiations, the goal of achieving at least 50% reduction of global emissions by 2050 ---", except that in 2012 where no reference was made to 50% reduction. In this sense, G8 Target shown in the Figure 6.34 is quite unclear. However, I have found in page 57 line 7-8 the following expression, i.e. "target proposed by the G8 of a 50% reduction relative to 2000 ---". From the above, "G8 Target" should be replaced by "50% reduction from 2000". | We will clarify this data point with a reference and explicit defintion. |
| 3152 | 6 | 55 | 10 | | | This chapter has a few figures that could be iconic for the WG3 overall. They include: figs 6.5, 6.6, 6.7 and 6.34. As you trim the chapter pls try to keep those figures and work with TSU to make them clear. For example, add historical data to figure 6.7 to help put the pathways into context. | OK. The author team will work in improving the graphic in Figure 6.7 to see whether historical data can be |
| 7684 | 6 | 55 | 11 | | | The first clause should already mention what the ranges mean, e.g. "… CO2 emission ranges in scenarios with Category 0 to Category 6 radiative forcing targets". The comment aplies also to Figure 6.35. Also change "AMPERE protocol" to "AMPERE project". | We will clarify the figure caption and description. |
| 6282 | 6 | 56 | | 56 | | Remove "ORNL" from the graphic and replace with "History" who compiled these data are not the important point to convey in this graphic. | Agreed. |
| 9898 | 6 | 56 | 12 | 56 | 13 | Deviating from the cost-minimizing near-term emissions profile does not necessarily increase global costs of meeting a long-term stabilization goal. Proper life cycle costing calculations can support decision making for the cost minimal solution in the long run. | Integrated assessment models take into account "life-cycle" costs already and can be used to calculate a stabilization pathway that minimizes these costs. By |
| 16723 | 6 | 56 | 12 | | 15 | Clarify please -- low cost options to reduce emissions to meet the 2 degree target are expiring -- we are going to be left only with much more expensive options if we continue on current course. | Right, the cost dimension is important here. We will work on revising the text |
| 8113 | 6 | 56 | 25 | 57 | 2 | This paragraph might consider including: Rogelj, J., McCollum, D., O'Neill, B. & Riahi, K. Feasible 2020 emission windows for staying below 2°C during the twenty-first century. Nature Climate Change (in review, 2012). | We will include the reference. |
| 9899 | 6 | 57 | 10 | | | Please provide the references for the "published scenarios about option value". Otherwise questions like: which decision-makers are addressed, politicians on a global, national or local scale or managers? | This sentence should be reworded to avoid grammatical confusion. It is intended to say that broad conclusions about option value can be drawn from the literature of published scenarios. It |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 11429 | 6 | 57 | 11 | 57 | 13 | The statement in these lines that "there is some evidence that an emissions pathway through 2020 that follows the pledges in the Copenhagen Accord preserves the option of achieving a long-term target in the range of 450 CO2-e" should be qualified and explained with respect to its bases and its assumptions. A balancing statement or discussion should be provided that wuld also show what the other evidence might indicate in terms of the Copenhagen/Cancun pledges, particularly of developed countries, being insufficient and needing to be scaled up. Without such an explanation or balancing statement, the current text could be taken by readers of IPCC AR5 as an implicit policy endorsement by the IPCC AR5 that developed countries' pledges under the Copenhagen Accord/Cancun Agreements are already sufficient and that they no longer need to show much greater ambition in terms of their mitigation targets for the period up to 2020. This could be taken by many, especially from developing countries, to mean that the burden for future mitigation efforts should therefore be on developing countries. If this becomes the case, then the scientific credibility and neutrality of the IPCC could become subject to challenge as it could be seen as having shifted from being a scientific body into becoming a policy recommending body with built in biases in favor of developed countries. | The statement is an objective assessment of the results in published stabilization scenarios. There are in fact several scenarios in which only the Copenhagen targets are enforced through 2020 but that in the long run can reduce emissions sufficiently to meet a 450 CO2-e target in 2100. The converse - that in other scenarios enforcing only Copenhagen through 2020 makes the achievement of 450 CO2-e by 2100 impossible - is difficult to deduce given the less than systematic reporting of infeasibilities. On the other hand, the cost dimension is important, and we will work on revising the text to bring out the result that doing "only Copenhagen" through 2020 raises the costs of 450 relative to an optimal path. More generally, the thrust of the comment seems to be about burden sharing and the allocation of mitigation responsibility among countries, whereas |
| 12310 | 6 | 57 | 20 | 57 | 23 | The use of the term "institutions" might be too limiting since this isrelated to climate releated policy instruments in a broader sense. | Could not the capacity to implement a particular policy instrument be considered an "institution"? Perhaps |
| 11755 | 6 | 57 | 36 | 57 | 38 | Even though ETS and carbon tax are examples, readers could misunderstand such institutions are better than others.Howard Geller and Jakin Nordqvist show the effectiveness of energy efficiency labeling, Japan's Top Runner Programme in their respective paper. |---|---|---|---|---|---|---|---|
| 12311 | 6 | 57 | 40 | 58 | 2 | This paragraph could include some more about the implementation and deployment and the possible barriers related to implementation and deployment. | The author team will consider expanding the discussion to include barriers to implementation and deployment - presumably in the current context the comment refers to identifying and |
| 16724 | 6 | 57 | 40 | | 48 | Highlight -- very important. | This is a key message of the section. |
| 3297 | 6 | 57 | 16 | 58 | 7 | This is good section. Keep it. | OK. |
| 9900 | 6 | 58 | 17 | 58 | 27 | During the life of a technology diverse barriers might emerge. This paragraph should be elaborated to raise awareness among decision-makers that the "complex process of interactions" has to be managed and can be managed. | We are not sure what precisely the reviewer means with "complex process of interactions", but we have made more explicit that barriers that might emerge |
| 9896 | 6 | 58 | 42 | | | the models don't "predict" this, this effect is built into the models as the prior sentence makes clear. | Yes, we agree that the choice of the word 'predict' is unfortunate here. |
| 8693 | 6 | 58 | 42 | | | the models don't "predict" this, this effect is built into the models as the prior sentence makes clear. | See the previous comment and our reply, which somehow is duplicated. |
| 16725 | 6 | 58 | 7 | | | Suggest insert: However, market participants will not invest in development or deployment of large, low emitting technologies if they lack confidence in the political commitment to the carbon pricing system. Investment decisions are made looking at the long term price outlook, while operating decisions are made based on the current, or spot price of emissions. | This is an important point. The author team will work on ways to incorporate this point into the discussion. |
| 6283 | 6 | 58 | 9 | 58 | 38 | There are a few statements in this section that while I might agree with personaly, I am not sure they belong in this report or if there is sufficient literature that can be cited to substantiate the point. "The likelihood of a unified global policy for greenhouse gas mitigation is low for the near future." | We same to agree here, but recognise the reviewer has a point; we have reformulated this and the subsequent |
| 9068 | 6 | 58 | 8 | 63 | 48 | 6.5 Integrating technological and societal change can be deleted due to limitations on the nos of pages | The authors have been instructed to dwell on this subject at this place in the report and chapter, so we cannot delete it. But efforts have been made to write |
| 6284 | 6 | 58 | 10 | 60 | 33 | The vast majority of this nearly three pages of text is about how integrated assessment models deal with technological change. That is it is process oriented. Given the need to reduce the length of this chapter significantly, it would seem that much of this material could be cut back, the relevant literature could be cited and then you could get to the outcome / what the result is; which is that technology is important because it reduces cost significantly lines 7-14 on page 60. | Yes, our discussions seem to go into the direction of cutting this section back to some extent, even while it is hard to cite specific references as the literature on this subject is so large. Also, during the revising of the FOD and SOD we will have to make sure that these elements are appropriately addressed in either |
| 3298 | 6 | 58 | 8 | | | This is good section, especially page 58, line 39 to page 59, line 3. | Noted. We will account for this while nevertheless attempting to somewhat |
| 4209 | 6 | 58 | | | | The term "risk" should be more clearly defined. There are some risk categories in the deployment of new technologies. For instrance, when the certaintechnology is implement only in the small portion, then cost is high whle the outcome is negligible small (or negative, in some cases). In case of carbon tax, partial implementation will results a large distortion and thus none will consider it seriously afterwards. This is an example of bad taxtics. Second, there is a counter-risk when an option is widely implemented. This is discussed well. Third, there can be a risk when a large implementation is failed. This is a business risk but can cause additional societal risk such as finantial crisis. | The term risk will be clearly defined in the AR5 glossary, and Section 6.7 will adhere to this. The introduction of the section will focus on clarifying the type of risk addressed in the section (the risk of mitigation failure) and distinguish it from risk trade-offs (Chapter 6.6) and risk |
| 15223 | 6 | 59 | | | | Figure 6.36 needs to be clarified. | There was an editing problem in the creation of the figures for the FOD. We will make sure this doesn't happen again |

|---|---|---|---|---|---|---|---|
| 4205 | 6 | 59 | | | | hard to read! | There was an editing problem in the creation of the figures for the FOD. We will make sure this doesn't happen again |
| 5872 | 6 | 59 | | | | Figure is not legible, please rework. | There was an editing problem in the creation of the figures for the FOD. We will make sure this doesn't happen again |
| 16727 | 6 | 59 | 11 | | 20 | Do we need the references to the models, or here are the main points and then list the citations. | There was an editing problem in the creation of the references for the FOD. We will make sure this doesn't happen |
| 10794 | 6 | 59 | 31 | | | Figure is garbled and confusing. Please redesign | There was an editing problem in the creation of the figures for the FOD. We will make sure this doesn't happen again |
| 13174 | 6 | 59 | 32 | 59 | 38 | For the models implementing e.g. learning curves, it would also be useful to indicate whether they assume perfect foresight with intertemporal optimization. This is likely to have a big impact on model decisions, as the model knows the "winning technologies" beforehand (i.e. no uncertainty) and knows also how much having these technologies is worth in the future (i.e. there is no uncertainty about anything else, such as climate target, either). | Noted. We now briefly refer to this. |
| 14456 | 6 | 59 | 32 | | | This graph is illegible. | There was an editing problem in the creation of the figures for the FOD. We will make sure this doesn't happen again |
| 4206 | 6 | 59 | 4 | 59 | 20 | The effects of learning curve is that the increase of cummulative production induces cost reduction and promotes further implementation. This means, from another side of view, that small implementation in the early stage weakens the penetration. Thus, technology susbtitution is delayed or never implemented (lock-in effect). It seems to me this inverse efffect should be also touched upon here. | True. We have now included a sentence along these lines in the new version of this section. |
| 16726 | 6 | 59 | 8 | | | Replace "fossil fuels" with "high-emitting technologies". Fossil fuels can be useful with the correct technologies. | Yes , that is true. We have changed this. |
| 4768 | 6 | 6 | | | | Are categories represent the different range of "radiative forcing in 2100 (W/m²)" ? | Noted. Categories will be clearer in the |
| 5854 | 6 | 6 | | | | Please indicate what is given in the brackets (ranges, standard deviation, …). | Noted. |
| 8055 | 6 | 6 | | | | For me the information in Table 6.2 is at least as relevant as in Table 6.3 (which became Table ES.1). Why not include all data from the two tables in ES.1 ? | Noted. The ES is being substantially revised and the ordering and nature of points that it makes will be different in the SOD. In addition, it is not clear |
| 8614 | 6 | 6 | 10 | | | The top row of this table should be labelled "Year of Peak Emissions" and just "Peak Emissions". Also, the last three columns must be labeled as percentages. | Noted. The ES is being substantially revised and the ordering and nature of points that it makes will be different in the SOD. In addition, it is not clear |
| 12305 | 6 | 6 | 12 | 6 | 16 | This part focus on technology strategy. It is also important to see this in connection with climate change policies in a broader context, not only in relation to technology. This also involves how to handle risk sharing in a situation where there is a need for a shift in technology. There is more risk and higher cost involed for the early movers. Hence, this might create a need for other policies, especially in the transformation phase. This should also be reflected in the body of the text, for instance section 6.7 and/or section 6.3.5. | Noted. |
| 13123 | 6 | 6 | 13 | 6 | 15 | The wording is again too brave. Nobody knows what WILL happen in the scope of an almost 100 year long transition. These are model outcomes, reflecting very specfic sets of assumptions and the conclusions should be framed with that in mind (i.e. do not reformulate model outcomes as forecasts, but keep it clear that the statement about "predictions or forecasts" (page 15 line 6) is still valid) | Rejected. All the evidence that has been reviewed in this chapter indicates that to meet ambitious concentration goals will require a very different energy system |
| 2255 | 6 | 6 | 15 | 23 | 19 | Again, this mystrious preoccupation with EMISSIONS when the supposed theoretical influence is atmospheric CONCENTRATIONS. There is no scientificall established relationshio between the two | Rejected. This is an issue for WGI. |

|---|---|---|---|---|---|---|---|
| 4769 | 6 | 6 | 17 | 6 | 20 | I fully agree however it is difficult to put an economical value to all those elements. | Noted. |
| 9827 | 6 | 6 | 17-20 | | | As already mentionned, this perspective does not allow for the possibility of macro-economic benefits, which would make it much easier for policy makers to choose a transformation pathway over a reference scenario. Moreover the time perspective should be integrated: as the financial crisis demonstrates the shortterm macroeconomic costs are considered in decision making: they can be calculated quite easily based on predictions and they are relevant to politician as arguments in election campaigns. But longterm macroeconomic costs and benefits are often neglected. | Noted. The issue of negative costs will receive mention in the chapter, although it is unlikeley it will make it to the ES given space constraints. |
| 8615 | 6 | 6 | 17-20 | | | This sentence perfectly illustrates my point above. It does not allow for the possibility of macro-economic benefits, which would make it much easier for policy makers to choose a transformation pathway over a reference scenario. | Noted. The issue of negative costs will receive mention in the chapter, although it is unlikeley it will make it to the ES |
| 2181 | 6 | 6 | 2 | 6 | 4 | Expressing the stabilisation level as a radiative forcing is fine, but will not be very helpful to most readers. It should be possible to presnt this as transient or equilibrium temperature change with dialogue with WGI. | Rejected. At present, given the uncertainties in the relationship between concentrations and temperature, a clear methodology has not been articulated to express concentration pathways in terms of temperature. At the same time, the chapter will be modified to include a |
| 13124 | 6 | 6 | 25 | 6 | 27 | The range of model outcomes (which I assume this refers to) does not automatically provide a mapping of real life uncertainties. Also, as mitigation costs are a function of the baseline AND the cost range understandably increases the further away one is from the baseline, couldn't one alternatively interpret this range as reflecting the uncertainties of the baselines? Finally, one would expect the energy (and other) systems of 2100 to be quite different from those of today, no matter what is assumed for the mitigation target. Rephrase. | Noted. These are all good points. |
| 8616 | 6 | 6 | 25-27 | | | This sentence is correct - but it should say "net cost or benefit estimates" not "cost estimates". The reader needs to be clear that costs or benefits are measured relative to a baseline scenario's costs. The point is that the uncertainty in net costs goes in both the positive and negative directions depending on the values of all the input assumptions. This is another reason, supporting my point above, why the critical role of the variations in input assumptions between models should be explained. | Noted. The issue of negative costs will receive mention in the chapter, although it is unlikeley it will make it to the ES given space constraints. |
| 14392 | 6 | 6 | 9 | | | Define RC | Accepted. We will define the RCPs in |
| 6095 | 6 | 6 | 9 | | | It will be better for reader friendliness purpose to add concentration level and, if possible, temperature increase expressed in terms of probability. Alternative simplified idea is to refer to Table 6.2. | Noted. At present, given the uncertainties in the relationship between concentrations and temperature, a clear methodology has not been articulated to express concentration pathways in terms of temperature. At the same time, the chapter will be modified to include a section that attempts to explain the link between temperatures and |
| 11250 | 6 | 6 | | | | In the Executive Summary it is said that “dramatic changes” are required and that “dramatic expension” of low-carbon sources has to be included. But there is no reference to the chapter. Where can these "dramatic” changes be seen? | Noted. The changes in the energy system can be found in the section on energy system transitions. |
| 10980 | 6 | 6 | 25 | 6 | 27 | Why "such estimates must be based on characterizations of energy and other systems that are very different from those of today"? Does it mean the composition of future energy supply will widely and drastically change in comparison with that of current one? | Noted. The ES is being substantially revised and the ordering and nature of points that it makes will be different in the SOD. Regardless, a major result from the literature in this chapter is that |

|---|---|---|---|---|---|---|---|
| 15224 | 6 | 60 | | | | Figure 6.37 needs to be clarified. | There was an editing problem in the creation of the figures for the FOD. We will make sure this doesn't happen again |
| 6407 | 6 | 60 | 29 | 62 | 30 | I know this is the FOD, but filling in the references here would be helpful. | There was an editing problem in the creation of the references for the FOD. We will make sure this doesn't happen |
| 13175 | 6 | 60 | 8 | 60 | 8 | Should the numbers 1-6 be replaced with references? | There was an editing problem in the creation of the references for the FOD. We will make sure this doesn't happen |
| 17809 | 6 | 61 | | | | please refer to the document, UN 2012. From transition to transformation. Sustainable and inclusive development in Europe | Noted. |
| 9901 | 6 | 61 | 0 | | | It would be very good if the case can be made here even more strongly that increasing the level of R&D expenditures quite substantially is still bound to be highly cost effective by providing some rough estimates of how big the long run benefits might be from improved low carbon technologies. | We will expand this part with newer studies, if they become available. |
| 8694 | 6 | 61 | 0 | | | It would be very good if the case can be made here even more strongly that increasing the level of R&D expenditures quite substantially is still bound to be highly cost effective by providing some rough estimates of how big the long run benefits might be from improved low carbon technologies. | Will expand with newer studies, if available |
| 3299 | 6 | 61 | 1 | | | The table is fine, but it needs more explanation in the title paragraph and/or the text about it. | Yes, we agree. We particularly also emphasize the uncertainties associated |
| 3149 | 6 | 61 | 1 | | | This chapter has a few figures that could be iconic for the WG3 overall. They include: figs 6.5, 6.6, 6.7 and 6.34. As you trim the chapter pls try to keep those figures and work with TSU to make them clear. For example, add historical data to figure 6.7 to help put the pathways into context. | ok |
| 16728 | 6 | 61 | 10 | | | point made that policy must be credible -- this is very important for investors in big, long lived assets. Can you explain a bit more for people? | We could, but given the length limitations we may best refer that task to |
| 6106 | 6 | 61 | 15 | 61 | 16 | There is a sentence that "alternatively, carbon taxes greater than the Pigouvian level are recommended when one accounts for market imperfections in the knowledge sector (REFERENCE)". Pigouvian tax is a tax that materialize not only cost effectiveness but also economic efficiency (relying upon cost benefit analysis). Whereas in page 26, this chapter says that CBA is not approapriate for the purpose of discussiing stabilization pathways because CBA leads to increasing concentration. The expression here is inconsistent with the above expression. Also reference is absolutely needed. | Pigouvian taxation is independent of CBA analysis. The point here is to show that multiple policies can be welfare improving when there are multiple externalities |
| 14039 | 6 | 61 | 31 | 63 | 48 | In this part it would be appropriate to refer to wider interpretations of transformation and how this relates to sustainability pathways. Literature to consider: National Research Council. 2011. Climate Stabilization Targets: Emissions, Concentrations, and Impacts over Decades to Millennia. Washington, DC: National Academies Press; WGBU. 2011. World in Transition: A Social Contract for Sustainability. Summary for Policy-Makers, Berlin:Wickson, F. A.L. et al 2006. Transdisc. research: characteristics, quandaries and quality. Futures 38: 1046-1059; Raskin, P. et al. 2002. Great Transition: The Promise and Lure of the Times Ahead. SEI,Tellus Institute; Brown, L. 2010. PLAN B 4.0. New York: W.W. Norton and Company; Leichenko, R. and K. O'Brien, 2008. Environmental change and globalization: Double exposures. Oxford Press. ; Leiserowitz, A. A., R. Kates, and T. M. Parris. 2006. Sustainability values, attitudes, and behaviors: A review of multinational and global trends. Annu. Rev. Environ. Resour. 31: 413-44; Pelling, M. 2010. Adaptation to Climate Change: From Resilience to Transformation. London: Routledge; O'Brien, K. 2011. Global Environmental Change (2): From Adaptation to Deliberate Transformation. Progress in Human Geography. Published Online 10 November 2011; Westley, F., Olsson, P. Folke C. et al. 2011. Tipping Towards Sustainability: Emerging Pathways of Transformation. 3rd Nobel Laureate Symposium on Sustainability, Stockholm. | These are valuable suggestions, as indeed we do not only want to refer to integrated assessment modeling work on transformation pathways, but bring forward wider interpreattions of these pathways. |
| 13176 | 6 | 61 | 7 | 61 | 8 | Give references. | There was an editing problem in the creation of the references for the FOD. We will make sure this doesn't happen |

|---|---|---|---|---|---|---|---|
| 5925 | 6 | 62 | 9 | | | Suitable references to nuclear policies after Fukushima are: 1. Globally: P. Joskow, J. E. Parsons, The Future of Nuclear Power After Fukushima, Econ Ener Env Pol 1(2) (2012) 99-113, and 2. Concerning EU countries: Syri S., Kurki-Suonio T., Satka V., Cross S., Nuclear power at the crossroads of liberalised electricity markets and CO2 mitigation - case Finland. Energy Strategy Reviews (accepted with minor rev.) | Noted. This section was completely rewritten in the new draft and does not contain this matter anymore. |
| 3300 | 6 | 62 | 34 | 62 | 38 | This is an important paragraph. It needs more explanation to 'bring it up to' other paragraphs' length and depth. | we will improve the link between this paragraph and the rest of the section |
| 10954 | 6 | 62 | 44 | 62 | 44 | Fischer et al. (2011) missing in reference list. | Rejected. The reference actually *is* in the reference list ("Fischer & al 2011"). |
| 18640 | 6 | 63 | | | | Page 63: The challenge is to avoid self-reinforcing loops between technical choices, life-styles and institutions which result in a carbon intensive lock-in. | we will give one example of this loop like the link between urban sprawl, the structure of transportation modes and |
| 17474 | 6 | 63 | 14 | 63 | 15 | Meaning not clear to me | difficult for us to see what you think unclear in this page. We will anyway |
| 9903 | 6 | 63 | 18 | | | Changes in consumption patterns are mentioned here, but I think much more attention ought to be given to the basic issue of economic growth in this sub-section. As you know, many advocates of "no growth", "low growth", etc. have become much more active over the last several years, and the world economic crisis has fed into concerns about how much economic growth is sustainable, and compatible with climate change mitigation. Yet, I don't believe that the IAM literature has many climate change mitigation scenarios that reflect these debates by doing sensitivity analyses using much lower economic growth rates for certain regions of the world, especially the OECD countries, than the growth rates used in the base case scenarios. These types of sensitivity cases should have been run by more IAM modeling groups by now, but even if the literature on this issue is skimpy, the issue should be discussed in this section of the report. Preferably, this section should be moved up front in the chapter to where all input assumptions are presented together, as I have previously advocated. It is important to discuss low economic growth scenarios because economic growth is one of many key policy levers that could be relied on to reduce greenhouse gas emissions, if needed. | we understand the point; and we will examine seriously your proposal. However, it will be more easy to do so, for reasons of time constraints; in the 2nd order draft. We retaing anyway the point that questions about changes in consumption patterns relate to the even more fundamental question of economic growth in matured economies |
| 8695 | 6 | 63 | 18 | | | Changes in consumption patterns are mentioned here, but I think much more attention ought to be given to the basic issue of economic growth in this sub-section. As you know, many advocates of "no growth", "low growth", etc. have become much more active over the last several years, and the world economic crisis has fed into concerns about how much economic growth is sustainable, and compatible with climate change mitigation. Yet, I don't believe that the IAM literature has many climate change mitigation scenarios that reflect these debates by doing sensitivity analyses using much lower economic growth rates for certain regions of the world, especially the OECD countries, than the growth rates used in the base case scenarios. These types of sensitivity cases should have been run by more IAM modeling groups by now, but even if the literature on this issue is skimpy, the issue should be discussed in this section of the report. Preferably, this section should be moved up front in the chapter to where all input assumptions are presented together, as I have previously advocated. | Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 9500 | 6 | 63 | 3 | 63 | 7 | good issue - It is obviously mentioned that a carbon tax has a bad influence for consumers | thanks |
| 6409 | 6 | 63 | 30 | 63 | 31 | I don't understand what "is a way of controlling the induction of automobile dependant transportation patterns" means | we will explain more clearly that investment in infrastructure combined with appropriate energy and real estate pricing determine the amount of mobility |
| 17420 | 6 | 63 | 35 | | | "Another critical sector here is agriculture and food production." It is not particularly helpful here to simply refer to these sectors without some explanation of how and why they are critical. | good point. We will develop and give some pieces of littérature |
| 16733 | 6 | 63 | 38 | | 44 | This presumes the market does not work to balance the utility of these activities as compared to the utility of cutting emissions in response to the carbon price -- in free economies, consumers act to maximize utility, not minimize costs. Emissions associated with some of the points you list may be very valuable to consumers (they have high willingness to pay). Example: Consumers may be willing to pay a lot for a flight for a vacation. The flight will become more costly with a carbon price -- yet consumers still want a vacation. If they take vacation with flight does this mean the policy failed? If the cap has integrity, the needed reductions are happening in activities with lower associated utility or very low cost reductions. | I am not sure I understand how you point is connected with the message of this para. I will try and be more explicit. The point is that, a) in a market economy with market (energy, real estate, land, labor) and institutional failures (including fiscal systems), a cap on emissions will entail welfare losses (as you say, activities with a lower utility or more costly) b) correction of these |
| 6410 | 6 | 63 | 47 | | | "unlock(ed)" overnight is colloquial and could be written "cannot be easily undone" or something more focused professional-sounding. | OK will be corrected |
| 16731 | 6 | 63 | 7 | | | These cost impacts can be mitigated via rebates or allocations of allowances to make price changes more gradual, giving consumers time to adjust. | OK we will suggest that. |
| 16732 | 6 | 63 | 7 | | 15 | Good. | thanks |
| 16734 | 6 | 64 | | | | Is Sustainable Development defined well enough to be meaningful in the context of climate policy? Is there a discipline around this so that terms are defined or understood? Does it ask too much of a climate policy to also need objectives of Sustainable Development (however it is defined)? | Noted. The IPCC plenary saw the relevance to discuss mitigation in the context of broader sustainable development and for that reason |
| 15225 | 6 | 64 | | | | section 6.6 seems to repeat the contents in chapter4: Sustainable Development. Please revise. | Noted. Chapter 4 is meant to provide framing (conceptual) whereas here the focus is on the applied side. We will ensure that sections/chapters build on |
| 16735 | 6 | 64 | 17 | | 43 | From an economic perspective, this does NOT mean these policies lower the cost to reduce CO2 (CO2 price is not good proxy for economic cost). Rather, they force actions that would not happen unless the CO2 price was very high, meaning the $/ton cost of the action is very high. These policies hide the true costs of lowering carbon from the carbon market -- they do not result in additional emission reductions, only in the reduction of higher cost instead of relatively lower cost reductions. These "co-benefits" come at a very high, but hidden, CO2 price. | Noted. The statement here is about the level of carbon tax and not about aggregated economic or societal costs. |
| 13177 | 6 | 64 | 21 | 64 | 25 | This should be cross referenced with what is being said on page 36, lines 7-17 (suggesting that cap-and-trade mitigation is more expensive if it's combined with instruments targeting subsystems) and on page 30, lines 9-13 (emission price does not reflect full costs of mitigation, if additional policies affecting emissions are in place). | Noted. This section has been significantly restructured with the new draft. |
| 9905 | 6 | 64 | 3 | | | What is meant by "sustainable development" in this report should be described in the introductory section 6.6.1. Which time scale is considered and which dimensions of decision making? | Accepted. This section was revised, references to Ch.4 added. |
| 8696 | 6 | 64 | 3 | | | What is meant by "sustainable development" in this report should be described in the introductory section 6.6.1. | This comment is a duplicate of comment no 9905, please see for |

|---|---|---|---|---|---|---|---|
| 3378 | 6 | 64 | 34 | | | Another reference for co-benefits of urban transport climate change mitigation measures is: F. Creutzig, D. He (2009) Climate change mitigation and co-benefits of feasible transport demand policies in Beijing. Transportation Research D 14: 120-131. The "co-benefits" are of an order of magnitude larger than climate benefits. | Accepted. Congestion, air pollution, accidents and noise are now covered in Table 6.5 which is i.a. sourced from Section 8.7 which in turn contains a |
| 4207 | 6 | 64 | | | | This section is very important especially for the decision makers in de elopping coutries. More concrete case studies, reports and studies in development economics should be refered. Currently model simulations and some case studies are mentioned. | Accepted. We have now attempted this by introducing Table 6.5. |
| 11430 | 6 | 64 | | 64 | | This section could be improved through the incorporation of specific references to various provisions of the UNFCCC that reflect the linkage between the achievement of sustainable development and effective climate change actions - e-g- UNFCCC Arts. 2, 3.4, 4.7. | Noted. |
| 17922 | 6 | 64 | 28 | 64 | 43 | The literature and details covered in this paragraph are very interesting, but might or should be covered in the respective sector chapters. In my eyes, the role of chapter 6 would rather be to provide the link between the framing and sectoral discussions of SD and co-benefits/co-costs with the tranformation pathway literature and provide an overview of methodological challenges. | Accepted. We have now attempted this by introducing Table 6.5. |
| 17349 | 6 | 64 | 30 | 64 | 34 | "Travel demand and choice of travel mode depend on land use planning interventions" there is no direct "dependency" or "causality" between travel demand, modal choice and physical spatial attributes of cities. The word dependency can here be rather misleading. The major part of the transport literature supports the proposition that travel is a derived demand, and both modal choice and phycical movement are more dependend on income, preferences, cost of transport, housing markets and demographic characteristics than a result of land use planning per se. The choice of words is important as well as the use of the most current literature. Suggest to use more recent literature here than (Cervero and Kockelman 1997), the latest appears to be with (Ewin and Cervero, 2010) which is OK. Problem seem to be that the academic literature will be strong on elasticities but scenarios cannot be built using them. | Noted. This section has been significantly restructured with the new draft. |
| 17923 | 6 | 64 | 45 | 65 | 27 | Please explain what is meant by 'Baseline Sustainable Development Policies and Actions' or paraphrase. These paragraphs seem to describe important caveats to conventional ways of accounting for costs of alternative baseline scenarios which are used throughout the chapter 6 which are partly based on the metrics discussion of chapter 3. At the same time, too little literature is provided (apart from the ecosystme service context) to substantiate the claims made. The part on different baselines in different regions is very promising but would need to be expanded (possibly by referring to the following paper: Steckel, Jan, Robert J. Brecha, Jessica Strefler, Michael Jakob und Gunnar Luderer (in review): Development without energy? Assessing future scenarios of energy consumption in developing countries. Working Paper. Submitted to Ecological economics (http://www.pik-potsdam.de/members/steckel/publications/development_energy_new) | Noted. This section has been significantly restructured with the new draft. |
| 13178 | 6 | 65 | 1 | 65 | 2 | This statement needs to be made more clearly. Is it meant to say that a given, non-minimized cost can be achieved with a number of technical systems? Or, in case least cost systems are discussed, should "identical" be preceeded with the word "nearly"? And why does this all depend on whether endogenous technical change is allowed? | Noted. This section has been significantly restructured with the new draft. |
| 16028 | 6 | 65 | 14 | 65 | 21 | Inapprehensible | Noted. This section has been significantly restructured with the new |
| 16736 | 6 | 65 | 21 | | | Is it established that "leapfrogging" is indeed possible in any but the smallest state/region? Has this been well established in the literature? | Noted. This section has been significantly restructured with the new |
| 16737 | 6 | 65 | 27 | | | add to last sentence: "with the understanding that within the economic context, forcing higher cost reductions via policy measures is a more costly and less efficient approach than allowing a CO2 price to shape consumption and investment choices which allows utility maximization within the society." | Noted. This section has been significantly restructured with the new draft. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 2184 | 6 | 65 | 28 | 67 | 36 | The key conclusions of this section need to be brought forward into the SPM. The conclusion that sustainability pathways have lower costs, additional co-benefits across sectors, improved health and wellbeing, greater equity, improved security, etc is probably the most important conclusion of the chapter, or even the entire WGIII report. | Noted. In the new draft co-benefit issues indeed have become part of the chapter ES and summary documents. |
| 11431 | 6 | 65 | 29 | 65 | 30 | The reference to the "sustainable development and green economy paradigms" should be reformulated in order to reflect the latest multilateral consensus coming out from the Rio+20 summit on the relationship between sustainable development and the green economy - i.e. of green economy in the context of sustainable development and poverty eradication as one of the important tools available for achieving sustainable development and that it could provide options for policy making but should not be a rigid set of rules. The Rio+20 outcome document provides a lot of multilaterally agreed policy statements regarding how green economy is not considered as a paradigm separate from that of sustainable development - e.g. paragraphs 56-74, Rio+20 Outcome Document (see http://www.uncsd2012.org/content/documents/727The%20Future%20We%20Want%2019%20June%201230pm.pdf) | Noted. This section has been significantly restructured with the new draft. |
| 16738 | 6 | 65 | 36 | | | Suggest add sentence: "Working outside of linked, CO2 markets, it is difficult to imagine how transfers of the scale needed would be funded." | Noted. This section has been significantly restructured with the new |
| 13181 | 6 | 65 | 40 | 65 | 45 | These seem like a rather courageous claims and presumably depend completely on how some of these benefits have been monetized. More references supporting these are needed, in any case, and I would even then suggest a more careful formulation, due to the difficulty of comparing costs against benefits that are non-trivial to monetize. | Noted. This section has been significantly restructured with the new draft. |
| 13180 | 6 | 65 | 41 | 65 | 41 | Reference is not included in the bibliography (or, alternatively, the given publication year is wrong_ | Accepted. This section has been significantly restructured with the new |
| 9988 | 6 | 65 | 42 | 65 | 45 | Low carbon technologies should include "heat pump technology" because heat pump has huge potential to reduce GHG emission, as described in (IEA, 2011, page16). This literature is listed in the No51 line of this table. | Noted. This section has been significantly restructured with the new draft. |
| 16739 | 6 | 65 | 45 | | | Suggest add after "etc." the following: "the benefits of which may be difficult to quantify." | Noted. This section has been significantly restructured with the new |
| 13179 | 6 | 65 | 7 | 65 | 11 | There are some incomplete sentences on these lines. | Noted. This section has been significantly restructured with the new |
| 17924 | 6 | 65 | 32 | 65 | 36 | Please provide a reference to substantiate the results in these sentences. | Noted. This section has been significantly restructured with the new |
| 10997 | 6 | 65 | 42 | 65 | 45 | Why will higher upfront costs of low carbon technologies "be more than balanced by gains from fuel conservation, enhanced energy security, improved air quality etc."? I should be supported logically.<br>Reference: IEA, Energy Technology Perspectives 2012 Pathways Clean Energy System, http://www.iea.org/Textbase/npsum/ETP2012SUM.pdf | Noted. This section has been significantly restructured with the new draft. |
| 6541 | 6 | 65 | 44 | | 45 | Replace "additional costs are more than balanced" with e.g. "additional costs can be balanced", as the description is not always true and it is ease to find the opposite. | Noted. This section has been significantly restructured with the new |
| 16740 | 6 | 66 | 29 | | 44 | This is not supported by economic literature -- it reads as a sustainability advocacy piece. Suggest it be rewritten with more attention to economic literature looking at total economic costs rather than simply the modeled CO2 prices. I do not disagree with the point that it is less costly for developing countries as compared to already developed countries to become low emitting economies. This is supported by research -- this should be the focus without folding in the discussion of sustainability which touches on many other aspects of development besides climate. | Rejected/Accepted. The author team has been tasked to contextualize with sustainable development, for this reason this continues to be covered in the new draft. The new draft, though, indeed tries to further substantiate the findings as |
| 11432 | 6 | 66 | 29 | 66 | 29 | Same comment as with page 65, lines 29-30, with respect to the relationship between sustainable development and green economy. | Noted. This section has been significantly restructured with the new |
| 13182 | 6 | 66 | 9 | 66 | 9 | Unclear what/where this "table 1" is. First table in section 6.5 shows R&D needs. | Accepted. This reference has been corrected when restructuring this section. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 16352 | 6 | 66 | 20 | | | I have the impression that section 6.6 needs substantial revision and development.<br>While section 6.3 provide costs, this section does not seem to link costs of stabilisation to sustainable development. The role of subsection 6.6.3 seems unclear, as it apparently focuses on a specific interpretation of the term 'low carbon society' (LCS) which is much narrower than the title would suggest (in particular, the last paragraph suggests that LCS is not viewed as a general concept but as a new and very specific framework). | Noted. This section has been significantly restructured with the new draft. |
| 9299 | 6 | 66 | 1 | 66 | 3 | Please add the following example and reference.<br>------(Shukla, Garg, and Dhar 2009). The regional cooperation between local government and cement industry generated co-profits to treat municipal wastes in cement kiln (MORIMOTO, NGUYEN, CHIHARA, HONDA and YAMAMOTO; Vol.2 No.4 2006, Journal of Life Cycle Assessment, Japan "Proposals for Classification and an Environmental Impact Evaluation Method for Eco-Services: Case study of Municipal Waste Treatment in Cement Production") | Noted. This section has been significantly restructured with the new draft. |
| 13183 | 6 | 67 | 16 | 67 | 16 | Unclear what/where this figure 1" is. First figure in section 6.5 shows technology specific cost trajectories. | Accepted. This reference has been corrected when restructuring this section. |
| 13184 | 6 | 67 | 22 | 67 | 22 | 6.2.3. is interpreation of model infeasibility. Probably 6.3.3. was meant? | Accepted. This reference has been corrected when restructuring this section. |
| 16029 | 6 | 67 | 25 | | | include: reduction of artificial fertilizer | Noted. This section has been significantly restructured with the new |
| 16742 | 6 | 67 | 27 | | 36 | Suggest delete this paragraph. How is this supported? What does it mean? I can imagine poorly designed systems that do not include carbon from land use changes causing problems, but this can be solved via better market design. What else is this referring to? | Noted. This section has been significantly restructured with the new draft. |
| 8698 | 6 | 67 | 27 | | | This last paragraph does not make much sense, and is not supported by references to research. I would either leave it out completely or re-write it to state more defensible positions supported by research. | Noted. This section has been significantly restructured with the new |
| 16350 | 6 | 67 | 28 | 67 | 30 | The sentence is not clear: what is the meaning of "increasing climate consequences" (following mitigation)?<br>In addition, It is frustrating to make such a general and theoretical statement -- that spending efforts in an area (mitigation) might reduce efforts in other areas (adaptation and 'development') without actually summarising studies that assess this type of risk and conclude whether it is possible to avoid it or not. There should be at least a link to the appropriate sections of the report. | Noted. This section has been significantly restructured with the new draft. |
| 11433 | 6 | 67 | 35 | 67 | 36 | The statement that "sustainable development is an essential framework to align mitigation and adaptation policies and actions" could be further strengthened by linking it to the various provisions of the UNFCCC that shows such a relationship - e.g. UNFCCC Arts. 2, 3.4, 4.7 | Noted. This section has been significantly restructured with the new draft. |
| 16741 | 6 | 67 | 8 | | 18 | Should compare the costs of non-market based policies in terms of the amount of emission reductions achieved to the CO2 price policies which drive the same amount of emission reductions. You will undoubtedly find that the latter is much less costly. Yes, RD&D with state support can create large value for a society, but large scale deployment to meet other policy positions then requires non-market actors to decide how much of what produced by whom -- the problem of picking winners and losers. This socializes broader economic risks, removing it from the private sector. | Noted. This section has been significantly restructured with the new draft. |
| 17926 | 6 | 67 | 28 | 67 | 30 | This kind of very general claim definitely needs a reference and might need to be reworded since the whole point of the section (and other discussions on co-benefits/co-costs) is to describe how to identify low-carbon pathways that are consistent with SD goals to avoid the mentioned unintended consequences. | Noted. This section has been significantly restructured with the new draft. |
| 17927 | 6 | 67 | 30 | 67 | 36 | These sentences resemble some of the key messages of Chapter 4 without any cross-reference (and, indeed, any references). Please liaise with the Chapter 4 LAs to make sure that the results are consistent. | Noted. This section has been significantly restructured with the new |
| 15226 | 6 | 68 | | | | Figure 6.38 needs to be revised. | Accepted. Replaced with other figure. |
| 15227 | 6 | 68 | | | | Section 6.7 on Risk. Methodology dealing with risks should be identified. | Rejected. Risk analysis is dealt with in Chapter 2 of the report. |
| 5873 | 6 | 68 | | | | Figure is not legible, please rework. | Accepted. Replaced with other figure. |

| 4770 | 6 | 7 | | 7 | | Yes, waiting for these definitions. | Noted. The ES is being substantially revised and the ordering and nature of points that it makes will be different in |
| 18625 | 6 | 7 | | | | Some sensational statements/conclusions such as:<br>Page 7: Macroeconomic costs for scenarios without CCS and nuclear power are estimated to be as much as two to three times higher than comparable scenarios with full availability of these technologies (all other things being equal). | Noted. The ES is being substantially revised and the ordering and nature of points that it makes will be different in the SOD. This statement will be revisited |
| 4189 | 6 | 7 | | | | The interpretation of this figure is not straightforward. One will find a clear relationship and other will not. I would like authors to talk about these figures carefully. | Noted. The ES is being substantially revised and the ordering and nature of points that it makes will be different in |
| 5856 | 6 | 7 | | | | Please make sure you explain "EMF". If the order in the header is "Overshoot … NTE" it should be kept this way in the table lines: "Overshoot" above "NTE". | Noted. The ES is being substantially revised and the ordering and nature of points that it makes will be different in |
| 5855 | 6 | 7 | | | | Please make sure you explain "final enegy categories" to the reader. | Noted. The ES is being substantially revised and the ordering and nature of points that it makes will be different in |
| 9178 | 6 | 7 | | 7 | | it should be noted the costs presented here are estimated based on the assumption that the governmental intervention is cost effective - often it is not the case. As such these are minimum cost estimate. | Noted. The ES is being substantially revised and the ordering and nature of points that it makes will be different in |
| 8617 | 6 | 7 | 1 | | | Why do you include "low-carbon" in the title of the vertical axis? Isn't this the total primary energy supply? What does "low-carbon" refer to"? | Noted. |
| 8618 | 6 | 7 | 1 | | | Where does the text refer to these figures? | Noted. |
| 14451 | 6 | 7 | 1 | | | Axes should start at (0,0). | Noted. The ES is being substantially revised and the ordering and nature of points that it makes will be different in |
| 11745 | 6 | 7 | 11 | 7 | 13 | Clarificaton is needed why macroeconomic costs for scenarios without CCS are estimated to be higher. | Noted. The ES is being substantially revised and the ordering and nature of points that it makes will be different in the SOD. This statement may not |
| 9829 | 6 | 7 | 11 | 7 | 13 | Please quote the sources for the statement, that the macroeconomic costs for scenarios without CCS and nuclaar power are astimated to be as much as two to three times higher than comparable scenarios. The sentence beginning "For example,….." seems likewise to be false, unless properly qualified. However, there is a new element here which is the relative cost of nuclear power and CCS compared to other no carbon electric generation options. So if the price of nuclear and CCS-related power is more expensive than renewable power options like wind and solar, which many people believe, then not having nuclear and CCS in the mix would actually lower the macroeconomic costs, not raise them. So it all depends, again, on the actual values of key input assumptions, including the price of fossil fuels, as discussed above. So the ranges of input assumptions that yield the result cited must be provided, when making such a sweeping statement. And it must be clear to the reader that with other assumptions the statement would not be true. | Noted. The ES is being substantially revised and the ordering and nature of points that it makes will be different in the SOD. This statement may not remain. If it does, it will be supported by text material within the chapter. |

|---|---|---|---|---|---|---|---|
| 8620 | 6 | 7 | 11 | | | Similarly, the sentence beginning "For example,….." seems likewise to be false, unless properly qualified. However, there is a new element here which is the relative cost of nuclear power and CCS compared to other no carbon electric generation options. So if the price of nuclear and CCS-related power is more expensive than renewable power options like wind and solar, which many people believe, then not having nuclear and CCS in the mix would actually lower the macroeconomic costs, not raise them. So it all depends, again, on the actual values of key input assumptions, including the price of fossil fuels, as discussed above. So the ranges of input assumptions that yield the result cited must be provided, when making such a sweeping statement. And it must be clear to the reader that with other assumptions the statement would not be true. | Please see the response to comment 9829, which appears to be a duplicate of this comment, despite being submitted by another reviewer. |
| 9830 | 6 | 7 | 15 | 8 | 2 | Mitigation efforts will have an impact on the competitiveness of nations, described in theoretical explanations like the | Noted. |
| 9278 | 6 | 7 | 6 | 7 | 7 | There is no data in the "no CCS" column. | Noted. The ES is being substantially revised and the ordering and nature of points that it makes will be different in |
| 9828 | 6 | 7 | 8 | | | Again, based on my discussion on the cost issue above, I believe this sentence is just plain false. I believe the correct version would be: "All other things being equal, [meaning if all other input assumptions are held constant] the net costs or benefits of mitigation increase disproportionately with increasing stringency of the long-term stabilization goal." | Accepted. We will mention the issue of negative costs. At the same time, the literature we are reviewing overwhelmingly indicates that there will |
| 8619 | 6 | 7 | 8 | | | Again, based on my discussion on the cost issue above, I believe this sentence is just plain false. I believe the correct version would be: "All other things being equal, [meaning if all other input assumptions are held constant] the net costs or benefits of mitigation increase disproportionately with increasing stringency of the long-term stabilization goal." | Please see the response to comment 9828, which appears to be a duplicate of this comment, despite being submitted by another reviewer. |
| 16685 | 6 | 7 | 9 | 7 | 13 | Do not lose this point -- extremely important for readers to understand that costs increase dramatically if the full suite of technologies can not be deployed based on their relative competitiveness under a carbon price. Should also include the point that costs will likely be much higher than calculated if other policy measures are used instead of a CO2 price to incentivize the deployment of low emitting technologies. | Noted. The ES is being substantially revised and the ordering and nature of points that it makes will be different in the SOD. This statement may not |
| 10981 | 6 | 7 | 11 | 7 | 13 | The sentence of "macroeconomic costs for scenarios without CCS and nuclear power are estimated to be as much as two to three times higher than comparable scenarios with full availability of these technologies." is good, in terms of indicating the substantial contribution of CCS and nuclear power to mitigation. It should not be deleted. | Noted. The ES is being substantially revised and the ordering and nature of points that it makes will be different in the SOD. This statement may not |
| 16745 | 6 | 70 | 1 | | 5 | These seem to me to be extremely different cases -- not clear they hold any lesson for the climate problem in terms of their scope or complexity or means to drive the change needed. | Taken into account. The broad discussion of transformation processes |
| 13186 | 6 | 70 | 11 | 70 | 11 | Should be table 6.7. | Yes. Reference corrected. |
| 16353 | 6 | 70 | 28 | 70 | 29 | I do not think that the risks of transformation needs to be considered along risks from climate change _alone_, as this sentence suggests. Transformation should be considered in a much broader view: taking into account the benefits and risks from climate change, but also the co-benefits from an integrated transformation to more sustainable societies. Transformation seeking climate mitigation alone is much less justified than transformation seeking sustainability as a whole.<br>Please improve this paragraph and add links with sections discussing co-benefits and sustainable development. | Taken into accout - the discussion of potential adverse side effects |
| 8699 | 6 | 70 | 28 | | | This paragraph should make it clear in conclusion that while of course there will be many risks and serious social disruptions caused by following strong mitigation scenarios such as RCP2.6, the world must do so anyway, because the risks from serious climate change will be far greater. On the other hand, pursuing transformation pathways that actually achieve sustainable development goals will be win-win strategies for humanity. | The IPCC aims to give a broad assessment of mitigation pathways aiming at different levels of mitigation. It is supposed to be policy relevant, but not policy prescriptive. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 11434 | 6 | 70 | 36 | 71 | 6 | There is no reference to policy barriers to technology deployment, transfer and diffusion such as intellectual property rights and other policy instruments. By not including such a reference, the identification of risks to increased technology deployment is therefore incomplete. The IPCC AR5 should be scientific in terms of identifying all possible risks and providing a discussion of these risks. | Noted. |
| 16747 | 6 | 70 | 40 | | | Rather than "physical resource scarcity" it may be better to say "input price risks …" Scarcity will manifest itself in higher prices. We can typically find supplies but we may not be happy with how expensive they've gotten during times of tight supply or spikes in demand. | Noted. |
| 16746 | 6 | 70 | 6 | | | Use of the word "risks" … do we mean costs? Or uncertainty? | The term risk will be clearly defined in the AR5 glossary, and Section 6.7 will adhere to this. The introduction of the section will focus on clarifying the type of risk addressed in the section (the risk of |
| 17929 | 6 | 70 | 17 | 70 | 17 | The inclusion of environmental side-effects in a risk discussion is not consistent with agreements reached in Wellington by which environmental side-effects will be framed as either co-benefits or co-costs of mitigation policies/actions and technical and operational risks would be discussed seperately. If this should not be appropriate for specific kind of side-effects (e.g. page 71, lines 3-4), this concern should be raised during LAM3. | The discussion of potential adverse side-effects has been moved to Section 6.6 Sustainable Development where it will be discussed together with co-benefits. This includes environmental side effects. |
| 18641 | 6 | 71 | | | | Page 71: The next draft may discuss shares of “fluctuating renewables” in relation to grid integration. Refer to our studies and the IEA study | Noted. The discussion of supply technology risks is mostly done in Chapter 7, and relevant parts are now summarized in Section 6.6. Thus, the |
| 9580 | 6 | 71 | 1 | 71 | 5 | These parts have biases for nuclear; please, take into account following and reflect some in the text; Abram and Ion describe the International Generation-IV Initiative which was established with the aim of fostering the research and development necessary to underpin the development of a new generation of nuclear energy systems. These Generation-IV systems, which comprise both the reactors and their associated fuel-cycle facilities, are intended to deliver significant advances compared with current advanced light water reactors in respect of economics, safety, environmental performance, and proliferation resistance. The Generation-IV systems are expected to be developed to the point of commercial deployment by at least 2030. The Generation-IV International Forum (GIF) members have identified six reactor systems that offer the potential for meeting the Generation-IV goals. (T. Abram and S. Ion (2008) Generation-IV nuclear power: A review of the state of the science, Energy Policy 36 (2008), See downloaded file “Abram Ion 2008.pdf”) | Rejected. Risks of nuclear energy are treated evenly with risks of other energy technologies. The discussion of supply technology risks is mostly done in Chapter 7, and relevant parts are now summarized in Section 6.6. Thus, the discussion of risks of Nuclear energy will be moved to Section 6.6 from 6.7. |
| 6412 | 6 | 71 | 13 | 71 | 13 | "status quo bias" is a behavioral decision-making term that doesn't really apply here. I understand the intent of the sentence, and it seems to me as though reference to path dependence is more appropriate here. | Noted. |
| 13187 | 6 | 71 | 21 | 71 | 21 | The reference is incorrect; the authors of the cited paper are Strachan and Usher. | Taken into account. Reference corrected. |
| 16749 | 6 | 71 | 31 | | 47 | Problems of the intersection of energy security vs. food security are not the result of climate policy per se but rather the misguided attempt to push preferred technologies without having given thought to the life-cycle carbon emissions associated with the technology. These problems could be partly avoided through better accounting of carbon as well as not mandating particular technologies (bio-fuels for transport in this instance). | Noted. |
| 4208 | 6 | 71 | 36 | 71 | 40 | Most important societal risk is "unemployment" especially in the transition period. | Noted. |
| 16748 | 6 | 71 | 9 | | 30 | Perhaps this can be simplified to say that as some technologies increase their share of the market, they may cause increases in system operating costs not reflected in the costs of an individual project. As written seems overly complicated. | Noted. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 17930 | 6 | 71 | 31 | 71 | 32 | Please liaise with Chapter 7 to provide a consistent assessment of the challenges of fluctuating renewables and whether this should be framed as a risk (rather than an institutional and technological barrier). | Fluctuating renewables can pose a risk to energy system reliability and thus are an adverse side effect and risk trade off. Now delegated to Section 6.6 that will |
| 15934 | 6 | 71 | | | | It may be worth discussing the water footprint of the energy technologies available for use today - as they will in a very large part determine the water use intensity of the world's mitigation strategies (in an ideal world ofcourse) - which is an important part of any comprehensive solutions set. | The water footprint of mitigation technologies is a potential adverse side effect and risk trade-off and will now be discussed in Section 6.6 Sustainable |
| 16750 | 6 | 72 | 11 | | 20 | Would be helpful to report how large an increase in commodity food prices and how this impacts the very poor more than rich (who consume more processed food and for whom food budget is smaller share of household budget). How can we mitigate these impacts and where does it matter? | Noted. We agree that information on food price increases are highy relevant, and the relevant literature is referenced |
| 16751 | 6 | 72 | 39 | | 47 | This should be using the outputs from integrated models which rely on carbon price -- the various chapters do poor job of laying out least cost to most costly options and are very difficult to line up, especially when comparing across sectors. So the question is, if author relies on the various chapters, how do they line up the options and the associated costs? What do you assume drives the transformation? This is important -- if it is a Co2 price that rises over time, we don't know precisely what techs will deploy where, but we know the transformation will occur if market participants are confident in policymakers long term commitment. If driven by individual country's policy mandates, then more effort may be required to ensure there are not unintended consequences or large amounts of emissions' leakage. | The comparison of sectoral and integrated mitigaiton studies is still work in progress and therefore the entire Section 6.8 is under revision with more information from both sets of studies becoming available. The section is therefore being restructured for the SOD. |
| 17932 | 6 | 72 | 26 | | | The use of the terms 'public acceptability' is inconsistent with agreements reached in Wellington (p.36). In accordance with chapter 2 usage, the term 'public perception' would be preferrabe (even to 'public acceptance' on page 71, line 6). | Changed to public perception |
| 16752 | 6 | 73 | 22 | | 46 | I don't understand the value of this discussion. Is it needed to articulate the potential technology deployment under a CO2 price? Or is it to define for policymakers those policies or standards they should implement? Models can only roughly show whether a path is possible and the relative costs of different pathways -- they are imperfect. As the future unfolds, we learn and adjust. Models can not foresee the details or reliably chart every future change. | The comparison of sectoral and integrated mitigaiton studies is still work in progress and therefore the entire Section 6.8 is under revision with more information from both sets of studies |
| 11757 | 6 | 73 | 36 | 74 | 2 | Delete to save the volume. These seem to be needless. | The misuse of the bottom-up/top-down terminology in the literature illustrates that it is important to stress this point. However, we will make an effort to |
| 9582 | 6 | 73 | 36 | 74 | 2 | Please, delete here or move to footnote. | The misuse of the bottom-up/top-down terminology in the literature illustrates that it is important to stress this point. However, we will make an effort to |
| 6413 | 6 | 73 | 6 | 73 | 21 | There seems to be too much summary of AR4 and not enough direct articulation of the important evolution in AR5. | Discussion of comparison between sectoral and integrated studies in AR4 |
| 11756 | 6 | 73 | 6 | 73 | 21 | Delete to save the volume. These seem to be needless. | Discussion of comparison between sectoral and integrated studies in AR4 |

|---|---|---|---|---|---|---|---|
| 16753 | 6 | 74 | | | | How is this useful to policymakers? Better information might be: 1) how big is energy use in buildings, can it be reduced via market price on carbon for less than similar reductions in the electric sector? The goal should not be zero-net-energy use by buildings, but rather reducing emissions at the lowest possible costs. If zero net energy use is less costly than zero emissions from other sources, they should happen first. If the cost of zero net use is more costly, it should happen much later. Economic modeling and experience show that carbon price is most efficient and effective -- help policymakers understand how building energy use responds in that context. | The comparison of sectoral and integrated mitigaiton studies is still work in progress and therefore the entire Section 6.8 is under revision with more information from both sets of studies becoming available. The section is therefore being restructured for the SOD. |
| 9907 | 6 | 74 | 2 | | | One of the major bottom-up studies that has been done with a great degree of sectoral disagregation is the Raskin, et. Al. 2010 study of four scenarios referenced above. (Sustainability 2010) This study provides far more detail than is described in sections 6.2 and 6.3 of this chapter. The Tellus Institute paper is supported by a 300 plus page Technical Documentation of the Polestar model on the Tellus website www.tellus.org. The link is: http://www.tellus.org/publications/files/TheCenturyAhead_TechDoc.pdf | The suggested publication will be considered for inclusion in the SOD. However, as pointed out by the reviewer, parts of Section 6.3 are probably the place where this information should be |

| 6497 | 6 | 74 | 9 | | | 6.8.2.1 (Sectoral Energy Use Industry, Transport, Human Settlement) and 6.8.3 (Regional (Sectoral) Analysis and Transformation Pathways Industry, Transport, Human Settlement) had better to be aggregated.<br>Because they are similar in the content. | The comparison of sectoral and integrated mitigaiton studies is still work in progress and therefore the entire Section 6.8 is under revision with more information from both sets of studies |
| 9583 | 6 | 75 | 16 | 75 | 18 | Please, replace here with following; public acceptance is one of the common and major obstacles that should be solved when building new power facilities. | Comment is noted and will be considered as the text is adjusted for the |
| 9584 | 6 | 75 | 20 | | | Please, add the following information; developing infrastructure such as transmissions for new plants take a long lead-time, therefore, it is indispensable to solve the institutional issues for infrastructure development and particular barriers for uncertainty for policy implementation. (ECORYS (2010)<br>“Assessment of non-cost barriers to renewable energy growth in EU Member States “)<br>http://ec.europa.eu/energy/renewables/studies/doc/renewables/2010_non_cost_barriers.pdf<br>ECORYS [1] identified the nine major issues and ranked these issues in order of severity, divided over three groups. According to the study, “most severe types of barriers” include:<br>1) Administrative hurdles like planning delays and restrictions, lack of coordination between different authorities, long lead-times in obtaining authorizations, severe costs for obtaining permission, etcetera.<br>2) Barriers linked to grid connection and access affecting all RES-E technologies, are the second main obstacle - not so much in terms of the physical connection (where administrative and cost issues dominate), but limited priority access with regard to fossil power production, insufficient transport capacity linked to obsolete infrastructure, and limited interconnection capacity may block or at the least delay renewables development.<br>3) Issues related to limited information and awareness include a lack of general knowledge on RES benefits, poor dissemination of support measures, poor knowledge dissemination of pilot and/or demonstration projects and insufficient funding for awareness campaigns. | This point is based on the discussion in the energy systems chapter (Chapter 7) and will be resolved in accordance with the discussion there. |
| 13281 | 6 | 75 | 22 | 75 | 34 | As mentioned earlier, CCS is a key option for decarbonisation in a number of important industry sectors. This is especially true for those sectors, such as cement and iron&steel, that cannot be fully decarbonised with renewables or nuclear, as some of their CO2 output results from chemical reactions | This point has been added in the discussion of economics of mitigation. Depending on space availability we will |

|---|---|---|---|---|---|---|---|
| 16754 | 6 | 75 | 22 | | 34 | This is not that helpful. What is the significance? In a carbon constrained world with a carbon price, these sectors or commodities would factor in the carbon price. As the price increased, the commodity price or activity costs would increase driving innovation to find substitutes, change processes to reduce emission intensity or otherwise respond to reduce this part of their cost structure. | The comparison of sectoral and integrated mitigaiton studies is still work in progress and therefore the entire Section 6.8 is under revision with more information from both sets of studies |
| 16030 | 6 | 75 | 26 | | | another 30% or more | This point is based on the discussion in the industry chapter (Chapter 10) and will be resolved in accordance with the |
| 16755 | 6 | 75 | 36 | 76 | 6 | Is the goal in a climate policy to reduce energy use or to reduce carbon emissions? Much of this discussion is based on engineering studies which ignore or overlook many market realities which are not easily dealt with even via a policy. The policy should be emissions focused. The building sector efficiently participates in lowering emissions by responding to the carbon price signal embedded in the delivered energy -- to go beyond this usually means inefficiency -- which is likely unsustainable. | The comparison of sectoral and integrated mitigaiton studies is still work in progress and therefore the entire Section 6.8 is under revision with more information from both sets of studies |
| 15013 | 6 | 76 | 12 | 76 | 16 | Compared with the description on LDV, this part of aviation is too long. | The comparison of sectoral and integrated mitigaiton studies is still work in progress and therefore the entire Section 6.8 is under revision with more information from both sets of studies |
| 15115 | 6 | 76 | 12 | 76 | 16 | The statement in this paragraph is not accurate. In 2010, the 37th Session of the Assembly of ICAO endorsed among other things: (1) a global aspirational goal of 2 per cent annual fuel efficiency improvement up to year 2050 ;(2) a medium term global aspirational goal from 2020 that would ensure that while the international aviation sector continues to grow, its global CO2 emissions would be stabilized at 2020 levels and (3) develop a global CO2 Standard for aircraft aiming for 2013. | The FOD version of Section 6.8 is based on an ad-hoc review of the sectoral chapters with an attempt to compare the findings presented in these chapters with the developments in the transformation pathways assessed in Chapter 6. The comparison of sectoral and integrated mitigaiton studies is still work in progress and therefore the entire |
| 16757 | 6 | 76 | 23 | | | Recent research re electric vehicles shows that most owners charge their vehicle at home. There is not the need for the massive charging infrastructure frequently cited. | 17135 | 6 | 76 | 25 | | | DELETE: modal shift<br>REVISE TO: well harmonized multi-modal transport. | Comment is noted and will be considered as the text is adjusted for the next draft. |
| 16253 | 6 | 76 | 41 | 76 | 42 | I would be hesitant to call spatial planning a "holistic approach". | This point is based on the discussion in the human settlements chapter (Chapter 12) and will be resolved in accordance |
| 8047 | 6 | 76 | 7 | 76 | 11 | This view on transport is too much car centered. We know OECD countries like Japan where public transport has a market share of 50 %. Of course cars are mostly the biggest source of emissions. But in the beginning of this chapter there should not be the car (as the main problem) but the transport structure with its diversity. | The comparison of sectoral and integrated mitigaiton studies is still work in progress and therefore the entire Section 6.8 is under revision with more information from both sets of studies |
| 16756 | 6 | 76 | 8 | | 26 | Looking at aviation -- fuel is already the largest costs component, so carefully managed. A carbon price embedded in the fuel should be adequate to create economically efficient emission reductions. Producing separate targets based on engineering potential are likely driving uneconomic reductions and distracts policymakers from the true least costs approach. Renewable fuel standards, using bio-energy via liquid fuels, done outside of a comprehensive carbon market that includes land use changes, risks large increase in emissions via increased deforestation. | This point is based on the discussion in the transport chapter (Chapter 8) and will be resolved in accordance with the discussion there. |
| 8048 | 6 | 77 | 23 | 77 | 28 | We know that the cost ($/t CO2) in the transport sector are often higher that in other sectors (with this logic not much should be done in the transport sector). But we know the multiple co-benefits if we reduce CO2-emissions in the transport sector (e.g. modal shift leads to better air, less accidents, livable cities) which often are more important that the value of the CO2 saved. Conclusio: to look only on CO2 is not helpful, mention also the many other co-benefits. | Co-benefits of climate mitigation will be discussed in Section 6.6. |
| 16758 | 6 | 77 | 30 | | 40 | What are the economics of high density vs. low density development? Why are some cities high density and others low density? There is utility in both -- how increase utility/desirability of high density? If CO2 cap includes emissions from land use changes, electricity, industrial activity and direct emissions from fossil fuels, how are cities in different context likely to evolve? Has this been examined anywhere to compared to current development trends? | This point is based on the discussion in the human settlements chapter (Chapter 12) and will be resolved in accordance with the discussion there. |
| 16254 | 6 | 77 | 31 | 77 | 31 | The reference (Müller et al 2011) is wrong: this article has not been published yet (will be submitted in September 2012 to Science). | Reference will be updated. |
| 5233 | 6 | 77 | 6 | | | Emissions from energy conversion are not considered here separately, although a different logics is applied in the chapter 6.8.2.1. | The comparison of sectoral and integrated mitigaiton studies is still work in progress and therefore the entire Section 6.8 is under revision with more information from both sets of studies |
| 4210 | 6 | 77 | | | | Will LCA approach be touched upon here? | The comparison of sectoral and integrated mitigaiton studies is still work in progress and therefore the entire Section 6.8 is under revision with more information from both sets of studies |
| 9420 | 6 | 78 | | | | There are so many lines and it is difficult to understand this figure and its explanation. It is more informative to analyze relations between sectoral energy use and sectoral CO2 emissions. When discussing sectoral CO2 emissions, it is imporant to clarify whether effects of electricity savings in the demand side are included in the demand side or such electricity saving potentials in the demand side are counted in the Power sector. | The lines have no meaning and were not part of the original document. There seems to have been a conversion error in the preparation of the FOD. |

|---|---|---|---|---|---|---|---|
| 13125 | 6 | 8 | 3 | 8 | 6 | Although I do not seriously doubt this conclusion, I don't think it can be made based on the model outcomes. In other words, technology alone will not bring emissions down unless one expects technologies capable of doing this to emerge and implements them in the model (i.e. low cost, carbon free, high potential technologies. A very optimistic fusion scenario, for example). The current observation is somewhat circular and just indicates that virtually nobody has created such a scenario. One can naturally speculate that this is because such a scenario would seem "unlikely", but one could equally well argue that it's "likely" that the 2100 energy system has aspects that would today be consider "unlikely" - or ones we are currently know nothing about. Qualify the conclusion better. | Noted. The ES is being substantially revised and the ordering and nature of points that it makes will be different in the SOD. If this statement remains, it will be clarified |
| 11369 | 6 | 8 | 3 | 8 | 5 | The statement "Technology alone will not stabilize greenhouse gas concentrations" would preferably need a short reasoning on 'why'. The following two sentences read also very 'isolated'. This should be better connected and justified. | Noted. The ES is being substantially revised and the ordering and nature of points that it makes will be different in |
| 16686 | 6 | 8 | 3 | | | Insert "improvements absent a CO2 price" after "Technology …" at start of sentence. | Noted. The ES is being substantially revised and the ordering and nature of points that it makes will be different in |
| 8621 | 6 | 8 | 3 | | | I think you mean "Changes in technology" or "Improvements in technology…" to the degree they are incorporated into baseline scenarios, as the next sentence makes clear. | Noted. The ES is being substantially revised and the ordering and nature of points that it makes will be different in |
| 9835 | 6 | 8 | 38 | | | Trade-offs in transition pathways are a very important issue that should be considered more in depth and positioned at a more prominent part of the report. | Noted. |
| 9836 | 6 | 8 | 44 | 10 | 15 | Writing the report from a normative scenario perspective and adding a backcasting approach would increase the possibility to raise the awareness of decision makers, like in this sentence. This perspective could enrich the whole report. The questions given in this part should be positioned in a more prominent place of the report and used as guidelines for structuring. Moreover it might encourage decision-makers to think in options and longterm consequence | Noted. |
| 3072 | 6 | 8 | 44 | 8 | 46 | Same comment as p. 5 lines 3 and 29, above | See response to previous comment. |
| 4190 | 6 | 8 | 44 | 8 | 44 | "dangerous" -- Does it mean "determinstic" or "probabilistic" or both? It seems to me, "possible dangerous" would be better expression. Otherwise, it sounds as if "zero-emission" could avoid all climate risks. | Noted. This phrase may not longer be found in the introduction in the new revisions. Regardless, whether it remains or a similar statement remains in the introduction, we will no longer |
| 13216 | 6 | 8 | 44 | 8 | 44 | In the past, IPCC has always carefully avoided to express an opinion on what is "dangerous", considering that it was a political matter, not a scientific one. Please, don(t use this word when qualifying the most severe emissions reduction discussed by the policy makers | Noted. This phrase may not longer be found in the introduction in the new revisions. Regardless, whether it remains or a similar statement remains in the introduction, we will no longer |
| 14394 | 6 | 8 | 46 | | | “Co2 emissions … must eventually be brought to or below zero.” This is flat out wrong. According to IPCC SAR4, Scientific, p. 512, there is a natural exit of 3.3 GtC (12.1 GtCO2) from the atmosphere annually. So at stabilization there could be new emissions of at least this amount, not requiring going to zero. Since most abatement cost models show extremely non-linear cost curves as emissions are cut toward zero, it is misleading and unduly pessimistic to assert that emissions must be cut to zero. My figure for the required target for CO2 emissions to achieve 450 ppm stabilization is 1.4 tCO2 per capita per year. | Noted. The introduction is being revised and the ordering and nature of points that it makes will be different in the SOD. If this statement remains, it will be clarified |
| 13127 | 6 | 8 | 46 | 9 | 1 | I assume this comment has been left in accidentally? | Noted. |
| 14452 | 6 | 8 | 46 | | | CO2 emissions can never be zero, all animals respire CO2 and organic matter decomposes. Do you mean net fossil-fuel and LUC derived CO2 emission must be zero? This concept must be edited for accuracy. | Noted. The introduction is being revised and the ordering and nature of points that it makes will be different in the |

|---|---|---|---|---|---|---|---|
| 8701 | 6 | 80 | 4 | | | I would either omit section 6.9 or greatly shorten it. The grounds for omitting it are that geoengineering technologies have never been carefully integrated into climate mitigation scenarios, and certainly not by IAMs. Furthermore the lack of knowledge of the physics, chemistry, and economics of geoengineering schemes are so great at this time as to make most discussions of these possibilities almost pure speculation. | Same as previous |
| 8509 | 6 | 80 | 4 | 80 | 5 | The title of section 6.9 might be unclear for a reader. What is “carbon”? What “radiation” should be managed? What should include “environmental risks”? It could be better to use the following title: “Geo-engineering approaches to prevent global warming”. | the title distinguishes between the different approaches to geoengineering due to their heterogenity. The need to distinguish different approaches due to the very different potentials and risks they pose is a key message of the |
| 8052 | 6 | 80 | 4 | 82 | 39 | In this paragraph on geoengineering I miss the political aspect on some of the drivers. We see the fossil fuel industry as a driver - there some who have been climate deniers for a long time, they did not want mitigation, and now they say it is too late for mitigation we have to go to geoengineering. | This is not the place for political analysis. |
| 3147 | 6 | 80 | 4 | | | section 6.9 (on geoengineering) sticks out and doesn't belong here. What does geoengineering have to do with transition pathways? | Answer: ??? (I personally agree that it makes little sense to have geoengineering in this chapter but it is a |
| 8050 | 6 | 80 | 42 | 80 | 42 | the wording 'with a wide variety of potential benefits and impacts' sounds too positive having in mind the 'large-scale disruption to ecology of the ocean'. Write at least 'with a wide variety of potential benefits and large negative impacts' | text completely revised, comment no longer applies |
| 16761 | 6 | 80 | 43 | 81 | 21 | This is very clearly written and logical -- helpful! | text completely revised, comment no |
| 13739 | 6 | 80 | 7 | 80 | 7 | Insert before "a diverse": " As global emissions continue to surpass the expectations deployment of carbon negative technologies can be seen as a requirement to stay below 2 degrees of warming in this century (de Elzen et al., 2012)." | text completely revised, comment no longer applies |
| 3285 | 6 | 80 | 4 | | | The two subsections (6.9.1 and 6.9.2) take very different angles to approach the two broad types of geoengineering (CDR and SRM) and would benefit from harmonization. | No specific suggestions for harmonization were provided so it is |
| 8508 | 6 | 80 | 4 | | | In section 6.9 (between 6.9 and 6.9.1) the main principles of geo-engineering should be presented: (a) definitions of SRM and CDR; (b) difference between SRM and CDR; (c) goals of SRM and CDR implementation; (d) conditions of beginning and stopping of SRM and CDR implementation (timescale of implementation); (e) potential efficiency of different geo-engineering methods (or potential forcing). The objective of geo-engineering formulated in 6.9 should correspond to formulations given in the Introduction: “to prevent abrupt or catastrophic damages which can be provoked by possible climate crisis”. It should be kept in mind that geo-engineering of CDR type deals with GHG removal ONLY FROM THE ATMOSPHERE (not from smoke gases in the industry). | We agree that more clarity about timescale would be beneficial. The link tying geoengineering to abrupt climate change is too strong, this is but one of a set of arguments advanced for the possible use of geoengineering. |
| 6285 | 6 | 80 | 5 | 80 | 6 | One outcome of the IPCC Experts Meeting on Geoengineering which was held in Lima in 2010 was that there would be a statement to the effect: "While the term "geoengineering" is used in some discussions of what can be done to address climate change, that term does not have a specific scientific or technical meaning that is understood across many different research cmmunities. Therefore, this section will discuss the two distinct research topics of "Carbon Dioxide Removal" and "Solar Radiation Management" that are often lumped under this broader term of "geoengineering." This could serve as a short block of text that separates the boldfaced headers for Sections 6.9 and 6.9.1. | Yes. |
| 6290 | 6 | 80 | | 81 | | A general note on section 6.9.1, this section is pretty light on references to the peer reviewed literature. For key points, I would suggest citing more (perhaps many more) peer reviewed papers. For example, there is a large literture about the potential role of BECCS and more than just the Wise et al, 2009 paper should be cited here. The short paper by Dooley in the IPCC Geoengineering Experts meeting cites a number of these papers on the role of BECCS and some of those peer reviewed paper (and not the Dooley summary) should be cited here. | OK. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 6287 | 6 | 80 | 11 | 80 | 13 | The authors of Chapter 6 need to figure out what should be covered in Section 6.9. If the focus of Section 6.9 is narrowly defined to be what does the peer reviewed literature tell us about the role of CDR and SRM in "Transformation Pathways" then I think this sentence ought to read that it is only for BECCS that there is a robust literature about how SRM and CDR play in Transformation Pathways. Yes there is a literaure about iron fertilization but it is an engineering, ecological and earth system science focused literature and not a literature about how iron fertilization fits into a portfolio of potential responses to cliamte change. That is a question for the authors of Chapter 6 is should there be a clear emphasis about what is known and more importantly not known about how CDR and SRM fit into "Transformation Pathways" and less a description of the basic technologies absent this sense of how they fit into a broader set of actions? Also any sentence that says there is a sufficiently deep body of scientific and policy analytic literature ought to have way more than two citations. | True, there is little in the literature on transformatoin pathways |
| 6289 | 6 | 80 | 20 | 81 | 3 | There is nearly a page devoted to ocean fertilization but at the end the reader has no better understanding of how does this concept of ocean fertilization fit into "Transformation Pathways." Is ocean fertilization 100% of the solution to anthroprogenic climate change or 0.01%? Is it really cheap and therefore something that would be done early (assuming a Hotelling like price path for GHC emisssions to the atmosphere) or is it very expensive? I am not suggesting that Chapter 6 needs to answer these questions but I do think the authors and review editor(s) for Chapter 6 neeed to think about wheter in the context of Chapter 6 or WGIII's contribution to AR5 it is better to devote a page telling the reader about the basic biological and biogechemical processses involved in ocean fertilization. Or is it better to point the reader to good technical literature that describes the potential processes for iron fertilization and then devote the text here to making it clear that before AR6 comes around there is a pressing need to understand how this class of CDR activities would fit into "Transforamtion Pathways." Compare the text on ocean fertilization to the text two paragraphs down about BECCS and DAC. BECCS and DAC are also complex systems but the reader is (appropriately) not walked through whether it is better to use NaOH or something else to capture CO2 from the air or the specifics of the configuration of the DAC units or other critical technical details. For the purpose of this chapter the discussion of DAC, BECCS and biochar seem to be at the right level and hit the points that are relevant for a discussion of "Transformation Pathways." | In the final report iron fertilization receives a more proportianate coverage with a little over one paragraph. |
| 4309 | 6 | 80 | 45 | 81 | 3 | the possibility to add alkalinity to the oceans might be workig in theory, but in practice it poses a large challenge. thus, it is not only risky and expensive, but also highly impractical (see Borel, B. (2008): Cleaning up CO2 with a twist of lime. Cosmos Magazin. http://www.cosmosmagazine.com/node/2117) | The paragraph on enhanced weathering notes the idealized nature of some studies and points to a number of risks and limitations and concludes that "The confidence level on the carbon cycle impacts of enhanced weathering is low" |
| 4311 | 6 | 80 | 6 | 81 | 21 | all CDR-approaches involving BE-CCS or DAC have the same storage-obstacles common CCS has. (see IPCC special report on CCS). That has to be noted in this particular section to make it more balanced. | the final report notes: "Carbon captured through CCS, BECCS and DAC are all intended to use the same storage reservoirs (in particular deep geologic |

|---|---|---|---|---|---|---|---|
| 6919 | 6 | 80 | 6 | | | This section mostly focuses on the assessment of the physical science basis of specific geoengineering options. However, this component of the assessment of Geoengineering is done in WGI AR5 and a reassessment here in WGIII Ch6 must be avoided to avoid unnecessary overlap and potential inconsistency within the WG AR5 assessment. Rather than producing your own assessment, reference to WGI AR5, Chapter 6 should be made for a comprehensive assessement of the physical science basis of CDR. We suggest to also consider the cross-WG IPCC Expert Meeting Report on Geoengineering held in June 2011 (IPCC, 2012: Meeting Report of the Intergovernmental Panel on Climate Change Expert Meeting on Geoengineering [O. Edenhofer, R. Pichs-Madruga, Y. Sokona, C. Field, V. Barros, T.F. Stocker, Q. Dahe, J. Minx, K. Mach, G.-K. Plattner, S. Schlömer, G. Hansen, M. Mastrandrea (eds.)]. IPCC Working Group III Technical Support Unit, Potsdam Institute for Climate Impact Research, Potsdam, Germany, pp. 99. ). | This section has been rewritten and expanded. It was decided to gives an accessible overview of the physical scence before exploring the other relevant issues. Sections 6.9.1.2, 6.9.2.2 and 6.9.3 give this broader perspective |
| 6286 | 6 | 80 | 7 | 80 | 11 | Consider moving the sentence about there being many different CDR techniques and we don't know that much about how they would play out in practice up into the short section suggested to separate Section 6.9 and 6.9.1 and make it a more general statement about CDR and SRM. Then cite the many reports that stress this point that there are lots of potential ideas but few if any have really been fleshed out or tested in the real world (we have nuclear power plants and we have half a century of opperational data from them, there is no comperable body of knowledge for anthroprogenic CDR or SRM schemes). This point needs to be front and center before the individual technologies are discussed. IPCC, Meeting Report of the Intergovernmental Panel on Climate Change Expert Meeting on Geoengineering, O. Edenhofer, et al., Editors. 2012, IPCC: Potsdam, Germany. p. 108 Vaughan, N.E. and T.M. Lenton, A review of climate geoengineering proposals. Climatic Change, 2011. The Royal Society, Geoengineering the climate: Science, governance and uncertainty, 2009, The Royal Society: London. p. 98. Asilomar Scientific Organizing Committee, The Asilomar Conference Recommendations on Principles for Research into Climate Engineering Techniques, 2010, Climate Institute: Washington DC. p. 40. | The final report notes carefully the limits to current knowledge on these methods. |
| 6288 | 6 | 80 | 7 | 81 | 21 | At the IPCC experts meeting on geoengineering there was considerable discussion about not throwing everything under the header of CDR. In particular, there was push back as to whether things like no till agriculture, afforestation, and potentially even BECCS should be included under CDR. The reason for not including changes to agricultural practices and forestry under CDR is that these are already well developed concepts with their own literature and even accounting rules and that nothing is gained by including them under CDR/geoengineering. I think I would leave DAC, BECCS, biochar and ocean fertilization in this section 6.9 but I would seriously consider removing much of the "traditional" terrestrial management things from this discussion. | Yes |
| 2429 | 6 | 81 | 1 | 81 | 1 | I assume you mean "atmosphere" rather than "biosphere" here. | text completely revised, comment no |
| 8051 | 6 | 81 | 10 | 81 | 16 | This sounds as if this technology had no problems with acceptance. We know the SR on CCS and the optimistic expectations, but since then much of the optimism on CCS projects has vanished. Please reflect shortly that BECCS could meet the same problems, and the question where the huge amount of biomass would come from is equally an open one. | These issues are covered in the final draft. |
| 2430 | 6 | 81 | 12 | 81 | 14 | Is this "summary" still up to date? | This section has been rewritten, updated |
| 2431 | 6 | 81 | 14 | 81 | 16 | The sentence contradicts itself: the cost of BECCS is similar to coal with CCS although the cost of biomass is unrelated to coal. I suspect you mean the cost of the CCS is similar for BECCS and for a coal-fired power plant. However the two technologies achieve different things: coal+CCS produces (almost) carbon-free energy, BECCS produce energy and (ideally) withdraws carbon from the atmosphere. | text completely revised, comment no longer applies |
| 15436 | 6 | 81 | 14 | | | After "comprehensive summary." INSERT A NEW SENTENCE: "However, safe and permanent storage of CO2 is a major hurdle; leaked CO2 could have significant negative impacts (Shaffer, 2010)." See Gary Shaffer, "Long-term effectiveness and consequences of carbon dioxide sequestration," Nature Geoscience, 3, 464 – 467 (2010) Published online: 27 June 2010 \| doi:10.1038/ngeo896 | text completely revised, comment no longer applies |

|---|---|---|---|---|---|---|---|
| 14337 | 6 | 81 | 23 | 81 | 25 | The text emphasises the "fact" that SRM would act quickly. However, recent studies havemitigated this prospect. Cf. Williamson, P., Watson, R.T., Mace, G., Artaxo, P., Bodle, R., Galaz, V., Parker, A., Santillo, D., Vivian, C., Cooper, D., Webbe, J., Cung, A. and E. Woods (2012). Impacts of Climate-Related Geoengineering on Biological Diversity. Part I of: Geoengineering in Relation to the Convention on Biological Diversity: Technical and Regulatory Matters. Secretariat of the Convention on Biological Diversity. Montreal, Technical Series No. 66 | Most of a paragraph is now devoted to the issues of geological storage. |
| 13741 | 6 | 81 | 23 | 81 | 23 | Rephrase: "The feature that makes SRM special for climate policy is the very quick response of climate variables upon its successful deployment (Shepherd et al. 2009)." | text completely revised, comment no longer applies |
| 8515 | 6 | 81 | 23 | 81 | 23 | “Role” cannot act quickly or slowly. SRM methods can. | text completely revised, comment no |
| 8514 | 6 | 81 | 23 | 81 | 24 | It is appropriate to add two references: Budyko, 1982 (Budyko, M.I. 1082. The Earth’s Climate: Past and Future. New York: Academic Press) and Izrael, 2005 (Izrael, Yu.A. 2005. An efficient way to regulate the global climate is the main objective of the solution of the climate problem. Russian Meteorology and Hydrology, No. 10, pp. 1-4) | text completely revised, comment no longer applies |
| 15437 | 6 | 81 | 23 | | | Section 6.9.2. should be considered for deletion due to the speculative and controversial nature of SRM. At the very least, the section needs an introduction that conveys the speculative / theoretical nature of SRM, such as the following: At the beginning of line 23, INSERT: Blocking or reflecting sunlight away from the earth (so-called Solar Radiation Management) is a controversial proposition because it has the potential to cause significant environmental damage, including releasing additional GHGs into the atmosphere, changing weather patterns (including reducing rainfall), damaging the ozone layer, diminishing biodiversity, reducing the effectiveness of solar cells, and risking sudden and dramatic climatic changes if the efforts are stopped, either intentionally or unintentionally. SRM will not address the problems of atmospheric GHGs or ocean acidification and could even worsen ocean acidification and ozone depletion. (Robock A., Oman L. & Stenchikov G. [2008]. Regional climate responses to geoengineering with tropical and Arctic SO2 injections., J. Geophys. Res., 113, D16101, doi: 10.1029/2008JD010050.) Political questions are equally critical: Who controls the Earth’s thermostat? Who will make the decision to deploy if such drastic measures are considered technically feasible and with whose consent? If something goes wrong, who is responsible for the damages? (See ETC Group, Geopiracy, The Case Against Geoengineering, 2010 [online] http://www.etcgroup.org/content/geopiracy-case-against-geoengineering) | SRM was included in the final report given the growing literature base and public and policy awareness. The final report is substantially altered from the earlier draft form and much care has been taken to note technical uncertainties and risks but also the socio-political and ethical issues that SRM raises. |
| 8516 | 6 | 81 | 26 | 81 | 26 | SRM methods do not “mask”. Cooling effect caused by them counteract warming effect caused by GHGs. | text completely revised, comment no |
| 13742 | 6 | 81 | 28 | 81 | 29 | Rephrase: "Emissions reductions result in mitigation of climate change on time-scales of more than decades because of the inertia inherent in the carbon cycle. On the century timescale, however, only the reduction of emissions and sequestration of GHGs can reduce the long-run climate risk; SRM might provide rapid cooling for only both a limited time and limited level of GHG concentrations. ..." | We do not think this text makes sense because it (falsely) condones acceptance of the idea that SRM would be used to provide rapid cooling. Since many climate impacts depend on the rate of temperature change it is hard to |
| 8517 | 6 | 81 | 30 | 81 | 30 | It would be better to add the word “concentrations”: …only reduction of concentrations of long lived GHG can reduce… | text completely revised, comment no longer applies |
| 2423 | 6 | 81 | 34 | 81 | 43 | This paragraph does not bring much and could be deleted if space is needed. | text completely revised, comment no |
| 8961 | 6 | 81 | 34 | | | This claim is not true. Public understanding, as well as technical understanding is minimal. | This claim is no longer made |
| 13743 | 6 | 81 | 34 | 81 | 34 | Rephrase "Scientific understanding and public understanding of SRM is, though growing rapidly, still very limited (Shepherd et al. 2009); (Mercer et al., 2011)." | "Very" limited is a value judgment. It is objectively true that with a doubling time of about two years the growth in |
| 8962 | 6 | 81 | 38 | | 44 | Scientiic opinions should be weighed, not counted. Joseph Henry ca. 1850. The claims here are meaningless. | text completely revised, comment no longer applies |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 8518 | 6 | 81 | 43 | 81 | 43 | It is appropriate to add a separate paragraph: “Along with theoretical investigations (Izrael et al. 2007 – Izrael Yu.A., Borzenkova I.I., and Severov D.A. 2007. Role of stratospheric aerosols in the maintenance of present-day climate. Russian Meteorology and Hydrology, No 10, pp. 1-4) some limited field experiments related to SRM were conducted lately in Russia (Izrael et al. 2011 – Izrael Yu.A., Zakharov V.M., Ivanov V.N. et al., 2011. Field experiment to simulate influence of aerosol layers on changeability of solar insolation and meteorological characteristics of the atmospheric boundary layer. Meteorology and Hydrology, No 11, pp. 5-14, in Russian). The results of the experiments to study interaction of solar radiation with artificial aerosols and natural cloud layers demonstrated that reduction of radiation flux led to relatively fast reaction of temperature and turbulent heat fluxes within atmospheric boundary layer. It was shown that partial screening of the surface by aerosol can be considered as effective means for control of solar radiation intensity and temperature regime of air boundary layer. There are broad prospects for international cooperation to carry out field experiments of different scale under the auspices of World Meteorological Organization. | WG1 covers more of the technological and physical science basis and as such WG3 is not the appropriate venue for this issue. |
| 8519 | 6 | 81 | 44 | 81 | 48 | The effectiveness of a geo-engineering method is its capability to compensate (partly of fully) positive radiative forcing caused by GHGs. The effectiveness of SRM and inability of SRM to compensate effects of GHGs perfectly on regional scale are absolutely different things. The effectiveness of space-based and stratospheric-based RGM methods are not limited on global scale (Lenton T.M. and Vaughan N.E., 2009. The radiative forcing potential of different climate geoengineering options. Atmos. Chem. Phys. Discuss., vol. 9, pp. 2559-2608; The Royal Society, 2009. Geoengineering the climate: Science, governance and uncertainty. ISBN: 978-0-85403-773-5, 83 p.). Indeed, theoretically it is possible to compensate perfectly any change of a climatic parameter (global averaged) by SRM but due to different physical basis of greenhouse warming and SRM regional distribution of the parameters will be different. | We do not believe this citation materially as to the understanding of geoengineering, so we propose not to include it on account of the space constraints. |
| 15435 | 6 | 81 | 9 | | | At end of line 9, INSERT: In all cases, permanent (or even medium-term) sequestration has not been established. (A. Strong, J. Cullen, and S. W. Chisholm. (2009) Ocean Fertilization: Science, Policy, and Commerce, in Oceanography: Vol. 22, No. 3, 236-261 and Strong et al., "Ocean fertilization: time to move on," Nature 461, 347-348 (17 September 2009) \| doi:10.1038/461347a, published online 16 September 2009 and CBD Technical Series 45, "Scientific Synthesis of the Impacts of Ocean Fertilization on Marine Biodiversity", 2009) | This section notes a number of limitations of ocean iron fertilization and raises the issue of the longevity of carbon storage in general however section 6.5.3.2 covers these specific issues in more detail. |
| 4310 | 6 | 81 | 14 | 81 | 16 | Biomass is currently a decentral form of energy while CCS necessarily requires a centralized system. The comination of both has so far only been on a theoretical level and migh in practice require a different mode of biomass-“production“ (large plantations, infrastructure...). This has an impact on costs and overall CO2-mitigation levels (UBA 2011, S.23, Aznar, c., Lindgren, K., Larson, E. & Möllersten, K. (2006): Carbon capture and storage from fossil fuels and biomass – costs and potential role in stabilizing the atmosphere. Climatic Change, Volume 74, Numbers 1-3 / Januar 2006, S. 47-79.) | BECCS is covered alongside other CDR techniques and a number of limitations are noted both in section 6.9.1.1 and 6.9.1.2 but are covered in more detail in section 6.5.1 of WG1 |
| 6291 | 6 | 81 | 20 | 81 | 22 | It is probably true that the Socolow APS study of DAC is the only broad-based study and I think that study is accurately described here, however this is an IPCC assessment of the peer reviewed literature and I think peer reviewed papers on the cost of DAC also ought to be cited. Zenz House, K., et al., Economic and energetic analysis of capturing CO2 from ambient air. PNAS, 2011. Baciocchi, R., G. Storti, and M. Mazzotti, Process design and energy requirements for the capture of carbon dioxide from air. Chemical Engineering and Processing, 2006. 45(12): p. 1047-1058. in additon to work produced by Keith et al and Lackner et al should probably be cited here too. | The report has been updated and a broader range of literature has been cited. Section 6.5.1 of WG1 covers this particular issue in more depth. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 9585 | 6 | 81 | | | | Please, take into account the following information in the text;<br>The other key geo-engineering mechanism, Solar Radiation Management (SRM), is suggested as a low-cost climate change intervention tool that may temporarily alleviate climate change. More is known about SRM as scientific research into the field continues and research programs are sponsored. Nevertheless, the inherent efficacy of SRM remains limited as it cannot perfectly compensate for the effects of the proliferation of green house gases.<br>A critical climate issue is the serious problem of the decrease in the pH of the Earth's oceans. The increased levels of anthropogenic CO2 in the atmosphere have already caused significant ocean acidification during the past decades and the rate of ocean acidification is ever increasing [1]. Hoegh Guldberg et al., in an academic paper on climate change effects on coral reefs [2], project that ocean acidification will bring about an oceanic pH drop of 0.4 pH units by the end of this century, with ocean carbonate saturation levels potentially falling below levels necessary to sustain coral reef accretion by 2050. An IPSO backed expert workshop summary report [3] contends that acidification increases the susceptibility of corals to bleaching, changes the behaviour and toxicity of heavy metals and may reduce the limiting effect of iron availability on primary production in some parts of the ocean.<br>Consequently, as a result of the above, the environmental and societal impact is clearly huge. Stabilizing and turning around the effects of climate change on the oceans is a long-term task, according to the National Oceanic and Atmospheric Administration (NOAA) chief Jane Lubchenco [4].<br>The United Kingdom's Parliamentary Office of Science and Technology published a short briefing note on geo-engineering research in 2009 [5]. It mentions the significant uncertainty intrinsic in models predicting SRM effects. The note hinted that climate outcomes not foreseen by modelling might arise and, importantly, it also states that SRM 'has no effect on the other consequences of elevated CO2 levels such as ocean acidification.' The publication goes on to report that solar radiation management techniques 'can do nothing except buy time for efforts to reduce atmospheric CO2 to succeed as they do not address the root causes of climate change.'<br>Similarly, the IPCC Meeting Report of the Intergovernmental Panel on Climate Change Expert Meeting on Geoengineering [6] emphasises that whilst SRM may impact precipitation patterns on a regional basis, SRM by itself offers no substantial solution for CO2-induced ocean acidification. Likewise, in a paper published by the Royal Society, it is said that SRM techniques will not address effects caused by increased concentrations of atmospheric greenhouse gases, such as ocean acidification [7].<br>Therefore, it may be prudent to include such an inherent shortcoming in the draft section on SRM and its related capabilities and limitations.<br>[1] Gangjian Wei, Malcolm T. McCulloch, Graham Mortimer, Wengfeng Deng and Luhua Xie. (2009) Evidence for ocean acidification in the Great Barrier Reef of Australia. Geochimica et Cosmochimica Acta. | 8399 | 6 | 81 | | | | Since this section focuses on risks, the risk due to cessation of SRM should be mentioned, a risk that is proportional to the amount of SRM used. (Coordinated with Chapter 13, which also discusses SRM) | In the revised section the risks of SRM are covered in greater detail than in the |
| 3286 | 6 | 81 | 22 | | | This subsection completely ignores the literature on other types of SRM than stratospheric aerosol injections. While the stratospheric injections have been the most extensively studied method, there is a considerably body of literature especially on cloud brightening but also on surface albedo modification (there are too many publications to be listed in detail here; they can be easily found with little effort). I also find the cited literature biased toward a couple of North American research groups, and e.g. the European studies on the feasibility and effects of different SRM methods are ignored. In addition, some of the major risks related to SRM methos (such as termination effects, ocean acidification, potential hydrological changes related to monsoon circulation and rainfall in the Amazon region, etc.) merit more discussion. | The section has been rewritten and now covers a range of SRM methods which are covered in more detail in section 7.7.3. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 6920 | 6 | 81 | 22 | | | This section mostly focuses on the assessment of the physical science basis of specific geoengineering options. However, this component of the assessment of Geoengineering is done in WGI AR5 and a reassessment here in WGIII Ch6 must be avoided to avoid unnecessary overlap and potential inconsistency within the WG AR5 assessment. Rather than producing your own assessment, reference to WGI AR5, Chapter 7 should be made for a comprehensive assessement of the physical science basis of SRM. | Answer: we will ensure that better coordination with WG1. |
| 6292 | 6 | 81 | 23 | 81 | 24 | Suggest striking the first sentence here and moving the citations at the end of the current first sentence to the end of the current second sentence. Both sentences say the samething but the current second sentence is more informative and uses more technically precise terminology "decades" as opposed to "quickly." | text completely revised, comment no longer applies |
| 6293 | 6 | 81 | 28 | 81 | 29 | Suggest striking sentence that beggins with "Emissions mitigation neceearily…" This point about the relative time scales of mitigation and SRM is made at least three times in this opening paragraph. This can be said once. Also the repetition of this point makes it sound as if these things are substitutes as opposed to commpliments. In terms of SRM and mitigation being compliments, I'd suggest citing a number of papers that make this point. A recent addition to the literature on this point is Smith SJ and PJ Rasch (2012) The Long-Term Policy Context for Solar Radiation Management Climatic Change (accepted). | We agree this point should only be made once. |
| 6294 | 6 | 81 | 29 | 81 | 30 | While true, the sentence that says "Mitigation cannot…" seems a bit inconsistent with the discussion earlier in this chapter about how near term actions or inaction drives the shape of longer term options. Again, the point here should not be whether SRM or mitigation is better or faster or whatever other metric but rather that they represent potential commpliments but that there really isnt a literature describing this complementary role in terms of "Transformation Pathways" and that really is somethign that needs to be developed before AR6 | The reason they are potential compliments is that the have differing capabilities. |
| 4312 | 6 | 81 | 31 | 81 | 31 | this sentence ignores the well acknowledged „moral hazard“ problem. therefore you might insert „...misconception to think of a simple climatic one-time trade-off between“ | the moral hazard problem is raised in the final report |
| 8403 | 6 | 81 | 32 | 81 | 33 | I'm not sure that the paper cited actually talked about tradeoffs, although Goes et al. explicitly look at this and should probably be referenced. Also, our recent paper shows that, if SRM was needed, then SRM and mitigation would need to occur together in order to reduce both near- and long-term risks. References: Smith, Steven J and PJ Rasch (2012) The Long-Term Policy Context for Solar Radiation Management Climatic Change (accepted). Goes M, Tuana N, & Keller K (2011) The economics (or lack thereof) of aerosol geoengineering. Climatic Change 109:719–744 DOI 10.1007/s10584-010-9961-z. | We will look at the new Smith and Rasch paper. |
| 6295 | 6 | 81 | 34 | 81 | 35 | The Shepherd et al 2009 paper is not listed in the references so this reviewer can not determine to what extent that paper supports the assertion that the science SRM and public support for SRM has "grown rapidly." The Mercer 2011 article is listed in the references and can be found on line. It is not clear how the Mercer paper supports the assertion that "public understanding of SRM is growing rapidly." The Mercer paper includes time series data on the "publics expososure" to news stories about SRM but that is clearly not the same as understandng. The Mercer paper cites unpublished previous studies that show public awareness of SRM is potentially less than 10%. Malone et al 2010 based on the pioneering work of Bishop et al 1986 argued that surveys with response rates that low are likely measuring non-stable psuedo opinions. The Mercer paper states "We found that the assessed familiarity of geoengineering is likely around 8%, which is greater than past empirical assessments." and notes that this is a single assessment. Again, I do not see any evidence that "public support for SRM" has grown rapidly. Delete this concept from AR5 which is meant to assess the collective wisdom of the peer reviewd literature and not one or (depending on what is in the Shepherd paper) two papers. Malone, E., J. Dooley, and J. Bradbury, Moving from misinformation derived from public attitude surveys on carbon dioxide capture and storage towards realistic stakeholder involvement. International Journal of Greenhouse Gas Control, 2010. 4(2): p. 419-425. G.F. Bishop, A.J. Tuchfarber, R.W. Oldendick Opinions on fictitious issues: the pressure to answer survey questionsPublic Opinion Quarterly, 50 (1986), pp. 240–250 | This text will either be removed or altered to ensure that there is no implication that support is growing rapidly. The point that does seem supported by data is that knowledge is growing rapidly. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 6296 | 6 | 81 | 34 | 81 | 43 | Delete this entire paragraph. It is not clear what the point of this paragraph is supposed to be. This section should either discuss how SRM fits into Transforamtion Pathways or describe key technical / scientific points. The history of SRM literature and how it grew from a tiny litterature to a slightly larger literature isn't a core point. | this paragraph has been removed and the final version of the report does focus on these issues. |
| 6297 | 6 | 81 | 44 | 82 | 13 | This is well written and informative. I think that this text here as well as a shortened version of the first paragraph in Section 6.9.2 is probably all that needs to be said about SRM in terms of Transformation pathways. I would end this section with a paragraph stressing that much work needs to be done to understand the role of SRM and CDR in Transforamtion Pathways (i.e., society's potential responses to climate change) and then be done with it. [i would certainly cite the Moreno-Cruz et al 2012 paper but probably drop the sentence that describes the particular metric used in that study. the text in the proceeeding sentence that says "but (c) one of the first studies to examine the effectives geoengineering in compensating for temperature or precipitation changes on a regional basis shows that SRM can compensate for increased GHG surprisingly well even at a regional level" is adequate discription of the Moreno-Cruz et al 2012 work for the purpose of chapter 6 in WGIII [WG1 or WGII would seem better places to discuss the specifics of this study]. | The text has been rewritten and around 3 pages are devoted to SRM. Many methods for SRM are described and a range of risks and uncertainties deiscussed as well as the potential role for SRM in transformation pathways. This longer format was deemed necessary to appropriately cover this controversial issue. |
| 8513 | 6 | 81 | 22 | | | Section 6.9.2 deals with only one version of SRM namely injection of submicron aerosol into the stratosphere. It should be mention that reflection of a part of solar radiation can be provided by different surfaces in different locations. So, at least 4 types of SRM should be distinguished: space-based, stratospheric-based, cloud-based, ground-based. Shortly they are mentioned in sections 9.5.2 and 13.4.2. Besides, the text of 6.9.2 focused mainly on shortcomings of stratospheric-based SRM. Nothing is said about physical principles of SRM. The main part of the text of the section is devoted to discussion of shortcomings of SRM. It is one-sided approach. There is no ideal method to prevent global warming. Any conclusion about advantages and disadvantages of this or that method must be done on the basis of cost-benefit analysis. | Many methods of SRM are now described in this section and their limitations noted. |
| 8963 | 6 | 82 | 13 | | 16 | This is a very crude model at best. Too much emphasis given to it in the report. | text completely revised, comment no |
| 13695 | 6 | 82 | 20 | 82 | 20 | Add text after "productivity": "SRM may lead to unwanted changes in regional climate patterns such as the monsoons, with the potential of massive damage (Burns 2011, Keith et al. 2010)." References: Burns, W. (2011): Climate Geoengineering: Solar Radiation Management and its Implications for Intergenerational Equity, in: Stanford Journal of Law, Science & Policy, 4, p. 39-55; Keith, D.; Parson, E.; Morgan, G. (2010): Research on global sun block needed now, in: Nature, 463, 426-427 | The risks of SRM are raised and covered in more detail than in the earlier draft. |
| 9244 | 6 | 82 | 21 | 82 | 39 | SRM measures could change the precipitation patters and reduce direct solar radiation. The former has potential impacts to water resource. The latter has explicit impacts to solar thermal energy potential. | The text makes this point. |
| 5234 | 6 | 82 | 23 | | | At least two types of risks could be mentioned also. First, the risks related to the governance of SRM systems (refer e.g. to Chapter 13.4.2) and, second, the risk related to ocean acidification if the atmospheric CO2 concentration is not limited but the radiative forcing is compensated by SRM (see e.g. FOD of WG I or the IPCC Workshop on Impacts of Ocean Acidification on Marine Biology and Ecosystems, Okinawa, Japan, 2011). | It make sense to make some mention of the difficulties (or risks) associated with governance. If we mention ocean acidification we simply need to mention that SRM does not reduce its risk. It is |
| 8964 | 6 | 82 | 24 | | 25 | Ozone and, I would say hydrological impacts, which indicate reduced rainfall in Africa and India. | The risks of SRM are raised and covered in more detail than in the earlier draft. |
| 8522 | 6 | 82 | 24 | 82 | 25 | It would be too naïve to say that “Ozone depletion … is by far the best studied risk”. The experimental data obtained just after the Pinatubo eruption shown that ozone depletion within the volcanic cloud was significant (up to 20%). However, nobody proved scientifically that such depletion was caused by sulfuric acid droplets (used for SRM) but not by volcanic ashes (not used for SRM). It was evaluated that Pinatubo produced global ozone depletion on the level of 2.5% (Kinnison D.E., Grant K.e., Connell P.S., Rotman D.A., Wuebbles D.J., 1994. The chemical and radiative effects of the Mount Pinatubo eruption. J. Geoph. Res., Vol. 99, No D12, pp. 25705-25731, doi:10.1029/94JD02318). It is important to remember that Pinatubo injected into the stratosphere about 10 Mt of sulfur that is much more than would be needed for SRM purposes. | There are far more papers about the ozone depletion risk of solar geoengineering then there are about any other geoengineering risk. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 8523 | 6 | 82 | 25 | 82 | 28 | The phrase “For sulfate aerosols…” is contradictory: (a) additional aerosol reduces NOx; (b) reduced NOx should produce less ClO; (c) reduction of ClO leads to preservation of ozone. The net result is: the higher aerosol concentration, the higher ozone concentration | The text has been revised and the ozone consequences of sulphate aerosol injections are discussed briefly. WG 1 |
| 8965 | 6 | 82 | 36 | | 38 | This reduced loading claim is very uncertain and is based on wishful thinking. | text completely revised, comment no |
| 8520 | 6 | 82 | 4 | 82 | 5 | “cycle” cannot decrease. Evaporation or precipitation amount can. | text completely revised, comment no |
| 17397 | 6 | 82 | 6 | 82 | 16 | The following study should be mentioned: Riche, K.L., Morgan, M.G., Allen, M.R., 2010. Regional climate response to solar-radiation management. Nature Geoscience 3: 537-541. | Other citations which address similar issues are cited in the report. |
| 8521 | 6 | 82 | 8 | 82 | 8 | Double “that” | text completely revised, comment no |
| 6298 | 6 | 82 | 21 | 82 | 39 | I would delete this as a stand alone paragraph and instead take the literature cited here and summarize it in a closing paragraph agbout unknowns and future research. This seems too detailed for this chapter. | The text has been completely rewritten and greater space is devoted to |
| 16762 | 6 | 83 | 11 | | 20 | This seems much more important when policymakers are trying to define what must happen via policy rather than when simply setting a carbon constraint with a price and letting the market figure it out. | Noted. |
| 13744 | 6 | 83 | 14 | 83 | 14 | Insert "The apparent availability of carbon negative or SRM technologies will also influence mitigation strategies." | Noted. We will consider including the treatment of SRM as a priority in the next draft upon consideration of the |
| 2230 | 6 | 83 | 21 | 85 | 16 | Those 3 questions are (the) essential questions the world asks the IPCC on mitigation. Hence, carefully considered answers are needed, which are as clear as possible on the answers. Do a cross check across all chapters to avoid any duplication of those FAQ (e.g, currently there is a Copenhagen Accord target question in chapter 7 which shoudl not be there (but is rather a duplication of this Q1 (6.11.1)) | Noted. |
| 2231 | 6 | 83 | 22 | 83 | 24 | The question should be reformulated, e.g. with respect to "chances to achieve the Copenhagen Accord, i.e. stabilizing at max 2 degrees warming). A phrase like "under control" is too vage. | Rejected. At present, we are comfortable with more general language that would |
| 11372 | 6 | 83 | 25 | 83 | 25 | This sentence needs to be reformulated to be clearer | Accepted. |
| 16763 | 6 | 83 | 4 | | 10 | It is important to highlight that economic response, in terms of technology choices, infrastructure development and so on will vary from place to place depending on current level of development. Price based policies allow for this and result in each country following the most efficient pathway via trade of emissions. It is extremely difficult for governments or analysts to pre-define the best pathway and then to build policies to make the future conform to the analysis. | Noted. |
| 16764 | 6 | 83 | 42 | | | Suggest inserting after "across countries" the following: "whether they rely on more or less costly or effective approaches," | Noted. This section is going to be substantially shortened for space, so very little will remain from what is currently there. Nonetheless, the point is |
| 16765 | 6 | 83 | 44 | | | At end of paragraph, suggest inserting: "Research indicates that policies which use a carbon price to incentivize change are the most effective and least costly means to lower emissions of GHGs. The timing with which a market is developed that includes at minimum the largest emitting countries is a major determinant as to whether or not a 450 ppm or 500 ppm target can be realistically met." [It is generally realized that absent an agreement with trading of emissions between the major emitting countries that the goal of 2 degrees is impossible -- I think this should be said in the document or we can not expect policymakers to know it.] | Noted. This section is going to be substantially shortened for space, so very little will remain from what is currently there. Nonetheless, the point is being considered in the current draft. |
| 2232 | 6 | 83 | 45 | 84 | 7 | Can the stabilization target be expressed (also in) temperature warming. Radiative forcing values will just not be used and understood outside the climate scientists community. | Rejected. This chapter is focused on RF. We will note the link to temperature |
| 11373 | 6 | 83 | 45 | 84 | 2 | Also this sentence does not read well. Is there some part missing? Please consider to reformulate that. | Accepted. |
| 13746 | 6 | 84 | 10 | 84 | 10 | Rephrase: "There are many technologies that can contribute to reducing the carbon intensity of human activities. This means that no single technology can serve as a "silver bullet", … | Noted. This section is going to be substantially shortened for space, so very little will remain from what is currently there. Nonetheless, the point is |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 4211 | 6 | 84 | 11 | 84 | 14 | The term "risk" should appear in this sentence to clarify the relationship with 6.7. | Noted. This section is going to be substantially shortened for space, so very little will remain from what is currently there. Nonetheless, the point is |
| 11758 | 6 | 84 | 14 | 84 | 17 | Good example. | Noted. |
| 9586 | 6 | 84 | 14 | 84 | 17 | Good comment and good for exective summary | Noted. |
| 6760 | 6 | 84 | 14 | | 17 | Good description. It's very important. | Noted. |
| 10652 | 6 | 84 | 14 | 84 | 17 | Appropriate statement. | Noted. |
| 5875 | 6 | 84 | 14 | 84 | 17 | I object. There is no such thing as a zero-carbon electricity source. Nuclear power installations cause emissions during construction, maintenance, running, intermediate and / or final waste storage, fossil energy with CCS just reduces efficiency to c&s C which "is there" (and this source also has emissions from construction, running and maintenance), and "renewables" of course also have C emissions! Low or "zero" emissions during the "electricity generating phase" have to be related to the life-cycle emissions of the "electricity generating device" to get the complete assessment. | Noted. It may be wise to move to a nomenclature on low-carbon technologies. |
| 13747 | 6 | 84 | 17 | 84 | 17 | Insert: "In addition to reducing the carbon intensity of energy systems the contribution of carbon negative technologies such as bio energy with carbon capture and storage (BECCS) will be invaluable to counteract diffuse sources of carbon such as land-use change induced emissions or emissions from transportation and to reach adequate emission reduction pathways despite upcoming implementation difficulties. …" | Noted. This section is going to be substantially shortened for space, so very little will remain from what is currently there. Nonetheless, the point is |
| 11374 | 6 | 84 | 19 | 84 | 19 | Why mention here only technology? Also changed behavior (in not using too much energy) could be mentioned here, even the question adresses technology. This somehow implies that technology might be the 'sole' solution | Noted. The questiion of when to single out technologies as examples is being considered for the SOD. |
| 13748 | 6 | 84 | 19 | 84 | 19 | Insert after "… will": "also" | Noted. This section is going to be substantially shortened for space, so very little will remain from what is currently there. Nonetheless, the point is |
| 13745 | 6 | 84 | 2 | 84 | 3 | Rephrase: " Indeed studies indicate a global emissions peak a requirement for this goal, … (den Elzen et al., 2012)" | Noted. This section is going to be substantially shortened for space, so very little will remain from what is currently there. Nonetheless, the point is |
| 11375 | 6 | 84 | 23 | 84 | 25 | This statement implies that 'only' technologies would be able to overcome this issue; here again, changed human behavior (in theory) could be an alternativ. | Noted. This section is going to be substantially shortened for space, so very little will remain from what is currently there. Nonetheless, the point is |
| 13749 | 6 | 84 | 23 | 84 | 29 | Delete | Noted. This section is going to be substantially shortened for space, so very little will remain from what is currently there. Nonetheless, the point is |
| 8966 | 6 | 84 | 24 | | 25 | Analysis of technology is woefully lacking, since tech can be a two-edged sword and can generate its own dynamics. | Noted. |
| 16031 | 6 | 84 | 26 | 84 | 29 | i not agree with this argumentation. First: CCS is not enough prooved. And why is this the only way? What is with bioenergy and use of CO2 for other purpuses for example with algae. What is with the production of renevable energy per wind or solar and the production of hydro or methan with the electricity that is not used (Power to Gas-Technology) | Rejected. The literature on scenarios shows the potential benefits of CDR technologies. We do not assert here that the technology is available or proven, |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 8053 | 6 | 84 | 26 | 84 | 26 | insert 'is': 'The one possible exception to this is biomass coupled with carbon dioxide capture and storage.' | Noted. This section is going to be substantially shortened for space, so very little will remain from what is currently there. Nonetheless, the point is |
| 9588 | 6 | 84 | 27 | 84 | 29 | Please, describe the reality of BioCCS here as it may have limitation to deploy and uncertainty as follows; Rhodes and Keith in a 2008 peer-reviewed commentary on biomass with capture noted that while the high end of estimates for potential biomass availability support the view that biomass could provide the central mechanism for managing global climate and energy challenges, it is doubtful because [1] of the deep uncertainty in the feedstock supply estimates; the environmental implications of maximizing production; the complex social and ethical issues arising from the required re-organization of global land use; and the potentially high costs of such a strategy.<br>They further note that [2] relatively large allocations of land in the developing world would be required to support the scales of bio-energy development implied by globally-aggressive biomass-based strategies. For example, land availability estimates indicate that 84% of arable land not in commercial use is in tropical regions of the world. Local food production capacity, which likely represents a more immediate concern in the developing world than carbon emissions, could be displaced. More generally, rural populations could be forced to adapt to radically changed local environments, including environmental consequences from large-scale biomass production. The notion that these disruptions should be absorbed by the developing world in order to mitigate carbon emissions in industrialized nations raises complex ethical issues of “biomass justice”.<br>[1] J.S. Rhodes and D.W. Keith (2008) Biomass with capture: negative emissions within social and environmental constraints: an editorial comment, Climatic Change, 87, p. 323, lines 9-14.<br>[2] J.S. Rhodes and D.W. Keith (2008) Biomass with capture: negative emissions within social and environmental constraints: an editorial comment, Climatic Change, 87, p. 323, lines 31-41. | Noted. This literature will be considered in the discussions of CDR technologies. |
| 2234 | 6 | 84 | 30 | 85 | 16 | Repeated comment from above which is true here as well: The IPCC should consider to contrast the sum of three cost elements to society when presenting this UNDER DIFFERENT SCENARIOS: 1) Mitigation, 2) Adaptation, 3) Damage cost. Then it will get obvious, that with more money invested in mitigation the TOTAL cost to society can actually be kept lowest. (Dentist analogy). The current representation of JUST showing cost for mitigation only, has of course the consequence that the more mitigation you are doing, the more cost you will incur. Consequently, mitigation is seen as MAIN cost to society, while the other cost elements will likely be bigger and will have much higher uncertainty. | Rejected. This is not the job of this chapter. This chapter is just focused on mitigation. |
| 11995 | 6 | 84 | 30 | | | I would suggest to compare the cost of mitigation to the cost of extreme weather events, rising sea levels etc. | Rejected. This is not the job of this chapter. This chapter is just focused on |
| 16766 | 6 | 84 | 31 | | 47 | Can you make point that these are costs only, not net cost or benefits. Presumably, we have made determination one way or another that the possible downsides are costly enough that we want to act. Policymakers and the public also interpret costs in terms of absolute loss, usually from what they have now. Suggest we help translate costs so people understand this is really a slight reduction in growth rates -- that economies still grow over time, and that people's welfare continues to improve. Can translate costs into additional time needed to achieve same level of GDP/capita in the no policy case. | Noted. This section is going to be substantially shortened for space, so very little will remain from what is currently there. Nonetheless, the point is being considered in the current draft. |
| 2233 | 6 | 84 | 8 | 84 | 29 | 1) It should be noted that the solution is very fragmented across sectors and technology options, thus clearly a "silver bullet" does not exist. 2) Do include some non-CO2 examples (too energy focused now), 3) Energy efficiency measures play a too small role in the answer (too much power supply), 4) Consider to systematically walk through all sectors with 2-3 examples of mitigation options each. | Noted. This section is going to be substantially shortened for space, so very little will remain from what is currently there. Nonetheless, the point is |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 10998 | 6 | 84 | 14 | 84 | 17 | Fossil energy with CCS might not be said as a zero-carbon electricity source. In the chapter 5, nuclear power is described as "near zero-carbon electricity source". The sentence of "nuclear power and fossil energy with CCS are not sufficient without technologies such as heat pumps and electric cars that can allow electricity to substitute for liquid and solid fuels" could lead to misunderstanding. To make use of nuclear energy and renewable energy instead of fossil energy contributes enough to mitigate greenhouse gas emissions. | Noted. It may be wise to move to a nomenclature on low-carbon technologies. |
| 17478 | 6 | 85 | 14 | 85 | 14 | should this say "increase costs" rather than "reduce costs"? | Accepted. However, this section is going to be substantially shortened for space, so very little will remain from what is currently there. Nonetheless, the point is |
| 6543 | 6 | 85 | 14 | | | "increase cost" instead of "reduce cost"? | Accepted. However, this section is going to be substantially shortened for space, so very little will remain from what is currently there. Nonetheless, the point is |
| 6544 | 6 | 85 | 14 | | 15 | Modify the Description, taking into consideration that the chance to fail in meeting the 450 ppm CO2-equv target of models is high if some of the mitigation technologies are not available, according to the descriptions of P48 line 11-16 and Figure 6.29. | Noted. |
| 8054 | 6 | 85 | 14 | 85 | 15 | I read: 'Reductions in the availability of mitigation technologies can also reduce costs, more than doubling costs when key technologies such as CCS are not available'. I thought the opposite: reductions of the availability of technologies leads to an increase of costs: 'Reductions in the availability of mitigation technologies can also increase costs, more than doubling costs when key technologies such as CCS are not available'. | Accepted. However, this section is going to be substantially shortened for space, so very little will remain from what is currently there. Nonetheless, the point is being considered in the current draft. |
| 14406 | 6 | 85 | 3 | | | The missing figures (“xx%”) are crucial! | Noted. |
| 6542 | 6 | 85 | 2 | | 4 | Modify the description, taking into consideration that the macroeconomic costs to meet goals below 2.6W/m2 given here may have serious downward bias, as suggested in P48 line 11-16 and P56 line 25-28. | Noted. |
| 14034 | 6 | 9 | 1 | | 8 | The large-scale transformations in human society will undoubtedly involve much more than how we produce and consume energy and use land; it will involve both those large and visible changes in systems and structures, but it will involve also change in meaning making and in the way society relates to nature (see comment #37). It would be good if the introduction made it clear what changes the chapter focuses on and how this relates to the wider literature on social change and transformation. | Noted. |
| 11370 | 6 | 9 | 17 | 9 | 22 | Literature: Here references should be provided | Noted. Referencing will be improved in |
| 4191 | 6 | 9 | 17 | 10 | 6 | I agree these are important point. But I think this paragraph can be written concisely focusing on the variety of possible options including mitigation and adaptation and trade-offs among factors. | Editorial. |
| 3073 | 6 | 9 | 19 | 9 | 29 | Same comment as p. 5 lines 3, above | Noted. Could not find the previous |
| 13128 | 6 | 9 | 2 | 9 | 2 | Replace "will" with "would". Few things currently suggests that we are on that trajectory. | Noted. The introduction is being revised and the ordering and nature of points that it makes will be different in the |
| 16687 | 6 | 9 | 21 | | | after the word "choices", insert "made over decades" to as to reinforce that this is a long term process and choices and pathways evolve over time. It may help to make this explicit and state that pathways may evolve over time as we learn and as conditions change ... the path will be adjusted. This policy is unlikely to be set and then never adjusted -- we will have the option to go faster or slower. | Noted. |
| 14453 | 6 | 9 | 3 | 9 | 4 | CO2 emissions can never be zero, all animals respire CO2 and organic matter decomposes. Do you mean net fossil-fuel and LUC derived CO2 emission must be zero? This concept must be edited for accuracy. | Noted. The introduction is being revised and the ordering and nature of points that it makes will be different in the |
| 9279 | 6 | 9 | 33 | 9 | 43 | This paragraph is duplicative of Chapter 6, page 5 lines 17 - 27. | Noted. In the SOD, overlaps between the ES and the introduction will be |

| 16688 | 6 | 9 | 33 | | 43 | Redundant with previous paragraph? Delete? | Noted. |
| 14395 | 6 | 9 | 4 | | | Reiteration of zero emissions target is very unfortunate by giving the impression that it is impossible to achieve and tilting the policy mix toward (risky) geoengineering. | Noted. |
| 14035 | 6 | 9 | 40 | | | Add equity concerns | Noted. |
| 12624 | 6 | 9 | 41 | 9 | 43 | I see no reason to single out any technologies here. All technologies include trade offs, CCS, Nuclear, Wind, Solar, etc. | Noted. The questiion of when to single out technologies as examples is being |
| 12667 | 6 | 9 | 41 | 9 | 43 | I see no reason to single out any technologies here. All technologies include trade offs, CCS, Nuclear, Wind, Solar, etc. | Noted. The questiion of when to single out technologies as examples is being |
| 9566 | 6 | 9 | 42 | | | Please, remove coal-fired from coal-fired CCS as we need any types of CCS. | Noted. |
| 9565 | 6 | 9 | 42 | 9 | 43 | Please, delete examples of nuclear and CCS, or add examples of wind power and geothermal as they involve bird-strikes (wind power) and sources of mercury contamination (geothermal power). | Noted. The questiion of when to single out technologies as examples is being |
| 9837 | 6 | 9 | 45 | | | I think that this issue of "feasibility" is raised far too early in the chapter, and too much emphasis is given to it. You have not even described many other key results yet, and infeasibility is not very interesting as an issue since it is purely an artifact of the limited range of input assumptions used in some models. | Noted. There is some confusion between the notion of feasibililty in general and the concept of models not being able to produce particular scenarios. This will be |
| 8623 | 6 | 9 | 45 | | | I think that this issue of "feasibility" is raised far too early in the chapter, and too much emphasis is given to it. You have not even described many other key results yet, and infeasibility is not very interesting as an issue since it is purely an artifact of the limited range of input assumptions used in some models. | Please see the response to comment 9837, which appears to be a duplicate of this comment, despite being submitted |
| 15280 | 6 | 9 | 47 | 9 | 47 | "biogoephysical" to be "biogeophysical" | Editorial. |
| 12307 | 6 | 9 | 9 | 9 | 16 | Please consider to put this passage first in the introduction. | Noted. |
| 8973 | 6 | 90 | 7 | | | Add the following reference. Fleming, J.R. (2010) Fixing the Sky: The checkered history of weather and climate control. Columbia University Press, New York. 325 pp. | Noted. We will consider this reference. |
| 14539 | 6 | all | | | | No mention is made of '350 ppm' target which the Association of Small Island States is asking for. Although the Copenhagen agreement called for a 450 ppm target, it also said that '350 ppm' would be considered | Accepted. We will mention the 350 ppmv CO2-e goal in the SOD. |
| 11996 | 6 | all | | | | I strongly suggest to acknowledge the achievements of the CDM in this chapter, it currently is not mentioned even once. The success to date and potential cost mitigation potential, signalling effect, contribution to improved justice and perceived fairness as well as the training provided so far is all very well documented in the study commissioned by the UNFCCC's CDM Executive Board, overviewed by an independent High Level Policy Panel. The findings and underlying research can be found on cdmpolicydialogue.org. | Rejected. This is not the chapter for discussion of CDM. This chapter is considering long-term transformation pathways. CDM would be more appropriately discussed in the policy |
| 2185 | 6 | `65 | 28 | 67 | 36 | It would be useful to introduce some concepts here that the climate community may be unfamiliar with such as sustainability, sustainable development (as it pertains to all countries not just developing countries), wellbeing. Without these concepts it is hard to explain why integration of climate mitigation within broader sustainable development goals is important. Mention should also be made of the commitment at Rio+20 to develop a set of sustainable develpment goals by 2016, in which climate mitigation is certain to be included. | Noted. This section has been significantly restructured with the new draft. |
| 3403 | 7 | | | | | A major report on CCS cost has been published by the European Technology Platform ZEP, incorporating robust cost data from many industrial participants in Europe and elsewhere. | Taken into account - the cost data provided there are taken into account. |
| 3405 | 7 | | | | | Very poor section. Superfitial, simplistic, missinformative. Too many easywords ant too few numbers and solid references (emmision limits and legislation around the world for key contaminants?). Is the reference to SRREN correct when referring to a comprehensive assesment of nuclear energy health impacts?. Is the reference to CCS effects on human health (0-60% ¡¡¡) reliable (Singh et al 2011) ?. Is it really that serious at global scale the lack of cooling water (see lines 11-19 in page 60). This is one of the lowest quality sections in this FOD. | Noted. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 3406 | 7 | | | | | As a lay citizen, I demand from the IPCC the highest possible rigour in handling this sensitive section. THIS IS POTENTIALY VERY EMBARASSING FOR THE IPCC PROCESS: numbers on casualties MUST BE SUPPORTED BY RELIABLE SOURCES, and conflictive numbers (if any) must be also reported in an IPCC report even if they do not fit with author´s prejudices. I am not an expert on these issues, but I strongly feel this FOD is very far from the objective of a balanced view of the state of the art in section 7.9.3. IT SHOULD BE TOTALLY REWRITTEN AND THE AUTHORS FROM THIS POOR FIRST DRAFT SHOULD CONSIDER RESIGNATION IN VIEW OF THEIR SUPERFITIAL, UNREFERRENCED FOD | Editorial comment. It would help us if the reviewer pointed what specifically appears unbalanced and in what way. |
| 17210 | 7 | | | | | It is not clear what the purpose of this table is. It contains a lot of numbers that are not fully put into perspective. Also, the table is difficult to understand and requires several explanations to make it understand. The LCAs may want to discuss whether the table could be skipped. | This table portraits the global energy picture in one table. This is the purpose of it. |
| 17223 | 7 | | | | | The y-axis scale is missing. This must be corrected. | Accepted. Figure has been corrected. |
| 17216 | 7 | | | | | The positive contribution of electricity per GDP is surprising. The authors are requested to check this. | Taken into account – Please note that the figure has been replaced and the analysis has been updated. The original figure was easy to misunderstand, and |
| 17217 | 7 | | | | | What is the data source for the growth of GDP? Is this IMF, Worldbank, or something else? | This is IEA data. See note to the figure |
| 17220 | 7 | | | | | The figure is not from the peer-reviewed literature. The CLAs are requested to use peer reviewed literature for such a figure. | Taken into account: GEA is peer reviewed literature - the in the figure data are GEA but the concept of presentation was 'borrowed' from Farrel. |
| 6417 | 7 | | | | | It would help to define TPES in the table, or to spell it all out where it is bold in the third row | Accepted. It has been spelled out. |
| 6416 | 7 | | | | | This figure seems odd. The top is difficult to interpret, given how the x axis is partitioned and not in order. | Design of the figure 7.1 was improved |
| 6430 | 7 | | | | | The "baselines" are confusing. Does it represent business as usual? If not, it seems as though BAU should be added. If so, some reference to BAU as a baseline would be helpful. | The baseline refers to the fact that there is no climate policy assumed in the scenario. There might be other aspects in the scenario, however, which are not |
| 16113 | 7 | | | | | This section as a whole is not balanced. There is presently no CCS industrial scale installation on a thermal plant, the main presumed market, as justly mentiond in lines 7-8 page 31. The paragraph should take more space to explain why, if the technology is as available as mentioned earlier in the section. Instead, it goes around a myriad of references as to please everyone, but gives no credible roadmap for cost-cutting in the short and medium-term is given. Then why allocate so much (2 pages) for a technogy that promises less in the medium term than, say, wave power or thermal recovery with new cycles? | Rejected. No scientific evidence or body of peer reviewed literature is offered in support of this observation .The totality of what is written about CCS in all parts of Chapter 7 seems balanced. But because it is broken up and scattered it |
| 15540 | 7 | | | | | This chapter could be shortened by having less text describing data already presented in graphs and tables e.g. material on p 13 describing evidiece presented in Table 7.1. Some of the material describing developments in energy use and supply is not particularly relevant for emissions and climate change. | Accepted - text revised. |
| 2352 | 7 | | | | | Reference to be assessed on transaction cost "Updated capital cost educates for Electricity generation plants, EIA, Nov 2010" (sorry, dont have report and page number) | Noted |
| 9260 | 7 | | | | | Excellent way of presenting the data! | Noted |
| 5737 | 7 | | | | | Probably this table considers just fuel used in agriculture/forestry/fisheries and this is why the energy consumptionof agriculture looks so low. Including indirect energy and electricity uses would change the scenario a lot (http://www.fao.org/docrep/014/i2454e/i2454e00.pdf) | Taken into account. It is not a scenario. It covers only direct consumption. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 5743 | 7 | | | | | I cannot agree with the definition of modern/traditional bioenergy contained in the figure as too simplistic. Using fuel wood in an open fireplace is not 'modern' for example. Please use and include where appropriate the definition developed by GBEP (see the glossary of the GBEP sustainability indicators report: http://www.globalbioenergy.org/fileadmin/user_upload/gbep/docs/Indicators/The_GBEP_Sustainability_Indicators_for_Bioenergy_FINAL.pdf) | GBEP does not define traditional biomass. They define modern or traditional bioenergy services. "Modern bioenergy services are defined as modern energy services relying on biomass as their primary energy source. Modern bioenergy services include electricity delivered to the final user through a grid from biomass power plants; district heating; district cooling; improved cookstoves (including such stoves used for heating) at the household and business level; stand-alone or grid-connected generation systems for household or businesses; domestic and industrial biomass heating systems; domestic and industrial biomass cooling systems, biomass-powered machinery for agricultural activities or businesses; biofuel-powered tractors and other vehicles, grinding and milling machinery.<br>Modern bioenergy services do not |
| 13300 | 7 | | | | | For the UK, the most comprehensive MAC carve analysis was undertaken by the Committee on Climate Change in our report 'Building a low-carbon economy' in 2008. This report recommended the UK's 2050 target and 'carbon budgets' from 2008-22, which were then set in law under the Climate Change Act. It is available from http://www.theccc.org.uk/reports/building-a-low-carbon-economy | Taken into account - table 7.5. was deleted due to space constraints. Comment is obsolete. |
| 11873 | 7 | | | | | Can you expand on the "carbon neutral is not climate neutral" points? There is a long list of citations, but there is no explanation of what those studies said - include a list of some of those reasons. Similarly, the highlighting of bottom up analyses is equally vague - what are some of the relevant climate effects that are being considered? Also (and this is linked to the Forcings of Biogenic CO2 issue) it might be a good idea to (1) include a citation to PAS2050 which addresses/discusses some of these questions/points at least from an accounting perspective, and (2) there is a lot of literature on temporary carbon storage in biomass/forests that started in the 90s but only Cherubini's forestry work is cited (this is not to dispute the high quality of the cited work, but it seems important to reference the is a larger body of literature on the topic since other research has addressed different nuances of the issue). | Rejected - comment seems to be misplaced. Please clarify to which part of the text your comment actually refers. 7.14 is about frequently asked questions. |
| 11854 | 7 | | | | | This figure needs axis labels - in its current form it is impossible to interpret | Accepted. Figure has been corrected. |
| 11857 | 7 | | | | | This figure is not clear (both literally and figuratively). This figure needs improved explanation if it is to stay in. | Taken into account - figure has been |
| 11849 | 7 | | | | | This figure is difficult to interpret. While it is noted that the data will be updated, I believe the approach to labeling and discussing the figure must be changed as well. Perhaps have one pie chart with "energy related" and "non energy-related" emissions, then have break-outs of the composition of those section for each? Also, reporting CO2e emissions clearly requires that the GWP time horizon be stated (assuming 100-year, but should be explictly stated), as well as the GWP publication year (assuming that the GWPs reported in WG4's AR5 contribution will be used, but still worth reporting). | Taken into account. The section has been deleted. |
| 11871 | 7 | | | | | This figure requires a legend, the reader cannot interpret the data presented, what does the grey, red and blue mean? | The figure in question has been removed. New figures have been |

|---|---|---|---|---|---|---|---|
| 11858 | 7 | | | | | This section isn't exactly duplicative, but transmission (as well as resource availability) are also discussed with some overlap in concepts in subsections of 7.4. Can these sections be eliminated/combined with those in 7.4? This might be an opportunity to reduce length. | Rejected - the discussion in 7.4 only refers to a more extended here. |
| 9238 | 7 | | | | | Please update latest number (year 2010) if possible. | Accepted. Was done |
| 9241 | 7 | | | | | Please refer latest edition of the Red Book (2012) if possible. | Taken into account. The section has |
| 6803 | 7 | | | | | Overall, I found this chapter lacking in terms of describing the various carbon-free energy alternatives (with the exception of details provided on nuclear technologies). Solar energy is properly identified as the largest resource, but there is no description of the various PV and CSP technologies and their pros and cons. For example, capacity factors as well as capacity values can vary greatly. Also lacking is any description of the current R&D opportunities and targets. Finally, repeated studies have shown that energy efficiency has the largest carbon reduction potential and negative costs. Yet efficiency is only briefly mentioned in the context of transmission. | Rejected - renewable energies have been discussed in detail in the recent IPCC special report on renewable energies (SRREN). Space constraints do not allow to repeat all information on renewable energies given there in the AR5. Energy efficiency is not discussed |
| 6801 | 7 | | | | | For nuclear, the cost range is too narrow and the average cost is too low compared to some studies on the costs of new plants. Later on page 50, line 20, a cost range of 42 $/MWh to 137 $/MWh is given. Also, later comments properly point out that costs will likely escalate in the post-Fukushima environment. | Taken into account - the cost data have been updated. |
| 6802 | 7 | | | | | The various costs in the table are not comparable because they do not account for the varying subsidies given to each. And, of course, the costs associated with environmental externalities are not included. This report should reference the U.S. National Academy study on the true costs of energy. | Rejected - BNEF's LCOE analysis reflects the generation cost without direct subsidies, such as feed-in tariffs or green certificates. This is mentioned in the text. Space constraints do not allow |
| 6231 | 7 | | | | | a distinction must be made between capacity (GW) & energy (GWh) as the technologies have significantly diffeent utilistion capacities | Taken into account. The section has been deleted. |
| 6225 | 7 | | | | | This graph does not add any useful information | Rejected. The claim for an unbalanced treatment would need to be better substantiated. Here, additional material demand is discussed. There is no space |
| 6246 | 7 | | | | | Indications for the amount of the y axis? | Accepted. Figure has been corrected. |
| 6232 | 7 | | | | | a 10% IRR is not commercial and underestimates real costs, 15% would be more appropriate | Rejected - LCOE are highly dependent on various sensitiveness. In order to establish a common baseline for comparison 10% has been used. According to http://www.oxera.com/Publications/Reports/2011/Discount-rates-for-low-carbon- |
| 6233 | 7 | | | | | diagram does not add any message | Editorial. The figure presents a lot of information that is not repeated in the |
| 6234 | 7 | | | | | message lost in information overload | Accepted: We have extensively rewritten this section to try to sharpen our |
| 6235 | 7 | | | | | this graph adds nothing other than confusion | Taken into account - comment is obsolete. Figure has been deleted. |
| 6228 | 7 | | | | | The top graph is illegible | Taken into account. The section has |
| 16835 | 7 | | | | | Nice chart -- would be greatly improved if it also included Natural Gas/CCS, IGCC/CCS and Oxyfuel/CCS as these are all technologies that models indicate may be important parts of a mitigation set. | Accepted - CCS costs are shown in chart. |

|---|---|---|---|---|---|---|---|
| 4318 | 7 | | | | | This table measures recent growth in renewable energy only in installed MW of capacity, rather than energy generated (MWh). This is seriously misleading. Firstly,wind farms generate more than about 85% of installed capacity for a very short time–probably in the region of 2%. It would be fair to say that the effective maximum capacity of a wind farm is about 80% of the installed capacity. So to compare the installed capacity of renewable energy with conventional power stations that will deliver 100% of installed capacity when needed, is seriously misleading. Secondly, the capacity factor of renewable energy technologies (apart from hydropower) is very low indeed. Few windfarms generate a capacity factor of more than 30%, and most are in the region of 20 to 25%. A well sited solar farm in a tropical area has a capacity factor of about 22% while those in Germany have a capacity factor of 9.5%. ( http://theenergycollective.com/willem-post/46142/impact-pv-solar-feed-tariffs-germany) With capacity factors like this, roughly 9,000 MW of solar power is required to produce the same amount of energy as a 1000 MW nuclear power station. But, because of solar cells will not be producing anything during peak demand times in winter, a 1000 MW backup plant would also be needed. According to http://www.pv-tech.org/news/it_cost_3.6_million_per_mw_to_purchase_solar_power_projects_in_2011 solar power plants cost €3.6 million per megawatt. So we can compare the cost of a €5 billion nuclear power plant (approximately US$6.6 billion) with €32 billion for 9000 MW of solar power plus €2 billion for the backup plant. So, on the equivalent basis, solar power cost is roughly 6.8 times higher. And that is without any allowance for the additional transmission. Even if the nuclear power cost was double the figure given, the difference is huge. I believe that it should be pointed out that the low capacity factor of solar and wind power brings additional costs that need to be taken into account | Table 7.4 is not on this page. It is on page 33. If table 7.1 is meant it speaks only on billion kWh |
| 10800 | 7 | | | | | The chapter is too long, improvement shall be made to enhance the coherence and focus. State clearly the pupuse of each section, scopes, gaps, and limitation in the information, data and conclusions presented. The chapter falls short of presenting potential risks (long-term) of nuclear accidents (man-made or caused by natural forces). In addition, it's important to compile/analyze/present data on the costs of renewables in consistent manner, in comparisons with tranditional energy sources. The relevant sections should include more data of RE costs (from material, transport, manufacturing, utilization, integration) as well as quantifiableof benefits. In general, every sections shall be shortened and shall try to avoid ambiguous statements. If in doubt or opinionated, authors shall point out what is the knowledge gap as of today and proactively acknowledge reseach areas to be expected and recommended in the future. Getting rid of ambiguous statements/paragraphs shall help truncating the chapter within 60 pages. | Accepted - text revised as far as space constraints allowed this. |
| 17283 | 7 | | | | | This figure is quite nice. However, I am missing Final Energy in the analysis. In my view, FE is more meaningful than TPES, because less ambiguities exist in its definition and accounting. I would suggest adding FE/GDP and PE/FE as indicators in the decomposition. | Thank you. Adding final energy to it will overloaded it and make it harder to read. For chapter 7 is important how much energy the energy sector has to deliver |
| 17391 | 7 | | | | | General comments. The chapter provides a very clear account of the major issues, and particular, the major changes since the last report. The writing team exhibit an excellent appreciation of the significance of the many relevant events since the last report, and exhibit sensible, pragmatic and informed assessments of their likely impact. Of particular importance here is the greater growth in GHG, which exceeded that of GDP per capita in the latest period (attributable largely to growth in economies and population) with a shift towards coal in generation (mainly reflecting China's and India's demands). There is a wealth of detail and many carefully balanced judgements are reported together with an indication of the extent of agreement and the quality of the relevant evidence. The overall impression is of a carefully considered, well-balanced report, which draws on the best available evidence. | Noted. Thank you. |

|---|---|---|---|---|---|---|---|
| 17392 | 7 | | | | | In terms of detail a number of things occurred to me, though unfortunately I did not have time to go through the text in detail. Firstly, I think the draft status does show a little and the English needs a little tidying up throughout (though this is a minor issue – and I fear one that if it was fully met could only increase the length of the chapter). Secondly, I felt that there was a fair amount of repetition (perhaps because different sections were written by different individuals), which while useful for emphasis, might be pruned given the pressure on space. Thirdly, while the discussion of the carbon price was very sensible, I wondered if its fundamental importance gets a bit lost in the detail. Of course it is not the only policy, but frankly without the establishment of a credible long-term price of carbon (and I think that is going to require taxes – though these need to be "balanced budget" to be acceptable, and revenues targeted for "green" purposes - it is difficult to see how all the other policies can work. Fourthly, the authors quite rightly emphasise the externalities associated with RD&D and the importance for low carbon technologies, but it would be useful to have some indication of appropriate scale of intervention. Fifthly, while issues of policy coordination are raised and discussed I fear the problem is rather bigger than explicitly acknowledged here: and without the political will to do so it is difficult to see how this problem is going to be resolved. We have numerous overlapping policies (even in single countries) generating responses of unknown complexity, and numerous countervailing effects the net outcome of which is unclear. (The consequences of trading schemes for renewable generation technologies included in the traded sector is now a well-understood example, but only one iexample of the importance of multi-level governance here.) Sixthly, the discussion of the co-benefits was useful, and indeed it may be critical politically yet it seemed to lack a coherent unifying framework (and quantification) that might enhance the important main message here (perhaps "welfare" is problematic?). Finally, in terms of gaps, the absence of regularly updated input-output (and ideally social accounting matrix data) limit both our descriptive and modelling abilities. On the latter our understanding of the interdependencies of the energy-economy-environment subsystems remains rudimentary yet is crucial to a full understanding of, and ability to evaluation, energy and climate change policies. | Improved in SOD. For carbon prices, see 7.12. |
| 17393 | 7 | | | | | Peter McGregor, 14 September 2012. | Noted |
| 17812 | 7 | | | | | 1. Household energy insecurity in Europe is a combination of a problem of "supply" – where some households generally lack access to network energy for cooking or space-heating or temporarily lack access to electricity for hours or days at a time – and a problem of "demand" – where households cannot afford sufficient amounts of energy, energy-efficient housing or heating equipment. | That is more the subject of chapter 9. It could only be briefly mentioned in section 7.9.1.2 |
| 17813 | 7 | | | | | 2. The following policy priorities to improve household energy security emerge for the WHO European region: | That is more the subject of chapter 9. It could only be briefly mentioned in |
| 17814 | 7 | | | | | § Households in eastern Europe and Central Asia that currently cook with biomass fuels or coal should gain access to cleaner fuels and/or cleaner-burning and more fuel-efficient cookstoves. | That is more the subject of chapter 9. It could only be briefly mentioned in |
| 17815 | 7 | | | | | § Households that cannot afford to maintain health-protective temperatures during the winter months should be supported through a combination of appropriate social support, tariff measures and strategies to upgrade old housing stock to improve energy efficiency. | That is more the subject of chapter 9. It could only be briefly mentioned in section 7.9.1.2 |
| 17816 | 7 | | | | | § Households across the WHO European region that are at particular risk of experiencing heat distress – through their building design or the characteristics of their inhabitants – should be encouraged to improve thermal insulation and, where appropriate, to install air conditioning or electric fans. | That is more the subject of chapter 9. |
| 17817 | 7 | | | | | 3. Measures to increase household energy efficiency can bring substantial savings in CO2 emissions and thereby contribute to climate change mitigation (the building stock having the highest share of negative and low-cost greenhouse gas reduction potential among all sectors). | That is more the subject of chapter 9. |
| 17818 | 7 | | | | | Bettina, if I remember correctly EURO advised that Eastern in this context need to be written with a small ‚e' – to be corrected in the whole text. | Editorial |
| 17819 | 7 | | | | | I think this statement refers to Ref 88. | What statement? |

Revue Epidemiologie et Sante Publique 45(4):293-304 (1997). | Taken into account. This is a very well-meaning attempt to alert us to relevant literature. However, we cannot start by reviewing the epidemiological or toxicological literature on individual pollutants emitted by power plants. We have not found burden-of-disease type overviews that attribute DALYs to individual emission sources (rather, more abstract, urban air pollution). The main purpose of the work here is to |
| 18646 | 7 | | | | | The FAQs - clearer messages please. | Taken - into account. The frequently asked questions (FAQ) have been reformulated in order to address issues related to the energy supply sector only. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 10795 | 7 | | | | | The chapter misses forest plantations in degraded soils of the tropics. As a renewable energy source, forest plantations can capture large amounts of CO2, while suppling woodchips for replacing coal in power plants and also replacing coke in ironmaking. Charcoal ironmaking is traditionally done in Brazil, with net CO2 capture, as compared to ironmaking with coke. Sources of reliable information: Brazil´Ibama, the national Institute for Environment and Nature; AMS, Associacao Mineira de Silvicultura, and Brazils Forest Service of the Ministry of Environment. | This is not the subject of this chapter. See Introduction. Forest issues are treated in chapter 11. |
| 3635 | 7 | | | | | Table 7.2 hardly readble. | Taken in to account - readability has |
| 3637 | 7 | | | | | Figure 7.11 hardly readble. | Taken into account. Figure has been |
| 3636 | 7 | | | | | Figure 7.9 hardly readble. | Accepted |
| 7478 | 7 | | | | | In urban areas, there is a choice of fuels and price of the various fuels determines what people buy. LPG is the most convenient fuel, but it has to be bought in bulk. Fuelwood, charcoal and kerosene can be bought in small or large quantities. Electricity is expensive and supply is unpredictable. Thus, the choice depends on price, availability, preference and the type of food/ beverage that is being prepared. | Noted. That is more the subject of chapter 9. |
| 15509 | 7 | | | | | Resources and resource availability - Very well presented. Suggestion to introduce somewhere a paragraph (introduction words) on “available” resources and “climate change patterns”. In another word, resources already well identified and other potential ones are already enough to go much over than a 450 ppm trend - see IPPC SRREN, IEA or others. | Noted. Thank you. Resources definitions which are in use in the chapter are given in section 7.4 |
| 5328 | 7 | | | | | The table hides that the high growth in some sectors is due to high subsidies (feed-in-tariffs). It would be interesting to know the growth of capacity per dollar of a feed-in tariff. | Rejected - the impact on policy on RE development is addressed elsewhere in the chapter. The statistic suggested by the comment is not available in the peer |
| 5235 | 7 | | | | | The legend of Figure could be more informative by giging the names of the source sectors. | Taken into account. The section has |
| 11158 | 7 | | | | | The grouping of countries e.g. Africa as a block is misleading. Further, regretably, China and India dorminates statistics on Developing countries and overshadows most other developing countries. In future, it might be worthwhile to consider distinguishing between BRICS (Brazil, India, China and South Africa) and other developing Countries. Data on Africa is sparse and where avaialable, is hugely over-aggregated. Understandably, it is difficult to present accurate regional data on specific regional initiatives. Recent discoveries of of oil, gas and coal in many of the Countries in Eastern Africa - Sudan, Somalia, Tanzania, Uganda, Kenya will impact on the regions CC mitigation efferts. It might be important to highlight/mention these discoveries, whatever the scale, because thay will impact on renewable energy initiatives that the countries were embarking on.. | Noted. We understand those concerns and tried to make this point clear. The WGIII has regional split we trying to stick to. In some cases separate countries are mentioned in the text. But significant detalization will overload figures and made them hardly readable. We are stressing the importance of China and India in sections 7.2 and 7.3. But there would be a battle for showing |
| 10540 | 7 | | | | | Question to ask for whole chapter is what is new since AR4. Seems to be mainly regurgitation of the same info (also the case for other chapters I realise - including Transport!). | Agreed - focus should be on what's new since AR4 with some allowance for covering key fundamental points to orient reader to a given topic (i.e., |
| 3008 | 7 | | | | | This table lacks the citation of a recent and comprehensive study undertaken by the World Bank in Brazil: Low Carbon Emission Scenarios in Brazil. Please see http://siteresources.worldbank.org/BRAZILEXTN/Resources/Brazil_LowcarbonStudy.pdf. | Rejected - There is no table 7.5 at this page. If figure 7.5 is referred to, then it just shows historical evolution with no |
| 3000 | 7 | | | | | Figure 7.10 is not clear. What is the label of axis-x? | Accepted. Figure has been corrected. |
| 5934 | 7 | | | | | assessment of the various technologies, and the LCA approach could be seen as uncertain and opaque. Is it necessary to base the IPCC work on life-cycle assessments? | Rejected - the methodological annex for details on the LCA method. |
| 5936 | 7 | | | | | The representation of uncertainty of resource assessments by height of columns seems to hide the large potential for hydropower, which due to a precise resource assessment is represented by an almost invisible line. | Accepted - new figure makes it somewhat more visible |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 2937 | 7 | | | | | It is not clear to this reader (and I daresay to many others) what the authors include and exclude in the "energy sector" which this chapter is supposedly about, and how that relates to the coverage of other chapters in this volume. Thus we read in the chapter summary (p5 lines 2-3) "the energy sector...provides only 45 % of energy-related GHG emissions". So where are the other 55% ? One is left to presume that the other 55% are attributable to transport, buildings, and industry (chapters 8,9,10) . Or do these only add up to 45% or 50%? This division between chapters both conceptually and numerically needs to be clarified, or readers will be very confused. Section 7.1.1 (where one might expect a clear and comprehensive discussion of these issues) has only one short and inadequate paragraph (p7 line 46- p8 line 3) , with no reference to how the related chapters fit in. The discussion in chapter 4 about "emissions measured by source" and "emissions measured by consumption" is also relevant here. | Accepted - a diagram in the introduction now clarifies the system boundaries. |
| 14895 | 7 | | | | | There is a substantial overlap between Chapter 15 and Chapter 7 section 11 on policies please align and refer rather than duplicate and contradict | Accepted - text revised. |
| 17201 | 7 | | | | | The chapter is densely populated with grey literature (incl. Conference papers) and non-peer reviewed articles. The CLAs are requested to make a thorough review of the material cited throughout the chapter. | Accepted - most of the literature is peer-reviewed. Beyond peer-reviewed journals, references are made to reviewed publications of IPCC, IEA and |
| 17235 | 7 | | | | | Publications in "Energy Procedia" are usually only conference proceedings that are not peer reviewed. | Noted. |
| 17280 | 7 | | | | | The scope of the chapter is not entirely clear. It would be valuable to frame the scope of the chapter in terms of the mitigation options that are taken into account. Are only emission reductions in the energy conversion sector (e.g. electricity production) considered? Or also the provision of alternative, low-carbon combustible energy carriers (such as biofuels for transportation)? It should also be clarified that any options related to fuel switch or energy demand reductions are discussed in the sector chapters. | Accepted - text revised. |
| 17205 | 7 | | | | | The sub-section is not really summarizing the AR4, e.g. there is a reference to IEA(2012). | Taken into account - comment is obsolete. Overview of AR4 was deleted. |
| 3408 | 7 | | | | | This is a section discussing issues that seem to belong to other chapters and that are treated here quite superficialy. Incredibly poor text in pages 65 lines 9 to 30, from trivial statements (line 9-11) to random choice of a nice case example in Denmark, which is again poorly explained . Anohter example of extremly low quality rethoric is between lines 37 and 43 in page 65. Another example: we should agree that it is trivial to note that "...agriculture which is a seasonal activity" in line 1 page 66, followed by irrational, opinionated, rethoric. DELETE SECTION ? Section 7.10.5 is much better (factual and informative) and could be saved and put elsewhere. | Taken into account - text has been rewritten. |
| 17943 | 7 | | | | | An introductory sentence along the example of Chapter 9 referring to the agreement reached in Wellington (p. 36) might be helpful for readers: "Barriers and opportunities are referred to as conditions that hinder or facilitate the implementation of the analyzed measures." | Rejected - this is a matter of the glossary. |
| 3639 | 7 | | | | | Delete or massively reduce to save space as overlaps with chapters 4.3.5, 6.3.7, 6.7.1. | Accepted - text is reduced considerably. |
| 3640 | 7 | | | | | Delete or massively reduce to save space as overlaps with chapter 4.3.8. | Taken into consideration. Revised. |
| 17944 | 7 | | | | | The discussion provided in this sub-section should be linked to the section 2.4.4.2 that provides a number of important references. | Noted. |
| 3641 | 7 | | | | | Delete or massively reduce to save space as overlaps with chapter 3.4.2, 3.11, 4.3.3. | Rejected. This section is specific to the |
| 17951 | 7 | | | | | Further issues that might be discussed in this section are aesthetic perceptions of wind energy and grid technologies, infrastructure lock-in with respect to legal aspects, liability for accidents (as in the case of off-shore wind). | Taken into consideration. But the reviewer does not provide references. We have looked for further references. |
| 3642 | 7 | | | | | Delete or massively reduce to save space as overlaps with chapters 4.3.2, 4.1.2.3, 4.6. | Rejected. This is a cross-cutting issue, and we are addressing the specifics of capacity building in the energy sector |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 3409 | 7 | | | | | This is a section of overall good quality but I am not sure if it belongs to this chapter. In particular section 7.11.2 must be treated in much more details in other chapters of this AR?. Only one comment on text in page 68, line 32-34: is it sensible to rely on technologies to be deployed after the middle of the 21st century? | Taken into account - the description of the instruments and their economic justification is left to the policy chapter |
| 17232 | 7 | | | | | The study below shows that technology policies can help to overcome the negative effects of delayed carbon pricing. In this study technology policy is not a complement, but a temporal substitute for a missing carbon price. The study also analyzes the regional distribution effects. Bauer N, Baumstark L, Leimbach M (2012): The REMIND-R model: the role of renewables in the low-carbon transformation—first-best vs. second-best worlds. Climatic Change, online first. DOI 10.1007/s10584-011-0129-2 | Rejected - space constraints do not allow for a discussion related to the justification of single instruments. This is to be done in chapter 13-15 or 3. |
| 3410 | 7 | | | | | This is an excellent section for a FOD. Authors responsible for this section should be encouraged to read and critically comment on previous sections ¡¡ . | Noted. |
| 4465 | 7 | | | | | This section offers little in the way of sectoral policies. There is no balance in the discussion since most CO2-emitting sectors are omitted. The discussion on policies for electricity generation are general, rather than practical. There is no discussion of what works and what does not, across a range of countries and time periods. Therefore, there is little offered to the reader to inform decision making in the future. To illustrate, Table 7.6 offers a summary of policy options. However, the question remains on how effective any of these policies has been in the past, whether they should be continued and can deliver on the desired avoided CO2 volumes in the required time. Thus, a more analytical discussion is required, rather than repeating the generalizations and concepts that most readers are familiar with already. | Accepted - this section should not discuss policy issues in detail. This is done in 7.11. The policy discussion from table 7.6 has been removed. |
| 11544 | 7 | | | | | Why is this here? Chapter 6 is the place for it, this is why there is a chapter 6, right? | Reject - Chapter 6 aims at an integrated view of the transformation, while this section looks at the implications of the |
| 10688 | 7 | | | | | I can't understand the importance of this figure. It seems that it is only meant to show the diversity of technology utilization by country in different models and no further implication is not shown. | Taken into account - comment is obsolete. Figure has been deleted. |
| 3643 | 7 | | | | | Delete or massively reduce to save space. Overlaps with chapter 6.3. | Noted - but figure removed. |
| 11872 | 7 | | | | | This section seems to gloss over a lot of work that has been done to consider different methods for considering cumulative versus instaneous conditions/effects, and how they address (or don't address) the issue of irreversible climate change events/processes. Why are all of these considerations /alternatives seemingly ignored? | Rejected. The issue is already covered in detail in chapter 6 |
| 3644 | 7 | | | | | Delete or massively reduce to save space. Overlaps with chapter 6.3.2. | See comment 11872. Luckow (2012) should be replaced with a citation to Edmonds, J., Luckow, P., Calvin, C., Wise, M., Dooley, J., Kyle, G., Kim, S., Patel, P., Clarke, L., 2012. Can Radiative Forcing Be Limited to 2.6 |
| 3645 | 7 | | | | | Delete or massively reduce to save space. Overlaps with chapter 3.10.2., 6.3.4, 6.3.6.3. | Taken into account - comment is obsolete. Figure was removed. |
| 17236 | 7 | | | | | the issue of CO2 emission statistics is not only a gap in knowledge but a gap in preparation for poolicies. Emission policies with caps require national statistics of emissions. If these statistics are not made available and accepted by national institutions there might be a serious lack of institutional capacity building that will deply effective and comprehensive policies to reduce GHG emissions. | Noted. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 3012 | 7 | | | | | I suggest including the discussion about gaps related to GHG metrics. Temporal issues are of fundamental importance in the evaluation of mitigation strategies dependent on multi-gas comparisons. First, it isn't clear which climate change impact the metric is a proxy for. The term "warming potential" is misleading, for the relationship between the radiative forcing which results from a pulse emission and its warming potential is not a simple one, as two gases with the same GWP will not necessarily cause the same temperature change and climate impact. Second, in spite of advances, much uncertainty remains regarding the appropriateness of GWP as a metric for determining equivalence of short-lived gases or a gas such as CH4, which may be regarded as short-lived relative to CO2. Studies show the dependence of the GWP for short-lived gases on geographic origin of emissions and on the effect of feedbacks. Also, there are two aspects of time which are not properly addressed when the fixed GWP metric is applied: the moment when an emission pulse occurs, and the choice of time-horizon and target year to be used for comparison of climatic impacts. This means that pulse emissions are weighted equally, regardless of how far the emission is from the target year, a clear disadvantage for mitigation policies with specific temporal objectives. The fact that GWP is time-invariant can cause the overestimation in multi-gas equivalency of short-lived such as CH4, particularly when shorter time-horizons are used. | Noted - the reviewer is right in emphasizing this, however, gaps related to GHG metrics are to be addressed in chapter 6 and the methodological annex. |
| 17209 | 7 | | | | | The issue of traditional biomass is not considered here. However, this is an important part of the energy sectors in developing countries. | Only two examples with highest penetration are taken for power generation - coal and gas. Biomass and |
| 17211 | 7 | | | | | The sub-section doe snot discuss the role of international energy technology markets. The availability of alternatives and the diffussion rates of new technologies this is very important, especially for the case of renewables and nuclear. The international spread of technology costs (e.g. Solar PV) is of great importance. This is important for the IPCC AR5 because this is a key for international technology policies to accelerate the diffusion rates of technologies. | Rejected - space constraints do not allow to go into the details here. |
| 17212 | 7 | | | | | The sub-section does not discuss the role of oil prices. This is important because the mitigation costs of CO2 from the energy sector very much depend on the price of oil because (i) CO2 abatment costs are the opportunity costs of not using fossil fuels in traditional ways and (ii) the oil price has a large impact on gas and coal prices. This is still true, though the link of oil and gas prices has been unlcoked in the US recently. | This introductory part of the chapter showing the present status in energy sector. Section 7.3.3 was removed |
| 17213 | 7 | | | | | The CLA may want to to consider the emissions of suplhur, black carbon, VOCs as well. Gas Flaring might also be interesting because it emits a lot of black carbon that influences albedo in the arctics. | Taken into account. The section has been deleted. |
| 11848 | 7 | | | | | The discussion of energy-related CO2 and GHG emissions is quite confusing. Does energy-related emissions refer to emissions from the total fuel cycle (or life cycle) emissions? If so, can this be stated more clearly and succinctly? | Taken into account. The section has been deleted. |
| 11850 | 7 | | | | | This section lists a lot of data and facts without providing a great deal of analysis or interpretation (e.g. section 7.3.2.2). Is it possible to provide these data in tables, or better, figures that are easier to digest and interpret? This could also shorten the text. | Taken into account. The text was shortened. |
| 2997 | 7 | | | | | All discussion misleads the fact that petroleum reserves (conventional or not) can increase not only by discoveries but also by EOR. This is an important issue, since CO2 capture and storage can either improve EOR or compromise it. | Noted Comment is valid, but space limitation exclude to go into the details here. |
| 2998 | 7 | | | | | Again, in all section 7.4 there is the need to better differentiate between shale oil and oil shale. Authors seem to not recognize this important distinction and use wrongly both concepts. | Rejected: The distinction can only be made where time and space permits. Use here is consistent with the purpose |
| 12916 | 7 | | | | | Residual heat from industrial processes (steel, refineries etc.) and power production constitute a large and untapped energy resource that could be used for district heating (and cooling). This resource could replace fossil fuels in district heating networks or biofuels which then could be used for other purposes. | This resource is widely used in some countries like Russia for example. As too industrial waste heat this is the subject for chapter 10. Here we may reflect that |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 17219 | 7 | | | | | The section is not reviewing the most recent literature. The CLAs are strongly recommended to improve this section. The section should also comprise text and quantifications on EROI, co-emissions (includig deforestation and peat land loss for tar sands), policies like concessions and royalties. Regarding co-emissions a review of shale gas is required. | Rejected - not possible given space limitations. |
| 16097 | 7 | | | | | The beginning of this section could be shortened and clarified. The first paragraph is there for criticism and rebuttal in the next ones. Maybe a more direct approach would be clearer and shorter. | Accepted - text shortened |
| 16098 | 7 | | | | | The depletion issue is clear only in the end from the point of view of climate : p.26 line 17 it is explicit. But the section should precise who disagrees with the vision of that much available hydrocarbons, and if the difference between sources could be removed by more knowledge or research. | Rejected: This is extensively done in the GEA reference. |
| 16099 | 7 | | | | | A graph comparing these fossil reserves with the carbon budgets in order to limit global warming to 2°C or less is needed here, updated from AR4. This could be in addition to table 7.2 | Rejected due to space limitations |
| 16100 | 7 | | | | | Wouldn't ex-coal liquids be relevant in this section? | Rejected - no, this section is about resources not their eventual use |
| 6798 | 7 | | | | | When covering unconventional fossil fuel resources, it is extremely important to detail the additional carbon emissions associated with these resources and the large carbon emissions potential of these reserves if they are tapped. | Accepted- text revised. |
| 4080 | 7 | | | | | It would be nice to have a graph in this section representing carbon content of different fossil fuels and carbon emissions allowed by different stabilization scenario, e.g. an update of IPCC, TAR, 2001, SYR, Fig. 7-5 : http://www.ipcc.ch/ipccreports/tar/vol4/english/fig7-5.htm . Even better would be a « peak-oil » like graph presenting fossil-fuel use in the coming years allowed by stabilization scenarios. It could be something like http://www.peakoil.org.au/charts/world.oil.gas.coal.production.1965-2050.gif but taking the climate constrain into account. This should probably be done « all other things being equal » (i.e. no big modification in livestock, no CCS...). | Rejected: Space limits prohibit this detail. |
| 17221 | 7 | | | | | The sub-section does not consider the most reccent findings of WEC regarding the additional recoverable uranium at costs higher than 80US$ per kg Uranium | Accepted - and updated to reflect Red Book 2012 |
| 2999 | 7 | | | | | it would be interesting to mention that huge amounts of natural uranium equivalent remain in the military reserves of the USA and Russia. However, the Red Book cited in the report acknowledges that the uranium mining capacity numbers are higher than the possible real production from mining. | Rejected: Comment correct - but space limitations prohibit this level of discussion. |
| 16228 | 7 | | | | | I guess it'll be good to add a Matrix as a comparison between energy that could be obtained through the application of each type of new and renewable energies compared to the cost of financial investment, and by imposing a best suitable conditions for that and also impose worst, I suppose that comparison will be useful purely for developing countries and least developed countries | Rejected - though this would indeed be useful, it is simply not available in the peer reviewed literature |
| 16808 | 7 | | | | | Previous sections were helpful because of inclusion of costs -- this section omits any discussion of costs or economics and is therefore less helpful. Policymakers need some context. | Accepted - text has been amended to be clear that no overarching single cost metric has been used for RE potential studies. As we are forced to refer to the available literature we are unable to |
| 3392 | 7 | | | | | I do not have sufficient technical expertise in all subsections under 7.5 but I strongly feel that there is something wrong in the current draft. Generic text is mixed with disconnected pieces of valuable information. Obvious "text-book" ideas, that could be omitted, are mixed with highly technical excursions to detail, that are unnecessary in an IPCC report. In summary: a poor job by the drafting authors. Only some detailed examples below. | Noted. |
| 17749 | 7 | | | | | there is no discussion on behavioural aspects as the section heading suggests | Taken into account - the heading is used for all sector chapters. It fits to end use sectors, but does not really apply to |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 16109 | 7 | | | | | Consumption patterns -in French Sobriété- and even most of energy efficiency gains are absent in this section. They should be mentioned as an introduction or recall of the other chapters. Otherwise it is misleading for decisionmakers in terms of relative size. Energy efficiency has to be recongnized as a wider potential than all other options. | Taken into account - the system boundaries are described in chapter 7.1. Energy efficiency at the consumer level is discussed in the demand sectors. |
| 16810 | 7 | | | | | This section may be shortened -- it also lacks the very important discussion of relative costs … simply listing the technology options without showing how their costs compare to other technologies is not that helpful. | Noted. |
| 13294 | 7 | | | | | It is worth mentioning in this section that decarbonisation of the heat and transport sectors has the potential to require signficant additional distribution network capacity, as heat pumps and electric vehicles are adopted. It is also worth mentioning that the amount of additional capacity required will depend on the patterns of consumption from these new demands, which depend on whether smart infrastructure is introduced (e.g. smart EV charging overnight vs. charging at the early evening peak on returning home from work have an order of magnitude difference in their costs of electricity distribution) | Accepted - short paragraph added to the end of 7.5.2 |
| 16812 | 7 | | | | | While there is potential to squeeze out gains in transmission and distribution of electricity, these seem relatively small compared to costs -- why spend so much space on it in report unless these are indeed much less costly on a $/ton basis than other mitigation options in generation. | Noted. Actually, this is a fair comment - A possible answer is to demonstrate that savings won't come easily from this area |
| 7733 | 7 | | | | | The whole section gives the impression that CCS is a dominated technology, with risks under control and competitives costs. CCS is still to be develped in order to overcome a variety of barriers. Deep detailed studies are needed to correctly access the risk of CO2 leakage. Chosing an adequate site for CO2 storage has no methodological correct answer and this is a concern that needs to be adressed. Projects like the CCS with storage in saline acqufiers as the one in Wayburn in Canada, have been stopped, which is a clear sign that some important difficulties remains. | Rejected. No scientific evidence or body of peer reviewed literature is offered in support of this observation .The totality of what is written about CCS in all parts of Chapter 7 seems balanced. But because it is broken up and scattered it |
| 16038 | 7 | | | | | In this sectionthe the description of CCS can be shortend. But it has to include the discussion about the riscs and the uncertainties of CCS and the possibility of the use of CO2 after sequestration CCU (Carbon capture and usage) for example with algae. | Rejected. No scientific evidence or body of peer reviewed literature is offered in support of this observation .The totality of what is written about CCS in all parts of Chapter 7 seems balanced. But because it is broken up and scattered it |
| 16815 | 7 | | | | | This section would benefit greatly by inclusion of discussion re the relative cost of renewable energy vs. other low emitting energy technologies. Models show that renewable energy is a very important component of a low emitting technology set, but not the only part of a low cost solution. If restrict the future to only use renewable energy technologies, the models indicate the cost is several times greater than if we allow nuclear and CCS technologies to deploy. See chapt 6. | Rejected - very good points, but better addressed in the cost and scenarios sections of the chapter. Please review those sections in the next round to ensure that these important points are |
| 3003 | 7 | | | | | The manuscript summarized very well the current status of nuclear energy. However, the promise that Generation III designs could be safer, but simpler and cheaper has been shown to be inaccurate. Moreover, in spite of the optimism for the nuclear industry in China, there are still significant issues about whether this country will have as open and accountable processes for the nuclear industry as those in other countries. | Rejected - The reference to smaller modular reactors and potential for improved economics is conditional. Discussion of nuclear industry in China |
| 17224 | 7 | | | | | The sub-section does not discuss the issue of refurbishment costs of existing nuclear power plants for life-time extension up to 60 years. These costs are substantial. The CLAs are requested to include this into the review. See Schlesinger M, Lindenberger D, Lutz C (2010) Energieszenarien fr ein Energiekonzept der Bundesregierung. Project Number 12/10 (German Federal Ministry of Economics and Technology, Berlin | Rejected - not supported by available data. Life extension policies vary across regions. Life extension is common in the US, and 73 reactors in the US have had their operating license extended from 40 to 60 years (US NRC). Life extension is |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 17229 | 7 | | | | | The sub-section is not discussing the international dimensions of using nuclear power. This includes escpecially the issue of proliferation. Expanded use of nuclear power for climate change mitigation also requires a more stringent framework to avaoid proliferation. Heree international security and cliamte policies are strongly interrelated. | Taken into account - section 7.5.5 ends with "Continued use and further expansion of nuclear energy worldwide as a response to mitigating climate change require greater efforts to improve the safety, economics, uranium utilization, waste management, and proliferation concerns of nuclear energy |
| 17230 | 7 | | | | | regarding large scale integration of renewables for CO2 emission reductions the study by Haller et al.; Energy Policy, Vol. 47, pp282-90 is useful to consider here. The study shows that the same level of emissions in the EU-NorthAfrica region can be achieved at lower costs, if international grid integration is available. | Rejected - space constraints do not allow to go into every detail here. |
| 9243 | 7 | | | | | Please add the 'access to the electricity' itself in the developing regions if possible. | Rejected - the comment seems to be |
| 16826 | 7 | | | | | Could be significantly shortened. No context, not particularly useful in terms application or policy formation. Can you provide range for how costly potential improvements are on a $/ton basis so policymakers can know if these improvements are likely in a low carbon price environment or a high carbon price? | Accepted - content of the text has been improved. Cost issues are to be discussed in section 7.8.2.R1193 |
| 3399 | 7 | | | | | This is really superfitial again, and with too many references to support "text-book" generic ideas. Key figures from the key reports to highlight the existing infraestructure for fuel supply systems should be highlighted (a table?). May be delete the paragraph on H2 transport (line 23-34)... | Taken into account: Entire hydrogen paragraph has been revised. |
| 6432 | 7 | | | | | This section has a lot of references for large ocean vessel transportation and offshore transportation, but only a couple for onshore pipeline transportation. The reference to Johnson and Ogden is not the best work or most productive work. Here is some relevant and more thorough text, with more and more appropriate references:" A large and integrated network of dedicated CO2 pipelines will be needed to transport enormous volumes of CO2 between spatially distributed CO2 sources and CO2 storage reservoirs. For example, in the United States, this could require building a network to carry a larger volume of CO2 than domestic oil consumption (1). Large pipelines that can aggregate CO2 enjoy tremendous economies of scale (e.g., 2), enabling operators to build cheaper and more resilient CO2 networks (3), though networks will likely evolve over time starting with smaller unconnected networks (4) and progressing to cooperative systems involving multiple stakeholders (5). The pipeline network will be integral to a cost-effective and reliable CCS system, for example, being able to flexibly route CO2 sources and sinks with varying supplies (e.g., changes in electricity production) and reservoir performance (e.g., potential leakage) (6).<br><br>1. Middleton RS, Keating GN, Stauffer PH, Viswanathan HS, & Pawar RJ (2012) Effects of geologic reservoir uncertainty on CCS infrastructure. International Journal of Greenhouse Gas Control 8:132-142.<br>2. Kuby MJ, Middleton RS, & Bielicki JM (2011) Analysis of cost savings from networking pipelines in CCS infrastructure systems Energy Procedia 4:2808-2815.<br>3. Middleton RS & Bielicki JM (2009) A scalable infrastructure model for carbon capture and storage: SimCCS. Energy Policy 37(3):1052-1060.<br>4. Johnson N & Ogden J (2011) Detailed spatial modeling of carbon capture and storage (CCS) infrastructure deployment in the southwestern United States. 10th International Conference on Greenhouse Gas Control Technologies 4.<br>5. Middleton RS, Wei R, Kuby MJ, Keating GN, & Pawar RJ (2012) A dynamic model for optimally phasing in CCS infrastructure. Environmental Modeling and Software 37:193-205.<br>6. Middleton RS, et al. (2012) The cross-scale science of CO2 capture and storage: from pore scale to regional scale. Energy & Environmental Science 5(6):7328-7345. | Noted. The references provided by the reviewer are not inherently any better than those already included in the text. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 3401 | 7 | | | | | Excess of references for simple ideas. Do you really need 9 references to support the obvious statement "Effect of climate change on overall energy demand will vary geographically". In general, this is a poor section 7.7, full of trivial and superficial ideas, combined with a pretencious use of references. Just one example: Lines 40-42 in page 44: do you need to refer to two papers to support this thermodinamic evidence?. These ideas are much better treated in section 7.8.1 which reads excellent. Delete most of this section? | Rejected - The IPCC decided upon the chapter sections, and this one must be included. The WGII report covers the issues covered here in depth, but we must nonetheless at least summarize the basics of the literature. With planned revisions, we believe that the text will accurately reflect the literature, and point readers to some of that literature. While it is true that one need not have an excess number of citations, one purpose of IPCC documents is to help the reader identify relevant literature to get started with, so we do not wish to severely restrain citation numbers. We will look to eliminate some citations, however, in |
| 3005 | 7 | | | | | I suggest including the following references. Pryor, S. C., R. J. Barthelmie, and E. Kjellström, 2005a. Potential climate change impact on wind energy resources in northern Europe: Analyses using a regional climate model. Climate Dynamics 25: 815−835. Pryor, S. C., J. T. Schoof, and R. J. Barthelmie, 2005b. Climate change impacts on wind speeds and wind energy density in northern Europe: Empirical downscaling of multiple AOGCMs. Climate Research 29: 183−198. Pryor, S. C., R. J. Barthelmie, E. Kjellstrom, and J. Mann, 2005c. Potential climate change impacts on wind energy resources in northern Europe. Geophysical Research Abstracts 7: 01544. Pryor, S. C., and R. J. Barthelmie, 2010. Climate change impacts on wind energy: A review. Renewable and Sustainable Energy Reviews 14: 430−437. | Rejected - These are all excellent citations, but the majority if not all of them are included in the IPCC SRREN, which is the source document used for discussion of possible wind energy impacts. That meta-study includes these citations by reference. |
| 17231 | 7 | | | | | The study below quantifies the emission reduction potentials in the energy sector. The authors might cite this. Luderer L, Pietzcker RC, Kriegler E, Haller M, Bauer N (2012): Asia's Role in Mitigating Climate Change: A Technology and Sector Specific Analysis with ReMIND-R. Energy Economics Special Issue on the Asian Modeling Exercise. Accepted for publication. | Rejected - space constraints do not allow to go into the details here. |
| 11549 | 7 | | | | | This subsection is not very well structured. Pls agree on a generic structure for how to deal with different technologies in which order and stick to it (first RE issues, then CCS, then… etc) - coordinate also with Ch 6. | Accepted - the text is revised accordingly. |
| 10053 | 7 | | | 48 | | The costs for new nuclear power plants are unclear and scientific literature should be quoted. Either the shown nuclear cost figure is based on a scientific publication (reference should be added) or this range must be much larger. In the UK the nuclear industry asks for a feed-in tariff for new nuclear power plants of approx 19cents/kWh. The current figure and the range is misleading. | Taken into account - the cost of nuclear power plants are reconsidered and based on IEA data. |
| 10054 | 7 | | | | | This section needs significant more work, as the current status does not provide the required level of information. Table 7.5 provides an incomplete overview from mostly grey literature. The curves should also be part of this section rather than only writing about the curves. | Taken into Account - This section gives context to the relative economic potential of energy supply options, and while the broader economic assessment in other chapters is referenced, these links will be made more comprehensive. The |
| 3638 | 7 | | | | | Concentrate on energy security issues. Massively reduce rest to save space as overlaps with chapter 5.10. | Rejected. There is virtually no overlap |
| 17933 | 7 | | | | | Introductory sentences like the ones in Chapter 10 might be a good idea to prepare the reader for the following discussions: "Besides economic cost aspects, several other aspects have implications on the final deployment of mitigation technologies. Co-benefits, co-costs, risks and uncertainties associated with alternative mitigation technologies as well as public perception thereof can affect investment decisions of companies and priority setting of governments." | Accepted. An introductory section has been inserted. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 9264 | 7 | | | | | The use of depleted oil/gas fields for CCS could extend the socioeconomic viability of oil towns/industries. | Rejected. No scientific evidence/publications provided to support suggested changes. This might be true but this seems like a minor nuance of a point. I'm also not aware of any literature on this point. Lastly, it is not clear (again there is no literature on this point) as to how large the rents would be from storing CO2 in a depleted oil field and who would share in those |
| 17936 | 7 | | | | | Please consider reviewing the following paper: Steckel, Jan, Robert J. Brecha, Jessica Strefler, Michael Jakob und Gunnar Luderer (in review): Development without energy? Assessing future scenarios of energy consumption in developing countries. Working Paper. Submitted to Ecological economics (http://www.pik-potsdam.de/members/steckel/publications/development_energy_new) | Noted. |
| 3002 | 7 | | | | | The manuscript emphasizes the issue of how integrating CCS-baseload plants into grids, but it does not emphasize the fact that:<br>a. Depending on the technology, CCS will increase the water demand of the plant, and can even undermine its application to some facilities. See Feeley, T.J., Skone, T.J., Stiegel, G.J., McNemar, A., Nemeth, M., Schimmoller, B., Murphy, J., Manfredo, L., 2008. Water: A critical resource in the thermoelectric power industry. Energy. 33, 1–11. Zhai, H., Rubin, AND., Versteeg, P., 2011. Water Use at Pulverized Coal Power Plants with Postcombustion Carbon Capture and Storage. Environmental Science and Technology, 45, 2479 - 2485.<br>b. Post combustion capture plants generate toxic residues. This can undermine the large scale application of this option. See THITAKAMOL, B.; VEAWAB, A.;AROONWILAS, A. Environmental impacts of absorption-based CO2 capture unit for post-combustion treatment of flue gas from coal-fired power plant. International Journal of Greenhouse Gas Control, v. 1, n. 3, p. 318–342, jul 2007. STRAZISAR, B. R.; ANDERSON, R. R.; WHITE, C. M. Degradation Pathways for Monoethanolamine in a CO2 Capture Facility. Energy & Fuels, v. 17, n. 4, p. 1034–1039, 1 jul 2003.<br>c. Given the energy penalty, it is worth estimating the life cycle emissions of power plants with CCS. This was proposed by FERON, P. H. M. Exploring the potential for improvement of the energy performance of coal fired power plants with post-combustion capture of carbon dioxide. International Journal of Greenhouse Gas Control, v. 4, n. 2, p. 152–160, mar 2010. HERTWICH, E. G.; AABERG, M.; SINGH, B.; STRØMMAN, A. H. Life-cycle Assessment of Carbon Dioxide Capture for Enhanced Oil Recovery. Chinese Journal of Chemical Engineering, v. 16, n. 3, p. 343–353, jun 2008. KOORNNEEF, J.; KEULEN, T. VAN; FAAIJ, A.; TURKENBURG, W. Life cycle assessment of a pulverized coal power plant with post-combustion capture, transport and storage of CO2. International Journal of Greenhouse Gas Control, v. 2, n. 4, p. 448–467, out 2008. | Taken into account. We added that CCS increases the cooling requirement with a reference to Zhai et al. Please note that the toxic emissions from amine-based CCS plants have been considered in the cited reference. |
| 3009 | 7 | | | | | An important issue very well documented in the literature is the tradeoff between oil products tighter specifications (especially for distillates and petrol) and GHG emissions from petroleum refineries (due to the increased fuel combustion and also the hydrogen requirements of hydrorefinery units). The section lacks this crucial discussion, which poses the challenges of matching energy security targets with high quality liquid fuels without increasing GHG emissions. Please see SZKLO, A. S., SCHAEFFER, R., 2007. Fuel specification, energy consumption and CO2 emission in oil refineries, Energy, 32(7): 1075-1092. JOHANSSON et alli. 2012. Assessment of strategies for CO2abatement in the European petroleum refining industry.Energy 42(1): 375-386. NORDRUM et alli 2011. Assessment of greenhouse gas mitigation options and costs for California Petroleum Industry facilities: The shape of things to come. Energy Procedia 4: 5729-5737. | Rejected. Please note that refining and transport are not addressed in Ch.7 |
| 17939 | 7 | | | | | It might be a good idea for the reader to cross-reference other health-related impacts in other other chapters - particularly Chapters 8 and 9. | Noted. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 16848 | 7 | | | | | Listing the deaths associated with each source -- you need a timeframe please. Is it each year? The last 10 years? Since time began? | Editorial comment. This information is contained in the figure caption. |
| 3010 | 7 | | | | | I do recognize that the safety record of nuclear energy has been relatively fine and Generation III reactors have enhanced safety features compared to the 1970s-era Generation II designs like those at the Fukushima Daiichi facility in Japan. In addition, as the section indicates, the number of fatalities from the nuclear energy system is far smaller than the number killed or injured, for example, producing energy from coal or hydropower. However, the manuscript seems to minimize the fact that:<br>1. nuclear accidents pose threats for longer periods. Chernobyl nuclear power plant is now encased in a huge sarcophagus that will have to be maintained for hundreds of years to prevent radiation leakage.<br>2. relicensing of existing nuclear plants beyond their design lifetimes increases vulnerability and risk: most of the current fleet of reactors are not and won't be from generation III or even III+. Hence, chances for another disaster grow.<br>3. Finally, the long-term waste disposal problem has yet to be solved for nuclear power, and decommissioning costs are still highly uncertain. The minimum safety requirement for material leakage established by the US Environmental Protection Agency is 1 million years. This is a time very far beyond any possibility of social planning or even imagination. The manuscript, as it is, seems to compare the low social acceptability of nuclear with its low accident record, without acknowledging the reasons behind societies' preferences. | Reject. Please note that we do not have the opportunity for a longer discussion of these issues. It is correct that lifetime extension of existing NPP are not addressed in this report as a mitigation option. We have noted explicitly, now in a table, that the waste issue needs to be resolved. |
| 17941 | 7 | | | | | Please consider a broader discussion of risks and uncertainties along the classification of risks and uncertainties provided in Section 6.7. Please liaise with the other sector chapter LAs to discuss the process by which a more consistent approach can be reached. | Rejected - space constraints do not allow to go into the details here. |
| 11550 | 7 | | | | | The focus on fatality in the context of risk is too narrow and the section is not systematic enough. Instead of focussing on number of fatalities from Chernobyl, authors may want to explain more comprehensively the risks associated with different technologies (e.g. CCS leakage, risks related to intermittency ->security, health hazards etc); distinguish between mortality and morbidity for humans; but also risks to humans, vs risks to broader environment, etc. | Rejected. The treatment of risk suggested here would be worthwhile but cannot be taken in the short space available here. |
| 17942 | 7 | | | | | The title of this sub-section is not consistent with agreements reached in Wellington (p. 36), by which it should be named: 'public perception'. | Accepted - we have made the change |
| 17350 | 7 | | 2 | | 9 | Discussion of public acceptability of new technologies is missin, unless it is expected that it will be in other chapters in which case it needs to give cross-reference. Also cross-reference to concepts like willingness to accept chapter 3. | Rejected - Not clear what other new energy supply technologies are being referred to here, as we include CCS, |
| 11866 | 7 | | | | | It's not clear that this section really conveys particularly interesting information to the reader. Though it is interesting to consider trade-offs in local/regional electricity grids dependent on fossil fuels that may be imported, versus renewables that are local but not reliable on diurnal/seasonal cycles -this isn't really done in the section. Also, it seems to convolute issues of oil which (outside of oil-producing states where it may generate electricity) is really dominantly used for the transportation sector versus electricity grid reliability. | Rejected. The reviewer makes an interesting point. However, the suggestion made would require a lot more space than what is allocated in this section. Regarding the issue of oil, it is true that oil-importing states rely on the resource for electricity; but also many oil-importing developing countries also rely |
| 12912 | 7 | | | | | This section mainly focuses on the negative effects of bioenergy use. It would be appropriate to balance these negative effects with an up front description of the main beneficial effect, which is the replacement of fossil fuels. It is true that taking biomass out of forests can reduce carbon stocks and have a radiative forcing on climate. But the establishment of new forests may build up new carbon stocks and have a negative focing on climate, see further comment 4. | Agreed. : sure, as long as we note that the assumption of 1:1 replacement is atheoretical. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 12913 | 7 | | | | | Again, the this section mainly focuses on the negative effects and criticism of bioenergy use. It would be appropriate to balance these with the main beneficial effect, which is the replacement of fossil fuels. As an example, in the section on Fossil fuel deplacement (page 91, line 26-), 20 lines (26-47) are dedicated to describing why bioenergy does not fully displace fossil fuels, while only two lines (47-48) mention the important fact that this can be avoided by appropriate cap and pricing instruments. | Agreed. Need to be balanced. RICH: Felix, please explain to me how policy instruments affect global fuel market effects. I believe this is incorrect. All sectors have challenges in achieving efficient substitution of current CO2 |
| 16879 | 7 | | | | | Sustainable development -- I'm not aware of a formal definition of this concept -- are we talking about ecological systems, human systems, populations? Can we be more precise? | Rejected - comment seems to be misplaced. Please clarify to which part of the text your comment actually refers. |
| 3381 | 7 | 0 | | | | I have been supporting and contributing to the IPCC work for many years. It is therefore a great disappointment to read this FOD on this key chapter on Energy Systems. Huge differences exist between sections: from embarrassingly poor, superficial, rhetoric and badly written to excellent pieces of work. I do not know any of the authors and have no prejudices towards them, but I strongly feel some of them have done a very poor job for the IPCC in this FOD and should consider resignation (including, or in particular, any CLA responsible for the overall editing quality of this FOD). Some examples of clear flaws are included in this review. Other minor but also important points/questions have to be left for a SOD. CROSS REVIEW BETWEEN LAs HAS TO BE ENCOURAGED FOR THE SOD. | Noted - no operational suggestion is given here. The chapter has been improved considerably. A detailed cross review of the entire chapter has been carried out. |
| 3382 | 7 | 0 | | | | It should be a very easy job to come down to 60 pages. Full subsections can be deleted because they repeat message better treated in other sections (see comments below). The number of references is huge and can be reduced by 1/2. Many of them are brought in to support obvious ideas or text with no new factual infomation. Also, when a major report by the IPCC, IEA, major database etc is referred to support certain data or piece of information, it is not be necessary to refer as well to a paper publication by an author or small group of authorsn (it may be even un-ethical if this reference is to your own group). | Noted - the reference list is not part of the page counting. The suggestion was taken into account where appropriate. We do acknowledge that the size has to be reduced. |
| 4428 | 7 | 0 | | | | The authors rely on IEA projections in the early part of the Chapter. Therefore, the Chapter reads more as a condensed IEA report and lacks the analysis and suggestions that we need to break the projected trends. The Chapter could be shortened by removing the background on oil reserves/resources on p23. The CCS discussion could be shortened and its nature as an end-of-pipe emphasized. That is, less use of carbon intense fuels means a decreased need for CCS facilities. The nuclear discussion could be shortened. The discussions on both nuclear and CCS are large disproportionately compared with the brief account of all other renewable energy sources. Similarly, the discussion on transporting natural gas and CO2 could be reduced. | Accepted - IEA projection has been removed from the early part of the chapter. The discussion of fossil reserves was shortened significantly. Rejected - CCS and nuclear play an important role in chapter 7 and therefore they have to be discussed in chapter 7. There has been a special IPCC report on renewable energies (RE) recently. The treatment of renewables energies therefore can be shorter than that of nuclear and CCS. Note that there is a biomass annex in chapter 11 in addition |
| 12313 | 7 | 0 | | | | General comment: The use of SF6 in high-woltage appliances, such as gas insulated switchgears should also be covered in this chapter. Rationale: Use and, in particular, leakage of this long lived and highly potent GHG might be mitigated in a relatively cost-efficient manner. New infrastructure projects on electricity transmission are potential new sources of significant emissions of this GHG. | Rejected - the SF6 issue is a very specific one. Space constraints do not allow to go into all possible options for GHG mitigation in the energy sector |
| 15353 | 7 | 0 | | | | Overall the document is comprehensive and has a good balance of pertinet climate change and energy issues pertaining to both developed and developing countries. A balance which is important for the global drive to comabting as well as adapting to climate change. | Noted - a balance is indeed important. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 16946 | 7 | 0 | | | | I regret I have not had time to review the Sectoral chapters in depth. My only overall comment on this chapter is that whilst the Sankey diagrams are technically very valuable, their complexity may risk obscuring simpler messages about the underlying structures of the energy system. A simpler classification and flow diagram - along with quantification of both energy and carbon associated with each main block - is offered in Chapter 3, of Grubb, Hourcade and Neuhoff, Planetary Economics: the Three Domains of Sustainable Energy Development, Taylor & Francis forthcoming (Chapters 1 – 5 submitted, others in draft available on request).<br>As it happens, our flow diagram pinpoints precisely the structure that follows in the next three IPCC chapters - namely that the energy system is driven primarily by the demands of transport, Buildings and Industry - and elaborates on some of the structural characteristics. Whether or not using a diagram like this, I do think that Chapter 7 should help to set this structural context and placement for the subsequent three chapters. | Taken into account - a simplified graph now illustrates the relationship between the energy supply sector and the demand sector (see introduction). |
| 9409 | 7 | 0 | | | | When summarizing findings in the IPCC AR4 and discussing effects of energy system or energy intensity improvement, it may be useful to review the following paper.<br>Hanaoka, T. Kainuma, M., Matsuoka, Y. (2009) The Role of Energy Intensity Improvement in the AR4 GHG Stabilization Scenarios. Energy Efficiency, 2(2):95-108, DOI: 10.1007/s12053-009-9045-y | Taken into account - the comment is obsolete. The summary of the AR4 has been deleted due to space constraints. |
| 2819 | 7 | 0 | | | | I have three general comments on balance/comprehensiveness (which are reflected in detailed comments below):<br>1. Although the chapter is headed “Energy Systems” it gives insufficient attention to systems aspects. The largest part of the discussion is on low carbon resource availability and technologies – which is odd since, as the chapter acknowledges, this is not the main problem area. In my view, these sections (along with the scenarios section) could be shortened (including the discussion of bioenergy, which seems out of place here and should perhaps be relocated). Systems issues (such as infrastructure, investment, policies, institutions, regulation, market and pricing structures, systems operation and coordination, risk management and uncertainty etc) need more attention; demand in particular is inadequately treated. This may well be because some aspects of demand are discussed in other chapters, but the systems chapter is where things should be brought together.<br>2. The choice of references seems to privilege academic (in both senses) sources over empirical analysis. For instance, scenarios and modelling results are often cited as though they had evidential value, even when there is (often conflicting) evidence available from the real world. The text does not set the scenarios in context or expose their sensitivity to the underlying assumptions. Most of the models assume a world of perfect foresight and no uncertainty and so fail to deal with some major issues affecting choices in the real world.<br>3. In general, the discussion of specific issues is balanced. However, there are a number of points where the choice and treatment of sources seems selective. These are mostly relatively minor in themselves but they all point in much the same direction and leave an impression of bias in favour of certain options (renewables, CCS and carbon pricing) while other options are treated more neutrally (nuclear) or largely ignored (systems options).<br><br>While none of these problems is fundamental, in combination they have the result that the scale and nature of the problem is mischaracterised and the responses are only partly analysed. | Taken into account - 1.) A new diagram in the introduction now clarifies the relationship between chapter 7 and the demand sectors. As chapter 7 is constrained to the energy supply part of the energy system, low carbon technologies must be discussed here in detail. Demand aspects are discussed in detail in the demand chapters. The discussion of general system issues has been improved throughout the chapter (especially in section 7.11). 2.) Rejected- the models used to derive the scenarios in section 7.11 are introduced and discussed together with their weaknesses in chapter 6. Space constraints do not allow to repeat the discussion in our chapter 3.). Taken into account - there is now a detailed discussion of the relative importance of the various options in section 7.11. |
| 15016 | 7 | 0 | | | | The impact of shale gas must be discussed somewhere in this chapter. | Accepted - The discussion of shale gas has been extended in sections 7.4.1 |
| 15017 | 7 | 0 | | | | The discussion on the variation of CO2 emission factor from power generation will be useful to see the future reduction potential to electrification. | Taken into account - section 7.5.1. now provides a detailed discussion the CO2 |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 4083 | 7 | 0 | | | | The German Academy of Science (Leopoldina) recently issued a report named « Bioenergy, chances and limits », that can be downloaded here http://www.leopoldina.org/en/publications/detailview/?publication[publication]=433&cHash=6828ed4387801f3c1eeddaa5b636cf40 . This repport is less optimistic than previous IPCC publications on bioenergy mitigation potential. IPCC figures on bioenergy should probably be re-considered with care, especially now that we have more insight on previous errors on biofuel carbon accounting (see here, for example http://www.guardian.co.uk/environment/2011/oct/07/european-biofuels-target-us-scientists ). | Noted - bioenergy now has become an annex of chapter 11. The merits and shortcomings related to bioenergy usage are discussed there in detail. |
| 11918 | 7 | 0 | | | | Much space can be saved by removing redundancies, replacing text numbers with figures, and giving the text a good Engish edit.Also, order of text often does not seem logical. Why go from global markets (7.2.2) into Scale of GHG emission (7.2.3)?, especially in a section on Production, Conversion , and T&D? | Taken into account - text has been improved. |
| 18497 | 7 | 0 | | | | The presentation of mitigation options across the chapter is often inconsistent. This may only be limited to the order of technologies (e.g. in section 7.4 nuclear is presented before RE. In 7.5 this is reversed), but also varies quite substantially in the second half of the chapter (e.g. sometimes highlighting only one or two options, RE and CCS). Implementing a clear and consistent set of options (e.g. fuel switching, ee, RE, CCS, and nuclear) across sections 7.8, 7.9, 7.10 and 7.11 would be particularly useful to guide the reader. | Accepted - where it is feasible we discussed the options in the following sequence: fuel-switching, energy efficiency improvements, renewables, nuclear, CCS |
| 9220 | 7 | 0 | | | | The chapter 7 is the bigger importance. The date, technology and economy information, and the sources used in this chapter is the bigger relevant  The structure is well, but may be the chaptar can be shortened if Bioenergy Annex goes to Annex II Methods and Metrics. On the other ham, many titles of figures and tables includes some explanation that can send to foot page or the other place | Noted - the Bioenergy Annex was moved to another chapter. |
| 2990 | 7 | 0 | | | | In all document shale oil must be distinguish from oil shale. “Shale oil” is also referred to as “tight oil”, although they are not exactly the same thing. It is more important, however, not to confuse “shale oil” with “oil shale,” as often occurs. Put simply, “shale and tight oil” are conventional oils (light oils with low sulfur content) trapped in unconventional formations, which make it extremely difficult to extract hydrocarbons. By contrast, “oil shale” is a precursor of oil called kerogen, a sort of teenage-oil that constitutes the building blocks of conventional oil. Oil shale is trapped in rocks with low porosity and permeability, making the extraction of kerogen difficult. However, the oil shale rocks are closer to the surface than those containing shale and tight oil. Thus, both the oil shale formations that contain kerogen and the kerogen itself are “unconventional.” | Rejected - the usage of the terms is consistent with the scientific literature. |
| 3006 | 7 | 0 | | | | In the manuscript, CCS was mainly analyzed for thermal power plant. However, different studies have shown that CCS will probably be applied in oil refineries too, mainly in hydrogen production units and FCC units. Please see Gomes, G.L., Szklo, A.S., Schaeffer, R., 2009. The impact of CO2 taxation on the configuration of new refineries: An application to Brazil. Energy Policy, 37, 5519–5529. de Mello, L., Pimenta, R. Moure, G., Pravia, O., Gerahart,, L., Milios, P., Melien, T., 2009. A technical and economical evaluation of CO2 capture from FCC units. Energy Procedia 1 (1): 117-124. Kronberger, B.,  Johansson E., Löffler, G., Mattisson, T., Lyngfelt,A., Hofbauer, H., 2004. A Two-Compartment Fluidized Bed Reactor for CO2 Capture by Chemical-Looping Combustion, Chemical Engineering & Technology, 27 (12): 1318-1326. Miracca, I, Åsen, K., AssinK, J., Coulter, C., Curran, L., Lowe, C., Moure, G., Schalsner, S., 2009. The CO2 Capture Project (CCP): Results from Phase II (2004-2009). Energy Procedia, 1 (1): 55-62. Castelo Branco, D.A., Szklo, A., Gomes, G., Borba, B.S.M.C., Schaeffer, R., 2011. Abatement costs of CO2 emissions in the Brazilian oil refining sector. Applied Energy, 88, 3782-3790. LINDSAY, I. et al. Designing a climate friendly hydrogen plant. Energy Procedia, n. 1, p. 4095-4102, 2009. MAHONY, L. CO2 capture for refineries, a practical approach. Energy Procedia, n. 1, p. 179-185. 2009. | Accepted - CCS can be applied to many different kinds of large stationary CO2 point sources. This point is explicitly made in the first paragraph of section 7.5.5. |

| 3007 | 7 | 0 | | | | The manuscript lacks discussion on the important subject of gas venting and flaring. Please see the World Bank Programme related to that (TheWorld Bank Group. GGFR – Global Gas Flaring Reduction.Washington, DC:World Bank. See also: http://web.worldbank.org/WBSITE/EXTERNAL/TOPICS/EXTOGMC/EXTGGFR/0,contentMDK:22137498~menuPK:3077311~pagePK:64168445~piPK:64168309~theSitePK:578069,00.html; 2007); see also Castelo Branco et al. Co2e emissions abatement costs of reducing natural gas flaring in Brazil by investing in offshore GTL plants producing premium diesel. Energy 35 (2010) 158–167. | This is briefly mentioned in 7.5.1 |
| 10041 | 7 | 0 | | | | This chapter lacks up to date information about the current development of the RE sector and focusses only on a very limited amount of scenario which are neither representitive nor balanced. More informations of the previous IPCC report about Renewable energy (SRREN) must be incorporated. Currently the chapter is quite weak and too focused on IEA data, while the latest RE research results are not present. | Rejected - most of the discussion on IEA scenarios has been removed. The scenario results are based on a database which contains over 800 different |
| 3153 | 7 | 0 | | | | This chapter is so massively over limit it was almost impossible for me to review it. Delete the annex on bioenergy—why not just integrate it with the main text? | Taken into account - bioenergy annex has been moved to chapter 11. The size of chapter 7 has been reduced considerably. |
| 4317 | 7 | 0 | 0 | 0 | 0 | Wind power is now technically mature and it is not realistic to expect major reductions in cost apart from those following on from reductions in the cost of materials such as steel and material used to make the blades. Many manufacturers of wind turbines are no longer profitable and their share price is declining rapidly. (e.g Vestas) In the case of solar power, prices of solar cells are not likely to decrease much below $1/Watt because, at this level, most manufacturers are losing money. The cost of mounting the cells, providing the cabling from the cells to the inverters, the cost of the inverters and transformers and the connection to the grid are all things that form the major part of the cost and are not likely to decrease substantially in the future. Many manufacturers of solar cells are no longer making a profit and their share prices are declining rapidly. Both industries are entirely dependent on a very large amount of subsidy. This subsidy is added to electricity prices so, in effect, the poor are subsidising the rich who are able to "Invest" in subsidised projects.. This is not sustainable. This section needs to be expanded to explain the situation. | Rejected - Many of these issues are adequately addressed in the present text, in our view. In fact, there are expectations for wind energy costs to continue to decline. We have seen substantial turbine advancements just in the last couple of years, primarily focused on reducing LCOE in lower wind speed sites. There are many expectations for this to continue. Similarly, solar modules today sell at ~70 cents/W (well below $1/W), and the cost of production roughly matches this figure. While it is certainly true that both wind and solar manufacturers are currently operating on low margins, and in some cases negative margins, there is little indication that technological progress has ceased. Many industry watchers expect sub 50 cent/W modules in the next few years. Continued reduction in costs are especially possible if one considered non-hardware costs. In Germany, residential solar is installed at ~$2.5/W; in the US that figure is above $5/W - the difference comes in non-hardware costs. So even when hardware costs become static, there continue to be opportunities for overall cost reduction. As such, we |

| 4319 | 7 | 0 | 0 | 0 | 0 | No one has been killed by the Fukushima accident and, because the radiation level experienced even by the workers at the site, was below the level that research has established as being dangerous, nobody will. (www.radiationandreason.com) In this respect, note that one dam failure in China (Banquio) ~26,000 people directly and many more from starvation. But the world did not stop building hydro schemes. I believe that, as the IPCC claims to be science-based, scientifically-based evidence like this should be pointed out. | Taken into account – Please note that there are many conflicting statements in the public about the risk of nuclear power and the consequences of the Fukushima accident. As a scientific body, the IPCC has to rely on peer-reviewed scientific publications. Utilizing research that has just become available, section 7.9.3 now includes following sentences: “The Fukushima-Daiichi accident resulted in much lower radiation exposure. 30 workers received radiation exposure above 100 mSv, and population exposure has been low |
| 4320 | 7 | 0 | 0 | 0 | 0 | In many–if not most–countries renewable energy generates the maximum amount of power at times when the seasonal and daily electricity demand is not at a maximum. It is true that, at some expense, pumped hydro can compensate for daily fluctuations and batteries and other things can, at great expense, cater for shorter term fluctuations. However, there is no method available or on the horizon for storing large amounts of electricity for weeks or months. Pumped storage schemes have a daily cycle and have sufficient storage for 6 to 10 hours of full load operation. There are a few schemes with larger storage. In order to store large amounts of energy for long periods, a pumped storage hydropower scheme would have to have 2 huge lakes with 500 to 800 m elevation between them. It would also need a substantial water supply to make up evaporation losses. There are very few suitable sites available around the world and even fewer within reasonable distance of a large load centre. So there is no chance of storing surplus electricity from renewable energy sources for periods longer than a day or so. This single fact means that renewable energy cannot make a contribution to energy supply much over about 20%. Therefore, it cannot substitute for fossil fuel plants or nuclear power. The conclusion is that if there was a need to reduce carbon dioxide, nuclear power is the only large scale technology that we have. (Hydropower cannot provide large amounts of electricity in most countries.) Given the wind and solar power are much more expensive than nuclear, the pursuit of large-scale renewable energy is a mirage. (Note that countries that have more than 20% of renewable energy such as Denmark, export much of it at a low price to Scandinavia and Europe when the wind is blowing and blow it back at a much higher price when the wind is not blowing.) I think what I have written needs to be covered in the report. If it is not covered, then the thrust of the report is seriously misleading. | Rejected. Please note that the issue of grid integration and balancing is addressed in 7.6.1. |
| 10440 | 7 | 0 | 0 | | | There is an excessive of citations of IEA report, please expand your reference base | Accepted - the reference base has been |
| 10441 | 7 | 0 | 0 | | | Why is the bioenergy in annex. This is very important and should be included in a chapter, eliminating some of the economic theory | Rejected - space constraints do not allow to go into the details of bioenergy in chapter 7. The annex has been moved |
| 3634 | 7 | 0 | 0 | | | Chapter 7 elaborates too much in CCS relative to other mitigation options, e.g. renewable energies. Chapter too much CO2-driven. Other GHG emission reductrion potentials not sufficiently discussed. | Taken into account - other gases (e.g. fugitive methane emissions are now treated in more detail. The discussion on CCS and nuclear is longer as there had |
| 4827 | 7 | 0 | 0 | 0 | 0 | The chapter would profit from short summaries at the beginning and end of each section to help the reader remember the focus and main line of the chapter given how long the chapter is | Taken into account - a new introduction clarifies the content of the entire chapter. In various occasions, pointers to other sections are used to facilitate readability and understanding. However, due to |

| 4828 | 7 | 0 | 0 | 0 | 0 | The chapter should give more weight to affordability implications given the current economic crisis as this has an important impact on climate related policies. | Taken into account - sections 7.10.2 and 7.11 now contain a detailed discussion |
| 17745 | 7 | 1 | | | | 39 pages of references are far too many; several IEA reports are simply repetitive | Rejected- in order to provide a comprehensive assessment the underlying literature must be assessed. |
| 6255 | 7 | 1 | | | | Energy in itself is not important to consumers. It's rather the services that energy delivers that matter. This is particularly relevant in discussions of risk, behavioural patterns and new investment. The interaction with consumers is currently lacking in the chapter, meaning that the context or the reality grounding the chapter is weak. In addition, the notion of behaviour related to market segmentation should also be considered in relation to customer centricity. A holistic view must be taken since the decarbonisation of electricity is the key to decarbonising other sectors (transport. domestic) which whilst reducing total overall emissions could cause increased emissions from the electricity sector | Taken into account - This is a problem with the entire report setup. The electrification is now addressed all the way in the scenario selection. |
| 6256 | 7 | 1 | | | | thereis a lack of distinction in the chapter between energy systems in developing countries and those in developed countries | Taken into consideration - a box on this distinction has been provided. |
| 6257 | 7 | 1 | | | | Roadmaps from different sources are recommended for inclusion in the chapter, including the EU 2050 Roadmap, and scenarios from Eurelectric (Power Choices) , EPRI (Prism) and Greenpeace. | Rejected - space constraints did not allow to include these scenarios in addition to the 800 scenarios of the |
| 6258 | 7 | 1 | | | | The diagrams must be much clearer. At present they detract from the text. | Accepted - almost all diagrams has been improved or changed. |
| 6259 | 7 | 1 | | | | The language in the chapter is often inconsistent in its use of the terms energy, power, and electricity | Accepted - language usage has been |
| 6260 | 7 | 1 | | | | Additional sources of information should be used - suggested sources attached separately below | Taken into consideration - suggested sources have been reviewed and |

| 4638 | 7 | 1 | | 96 | | General comments on Chapter 7.<br><br>First some background information. I have had over 40 years experience in renewable energy, especially biomass energy. I have worked in over 50 countries on biomass energy surveys, wood consumption/timber trends studies, renewable energy supply & demand, biomass inventories and the environment. I have lived in Africa and Asia for 17 years.<br>Some of my recent publications, which are pertinent to this chapter, are:<br>Openshaw, K (2010a). Employment generation by biomass energy and its contribution to poverty alleviation in Malawi and other developing countries. Biomass and Bioenergy Journal 34, 2010. Elsevier, Oxford, England UK.<br>Openshaw, K (2010b). Can biomass power development? Gatekeeper Series 144, April 2010. The International Institute for Environment and Development (IIED), London, England UK.<br>Openshaw, K (2011a). Biomass as a benign energy source. Chapter 52 in Encyclopedia of Agrophysics. Eds. J. Glinski, H. Horabik, J. Lipiec. Springer.com/agrophysics. P.O. Box 17, 3300 AA Dorrdrecht, the Netherlands.<br>Openshaw, K (2011b). Supply of woody biomass, especially in the tropics: is demand outstripping sustainable supply? The International Forestry Review, Vol. 13(4), 2011. Ed. A.J. Potinger, the Crib, Dinchope, Craven Arms, Shropshire, SY7 9JJ UK. Published by the Commonwealth Forestry Association.<br>Barnes D.F., Priti Kumar, Keith Openshaw (2012). Cleaner hearths, better homes: new stoves for India and the developing world. Oxford University Press. The World Bank. ESMAP (energy sector management assistance programme). ISBN 0-19-807836-6.<br>Openshaw, K (2012). Remote sensing of biomass: principles and applications. Submitted for publication to the second sustainable world forum.<br>Biomass energy is the only energy form that is treated in two ways, namely 'traditional' and 'modern'. This separation infers that 'traditional' biomass energy is non-sustainable and has to be substituted as quickly as possible for 'modern' biomass and other forms of renewable energy (RE). For example, P. 18 line 14 states that biomass and waste (demand) are growing at 2% per annum including traditional and modern ---. P. 57, line 8. "Providing clean, affordable and reliable modern energy services is also at the heart of development challenges in many developing countries ---". P. 57 line 12 "over 3 billion people are estimated to lack access to modern fuels for heating and cooking ---". P 58 line 6 "The provision of access to clean, efficient, affordable and reliable energy services entails multiple co-benefits ---". Also, footnote 1 on page 9 talks about more comprehensive coverage of energy resources, including non-commercial ones (i.e. traditional ones).<br>Granted unprocessed biomass has a lower energy value per unit weight and is more difficult to control than liquid and gaseous fuels. But charcoal is lumped with fuelwood, residues and dung as traditional. Charcoal is a processed smokeless biomass fuel that has an energy value on par or better than most coals and has never been 'non-commercial'. To denigrate some biomass as traditional, infers that the people using it are handicapped! In my opinion, there should be no distinction with types of biomass as inputs for different end uses.<br>Chapter 7 keeps on mentioning energy access to modern fuels. But what it really means is access to electricity, for most people do have access to kerosene for cooking and lighting and many have access to LPG and even natural gas, especially in urban and peri-urban areas. However, for the rural population, if biomass is available within a reasonable collection area, most will use it in preference to fossil fuels. Kerosene is used sparingly for | Noted |
| 3384 | 7 | 10 | | 12 | | Space saving: Figure 7.1 top, can be deleted or the full Figure 7.1 can be deleted because the key numbers are in the text. The choice of categories reflect some prejudices in favour of geothermal: geothermal (0.06% of electricity) deserves a single colour/category, while wind (1.4% of electricity) is aggregated together with solar and mentioned only "after" solar. The same applies to Table 7.1: why "Geothermal, Solar etc" ? It is obvious from real numbers that it should be "Wind, Solar etc". Is this flaw also present in the IEA 2011 report used as a reference ?? | Disagree. This figure does illustrate very important point - that in last decade, fuel mix was evolving in favour of fossil fuels. It was modified in SOD. |
| 4639 | 7 | 10 | | 10 | | . Percentage use. For 2009, solar, wind, etc. should be 0.5% not 0.0%. | Numbers were eliminated. |
| 4640 | 7 | 10 | | 10 | | Figure 7.1 Incremental growth in China. Between 1999 and 2010, biomass energy increased by about 25% or over 2% per year. No growth is shown in the graph. (Total growth increased 2.6 times). | There are no statistical sources supporting this statement. IEA reports |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 15942 | 7 | 10 | | 10 | | why use 2009 data when 2010 data has been available for nearly a year…? And all such comparisons are invidious anyway, unless your energy source of choice happens to waste up to 2/3 of its energy as heat. I suggest you treat heat, transport and electricity separately. | Data was updated to 2010. |
| 18502 | 7 | 10 | | | | It would be useful to have the same colors for the same technologies in the top and bottom panels. | Agree. We improved the design of figure |
| 18503 | 7 | 10 | | | | Top panel: Having 2009 as an individual year to the left of a ten year increment beginning with 1991 is difficult to digest. It might be more useful to have an annual continuum from 1991 to 2009, rather than 10 year increments. | Not clear why. This section is mostly on evolution for the last decade. |
| 18504 | 7 | 10 | | | | Lower panel: Note that it may be politcally problematic to single out China in this graph, as there are no other individual countries highlighted. | China was removed from the figure and included in Asia. |
| 10498 | 7 | 10 | | | | This is showing trends and is also referred to on page 18 - so suggest move from here to section 7.3. | The scale is presented by the table. This figure allows to see what energy sources |
| 6174 | 7 | 10 | 12 | 11 | 2 | This seems like one of the most important points to be made with respect to TPES – that supplying energy consumes more energy than anything else. Emphasize this point more strongly. | Text says "The energy supply sector is itself the largest energy user". So we |
| 2991 | 7 | 10 | 12 | | 16 | Text is not clear: First, it is hard to understand the meaning of populated in the sentence. Second, the causality is spurious here: it is not true that a site that provides different energy vectors is more complex than one that is based on a highly-sophisticated and selective process to optimize one major fuel. This is easily seen in oil refineries. Hydroskimming refineries may provide different fuels (from fuel oil to petrol), while hycon refineries are able to optimize their outputs in a few high value added products. | The meaning relates to the table 7.1. The part of the table related to energy sector has less empty sells today as it was 10-20 years back. |
| 17207 | 7 | 10 | 15 | | | The text is misleading, since the conversion losses come with the production of higher value final energy carriers. This is especially the case for electricity, which is clean at the point of use and usually has a high marginal product. | Point is not taken. All energy is used to produce services we need. We do not need energy per se. So energy sector losses are just an energy price for higher |
| 12320 | 7 | 10 | 2 | | | Please consider to add a figure (before figure 7.1) that shows energy consumption per source per region for 2009. This would complement the regional figure (second part of figure 7.1). | The task for figure 7.1 is to show what had happened in last decade. Adding new figures would be nice, but space |
| 9632 | 7 | 10 | 2 | | | the charts are confusing and the one legend for two charts is also confusing - consider labelling them a and b | We improved the design of figure 7.1 |
| 11917 | 7 | 10 | 2 | | | Figure 7.1 is confusing. Are the "increments" added increments? Would perhaps show better as a line diagram. | We improved the design of figure 7.1 |
| 16120 | 7 | 10 | 39 | 13 | | These sentences seem to imply that curtailing some wind in part of the year is a "last resort" strategy. In reality, it can be much more economic or practical than new power lines or other flexibility improvements. For example this is official policy in Ireland. The sentences imply also we need synchronized implementation of flexibility measures, adding unnecessary burdens to an already complex path. Suggestion for the last sentence : "indeed curtailment of wind power is common practice where and when transmission contraints prevent full utilisation of available wind, [and increase of transport capacity may be suboptimal]." | There is no line 39 on this page. |
| 9222 | 7 | 10 | 2 | 10 | 6 | To integrate both Figures and send the "note" to foot page | We improved the design of the figure 7.1 where figures were integrated |
| 10065 | 7 | 12 | | | | Instead of using the Header "Geothermal, Solar, etc." classify this as "Non-Combustible Renewables" | We use headings taken from the |
| 15015 | 7 | 12 | | | | Although these data are useful, but too much detailed. | Noted. The global energy balance is complex. This table shows end-use sectors by one line each and illustrate what energy carriers are needed for such sectors, It shows energy sector with |
| 10439 | 7 | 12 | | | | The entire table looks very similar to IEA world report tables, please change colors, orientations etc | It is more detailed than in IEA key world energy statistics. So colour scheme is |
| 10499 | 7 | 12 | | | | Change "bln kWh" to TWh. Need to explain why negative values in caption or footnote. Confusing as it is and needs greater explanation in the caption | Accepted - Negative numbers are explained in the footnote. |

| 12587 | 7 | 13 | 1 | | | The levels of waste heat from thermal power stations could be mentioned in contaxt of total space heating demands, which I feel puts things in perspective. For example, in the UK the waste heat from thermal power stations is roughly equivalent to the total space heating demands in the UK. For evidence, please see http://www.decc.gov.uk/en/content/cms/statistics/publications/flow/flow.aspx | The heating sector is mentioned. CHP plants are reflected in the table. There are some limitations for their deployment based on heat demand and the |
| 9633 | 7 | 13 | 1 | 13 | 7 | The message in the first paragraph is not clear - hard to understand what is being said. | Accepted. The message was made clearer in the new first paragraph. |
| 2823 | 7 | 13 | 1 | 13 | 3 | The reference to “relatively low average global efficiency” is unclear. Relative to what? Efficiencies have been steadily increasing over time. If the reference is to some theoretical potential, citing only fossil sources is misleading; conversion efficiencies of renewable sources or nuclear are generally much lower (in terms of the amount of potentially available energy which they convert to useful work). | Relative to the best available technologies. See paragraph below. |
| 11846 | 7 | 13 | 1 | 13 | 7 | This paragraph is quite confusing, particularly lines 4 through 7. It seems quite clear that converting primary energy into energy carriers is inefficient - but it is not clear what this paragraph is saying beyond that - what is meant by "large own energy use in energy sector," for example? If it simply means it takes energy to make energy, and on average a lot of energy is lost as waste heat, it seems like this can be said simply and concisely. This is one of many spots in the chapter where text can be eliminated without losing content. | Disagree. It is not that simple. Energy transformation technologies require energy and bring some losses. Both arte substantial. Some comments stress importance of this message (see |
| 5943 | 7 | 13 | 1 | 21 | | There is an issue of objectivity (use of language which could be considered pejorative) which does not reflect the age of investments and economic factors | There is no such flavour in those paragraphs. They just fix present low efficiencies and potential for |
| 16782 | 7 | 13 | 1 | | 32 | Could be significantly shortened. No context, not particularly useful in terms application or policy formation. | Some cuts were made. It brings present status picture as a departure point for |
| 16783 | 7 | 13 | 1 | | 7 | These numbers do not address the "quality" or usefulness of the energy -- the more relevant metric to discuss is the delivered cost of the useful energy. | The issue of energy costs is dealt with later in the chapter. Here only the energy |
| 6226 | 7 | 13 | 12 | 13 | 15 | Mention should be made of thermodynamic limitations on efficiency (Carnot/Kalina cycles) | Rejected - the thermodynamic limits are of limited use as long as the temperature conditions are not fixed. In addition, fuel cells might use fossil fuels with a |
| 16784 | 7 | 13 | 12 | | 15 | The implication is that there are large improvement opportunities possible, but these are only really true if we build completely new plants -- most can not be modified to produce these efficiencies. Do you want to leave reader with impression that modification can do the job or that we might just build new plants and that will help when building a new plant with only slightly better tech will lock in emissions for 40 years? | Those issues on what technically is possible and by when are dealt with later in the chapter. This is just an introduction to those sections. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 2992 | 7 | 13 | 14 | | | It is not true that gas fired plant efficiency is only related to best practices. It depends on the environment conditions of the operation (temperature and pressure) and also it depends on the integration of these plants into the power grid. | There are many factors like capacity load and others. The comparison is made keeping other factors equal. |
| 16785 | 7 | 13 | 15 | | 21 | It is not clear to me what the point is of citing thermal efficiency numbers without any context. How is this meaningful to the issue at hand? | Those issues on what technically is possible and by when are dealt with later in the chapter. This is just an |
| 16786 | 7 | 13 | 22 | | | Suggest perhaps that you qualify statement by inserting at start of sentence: "In some cases," -- the statement as it stands now is not a universal condition. | There is "often" in this sentence to reflect this concern. |
| 4102 | 7 | 13 | 25 | 13 | 25 | Here, and at many other points, the 'Global Energy Assessment' is referenced as 2011. As of September 5, 2012, I await my copy from Cambridge University Press as a reviewer. | Noted. The correct reference details of the GEA were updated. |
| 9634 | 7 | 13 | 26 | 13 | 27 | Please clarify - is this 82% of what is used by industry, not including electricity generators? | The final use means that all energy transformation sectors are excluded. It is |
| 5151 | 7 | 13 | 26 | 13 | 26 | what is the intent of this sentence? | Intent is to show what sector demands what energy, which energy supply sector |
| 10500 | 7 | 13 | 3 | | | Does the 37% include T&D? References needed in this para. | It is for power generation as it is written. |
| 5948 | 7 | 13 | 33 | | | Section 7.2.2 does not describe energy markets per se (rather it describes traded volumes). It is not clear what the value of this section is. A more relevant aspect may be to highlight the differences in fuel prices between regions and its influence on demand | Taken into account - text has been shortened. Space constraints do not allow to go into the details of price |
| 16788 | 7 | 13 | 33 | | 37 | This seems to imply that trade creates more problems than benefits -- evidence suggest this is not true. The problem is not trade, but end use efficiency and energy technologies. | Taken into account. The text was reformulated to avoid this impression. |
| 16787 | 7 | 13 | 33 | 15 | 4 | This section could be significantly shortened and still make the useful points. The usefulness of this section is not clear -- if wish to discuss problems of oil dependence, perhaps ref peer reviewed lit exploring links of energy price volatility as trigger for economic recessions or something of this nature. You should check how well this is regarded in economics profession, but you might begin with Oil Price Uncertainty by Elder and Serletis in the Journal of Money, Credit and Banking. | Taken into account. The inclusion of this section is agreed by authors to be important to bring the message of regional variations in the development of technologies. The section has been |
| 5944 | 7 | 13 | 34 | 37 | | The paragraph lacks clarity. Is international trade being presented as a risk or opportunity? What is the role of markets? | Taken into account - comment is obsolete. Underlying text has been |
| 6418 | 7 | 13 | 36 | 13 | 36 | I suggest using a word other than "price". It implies financial issues, but here it is being used more as "the expense of" | Accepted. The editing replaced it by "at the expense of" as suggested by the |
| 10502 | 7 | 13 | 5 | | | Footnote 2. ….. of "the" direct equivalent method, "as used here, gives lower losses." | If power generation efficiency is just 37% that means losses are 63%. For CHPs losses are 41%. Why you think |
| 17361 | 7 | 13 | 6 | | | high potential indirect multiplication effects… | Accepted - It has been fixed. |
| 6175 | 7 | 13 | 8 | 13 | 21 | No need to summarize the chart so directly. The large number of detailed staistics actually impairs comprehension. Instead, highlight the numbers that are striking, unexpected, or relate to future arguments and ideas. | Some text which repeated the table data was eliminated. Paragraph on low heat and power generation efficiencies are |
| 15943 | 7 | 13 | 8 | 13 | 12 | Why use 2009 data, when 2011 data is available for RE sources, at least, although it may have been published just after this draft was prepared, i.e., July 2012 - see IEA 'Renewables Mid-Term Market Report' which has production numbers for RE sources for 2011 http://www.iea.org/w/bookshop/add.aspx?id=432 | Data was updated. |
| 13288 | 7 | 13 | 9 | 13 | 21 | When citing conversion efficiencies, it should be clear whether they are on a gross or net calorific value basis (also known as higher / lower heating value) - this makes a difference of around 5 % points, which is pretty significant | Rejected. The title of table 7.1 says that. |
| 10501 | 7 | 13 | 9 | | | with "total" generation losses. These data could be more clearly shown in a pie chart figure. 28.7% plus 4.4% = 33.1% of TPES has losses of 16.7% of TPES - meaning there are around 50% losses. Seems high - but maybe not. See TS Fig 8.2 of the SRREN for graphical representation. | If power generation efficiency is just 37% that means losses are 63%. For CHPs losses are 41%. Why you think |

|---|---|---|---|---|---|---|---|
| 13454 | 7 | 13 | 6 | 13 | 7 | Text: "Those low efficiencies and large own energy use in energy sector result in a high potential indirect multiplication effects of energy savings from end users" This point cannot be stressed enough - reducing final end point consumption has a more-than-equivalent impact on energy waste at all stages in the energy supply chain - it can even remove the need for replacement energy plant on lifecycle turnover, in some cases. | Noted. |
| 17386 | 7 | 131 | 19 | | | R. Vautard et al. (2010): Northern hemisphere stilling partly attributed to an increase in surface roughness. Nature Geoscience Letters, 17 October 2010. | Rejected - Good citation, but cannot easily place this within the quote |
| 17746 | 7 | 135 | | | | there should be a page of FAQ | Taken into consideration. FAQs are now presented through boxes in the text. |
| 15542 | 7 | 14 | 1 | | | Increased trade should reduce the volatility of prices | Taken into account - comment is obsolete. Underlying text has been |
| 5945 | 7 | 14 | 1 | 3 | | Ditto | Please clarify what you mean. |
| 17215 | 7 | 14 | 16 | | | In the list of countries the US is missing. | Taken into consideration. The text has |
| 5947 | 7 | 14 | 17 | 19 | | Clarity lacking. What is the intent of this statement? | Rejected - the sentence is based on a |
| 16033 | 7 | 14 | 17 | 14 | 19 | to much sources | Rejected. Not harmful to have many |
| 6419 | 7 | 14 | 20 | 14 | 20 | Without policy limiting CO2 emissions, natural gas does not penetrate due to its low CO2 emissions relative to coal. As written, this sentence implies that it does. It penetrates because of its high energy density, transportability, and fungibility for end-uses... not because it burns efficiently. | Accepted. The sentence has been deleted. |
| 12321 | 7 | 14 | 20 | 14 | 21 | Market penetration depends on pricing - not GHG emissions. However, lower GHG emissions gives natural gas a competitive advantage in markets with CO2 pricing. Please consider to reflect this fact. | Taken into consideration. The text has been deleted. |
| 13289 | 7 | 14 | 20 | 14 | 20 | The combustion GHG emissions from natural gas are not 'low' as stated, merely lower than coal and oil - suggest replacing with 'relatively low' | Agreed. The text has been modified. |
| 18045 | 7 | 14 | 20 | 14 | 20 | Replace "low" with "lower GHG emissions than coal". The term "low" is very subjective and ambigious. | Agreed. The text has been modified. |
| 16789 | 7 | 14 | 20 | | 34 | The beginning of the paragraph suggest that transport of nat gas is expensive -- this is not universally true -- pipeline transport can be relatively inexpensive and exists in several places as you note later in paragraph. | Rejected - for most countries this is the case. |
| 2824 | 7 | 14 | 23 | | | This overstates the regional nature of gas markets. There is significant inter-regional trade and some inter-regional price transmission so it is not true that markets are limited to regional scales, though of course the regional markets do all have different characteristics. | True but don't see relation with the lines quoted |
| 7119 | 7 | 14 | 27 | | | "...reached 32% with special concern for almost 650 mln." Missing units after 650 million. | Accepted - text revised. |
| 9635 | 7 | 14 | 35 | 14 | 42 | Include that: Coal was only to renewables as the fastest growing fuel in 2011 (BP, 2012) | Rejected - the text discusses the different fuels and sources in sequence |
| 2825 | 7 | 14 | 35 | | | While it is often claimed that coal is widely distributed, the claim appears to have no foundation. Occurrences of coal are of course widespread, but that is true of other fossil fuels and not of any particular significance. In terms of proved reserves, BP lists 55 countries with natural gas reserves, of which the largest has 23.7% of the global total; for coal the equivalent numbers are 33 and 28.9%. Production of coal is even more concentrated (the largest coal producer, China, accounts for 45.6% of the world total while the largest gas producer, the US accounts for only 20%), as is trade. | Rejected - the text discusses the different fuels and sources in sequence not in comparison. |
| 16790 | 7 | 14 | 35 | | 42 | You may want to include point that export of coal from North America is increasing as lower coal demand (from competition with cheap natural gas) is dropping prices, making North American coal competitive on the global market. | Taken into account - the US now are mentioned as a big producer |
| 11847 | 7 | 14 | 36 | 14 | 37 | Please tell the reader the top importing countries - it is strange that the top exporting country is listed (Australia) but that importing countries are not identified. | Taken into account - comment obsolete. Underlying text has been deleted. |
| 5946 | 7 | 14 | 4 | 8 | | Clarity lacking. The global oil market is not driven primarily by fuel transportation costs | Taken into account - it is now driven, but |
| 10503 | 7 | 14 | 40 | | | Here and elsewhere needs past tense | Accepted. "Was" used instead of "is" |

|---|---|---|---|---|---|---|---|
| 9468 | 7 | 14 | 43 | 15 | 1 | I have a doubt about the description that trend for uranium production to expand is challenged recently by the Germany's decision to phase out its nuclear program and Fukushima accident, as in many countries other than Germany and some countries there are movements of building new and additional nuclear facilities, from the standpoint of energy security.<br>In September 2011, J. Steyn and T. Meade published an article in Nuclear Engineering International about the uranium supply capasity and requirements in the world after the Fukushima accident [1]. It concludes that "One repercussion of the recent events at Fukushima Daiichi in Japan was an immediate drop in uranium requirements in Japan and Germany. But, over the long term, uranium requirements are expected to grow steadily."<br>They note that it is clear from the data, that current mine capacity and capacity under development, plus total already mined uranium (AMU), are projected to be adequate to meet reference requirements through the early 2020s. They also note that if needed, projected supply can be augmented by prospective mine capacity, of which there is a significant amount.<br>[1]J. Steyn and T. Meade (2011) "Demand down, for now," Nuclear Engineering International, September 2011, pp. 22-26<br>See online article at http://www.neimagazine.com/story.asp?storyCode=2060839 | Taken into account - comment is obsolete. Underlying text has been deleted. |
| 6420 | 7 | 14 | 43 | 14 | 43 | "About 433" is quite specific. If it is 433, then that should simply be stated. Or perhaps something like, "Approximately 430" | Agree, editing. "About" has been deleted. |
| 18200 | 7 | 14 | 43 | | 47 | Add to paragraph: About 433 nuclear reactors worldwide require annually 77,000 t of uranium oxide concentrate (U3O8). Uranium mines supply about 60,000 t of U3O8 with the rest supplemented by secondary supplies from ex-military materials and other inventories (World Nuclear Association, 2011). Trend for uranium production to expand by 52% observed in 2000-2010 is challenged recently by the Germany's decision to phase out its nuclear program by 2022 and the Fukushima major accident in Japan. The number of uranium exporters is limited to a few countries - Kazakhstan, Uzbekistan, Namibia, Niger and to a lesser extent South Africa, as well as Australia and Canada ((World Nuclear Association, 2011). Markets for other energy carriers (combustible biomass, waste, electricity, and heat) are mostly domestic, because they don´t need any with very limited amounts of cross-border trade (Table 7.1). | Taken into account - comment is obsolete. Underlying text has been deleted. |
| 18201 | 7 | 14 | 43 | | 47 | About 433 nuclear reactors worldwide require annually 77,000 t of uranium oxide concentrate (U3O8). Underlying text has been deleted. |
| 5926 | 7 | 14 | 43 | 44 | 1 | Suitable references to nuclear policies after Fukushima are: 1. Globally: P. Joskow, J. E. Parsons, The Future of Nuclear Power After Fukushima, Econ Ener Env Pol 1(2) (2012) 99-113, and 2. Concerning EU countries: Syri S., Kurki-Suonio T., Satka V., Cross S., Nuclear power at the crossroads of liberalised electricity markets and CO2 mitigation - case Finland. Energy Strategy Reviews (accepted with minor rev.) Concerning the EU, all Eastern European MS still see nuclear power as viable option, whereas mainly Germany, Italy and Switzerland have chosen to abandon nuclear power (production/ plans). | Taken into account - comment is obsolete. Underlying text has been deleted. |
| 9503 | 7 | 14 | 45 | 15 | 4 | This texts may cause the misunderstanding of the uranium supply shortage, and should be deleted. Because the supply of uranium have been enough, and effects for the uranium supply by the Germany's decision and Fukushima accident are temporary. Smallness of the number of supply country cause no problem. | Taken into account - comment is obsolete. Underlying text has been deleted. |
| 16034 | 7 | 14 | 47 | | | Germanys and Japons decission to phase out there nuclear programs (2022, 2030th years) | Noted. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 9223 | 7 | 14 | 10 | 14 | 10 | Delete "Figure 7.1") because in Figure 7.1 can see this detail | Accepted. The figure has been deleted. |
| 13456 | 7 | 14 | 20 | 14 | 23 | Text: "Natural gas penetrates many markets because it burns efficiently with low GHG emissions, and requires limited processing to prepare for end use. But it is disadvantaged in terms of transmission and storage, because of its low energy density, which makes transportation costs a large fraction of the total supply chain costs. This limits the development of gas markets to regional scales." Gas fuels are likely to become increasingly sought after for a number of reasons, including low combustion carbon emissions, and oil supply questions. This makes it imperative for gas capture, storage and distribution networks to rise up the agenda, for both climate change and energy security reasons. It may be that gas prices will need to rise to accommodate these extra costs. | Agree with addendum but issue of space |
| 3448 | 7 | 14 | 35 | 14 | 42 | It should be mention the importance of USA in the coal consumption worldwide | Taken into account - the US are now mentioned as a large coal producer. |
| 13457 | 7 | 14 | 39 | 14 | 42 | Text: "Australia dominated the list of coal exporters (IEA, 2011a). China is responsible for nearly 90% of additional global coal use in 2000-2009 (Figure 7.1). India also plays an increasingly important role. Power generation remains the main driver of global coal demand (US DOE, 2011a)." With the disruption in the global economy, it is possible that China will not be able to keep up its current rate of economic growth as its trading partners have worsening deficits. | Rejected - the section is about historic trends not future expectations. |
| 13455 | 7 | 14 | 6 | 14 | 8 | Text: "Most prominent oil supply security concerns relate to over 3 bln. people living in 83 countries (including all of the world's low-income countries) importing more than 75% of the oil and petroleum products they consume." It is critical that the issue of energy access be addressed, because many of the countries dependent on energy imports are at risk of paying ever-increasing prices for those energy supplies. Some countries are consistently in GDP deficit over energy imports, and a worsening situation, either in terms of fuel scarcity, or fuel cost increases, will lead to these countries being unable to achieve development goals. | Agree with addendum but issue of space constraints. |
| 7118 | 7 | 14 | 7 | | | "relate to over 3 bln". Missing units after 3 billion | Accepted - text revised. |
| 3386 | 7 | 15 | | | | Section 7.2.3 should be rewritten. Explain clearly what sectors are included in the "Energy related GHG emissions" (Energy sector, trasnport, industry, buildings… to add 100%), and make figure 2 consistent with the text (at present it is not using the same categories mentioned in the text (around line 17). | Taken into account. The section has been deleted. |
| 3449 | 7 | 15 | | 15 | | Include in this figure the total amount of GHG emissions | Taken into account. The section has |
| 6796 | 7 | 15 | | | | This is a useful figure, although there is a lot of uncertainty in some of these numbers, such as the Chinese emissions. The problem with this graph is that many readers will interpret this to mean that China is the biggest cause of climate change. It would be better if you also included a graph showing the accumulated energy emissions to date of the various countries. It is the sum of all the added CO2 to the atmosphere since pre-industrial times that causes climate change. Absent an additional figure, the text (and, perhaps the figure caption itself) should provide some explanation. | Taken into account. The section has been deleted. |
| 6177 | 7 | 15 | | | | The coloring here renders this chart difficult to read. Suggest using more contrasting colors and/or patterns. | Taken into account. The section has |
| 5152 | 7 | 15 | | 15 | | unclear - is it meant that the 33028 comes from th energy sector and the rest do not ? | Taken into account. The section has |
| 10506 | 7 | 15 | | | | Could leave transport and industry CO2 data in the pie chart and not in the box which then really becomes an "energy sector" box. CO2 "other" I assume is deforestation - so why not call it that - also CH4 and N20 "other" are maybe mainly Agriculture | Taken into account. The section has been deleted. |
| 10507 | 7 | 15 | | | | Does top graph include transport emissions too? Another example of where the chapter boundaries are unclear. | Taken into account. The section has been deleted. |
| 4103 | 7 | 15 | 1 | 15 | 3 | Although thorium is mentioned later (p. 24) this would be an appropriate place to mention thorium also. | Rejected - space constraints do not allow to go into the details here. |
| 6227 | 7 | 15 | 11 | 15 | 11 | Coal combustion does not produce Nitrous oxide (N2O) emissions but does produse Nitric oxide (NO) & Nitrogen dioxide (NO2) emissions which have difereen GWPs | Taken into account. The section has been deleted. |
| 10505 | 7 | 15 | 17 | | | Can add chapter numbers 8,9 and 10 here | Taken into account. The section has |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 2969 | 7 | 15 | 18 | | | In the legend it is written “energy sector” but it should probably be “power sector” as in figure 7.3. This is in line with the previous comment. | Taken into account. The section has been deleted. |
| 12323 | 7 | 15 | 18 | | | Please improve the colour coding/caption as it does not seem to be coherent. It is also difficult to see how this ties with the percentages given in the text above. | Taken into account. The section has been deleted. |
| 17214 | 7 | 15 | 23 | | | The CLAs may want to discuss the issue of national CO2 statistics and the global aggregate here. | Taken into account. The section has |
| 13291 | 7 | 15 | 23 | 15 | 24 | Where this says 'As is the case with energy...' it should probably say 'energy consumption' | Taken into account. The section has |
| 16791 | 7 | 15 | 23 | | | Rather than a disagreement, could it perhaps be a range of values or estimates? | Taken into account. The section has |
| 10504 | 7 | 15 | 4 | | | Table 7.1 doesn’t show this as is stated in the text. | Taken into account. The section has |
| 13290 | 7 | 15 | 5 | 15 | 17 | As per the first sentence of the Executive Summary, it is essential to define here what you mean by the 'energy sector' (presumably heat and power generation) - otherwise this section is very confusing | Taken into account. The section has been deleted. |
| 12322 | 7 | 15 | 6 | 15 | 9 | Please define what is included in the energy sector. It is also unclear what percentage of emissions are the result of fugitive methane emissions etc. Please consider to include this and rephrase. | Taken into account. The section has been deleted. |
| 6176 | 7 | 15 | 6 | 15 | 6 | See comment #1. The "energy sector" would be less confusing if it were renamed as "the energy supply sector". | This name is set in IPCC Inventory Guidelines. There it is called energy industries. A new figure in section 7.1 |
| 18505 | 7 | 15 | | | | This section can be shortened substatially (e.g. removing much of figures 7.2 and 7.3) by referring to the discussions in Chapter 5, which provide overarching information on emission trends across sectors. This section should focus more strictly on energy. | Taken into account. The section has been deleted. |
| 9224 | 7 | 15 | 18 | 15 | 21 | To improve the legend,it is very confuse | Taken into account. The section has |
| 3387 | 7 | 16 | | | | Consider deleting paragraph and even the Figure 7.3-top as there is no statisitical correlation to report beyond what the numbers stata in Figure 7.3-bottom. | Taken into account. The section has been deleted. |
| 16095 | 7 | 16 | | | | The trend as drawn is not very convincing | Taken into account. The section has |
| 6178 | 7 | 16 | 1 | 16 | 2 | References to large ranges of variability, experessed here as 1-99%, are not improved by adding numbers to such an open-ended range. | Taken into account. The section has been deleted. |
| 5949 | 7 | 16 | 3 | 4 | | Lacks clarity. It is not clear wht the purpose of including the analysis in this paragraph is other than to say that the extenf of the agriculture and forestry sector in each country determines where the upper bound on the contribution of energy related emissions lies. | Taken into account. The section has been deleted. |
| 3777 | 7 | 16 | 4 | 16 | 6 | "the energy sector emissions contribute more than 60% to total national GHG emissions. I understand this doesn't apply to all countries. See as example, Brazil. | Taken into account. The section has been deleted. |
| 3778 | 7 | 16 | 6 | 16 | 7 | Power generation dominates emission in all 15 major emitting countries. I understand this is not the case for Brazil. | Noted. Right, Brazil is an exception. This figure was removed. |
| 9636 | 7 | 16 | 7 | | | Label charts a and b | Taken into account. The section has |
| 4641 | 7 | 17 | | 17 | | . Difficult to follow. Bar column colors not explained. | See legend in low left corner. |
| 3388 | 7 | 17 | 1 | 22 | 8 | Is this section necessary in view of other chapters dealing in more detail with the same issues?. In particular: section 7.3.3 is too small, generic, superfitial and somehow rethoric if the topic is treated just in this subsection. It unnecessary here, as this important issue is treated somewhere else in the AR. | This introductory part of the chapter shows the present status in energy sector. Section 7.3.3 was removed |
| 3154 | 7 | 17 | 1 | | | Section 7.3 overlaps with other drivers discussion. Should all this be done in chapters 4 or 5? | Those two chapters provide much material on drivers. In energy supply chapter there is only brief discussion on drivers to follow approved by IPCC |
| 9637 | 7 | 17 | 14 | 17 | 14 | Reference for slower population growth - is this global population growth? | It is on p. 16. Yes, it is global. |
| 17362 | 7 | 17 | 17 | | | evolution was much… | Editorial. |
| 9638 | 7 | 17 | 25 | | 29 | Energy demand grew and CO2 emissions increased in spite of efficiency improvements, owing to the electrification programme in China | Noted. It is not clear what LAs are requested to do. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 6179 | 7 | 17 | 25 | 17 | 26 | "Rates of global energy intensity decline were not sufficient to compensate for GDP growth, thus leaving room for energy demand to expand." As phrased, this suggest that growth in energy demand found an opportunity, when as described it was a tautological outcome. Rephrase as "Rates of global energy intensity decline were not sufficient to compensate for GDP growth, thus energy demand inevitably expanded." | The suggested phase express the inevitability of energy demand growth. First, we do not meant this, second, it is not simply true (see fig. 7.1). |
| 6446 | 7 | 17 | 25 | 17 | 26 | This sentence refers to the rebound effect and I suggest mentioning rebound effect at this point. | There is no text on rebound effects in this section. This is an issue mostly for final use sectors which are dealt with |
| 11919 | 7 | 17 | 25 | | | This sentence can be dropped - it does not add anything and is confusing in any case, i.e., energy demand can arise for a number of reasons, not just intensity decline. | Disagree. This sentence does not say this. It just say that EE progress was not sufficient to compensate for economic activity growth globally, while in some regions it did compensated and there |
| 11920 | 7 | 17 | 26 | | | Begin with "Energy demand growth" | The phrase is wider and we prefer to keep it as it is. The chapter is on energy |
| 5950 | 7 | 17 | 4 | | | Is there evidence to support the statement that natural resource availability is a factor in influencing the growth in energy supply and demand? | Text says "for energy demand and supply". It is hard to argue against that resources availability is a key driver for |
| 4807 | 7 | 17 | 4 | 17 | 4 | "Major drivers for energy demand and supply" you should mention demand drivers first and they supply drivers | They are different. Supply drivers include also resources availability. |
| 13458 | 7 | 17 | 10 | 17 | 13 | Text: "The interplay between the drivers in 2001-2010 was very different from that in the previous decades (Figure 7.4).Global total primary energy supply (TPES) expanded by 27%, or by 2.4% per annum (2% in 2011), which is much faster, than in 1980-2000, when energy prices were significantly lower." The globalisation of trade has been a major economic goal of the World Trade Organisation and other bodies. It is logical that when industry relocates to countries where there is little infrastructure, that solid fuels are the choice for the power generation that manufacturing needs. In order to lessen the carbon intensity of globalised production, it is necessary to provide more sophisticated energy systems, through technology transfer, and through the building of grids, storage and plant needed to operate more carbon-efficient electricity and gas systems. | All those issues are covered by chapter 7 in following sections. |
| 9225 | 7 | 17 | 22 | 17 | 22 | Add "Note" after (2011 a) | This is IEA data. See note to the figure |
| 13459 | 7 | 17 | 25 | 17 | 26 | Text: "Rates of global energy intensity decline were not sufficient to compensate for GDP growth, thus leaving room for energy demand to expand" China, for example, is attempting to initiate strong renewable energy growth, whilst at the same time continuing with policies for strong economic growth. As in more developed countries, renewable energy sector growth is slower than fossil fuel use growth. | Taken into account - comment is obsolete. Underlying text has been deleted. |
| 13460 | 7 | 17 | 27 | 17 | 29 | Text: "Global energy consumption per capita after stabilization in 1991-2000 started growing as fast as it was back in 1971-1980." This partly reflects an economic shift - energy-intensive manufacturing was transfered, under globalisation policy, from energy-efficient economies to energy-inefficient economies. | It mostly reflects the growing share of China and India in global energy use and growing per capita consumption in those |
| 6180 | 7 | 18 | 1 | 17 | 1 | "The slow trend to diversification of energy sources away of fossil fuels was blocked in last decade." is misleading. As worded, this sounds as if there was an active thwarting of policy, when several other explanations are possible. Suggest rephrasing as "The trend to diversification of energy sources away from fossil fuels slowed in last decade." | Taken into account - comment is obsolete. Underlying text has been deleted. |
| 16792 | 7 | 18 | 1 | | 18 | May be able to delete this section -- or significantly shorten and replace with ref to IEA pubs, or replace with a graph. | Disagree. This is the only section on recent trends in energy supply in energy supply chapter. Trends for primary |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 16096 | 7 | 18 | 17 | 18 | 18 | This association of RE and nuclear is misleading also because the development and decline of nuclear was associated in the US or in France by an increase of costs (see Grubler A. 2010 “The costs of the French nuclear scale-up: A case of negative learning by doing, Energy Policy 38 (2010) 5174–5188 ). RE is also much more market driven with many actors, when states dominated the process of nuclear expansion. | This phrase is only on the fast development of the RE contribution, but not on the whole cycle to its evolution. |
| 10509 | 7 | 18 | 17 | | | Not Fig 7.4 - not clear which figure it refers to | Taken into account - comment is obsolete. Underlying text has been |
| 3155 | 7 | 18 | 19 | | | I would keep figures 7.5 and 7.6 and pare back the rest | Figures were modified or replaced. |
| 6421 | 7 | 18 | 26 | 18 | 30 | "was marked by the failure to decarbonize the global fuel mix" is a very strong statement, and I doubt that anyone expected to decarbonize in a decade. Figure 7.5 shows CO2 emissions, and nothing about policy. There needs to be support for the statement about "strongest ever carbon emission mitigation policies" | Accepted. Text revised: Failure to do progress in decarbonizing. |
| 4430 | 7 | 18 | 26 | 18 | 30 | Could this irony be attributed to policies which promote low gCO2/kWh instead of low gCO2 absolute? It is the issue of normalized measures concealing the real trends (illustrated in Fig 7.4). Indeed, climate change is affected by absolute amounts of CO2, even if we become more efficient at extracting energy services per mass CO2. | Very good guess. Irony was initially in the text, but then was removed through editorial process. The commitments for many countries are expressed in |
| 4104 | 7 | 18 | 26 | 18 | 30 | The impacts, causes and sources of 'embedded emissions' should also be mentioned here. | Chapter 5 deals with this issue. There are grounds to speak on this subject in |
| 6181 | 7 | 18 | 26 | 18 | 30 | The comment that the last decade has seen both the highest growth in emissions and the greatest political will to curb them seems really critical to the story being told here. it would be valuable to unpack why this might be – where is the increase coming from? Is this unique to the energy sector? | Agree. New figures 7.3-7.4 provide visual images for causes with accompanied some text. They all show the origins for increase both by sectors |
| 10508 | 7 | 18 | 4 | | | Is this OECD demand for transport or for oil? - ambiguous as written. If oil, it has declined due to lower demand for heating oil - maybe worth clarifying. | The statement is correct. The OECD oil consumption by transport both in 2009 |
| 6797 | 7 | 18 | 5 | 18 | 6 | When mentioning coal, it should be pointed out that recent advances in directional drilling and hydrofracturing of shale gas reserves has caused natural gas prices in the U.S. to plummet and that for the first time recently US electricity production from natural gas exceeded that from coal. This is a dramatic shift with significant carbon emissions consequences. | Taken into account. Sorry. But we can not discuss the situation for each country in detail in this section. At fig. 7.1 it is visible that in North America the coal use comes down with some |
| 9639 | 7 | 18 | 6 | 18 | 7 | On what basis is coal's share in the energy mix expected to decline after 2010-2011? Reference? Evidence? | The references to the future were |
| 13461 | 7 | 18 | 1 | 18 | 11 | Text: "The slow trend to diversification of energy sources away [from] fossil fuels was blocked in last decade (BP, 2011a; IEA, 2011a; US DOE, 2011a). Oil continues to suffer a long run decline in global energy market share. Nonetheless, despite energy security and climate concerns, oil demand was growing by 1% annually driven mostly by non-OECD transport with OECD demand likely peaked in 2005 and expected to decline (BP, 2011a; IEA, 2011a). Coal demand was growing by over 4% per annum and accounted for nearly half of the increase in global energy use in 2001-2010. The share of coal in the global energy mix after peaking around 28-30% in 2010-2011 is expected to decline. About all coal demand growth originated from non-OECD countries (Figure 7.1) with China pivotal in determining the future of global coal market (IEA, 2012a). With 2.7% per year consumption growth natural gas lost the status of the fastest growing fossil fuel to coal in the last decade. It is expected that its share will be back to the increase trajectory after flatting (IEA, 2012a)." Although BP analysts and others have suggested that there will be "peak oil demand", this is not conclusive. Most of the drop in oil demand over the period 2006 to 2010 could be viewed as a direct result of economic stress, and the downturn in oil consumption was reversed as soon as there were signs of economic recovery. If the economic flows are disrupted again, and if the global economy contracts permanently, this still may not signal "peak oil demand", as even in the contracted economy, there could still be strong demand for oil. | Taken into account - comment is obsolete. Underlying text has been deleted. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 13462 | 7 | 18 | 17 | 18 | 18 | Text: "The rate at which modern renewables penetrate the global energy market is similar to the emergence of nuclear power in the 1970's and 1980's (BP, 2011a)." It is interesting to note this, and it is also interesting to note that the underlying financial support for this is of a very different form. Nuclear power required intensive centralised state financial and framework support, but renewable energy technologies are more quickly profitable, so do not require more than an initial "hand hold", such as widely used feed-in tariffs. | Taken into account - comment is obsolete. Underlying text has been deleted. |
| 13463 | 7 | 18 | 19 | 18 | 30 | Text: "7.3.1.2 Evolution of global energy-related GHG emissions : According to the EDGAR 4.2 FT 2008 dataset, global total greenhouse-gas emissions increased by 27% during the 1990-2008 with CO2 emissions from fuel combustion (+40%) drove much of this increase accompanied by CH4 emissions from fossil fuel production (+43%) (EIA, 2011). CO2 emissions trajectory partly mirrors the story of the global economic cycle and after decline in 2009 by about 2% regain over 5% in 2010 and by another 3% in 2011 reaching historical maximum of 31.4-33.2 Gt CO2- eq. (BP, 2011a; Enerdata, 2012; IEA, 2012a). In addition to the strong TPES growth, the last decade (2001-2010) was marked by the failure to decarbonize global fuel mix (Figure 7.5). The decade with the strongest ever carbon emission mitigation policies will be remembered as the one with the highest in last 40 years emission growth (2.6% per annum) driven mostly by additional coal use (by two thirds) and by growing power and heat generation (Figure 7.5)." The failure of global carbon policy, up until now, to start significant decarbonisation, suggests that it is unviable. Renewable energy capacity is being added, but this does not displace carbon energy in many cases. The efforts to make high carbon energy relatively more expensive than low carbon energy are not effective because the policies are based on microeconomic behaviour models - it does not trigger low carbon energy investment - whereas significant targeted capital is required to leap this hurdle and create an energy market with deep renewable energy penetration. | This is just comment without clear suggestion. Does reviewer want we add the proposed text? There are some discussion along those lines in section 7.3.3 and later in the chapter. |
| 7121 | 7 | 18 | 19 | 18 | 33 | This section should be merged with section 7.3.1.2 as they have a common theme | The table of content for the chapter is fixed. So those two subjects are related |
| 18643 | 7 | 19 | | | | Page 19: Studies do not support the leapfrogging hypothesis that developing countries would shift towards isgnificantly less carbon-intensive energy use patterns while bridging income gaps with developed ones.<br>If so, what is the conclusion? | At this section historical emission is described. Conclusions and long -term options are covered in section 7.12. |
| 6422 | 7 | 19 | 19 | 19 | 20 | "Global picture masks significant regional disparities." is an awkward (incomplete?) sentence. | The following sentence clarifies it. |
| 2826 | 7 | 19 | 19 | | | At some points, as in this sentence, a little more precision would be helpful. Income is probably the main determinant of demand for energy services but demand for energy is also a function of the equipment in use, and there is at least some evidence of an S-curve leading to a levelling off of energy demand at higher income levels. | The detailed description of drivers is the subject for chapter 5 which comes before chapter 7. They discuss this issue there. |
| 18046 | 7 | 19 | 24 | 19 | 24 | New formulation needed. | From the comment, it is not clear what |
| 16794 | 7 | 19 | 25 | | 26 | What drove this -- why were they different? Unclear. | More explanation of this is presented in |
| 12031 | 7 | 19 | 25 | 19 | 26 | Isn't this the reflection of poor energy efficiency at the beginning? | At the beginning of what? It is a reflection of very good structural reforms, which made such deep reductions possible (see fig. 7.6). Those countries had high energy intensities for decades, but under command economy failed to reduce them. So the issue is not the starting point. Today the US and Canada |
| 18047 | 7 | 19 | 27 | 19 | 29 | Unclear formulation | From the comment, it is not clear what |
| 16795 | 7 | 19 | 27 | | 35 | List of percentages is not that helpful. For the paragraph, hard to readily see meaning -- what is the significance of this? Could a graph with quick explanation be better? | It reflects dynamics. More on this issue is presented in chapter 5. |
| 16793 | 7 | 19 | 3 | | 8 | Was this hypothesis based on the "no policy" scenario, or on scenario with a global CO2 price? The development of the energy sector will be very different with a long term, robust and durable CO2 price on emissions. | All this page is on historical evolutions, not on scenarios. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 12032 | 7 | 19 | 36 | 19 | 41 | The change of carbon intensity very much depends on the period you choose. If you choose 1980, OECD Europe is not the fastest area. Comparison of absolute intensity should be discussed together. | This is not true. In 1981-1990 the OECD still was doing much better then the rest |
| 17218 | 7 | 19 | 41 | | | the authors are requested to check the reference. To my knowledge this reference is not dealing with the devleopment of carbon intensity, but with energy potentials and endowments. | We did double check, but this statement is referred appropriately. |
| 4431 | 7 | 19 | 5 | 19 | 8 | What explanations are offered for developing countries not leapfrogging? | Here this is only presented as a fact. The explanation should be available from |
| 2583 | 7 | 19 | 5 | 19 | 8 | Other studies (mainly made by Dan Kammen) scientifically proofed that Renewable energy creates more jobs than conventional energy (between 3.5 and 5 times). So, It would be an opportunity, beyond the finding, for the developing countries, specially those lacking fossil energy resources, to invest in renewable energy | Chapter 7 has special section on it (see section 7.10.4) |
| 11921 | 7 | 19 | 5 | | | Think you mean "data do not support" rather than "studies …." | The wording is "Studies do not support" |
| 6229 | 7 | 19 | 6 | 19 | 30 | The lines 6-8 and 27-29 are contradictory | They are not. GDP energy intensities in developing nations are moving down faster than in OECD countries thus converging in the long-term but mostly |
| 5951 | 7 | 19 | 9 | 18 | | Should energy efficiency improvement not also be considered as a driver of energy demand in addition to population and economic growth. This also contributed to the stable demand in OECD Europe | It is considered and plotted at fig. 7.2 |
| 9640 | 7 | 19 | | | | Why is data to 2009 and not 2010/2011? Surely there is more recent data available? | As more recent data appear they will be |
| 13465 | 7 | 19 | 14 | 19 | 15 | Text: "Population and income growth are the two most powerful (but not the only) driving forces behind the demand for energy and energy related CO2 emissions." A significant driving force that should be mentioned is "state direction" - in other words, the intentions of governments, who are the leaders in plans for the built environment, transport and industry. | The intention of the section was not to list all drivers. This is a subject for chapter 5. Here only Kaya like identity factors are reflected to see how slow we |
| 6547 | 7 | 19 | 15 | | 18 | Explain more in detail or give a reference paper, as the description here is not clear enough partly because of the indicators not found on Figure 7.6. | Taken into account. Cannot do this within page limits. See chapter 5 for |
| 13466 | 7 | 19 | 19 | 19 | 20 | Text: "Income evolution is the most influential determinant on the overall demand for energy. Global picture masks significant regional disparities." Income is not directly causally related to demand for energy. Changing lifestyle aspirations for consumption are constructed by corporate marketing mechanisms, and state leadership on urban development and manufacturing creates an energy-hungry environment. | More discussion of driving forces interplay are reflected in chapter 5. Here only Kaya like identity factors are used. Income make possible acquiring |
| 10045 | 7 | 19 | 2 | 19 | 41 | The regional data for the demand trends should include graphs for a better overview - especially the TPES trends and the energy intensity trends by region | Those are to be provided by chapter 5 |
| 13467 | 7 | 19 | 25 | 19 | 26 | Text: "This region was the only one that managed to decouple economic growth with energy use: its GDP in 2009 being 6% above the 1990 level while TPES declined by 32% over the same period." The reasons why total primary energy supply (consumption) dipped in the Non-OECD Europe and Eurasia region are not necessarily to do with improved energy efficiency of productivity or a greater use of low carbon energy - the collapse of the former Soviet Union saw Russia and its former satellite states experience considerable economic hardship. Thus, it may not be reasonable to claim that economic growth was decoupled from energy use. | That opinion reflect shortage of literature on this subject. The facts are: many of those countries rebuild there 1990 GDP in 2000-2008 using 30-50 energy less and emitting 30-40% less. This is EE contribution. See fig. 7.6 and compare 1991-2000 and 2001-2009 |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 13468 | 7 | 19 | 33 | 19 | 41 | Text: "Besides technical improvements, falling energy intensities reveals structural changes away from industry toward less energy intensive activities – first in rich and then in newly industrialized economies…most developing countries show little or no de□-carbonization. Historical trends reveal that rising carbon intensity is a common feature of many developing nations in early industrialization stage in which heavy use of fossil fuels for power production plays a key role (Rogner et al., 2011)." Falling energy intensities as countries move their economies away from industry towards a service/knowledge/finance economy indicates that carbon dioxide emissions from energy use have been outsourced to other countries through the process of the globalisation of industry. There is a natural stop point to this process - those developing countries that have taken on the manufacturing burden will not be able to outsource their energy use commitment to completely undeveloped countries - who simply do not have the infrastructure to do this. A counterpoint to this argument that falling energy intensities resulting from high levels of development (known in some circles as the "Kuznets Curve"), is that countries like the United States of America are considering re-starting some of their manufacturing at home - to create jobs. It is to be expected therefore, that the USA, and other countries who re-home their manufacturing, will see rising energy intensities. | Just to make this point clear. Structural change contribution in Chinese economy was responsible for about 50% of energy intensity reduction, while in many EU economies only for 20-30%. The faster economy develops the larger is the contribution of structural factors. In last two decades energy intensity was declining faster in developing nations mostly due to higher contribution of the structural factor. The exception is when economic growth becomes over 10% per year. At that point structural changes are providing no or negative contribution due to the fact that such growth and |
| 13464 | 7 | 19 | 5 | 19 | 8 | Text: "Studies do not support the leapfrogging hypothesis that developing countries would shift towards significantly less carbon-intensive energy use patterns while bridging income gaps with developed ones (Jakob et al., 2012)." Carbon-intensive energy vendors, and those selling high carbon energy power plant and high carbon fuels, may be doing less business in developed countries, and so have turned their attention to markets elsewhere. A parallel can be found in the health policy to reduce smoking - more cigarettes end up getting sold in China for example. This suggests there should be obligations on energy companies to diversify their portfolios. | So, what is the comment? Does reviewer agree or disagree with the statement? |
| 6237 | 7 | 2 | 10 | | | Long-term price trends are missing | Rejected - comment seems to be misplaced. Long-term price trends |
| 6238 | 7 | 2 | 13 | | | integrated coal and still integrationg global gas market should be dealt with in more depth since a sustainable global price trend supports cliamte cahnge mitigation. | Rejected - comment seems to be misplaced. It is not clear what the |
| 13024 | 7 | 2 | 11 | 2 | 11 | […but also because we measure now emissions more accurately, and are focusing all our attention on these processes.] | Wrong page references. It is page 5. If more accurate data appears the emission for previous years is adjusted. |
| 13025 | 7 | 2 | 21 | 2 | 21 | Therefore, constraints | Taken into account - comment is obsolete. Statement has been deleted. |
| 13026 | 7 | 2 | 22 | 2 | 22 | limit global GHG concentrations to the agreed levels | Taken into account - comment is obsolete. Statement has been deleted. |
| 13027 | 7 | 2 | 30 | 2 | 30 | energy supply sector is high, despite their limited widespread deployment. | Taken into account - comment is obsolete. Statement has been deleted. |
| 13028 | 7 | 2 | 42 | 2 | 42 | efforts to overcome most of | Taken into account. Overcome does not |
| 13029 | 7 | 2 | 43 | 2 | 43 | proliferation risks. | Accepted - text revised |
| 13030 | 7 | 2 | 44 | 2 | 45 | reactor technologies and the management of the fusion reaction, trying to reduce the unsolved problems of nuclear energy use. | Taken into account. There is no much on fusion in the chapter to put it in the |
| 13031 | 7 | 2 | 45 | 2 | 45 | It is argued that the capture and storage | Chapter provides practical examples for CCS implementation, which confirm this |
| 13023 | 7 | 2 | 9 | 2 | 9 | rationalize the energy sector [Failure to rationalize the energy sector, i.e., to implement a better fuel use in transport, industry, etc.; driving a progressive rational and efficient use of energy, diversification of energy sources, technologies and system configurations (including ICT, DG, smart grids, etc.). In this framework, decarbonization is at best a piece of the whole picture of energy and development.] | Noted |
| 10510 | 7 | 20 | | | | Once again does "energy-related" include transport? | No. It is only energy supply sector |
| 3156 | 7 | 20 | 1 | | | I would keep figures 7.5 and 7.6 and pare back the rest | All figures were modified in SOD. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 9641 | 7 | 20 | 14 | 20 | 20 | This paragraph would be better shown in a chart | Such chart is included in the SOD. |
| 4432 | 7 | 20 | 17 | 20 | 19 | Repetition of sentences from p xx, line xx illustrating how China has become the world's largest emitter of CO2. | Taken into account - comment is obsolete. Underlying text has been |
| 16035 | 7 | 20 | 5 | | | unclear: de-carbonization progress from -0,3% per annum is a rise of carbon??? | This comment is not clear. |
| 16796 | 7 | 20 | 7 | | | Suggest insert after "… below the 2000 level." the following sentence: "This is consistent with analysis that suggest that end use energy efficiency improvements are likely to occur before large changes in energy supply technologies." This helps the reader understand a plausible sequence of deployment in a transition to a low emitting future. | Here we just are dealing with historical data. So we may say that it happened leaving for section 7.11 to say what is likely for the future. |
| 6182 | 7 | 20 | | | | Consider taking the two main points of this section – that despite some countries' progress towards decreased carbon intensity of energy, the massive growth of China and India more than make up for this and that the US has been eclipsed as the biggest emitter – and weaving them in to the previous section. | Taken into account -text revised. |
| 13471 | 7 | 20 | 22 | 20 | 26 | Text: "The relatively few studies that undertook ex post verification of energy model baselines (e.g., Pilavachi et al., 2008; Strachan, 2011), or the US DOE's review of its energy forecasts (US DOE, 2011b), showed the evolution and inclusion of current policies was a key determinant of projected energy supply, demand, and prices." This re-emphasises the point that energy consumption management needs to be subject to organisational administration - countries and regions need strong leadership, regulatory mandates and verification processes. | Wrong page reference. Within the new sectoral policy subsections, regulation, verification, and organisation administration are now covered in 7.11.3 |
| 7122 | 7 | 20 | 4 | 21 | 5 | See comment number 5 | Should be already dealt with |
| 13469 | 7 | 20 | 5 | 20 | 6 | Text: "Energy de-carbonization progress in OECD countries (-0.3% per annum) was smaller than in three previous decades" This low figure indicates that current decarbonisation policies are not producing a sustainable gradient of change in the general economic context. It also suggests a lack of organisation of energy use. Whilst it is becoming evident that companies and corporations are beginning to consider their Energy Management, by contrast public sector administration and household consumption are not being subjected to the same kind of targetting. Whilst it is perfectly possible to implement strong energy conservation measures on homes, offices and public buildings, and transport systems, there needs to be political and social organisational will to make it happen. Without new energy saving management services, the GDP/GNP cannot become more decarbonised. | We agree with this statement. Much of these issues are to be discussed in chapters 8-10. |
| 7120 | 7 | 20 | 5 | 21 | 5 | Comparison of energy related emissions between OECD and non-OECD countries does not give a better picture. It is being proposed that comparison of energy related GHG emissions be based on International Comparison Program (ICP) Regions Groups developed by world bank. Information on this aspect could be found on the website; http://siteresources.worldbank.org/ICPEXT/Resources/ICP_2011.html | Rejected - space constraints do not allow to go into the details here. |
| 13470 | 7 | 20 | 7 | 20 | 10 | Text: "In non-OECD countries, average annual increase of energy-related CO2 emissions exploded from 1.1% in 1990-2000 to 4.7% in 2001-2010 due to the expansion of TPES accompanied by growing carbon intensity of energy of 0.6% per annum, driven to a large degree by coal demand in China and India (IEA, 2011a)." From the point of view of economic and social development, an increase in the use of energy in a country is a positive signal. Energy enables capacity. | We do not share this opinion. Recent experience shows that energy services rather than energy resources do promote growth, but they can be produced using much less energy (see discussions on E |
| 9642 | 7 | 21 | 1 | 21 | 5 | This paragraph would be better shown in a chart | With given page limit is it not possible |
| 18048 | 7 | 21 | 1 | 21 | 2 | Add the figure for OECD Europe | Figures for SOD were modified. |
| 10511 | 7 | 21 | 10 | | | Need references, not just database names | Taken into account - comment obsolete. Underlying text has been deleted. |
| 16798 | 7 | 21 | 11 | | | Suggest add at end of paragraph: "Many consist of technology standards, subsidies for preferred technologies and simple admonitions to "be green." Some regions have used CO2 pricing mechanisms." | Taken into account - This section has been merged with 7.12, with pricing technology and enabling policies explicitly addressed in these 3 |

|---|---|---|---|---|---|---|---|
| 18051 | 7 | 21 | 15 | 21 | 15 | Add "and nuclear energy" after "fossil fuel" | Taken into account - the point here is that fossil fuel subsidies removal benefits all low carbon technologies. A discussion of nuclear (and indeed wind) |
| 7727 | 7 | 21 | 16 | 21 | 18 | First of all, there is just on Copenhagen Accord, therefore the plural in meaningless. Secondly, The Copenhagen Accord is not even listed in the UNFCCC main website as a significant milestone in multilateral Climate Change negotiations. Please, refer to the Kyoto Protocol as the main accomplishment and whose GHG emission targets should be met. | Taken into account - Refer to Cancun Agreement / Copenhagen Accord as per Co-Chair's recent guidance letter |
| 16799 | 7 | 21 | 19 | | 29 | Not apparent how this is useful for discussion -- suggest delete. | Taken into account - comment obsolete. Underlying text has been deleted. |
| 3779 | 7 | 21 | 26 | 21 | 26 | Spell RCP in full the first time it appears. | Taken into account - comment obsolete. Underlying text has been deleted. |
| 7728 | 7 | 21 | 30 | 21 | 31 | Emission reduction pledges have no importance in the UNFCCC negotiations. Countries are not obliged to go by the and they will not be charged for it. Kyoto Protocol emissions reductions pledges are the ones that should be mentioned in the text. I fail to understand why the main agreement on multilateral climate change negociations has been left out of the text. | Taken into account - Refer to Cancun Agreement / Copenhagen Accord as per Co-Chair's recent guidance letter |
| 16800 | 7 | 21 | 30 | | 40 | This is very important point and should not be significantly changed. | Taken into account - comment obsolete. Underlying text has been deleted. The important part was moved to the intro of |
| 10512 | 7 | 21 | 30 | 21 | 40 | Most of this covered in Chapter 1. Suggest check first - then delete | Taken into account - comment obsolete. Underlying text has been deleted. The important part was moved to the intro of |
| 18049 | 7 | 21 | 5 | 21 | 5 | France is not an appropriate reference, since its power sector is close to carbon free (nuclear and renewables) | Taken into account - comment is obsolete. Underlying text has been |
| 16797 | 7 | 21 | 5 | | | Suggest add at end of paragraph: "this reflects the stronger linkage of emissions per unit of economic activity rather than emissions per capita. As discussed in chapter 6, changes in energy technology choices can change this linkage." | Taken into account - comment obsolete. Underlying text has been deleted. |
| 4642 | 7 | 21 | 6 | 21 | 6 | Current policies and GHG reduction. As pointed out above, the use of more biomass seems an obvious goal. | Taken into account - this section does not discuss specific mitigation option but the role of biomass is discussed in detail in chapter 11, and here in Chapter 7 in |
| 18050 | 7 | 21 | 7 | 21 | 7 | It seems odd to refer to the EU in a sentence that descibes climate policies as poorly coordinted across national bounderies. 27 nations agreed on the climate and energy policies unanimously. | Taken into account - in new section 7.12.3 word editing makes clear EU policies are not as well coordinated with |
| 6183 | 7 | 21 | | | | The points made in this section are strong and should be continually emphasized throughout this document. The notion that despite our inability to stop trying to “talk the talk,” we've really been unable to apply policy tools to reduce GHG emissions in a meaningful way. | Noted |
| 18506 | 7 | 21 | | | | As the chapter is so far over its allocated pages, this section could be merged with the policy and scenario discussions in 7.11 and 7.12. This additional text is unnecessary. | Taken into Account - this section has been merged with 7.12, with pricing, technology and enabling policies |
| 6787 | 7 | 21 | 6 | 22 | 7 | It may be helpful to move and merge contents under section 7.3.3 to section 7.10. Policy may be discussed as a topic under "Barriers and Opportunities" and retain the flow | Taken into account - Co-chairs recommendation and chapter decision was to merge 7.3.3 with the sectoral |
| 11922 | 7 | 21 | 6 | | | Why is this section not in Ch 15? | Taken into account - comment obsolete. Underlying text has been deleted. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 10046 | 7 | 21 | 6 | 22 | 7 | This section should include the results of the scenario analysis of the SRREN report. The entire section is almost exclusively based on IEA projections. | Rejected - for reasons of space the IEA scenarios were used as an exemplar here. A full discussion of the SSREN listed scenarios will be elsewhere in AR5 |
| 16801 | 7 | 21 | | | | Why lead with what seems to be tacit agreement with peak oil theory and then explain it away after the 1st paragraph? Please state at the beginning that peak oil theory fails to account for what you very well describe later in the section. The reader who is pressed for time will stop after the 1st paragraph and leave with incorrect views. | Taken into account - comment obsolete. Underlying text has been deleted. |
| 12324 | 7 | 21 | 6 | | | Please consider to use a different title for the section. An example is "GHG emission projections", as it might better reflect the text. | Taken into account - comment obsolete. Underlying text has been deleted. The important part was moved to the intro of |
| 2970 | 7 | 22 | 1 | | | Starting the y-Axis at 20 Gt is misleading since reader on a first glance think that emissions have to be reduced nearly to zero already by 2040 to reach the 450 ppm scenario. Better show full y-Axis but extend projection to 2050 or beyond. | Taken into account - Figure has been deleted; comment is obsolete. |
| 7729 | 7 | 22 | 10 | 22 | 12 | This is not completely true. It is hard to tell how "rapidly" demand will lead to exaustion of remaining supplies, since technologies advance, making supplies that could not be extracted at present available in the future. This could expand supply, postponing a possble exaustion. | Taken into account - combined with other comment: See response to comment 3389. Text deleted |
| 6184 | 7 | 22 | 10 | 22 | 12 | "Oil, natural gas and coal are finite resources that cannot be reproduced in human time frames. Any extraction depletes the stock, and demand growth will rapidly lead to the exhaustion of remaining supplies." This theory of depletion vastly oversimplifies economic reality and history. As stated in line 21 on p. page 22, "Resources, therefore, are not fixed things." Conclusions of exhaustion, scarcity, and depletion cannot be justified from the information presented. | Taken into account - simplification a necessity given space allocation. Text deleted. |
| 5346 | 7 | 22 | 11 | 22 | 11 | Exhaustion will not necessarily be "rapid" - depends on the stock and rate of demand growth | Accepted. Text deleted. |
| 2993 | 7 | 22 | 11 | | | Please, withdraw rapidly from the text. The rhythm of the depletion cannot be defined in a such simplistic manner. | Accepted - text revised: Simplification a necessity given space allocation. Text |
| 6185 | 7 | 22 | 15 | 23 | 24 | While this section makes some great points, it seems as though it could be condensed. The main point – that our use of fossil resources has varied historically depending on market forces, technology changes, and social factors – should remain, but its current length could be decreased. | Accepted - text revised. |
| 10513 | 7 | 22 | 15 | 22 | 20 | Better shown as bullets and remove "first" "second" etc. | Text shortened. First, second etc. no |
| 7730 | 7 | 22 | 18 | 22 | 19 | Not to consider technological progress is a strong hypothesis and not very realistic. | Taken into account - Technology change |
| 6423 | 7 | 22 | 21 | 23 | 9 | I believe that there is significant agreement on the definitions of resources and reserves. This text articulates that distinction on page 23, beginning in line 3. The description of the changing "stocks" of resources is actually about reserves. I like the articulation, but the "resource" and "reserve" description seems to need tightening, which comes at the top of page 23. I suggest that the definitions be stated upfront and then have the articulation of the changing stocks (from prices, technology, demand, etc.) | Accepted - text revised. |
| 18202 | 7 | 22 | 21 | | 29 | Add to paragraph: Resources, therefore, are not fixed things. What matters is the timely availability of a resource in the market place at competitive costs. Changing market prices for a mineral may expand or contract the economically recoverable quantities. If a resource becomes too expensive the market responds in two ways: consumers tend to shift to alternative resources (demand reduction); and producers seek additional supplies through enhanced exploration activities and innovative production methods, thus enabling production from previously inaccessible deposits. Moreover, technology change and improvements in knowledge push the frontier of exploitable resources towards deeper, more remote or lower concentration occurrences, making resources a dynamically evolving rather than a 'fixed' quantity. Nevertheless, this "dynamics" is not an endless process; it depends also from other changing variables. | Rejected: There is insufficient space for these observations. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 18203 | 7 | 22 | 21 | | 29 | Alternative paragraph: Resources, therefore, are not fixed things. What matters is the timely availability of a resource in the market place at competitive costs. Changing market prices for a mineral may expand or contract the economically recoverable quantities. If a resource becomes too expensive the market responds in two ways: consumers tend to shift to alternative resources (demand reduction); and producers seek additional supplies through enhanced exploration activities and innovative production methods, thus enabling production from previously inaccessible deposits. Moreover, technology change and improvements in knowledge push the frontier of exploitable resources towards deeper, more remote or lower concentration occurrences, making resources a dynamically evolving rather than a 'fixed' quantity. Nevertheless, this "dynamics" is not an endless process; it depends also from other changing variables. | Rejected - text needed shortening. Suggested alternative text still too long. |
| 10514 | 7 | 22 | 21 | | | Suggest "Resource availability therefore is not fixed." Change "of a resource" to "of an energy resource" | Accepted - text revised: Text no longer |
| 2994 | 7 | 22 | 21 | | | The meaning of resource is not correct. Resource does not change with costs, but reserves do. | Rejected. The reviewer is wrong. Occurrences do not change with costs resources do (see shale oil and gas in the US which previously were |
| 2995 | 7 | 22 | 28 | | | Again, the meaning of resource is not correct. What evolve with costs are reserves and not resources. This is a big error in the manuscript. Please fix it. | Rejected. See previous comment 2994 ("Rejected. The reviewer is wrong. Occurrences do not change with costs resources do (see shale oil and gas in |
| 3389 | 7 | 22 | 8 | 28 | 15 | This is an example of a very poor section. Full of rethoric paragraphs with little and disperse interesting information. Author prejudices about the debate on peak production are obvious in the first paragraph: "...rapidly lead to the exhaustion of remaining supplies" ..."inevitable decline"....followed by a superfitial second and third paragraphs (should be deleted? between page 22 lines 15-20). Unfortunatly for the climate system of this planet, reserves scarcity is not really a problem....Very long introduction of simple concepts in page 23 between lines 12 and 37 (delete?). This is a missed opportunity to present in a consitent manner the problem of the huge reserves of fossil carbon: the important numbers on carbon reserves in page 23 line 36-37 and 38-39 do not get a single reference ¡¡ (while this chapter used 38 pages for references¡¡¡). Figure 7.8 also contains very important numbers (that are indeed very, very large and relevant in a report about energy and climate change): therefore this figure cannot the supported by a grey looking reference like Farrel (2008) when there are major databases (IEA?, BP?) reporting these type of numbers. The same applies to line 25-26 in page 24. Delete rethoric paragraph in page 25 lines 6-13. Page 25, Table 7.2 on fossil reserves (missing) may be very important and should be based in major international organization reports. The emerging concept of "carbon bubble" (associated to the huge market value of carbon reserves and the financial bubble that would burst if these reserves are not exploited), should be discussed somewhere in this section or elsewhere in this chapter. | Taken in to account- text revised. Reviewer seems to be unaware that the GEA reference is based on BP, USGS, BGR, WEC and other databases. "grey looking" reference to Farrel is preposterous - the data are GEA but the concept of presentation was 'borrowed' from Farrel. Carbon contents calculated from GEA energy resource data using IPCC intensities. Finally text changed and the "peakist" touch detected (wrongly so) by the reviewer deleted. |
| 4808 | 7 | 22 | 9 | 26 | 26 | This section can be shorter | Accepted - text revised. Text made |
| 13472 | 7 | 22 | 5 | 22 | 7 | Text: "This need for a radical break in current trends and the challenges of GHG reduction policy implementation illustrates the absolute scale of the GHG mitigation challenge." Since most things in economies seem to happen as a result of monetary reward, it would be tempting to suggest that policy could better be implemented by offering financial incentives. However, the changing climate and energy insecurity may prove quite sufficient in creating incentives for change - based on the financial implications of actuated risk. | Taken into Account - This section has been merged with 7.11, with pricing technology and enabling policies explicitly addressed in these 3 subsections. |
| 10047 | 7 | 22 | | | | This graph does not reflect the text above. Other than only IEA scenario projections should be included (see SRREN, Chapter 10) | Taken into account - comment obsolete. Underlying text has been deleted. |
| 15484 | 7 | 22 | | 28 | | (part of the text is not visible in the Excel block) - Resources and resource availability - Very well presented. Suggestion to introduce somewhere a paragraph (introduction words) on "available" resources and "climate change patterns". In another word, resources already well identified and other potential ones are already enough to go much over than a 450 ppm trend - see IPPC SRREN, IEA or others. | Accepted - text revised. Emphasis on climate implications added. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 13474 | 7 | 22 | 23 | 22 | 24 | Text : "If a resource becomes too expensive the market responds in 24 two ways: consumers tend to shift to alternative resources (demand reduction)..." This is not necessarily so. It is a tenet of microeconomics that this is so, but much energy use is inelastic, regardless of the price, and without deliberate regulation, policy, targeted investment focus and stimulus, alternative energy resources will continue to play a minor part in energy markets. Because we are so dependent on energy, energy price rises will only serve to create inflation, which will be followed by re-equilibration of the economy, having zero net effect. Energy price rises will not necessarily precipitate energy conservation or energy efficiency, in fact, it may make it more difficult for people to choose to do energy conservation and energy efficiency. Most energy efficiency of production is likely to be driven by regulation and policy, rather than the cost of energy. Most end-use consumer energy conservation is likely to be driven by subsidies, grants, loans and other monetary assistance. Most energy vendors will wish to increase energy sales, regardless of obligations to sell energy services such as conservation. | Noted. We talk here long-term. In the short-run demand is relatively in elastic - but not necessarily over a period of 20-30 years. Text deleted due to space limitations |
| 13475 | 7 | 22 | 24 | 22 | 29 | Text : "...producers seek additional supplies through enhanced exploration activities and innovative production methods, thus enabling production from previously inaccessible deposits. Moreover, technology change and improvements in knowledge push the frontier of exploitable resources towards deeper, more remote or lower concentration occurrences, making resources a dynamically evolving rather than a 'fixed' quantity..." This is also not necessarily so. It may not be possible to generate a healthy return on investment by going after harder-to-reach fossil fuel deposits - in which case, despite good new technology, innovation would fail. | Rejected - harder to reach deposits precisely means different technology - hence innovation |
| 6788 | 7 | 22 | 8 | 28 | 14 | It may be helpful to shorten, move and merge contents under section 7.4 to section 7.2. This move may be helpful to reduce the number of pages and yet retain the flow. Section 7.2 may be further renamed to appropriately reflect the revised contents. | Rejected: text revised and shortened and 7.2 emphasis and topic is separate to this section. |
| 3157 | 7 | 22 | 8 | | | Section 7.4 is way too long. Is anything needed here but one figure and a brief discussion focusing just on what's new since AR4? For most folks, it will be striking to have as much discussion of liquid and fissile reserves and relatively less on gas. | Accepted - section shortened |
| 7123 | 7 | 22 | 10 | 23 | 14 | These paragraphs may be deleted as they do not add much value to the section | Taken into account - text revised: Text shortened, but definitions have to be |
| 9226 | 7 | 22 | 8 | 22 | 8 | Change title by "Reserves, resourses and occurrences" | Rejected - section titles cannot be |
| 13211 | 7 | 22 | 9 | | | This part could be shortened and the main conclusion relevant to mitigation contained in the last sentence (page 25,line 17/18 ° should be emphazised "Fossil reserves alone contain two to four times that amount of carbon - a daunting outlook for climate stability." | Accepted- text revised: We talk here long-term. In the short-run demand is relatively inelastic - but not necessarily |
| 12325 | 7 | 22 | 9 | | | This section seems a somewhat unbalanced. Fossil fuels are getting a lot more attention and details than renewable resources. We recommend shortening chapter 7.4.1 significantly and emphasizing the point being made on page 25 line 14-18. | Accepted - fossil resource section reduced. Emphasis added. |
| 4433 | 7 | 23 | | 25 | | These pages contain background reading of a related topic. They should be omitted to maintain the focus of the chapter and reduce its length | Accepted - text revised: Text shortened. |
| 10515 | 7 | 23 | 1 | | | As above | Rejected - essentially applies to all |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 2996 | 7 | 23 | 1 | | | There is a consensus about the meaning of reserves and resources. Hence, I disagree with the text. Please see SPE, BP, and IEA, only to cite few references. SPE in the 1990s established the probability ranges related to all kind of reserves (P, 2P, 3P). Indeed, the fact that the meaning of reserves and resources is well established does not imply in a precise application of it. This is another question, which involves the bias when stating petroleum reserves. | Rejected - reviewer is wrong. There may be some consensus within various resource sectors, e.g. oil - but not universally (Russia has a different definition, etc.) There is certainly NO consensus between coal, oil/gas and uranium. BP, IEA O&G etc. use the same info source for conventional oil and gas reserves (no resources in BP) - no consensus there really. See Reference: Nick A. Owen, Oliver R. Inderwildi, David A. King, "The status of |
| 4105 | 7 | 23 | 10 | 23 | 14 | The political nature of 'proved reserves' data for conventional oil should be explained and the underlying facts set out. Saudi Arabia's ~ 260 billion barrels has scarcely changed over the past 20 years, nor has Kuwait's ~ 100 billion, nor UAE (Abu Dhabi's) ~ 98 billion since 1985. The late Matt Simmons and Hans Jud have taken an extreme position. Sadad Al-Husseini and Obaid Nawaf (both ex-ARAMCO senior geologists) quoted a figure of 140 billion barrels for Saudi Arabia over five years ago. The January 2007 issue of PIW Weekly reported its sight of a confidential report placing Kuwait's proved reserves at 48.5 billion barrels. The UAE has produced over 24 billion barrels of oil since 1985. Thus the current Saudi position is likely to be about 190 billion barrels; Kuwait 43billion barrels; and UAE 74 billion barrels. In none of these countries have there been significant new finds in recent years. | Rejected. No space here for the politics of oil. |
| 16802 | 7 | 23 | 14 | | | before end of last sentence, perhaps add: …"demonstrating that as current sources are depleted and price moves to higher levels, more costly sources are developed." | Rejected: Although the reviewer is correct, space limits prohibit a detailed |
| 10516 | 7 | 23 | 14 | | | Add …"estimated" oil reserves | Rejected: text deleted due to space |
| 9261 | 7 | 23 | 15 | 23 | 20 | The concepts are changing too, in that shale gas is now becoming conventional/common. The techniques for shale gas are not new - horizontal wells and fracking - so they are extractable using techniques for conventional hydrocarbons, though you do qulaify the staement with "generally". | Rejected: Although this true, the term generally still applies. |
| 2827 | 7 | 23 | 18 | 23 | 20 | The definition of “unconventional” is unclear and seems to mix together geological, economic and engineering considerations – how does EOR, for instance, fit in? It is not normally regarded as unconventional but appears to be covered by the definition here. (Admittedly, there is no standard international definition, but the text does not clarify anything). | Rejected. There is no universally accepted definition of unconventional - EOR is a borderline issue. Due to space limitation clarification cannot be |
| 10517 | 7 | 23 | 21 | 23 | 24 | Could add an example of fracking here. | Accepted - but text changed due to |
| 16803 | 7 | 23 | 23 | | | Suggest you add after the word "development" the following "and cost relative to prevailing market prices." | Accepted: Text revised. |
| 9643 | 7 | 23 | 28 | 23 | 28 | Additional quality criteria does not impact on the reserve statement - but means that the cost for environmental controls increases | Accepted. No change required. |
| 9239 | 7 | 23 | 30 | 23 | 30 | Rogner' instead of 'Wagner'? (check bibliography section also) | Accepted - text revised: Wagner is |
| 16101 | 7 | 23 | 35 | 23 | 37 | On coal reserves a reference could be useful | Accepted. Reference of summary table |
| 11924 | 7 | 23 | 37 | | | Need reference | Taken into account: Reference is same |
| 10518 | 7 | 23 | 38 | | | Data don't match those in Table 7.2. need to be consistent. Also for line 41.<br>ZJ not commonly used so define in a footnote | Rejected - reviewer confuses Gt of oil in the text with Gt C (carbon) in the table |
| 6424 | 7 | 23 | 41 | 23 | 42 | This statement about peak oil is speculative. | Rejected: Data ranges reflect the uncertainty found in the literature. |
| 6186 | 7 | 23 | 41 | 23 | 42 | "When compared with cumulative past production of 162 Gt (6.8 ZJ), “peak oil” production is imminent or has already been passed." This is very misleading. The paragraph is referring to conventional oil production, but concludes that overall oil production is peaked. Peak oil for conventional reserves is misleading, much as a discussion of declining Nintendo sales -- without consideration of other systems and online gaming -- would suggest an overall declining in entertainment. | Rejected: As noted the text, without resource & unconventional, the peak is imminent - but with those resources this in not the case. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 5347 | 7 | 23 | 41 | 23 | 42 | Not clear you can infer peak oil (a peak and subsequent decline in annual production) is imminent based on ratio of past production to conventional reserves. The right economic conditions could deliver increasing annual production despite declining reserves. This paragraph really refers to "peak conventional oil", the economic significance of which is debatable given the size of the unconventional oil resource discussed in the next section. This section does not discuss the important implications of declining conventional resources and increased exploitation of unconventional resources (i.e. a persistently high oil price and higher lifecycle emissions of oil extraction). | Rejected: Peak is relative to currently known reserves only - and text is quite clear about the potential role of resources (in addition to reserves) and unconventional reserves and resources. |
| 16804 | 7 | 23 | 42 | | | Suggest you insert between "production" and "is" the following: "within current price ranges" | Rejected: peak as presented by the peakist school is independent of prices |
| 13476 | 7 | 23 | 12 | 23 | 14 | Text: "For oil, the R/P ratio has fluctuated around 40 years for more than a century, while production has steadily increased. The quasi-constant R/P ratio could only be the result of an equivalent increase in oil reserves." This is also not necessarily so. It seems that the oil and gas companies have deliberately tried to keep their R/P at 10 or more years, in order to satisfy their shareholders. However, this does not mean that the level of reserves has increased overall. There appears to be a process of slowly adding already discovered and lower quality reserves to company or regional totals as needed to keep the R/P ratio at the desired level. For example, the enormous increase in proved reserves of South American (Venezuelan) oil reported in June 2011 by BP compared to June 2010 (http://www.bp.com/liveassets/bp_internet/globalbp/globalbp_uk_english/reports_and_publications/statistical_energy_review_2008/STAGING/local_assets/2010_downloads/statistical_review_of_world_energy_full_report_2010.pdf, http://www.bp.com/assets/bp_internet/globalbp/globalbp_uk_english/reports_and_publications/statistical_energy_review_2011/STAGING/local_assets/pdf/statistical_review_of_world_energy_full_report_2011.pdf ) "Reserves growth" may be the explanation given for this phenomenon, but it may not represent a true expansion of a reserve. | Accepted - text revised: Text deleted. |
| 13477 | 7 | 23 | 21 | 23 | 24 | Text: "Unconventional resources require different logistics and cost profiles, and pose different environmental challenges. Their future accessibility is, therefore, a question of technology development, i.e. the rate at which unconventional resources can be converted into marketable fuels at competitive costs." I would suggest that although engineering technology can show and has shown strong development in the ability of energy production companies to exploit unconventional fossil fuel resources, that this has not improved the net energy return on exploiting hard-to-reach and complex resources, nor has engineering prowess been accompanied by an equivalent improvement in environmental protection owing to the more complex nature of those resources. I would therefore wish to see some statement about the possibility that much unconventional fossil fuels will remain "uneconomic". | Rejected. Statement was in the ZOD text, but was unfortunately deleted due to space limitations. |
| 13478 | 7 | 23 | 25 | 23 | 28 | Text: "Assessments and comparisons of global coal reserves and resources are subject to uncertainty and ambiguity, especially when reported in physical unit (tonnes) and without a clear distinction of their specific energy contents, which can vary between 5 GJ/t and 30 GJ/t." I would suggest that all reports of coal reserves, resources/occurrences should be treated to a matrix assessment, tabling their accessibility/cost profile, their likely energy content, and their co-factors such as sulphur compounds and associated gas. There are some coal seams that profit-making energy producers are simply not going to go after, but some of these may still be exploited if states develop national energy companies to do so. This means that the likely method of exploitation - either publicly or privately financed - is important in assessments of "economically recoverable" coal. I think an assessment of this should be included in this report. | Rejected: Although these are important points space limitations make this impossible. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 13479 | 7 | 23 | 35 | 23 | 37 | Text: Coal occurrences are plentiful with reserves estimated at 13.3 to 21.0 ZJ (or 446 to 542 Gt C) and resources at 291 to 435 ZJ (or 7500 to 11,200 Gt C) globally." There is no reference here. I assume it is a reference to Rogner et al. 2011 (IIASA GEA Global Energy Assessment), summarised in Table 7.2. If so, there are two typographical errors, as the table shows reserves at 17.3 to 21.0 ZJ (not 13.3 to 21.0 ZJ as in the text) and resources as (7,510 - 11,230 GtC) not as (7,500 - 11,200 GtC) as in the text. As the Global Energy Assessment has only just been published (June 2012, launched at the Rio+20 Energy Day http://www.iiasa.ac.at/Admin/INF/PR/2012/2012-06-19.html; published July 2012 http://www.iiasa.ac.at/Research/ENE/GEA/report.html), the chapters are not yet available on the IIASA website, so I cannot know if the work referenced researchers with different methodologies on coal reserves and resources, such as Professor David Rutledge of CalTech. He published in 2011, "Estimating long-term world coal production with logit and probit transforms", International Journal of Coal Geology, Volume 85, Issue 1, 1 January 2011, Pages 23–33, http://dx.doi.org/10.1016/j.coal.2010.10.012, http://www.its.caltech.edu/~rutledge/DavidRutledgeCoalGeology.pdf. Rutledge's contribution is to calculate that the total of past and future coal production will amount to the order of 653 - 749 Gt, and that since 309 Gt has already been produced, that leaves 344 - 440 Gt left to produce. This amounts to the production of further reserves of = 9.98 - 12.76 ZJ (at 29 GJ/t), which is significantly lower than the reserves calculated by the IIASA GEA (GEA historical production is in terms of carbon emissions, and at 192 GtC gives an average of 62% carbon in the emissions from all the coal burned if Rutledge's historical production figure of 309 Gt is accurate. The energy value of the historical coal production is given in Table 7.2 is 7.426 ZJ, whereas at 29 GJ/t, Rutledge's historical production figure would be 8.961 ZJ). Others working on coal reserves and resources : "Validity of the fossil fuel production outlooks in the IPCC Emission Scenarios", Mikael Höök, Anders Sivertsson and Kjell Aleklett, in Natural Resources Research, Volume 19, Issue 2, June 2010, Pages 63-81, doi:10.1007/s11053-010-9113-1, (http://uu.diva-portal.org/smash/get/diva2:301406/FULLTEXT01); Hook, M., Zittel, W., Schindler, J., and Aleklett, K., 2010. "Global coal production models based on a logistic model", Fuel 89, 3546–3558 (http://www.diva-portal.org/smash/get/diva2:329110/FULLTEXT01); Mohr, S.H., Evans, G.H., 2009. "Forecasting coal production until 2100", Fuel 88, 2059–2067 (http://dancass.com/static/files/assets/cced3021/GME__2009__J85.pdf) [702 Gt = 20.36 ZJ]; Patzek, T., Croft, G., 2010. "A global coal production forecast with multi-Hubbert cycle analysis", Energy 35, 3109–3122 (http://xa.yimg.com/kq/groups/20593576/885722944/name/Patzek+and+Croft+2010+-+Peak+Coal+2011.pdf) [630 Gt = 18.27 ZJ]. All of this work points at lower recoverable reserves of coal than the World Energy Council 860 Gt coal at energy density of 29 = 24.94 ZJ (http://www.worldenergy.org/documents/ser_2010_report_1.pdf) and the BP 2012 report - 860938 Mt, which at 29 GJ/t = 24.97 ZJ (http://www.bp.com/liveassets/bp_internet/globalbp/globalbp_uk_english/reports_and_publications/statistical_energy_review_2011/STAGING/local_assets/pdf/coal_section_2012.pdf) The US Energy Information Administration (EIA) International Energy Outlook (IEO) gives total recoverable reserves of coal at 948 billion tons = 862.68 Gt (coal) at an average energy density of 29 = 25.01 ZJ (http://www.eia.gov/forecasts/ieo/pdf/0484(2011).pdf) | Accepted - text revised: Coal reserves corrected. GTC data rounded. |

| 13480 | 7 | 23 | 41 | 23 | 45 | Text : "When compared with cumulative past production of 162 Gt (6.8 ZJ), “peak oil” production is imminent or has already been passed. Including resources extends oil availability considerably - essentially doubling reserves (Figure 7.8). Even the higher range of reserves and resources would only postpone the peak by about two decades (depending on demand) before global conventional oil production starts its inevitable decline." To call the current oil production situation "peak oil" is an important and potentially controversial statement. I would hope to see a development of this argument in order to shield it from attacks from the cornucopians who believe that the appliance of geopolitics can ramp up supply. I do not accept that unconventional oil resources will double reserves, for two reasons. First, the accessibility problems of large unconventional oil fields are to my mind an order of magnitude larger than conventional crude exploitation. Not only is access more complicated, and require special rigging and boring equipment, but the risk of interruptions in supply from problems such as well blowout, pipeline blockages, breakages and production spillages is so much greater. It will be found that some resources are not worth the attention. Secondly, I think that the rate of production from some unconventional resources is going to be so slow as to render them "uneconomic" by any value assessment. I think that the unconventional fossil fuel resources should be treated to an "exploitability assessment" rather than be grouped together in one number, which offers an unrealistic appraisal of availability. Figure 7.8 goes some way to addressing this demand, but the text does not offer a breakdown of what this figure implies. The point about extending the peak by about two decades is a very important point to stress. I would hope to see some modelling of this as demonstration of potential. Some people still believe that "putting off" or delaying peak oil is equivalent to maintaining current production for a very long time - this view needs to be addressed, in my opinion. | Taken into account-text revised: The reviewer makes some important points regarding the complex nature of non-conventional fuels, however space limits make it difficult to include these. The two decade time scale is made clear. |
| 9644 | 7 | 23 | 36 | 24 | 8 | The units used: Gt C for coal are different to oil which is just Gt - are these meant to be the same? For comparative purposes it would help if they were. | Taken into account: Gt C reflect carbon content - the C does not stand for coal. |
| 9235 | 7 | 23 | 6 | 23 | 24 | May be is possible send the definitions of Reserve, resources, convetional and un conventional to Anexl Glossary | Rejected - some basic knowledge is needed to provide the context here. |
| 11923 | 7 | 23 | 9 | | | need to add "believed to be present in the earth's crust based on current geological information". Also don't need fossil line 8, as this applied to any valuable material. | Accepted- text revised. |
| 5133 | 7 | 24 | | | | the legend "tar sands" should be changed to 'oil sand" | Rejected: Both are used in the literature - however if the figure has to be redrawn |
| 16805 | 7 | 24 | | | | Excellent! Don't delete. Highlight if possible earlier in discussion to demonstrate how peak oil theory is not quite helpful. | Noted |
| 6447 | 7 | 24 | | | | Spelling error: than (not 'chan') | Editorial |
| 3780 | 7 | 24 | | | | Be clear regarding definition of production cost. Does it include exploration, exploitation costs? What about transportation cost up to refineries? | Taken into account- text revised: Production costs are all the costs getting the material to the surface - rest is not |
| 18507 | 7 | 24 | | | | Please note the agreement in the AR5 to use 2010 as the base year for currency. | Taken into account - the currency will be |
| 10519 | 7 | 24 | | | | Hard to decipher this figure. A) Conventional oil and EOR labels relate to two bars - so add arrows to show that. B) Convert x-axis labels to ZJ as used in text OR, preferred, convert text to EJ as used elsewhere in chapter. C) Implies all oil produced to date was produced for $4-10/bbl. Is this true? Not according to Fig 7.4 - though this is the oil price - not the cost I guess. Perhaps needs clarifying in caption. D) Suggest caption start "Liquid fuel reserve and resource supply potentials..." E). Only one reference fopr what is a contentious issue. Suggest an assessment of the literature be made and a new graph produced. | Rejected: The one reference is based on a comprehensive literature review including peak oil debate. These are production costs that cover 90% of production. Reviewer's reference to Fig 7.4 is not clear - no prices or costs there. |
| 11925 | 7 | 24 | 10 | | | WEC 2007 should be updated to WEC, 2010. | Accepted - Done |
| 3781 | 7 | 24 | 25 | 24 | 26 | What is the meaning of "Approximately 17% (135 million m3 or 5 EJ) is currently flared". It is easy to understand the 17% figure, but what is the meaning of 135 billion m3 as currently flared? Probably the last figure is obtained assuming the annual amount flared will remain stable in the future, until gas reserves already in exploration will be over. Please, confirm this interpretation. | Taken into account- text revised: text deleted due to space limitations |

| 10521 | 7 | 24 | 25 | | | 5 EJ / yr I assume | Editorial, however text deleted |
| 17363 | 7 | 24 | 33 | 24 | 34 | Compare Chapter 1, page 9, 46: Conventional oil reserves will eventually peak, but it is uncertain exactly when and what will be the nature of the transition to alternative liquid fuels. Conventional natural gas reserves are larger by scale, but less evenly distributed across regions. | Taken into account-text revised: Text no longer exist in Chapter 1 (and conventional nat gas are also more evenly distributed across regions) - text |
| 10520 | 7 | 24 | 8 | | | Have "oil sands" been omitted on purpose from the list? Either include or provide info separately | Accepted - done |
| 13481 | 7 | 24 | 13 | 24 | 16 | Text: "Oil prices in excess of $80 per barrel are probably needed to stimulate investment in unconventional oil development." The possibility is that if oil prices remain as high as they have been, that the economies as a whole will suffer inflation, because of the high dependency on oil (inelastic demand). This will then make the relative cost of exploiting unconventional resources that much more expensive - and large sections of the unconventional resource will remain uneconomic to produce. | Taken in to account: Could well be - hence "in excess of 80$ - e.g. see shale oil in the USA. |
| 13482 | 7 | 24 | 21 | 24 | 34 | Text: "Conventional natural gas can be found as “associated gas” accumulated as a gas cap above an oil pool or, with high reservoir pressures, dissolved in the oil or as non-associated gas. Recovery of associated gas is generally a by-product of oil production...Non-associated natural gas reservoirs are much more abundant than reservoirs with both oil and gas. When there are no significant liquid hydrocarbon components, a larger part of the in-place gas can be recovered by dropping reservoir pressures...Unlike oil, natural gas reserve additions have consistently outpaced production volumes and resource estimations have increased steadily since the 1970s [...]. The global natural gas resource base is vast and more widely dispersed geographically [t]han oil." I would suggest that it is important to explain a little about the change in the profile of hydrocarbon species the further down in the lithosphere fossil fuel drilling takes place. Deeper in the crust, the temperatures and pressures are higher, so there will be a tendency for fossil fuel fields to contain more gas (or more gas in solution). Natural Gas Liquids (NGL) could form a much higher proportion of some deepwater, subsea/submarine, deep pocket production than that from large oil fields nearer the Earth's surface. This higher overall availability of light hydrocarbon gases (and liquids) could mean that Natural Gas becomes one of the most valuable products from unconventional fossil fuel mining. This naturally leads on to a discussion about venting and flaring as these practices will need to be curtailed if the energy economy moves its preference from oil to gas products. It will also mean more expense at the wellhead - to capture, store and distribute the gas products. Capturing formerly vented or flared Natural Gas offers climate change protection, perhaps an order of magnitude higher than improving vehicle fuel efficiency over the course of the next decade - owing to the high global warming potential of methane. The increase of Natural Gas from deeper oil drilling, and the attempts to make use of this capacity, also means that unconventional gas resources will become progressively less attractive and likely to be abandoned, much as they were decades ago. | Rejected: This is a valuable comment, but space limitations do not permit further elaborations on NGLs etc. |
| 3450 | 7 | 24 | 7 | 24 | 20 | Include tight gas and tight oil among the list of unconventional hydrocarbons listed | Accepted - tight gas included |
| 3783 | 7 | 25 | | | | Check carefully data in table. It is hard to believe that the amount of unconventional oil produced by 2010 was 1/7 of the conventional oil. | Noted: Data checked = correct - it all depends on extraction time and definition: North Sea oil once was |
| 10522 | 7 | 25 | | | | Be consistent on ZJ or EJ as above. | Rejected - Table uses EJ for energy and GtC for carbon contents |

| 9469 | 7 | 25 | 1 | 25 | 5 | Unconventional natural gas such as shale gas has environmental and technical issues, and its development is not advanced in some areas.<br>As in page 24, it is described that production of Oil-shale is environmentally challenging, issues of unconventional gas also should be described.<br>In a commentary in the American Journal of Public Health, published in May 2011, Finkel and Law point out some isuues of shale gas development[1]. They note the following points ;a) toxic mud and fluid by-products from the drilling and fracking as well as spills of oil and gas wastes are not uncommon. Of the more than 8600 abandoned wells in Pennsylvania in 2009 alone, taxpayers paid to plug 259 because of leaking natural gas, oil, and acid mine drainage into the groundwater, surface water, and air, b) fracking has raised concerns regarding the way it may damage underground water supplies, c) soil contamination also has not been addressed fully, and d) little research has been done on the potential adverse health effects of fracking.<br>[1] M.L. Finkel and A. Law (2011) The Rush to Drill for Natural Gas:<br>A Public Health Cautionary Tale, American Journal of Public Health, Vol 101 No. 5<br>a)p. 784, column 3. b)p. 784, column 4. c)p. 784, column 4. d)p. 785, column 1. | Correct and not only for gas but all unconventional resources- but discussion here not possible due to space limitations |
| 3782 | 7 | 25 | 13 | 25 | 13 | Explain in more details what is the meaning of "diminishing energy ratios" in the context of this paragraph. | Rejected: This is a common term in the literature: It is the ratio of usable energy over total energy used for extraction - no |
| 16806 | 7 | 25 | 17 | | | Suggest replacing "a daunting outlook for climate stability" with "providing clear evidence that declining stocks of fossil fuels will not curtail emissions." | Taken into account- text revised. |
| 4079 | 7 | 25 | 19 | | | A line « Total » at the bottom of the table would be nice | Total exists in Table 7.2 |
| 11928 | 7 | 25 | 23 | | | It would be wise to mention that uranium and thorium have fissile components (isotopes). Otherwise it sounds like these are just substances. They give off energy from fission. | Rejected - space limitations |
| 16102 | 7 | 25 | 26 | 25 | 31 | The uranium resource described in this paragraph is clearly very dispersed. In p.26 lines 8 to 9, RE is dismissed on the same grounds. The chapter should be coherent between resources in this respect. | Rejected - text differentiates between conventional and unconventional resources - and defines a current min |
| 9240 | 7 | 25 | 34 | 25 | 34 | Please refer latest edition of the Red Book (2012) if possible. | Accepted - done |
| 10523 | 7 | 25 | 35 | 25 | 39 | Doesn't seem to match table 7.3 data. 3700EJ at < $260 /t leaves 3700 of total conventional resources - which is not "vast additional occurrences". Need to clarify. | Accepted & corrected |
| 11926 | 7 | 25 | 6 | | | This sentence, and in fact the entire paragraph, is a repeat of earlier | Accepted - text revised |
| 13483 | 7 | 25 | 1 | 25 | 5 | Text: "Unconventional natural gas reserves, i.e., coal bed methane (CBM), shale gas, deep formation and tight gas are now estimated to be larger than conventional reserves and resources combined. This does not include potential reserves from gas hydrates. In some parts of the world, unconventional gas already exceeds conventional supplies. In the Unites States unconventional gas now makes up about 60% of marketed production" I note there is no mention of the high-impact risks of exploiting coalbed methane - including underground fires and explosions. There is also no mention of the questions being put to shale gas producers regarding freshwater and aquifer extraction and the evidence surrounding groundwater poisoning. I would not say that gas hydrates are a "reserve" as there are few production models that are thought of as sustainable or economic. It is true that the United States relies increasingly on domestic unconventional gas production, but it would be useful to include a projection of the timescale over which this can remain true, owing to shale play/field depletion and the decline of more conventional gas fields. | Rejected: Point well taken but no action due to space limitations |

|---|---|---|---|---|---|---|---|
| 13473 | 7 | 25 | 14 | 25 | 18 | Text: "Since the industrial revolution, fossil fuel combustion released almost 400 Gt C into the atmosphere (Table 7.2). Fossil reserves alone contain two to four times that amount of carbon - a daunting outlook for climate stability." The reserves figures in Table 7.2 are to my mind rather suspect - particularly the one for coal reserves. I suspect that most of the unconventional oil and gas will remain unexploited owing to economic problems, and that, if the recoverable coal reserves are closer to 10 ZJ than 20 ZJ, the total hydrocarbons and coal that will get burned in the next 150 years is closer to the cumulative total of historical production so far - not twice or four times that amount. | Rejected - For coal and lower reserve limits this is correct but with oil and gas the lower range is twice historical emissions (900 vs. 400 Gt C) |
| 13484 | 7 | 25 | 14 | 25 | 18 | Text: "For climate change, it is the carbon endowment potentially available for combustion that matters. Table 7.2 also presents the world's fossil resource endowment in terms of its carbon content. Since the industrial revolution, fossil fuel combustion released almost 400 Gt C into the atmosphere (Table 7.2). Fossil reserves alone contain two to four times that amount of carbon - a daunting outlook for climate stability." As indicated in previous comments, I would contend that there is evidence that recoverable fossil fuel reserves going forward are comparable to historical production figures. The "safety limit" for global warming has been set at around 2 degrees C, and for that, only around 500 GtC (Allen et al. 2009) or 565 GtC (Carbon budget 886 GtC (2000-2049) ==> 565 GtC (2011-2049) Meinshausen et al. 2009 doi:10.1038/nature08017 Table 1) GtC more should be added in net emissions by 2050 - the "carbon budget" ("Warming caused by cumulative carbon emissions towards the trillionth tonne", Myles R. Allen, David J. Frame, Chris Huntingford, Chris D. Jones, Jason A. Lowe, Malte Meinshausen & Nicolai Meinshausen, Vol 458, 30 April 2009, doi:10.1038/nature08019, http://www.fraw.org.uk/files/climate/allen_2009.pdf, http://www.mathtube.org/sites/default/files/slides/PRIMA2009-Allen.pdf; "Greenhouse-gas emission targets for limiting global warming to 2 degrees C" by Malte Meinshausen, Nicolai Meinshausen, William Hare, Sarah C. B. Raper, Katja Frieler, Reto Knutti, Nature 458, 1158-1162, 30 April 2009, doi:10.1038/nature08017 http://www.nature.com/nature/journal/v458/n7242/full/nature08017.html, http://www.iac.ethz.ch/people/knuttir/papers/meinshausen09nat.pdf, http://www.pik-potsdam.de/~mmalte/pubs/Meinshausen_etal_2009_Nature/Meinshausen_etal_2009_GHGTargets2C_Nature.pdf; Allen, M. R., Frame, D. J., Huntingford, C., Jones, C. D., Lowe, J. A., Meinshausen, M. & Meinshausen, N. "Warming caused by cumulative carbon emissions towards the trillionth tonne". Nature, doi:10.1038/nature08019 (2009), http://www.nature.com/nature/journal/v458/n7242/full/nature08019.html, http://www.fraw.org.uk/files/climate/allen_2009.pdf). If economically recoverable fossil fuel resources prove to be comparable to this figure of a maximum "safe" carbon budget, then the 2 degree C carbon target may be possible. However, this level of emissions in such a short space of time would continue to threaten very dangerous climate change, with feedback warming, particularly as Arctic amplification is threatening massive gas release from tundra, permafrost and Arctic Ocean ("Estimating the near-surface permafrost-carbon feedback on global warming", T. Schneider von Deimling, M. Meinshausen, A. Levermann, V. Huber, K. Frieler, D. M. Lawrence, and V. Brovkin in Biogeosciences, 9, 649–665, 2012, www.biogeosciences.net/9/649/2012/ doi:10.5194/bg-9-649-2012, http://biogeosciences.net/9/649/2012/bg-9-649-2012.pdf) I would like to see some discussion of this possible outcome in the chapter - that recoverable fossil fuels are of the order of the 2 degree C carbon budget, but that global warming may still overshoot it owing to positive feedbacks. | Rejected. See previous comment (13473), not the section for a discussion on safety limits etc. |
| 9227 | 7 | 25 | | 27 | | To integrate both tables and to add the potential of RE the same as the Table presented in AR4 Chapter 4 Energy Supply Table 4.3.1. Whoever, if the suggestion is not acepted to add to table 7.2 the unconventional coal | Rejected - literature does not distinguish between conventional and unconventional coal really. Also coal |
| 4077 | 7 | 25 | 14 | 25 | 21 | The link between fossil fuels and climate is too short and should me more complete and more explicit | Rejected: this section is on resources. |

|---|---|---|---|---|---|---|---|
| 4078 | 7 | 25 | 17 | 25 | 18 | Some more information would be useful in the text there. I would suggest to add something like : « In 2010, fossil fuel combustion released 9,1 GtC in the atmosphere, accounting for x % of global GHG emissions. This can be compared with the annual absorption capacity of the Earth of x GtC. Fossil reserves alone contain x times more carbon than can be released in the atmosphere in a 450 stabilization scenario. » | Rejected: space limitations do not allow the discussion suggested |
| 13197 | 7 | 25 | 22 | 26 | 26 | Not mentionig the possibilities open by the breeder reactors is misleading. This omission must be corrected. | Accepted- text revised. |
| 11927 | 7 | 25 | 23 | 25 | 23 | Misleading. Obviously not all concentrations are "minute". Say that some concentrations are 50x average or more. | Accepted - Done |
| 13485 | 7 | 25 | 26 | 25 | 29 | Text: "The theoretically available uranium in the Earth's crust has been estimated at 100 teratonnes (Tt) uranium of which 25 Tt occur within 1.6 km of the surface (Lewis, 1972). The amount of uranium dissolved in seawater is estimated at 4.5 Gt. Without substantial R&D efforts, these occurrences do not represent practically extractable uranium." This assessment of the practical recovery of uranium from dispersed resources - especially as regards seawater - is much more reasonable than the over-optimism of Professor David MacKay in his work "Sustainable Energy Without the Hot Air" (http://www.withouthotair.com/, http://www.inference.phy.cam.ac.uk/withouthotair/c24/page_162.shtml ) | Noted |
| 16105 | 7 | 26 | | | | This table is not sourced and is fairly contradictory with such sources as the CEA (Commissariat à l'Energie Atomique) of France, which suggests much smaller reserves of uranium and pleads for breeder reactors. | Rejected - Table source is NEA Red book. FBRs have been justified on the ground of U scarcity - a flawed argument |
| 16107 | 7 | 26 | | | | Most of the table 7.3 is speculative, because it rests either on the full closure of the uranium cycle, not even achieved in France, or on a thorium cycle, not even described yet. | Rejected: space limitations do not allow the discussion suggested |
| 16103 | 7 | 26 | 1 | 26 | 14 | These lines contradict somewhat the previous paragraph that tended to take seriously the marine resource of uranium. | Rejected - terrestrial Th has not been considered "seriously" at present - so |
| 3390 | 7 | 26 | 15 | 26 | 23 | I am not an expert on nuclear, but it seems that lithium-based nuclear power should not deserve such a long pargraph compared to the similar space given to more mature resources (lithium it´s not even mentioned in Table 7.3). Perhaps this is a sign of lack of expertise on nuclear in the author´s team? | Accepted - paragraph deleted. Information on Li too sketchy - hence not listed in Table 7.3 |
| 16106 | 7 | 26 | 15 | 26 | 23 | Fusion is not a serious option in the timeframe of mitigation. This paragraph should be skipped and replaced by a mention that fusion energy is not to be seriously available in the next century. The paragraph contradicts also the absence of fusion in the rest of the chapter. The only mention should be in the policy sections, because the very high spending on fusion research hampers other developments, be they in nuclear or in renewables. | Accepted - text deleted |
| 13292 | 7 | 26 | 15 | 26 | 23 | While lithium is a potential source of nuclear energy it is (at least for the forseeable future) also essential in the manufacture of batteries for electric vehicles. It is worth mentioning this competition, with estimates of the relative quantities of lithium required for each, given that EVs are a major option for decarbonisation of the transport sector | Rejected Comment correct - paragraph on Li deleted due to space limitations |
| 13293 | 7 | 26 | 15 | 26 | 23 | Much of the identified lithium resource - at least in Argentina, Bolivia and Chile - is in the form of pristine salt flats. There are signficant environmental implications of exploiting a large proportion of these reserves, which probably ought to be mentioned | Rejected: Comment correct - paragraph on Li deleted due to space limitations |
| 16807 | 7 | 26 | 15 | | 23 | Providing some context re how soon this tech will be available would be helpful -- it seems to me this is not a ready technology, even w/in a decade or more. | Rejected - discussion on fusion technology out of scope here (text |
| 2584 | 7 | 26 | 27 | 28 | 14 | The text underestimates the potential that could play renewable energy combined with energy efficiency in supply sustainable energy. If we take EU target by 2020: 20% energy efficiency and increasing renewables part to 20%, I, objectively that this will lead to less GHG emissions. Although, the fact that some countries would reduce the use of nuclear energy might not impact the current trends of GHG. Even in China, renewable energy are developing fast, and due to the technological progress, renewable energy will be soon the cost effective among energy sources. | Rejected - this section focuses only on technical potential; scenario literature and costs are addressed elsewhere in the chapter and AR5, so this comment is best addressed elsewhere |

|---|---|---|---|---|---|---|---|
| 3391 | 7 | 26 | 28 | 28 | 14 | Poor section with odd references to support simple ideas. Since there is an IPCC SR on RE it should be easy to rewrite, focusing on key messages from the SR. Avoid rethoric and unnecessary refernces (like in page 26 line 32 to page 27 page 8) or line 3 to line 11 in page 28 (that says the same that the last sentence) | Rejected - this section largely derives from some of the main themes in the SRREN, and many of the references are to the SRREN and its various chapters. The comment does not provide any |
| 18206 | 7 | 26 | 28 | | 35 | Comments: Hydraulic energy" is kinetic energy of water, flowing from a higher to a lower position, due to gravity. "Bio-Energy" is energy stored in biomass by photosynthesis, then extracted by different means. Comments: The RE potential is constantly available, provided you uses the means (economic, technological and other) adequate and sufficient to achieve its utilization. Knowledge and progressive practice with RE allows its deeper and better use. Comparing (with obvious restrictions) exploitable or Available potential of RE – REA (eg expressed in MM boe/yr) with proven reserves of fossil fuels, such amount (REA) will be available each year that passes, eg for 30 years (life average of a power plant). This explains the concept of available potential of RE, its magnitude and the difference with fossil energy reserves. | Rejected - We agree with the comment in many respects. However, hydro and bio energy rely on secondary forms of solar energy: we use the same definition of renewable energy as used in the special report, so we do not wish to deviate from that recent reference. We note in footnote 10 the need to extract RE at a rate that is lower than the rate of |
| 18207 | 7 | 26 | 28 | | 35 | Alternative paragraph:<br>7.4.3 Renewable energies (RE).<br>The sources of RE are thermal energy coming from the Sun, and it's interaction with the Earth's rotation, driving the air layers of the lower atmosphere, the water masses of the ocean, and the water circulation cycle in the atmosphere, allowing the use of solar, wind, ocean and hydraulic energy. Bio-energy is the use of energy stored in biomass by photosynthesis*. Geothermal energy is obtained from water and gases in reservoirs recharged with water from the surface, heated by the much higher temperature of magmatic rocks arising from deeper levels in the Earth's crust. In a realistic and practical sense, we can consider the available potential of RE, which depends not only on technologies or practices, but also on other critical and essential factors like social, economic and land use needs, possibilities and constraints, along with the technological level, because the available potential is the result of the interaction of all the above mentioned factors. Technical potential, as defined in Verbruggen et al. (2011) depends only on technologies and practices; nevertheless, the total global technical potential for RE as a whole is substantially higher than current global energy demands. Figure 7.9 summarizes the ranges of global technical potential for the different RE sources. A variety of practical, land use, environmental, and/or economic constraints are sometimes used in estimating the technical potential of RE. Definitions of technical potential therefore vary by study (e.g., Aviel Verbruggen et al., 2010), as do the data, assumptions, and methods used to estimate it (e.g., Angelis-Dimakis et al., 2011). Also important is the regional distribution of the technical potential. Though the regional distribution of each source varies (see, e.g., IPCC, 2011a), Fischedick et al. (2011) report that the technical potential of RE as a whole is at least 2.6 times as large as 2007 global primary energy demand in all regions of the world. | Rejected - we find the current text to be clear as stated, and very directly related to the text included in the SRREN |
| 10524 | 7 | 26 | 30 | | | Could add: …..bioenergy "and biofuels", …. | Rejected - as used in this chapter, and the SRREN, biofuels are a component of bioenergy. We do not think it is |
| 9990 | 7 | 26 | 30 | 26 | 31 | RE should be defined to include "aero thermal energy" that can be used with heat pump. RE is defined to include "aero thermal energy" based on the EU direction of "Promotion of the use of energy from renewable sources" and Japanese Law of "Sophistication of Energy Supply Structures". | Rejected - we need to stick with the SRREN for this purpose, to be consistent with previous IPCC reports, though we acknowledge that different definitions do exist. There is no single |
| 16108 | 7 | 26 | 32 | 27 | 13 | Estimates for RE technical potentials are clear, uncertainties are explicit and referenced. This is unlike the nuclear part, in particuler table 7.3 | Rejected: Table deleted - space limitations do not allow the discussion |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 2828 | 7 | 26 | 32 | 27 | 34 | The discussion of renewable potential should be clearer about the fact that most of the studies examined do not consider economics – most of the quoted renewables potential is not directly comparable with the figures quoted for fossil fuel reserves and this should be noted. | Accepted - A number of the potential studies do in fact include actual or proxies for economic conditions when establishing resource potential, in part to distinguish between theoretical and technical potential. But these restrictions vary widely by study, as already noted in the text. As for fossil energy, the same levels of inconsistencies often exist, one reason that the distinction between resources and reserves is not always precise. We made one change to the text, and that is to note that the resource |
| 4809 | 7 | 26 | 32 | 26 | 35 | Remove the sentence on theoretical potential to reduce the size of the chapter | Accepted - removed |
| 4643 | 7 | 26 | 33 | 26 | 34 | “Because the theoretical potential does not take into account energy conversion losses or deployment barriers, the theoretical potential is of relatively little practical use”. This should not apply to biomass. | Taken into account - the discussion of theoretical potential has now been |
| 10525 | 7 | 26 | 33 | | | IPCC 2011b - the SPM - is a better rference here than just Chapter 1 of that SRREN report | Rejected - most of the details about theoretical potential for RE are included in Chapter 1 of the SRREN, so if a reader wants to understand that literature Ch. 1 is the place to go. The SPM certainly says what we have said here, but it is not the source of the actual information to defend the statement. Regardless, in the end, due to space |
| 16104 | 7 | 26 | 7 | 26 | 14 | Thorium is described without reference to any practical reactors being developed, there or elsewhere in the chapter. It is not helpful to list it as a resource (for what?) | Taken in to account: Text deleted due to space limitations |
| 4106 | 7 | 26 | 7 | 26 | 14 | Further detail by country should be given, to include research and investments in India, China, the USA, etc. as well as such data that do exist on the resource base - which is far larger than implied here. This sub-section seems to show a bias. | Rejected - space constraints do not allow to go into the details here. |
| 11851 | 7 | 26 | 7 | 27 | 14 | I think thorium (and perhaps lithium) should be introduced a bit better. Uranium is well-known as a source for nuclear power, but less so thorium and lithium. As a side note - this entire section (7.4) is written very nicely. Much easier to follow than preceding and following sections and concisely written! However much of what is covered seems common knowledge (i.e. reserves, reserves base, etc.), and not just here, but throughout the chapter it is hard to tell what the goal of the chapter is - to review all the background, or to point out new information (as compared to AR4 and preceding reports)...not all sections are equivalent in this respect | Agree with comment - but texts on Th and Li deleted due to space limitations |
| 6425 | 7 | 26 | 8 | 26 | 8 | "virtually every continent of the world…" there are only 7 continents, and this statement implies that the presence of thorium is quite extensive but its precision is vague. Can this be tightened? | Accepted - text deleted due to space limitations |
| 18204 | 7 | 26 | 9 | | 10 | Add to paragraph: (9) Reserves and resources of uranium are based on a once-through fuel cycle operation. Closed fuel cycles and breeding technology could would increase the uranium resource dimension 50–60 fold. But these “breeded” radioactive fuels represent a much greater contamination problem, in terms of use and storage. (10) In practice, RE sources are sometimes extracted at a rate that exceeds the natural rate of replenishment (e.g., traditional biomass, geothermal energy). Most, but not all, RE sources impose smaller GHG burdens than do fossil fuels. | Rejected: Comment correct - but space limitations prohibit this level of discussion. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 18205 | 7 | 26 | 9 | | 10 | Alternative paragraph:(9) Reserves and resources of uranium are based on a once-through fuel cycle operation. Closed fuel cycles and breeding technology could increase the uranium resource dimension 50–60 fold. But these “breeded” radioactive fuels represent a much greater contamination problem, in terms of use and storage. (10) In practice, RE sources are sometimes extracted at a rate that exceeds the natural rate of replenishment (e.g., traditional biomass, geothermal energy). Most, but not all, RE sources impose smaller GHG burdens than do fossil fuels. | Accepted - text revised. |
| 6187 | 7 | 26 | | | | This section, and those that follow, have a number of places for potential cuts. Paragraphs spent on describing the availability of fringe nuclear fuels that exist mostly in labs could be shortened or cut entirely, as their contribution to the overall goals are miniscule. | Taken into account - text has been reduced considerably. |
| 9262 | 7 | 26 | | | | Under renewable energy you could comment on the ability to store it by using excess green energy to pump compressed air into subsurface reservoirs for use when the sun doesn't shine, wind stops, or there's peak demand etc. It's not common, but has been done for decades. Also comment on risk of deploying solar, wind and hydro during changing weather patterns due to climate change - requires forecasting to be correct. - maybe just refer reader on to 7.7.2? | Rejected - these issues are important, and are covered elsewhere in the chapter and need not be included here as well |
| 4107 | 7 | 26 | 27 | 28 | 14 | This whole section, though very important for the Assessment, is extraordinarily short and weak. The bland reference to the theoretical potential is far too generalised. There are severe limits on all forms of RE except CSP + UHVDC transmission taking a global perspective. At the regional level, taking into account latitudes and solar insolation, mean wind speeds, the presence or absence of large tidal ranges and wave movements as well as geothermal potential, need all to be taken into account. Belatedly, people are now awakening to bioenergy/biofuel constraints for many purposes and locations. There is reference to the technical potential for solar (p. 27, line 12) without differentiating between solar PV and CSP, and/or where solar PV systems can be optimally located and for what purposes. The brief reference to region potential (p. 27, lines 21-24) scarcely begin to face up to the challenges and differences. The bland statements on global and regional potentials (p. 27, lines 25-27) fail to address the challenges of low power densities, intermittency, etc. The reference on p. 28, lines 1-2, to wind energy potential and its treatment in the IPCC Special Report is jejune. The UK's offical planning guidance (PPS 22, Companion Guide, page 165) claims that wind energy developments in the UK typically achieve a load (or capacity) factor of 30% with a range of 20% to 50%. In fact data from the wind energy developers themselves for onshore developments in England over the past five years demonstrate that the average has been 22% (in 2010 down to 18.7%), and the range 4% to (in one case in the exceptionally windy year of 2008) 49%. Graham Sinden claimed back in 2007 that 35% would rapidly become typica. There is no evidence of that happening. The issue of intermittency is also very important, both from the point of view of the need for traditional source back-up, but also because hopes that - for example - if it is windy to the West or South of the UK this would back up for where there was a lack of wind for offshore facilities to the East or North. Research evidence shows (eg. Oswald et al) that if is calm in one nearby maritime area it is highly likely to be calm elsewhere offshore in that region. | Rejected - space constraints preclude a detailed discussion, but we provide links to the SRREN, which addresses issues of technical potential in more detail. This section also only addresses technical potential (not market/social/realistic potential, considering various constraints), while linking to other sections of the chapter that address scenarios/integration/ and the various constraints and opportunities for the use of RE. Those matters are best addressed in other sections of the chapter, not here. The same approach is used in discussing the potential for fossil and nuclear: we are not judging what is possible of likely in these sections, only how much resource there is. As such, this subsection's approach is consistent with those of others in 7.4. |
| 7731 | 7 | 27 | | | | Figure unclear. Suggest to improve resolution of it. | Accepted |
| 4434 | 7 | 27 | | 27 | | Figure should be re-drawn for clarity | Accepted |
| 10066 | 7 | 27 | | | | It should be made more clear that the RE potentials are annual potentials | Accepted |
| 4645 | 7 | 27 | | 27 | | The total primary energy consumption for 2009 is given as 492 EJ. The technical range for biomass is given as 50 EJ to 500 EJ. According to IEA, the biomass primary energy consumption for biomass is 10.2% of the total or 50 EJ. If wood consumption for non-energy uses is included, then this total is increased to about 72 EJ. Thus, the lower estimate of 50 EJ may have already been achieved. | Rejected - The IPCC report addresses this issue, and we do not have the space to reproduce the argument here. It is a good point, and for biomass, depends |

|---|---|---|---|---|---|---|---|
| 15944 | 7 | 27 | | 27 | | For wind energy potentials see the recently published - Nature Climate Change;<br>'Geophysical limits to global wind power'<br>Kate Marvel, Ben Kravitz & Ken Caldeira ; and PNAS 'Saturation wind power potential and its implications for wind energy'<br>Mark Z. Jacobsona,1 and Cristina L. Archerb,1<br>Nature Climate Change (2012) doi:10.1038/nclimate1683<br>Received 01 May 2012 Accepted 08 August 2012 Published online 09 September 2012 | Accepted - The figure is included in the SRREN, and is not planned for an update for the AR5. We have reviewed these citations for inclusion in the text, however, and have included one of the two. |
| 12157 | 7 | 27 | | 27 | | It's very important to improve the quality of the Figure 7.9, after all, it's difficult to understand well some information. | Accepted |
| 16809 | 7 | 27 | 1 | 28 | 14 | Just as in previous section's discussions of resource availability of fossil fuels, renewable energy sources have similar economic limits, i.e., some amounts are available at relatively low costs and some at a much higher cost. The supply curve slopes upward and to the right. Example: Some wind energy sites are ideal -- close to electric transmission and with good wind. As you move away from this optimal site, the costs increase (or productivity declines) -- the site may yet be fine, but it is not as good as the optimal. In a world with a carbon price, you would develop the optimal site first and may not develop the less optimal site until later when carbon price had increased. | Noted - this point is addressed later in the section, at least briefly |
| 9645 | 7 | 27 | 13 | | | Figure is blurry and difficult to read | Accepted |
| 12597 | 7 | 27 | 25 | | | It is interesting how the EU27 shows that financial wealth and renewable resource wealth (such as the UK) does not equate to high levels of renewables. To take the UK example further, looking at data from www.energy.eu, the UK is number 25 in the EU27 for renewable energy penetration, a surprisingly low position. | Noted - Does not appear that this comment suggests a textual change |
| 18208 | 7 | 27 | 25 | | 29 | Alternative paragraph:<br>As estimated by this literature, the global and regional technical potentials for RE as a whole are unlikely to limit deployment. Further, as with other energy sources, all else being equal, continued technological advancements can be expected to increase estimates of the technical potential for RE in the future, so as improvements in energy policy, planning and R&D&D, internalizing the environmental, land-use and social advantages of RE, reflected by its available potential, in the general frame of all the viable energy options, be it at sub-continental, national or regional level. | Rejected - Unnecessary detail for a section this is already at its page limit |
| 4644 | 7 | 27 | 9 | 27 | 10 | This statement points to the urgent need for reliable land use maps and inventories. This cannot be over-emphasized. | Noted - does not seem to suggest an actual textual change |
| 3394 | 7 | 28 | | 29 | | Simplify discussion around Figure 7.10. Well known ideas and I guess few changes respect to AR4. No need for so many new references unless they are supporting key numbers in Figure 7.10. Preferably, you should use references from major reports. | This section tries to address both new findings related to fugitive emissions of methane especially from natural gas systems, opportunities for reductions of these fugitive emissions from all fossil systems, and the existing fuel switching strategy. While fuel switching is discussed in AR4, the new findings listed here show that the issue is not quite as simple because gas fired power |
| 3272 | 7 | 28 | | 37 | | Section title of 7.5 is "Mitigation technology options, practices and behavioural aspects", but there is little description of behavioural aspects in this section. | Accepted - important behavioural aspects in the field of energy consumption are to be discussed in the demand chapters. In chapter 7 behavioural aspects are addressed in 7.6 (e.g., demand response) and 7.9 (risk |

| 10528 | 7 | 28 | 11 | | | … of the biomass resource (de Vries et al., 2007)." Delete "e.g" from in front of references. | Accepted |
| 12589 | 7 | 28 | 12 | | | One thing which also helps acceptance is joint ownership of the energy systems. If a system is owned by a community, they are much more supportive of it | Rejected. While the argument has merit, we do not have space to get into this |
| 12590 | 7 | 28 | 12 | | | There are issues with disinformation on renewable energy systems. Some of this is perpetuated by organizations which do appear from the outside to be fair, neutral sources. The Renewable Energy Foundation in the UK is a good example of this. | The comment seems to be misplaced. |
| 2971 | 7 | 28 | 15 | | | The “behavioral aspects” are missing in this section. | Rejected. This section addresses the emissions from the well/mine to electricity, heat, or refinery gate. Behavioural aspects may be important regarding the management of the chain |
| 5954 | 7 | 28 | 15 | | | Sections 7.5 andf 7.6 provide excellent summaries of current technology and infrastructure performances in relation to consideration of future mitigation. However, it would also be worthwhile to include a brief summary of advanced laboratory research developments, including use of nanotechnology, that have the potential to fundamentally restructure energy production and provision. | Rejected. First, we need to base the assessment on technologies that have been demonstrated in order not to mislead policy makers. The technologies must have been assessed in the peer-reviewed literature. Second, this would |
| 4814 | 7 | 28 | 15 | 28 | 15 | Include assessment of demand side management (smart grids/meters, energy efficiency measures, storage, etc) to the list of mitigation options | Rejected - though not from the perspective of resource potential, storage and DR issues are addressed in a later section. We have forwarded this |
| 3393 | 7 | 28 | 17 | 28 | 19 | Is this the place to remember that fossil fuels are a major cause of anthropogenic climate forcing…?. Delete full paragraph | The section also addressed the emissions from fossil fuel production, which were not covered anywhere else. This is now included in the discussion of |
| 10529 | 7 | 28 | 18 | | | Rest of chapter / report uses Gt, not Pg so suggest change to be consistent | Taken into account - comment is obsolete. Underlying text has been |
| 10526 | 7 | 28 | 2 | | | Why only wind chosen here? Suggest delete the wind reference and just leave Verbruggen et al, 2011 - and delete "generally". | Accepted |
| 9646 | 7 | 28 | 20 | 28 | 20 | add "oil and gas" before wells and pipelines or it sounds like it is coal wells and pipelines. | Accepted. Language changed. |
| 3784 | 7 | 28 | 20 | 28 | 20 | Check the figures in "(0.3 PgCO2, 1-28 PgCO2e CH4) | Taken into account - sourced checked. The numbers are correctly reproduced. Please note this paragraph has been |
| 3785 | 7 | 28 | 20 | 28 | 24 | Improve Figure 7.10 adding information on technologies required to reduce GHG emissions shown | Taken into account. Note that the original figure was not reproduced correctly in the FOD. CCS is included. Other emission reduction opportunities were not shown. They are potentially more difficult as many of the listed |
| 11929 | 7 | 28 | 21 | | | Label missing on abcissa in Figure 7.10. | Accepted. The figure was not correctly |
| 10530 | 7 | 28 | 22 | | | Not 7.2.3. Maybe quote Section 8.2 better | Accepted. |
| 17364 | 7 | 28 | 26 | | | can be reduced through… | Accepted. |
| 11930 | 7 | 28 | 27 | | | Define distinction between T and D. Which losses? T or D? | Rejected. This comment must be |
| 6696 | 7 | 28 | 29 | 28 | 37 | For sustainable development, we must consider energy security and economic influence. From this standpoint of view, not only replacing existing coal fired power plants by highly efficient natural gas power plants, but also replacing by more efficient coal plamts is needed. | Rejected. You are suggesting to introduce a longer discussion of alternatives which we do not have place |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 11762 | 7 | 28 | 29 | 28 | 31 | Energy must be choosen taking into not only enviromnet but also economy and energy security. To avoid the misunderstanding, [prvided the economy and energy security is not taken into account] should be added after this sentence. Refer to No.4. | Reject. Energy security is addressed in 7.9.1, this section refers to climate mitigation. |
| 10067 | 7 | 28 | 29 | | 30 | It should be spelled out that the CO2 reductions here relates to the emissions during combustion only. | Reject. The review comment seems to be misplaced as specific emission |
| 10654 | 7 | 28 | 29 | 28 | 31 | Add a statement coal is preferred from the view point of energy security. | Reject. Energy security is addressed in 7.9.1, this section refers to climate |
| 9991 | 7 | 28 | 29 | 28 | 37 | This part should be revised to explain that it is important to use coal power efficiently from a viewpoint of energy security and economic efficiency. IGCC (Integrated Gasification Combined Cycle) technology is developing and has potential to reduce CO2 emission in the future, as described in (IEA, 2011, page7, 42 Fig14) and (Janos, 2009, page5 and 7-8, Figure1 and Table 1, 2).<br><br><Reference><br>[1] IEA (2011). Power Generation from Coal Ongoing Developments and Outlook, IEA Information Paper. Available at: http://www.iea.org/papers/2011/power_generation_from_coal.pdf<br>[2] Janos M Beer (2009). Higher Efficiency Power Generation Reduces Emissions, National Coal Council Issue Paper. Available at:<br>http://web.mit.edu/mitei/docs/reports/beer-emissions.pdf | Taken into account - this was evaluated in the figure 7.10. The missing labelling was corrected for the SOD. The cited literature was taken into account if appropriate. |
| 9368 | 7 | 28 | 29 | 28 | 31 | Coal fired power plant has potential to reduce CO2 emissions by improvig the efficiency of the plant.(IEA,2011).Thus it should include the view that effective utilization of coal fired power plant is needed for energy security. | Accepted - concerning domestic coal, this comment is addressed in section on energy security (7.9). |
| 13036 | 7 | 28 | 3 | 28 | 6 | This sentence appears to be a misleading restatement of data on technical potential for RE, and the source supplied does not sufficiently support the assertion of limited RE potential. | Accepted, in part - On a long term basis and under high carbon reduction targets, some technologies have limits on their contributions. We have clarified the statement to make it clear that we are talking about cases in which very deep carbon reductions are sought, and where individual technologies cannot meet huge proportions of total energy supply |
| 18052 | 7 | 28 | 31 | 28 | 31 | After "(NGCC) power plants" add" renewable energy technologies, efficiency". Without a reference to renewables is seems that the only mitigation options in the power sector is fuel switching from coal to gas and CHP, despit efficiency and renewables being the options with the highest carbon reduction potential in most areas of the world. | Rejected. This section addresses mitigation opportunities within the fossil fuel sector. The text is not formulated to suggest that fuel switching is the only |
| 10068 | 7 | 28 | 32 | | 34 | The methane issue should be more elaborted, with respect to the differen GWPs in different timeframes for the different GHGs .<br>See: The future of Natural Gas, E. Monitz et al, MIT (2011);<br>Shindell et al, Science 326, 716 (2009) | Taken into account - it has been noted that the 100 y GWP is used. It is an editorial decision of GWIII to utilize GWP100 throughout the report. |

|---|---|---|---|---|---|---|---|
| 2829 | 7 | 28 | 34 | 28 | 37 | The discussion of LCA here is out of place and over-compressed and this sentence (and probably the whole paragraph) could be omitted – there is a better treatment in 7.8.1. In any event, the referencing at both points is odd. Singh et al 2011 is about CCS technologies so it is not clear why it is used as a reference for conventional generation – on which it takes its figures from the Ecoinvent database, which reflects historical European conditions. The discussion should point out that LCA figures are situation specific and depend on the underlying assumptions, so that quoting any single figure is misleading. In the comparison cited here, there is also an odd mixture of average and marginal data. While this is made clear in relation to the technology, it is not clarified in relation to the supply source. The natural gas-related emissions on which the comparison is based are based on the situation in Europe nearly a decade ago. For a new NGCC emissions would depend on the assumptions about the gas source – Russia? Qatar LNG? US shale gas LNG exports ? – all of which would give very different results, especially given the uncertainty about methane emissions in transmission from Russia, which alone could completely overturn the conclusion. | Accepted. We have updated the analysis using more recent emissions estimates for fugitive emissions from Burnham et al. The LCA appropriately combines different sources of emission. In this section, we systematically emphasise the importance of fugitive emissions during fuel production and emissions associated with gas transport, which may make fuel switching less attractive than when addressing only power plant emissions. We would appreciate references for emissions from |
| 11852 | 7 | 28 | 36 | 28 | 37 | Why is only one value and one data source reported for Coal vs NGCC (Singh et al 2011)? There are numerous LCA studies with varying estimates (e.g. - and this list is not exhaustive - Burnham, A., et al. Life-Cycle greenhouse gas emissions of shale gas, natural gas, coal, and petroleum. Environ. Sci. Technol. 2012, 46, 619-627; Argonne National Lab's GREET 2012 Model; Jaramillo et al. Comparative lifecycle air emissions of coal, domestic natural gas, LNG, and SNG for electricity generation. Environ. Sci. Technol. 2007, 41, 6290–6296; etc. ). | Taken into account. Please note that the findings from the paper by Jaramillo et al are cited. The Burnham paper was not available at the time of writing. The figure has been updated taking the fuel chain emissions from Burnham. |
| 17222 | 7 | 28 | 37 | | | The carbon intensities are not the default values recommende by IPCC and used by IEA. The CLAs are strongly requesed to check these numbers. | The numbers are sourced from the IPCC database following 2006 guidelines. Antracite: EF-ID 117627; natural gas: |
| 11853 | 7 | 28 | 37 | 28 | 38 | Why is the carbon content of anthracite coal listed? Anthracite is most typically used in metallurgical processes, not power generation. Anthracite has a high carbon content compared to, for example, bituminous or sub-bituminous coal (more typical for power generation). | Accepted. Has been replaced by sub-bituminous coal, which has a carbon content of 26.2 g/MJ compared to 26.8 |
| 6448 | 7 | 28 | 37 | 28 | 38 | Note that anthracite is not the major coal type used in electricity production; this sentence should include data for sub-bituminous coal which is much more widely used for electricity production | Accepted. Has been replaced , see response to comment 11853. |
| 5153 | 7 | 28 | 4 | 28 | 4 | how do this claim match the deployment predictions of ch 5 in the SRREN where Hydro may increase from 3000 to even 9000 TWh in 2050 - the sentence hints that there is not much hydro to develop | Accepted, in part - On a long term basis and under high carbon reduction targets, some technologies have limits on their contributions. We clarified the statement to make it clear that we are talking about cases in which very deep carbon reductions are sought, and where individual technologies cannot meet |
| 16036 | 7 | 28 | 41 | 28 | 42 | Further emissions ereductions maybe possible through CO2 Capture and storage and CO2 Capture and use for example through algae | Rejected. No reference provided to evaluate this option. |
| 5134 | 7 | 28 | 42 | | 45 | The sentence is not clear. What specific message the statement is trying to convey? | Accepted. Change to: "If gas is liquefied with a dirty power source and shipped over long distances, It should be noted that, depending on specific circumstance of fuel production, liquefaction and transport, the range of life-cycle GHG emissions of electricity |
| 10527 | 7 | 28 | 5 | | | Are solar and wind really "seemingly more-abundant"? Not shown by technical potential analysis of scenarios in Chapter 10 of SRREN. | Accepted - more abundant based on technical potential alone (not scenarios). |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 4646 | 7 | 28 | 9 | 28 | 11 | “Competition for land --- may impact on aggregate technical potentials, as might concerns about the carbon footprint and the sustainability of the resource (e.g. biomass) ---“. This should not apply to woody biomass from existing sources as its NPP is far in excess of current demand. | Rejected - the word "may" provides the appropriate caveat here |
| 4779 | 7 | 28 | 3 | 28 | 6 | The sentence "may be limited by the available technical potential, e.g., hydropower, bioenergy, and ocean energy" is not correct. As stated in IPCC/SRREN report the untapped technical potential for those 3 technologies is still huge, refer to Figure 7.9 for instance. | Accepted, in part - On a long term basis and under high carbon reduction targets, some technologies have limits on their contributions. We have clarified the statement to make it clear that we are talking about cases in which very deep carbon reductions are sought, and where individual technologies cannot meet |
| 6188 | 7 | 28 | | | | This section is in general detailed, well-written, and comprehensible. However, it tends towards listing technologies and providing a brief explanation of them, which isn't quite effective in understanding how they compare to each other. Using tables or other figures as the primary means of displaying information could solve this problem, while potentially reducing the total page count. | There is a figure comparing different fossil fuel options. It is not clear whether the review comment suggests a figure for the entire section 7.5. Please note |
| 18508 | 7 | 28 | | | | An intro paragraph to this section explaining how the options presented in the different sub-sections fit together or complement one another would be useful. | Accepted - an intro paragraph to 7.5 has been introduced. |
| 18514 | 7 | 28 | | | | Each of the sub-sections (i.e. technology categories) has a different focus and structure, and in some cases topics stray to cover scenarios and risks. Some differentiation is of course necessary because of the fundamentally different nature of the technologies, but some similar structural elements would be useful. For example, an introductory paragraph summarizing the different options available in that category, a paragraph on changes since the AR4 (Section 7.5.4 does this in an exemplary way!), and a paragraph+ for each of the different options including where they've been deployed. | Accepted - issues of risk and scenarios have been removed as they are covered in other sections of the chapter. An introductory paragraph has been added. |
| 13486 | 7 | 28 | 40 | 28 | 41 | Text: "Emissions associated with NGCC are still too high to meet long-term stabilization targets." This is true if one considers all new Natural Gas combustion plant to be in permanently in operation. However, balancing variable Renewable Energy capacity with Natural Gas as backup will allow for gas power generation to idle. With the growth in different streams of Renewable Gas, net carbon emissions of gas generation should reduce significantly, even if carbon intensity is somewhat increased owing to variable energy values of the Renewable Gas sources. One important condition of new gas plant commissioning should be that the gas turbines are not only efficient, but flexible, or permit retrofit for more flexibility - to allow greater flexibility in the use of new resources of gas - namely Renewable Gas, which is likely to have variable energy density. | Taken into account - specified that this is the case only for use of NGCC for base load power. |
| 13487 | 7 | 28 | 41 | 28 | 42 | Text: "Further emissions reductions are possible through CO2 capture and storage" It seems to me to be wasteful to burn more gas in order to capture the carbon dioxide and pump it into permanent storage. The time taken to develop widescale carbon capture and storage capacity is going to take much longer than it would take to properly implement fugitive gas capture. (Example reports : "Leaking Profits, NRDC http://www.nrdc.org/energy/leaking-profits.asp; "Controlling fugitive methane emissions in the oil and gas sector", IIGCC, http://www.iigcc.org/__data/assets/pdf_file/0017/15371/Methane-emissions-Statement.pdf) | Rejected. We cannot base our report on the political statements of interest groups. |
| 14703 | 7 | 28 | | | | Assessment of GHG emission from unconventional gas is large depended on which GWP factor should be used. For examples, Howarth et al., 2011 is using much higher GWP (105 as 20 year and 33 as 100year from Shindell et al.2009) than IPCC 2007(72 as 100 year and 25 as 100year). Therefore the emission is evaluated very high. So the information which GWPs and time horizon are used should be shown in IPCC assessment report. | Accepted - see response to review comment 10068 |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 18509 | 7 | 28 | 16 | | | Section contains good information, but the structure is intermixed, making it difficult for the reader to pull clear messages. Having dedicated paragraphs on the three options introduced: 1) fuel switching; 2) ee; and 3) reducing fugitive emissions would be helpful. | Reject. Please note that fuel switching makes sense ONLY when fugitive emissions from natural gas chains are kept low and LNG plants use clean electricity and LNG ships are well designed and operated at the right |
| 15485 | 7 | 28 | 18 | 28 | 19 | Fossil fuel extraction, conversion and fuel switching – add in the brackets data for building and construction sector in the list as they represents around 40 % of the global GES | Rejected. The building and construction sector is addressed in Ch.9 |
| 4081 | 7 | 28 | 25 | 28 | 28 | Total climate forcing has to be reduced. It is not relevant to focus on climate forcing « per unit energy delivered ». I would suggest « Climate forcing from fossil fuels can be reduced through (1) containing the global energy demand (2) higher energy efficiency (3) switching to lower carbon-intensity fuels and (4) reducting fugitive emissions along the supply chain and black carbon emissions from combustion. » | Rejected. While this is absolutely true and the basis for WGIII, this section specifically focuses on reducing emissions in the fossil fuel/power/heat |
| 9228 | 7 | 28 | 28 | 28 | 28 | To add "(4) change or swuitching to economy structure more light" | Rejected. While this is relevant for mitigation overall, it does not fit into this section which deals with the fossil fuel |
| 11713 | 7 | 28 | 15 | 30 | 35 | High efficiency distribution generation, especially fuel cells (PEFC, SOFC) has been advanced and already commercialized. It might be effective not only reducing transmission loss but also changing the scale of combined heat and power (e.g. CHP in single home) and scale of energy system (e.g. smart grid). More discription on distribution generation is needed. | taken into account - fuel cells now are mentioned in the text. |
| 12326 | 7 | 28 | 15 | | | We recommend adding an introduction that describes the challenge - how much mitigation is needed in the 450 ppm scenarios, and the stabilization scenarios. The danger of "lock-in" should be commented on as this might be quite relevant in regions where the focus is on building a natural gas infrastructure without CCS. (Long term versus short term mitigation needs.) We also recommend moving (a shorter version of) section 7.8.1 to this sectrion 7.5 and moving chapter 7.8 (Costs and potential) immediately after chapter 7.6. | Taken into account - introduction has been added. |
| 12327 | 7 | 28 | 15 | | | Regarding the structure of 7.5: We recommend rearranging the order of the sub-sections to: 1. renewable energy, 2. fossil fuel extraction … 3. CCS 4. nuclear energy and 5. energy efficiency in transmission and distribution. Reasoning: this latter is relevant for all energy production, and will provide a better transition to Section 7.6. | A common order has been agreed for all the sections of this chapter. |
| 3395 | 7 | 29 | | 30 | | Focus on energy losses figures and avoid detailed technical details about trasnmission lines operating conditions, clearly out of scope in an IPCC AR report. | On reflection I don't accept this - the text was to be shortened and has been slightly, but note that examination of |
| 4435 | 7 | 29 | | 29 | | A y-axis with numbers is needed for this figure. | Taken into consideration. The figure has been revised (now figure 7.8) |
| 16110 | 7 | 29 | | | | No scales given. Even with the right scale, this figure is misleading, because the thermal plants will not usually be used as baseload, and their emissions will depend on the rest of the system. | Taken into consideration. The figure has been revised (now figure 7.8) |
| 14542 | 7 | 29 | | 29 | | Figure needs to be fixed | Taken into consideration. The figure has been revised (now figure 7.8) |
| 9591 | 7 | 29 | | | | Please, add name on each bar chart and calibrate unit. | Accepted. Figure has been corrected. |
| 4522 | 7 | 29 | | | | I do not understand this figure? Is there a label on the x-axis that is missing? | Accepted. Figure has been corrected. |
| 6230 | 7 | 29 | | | | no distinction between coal & gas | Accepted. Figure has been corrected. |
| 15945 | 7 | 29 | | 29 | | there is no identification of the X axis in this chart | Accepted. Figure has been corrected. |
| 10531 | 7 | 29 | | | | Explain the arrows with -19%, -16% -80% of what? Need x axis labels.Add data to y-axis. Explain probability bars. Delete "(BAT)" | Accepted. Figure has been corrected. |
| 10048 | 7 | 29 | | | | Legend unclear - different technologies should be included in the x-axis | Accepted. Figure has been corrected. |

|---|---|---|---|---|---|---|---|
| 14702 | 7 | 29 | 12 | 29 | 13 | There are other analysis for life cycle GHG emission assessment for unconventional natural gas. Their analysis is summarized as follows;<br>1)Fugitive emission from shale gas well completion with hydraulic fracturing is much smaller than the emission from gas combustion at final demand. And the fuel combustion of natural gas is much smaller than that of coal. Therefore, the emission from shale gas is much smaller than coal by LCA. Reference cited; National Energy Technology Laboratory 2011(Life Cycle Greenhouse Gas Inventory of Natural Gas Extraction, Delivery and Electricity Production), Shell Global Solutions (U.K.), Shell Technology Centre Thornton 2011(Modeling the Relative GHG Emissions of Conventional and<br>Shale Gas Production).<br>2)Furthermore three is the report which points out that emission from shale gas is smaller than conventional natural gas because shale gas does not need liquid unloading. Reference cited; Argonne National Laboratory 2012 (Life-Cycle Greenhouse Gas Emissions of Shale Gas, Natural Gas, Coal, and Petroleum). | Taken into consideration. Note that there are competing views on this issue. See for example review comment 13488 and the references cited therein. We are surveying this emerging field and attempt to consider all findings and perspectives. |
| 5135 | 7 | 29 | 16 | | | Replace 'tar sands" with "oil sands" | Accepted. Replaced. |
| 9647 | 7 | 29 | 19 | | | No axis labels on the chart | Accepted. Figure has been corrected. |
| 9270 | 7 | 29 | 20 | | | Need to add actual units of measurement to Y axis (i.e. intervals of x kgCO2-e) | Taken into consideration. The figure has been revised (now figure 7.8) |
| 4082 | 7 | 29 | 20 | | | This figure lack of legend for histogram bars | Accepted. Figure has been corrected. |
| 15465 | 7 | 29 | 26 | 29 | 31 | We can add the fact that in the US, the combinsed transmission and distribution losses in the US are much higher at 14.9% in 2010. See reference: page 10 of http://www.americanprogress.org/wp-content/uploads/2012/08/0709_CleanEnergyWeb2.pdf or US EIA Annual Energy Review, 2012 | Rejected as the I don't believe that such focus on US data is appropriate, and actually the IEA give 6% losses fore the |
| 4810 | 7 | 29 | 26 | 29 | 27 | Add a line on the rationale for transmission losses being less than distribution losses. Does this apply to all countries? I would think that countries such as Brazil where most of the generation is located far from consumption would have more transmission losses compared to distribution, than countries where generation is close to consumption. Or is this losses by km instead of system losses? | Accepted. Text amended. |
| 10532 | 7 | 29 | 26 | | | Deelete "are known as transmission losses, they" and add "high-voltage" transmission system and "low-voltage" distribution system. Delete "(distribution losses)". | Accepted |
| 9648 | 7 | 29 | 28 | 29 | 31 | Seems outdated - is there more recent data? A comparison with non-OECD countries would be useful. | Accepted - text revised. |
| 10533 | 7 | 29 | 28 | | | Change "energy delivered" to "electricity delivered". But below is the 6.5% losses of electricity delivered or electricity generated? I suspect the former. Need to clarify in text | Accepted and dealt with |
| 16811 | 7 | 29 | 3 | | 6 | When discussing emissions from the energy use in fossil energy extraction, do we risk double counting emissions if we include these in emissions from fossil fuel use, as it typically done? | Taken into account. Please note that a consistent life-cycle methodology ensures that each emission is counted |
| 4436 | 7 | 29 | 30 | 29 | 31 | This transmission+distribution losses figure should be updated. | Accepted and dealt with as far as |
| 18510 | 7 | 29 | 30 | 29 | 31 | Is there not a more recent reference? At the time the AR5 is published, this reference will be more than 10 years old. | We are running with IEA 2003 until we have something better that is properly |
| 14543 | 7 | 29 | 6 | 29 | 6 | Consider adding " and ocean thermal energy conversion has significant potential for providing base load energy for small island state". Although small islands are minor emitters, they also need to take mitigation more serioosly, and be aware that RE such as OTEC can provide energy independence. | Taken into account. A box on developing countries and LDCs was included. |
| 16037 | 7 | 29 | 9 | 29 | 11 | to much sources | Rejected. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 13488 | 7 | 29 | 12 | 29 | 13 | Text: "Fugitive emissions associated with unconventional gas production are controversially discussed (Howarth et al., 2011; Cathles et al., 2012)" Additional papers : "Methane Emissions from Natural Gas Systems", Robert Howarth, Drew Shindell, Renee Santoro, Anthony Ingraffea, Nathan Phillips, and Amy Townsend-Small, February 25, 2012, Background Paper Prepared for the National Climate Assessment, Reference number 2011-0003, http://www.eeb.cornell.edu/howarth/Howarth%20et%20al.%20--%20National%20Climate%20Assessment.pdf; Howarth et al. 2012, "Venting and leaking of methane from shale gas development: response to Cathles et al.", Climatic Change, DOI 10.1007/s10584-012-0401-0 http://www.eeb.cornell.edu/howarth/Howarthetal2012_Final.pdf | Taken into account. Please note that fugitive emissions of methane is an emerging issues also for coal. There is a lot of work that is coming out and we are keeping an eye on this. However, we are trying to get a balanced view and we see at this point no basis for endorsing one or the other of the competing views. |
| 13490 | 7 | 29 | 20 | 29 | 24 | This figure is missing the horizontal axis. | Accepted. Figure has been corrected. |
| 13489 | 7 | 29 | 40 | 29 | 42 | Text: "Emissions associated with NGCC are still too high to meet long-term stabilization targets. Further emissions reductions are possible through CO2 capture and storage (Section 7.5.3)" Carbon Capture and Storage is possible, but the question remains as to whether it is probable. Although on a very local level it is already being employed, it is difficult to imagine incentives for widescale use, considering its implications for added combustion of fuel, and the construction of a parallel infrastructure to gas grids. It is unlikely to happen in developing countries, who lack infrastructure-building capacity. Whilst it is true that Natural Gas Combined Cycle emissions are too high to meet long-term stabilisation targets, if they gradually become back up to renewable energies, such as widespread wind and solar power, and if gas supplies become decarbonised through increasing proportions of Renewable Gas (Renewable Hydrogen and Renewable Biomethane, principally), there is no reason to doubt that gas generation will continue to be useful and fall within any low carbon regime. | Rejected -- no scientific evidence / publications are provided to substantiate the reviewer's opinion. The reviewer is expressing their personal opinion. It is difficult to respond to a generic statement that "it is hard to believe" without some substance behind the comment or specifics about what should be changed in the text. |
| 15355 | 7 | 29 | 25 | | | This section could be strengthened through incorporating information on energy effiency in other areas for example demand sectors such as industry (boilers etc), buildings, transport, as the energy balance and other sections refer to significant consumption, low efficiencies as well as there being high potential for savings. | Rejected - such information is appropriate in this section. |
| 3451 | 7 | 29 | 26 | 29 | 31 | Are there any updated figures regarding T&D losses?. In the document the figure presented is for the year 2000 | Is IEA 2003 the latest published figure? I have added a ref to online IEA data for |
| 11931 | 7 | 29 | 27 | | | Energy intensive? | Unclear what is intended by this comment - the use of the term was fine |
| 6240 | 7 | 3 | 13 | | | ince prices determine demand, subsideis bias the price signal, IEA made some investitgation in international subsidies in their WEO, role of ubsidies in climate perspective should be mentionend in more depth. Especially subidies in developing countries | Taken into consideration - subsidies are mentioned in 7.12.3 |
| 6241 | 7 | 3 | 29 | | | topic of energy taxes is just mentioned but energy taxing might be looked with some higher depth since energy taxing might also help the meet climate purposes. | Rejected - space constraints do not allow to go into the details here. |
| 6239 | 7 | 3 | 3 | | | many mire reports than referenced have been produced on this topic | Rejected - comment seems to be misplaced. It is not clear what the |
| 12586 | 7 | 30 | | | | There is still much work to be carried out on CCS. Technically yes it is possible, but how commercially possible is it? | Noted. The text as currently written specifically addresses this point when it says "CCS is a technology suite that has the single purpose of capturing and storing CO2 and therefore is not deployed without either limits on |
| 4647 | 7 | 30 | | 30 | | CCS. See my notes above. | Comment unclear - as reviewer gave many comments at different places. |
| 4437 | 7 | 30 | 1 | 30 | 2 | Reference for the assertion of 25% losses from distribution transformers in Europe. | Only grey literature here but I have added a new ref (EU project report) |
| 17281 | 7 | 30 | 1 | | 2 | This statement requires a reference | Accepted and done |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 15486 | 7 | 30 | 1 | 30 | 6 | Add data for developing countries (Africa Region based on studies on Grid integration) and, if possible, also for transition economies such as China in order to have comparable perspective | A figure for India was added, but to add more due to page constraints and limited value of the additional data is not |
| 4108 | 7 | 30 | 18 | 30 | 25 | There could usefully be a more detailed discussion here about work being done, and progress made, on UHVDC transmission, links to CSP and the Desertec concept, developments in California, and potntial to harness wind energy as well over large distances which might offset the criticism immediately above. | Rejected. Since the section is already too long and this is speculative, this was not added. |
| 18053 | 7 | 30 | 20 | 30 | 21 | "for very long lines" must be more specifically defined. App how many km? | Accepted and dealt with |
| 9470 | 7 | 30 | 23 | 30 | 25 | This part should be left in this report, as there is possibility that connecting renewable energy to utility grid increases transmission losses. | Accepted - no change required |
| 4438 | 7 | 30 | 23 | 30 | 25 | Define considerable distances. What losses are predicted for programmes, such as the IEA PV in the desert? There are discussions of a pan-Asian network and pan-Australian network. | Done |
| 16111 | 7 | 30 | 23 | 30 | 25 | This paragraphe is doubtful, because the losses will depend both on the local resouces such as PV, and the matching of this resource to the electricity usage in the area. Present developments are favourable with such local or even in-house production, the transmission being used in limited hours of the year (thus limiting losses). | Its not doubtful - its precise and logical |
| 11763 | 7 | 30 | 23 | 30 | 25 | This kind of concern should be recognized. | Accepted - no change required |
| 10655 | 7 | 30 | 23 | 30 | 25 | Good argument. | Accepted - no change required |
| 5155 | 7 | 30 | 23 | 30 | 23 | what os meant by "time varying renewable" ? Intermittent or variable ? | The term has been used as it is more precise than the two alternatives offered. |
| 9992 | 7 | 30 | 23 | 30 | 25 | This part should be kept in SOD because problems of RE are mentioned well and comprehensively. As described in FOD, Transmission losses caused by introducing huge amount of RE are considered to increase more than those of constituted only by large scale power plants system. This is because renewable power generators are located far from city areas. This information is described in (Quezada, 2006, page 533 and 537)<br><br><Reference><br>[1] V.H. Méndez Quezada, et al (2006). Assessment of Energy Distribution Losses for Increasing Penetration of Distributed Generation, IEEE TRANSACTIONS ON POWER SYSTEMS, VOL. 21, NO. 2, MAY 2006, | Accepted - no change required |
| 9369 | 7 | 30 | 23 | 30 | 25 | It raises an important fact. | Accepted - no change required |
| 16813 | 7 | 30 | 25 | | | Suggest adding this at end of line: ",which results in increasing relative cost for more remote resources." | Rejected. Not supported by the underlying technical literature. Furthermore, I don't understand what |
| 5136 | 7 | 30 | 26 | | 35 | As the losses due to transmission & distribution of electricity have been discussed in the section 7.5.2, this particular section dealing with fossil fuel ( oil & gas) transmission & distribution must discuss the associated energy loss and related energy efficiency issues. | Noted. The point the reviewer is making is not clear. |
| 9649 | 7 | 30 | 26 | 30 | 35 | this paragraph is out of place - doesn't fit with the rest of the section | I don't see a problem with the paragraph |
| 5154 | 7 | 30 | 3 | 30 | 6 | Sentence starting with "An increase--" - message could be made more easy to comprehend | Accepted and done |
| 2972 | 7 | 30 | 36 | | | A description of the infrastructure needs (pipelines) for CCS should be included. | Taken into account. This topic is |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 18211 | 7 | 30 | 37 | | 44 | All of the components of integrated carbon dioxide capture and storage (CCS) systems exists and are in use today by the hydrocarbon exploration, production and transport; petrochemical refining; and power engineering sectors. A complete end-to-end CCS system would mitigate CO2 emissions by capturing CO2 from large (e.g., typically larger than 0.1 MtCO2/year) stationary point sources, compressing the captured CO2, transporting and injecting the compressed CO2 into a suitable deep (typically more than 800m below the surface) geologic structures, and then applying a suite of measurement, monitoring and verification technologies to ensure the safety, efficacy, and permanence of the captured CO2's isolation from the atmosphere (IPCC, 2005; HJ Herzog, 2011).Comment: As indicated in paragraph this technology is in the experimental stage. The text of this technology as a real and tangible to offer a product that does not exist from the establishment of a broad base theme. | Rejected. Not supported by a compelling body of scientific evidence/publications. The text as currently written in Chapter 7.5.5 is more accurate than this suggested revision. |
| 18212 | 7 | 30 | 37 | | 44 | Alternative paragraph:<br>All of the components of integrated carbon dioxide capture and storage (CCS) systems exists and are in use today by the hydrocarbon exploration, production and transport; petrochemical refining; and power engineering sectors. A complete end-to-end CCS system would mitigate CO2 emissions by capturing CO2 from large (e.g., typically larger than 0.1 MtCO2/year) stationary point sources, compressing the captured CO2, transporting and injecting the compressed CO2 into a suitable deep (typically more than 800m below the surface) geologic structures, and then applying a suite of measurement, monitoring and verification technologies to ensure the safety, efficacy, and permanence of the captured CO2's isolation from the atmosphere (IPCC, 2005; HJ Herzog, 2011). | Rejected. Not supported by a compelling body of scientific evidence/publications. The text as currently written in Chapter 7.5.5 is more accurate than this suggested revision. |
| 12626 | 7 | 30 | 39 | 30 | 39 | "would mitigate"  should be changed to present tense "mitigates" as it is happening today. | Editorial. That sentence was meant to define CCS. There was no greater point being articulated. The verb tense can be changed but I don't think this is necessary as the existing CCS projects are described in a subsequent paragraph |
| 12669 | 7 | 30 | 39 | 30 | 39 | "would mitigate"  should be changed to present tense "mitigates" as it is happening today. | Editorial. That sentence was meant to define CCS. There was no greater point being articulated. The verb tense can be changed but I don't think this is necessary as the existing CCS projects are described in a subsequent paragraph |
| 6426 | 7 | 30 | 40 | 30 | 43 | somewhere in here it should state the the CO2 is injected as a liquid or a supercritical fluid | Rejected (not supported by the broad body of peer reviewed literature). In the CCS technical literature and for most CCS applications one would use the term "super critical CO2." However, this section 7.5.5. needs to be written in a way that allows a broader and in particular non-CCS specialist reader to understand the text. The text currently reads "injecting the compressed CO2 into a suitable deep geologic formation." For CO2 storage into a deep unmiable |

|---|---|---|---|---|---|---|---|
| 10534 | 7 | 30 | | | | Missing something on super-conductors | Rejected outside the scope of this chapter not supported by peer reviewed research Super conductors are not a part of CCS systems. Perhaps this is a |
| 13491 | 7 | 30 | 1 | 30 | 2 | Text: "Approximately 25% of all losses in Europe are due to distribution transformers (and this will be similar in OECD countries) so use of improved transformer designs can make a significant impact." A programme of replacement of equipment in the electricity grids is a major undertaking, and cannot be expected without mandatory efficiency targets being set for utility companies. | Accepted - I have added a phrase. |
| 3452 | 7 | 30 | 1 | 30 | 22 | In Latinamerica there are countries with T&D losses greater than 30 or 40% (fro example: Domenican Republic). Some paragraph about this situation should be mentioned in the report, because this is one of the difficulties to implement GHG reductions through DSM programme | Rejected - as there is no clear pattern here - Chile even with its highly extensive transmission manages much |
| 3396 | 7 | 30 | | 32 | | There is an IPCC SR on CCS 2005 and additional input in a two page summary requires careful choice of new messages. As in previous sections, avoid mixing reference to individual authors to support well established ideas in the IPCC SR. For example, references in lines 9-13 of page 7 can be omitted. Lines 13-17 must be deleted as they refer to a single (out of many more) research lines with a high level of inmaturity and speculative character (chemical looping concepts for O2 and CO2 are regarded by most experts as priority R&D options for advnaced CO2 capture systems and have reached a relevant pilot scale-up, while ionic liquids have not yet passed the basic conceptual-laboratory scale-test, membranes are not even mentioned (and they should not)... ). Amuzing number of references to support simple ideas between lines 18-44 in page 31. If we got to this level of referencing detail in the rest of the Chapter we would escalete to hundreds of pages of references¡¡. Page 32 line 13 starts with a poor and obscure sentence: "...one of the most sophisitcated analyses done to date": is it good to be "sophisticated"?. The last paragraph of the section (page 32 line 15 to 28) is better discussed in section 7.12. | Accepted. The number of references in section 7.5.5 has been cut down. |
| 9650 | 7 | 30 | | | | No mention of biosequestration or mineral carbonation | Rejected. Beyond the scope of this chapter. Mineralization is discussed at length in the IPCC SR on CCS. This was a decision the CLA's made when the very first CCS section was written. The decision was to stick to core aspects of CCS and not try to provide a |
| 6436 | 7 | 30 | | | | Since AR4 the theoretical and practical aspects of CCS have been examined and the paucity of real-world data highlighted (Page et. al., 2009). It has been shown that most energy penalty values are the product of mathematical models and that limited energy penalty data from pilot-scale studies are higher than the modelled values. I suggest that the present status of energy penalty data on CCS applied to electricity generation is reviewed and reported in AR5. In addition the likelihood that CCS electricity plants will be used as baseload plants will limit the penetration of variable renewables (references given in the comments on the next section. Additonal reference on CCS: Page, S.C., Williamson, A.G. and Mason, I.G., 2009. Carbon capture and storage: Fundamental thermodynamics and current technology. Energy Policy 37 (9), 3314-3324. | Rejected. Outside the scope of this chapter given space constraints. I don't see any reason to add a citation to this paper by the commenter. This small section of Chapter 7 can not cover every possible point about CCS. And it is my judgment that this is not a particularly important point for the purposes of an |

|---|---|---|---|---|---|---|---|
| 2830 | 7 | 30 | 36 | 32 | 28 | This section seems out of touch and out of date. It talks about "dozens" of demonstrations worldwide without pointing to the recent cancellation of many of them. It would not be apparent to a reader of this section why a recent journal article was entitled "How a 'Low Carbon' innovation can fail – tales from a 'Lost Decade' for carbon capture, transport and sequestration" (Economics of Energy and Environmental Policy vol 1 issue 2). The authors may not agree with this assessment but they should recognise the challenges it describes. | Rejected-- not consistent with the underlying peer reviewed literature. As clearly stated in the paragraph in question, CCS will not deploy unless there is a significant climate policy in place. CCS has only one purpose to reduce CO2 emissions to the atmosphere. The lack of commercial CCS deployment is an issue caused by humanity's lack of progress in |
| 10959 | 7 | 30 | 36 | 32 | 28 | Confer: Torvanger, Grimstad, Lindeberg, Rive, Rypdal, Bieltvedt Skeie, Fuglestvedt, Tollefsen (2012), Quality of geological CO2 storage to avoid jeopardizing climate targets, Climatic Change, 114, 245-260. Confer also: Torvanger, Lund, Rive, Carbon capture and storage deployment rates: needs and feasibility, Mitigation and Adaptation Strategies for Global Change, DOI: http://dx.doi.org/10.1007/s11027-012-9357-7 | Noted. These two papers cover the same material that is discussed in other works already cited in Chapter 7.5.5. Given the limited amount of space available in Chapter 7.5.5 there isn't room to cite these papers as the points |
| 4214 | 7 | 30 | 36 | 32 | 28 | While CCS technologies are presented as being well established, the section does not address the substantial barriers to their timely and economical implementation. Standards and regulations must be developed, adopted and implemented with full participation and concurrence of all stakeholders, public and private. The needed national and international standards do not yet exist; their development, with strong public and private sector involvement, will require years of effort. This should be recognized in the report. Given the standards and regulations, individual projects still need to be approved by cognizant local, state and national regulators - a process that can take a decade unless the processes of the many regulators are coordinated and are supported by modern information technologies (Moving Forward: In-Depth Findings and Recommendations from the Consultative Council (2011), National Institute of Building Sciences, p11 (http://nibs.org/client/assets/files/nibs/2011_MovingForward.pdf)). | Taken into account. These points are addressed in Section 7. These points are made in the later sections of Chapter 7.9.2, 7.9.3., 7.9.4, 7.10. Many commenters seem to want one coherent discussion of CCS and nuclear power. The original submissions for both of these topics were more of an integrated assessment. But much of this text has been dispersed to different sections of the chapter. This leads reviewers to say that this point is missing. It is not missing. It is just not in the place where |
| 12328 | 7 | 30 | 36 | | | This section gives a better description of CCS than the description in Chapter 10. Please make sure the descriptions are more consistent between the two Chapters, and this section 7.5.3 should be the basis. | Noted. No action required for Chapter 7. |
| 17748 | 7 | 31 | 1 | | | replace "mind" by "mid" | Editorial. Text has been rewritten |
| 9266 | 7 | 31 | 1 | 31 | 1 | Start of second sentence does not make sense "As of Mind …" - perhaps it is meant to say "As of mid …" | Editorial. Typo has been corrected. |
| 8907 | 7 | 31 | 1 | | | Typo - "mind" should be "mid" | Editorial. Text has been rewritten |
| 13295 | 7 | 31 | 1 | 31 | 1 | The word 'mind' should presumably be 'mid' | Editorial. Typo has been corrected. |
| 4523 | 7 | 31 | 1 | 31 | 4 | The GCCSI reference give 8 large scale integrated projects in operation not 4. | Accepted. Text has been rewritten |
| 4811 | 7 | 31 | 1 | 31 | 1 | As of mid 2012, instead of mind 2012. | Editorial. Typo has been corrected. |
| 5156 | 7 | 31 | 1 | 31 | 1 | last sentence: --mind? | Editorial. Typo has been corrected. |
| 2784 | 7 | 31 | 1 | 31 | 5 | I think it is worth making the point that none of the four functioning CCS projects are in the power sector. Making CCS work in the power sector is still a major challenge. | Accepted. Text has been rewritten making this point obsolete. The text in Chapter 7 is clear that early CCS deployment will occur outside of the |
| 2273 | 7 | 31 | 13 | 31 | 17 | Given the breadth of potentially promising advanced capture technologies, the specific emphasis on amino acids and iocinic liquid based capture materials appears to be a bit arbitrary. | Accepted. Text has been rewritten making this point obsolete. |

|---|---|---|---|---|---|---|---|
| 5733 | 7 | 31 | 13 | 31 | 17 | Currently, post-combustion capture from coal-fired power plants using solvent scrubbing must be technologically capable. However, NETL (Figueroa et al., 2008) and Davidson (2009) show the vision of innovative CO2 capture technologies from a perspective of time to commercialization and cost reduction benefit. Advanced technologies such as solid sorbents, membrane systems (Kai et al., 2008), ionic liquids, MOFs and enzymatic membranes, are expected to follow amine scrubbing systems.<br><br>J. D. Figueroa, T. Fout, S. Plasynski, H. McIlvried, R. D. Srivastava, “Advanced in CO2 capture technology – the U.S. Department of Energy’s Carbon Sequestration Program”, International Journal of Greenhouse Gas Control, 2(1), 9-20 (2008)<br><br>R. Davidson, “Post-combustion carbon capture – solid sorbents and membranes”, CCC/144, IEA Clean Coal Centre (2009)<br><br>T. Kai, T. Kouketsu, S. Duan, S. Kazama, K. Yamada, "Development of commercial-sized dendrimer composite membrane modules for CO2 removal from flue gas", Sep. Purif. Tech., 63 (2008) 524-530. | Accepted. Text has been rewritten making this point obsolete. |
| 8908 | 7 | 31 | 14 | | | The following statement "Wappel et al., (2010), and Vaidhyanathan (2010) are exploring advanced CO2 capture systems based upon novel approaches using amino acid and iocinc liquid-based capture materials which potentially represent the core of new CO2 capture systems that would require dramatically less energy (typically heat) to regenerate the capture solvent." is unnecessary and implies that ionic liquids and ammino-acid based CCS systems are significantly better than other advanced systems which are currently being researched (sorbent-enhanced shift, chemical looping, carbonate looping, ZECA, etc, etc). There are many others which should be mentioned if these two types of CCS are singled out for special treatment. There are also numerous issues with ionic liquids - high viscocity being probably the most challenging. The statement should be ommitted or simply left as "many advanced CCS technologies are being studied". Further details comparing the pros and cons of different advanced technologies are available in Mac Dowell, N., et al., An Overview of CO2 capture technologies. Energy and Environmental Science, 2010. 3 (11): p. 1645 - 1669. | Accepted / taken into account. The sections on CCS have been substantially rewritten to bring out the pros and the cons of the technology |
| 3001 | 7 | 31 | 14 | | | I could not understand the emphasis given to the research of Vaidhyanathan (2010) on iocinc liquid-based capture materials. The text states that this “potentially represents the core of new CO2 capture systems that would require dramatically less energy (typically heat) to regenerate the capture solvent.” Unfortunately, this is a very partial statement that, first, does not recognize the vast and diverse literature related to studies for reducing energy penalty; and, second, poses its expectation on a solely solution, which is very doubtful. I strong recommend to cite other studies that were published, showing that there is not yet a single and winner solution to reduce the energy penalty of post-combustion capture plants. Only to cite few examples, please see: Rochedo, P.R.R., Szklo, A.S., 2012. Work of Separation and Learning Curves for Carbon Capture based on Chemical Absorption. In: 7th Conference on Sustainable Development of Energy, Water and Environment Systems – SDEWES Conference, Ohrid-Macedônia. Raynal, L., Bouillon, P.A., Gomez, A., Broutin, P., From MEA to demixing solvents and future steps, a roadmap for lowering the cost of post-combustion carbon capture. Chem. Eng. J. Vol.171 No.3, pp 742-752, 2011. Zanganeh, K., Shafeen, A., 2007. A novel process integration, optimization and design approach for large-scale implementation of oxy-fired coal power plants with CO2 capture. International Journal Of Greenhouse Gas Control 1, 47–54. Rochelle, G., Chen, E., Freeman, S., et al, Aqueous piperazine as the new standard for CO2 capture technology.” Chem. Eng. J. Vol. 171 pp. 725-733, 2011. Svendsen, H. F., Hessen, E. T., Mejdell, T., Carbon dioxide capture by absorption, challenges and possibilities. Chem. Eng. J., Vol. 171, No. 3, pp 718-724, 2011. | Accepted. Text in section 7.5.5 has been substantially rewritten making this point obsolete. Hopefully the revised text is not nearly as narrowly focused as the FOD text on this point. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 17365 | 7 | 31 | 15 | | | ionic liquid-based capture… | Accepted / taken into account. The sections on CCS have been substantially rewritten to bring out the pros and the |
| 4440 | 7 | 31 | 18 | 31 | 18 | Quantify the high capital costs, for example as a proportion of new powerplant capital expenditure or final cost of electricity. | Taken into Account. The text in 7.5.5 now clearly says "Estimates for CO2 capture costs are summarized in |
| 15481 | 7 | 31 | 18 | 31 | 20 | High capital costs as such do NOT drive CCS plants down the dispatch curve - you want to run a plant intensively if its variable costs are low, which is a different matter. The issue is more that you would only want to build something with high capital costs IF it had low variable costs and therefore could be run intensively. See eg Stoft, Power System economics, Wiley 2003, or Kirschen and Strbac, Fundamentals of Power System Economics, Wiley 2004, or Green, OXREP 2001 or 2005 or many other sources! | Accepted. New text is not in this section that hopefully clarifies this point. |
| 2831 | 7 | 31 | 18 | 31 | 20 | This sentence is odd given that, as the text recognises, there are no large scale commercial CCS power plants so it is not clear what it is supposed to be describing. In a future low carbon system dominated by renewables and nuclear, CCS plant might have to operate flexibly; the problem is how to construct the necessary incentives. Page 38 explains this better. | Rejected. No scientific evidence or peer reviewed publications offered in support of reviewer's comment. |
| 11855 | 7 | 31 | 18 | 31 | 23 | It is unclear what the term "single purpose" refers to here (and earlier). And why does CCS's 'single purpose' define its likely use only on baseload power systems? | Noted. The single purpose nature of CCS is an important issue as it |
| 6189 | 7 | 31 | 18 | 31 | 20 | "The high capital costs and single purpose use for CO2 capture equipment when mated to power plants drives these CCS-enabled power plants down the dispatch curve where they serve primarily to produce baseload power." This sentence seems flawed. The high capital costs may serve to discourage CCS-enabled plants from being built to serve new capacity, but once built those capital costs should not affect its merit order in dispatching. | Accepted. New text is not in this section that hopefully clarifies this point. |
| 11856 | 7 | 31 | 26 | | 27 | The following wording "are likely to arise in the aspects of the industrial sector that produce high purity 27 CO2 waste streams that are typically vented to the atmosphere" is confusing. What is meant by 'aspects' in this context? Also, is it possible to give a few examples of the industries that producee these high-purity CO2 waste streams? | Noted. The single purpose nature of CCS is an important issue as it contextualizes when and why CCS will be deployed. |
| 6697 | 7 | 31 | 28 | 31 | 33 | The cost of CCS project depends on conditions, for example its location, fuel used. Recent studies show that various problems with the large-scale realization of carbon CCS have been indicated; most important among them is its cost. "at about $100/tonCO2 the electricity sector is largely decarbonized with a significant fraction being from CCS deployment" isn't necessarily true.<br><br>See: Finkenrath, M. (2011) Cost and Performance of Carbon Dioxide Capture from Power Generation, International Energy Agency.<br>The same study was published as the following peer-reviewed article (but was only available for 24-hour access online): Finkenrath, M. (2012) Carbon Dioxide Capture from Power Generation – Status of Cost and Performance. Chem. Eng. Technol., 35: 482–488. | Rejected. Not supported by accessible peer reviewed literature. Since this is not accessible I don't see that it can or should be cited. Also it is not clear if the two reports being referenced here are reporting first of a kind costs or n-th of a kind costs. Suggest no changes to the text in Chapter 7 as currently written. This text has now been moved to section 7.11.3 |
| 9471 | 7 | 31 | 28 | 31 | 33 | As bioenergy is widely recognized as carbon-neutral, I wonder if installation of BECCS is examined in a factual manner. I also doubt that large-scale utilization of BECCS is well underway when the price is about $100/ton CO2.<br>If they are facts, status of examination of BECCS should be described more specifically. | Noted. I am not sure what the meaning of "facts" is here in the commenters note. The sentence that is being referenced is an accurate description of |
| 9263 | 7 | 31 | 28 | 31 | 28 | The figure of 100$/ton is old and depends on many factors. Figures around $60/t are now likely to be achieved with existing technology, though that's in optimal conditions. Maybe specify a range or state "up to $100/t"? Needs reviewing/update check. | Noted. Whether it is $60 or $100/tonCO2 doesn't really matter in terms of the point being made here which is that CCS sets a backstop price |

|---|---|---|---|---|---|---|---|
| 2832 | 7 | 31 | 28 | 31 | 33 | This is another case where evidence from models should be qualified by reference to empirical evidence – see article referenced above. Even if models agree they do not necessarily provide much of a guide to the real world; it is symptomatic that a modelling result is described as an “important insight”. | Noted. No change required. |
| 16814 | 7 | 31 | 28 | | 33 | Suggest adding something to make clear the following: Economic modeling demonstrates the importance of CCS technology in terms of driving the costs of meeting stringent CO2 caps. If CCS is expensive, the CO2 price will be higher. If CCS is relatively inexpensive, the CO2 price will be lower. CCS, as a means to lower CO2 emissions, is much less costly than many other large scale mitigation options. | Noted. The text in question has now been moved to section 7.11.3 where it is presented in a broader context that hopefully brings forward the nuance the |
| 4812 | 7 | 31 | 28 | 31 | 28 | Add price to the line: at a PRICE of about $100/tonCO2 | Noted. |
| 9490 | 7 | 31 | 28 | | | Rewrite or delete reference to '$100/tCO2' in the context of CCS. This gives the wrong impression as CCS will in most cases be cheaper, and 70% cheaper than CO2 abatement without CCS (ref IEA Blue Map Scenario. | Reject. Not supported by the peer reviewed literature. I do not agree (to the extent I understand the review comment) and I do not believe this will improve the readability of the text. The |
| 9993 | 7 | 31 | 28 | 31 | 33 | This part should explain that there are many concerns about CCS. Even if carbon price maintain more than $100/tCO2, it is difficult to apply CCS in the real world because of technological, geographical, and public acceptance issues etc., as described in (Finkenrath, 2011, page39) and (Zobacka, 2012, Abstract). These literatures are listed in the No47 line of this table. | Taken into Account. The sections on CCS have been substantially rewritten to bring out the pros and the cons of the technology. NB. The discussion of CCS |
| 4441 | 7 | 31 | 30 | 31 | 33 | Net CO2 removal from the atmosphere when including land use changes and other externalities? | Noted. Yes, this is what the literature being summarized here is saying. |
| 16114 | 7 | 31 | 34 | 31 | 42 | The body of evidence does not go one way, as the message in this paragraph tends to say. What about earthquakes menacing the integrity of reservoirs? (e.g. Zoback M., Gorelick 2012 “Earthquake triggering and large-scale geologic storage of carbon dioxide” PNAS 109:5185–5189). This particular paper came after 2011, but so do several informations given in the same section (e.g. p.31 line 7, line 21, line 39...) | Taken into Account. The sections on CCS have been substantially rewritten to bring out the pros and the cons of the technology. NB. The discussion of CCS |
| 7732 | 7 | 31 | 39 | 31 | 42 | It is still premature to consider risk-reduction for CCS. | Rejected. Not supported by the peer reviewed literature. Furthermore, I don’t know what the basis is for saying it is premature to think about risk. It seems |
| 2274 | 7 | 31 | 42 | 31 | 42 | While a reference to a discussion of storage risks in chapter 7.9.3 is provided, they are nowhere mentioned in 7.9.3. | Taken into Account. The sections on CCS have been substantially rewritten. The risks of CCS and the means to mitigate them are now dealt with in |
| 16039 | 7 | 31 | 42 | | | In 7.9.3 is no discussion of storage riscs. | Accepted / taken into Account. The sections on CCS have been substantially rewritten. The risks of CCS and the means to mitigate them are now dealt |
| 16115 | 7 | 31 | 43 | 32 | 28 | The methodology for CCS is more balanced in its description of progress than previous paragraphs, but it does not describe the confidence level of the assessments quoted. This weakens the argument and looks like a plaidoyer in favour of CCS. In particular, the final sentence "the relative cost (...) could still be competitive with other large scale emissions mitigation measures" looks like a lobbying pamphlet and is ironic when no economic project has been started anywhere. | Rejected. No scientific evidence or peer reviewed publications offered in support of reviewer's comment. There is plenty of literature that comports with the idea of CCS being cost competitive with |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 2275 | 7 | 31 | 43 | 32 | 28 | These two sections on CO2 storage do seem to "downplay" a bit the existing differences in CO2 storage capacity evaluattion methodologies used across the world (some of which have quite significant differences in e.g. storage efficiency factor assessment or if the include open structures as well in their estimates) and the underlying uncertatinty of CO2 storage capacity estimates across most regions in the world (apart from a few highly developed countries), given the significant lack of site-specific geological data and injection experience for most regions. (see e.g. Lynton K Spencer, John Bradshaw, Barry E Bradshaw, Anna-Liisa Lahtinen, Alfredo Chirinos: Regional storage capacity estimates: Prospectivity not statistics Energy Procedia, Volume 4, 2011, Pages 4857-4864, or for a summary (in the grey literature) http://www.iea.org/media/workshops/2012/cert/Causebrook.pdf) | Rejected. Beyond the scope of Chapter 7. Yes there are differences in CO2 storage capacity methodologies. However, they are all based upon a fairly uniform set of bulk properties. Discussing these differences is too fine a level of detail for this Chapter. |
| 6427 | 7 | 31 | 46 | 31 | 46 | remove "just" | Editorial. Text has been rewritten |
| 16112 | 7 | 31 | 5 | 31 | 6 | The expression "critical advances" is clearly too optimistic when so much cost cutting is in order to match the present needs of carbon markets | Rejected -- not supported by the broad body of peer reviewed literature. A vast body of knowledge has been produced by these field experiments. There is no need to denigrate the importance of the |
| 5137 | 7 | 31 | 7 | | 8 | Considering the recent decision by the TransAlta ( a Canadian public electricity company) to withdraw from the heavily government subsidized CCS implementation in one of their coal-fired plants, there is some merit to add some discussion to the statement " CCS has not been applied to a large....". | Rejected. Not supported by peer reviewed literature. Not sure what the commenter wants to see done with the text. The cancelation of this particular project is yet more data to support the statement made at the start of this short CCS section that CCS is a single purpose climate mitigation technology |
| 4439 | 7 | 31 | 7 | 31 | 8 | A sentence could be inserted to describe the barriers to large-scale deployment of CCS solutions. This is relevant both as you have stated that each part of the CCS system exists already in practice and the potential that for CCS to mitigate global warming as discussed on p32, lines 13-28. | Taken into Account. These points are addressed in other parts of Chapter 7. These points are made in the later sections of Chapter 7.9.2, 7.9.3., 7.9.4, 7.10. There is material in Chapter 7 that |
| 10535 | 7 | 31 | 7 | 31 | 8 | How does a 2011 reference quite 2012 information? Also needs a comment on loss of power output due to power demand of CCS system. Also in section 7.5.3 needs a comment on legal liabilities and progress being made in that regard. | Accepted. Section 7.5.5 now explicitly discusses liability and what field research is telling us that informs |
| 3453 | 7 | 31 | 1 | 31 | 8 | Are there any cost to present regarding CCS? | Taken into Account. The text in 7.5.5 now clearly says "Estimates for CO2 capture costs are summarized in |
| 13492 | 7 | 31 | 28 | 31 | 29 | Text: "Integrated assessment models (see Chapter 6) tend to agree that at about $100/tonCO2 the electricity sector is largely decarbonized with a significant fraction being from CCS deployment" The problem with pricing carbon dioxide emissions is that, since the global economy is highly dependent on carbon dioxide emissions, a level of pricing at $100/tonCO2 would create significant risk of inflation, which would be followed by economic re-equilibriation, after which the carbon price would have no further impact. Plus, in a general atmosphere of volatility in energy prices, it is unlikely that a carbon emissions price of any amount would create enough of a signal to trigger decarbonisation - neither in energy efficiency, energy conservation, energy plant replacement, or in new energy sector investment. In fact, a strong carbon emissions price could deter energy users from investing in new energy resources, as they would be under financial duress from the carbon emissions pricing. There are too many forces and factors that would conspire to keep the price of carbon dioxide emissions "cost-efficient" and marginal, so it is hard to imagine a high price for carbon dioxide under any regime proposed to date. | Noted. The text as currently written accurately reflects the peer reviewed literature. It is clear that this reviewer does not agree with whether this is "likely" but that doesn't make what is written here wrong or doesn't require any changes. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 10049 | 7 | 31 | 28 | 31 | 30 | Integrated assessment models do not reflect the technical possibility of large scale CCS and do not take into account the real costs of CCS equipment in the current development stage, nor the significant efficiency losses of power plants using CCS technology. It is important to note, that these intergrated simply assume that technology might work and that this technology might be available. In all energy modells, CCS grows on the expense of (lower cost) renewable energy. The current paragraph is misleading and must be significantly rewritten to reflect the assumptions used in those modells oin order to come to the quoted results. | Rejected. No scientific evidence or body of peer reviewed literature is offered in support of the comment. Chapter 6 deals with the capabilities and limits of integrated assessment models. There is no space to repeat that discussion in Chapter 7 and there certainly is no room to cover that same ground as it relates to one sentence about CCS deployment |
| 11932 | 7 | 32 | 1 | | | CO2 storage "potential" (or capacity)? | Note -- storage capacity is meant which becomes clear from the context and the beginning of the paragraph which |
| 15488 | 7 | 32 | 17 | 32 | 24 | Quote at least fossil energies subsidies schemes which are part of difficulties RES face to reflect the real price | Rejected - comment seems to be misplaced - please clarify to which part |
| 15489 | 7 | 32 | 17 | 32 | 24 | Introduce in a short sentence positive externalities and the concept of energy service | Rejected - comment seems to be misplaced - please clarify to which part |
| 9488 | 7 | 32 | 2 | | | reference to storage capacity in utsira fm - should refer to NPD(2012). Reference toSTRACHAN ET AL not relevant .- refer to http://www.npd.no/en/publications/reports/co2-storage-atlas-/ | Accepted. Reference changed. |
| 6698 | 7 | 32 | 26 | 32 | 28 | The cost of CCS depends on the distance from emission source to storage site, geological and geographical conditions. It should be noticed that the places where CCS plants can be economically installed are limited. Recent studies show that adding carbon capture and storage to a reference-case supercritical pulverized coal (PC) unit would raise the cost of electricity from 5.3¢/kWh to 8.8¢/kWh, and that the cost of CO2 avoided would be $49.7 per tonne. Thus CCS is not estimated to be cost competitive at this time.<br><br>See: Rubin, E.S., C. Chen & A.B. Rao (2007) Cost and performance of fossil fuel power plants with CO2 capture and storage. Energy Policy 35, 4444–4454. | Taken into account. These points are covered extensively in the Chapter. |
| 9994 | 7 | 32 | 26 | 32 | 28 | This part should explain that there are only limited places where CCS is economical. Cost for CCS is related to geological and geographical conditions of the site such as the distance between CO2 emission source and storage site, as described in (Finkenrath, 2011, page39). This literature is listed in the No47 line of this table. | Taken into account. These points are covered 7.8.2.1 |
| 18054 | 7 | 32 | 30 | 35 | 30 | It could be worth adding that this "small fraction" already covers 20% of the world's electricity needs. | Accepted - we have noted the contribution of RE to electricity to provide context also to the growth we |
| 4813 | 7 | 32 | 30 | 32 | 30 | Provide figures for potential RE and the fraction currently used, if available | Accepted - We have links to the earlier section where technical potentials are addressed. Due to space limitations we have not quantitatively compared the technical potential to actual use, but |
| 2585 | 7 | 32 | 43 | 33 | 2 | Hydropower: Technological progress increased the energy conversion to 90%; so nowadays, it is economically viable to install and exploit microhydropower. | Rejected - this improvement has not really been dramatic since the AR4, and here we are only providing a couple examples. We do not have space to |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 10536 | 7 | 32 | 43 | 32 | 47 | Not clear why only these 3 examples are "notable". Could add geothermal (eg EGS or binary) and hydro (eg low head) to give better balance. | Accepted - we do not use the word "notable" alone, but instead make it clear that these are merely examples. We did not, however, add a lot of additional examples (other than CSP) as we are severely space constrained, and the examples could easily see no end. We have chosen a range of examples that, |
| 12599 | 7 | 32 | 44 | | | I think the major reason for the reduction in the price of PV has been the subsidization of Chinese PV factories by the Chinese government | Rejected - there is no peer reviewed literature that we are aware of, or even grey literature, that suggests this to be the case. The production cost of solar modules is now below $1/W, whereas modules sold for $4/W only 5 years ago. While there may well be some effect from subsidies from China, as suggested in the US trade case, that represents |
| 12598 | 7 | 32 | 46 | | | The reason we look to creating larger offshore wind turbines is that this means there is less infrastructure, as less turbines for the same energy output | Accepted - we have noted improvements in the cost structure of wind as a result, though we do not have |
| 18056 | 7 | 32 | 46 | 32 | 46 | write: "continued increase in the size, efficiency and therefore energy capture (...)" | Rejected - efficiency is not a well defined term in the wind industry, in our view. In fact, the trend towards larger rotors (with similar generator size) leads to greater energy capture, but efficiency is arguably reduced in that a smaller fraction of the available wind to the rotor |
| 18055 | 7 | 32 | 46 | 32 | 47 | Add: "increasing their yield and, thereby, economic viability." as the cost effect is made explicit for the other technologies in the paragraph - not for wind energy. | Accepted - we have noted the cost effect, though not in exactly the way |
| 12108 | 7 | 32 | 19 | 33 | 20 | In the discussion of technical potential for renewable energy - whilst it is important, as you have done, to be sober in this assessment, the fact that there is a large body of literature showing the technical potential for a transition to 80-100% renewable energy for electricity generation for many countries, now is surely important to note.....For an overview of this literature please see - Elliston B, Diesendorf M, MacGill I, 2012, 'Simulations of Scenarios with 100% Renewable Electricity in the Australian National Electricity Market'. Energy Policy 45:606-613. http://www.ies.unsw.edu.au/docs/diesendorf-simulations.pdf | Rejected - the issue is interesting but space constraints do not allow for an extended discussion. Please provide peer-reviewed literature to support your arguments. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 12109 | 7 | 32 | 19 | 33 | 20 | In the discussion of the technical potential of renewable energy - there is no discussion of the fact that a significant barrier to achieving 80-100 percent is the myth that "renewable energy cannot provide baseload power." It is obvious that four types of renewable sources – hydro, biomass, hot rock geothermal and solar thermal - can provide baseload power. Graham Sinden at Oxford University has also found that wind, wave, solar and tidal power can also provide base load electricity when used in combination on a large scale separated by several hundred kilometres and subject to different wind, wave, solar or tidal regimes. The total output of such systems generally varies smoothly. Based on historical date, he found that it would be impossible for such an integrated system to be in a situation of no wind, waves, sun or tidal change at any site. He has also demonstated that most of the UK's electricity could be generated from renewable. [REF - ◦Sinden. G. (2006) Diversified renewable energy resources. Carbon Trust. http://www.eci.ox.ac.uk/people/sindengraham.php] Other research groups have come to similar conclusions for other countries. - Sigurd Weinreich's team at The Centre for European Economic Research, has developed a model that shows it is technologically and economically affordable for the EU to make a transition over the coming decades to meeting 100 percent of their electricity needs from renewable and distributed energy sources. [Weinreich, S. et al (1998) 'Long-Term Integration of Renewable Energy Sources into the European Energy System', Environmental and Resource Economics, LTIResearch Group, Physica Verlag, Heidelberg. Available at http://www.amazon.com/Long-Term-Integration-Renewable-Environmental-Economics/dp/3790811041. ]<br>- Further literature overviewed in Iliston B, Diesendorf M, MacGill I, 2012, 'Simulations of Scenarios with 100% Renewable Electricity in the Australian National Electricity Market'. Energy Policy 45:606-613. http://www.ies.unsw.edu.au/docs/diesendorf-simulations.pdf | Rejected - the myth might be part of the political debate. The AR5 is a scientific assessment report, which summarizes the peer-reviewed literature. It does not have the obligation to observe the political debate and to correct potential misunderstandings. A balanced discussion of the challenges associated with providing high shares of RE is given in chapter 7.4.2 and 7.6..1. |
| 12107 | 7 | 32 | 29 | 33 | 20 | Shouldn't co-generation and tri-generation - combined heat and power be mentioned either in the renewable energy section or at least somewhere else appropriate in this chapter? I could find no mention of co-generation or tri-generation in the "Energy Systems" chapter 7. | Accepted - it is mentioned in 7.5.1 already; comment best addressed to that section |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 4109 | 7 | 32 | 29 | 34 | 14 | Section 7.4.3 was weak, but Section 7.5.4 Renewable Energy is even weaker. Issues such as power densities, real potential, and the plethora of exaggerated claims about performance to date and propsects are not dealt with. Is this all that can be said about CSP (page 33, line 10), or biofuels (page 34, lines 10-11) - already a disaster zone in the US transportation sector. Grand statements about the increased energy capture of wind turbines overlooks the patter of placing Vestas V90 machines where mean wind speeds are low, to increase energy capture and apparent capacity factor achievement while having too small a tubine etc to operate optimally in terms of total capex (the so-called Pickenham effect). Etc, etc. A complete rewrite is recommended. | Rejected - This section derives much of its material from the core material in the IPCC SRREN report, which we feel is appropriate. Technical potential is addressed in an earlier section. "Real" potential is not a well defined term, but is addressed to some degree in the scenarios section 7.11, which addresses deployment in various carbon mitigation scenarios. Economics is addressed in a later section of the chapter as well. These various issues were not intended to be covered in this specific subsection, and comments on those topics should therefore be directed to other sections by and large. We do not have the space to allow discussion of individual technologies in much depth. CSP, however, is addressed to some extent in the "infrastructure/integration" sections, as its primary advantage is that of thermal storage, issues addressed in the later section. Biofuels issues, including the many concerns, are similarly addressed elsewhere in the chapter, and in other chapters of AR5. The statement about increased energy capture of wind is technically accurate and, in our view |
| 11933 | 7 | 32 | 29 | | | Section could be reduced somewhat and simply refer to the recent IPCC report on RE, with one-line conclusions and references given here. | Noted -text reduced somewhat in places, but also augmented in others, with extensive referencing to the SRREN. |
| 10960 | 7 | 32 | 29 | 34 | 14 | Confer: Torvanger, Lund, Rive, Carbon capture and storage deployment rates: needs and feasibility, Mitigation and Adaptation Strategies for Global Change, DOI: http://dx.doi.org/10.1007/s11027-012-9357-7 | Taken into account. See comment above (4109) that suggested the inclusion of this paper in another part of |
| 15487 | 7 | 32 | 31 | 32 | 32 | Rewrite the sentence in brackets in a positive formulation “most, but not all, forms of RE supply have low life-cycle GHG emissions in comparison to fossil fuels » to avoid any misunderstand (even if the affirmation is true but comparing RE footprint in general as fossil fuels in general make no sense) | Rejected - We are not certain what the comment wants us to do with the sentence. Without further clarification on |
| 7124 | 7 | 32 | 34 | 34 | 13 | These paragraphs may deleted. The content in these paragraphs does not seem to focus on the section 7.5 title "Mitigation technology options, practices and behavioural aspects". However, some of the text could be moved to section 7.4.3 to serve as background material on Renewable Energy resources. | Rejected - the text here relates to conversion technologies, not resources. |
| 3260 | 7 | 32 | | 33 | | 1. This chapter needs more structure, by trying maybe a table or iconic figure that recapitulate all sources of energy described (nuclear, fossil, gas, hydrological, bioenergy, hydropower, windpower, solar energy, geothermal, etc) and map for each the acceptability and behaviroural implications.<br>2. Another suggestion on the change in the energy sector is the modification of land use for some of these sectors ( hydropower means big dams and a big change in water cycle, water flow, freshwater ecosystems, and other human impacts that can results in GHG emission). | Rejected - The acceptability issues are addressed elsewhere in the chapter, not in this subsection. Same is true on land use - those issues are addressed later in the chapter. Comment is really an overarching one that applies to the full |
| 13201 | 7 | 33 | 10 | 33 | 10 | The first time CSP is used, explicit the meaning Concentrated Solar Power | Accepted |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 12600 | 7 | 33 | 13 | | | Tidal devices have not really settled on one general commercial design, but they generally are horizontal axis turbines, for example Evopod, Open Hydro, Tidel and Marine Current Turbines. The only other main contender for this approach is the hydrofoil based devices such as Pulse Tidel. Wave is much more under development, generally devices are point absorbers, hydraulic or overtopping, | Accepted - we cannot provide these details, but we have added "certain types of tidal barrages" to make it clear that not all today devices are technically |
| 12601 | 7 | 33 | 14 | | | Typical three bladed horizontal axis turbine is mature, but there is still much work on a range of vertical axis turbines. Mostly these are for the urban environment where turbulant winds are supposed to, anecodtally, mean the vertical axis systems work better than horizontal. However, there is also the Aerogenerator X, a vertical offshore system hoped to scale up to 10MW – see http://www.windpower.ltd.uk/ | Accepted - we have added "traditional" to note that traditional land based technology is mature. We do not have the space to discuss more radical design |
| 18057 | 7 | 33 | 15 | 33 | 15 | Delete "relatively". | Accepted |
| 17367 | 7 | 33 | 15 | 33 | 16 | is increasing but is commercially mature… | Rejected - we believe that offshore wind is less technically and commercially mature. That said, the word commercial maturity is poorly defined. We eliminated it and instead noted that offshore wind is less technically mature |
| 18209 | 7 | 33 | 17 | | 24 | Delete: Because the cost of many RE technologies has historically been higher than market energy prices (e.g. Fischedick et al., 2011; Section 7.8), public R&D programs have been important and government policies have played a major role in defining the amount and location of RE deployment (Mitchell et al., 2011; IEA, 2011e; REN21, 2012). Additionally, because RE relies on natural energy flows, RE technologies must often be located at or near the energy resource, often collect energy from diffuse energy flows, and may produce energy output that is variable and—to some degree—unpredictable (IPCC, 2011b). The implications of these characteristics for infrastructure development and network integration are addressed in Section 7.6. Comments: Should be complemented by that R & D by the public sector institutions and associated patents most industrialized countries, could play an important role with respect to the effective transfer of technology to developing countries, it being understood that technology transfer is presumed easier when it comes to patents public sector private sector. | Rejected - We are not sure what is being requested, but we believe that the existing text is important to maintain. Issues of technology transfer are very important, but are not in the domain of this subsection - they are addressed elsewhere in the AR5 chapters. |
| 18210 | 7 | 33 | 17 | | 24 | Alternative paragraph:<br>Because the cost of many RE technologies has historically been higher than market energy prices (e.g. Fischedick et al., 2011; Section 7.8). Additionally, because RE relies on natural energy flows, RE technologies must often be located at or near the energy resource, often collect energy from diffuse energy flows, and may produce energy output that is variable and to some degree unpredictable (IPCC, 2011b). The implications of these characteristics for infrastructure development and network integration are addressed in Section 7.6. | Rejected - It seems that the commenter wishes to eliminate the text on the importance of R&D in driving costs lower, and the impact of policy in driving development. We think that these points are very important to maintain here to provide the proper context for why RE |
| 18213 | 7 | 33 | 17 | | 24 | Comment:<br>Variable retail prices can be used to make demand responsive to the availability of supply (Borenstein, 2005; Centolella, 2010). Comment: While this is true, people must be educated as to formally rational and efficient use of energy (UREE), in terms of development and sustainable consumption.<br>Alternative paragraph:<br>Variable retail prices can be used to make demand responsive to the availability of supply (Borenstein, 2005; Centolella, 2010). | Rejected - this comment is best addressed in the infrastructure/integration sections where these issues, including demand response, are addressed |
| 2587 | 7 | 33 | 17 | 33 | 24 | Bioenergy and hydropower can be stocked (thermal solar as well) and together with the integration of solar and wind energy, we can secure the supply. | Accepted - these issues are addressed in a later section of the chapter in more detail, but we made it more clear that the statements made here apply only to |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 4649 | 7 | 33 | 17 | 33 | 17 | “Because the cost of many RE technologies has historically been higher than market energy prices ---“. This does not apply to existing biomass energy use including ethanol from sugar cane. Fuelwood and charcoal are very competitive with the fossil fuel alternatives. It is usually fossil fuels (and electricity) that are subsidized. | Accepted - this is why we use the term "many" but we have also added "not all". We have not added examples here, however, as that is better addressed in |
| 16041 | 7 | 33 | 17 | | | Because the investment costs of many … (because the operating costs of RE normaly much lower than from other energy systems due not need to by energy feedstock) | Rejected - the point here is simply that the total cost of many RE techs has been higher than market energy prices, |
| 12842 | 7 | 33 | 17 | 33 | 24 | Please include in the discussion whether or not taxes are included when comparing prices of RE and conventional energy. Comparison should be done on a equal base. | Rejected - this statement is based on the IPCC SRREN (and supported by section 7.8), and the reader is directed to that source document for the considerable documentation and caveats |
| 18059 | 7 | 33 | 22 | 33 | 23 | Delete "to some degree unpredictable". Wind is variable but highly predictable within the timeframes relevant for efficient system operation. It is unpredictable beyond 1-2 weeks which is irrelevant for systems operation and so are other technologies due to, e.g. unscheduled shut-downs | Rejected - we discuss wind forecasting in a later section of the report. However, we are not aware of peer reviewed literature that suggests that wind forecasting is, in broad terms, better than fossil plant output forecasts. In fact, the many integration studies that have been conducted demonstrate that the level of unpredictability, on a day ahead and hour ahead basis, and even after forecasting, does have implications for unit commitment and dispatch and reserves. These are details are better left for a later section. That said, we have made some small revisions to the text |
| 16116 | 7 | 33 | 23 | | | The word "unpredictable" should not be used here. In developed areas with experience with windpower, the production of energy is variable but known in advance with very hig levels of confidence (less than 10% deviation in 24 hours). This is better than many thermal plants. | Rejected - we discuss wind forecasting in a later section of the report. However, we are not aware of peer reviewed literature that suggests that wind forecasting is, in broad terms, better than fossil plant output forecasts. That said, we have made some small revisions to the text here to note the RE sources can be forecasted, so as not to |
| 11765 | 7 | 33 | 25 | 33 | 33 | In response to the result of No.50, these sentense should be amended appropriate. | Rejected - sorry, but we do not know what No 50 refers to here. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 13296 | 7 | 33 | 25 | 33 | 33 | As per earlier comment - presumably RE was nearly half of new nameplate (i.e. peak) GW installed; however on average RE technologies will tend to operate at a much lower load factor (e.g. <20% for PV, around 30% for onshore wind) than fossil capacity operating at baseload, so TWh generation from RE installed in 2011 likely to be still consderably lower than that from new fossil plant - RE share might be 20-25%. Given that this is arguably a more accurate reflection of the share of new capacity, it would be worth adding this (probably in addition to the GW share, not instead) | Accepted - we cannot in fact show the incremental contribution to energy supply for the most recent year, as global energy supply statistics are always lagging by ~2 years. So the most recent-year statistics on energy supply contribution growth are not available on a global basis. We certainly agree that those statistics would be valuable (and more useful than capacity growth), however, so we now note the situation in a footnote so that the reader at least understands the limits to capacity |
| 18060 | 7 | 33 | 25 | 33 | 27 | If we insist referring to renewables as "relatively small", the bracket should say "(excluding traditional biomass and large hydro). The correct would be to write that - due to them comming into the market at a later stage, their share of total current energy supply is small, but their share of the market for new supply is significant globally and dominant regionally. | Accepted - we have presented data here so as not to only use words like "relatively small" that are hard to interpret. |
| 16816 | 7 | 33 | 25 | | 33 | Nameplace capacity of new plant is less meaningful than providing the amount of energy produced (GWhs) as percent of total -- it is important for people to see the progress is being made but that this is still at a relatively small scale. | Accepted - we cannot in fact show the incremental contribution to energy supply for the most recent year, as global energy supply statistics are always lagging by ~2 years. So the most recent-year statistics on energy supply contribution growth are not available on a global basis. We certainly agree that those statistics would be valuable (and more useful than capacity growth), however, so we now note the situation in a footnote so that the reader at least understands the limits to capacity |
| 10538 | 7 | 33 | 25 | 33 | 33 | This para better merged into section 7.2 | Taken into account - for the moment it will stay in this location, but it may be |
| 5927 | 7 | 33 | 25 | | 33 | Presenting only capacities gives a biased picture of the development: annual full-load hours of solar pv are often about 1000 h, wind 2000-2500 h, whereas fof conventional generation at about 5000-6000 h in baseload operation and up to 8000 h for nuclear. | Accepted - we cannot in fact show the incremental contribution to energy supply for the most recent year, as global energy supply statistics are always lagging by ~2 years. So the most recent-year statistics on energy supply contribution growth are not available on a global basis. We certainly agree that those statistics would be valuable (and more useful than capacity growth), however, so we now note the situation in a footnote so that the reader at least understands the limits to capacity |

|---|---|---|---|---|---|---|---|
| 9472 | 7 | 33 | 27 | 33 | 33 | It is written that “RE accounted for almost half of the 208 GW of new electricity generating capacity added globally in 2011”, but mentioning only generation capacity can lead to overevaluation of renewable energy, as many types of renewable energy have low generating efficiency. Taking into account the generating efficiency, electricity generated from renewable energy should be added. | Accepted - we cannot in fact show the incremental contribution to energy supply for the most recent year, as global energy supply statistics are always lagging by ~2 years. So the most recent-year statistics on energy supply contribution growth are not available on a global basis. We certainly agree that those statistics would be valuable (and more useful than capacity growth), however, so we now note the situation in a footnote so that the reader at least understands the limits to capacity |
| 4442 | 7 | 33 | 3 | 33 | 16 | How is maturity being defined in this paragraph? | Accepted - the definition is as noted already "level of technical and economic maturity to be deployed at significant scale". In other places we focus on technical maturity alone. While there is no single definition of maturity that is unambiguous, we have sought to be |
| 13212 | 7 | 33 | 3 | 33 | 4 | This sentence might be misunderstood : actually the solar cells improvements are not sufficient for puting PV at a "level of technical and economic maturity". I suggest deleting at least the first words "As a result of these and other advancements" | Accepted - excellent point |
| 10537 | 7 | 33 | 5 | | | IPCC 2011a better here than IPCC 2011 b | Accepted |
| 9651 | 7 | 33 | 6 | 33 | 9 | what about waste to energy? The relationship between bioenergy and food security needs to be mentioned somewhere. | Rejected - bioenergy encompasses waste to energy as per the IPCC SRREN. Food-bio links are addressed in chapter 11, and are not best addressed |
| 2586 | 7 | 33 | 6 | 33 | 8 | Bioenergy: R&D is proving the economic use of some drought resistant plant such as Jatropha for biofuel production. Since this specie can be grown in arid zone, it can be used as green barrier against desertification; a n impact of climate changes | Rejected - noted, but too much detail to be included here given severe space constraints |
| 17366 | 7 | 33 | 7 | | | biomass-fuelled power plants and… | Accepted |
| 4648 | 7 | 33 | 8 | 33 | 8 | See my comments above concerning lignocellulose-based transport fuel. | Noted |
| 15946 | 7 | 33 | 9 | 33 | 16 | solar pv is 'mature', and onshore wind is 'relatively mature'? Look at the numbers and the deployment and the LCOE. Wind is at least as 'mature' as pv. | Accepted |
| 16040 | 7 | 33 | 9 | | | (e.g. fuels, hydrogen or methan produced from … | Rejected - it seems to us that fuels is a sufficiently broad term to encompass the suggested additions, and we are under |
| 18058 | 7 | 33 | 17 | 33 | 24 | Delete the section. The first sentence about cost having historically been above market prices 1) holds for all technologies - not only RE and 2) confuses cost and prices. For over a decade, this has held true for all new technologies and still does, as most countries in the world are still operating with regulated prices for energy poverty reasons. The second sentence is dubious in stating that RE technologies must be located where the resource is (impliying far away from consumption), but failing to acknowledge that there are RE resources in some form in almost every location of the world. | Rejected - these points are quite directly made in the SRREN, and we believe they provide important links to other sections of the chapter in which related issues are addressed. While some wording changes have been made to this text based on this comment, and of course others as well, we believe the |

| 17388 | 7 | 34 | 17 | 37 | 18 | From line 17~18, “…There are 433 commercial nuclear power reactors operating in 30 countries with a total installed capacity of 367 GWe as of October 2011 (IAEA, 2011)”. I strongly suggest that the statistical numbers should be updated to the end of year 2011, which could and should be available at this time of report editing, I think the current data were given earlier for this FOD version due to unavailability of year-end statistics. In addition, this part should better capture the latest state of nuclear developments in the world, particularly the post-Fukushima policy shifts in some major nuclear power countries. According to the news of “Japan unveils plan to phase out nuclear power” by the BBC on Sept 14, 2012 (http://www.bbc.co.uk/news/world-asia-19595773), the Japanese government plans to shut down the reactors completely by 2040 and seeks to shift to renewable options or fossil imports(gas, oil and even coal). Such new policy changes would cause a significant impact on future nuclear deployment. | Accepted - Data updated with IAEA 2012. Nuclear policy in Japan is uncertain. |
| 18062 | 7 | 34 | 18 | 34 | 18 | replace "14%" with "13%" (according to the table) | Accepted - replaced with IEA 2010 data. |
| 18063 | 7 | 34 | 21 | 34 | 21 | delete "more than half". It seems odd to write more than half when it is more than two thirds | Accepted - text revised |
| 17368 | 7 | 34 | 21 | | | two-thirds (68%)… | This applies to Section 7.5.5<br>Editorial - text revised |
| 16042 | 7 | 34 | 21 | 34 | 22 | they represent 68% of the current …. | Accepted - text revised |
| 12544 | 7 | 34 | 7 | | | “Other more revolutionary small modular reactors (SMR) with additional passive safety features are near commercial status” -- this is simply untrue, if “near” means deployable in less than a decade at an affordable cost. The NRC does not anticipate online operation of any SMR design types prior to 2022. U.S. Nuclear Regulatory Commission, 2012. Report to Congress: Advanced Reactor Licensing. http://pbadupws.nrc.gov/docs/ML1215/ML12153A014.pdf | This applies to Section 7.5.5. Taken into account - text revised |
| 3786 | 7 | 34 | 8 | 34 | 14 | What about sugar cane or sweet sorghum that produces simultaneously liquid fuel for transport and electricity for the grid? | Comment does not refer to 7.5.5 |
| 9229 | 7 | 34 | 14 | 34 | 15 | To Incorporate three rows: Fossil electric power capacity above RE electric power capacity; gasoline demand or production below the row "ethanol production" and Diesel below the row of biodiesel production, to compare the share and dinamic | Rejected - space constraints preclude us from expanding the table, and data availability may be an issue. The contribution of RE electricity in % terms |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 4780 | 7 | 34 | 4 | 34 | 5 | It is important to note that storage hydropower and geothermal (as well as biomass under certain circumstances) are controllable renewable technologies that enhance the deployment of other variable renewables such as wind and solar. A sentence providing this information may be relevant. | Rejected - Good points, but addressed in the later section on infrastructure. |
| 18066 | 7 | 34 | | 37 | | In a report on the potential for climate mitigation, the timing of reductions should be addressed. This is perticular true for nuclear fission and fusion as well as CCS. Due to the long construction and planning times, these technologies are to a great extent long-term mitigation options that will not have significant impact on GHG reduction within the window in which AR5 says we need to reduce emissions. In fact, one must expect that the net carbon reductions from nuclear power will be negative as more plants are retired than new plants brought online, at least in the coming decade. | Rejected - not supported by current use of nuclear power nor historical deployment rates.<br>Disagree that nuclear fission is a long term option. They are operating today and contribute to emissions reduction, |
| 18511 | 7 | 34 | | | | Much of the text in this section covers risks associated with nuclear technologies. It is important that this is covered, but the reader would expect it in 7.9, where indeed much of the same discussion appears. To save space, shorten here to focus on the technology and merge the risks discussion with that in 7.9. | Rejected - 7.5.5 covers current nuclear status and plans, and the impact of current nuclear technologies on the fuel cycle. Nuclear fuel cycle and nuclear energy use are inherently tied. There is |
| 7125 | 7 | 34 | 23 | 37 | 2 | The content in these paragraphs does not seem to focus more o "Mitigation technology options, practices and behavioural aspects". These paragraphs could be trimmed or some of the material moved to section 7.4.2 to serve as background material for Resource and resource availability for nuclear | Rejected - All aspects of the nuclear fuel cycle is inherently tied to nuclear energy as a viable mitigation option. Some aspects of the fuel cycle must be discussed to provide context for nuclear |
| 16117 | 7 | 35 | 1 | 35 | 6 | Improved safety of EPR reactors is not proven because : none is operating and the record is nil; the size of the fuel charge is higher than any other civil reactor and thus inherently more problematic; safety is still depending on active measures and human responses. This paragraph should be more balanced. | Rejected - existing text uses the words "designs" and "features" and does not say that new LWRs are proven. |
| 15947 | 7 | 35 | 17 | 35 | 17 | the PBMR project in South Africa was abandoned years ago - and they were never 'developing' it. They were trying to get someone to pay for one. They had no takers. | Taken into account - text revised |
| 16817 | 7 | 35 | 20 | | | Suggest adding to end of paragraph: "the promise of "manufacturing" major components in this manner carries the possibility of beneficial learning curve impacts driving costs down significantly." | Taken into account - text revised |
| 9504 | 7 | 35 | 25 | 35 | 27 | Supply of uranium is enough for the future. So the text should be replaced like below. "the world has identified total resources of 5.4 million tons of uranium (available at a cost less than USD 130 per kgU), enough to last for 100 years at recent demand. Moreover, the IAEA notes that these figures include officially reported resources only, and that the potential is much higher as some countries do not report."<br>[1]IAEA (2010) “Red Book – Uranium: Resources, Production and Demand,” presentation at the RAF3007 Workshop on Uranium Data Collection & Reporting, July 2010(attached on email) | Taken into account - Resource issues addressed in 7.4.2. Text modified. |
| 11934 | 7 | 35 | 26 | | | "ore" grades | Editorial - corrected |
| 16119 | 7 | 35 | 30 | | | Use of the word "recycling" should not be used here to describe chemical reprocessing of nuclear waste. In France, the only country in the world to claim the whole cycle of reprocessing, actual use of waste materials amounts to only a few percentage points according to NGOs, and 12% according to the official Haut Comité à la Transparence et à l'Information sur la Sureté Nucléaire (http://hctsin.fr) in a 2010 report. It is a far cry from the 96% claimed by the French firm AREVA. | Rejected - Do not see a problem with the text as written. Text does not comment on the degree to which recycled materials are utilized. |
| 4110 | 7 | 35 | 45 | 35 | 45 | More on the thorium fuel cycle and its perceived advantages over uranium would be useful. | Rejected - Limited by page allocation constraints to discuss additional fuel |
| 17225 | 7 | 35 | 5 | | | Cummins etr al is not peer reviewed literature. | Rejected - referenced paper provides technical information on the safety features of AP1000 not available in peer |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 17226 | 7 | 35 | 5 | | | Is Goldberg counted as peer reviewed literature? | Taken into account - referenced report provides useful comprehensive information on Gen II and III and small modular reactors that is not available in |
| 18064 | 7 | 35 | 5 | 35 | 5 | add "and higher costs" after "features" | Rejected - Costs are addressed in 7.8.2. |
| 16118 | 7 | 35 | 7 | 35 | 20 | Gas cooled reactors are not inherently safer or cheaper, nor in a good industrial trajectory this part is misleading and should be removed. See "Thomas S. 2011, the pebble bed reactor : an obituary" Energy Policy 39 (2011) 2431–2440) | Taken into account - text revised |
| 17227 | 7 | 35 | 8 | | | Kuznetsov is not peer reviewed literature. | Taken into account - replaced with IAEA |
| 13494 | 7 | 35 | 41 | 35 | 42 | Text : "Partial recycling of used fuels, such as the use of mixed oxide (MOX) fuels where U-235 in enriched uranium fuel is replaced with recycled or excess plutonium already contributes to improved uranium resource utilization and waste minimization efforts". MOX processing is not without its problems, and in some cases has been abandoned (for example, Sellafield in the UK). | Taken into account - text modified. That paragraph ends with reprocessing drawbacks of higher cost, associated complexities and proliferation concerns. |
| 13495 | 7 | 35 | 44 | 35 | 47 | Text : "Ultimately, full recycling options based on either uranium or thorium fuel cycles that are combined with advanced reactor designs where only fission fragments are relegated as waste can significantly extend nuclear resources and reduce high level wastes (GIF, 2002)." No option is without its waste disposal and security risks. The storage and treatment of "low level radioactive waste" is frequently omitted in assessing novel reactor designs. Plus the toxicity of some of the fission products of alternative reactor designs has its own unique risk profile. The "fallow" time needed for core development, before energy production can being, for some of the alternative fission reactor designs, will almost certainly make it harder to attract project financing than it currently is. | Taken into account - the following text "Higher economic costs and complexities of advanced fuel cycles and reactor technologies are current drawbacks. Potential access to fissile materials from widespread application reprocessing technologies further raises proliferation concerns. The advantages |
| 13493 | 7 | 35 | 7 | 35 | 20 | Text: "Other more revolutionary small modular reactors (SMR) with additional passive safety features are near commercial status (Kuznetsov, 2008; Rosner and Goldberg, 2011; World Nuclear Association, 2012b). The size of these reactors is typically less than 300 MWe and much smaller than the 1000 MWe size of current LWRs. Their lower power density, large heat capacity, and heat removal through natural means contribute to their improved safety. SMRs based on light-water designs rely on the substantial experience with current LWRs and utilize existing fuel cycle infrastructure. Light water SMRs from Russia, South Korea, and US are near commercial status. Gas-cooled SMRs, in addition to their passive safety features, have higher operating temperatures for increased electricity generation efficiencies relative to LWRs and potential industrial applications as a source of high temperature process heat (EPRI, 2003; Ming Zhang et al., 2009). Gas-cooled SMRs are under development in China, France, South Africa, and US. In general, smaller reactors that can be constructed in a factory setting with modular construction techniques and flexibility for incremental additions to total power capacity could shorten the duration of construction periods and improve the quality and economics of new nuclear plants (Rosner and Goldberg, 2011)." This paragraph reads like sales material, which does not convince me of the neutrality of the references cited. As a result I have doubts about the development of small modular reactors, and would be concerned about unmentioned aspects of their operation, including the disposal of waste and security from attack. | Taken into account - text revised and new references added. Added "the widespread applicability of SMRs remains yet to be determined." The text states that light-water SMRs utilize existing fuel cycle infrastructure, and does not comment on waste and security. |
| 4443 | 7 | 36 | 20 | 36 | 28 | The discussion on the Japan earthquake could be omitted as there have been discussions on nuclear safety on p34 and later on p36. | Rejected - this particular discussion of Japan nuclear accident is not redundant to other sections, and serves to provide |
| 4111 | 7 | 36 | 20 | 36 | 20 | It should be stressed that if the retaining wall had been built higher, or if the Fukushima plant had not been placed so close to a techtonic plate and the ocean, and if proper maintenance had been done by Tepco over the years there would have been no nuclear accident. In this sense it was not a failure of a nuclear system, but a wider systemic failure. | Taken into account - The text as written states that the "earthquake" and "tsunami" caused the accident. It does not state that there is a failure of nuclear |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 15464 | 7 | 36 | 20 | 36 | 40 | It may be useful to mention somewhere in this section that in a dramatic shift away from policies that strongly suported the nuclear industry in Japan a "Cabinet panel on called for Japan to phase out nuclear power over the next three decades" http://www.washingtonpost.com/business/ap-interview-japan-nuke-probe-head-defends-report-that-didnt-blame-individuals-for-disaster/2012/09/13/c097b2f2-fe0c-11e1-98c6-ec0a0a93f8eb_story.html | Rejected - Nuclear policy in Japan is uncertain |
| 10541 | 7 | 36 | 20 | 36 | 28 | Also suggest to standardise the order of technologies discussed in each section to become the same for better readability e.g. coal/oil/gas/nuclear/RE/CCS | Accepted - sequence has been standardized: fuel shifting, RE, nuclear, |
| 11935 | 7 | 36 | 21 | | | should say "due to a loss of back-up power | Rejected - Unnecessary. |
| 9592 | 7 | 36 | 22 | 36 | 24 | Please, describe accurately the fact about Fukushima as two accidents differ in degree; France's national nuclear regulator IRSN published a comprehensive report in 2012 on the radioactive releases from the Fukushima accident. It found that the releases of radioactive iodine isotopes (of which iodine-131 is one of the most significant in terms of environmental and dosimetric impact) were on the order of a few hundred PBq, which is around ten times lower than the Chernobyl accident [1]. It also found that releases of cesium-137 (which will persist the longest in the environment with its half-life of 30.1 years), were estimated to be 21 PBq, accounting for around one-fourth of the cesium-137 released by the Chernobyl accident [2].<br>[1] IRSN (2012) "Fukushima, one year later: Initial analyses of the accident and its consequences," March 12, 2012<br>[2] IRSN (2012) "Fukushima, one year later: Initial analyses of the accident and its consequences," March 12, 2012<br>( http://www.irsn.fr/EN/publications/thematic/fukushima/Pages/overview.aspx | Taken into account - text revised. Reference to Chernobyl removed. |
| 11766 | 7 | 36 | 24 | 36 | 26 | As long as seeing next paragraph, nuclear deployment activities are still on-going around world. [some nations] is more appropriate. | Accepted - text revised |
| 9505 | 7 | 36 | 24 | 36 | 26 | Many countries are progressing the nuclear energy development, only Germany changed the policy. This text should be deleted. | Taken into account - text revised |
| 10657 | 7 | 36 | 24 | 36 | 26 | Disagree. There is more nations who promote nuclear energy than abandon it. | Taken into account - text revised. |
| 18065 | 7 | 36 | 26 | 36 | 26 | write "for many of the nations that utilise nuclear power" (it is in relatively few of the 204 nations in the world but in many of the 31 nations that have nuclear power). | Taken into account - text revised. |
| 16043 | 7 | 36 | 26 | | | Ad: Germany has decided to get out of the use of nuclear energy to the end of 2022 and Japon within the 2030th. | Rejected - Nuclear policy in Japan is uncertain. |
| 10043 | 7 | 36 | 26 | 36 | 28 | The list of countries who abanded nuclear programms is not complete. Countries like Belgium and Switzerland are currently discussing a nuclear phase | Rejected - Italy has no nuclear capacity. "Several nations" are used to include other countries. Nuclear capacity in Belgium and Switzerland are relatively |
| 7734 | 7 | 36 | 27 | 36 | 28 | The rsponse wasthat Japan has decided not to continue to pursue nuclear power as a source of enegy for the country. | Rejected - Japan nuclear policy is uncertain. |
| 7735 | 7 | 36 | 29 | 36 | 31 | For those nations, like Japan who has suffered immensely from the accident, populations have been strongly opposing to nuclear energy. This whole section could have been written in a way that convince people that nuclear energy is not to be used. However, it is not expected that scientific work takes this role. The current section is biased to show that nuclear problems have been or are about to be solved, which is not true. Please, access the risks of using this type of source of energy, which has been left out of the text, surprisingly. | Rejected - Risk of nuclear energy use covered in 7.9. |
| 16818 | 7 | 36 | 31 | | | Suggest adding after " … of power supplies." the following text: "Energy System modeling continues to show that nuclear technology provides one of the lower cost options for lowering CO2 emission from electricity generation." | Taken into account - Nuclear cost competiveness addressed in 7.8. Additional text added to recognize |
| 5157 | 7 | 36 | 39 | 36 | 39 | emerging nations ? Rephrase? | Taken into account - text revised |

|---|---|---|---|---|---|---|---|
| 17228 | 7 | 36 | 4 | | | The paragraph should discuss also the issue with a perspective to international policies. | Rejected - comment not clear. See 7.8 for nuclear cost, 7.9 for nuclear risk, and 7.12 for nuclear response to climate |
| 9473 | 7 | 36 | 41 | 36 | 44 | It should be described that nuclear power is one of the generation technologies that produces the least GHG emission in life cycle and have contributed to prevention of global warming. | Taken into account - text revised. Nuclear response to climate change |
| 11767 | 7 | 36 | 41 | 36 | 44 | Ameding to [Nuclear power has been around for five decades or more. Meanwhile it would be still cost effective compared with others(Tidball et al. 2010), unresloved issues remain for the .....] would be ballancing.<br>1.R. Tidball et al.:[Cost and Performance Assumptions for Modeling Electricity Generation Technologies], send attachment by another e-mail. | Taken into account - text revised. Cost discussion covered in 7.8. Nuclear response to climate change policy covered in 7.12. |
| 9593 | 7 | 36 | 41 | 36 | 44 | All forms of generation face unresorolved issues and nuclear is deployed in various reasons, including climate change mitigation. Please, rewite here by using following information; nuclear power is stemmed from the need to cost-effectively satisfy rapidly growing electricity demand in the emerging economies, as well as efforts to achieve energy and environmental policy objectives, including mitigating greenhouse-gas emissions and providing a secure, diversified and lowcost electricity supply. (WEO 2011, IEA) | Taken into account - text revised. Electricity demand and energy diversity referred to in earlier paragraph. Nuclear response to climate change policy covered in 7.12. |
| 10658 | 7 | 36 | 41 | 36 | 44 | Nucear economics have greatly improved. | Rejected - not supported by publically available cost data. See discussion on |
| 13198 | 7 | 36 | 41 | 36 | 43 | This statement is policy prescriptive and no justification is given for asserting that nuclear power is not presently a valid option for climate change mitigation. See a recent paper by R. Dautray, J. Friecdel and Y. Bréchet Nuclear energy in France today and tomorrow: IInd tio IVth generations, , C.R. Physique 13 (2012), 480-518, for a serious scientific analysis of this topic. | Taken into account - text revised for balance. Text does not say that nuclear is not a valid option. Nuclear response to climate change policy covered in 7.12. |
| 9995 | 7 | 36 | 41 | 36 | 44 | This part should be revised to explain that nuclear power has contributed largely to reduce CO2 emission in the world and has a merit to reduce CO2 emission more economically than renewable energy, as described in (Weisser, 2007, page1).<br><br><Reference><br>[1]Weisser, D. (2007). A guide to life-cycle greenhouse gas (GHG) emissions from electric supply technologies. Energy, Volume 32, Issue 9, Pages 1543-1559. | Taken into account - text revised to include nuclear contribution to emissions reduction. Nuclear cost competiveness addressed in 7.8. |
| 17750 | 7 | 36 | 42 | | | delete "CCS and" | Comment misplaced. Not in nuclear |
| 16819 | 7 | 36 | 43 | | | Re "resource sustainability" -- resources to build nuclear or any other technology is included in the economic calculations for the source. "Resource sustainability" is not well defined or understood. Does it take into account what we know from resource economics? | Taken into account - text revised |
| 5929 | 7 | 36 | 9 | | 10 | In Finland, the Posiva's final waste deposit Onkalo is under construction and progressing according to plans. | Taken into account - text revised. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 13496 | 7 | 36 | 24 | 36 | 28 | Text : "The severity of the nuclear accident in Japan has brought about a reinvestigation of nuclear energy policy and deployment activities for many nations around the world, most notably in Japan and Germany. The response to the accident has been otherwise mixed and its full impact may not be realized for many years to come." The Fukushima Dai-ichi 3/11 ongoing accident was not an unique failure in nuclear power plant management. There have been regulatory problems regarding safety, modifications, repairs and servicing of nuclear power plants for some time, particularly in Japan, France and the US. There are regular unplanned outages reported in the press, and sometimes media coverage of administration problems. Two important examples of ongoing issues include the February 2011 reports of problems with control rods (Perry Nuclear Plant, GE Hitachi, Marathon control rods http://starbeacon.com/local/x789958596/Perry-Nuclear-Plant-monitoring-defective-control-rods ) and September 2011 potential problems identified for scram in a seismic event (20 - 30 US reactors, GE Hitachi, NRC http://www.nrc.gov/reading-rm/doc-collections/event-status/event/2011/20110928en.html ). Reports into the Fukushima Dai-ichi multiple reactor accident concluded that failures in human systems were to blame - a "man-made disaster ( http://icanps.go.jp/eng/final-report.html http://icanps.go.jp/eng/07VIfinal.pdf http://fukushima.ans.org/report/Fukushima_report.pdf ). Belgium is to consider the decommissioning of two reactors with extensive cracking : Tihange 2 and Doel 3, and this move may prompt similar consideration elsewhere, as case cracking is apparently prevalent with reactor age. There is an ongoing demand to improve venting in containment vessels in the USA (NRC, March 2012, order to all Mark I and Mark II reactors). The promotion of a nuclear power "renaissance" is losing its power to convince. | Rejected - The Nuclear Energy section does not mention nuclear power "renaissance" and comments on current activities. Historical capacity factors for nuclear plants have increased. No power plant is designed to last forever. All nuclear reactors have design lifetimes. |
| 10050 | 7 | 36 | 26 | 36 | 27 | add all countries who reacted with specific measure such as Italy (abonded nuclear plans), Belgium (stalled plans) etc, | Rejected - "nuclear energy policy and deployment activities for several nations" are used to include other countries. Italy has no nuclear capacity. Nuclear capacity in Belgium and Switzerland are |
| 3397 | 7 | 37 | | 37 | | Delete text. Empty of relevant content: From line 5-8 and from lines 32-43. | Taken into account - comment is obsolete as most of the text has been deleted due to space restrictions. The |
| 3398 | 7 | 37 | | 41 | | Remaining text (page 38 to 39) can be drastically reduced as it only introduces trivial and well known ideas and a large number of references. Factual figures and quantitative information should be preferred in IPCC reports: section 7.6.1 is very poor (it´s rethoric, and abuses of trivial messages and references (see for example page 40 lines 33 to 47, including a reference to claim for Sims et al (2007, 2011) the "discovery" that electricty has to be transported for considerable distances¡¡¡ )) . Section 7.6.2 is a perfect example of a high quality job..... EFFECTIVE CROSS-REVIEW BETWEEN LAs HAS TO BE ENCOURAGED IN THE SOD | Taken into account - comment is obsolete as most of the text has been deleted due to space restrictions. The entire section 7.6.1 has been rewritten und shortened considerably |
| 12592 | 7 | 37 | | | | Other issues with renewables in the grid will include: real power fluctuation, reactive power generation and absorption, voltage dips, and voltage harmonic distortions. Please see Chen, Z., Spooner, E., "Grid power quality with variable speed wind turbines", Energy Conversion, IEEE Transaction on, 2001, Vol 16, Issue 2, pages 148-154 | Rejected, - power quality has not been a major barrier in areas that have increased the supply of variable RE. |
| 12593 | 7 | 37 | | | | Some more detail on infrastructure would be good. For example, substation issues, of which one solution is fault current limiters. | Rejected, seems too detailed of a point for this broad discussion that other |
| 12595 | 7 | 37 | | | | Superconducting magnetic energy storage can also be used for grid quality issues | Rejected, minor point and might be |
| 12603 | 7 | 37 | | | | Peak energy demand is also effected by heat pumps on defrost cycles and electric cars in localised areas – this needs to be sorted | Taken into account - comment is obsolete as text has been deleted due to |

|---|---|---|---|---|---|---|---|
| 6437 | 7 | 37 | | | | Since AR4 a number of authors have modelled 100% renewable electricity systems at half-hourly or hourly resolution, using historic data, and have demonstrated the technical feasibility of these systems. I recommend that these studies be included in the AR5 report. Denholm and Hand (2011) modelled hourly wind, PV (a mixture of fixed and 1-axis tracking) plus concentrating solar power electricity generation over the period 2005-2006. These authors demonstrated an inverse relationship between system flexibility and the curtailment of variable renewables. They showed that a poor observed correlation between wind availability and demand patterns could be improved by the addition of solar generation, with a resulting decrease in curtailment. Further reduction in curtailment by the addition of energy storage, and potentially demand response measures, was shown. Elliston et al. (2012) modelled a 100% renewable electricity generation system for Australia, at hourly resolution, for the year 2010. A generation mix comprising 27% (23.2 GW) wind, 17% (14.6 GW) PV, 18% (15.6 GW) CST with thermal storage, 6% (4.9 GW) hydro, 28% (24 GW) biomass and 2% (2.2 GW) pumped hydro energy storage (PHES) was found to be capable of supplying demand, consistent with existing standards. Mason et.al. (2010) demonstrated, at half-hourly resolution, how generation mixes comprising 53-61% hydro, 22-25% wind, 12-14% geothermal, 1% biomass and 0-12% additional peaking generation could provide a 100% renewable electricity system on an energy and power basis for New Zealand. Modelled systems were shown to provide security of supply, and to maintain net hydro storage, over a 3 year study period. In addition to these studies, several (apparently) non peer-reviewed but nonetheless robust studies (grey literature) demonstrated similar findings (Ackermann et al., 2009; Wright and Hearps, 2010; Troster et al., 2011; vandePutte and Short, 2011). | Rejected - space constraints do not allow to go into the details. |
| 6438 | 7 | 37 | | | | Additional peer-reviewed references for section 7.6.1: Denholm, P. and Hand, M., 2011. Grid flexibility and storage required to achieve very high penetration of variable renewable electricity. Energy Policy 39, 1817-1830; Mason, I.G., Page, S.C. and Williamson, A.G., 2010. A 100% renewable electricity generation system for New Zealand utilising hydro, wind, geothermal and biomass resources. Energy Policy 38 (8), 3973-3984; Elliston, B., Diesendorf, M. and MacGill, I., 2012. Simulation of scenarios with 100% renewable electricity in the Australian National Electricity Market. Energy Policy 45 (1), 606-613. (Apparently) non-peer-reviewed reports for section 7.6.1: Wright, M. and Hearps, P., 2010. Zero Carbon Australia Stationary Energy Plan. | Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 4355 | 7 | 37 | 3 | | | I think the section on electrical power system misses an important challenge to renewables: It's not only balancing, resource adequacy, and grids: Fluctuating renewables fundamentally alter the distribution of residual load: there will be more hours with low residual demand and fewer hours with high residual demand at high penetration rates of wind and solar power. Subsection 7.6.1.1 discusses mainly intertemporal flexibility (regulating power, ramps, balancing services) - but even if these issues would disappear, a wind/solar-intensive power system would be substantially different than a conventional one (less capital intensive / more peak load technologies). In other words, I suggest to split the section and discuss "contigency flexibility" (short-term responce, regulating power issues etc.) separately from "scheduled flexibility". While better forecasts of wind/solar power can decrease the need for balacing services, it is a fundamental property of these sources to be more available during some times than during others - and this fundamentally affects the requirements to the rest of the power system.<br>For references see<br>- Mills, Andrew & Ryan Wiser (2012): “Changes in the Economic Value of Variable Generation at High Penetration Levels: A Pilot case Study of California”, Lawrence Berkeley National Laboratory Paper LBNL-5445E<br>- Hirth, Lion (2012): “The Market Value of Variable Renewables”, USAEE Working Paper 2110237. | Taken into account - the point is accepted. New material has been added and there is more attention now to new loads and demand side management. |
| 11936 | 7 | 37 | 32 | | | This section should lead with a discussion of smart grids(many publications) and then get into integration of different types. Find it strange that smart grids are not mentioned until p.66. The discussion of RE is overly long and this section needs more balance | Rejected, smart grids were deliberately avoided as they mean different things to different people. There is a short note on |
| 10052 | 7 | 37 | 32 | 40 | 4 | This section requires more work: The system conflict between baseload generation and flexible generation should be explained in more detail - the grid is descripted as a barrier, but in fact it is the wy how the grid is used, not the grid itself. This should be made clearer in this section. The cable are the same in a flexible and in an inflexible grid - the grid management makes the main difference. | Taken into account - text has been rewritten considerably to clarify that point. |
| 10674 | 7 | 38 | 1 | 37 | 2 | Flexibility of CHP plants can also be improved through the addition of other heat sources such as network heat pumps see Kilmakommissionen. (2010). “Danish commission on climate change policy.” Kilmakommissionen. Copenhagen. Denmark. | Accepted - text added. |
| 9506 | 7 | 38 | 10 | 38 | 12 | "many country" is vague expression. At least there is no regulation about the restriction of flexible operation. This text should be deleted. | Accepted - text changed. |
| 16122 | 7 | 38 | 17 | | | In this line, it is not clear if CCS may become part of the solution to improve flexibility of the system. In fact, the research tries mainly to avoid that CCS hampers flexibility. This is not the same. The sentence could read "Characterizing CCS flexibility in order not to prevent evolutions to a more variable system.. is an area of active research". | Accepted - I've added a phrase to help clarify this but since I don't fully understand the comment, may have done the opposite. |
| 4817 | 7 | 38 | 19 | 38 | 27 | I'm not convinced by the low variable cost argument | Accepted - now re-phrased. |
| 13200 | 7 | 38 | 19 | 38 | 27 | The intermittence of wind energy may pose to the netrwirk satability serious problems which are not clearly presented by the present phrasing, e.g. How to cope with a wind speed zero over a large geographic region, under anticyclonic conditions which may prevail during several consecututive days, even if such an event does not occur every year ? Large investments in the network are necessary, for mainaining its stability, when the percentage of wind energy increases. Order of magnitudes shoul be provided, as far as popssible | Rejected - we address the low capacity credit of wind in the Resource Adequacy section |
| 5158 | 7 | 38 | 19 | 38 | 20 | hydropower is extremely more flexible than bio and geo and should not be directly compared here - it is a central property of storage hydro to be able to dispatch on very short notice - the phrasing: "to some extent" is not correct | Accepted - text re-written to ensure that high degree of flexibility of hydro is recognized |
| 18069 | 7 | 38 | 22 | 38 | 22 | Delete "highly". | Taken into account - comment is obsolete as text has been deleted due to |
| 18070 | 7 | 38 | 23 | 38 | 24 | Delete "because output cannot be perfectly forecast". No technology can be perfectly forcast and they do not need to be for efficient system operation. | Taken into account - comment is obsolete as text has been deleted due to |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 12545 | 7 | 38 | 25 | | | Recent research indicates that geographically and type-diverse deployment of renewable resources will substantially decrease the need and cost of balancing reserves. Many other improvements can be made in grid operations to support more effective integration of renewable resources. GE Energy, 2010. Western Wind and Solar Integration Study. NREL/SR-550-47434. Lisa Schwartz, et al. 2012. Meeting Renewable Energy Targets in the West at Least Cost: The Integration Challenge. Report to the Western Governors' Association. http://www.westgov.org/index.php?option=com_joomdoc&task=doc_download&gid=1602 | Rejected - this issue is covered adequately in Sims et al 2011 and space it limited here. |
| 5138 | 7 | 38 | 27 | | | the reference "Sims" should be prperly cited. | Accepted - but most have been removed |
| 4818 | 7 | 38 | 27 | 38 | 27 | Thus increasing consumer bills which has an important social impact given the economic crisis | Rejected - not relevant here. |
| 2835 | 7 | 38 | 28 | 38 | 32 | Another, probably the, key strategy is improvements in market and pricing structures. | Taken into account - demand response |
| 18072 | 7 | 38 | 28 | 38 | 32 | Add changes in market operation and load control as strategies | Taken into account - demand response |
| 18071 | 7 | 38 | 29 | 38 | 29 | "access to flexible thermal plants" should be changed to "access to flexible thermal and / or renewable plants" | Taken into account - text revised. |
| 4445 | 7 | 38 | 3 | 38 | 18 | What is CCS flexibility? Under what scenarios would a CCS fitted to a conventional powerplant not be operated at full potential linked to plant throughput? | Rejected - references adequately describe conditions under which |
| 15478 | 7 | 38 | 3 | 38 | 18 | this discussion is clearer than that on p 31; Pouret, L., N. Buttery and W.J. Nuttall (2009) “Is nuclear power inflexible?” Nuclear Future, vol. 5 no. 6, pp. 333-340 suggest that existing designs of PWR can flex down to 60% of output | Accepted - we already cite this reference but not this statement so have added it. |
| 18068 | 7 | 38 | 3 | 38 | 18 | It seems very odd that the section puts so much enphasis on a power technology (CCS) that will not be deployed at any significaant scale - and thus will have little impact on system balancing - during the next decade, at least. | Rejected - we feel that it is better to include all of the options in the review, albeit briefly. |
| 6439 | 7 | 38 | 3 | 38 | 18 | Given the findings of the renewable electricity system modellers just mentioned, there is now good evidence that the inflexibility of nuclear and "fossil fuel with CCS" plants, will place significant limits the penetration of variable renewables and/or require their curtailment. | Taken into account - text revised. |
| 4815 | 7 | 38 | 3 | 38 | 4 | Relatively low variable costs: is this variable costs of operation or investment? | Accepted - text improved and clearer in |
| 4816 | 7 | 38 | 3 | 38 | 4 | Is there a technical constraint to build flexible nuclear plants? Because financially there is the incentive to operate them as hydro-storage plant which are able to capture high prices at peak time (on top of their base load profit) as they can ramp up quickly enough to enjoy these prices | Taken into account - comment is obsolete as text has been deleted due to space restrictions. |
| 13199 | 7 | 38 | 3 | 38 | 18 | While there is no doubt that nuclear power and CCS are capital-intensive, the related problems seem overemphasized ; while France produces 80% of its electricitythrough nuclear reactors, no difficulty has arisen. Moreover, why relating this problem to those two topics only, it's obviously the same for wind power : | Rejected - the comment is misleading but the issues are complex and would require much more text to deal properly with them. This section is now better |
| 9489 | 7 | 38 | 3 | 38 | 18 | Reference to CCS should be made more specific whether CCS is done on gasfired or coalfired. Gasfired with ccs require smaller investments than coalfired and will in the future have a larger role to balance variations in a net with large renewable power. future developement within gasfired with ccs will be towards more integrated solutions and also more compact with faster respons to variations in electric output . | Rejected - space constraints do not allow to go into every detail. |
| 5930 | 7 | 38 | 3 | | 41 | Nuclear and CCS are both capital-intensive low-GHG technologies, and they need to be operated in baseload mode to be economically meaningful, as the authors mention. I think one key point is missing in this text: large amounts of variable generation (wind & solar) in the electricity system make investments in nuclear or CCS economically impossible. With a large penetration of variable RE, we have solar pv with annual full load hours of about 1000 h and wind with full load hours of 2000-2500 h. If the rest has to be provided by fossil back-up generation, then the possible GHG emission reductions from the system remain very modest. | Rejected - but please note improved phrasing. |
| 6440 | 7 | 38 | 33 | 38 | | The previous modelling results confirm that penetration of variable renewables can be greater than 20% for for at least two quite different scenarios (Mason et.al., 2010; Ellistion et. al., 2011). This matter must be examined for each region or country and the emerging evidence is that provided storage is adequate, and that some small degree of energy spillage is accepted, varibale renewables can be accomodated high levels. Advances in power point tracking technology make this increasingly feasible. | Taken into account - text revised. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 9594 | 7 | 38 | 34 | 38 | 36 | Please, describe here correctly as reference does not mention many regions, where balancing exceed 20% of total supply, but 7 regions, and not some regions, where balancing is above 40%, but two regions and one country. (IEA, 2011f) | Accepted - text changed. |
| 4819 | 7 | 38 | 38 | 38 | 38 | Note that new flexible generation will most probably be CCGTs in most countries which will increase GHG | Taken into account - comment is obsolete as text has been deleted due to |
| 2836 | 7 | 38 | 40 | | | The word “modestly” here is misleading. Presumably (though the text is unclear) this is a reference to cycling costs rather than total back up requirements (which can have a very significant impact on emissions in a wind-dominated system). Even in regard to cycling some studies show significant emissions and cost implications (eg Denny and O’Malley enpol.2008.10.050 http://dx.doi.org/10.1016/j.enpol.2008.10.050). | Rejected - Denny and O'Malley were included in review in Wiser et al 2011, the penalty remains less than 10% in these studies and below 5% in some of |
| 16822 | 7 | 38 | 7 | | 10 | Low variable cost almost by definition make a resource base load -- why would any system operate a low variable cost unit intermittently? | Taken into account - the text is now clearer so this misunderstanding is |
| 10687 | 7 | 38 | 28 | 38 | 32 | The importance of integrating information and communication technology (ICT) into power system management should be more explicitly stressed, since ICT is the key to realize secure communication, wide area monitering, and intelligent control and so on, which are essential to realize smart grids.<br>Load control (or demand response) is not only done to make demand follow the availability of supply in smart grids. Much study effort is being dedicated to better load control, by which the impact of variable renewable energy output can be mitigated without deteriorating the customer's comfort. | Accepted - demand response is clearly highlighted as an area of interest for providing flexibility. There is a short paragraph on smart grids at the end of section 7.6.1. |
| 9653 | 7 | 38 | 3 | 40 | | CCS does not really fit into this section - might be better to have it in the section on CCS or on its own | Rejected - this section is about electrical system issues as a whole, so it should |
| 4781 | 7 | 38 | 33 | 38 | 38 | Reference to IEA, 2011f is relevant. However it is important to mention that figures provided for Denmak (Fig 7.11) assume huge interconnections and back-up from neighbouring countries, in particular the flexibility provided by Norwegian hydropower. | Accepted - text changed. |
| 7736 | 7 | 39 | | | | Improve quality of image | Taken into account. Figure has been |
| 4446 | 7 | 39 | | 39 | | This figure could be re-drawn so the text is easer to read. | Taken into account. Figure has been |
| 12033 | 7 | 39 | | | | Not only the technical potential but also marginal costs should be discussed in this kind of comparison. For example, wind power can be much cheaper in areas with good wind conditions than those in poor conditions since the efficiency co-relate cubics of average wind velocity. | Rejected - the point about increasing marginal costs of wind sites is important, but not relevant to this section |
| 15948 | 7 | 39 | 10 | 39 | 13 | Better than curtailment, is using surplus wind to heat up the boilers in central and district heating systems, as is done now in Denmark. | Accepted text revised. |
| 15479 | 7 | 39 | 12 | 39 | 13 | in a number of EU countries, regulations strongly discourage system operators from constraining off wind power, and the support mechanisms used can force the system operator to pay the opportunity cost of subsidies foregone rather than the (near-zero) marginal cost of turning down the station | Rejected - although this is correct policy aspects and regulation issues are not discussed here due to space constraints. |
| 9654 | 7 | 39 | 13 | | | Figure is blurry and difficult to read | Taken into account. Figure has been |
| 16121 | 7 | 39 | 17 | 40 | 4 | Important paragraph that shows the system combinations are the key issue and not the choice of one source. | Noted. |
| 6450 | 7 | 39 | 17 | 40 | 4 | I strongly concur with the analysis and conclusions in this paragraph and suggest this represents important progress since AR4, which should be mentioned in the executive summary | Rejected - although it is correct, not every aspect can be included in the ES. |
| 2782 | 7 | 39 | 3 | 39 | 7 | Pumped hydro is not the only one. Also compressed air is used commercially e.g. in Germany. However, despite having both pumped hydro and compressed air storage in the power grid, the storage capacity in the German power grid is only 0.04 TWh. But storage capacity of the German gas grid is 217 TWh. Storage of wind power will begin in the German gas grid as wind methane in 2013. The same way also solar and wave power can be stored making very high share of intermittent power generation in power consumption possible. In addition, this technology makes it possible to use large amount of wind, solar and wave power in transport in methane vehicles (this is also Chapter 8 issue, see comment 38). | Taken into account - comment is obsolete as text has been deleted due to space restrictions |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 13037 | 7 | 39 | 3 | 39 | 5 | While pumped storage is indeed a major contribution to energy storage at large scales, this assertion neglects the fact that conventional storage hydropower is also a storage technology. I.e., pumped storage is only needed when traditional storage reservoirs are not available. It is not reasonable to build pumped storage unless you have no option to build a storage hydropower facility. The statement could be improved by rephrasing as follows: "Outside of conventional storage hydropower, to date, pumped hydropower storage is the only power storage technology deployed at a large scale, with 300 plants amounting to 95 GW worldwide." | Accepted - text revised. |
| 16823 | 7 | 39 | 3 | | | suggest you add to end of sentence after Borentstein and Centolella references" "although the difference between the high price time of day vs. low price time of day price shrinks during periods when natural gas prices are very low. | Taken into account - comment is obsolete as text has been deleted due to space restrictions |
| 5159 | 7 | 39 | 3 | 39 | 5 | in regard to large scale: it could be mentioned that ordinary storage hydro has the ability to balance variable sources - ref Norwegian systems balancing Danish wind production; SRREN chapter 5.5.4 - "the only power storage technology--- " is misleading. The previous sentence talkes about energy storage. Storage hydro should be mentioned as an energy storage and an energy source, while pumped storage is only storage not a source. Propose to insert: To date, "storage- and " pumped hydropower storage is the only -----. the number of plants (300) will, however, need to be corrected if Storage HP is included - or a new sentence after scale; "Presently 300 pumped storage HP plants are applied worldwide." -- ? | Accepted, Revise to indicate that both hydropower storage and gas storage currently play a big role, but distinguish this from storage that relies on the grid for charging |
| 10542 | 7 | 39 | 3 | | | Add to end of storage sentence "but usually at a relatively high cost." Could reference Sims et al 2011 | Taken into account - text revised. |
| 10069 | 7 | 39 | 5 | | | In 2010 EPRI published a Report Electricity Energy Storage Technology Options (No 1020676) and gave an estimate of 127 GW; The IRENA Working paper Volume 1: Power Sector, Issue 3/5 cites the International Hydropower Association (IHA) (2011), IHA 2010 Activity Report, IHA, London with an estimate of 120 to 150GW. It would be good if a range could be given here as well. | Taken into account - comment is obsolete as text has been deleted due to space restrictions |
| 12594 | 7 | 39 | 6 | | | I think storage needs to be discussed more – include a mention of redox batteries, superconducting energy storage and flywheels. Happy to provide summaries if necessary. | Rejected - further detail regarding storage left to reference to Chapter 8 of |
| 6449 | 7 | 39 | 6 | 39 | 7 | Additional references for compressed air energy storage: Pickard, W.F., Hansing, N.J. and Shen, A.Q., 2009. Can large-scale advanced-adiabatic compressed air energy storage be justified economically in an age of sustainable energy? Journal of Renewable and Sustainable Energy 1 (3), 10 pp; Pickard, W.F., Shen, A.Q. and Hansing, N.J., 2009. Parking the power: Strategies and physical limitations for bulk energy storage in supply-demand matching on a grid whose input power is provided by intermittent sources. Renewable & Sustainable Energy Reviews 13 (8), 1934-1945. | Rejected - no space to add this level of detail. |
| 10051 | 7 | 39 | | | | Figure is misleading as it does not reflect the reason why technical capability is low: A large share of baseload power plants in the grid is a contrain for RE - not the grid itself. | Taken into account. Figure has been deleted. |
| 13497 | 7 | 39 | 10 | 39 | 13 | Text : "Finally, if surplus renewable supply exists despite the best efforts of system operators, renewable energy generation can be curtailed by switching off unwanted plant or through regulation of the power output. Indeed curtailment of wind power is common practice where and when transmission constraints prevent full utilization of available wind." There is scope for using unused wind and solar power for such things as the production of Renewable Hydrogen through electrolysis, and for heating banks of molten salts. These can be later employed as back up - such energy stores could be used to smooth and extend the output of a wind or solar farm for times when the wind is not blowing, over-blowing, or when solar generation is impossible - at night. | Accepted - text added. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 13498 | 7 | 39 | 19 | 39 | 21 | Text : "Base-load operation of CCS and nuclear plant, on the other hand, is of little concern from a system balancing perspective up to the point where the capacity of nuclear and CCS approaches the minimum net load of the system." Not included in this analysis is the problem of outages, both planned and unplanned. There will always be a need to have back up - even for generation considered as "baseload". Studies on the "supergrid" concept, and others, show that with a sufficiently geographically-widespread and integrated system of renewable electricity generation, balancing capacity and output is very achievable ("Saturation wind power potential and its implications for wind energy", by Mark Z. Jacobson and Cristina L. Archer, 2012, http://www.pnas.org/cgi/doi/10.1073/pnas.1208993109; Gregor Czisch, "Scenarios for a Future Electricity Supply: Cost-Optimised Variations on Supplying Europe and Its Neighbours with Electricity from Renewable Energies" http://www.theiet.org/resources/books/renewable/scenarios.cfm, http://www.iset.uni-kassel.de/abt/w3-w/projekte/LowCostEuropElSup_revised_for_AKE_2006.pdf ) | Taken into account - comment is obsolete as text has been deleted due to space restrictions |
| 13499 | 7 | 39 | 30 | 40 | 2 | Text : "Finally, if substantial GHG emissions reductions are required, some of the most cost effective current solutions for system balancing (e.g., relying upon flexible but GHG emitting fossil plant) may no longer be acceptable, requiring the application of currently more costly options." In developed countries with a gas grid, the backup, balancing electricity generation plant that currently burn gaseous fossil fuels could be converted to burn increasing levels of carbon neutral gas fuels - Renewable Gas - mixtures of gas feedstocks, and by-products from the reactions of different thermochemical, catalytic and electrochemical processing of biomass and Renewable Hydrogen - either fed into the gas grid or produced locally to a power plant. However, there would need to be explicit planning for such a fuel change - including making sure that all new gas plant is flexible to a range of fuels. | Rejected - space constraints do not allow to go into the details here. |
| 6242 | 7 | 4 | 5 | | | picture seems pretty much realistic with perspective on the energy demand in developing countries but does not argue on the challenges to provide energy with relativ low energy density in more industrializd countries. | Rejected - comment seems to be misplaced. It is not clear what the |
| 4447 | 7 | 40 | 1 | 40 | 4 | The reader may be reminded here that large-scale conventional powerplants have lifetimes on the order of 30-40 years which locks the system into a particular operation. | Taken into account - comment is obsolete as text has been deleted due to |
| 12548 | 7 | 40 | 10 | | | A recent useful paper on resource adequacy metrics is: John Fazio, 2011. A Probabilistic Method to Assess Power Supply Adequacy for the Pacific Northwest. Northwest Power and Conservation Council. http://www.nwcouncil.org/energy/resource/Adequacy%20Standard%20Background%20(2008-07a).pdf | Rejected - not a journal paper. |
| 2837 | 7 | 40 | 10 | 40 | 19 | It seems very odd to discuss theoretical constructs like capacity credits in terms of “value” and not economic incentives like capacity payments and obligations. | Rejected - specific payments and obligations are a regulatory/institutional layer on top of a physical/economic system. The current approach focuses |
| 18073 | 7 | 40 | 13 | 40 | 13 | replace "with" by "and". The distinction is important as a high fuel supply is not in itself an assurance of reliability. | Accepted - but a different phrasing adopted. |
| 6451 | 7 | 40 | 15 | 40 | 16 | This statement is also supported by modelling reported by Mason et. al. (2011) | Accepted - Mason ref added to Zotero |
| 9996 | 7 | 40 | 16 | 40 | 19 | This part should explain that the higher planning reserve margin will result in more costly structure as a whole power system. This is because it is necessary to install additional equipments for power grid stabilization if variable power sources such as wind power or photovoltaic were installed into power grid. This information is described in (DeCarolis, 2006, page 395 and 403).<br><br><Reference><br>[1] J.F. DeCarolis and D.W. Keith (2006). The economics of large-scale wind power in a carbon constrained world, Energy Policy 34 | Rejected - costs are addressed in 7.8.1. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 16825 | 7 | 40 | 23 | | 26 | We may have a language issue -- a capacity credit of a coal plant would not be decreased per se, rather the nameplate capacity would decrease -- if the plant operated in a capacity market then yes its capacity credit would then decline. However, it is uncertain how much CCS will be used as coal retrofits vs. being designed as part of new plants. It is not broadly accepted as far as I know that the parasitic losses from CCS can be reduced during peak loads -- if this were so, why would not operators reduce these losses all the time? | Rejected - Since emissions go up during the time that parasitic losses are reduced, the plant operator would only want to reduce the parasitic losses during critical peak times if operating under a carbon constraint. So the plant would not operate with the reduced parasitic losses all of the time. This issue appears to primarily apply to |
| 4448 | 7 | 40 | 27 | 40 | 28 | Is line 27-28 a repetition of line 15-16? | Taken into account - comment is obsolete as text has been deleted due to |
| 4449 | 7 | 40 | 28 | 40 | 31 | These costs should be quantified. Specifically, how does the cost of energy storage compare with expanding generating capacity and associated fuel costs? | Rejected - costs are addressed in 7.8.1. |
| 17810 | 7 | 40 | 33 | | | After generation at the power station, electricity is transmitted via high-voltage power cables that are supported overhead, or laid underground, and these transmission lines run between substations. In this second stage, the major occupational hazards are electrical in nature, for example electrocutions. The third stage – distribution – connects the transmission system to the customer's equipment, and as in the second stage the main occupational hazards are again electrical (Fox 1998). Compared with the health impacts of the generation stage, there are few non-occupational exposures associated with the transmission and distribution stages of the supply chain. One area that has received particular focus over the past thirty years is the concern over exposure to electromagnetic fields (EMF). The World Health Organization's International EMF Project recently completed a thorough review of all health effects associated with exposure from the extremely low frequency electric and magnetic fields emitted from electric power lines (See: WHO, 2007 at http://www.who.int/peh-emf/publications/ELF%20EHC%20No238%20full.pdf). This chapter mainly provides a summary of the conclusions of this review. | Rejected - space constraints do not allow to go into the details here. |
| 16824 | 7 | 40 | 4 | | | Suggest adding sentence: Within this context, it is helpful to note that the most economically efficient determination of what resources to deploy and when is helped via a CO2 emissions price rather than via mandates to meet certain levels for favored technologies. | Rejected, Point is valid, but it seems to make sense in a policy section rather than this chapter |
| 6699 | 7 | 40 | 43 | 40 | 45 | It should be noticed that location of nuclear plant is determined by ground conditions and presence of coolant, rather than public health and acceptance. | Accepted - covered by change (see above comment) |
| 9474 | 7 | 40 | 43 | 40 | 45 | Although location requirements of a nuclear plant may differ according to countries and areas, it should be added that stable bedrock and a lot of cooling water are basic requirements. | Accepted, Change to indicate that cooling and site conditions are major |
| 11768 | 7 | 40 | 43 | 40 | 45 | Delete [health and safty]. They are too strange for reasons. | Accepted - the text has been changed to public perceptions of H&S |
| 9595 | 7 | 40 | 43 | 40 | 45 | Please, replace 'reasons of health, safety and public acceptability' with 'a result of site evaluation with regard to safety for the public in case of postulated accidents'. | Reject - see previous comment. |
| 10659 | 7 | 40 | 43 | 40 | 45 | Delete health and safety. Concern on health and safety are included in public acceptability. Nuclear plants are located at some disctance from the load centre mainly because it nees a lot of water for cooling and land cost is cheaper in Japan. | Accepted and re-phrased. |
| 9997 | 7 | 40 | 43 | 40 | 45 | This part should be deleted completely. In the survey described in (Jablon, 1991), it was reported that any general association was not detected between residence in a county with a nuclear facility and death attributable to leukemia or, in fact, any other form of cancer. In addition, wind turbines are also installed far from load centers too.<br><br><Reference><br>[1] Jablon, S., Z. Hrubec & J.D. Boice (1991). Cancer in Populations Living Near Nuclear Facilities. JAMA 265(11), pp. 1403-1408. Available at: http://jama.jamanetwork.com/article.aspx?articleid=385351 | Rejected but note that text has been revised to make it consistent with other comments. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 18075 | 7 | 40 | 44 | 40 | 44 | add "access to water" after "health, safety" | Accepted - change made |
| 15491 | 7 | 40 | 5 | 40 | 31 | Resource adequacy - Quote and give figures on Geothermal energy for electricity production with a special attention to the Hot dry rock on-going projects with regards to the impressive potential for this technology to serve on a base load | Rejected - rearranged text and ref to SRREN obviates the need for this. |
| 11937 | 7 | 40 | 5 | | | This section can be incorporated with earlier discussions on resources. | Reject - resources have a different |
| 11938 | 7 | 40 | 32 | | | This section should be included in earlier T&D discussion, reducing length of document | Reject - these are two separate topics. |
| 18074 | 7 | 40 | 33 | 40 | 44 | There is an unfortunate and misleading bias in the paragraph. Attempting to address additional transmission needs for the different technologies seperately makes sense. The section states that renewables "will often" (line 37); CCS "may" (line 40); and nuclear "may" (line 43) require additinal transmission. This is not generally. Most wind energy has been connected to the existing infrastructure (in areas with high penetrations, new lines are needed). The same is true for PV and other RE technologies. Offshore RE technologies, obviously requires new infrastructiure, but the term "will often" is misleading. Especially so, when the term "may" is used to descibe transmission needs of nuclear (which most often needs new infrastructure due to the scale) and CCS (which would certainly need need least carbon transport infrastructure, as well as electricity in many cases. Gas also often requires additional gas and/or electricity infrastructure. Delete the paragraph and address it without forcing a distinction between (many different) renewables, Nuclear and CCS. | Taken into account - text revised to be more balanced. |
| 5139 | 7 | 40 | 45 | 41 | 11 | The section should perhaps also include other examples. Recently, a publication " Canada: winning as a sustainable energy superpower" published by the Canadian Academy of Engineering (CAE) Energy pathways Task forceISBN 978-0-9730830-9-5, 2012, www,acad-eng-gen.ca, identifies one of the few big national projects vison for a high voltage Pan-Canadian transmission and interconnection scenario for enabling low-GHG electricity while replacing high-GHG electricity generation in many parts of the country. | Taken into account - comment is obsolete as text has been deleted due to space restrictions |
| 18076 | 7 | 41 | 1 | 41 | 2 | I doubt this is generally true, especially given that many renewables can be applied decentraly. Maintaining this sentence would, at the very least, be substantiated with a credible reference. | Taken into account - a paragraph on distributed generation is added emphasizing that they may show lower demand for an extension of the grid, |
| 10543 | 7 | 41 | 1 | | | Add …"additional" transmission…. | Accepted - text revised. |
| 10545 | 7 | 41 | 13 | 41 | 20 | Move to 7.2 | Rejected. This is very small description of fuel balance for district heat. It often neglected in many global energy studies. So, many unfamiliar with this sector. |
| 10546 | 7 | 41 | 15 | | | …own use, "which is around XEJ, excluding traditional biomass. Could check these data with IEA Renewable Energy heating and Cooling 2008 report. Are discrepancies. | This is from IEA energy balance (see table 7.1. for details. |
| 11859 | 7 | 41 | 31 | 41 | 37 | This paragraph is quite confusing and doesn't really offer specific new concepts other than listing potential future technolgoies. Perhaps it could be shortened? | Accepted - content of the text has been improved. |
| 3788 | 7 | 41 | 32 | 41 | 32 | Check "cite". | Accepted text revised. |
| 9998 | 7 | 41 | 34 | 41 | 36 | The potential future technology development should include "heat pump technology" because heat pump is a representative of high efficient water heater. In addition, this part should refer to some examples that high efficient system of heat pump using river water is developed and used. | Agree. But there is relatively small room for this technology to work in district heating systems. |
| 10547 | 7 | 41 | 37 | | | needs a reference | Agreed. Provided. |
| 11860 | 7 | 41 | 39 | 42 | 4 | Gasoline pipelines and ethanol are not compatible, nor can biodiesel be transported in diesel pipelines if those pipelines carry jet fuel (as is typical in U.S.). In the U.S., ethanol is transported by rail and truck rather than pipeline due to ethanol's hydrophylic properties. This means that ethanol (and biodiesel in some cases) is transported much less efficiently than conventional fuels. | Accepted. Text has been added to limit supply of liquid fuels to the retail end of the distribution chain. |
| 10549 | 7 | 41 | 39 | 41 | 43 | Repetitive. Suggest delete | Rejected - necessary to provide some context for the following discussion. |
| 10544 | 7 | 41 | 8 | | | Add …"numerous" small……. | Rejected - numerous is not necessary |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 18512 | 7 | 41 | | | | This section is focused strictly on ee improvements. Are there any challenges to fuel switching? E.g. incorporating more RE into district heating systems? Please incorporate mention of this aspect as well. | Taken into account in drafting the SOD. |
| 10548 | 7 | 41 | | | | Cooling networks not discussed - though is in title | Agreed. Text on cooling systems added. |
| 16123 | 7 | 41 | | | | The link of alternate gas injection, be it biogas, recombined methane, or hydrogen, is not done with the added flexibility of the links between regions and with storage, possibly an important feature in a 100% renewable system. Overall with section 7.6.3, it leaves the impression that only electrical links will bring flexibility to the power systems. | Accepted: Text has been added to indicate greater flexibility to RE sector via storage. |
| 11939 | 7 | 41 | 38 | | | Combine with 7.5.1 and shorten | Reject: The focus of the current section differs considerably from that of 7.5.1. |
| 7737 | 7 | 42 | 1 | 42 | 4 | What about GHG emissions reduction opportunities throughout fossil fuels production chains, such as in refineries, for instance? | Taken into account: Industrial processes are largely discussed in Chapter 10, although discussion on refineries is limited. Given the current focus of 7.6.3, the introductory text has ben altered to |
| 2785 | 7 | 42 | 14 | 42 | 22 | Personally I am very skeptical of biomethane replacing substantial quantities of natural gas. I think the anticipated scale of such substitution should be mentioned in the paragraph | Taken into account. Data from SRREN has been added. |
| 10550 | 7 | 42 | 16 | | | Could add more up to date SRREN ref from Ch 8 - Sims et al, 2011 | Taken into account: SREEN reference |
| 12602 | 7 | 42 | 17 | | | UK also injects biomethane into the grid - http://www.ngvaeurope.eu/uk-becomes-eighth-european-country-to-inject-biomethane-into-the-gas-grid | Taken into account: Text has been revised to be more general (page 42 line |
| 5140 | 7 | 42 | 23 | | 34 | It seems the entire paragraph is trying to discuss transport of hydrogen. The first sentence in the paragraph suggesting existing natural gas network could be used for hydrogen transport is questionable considering material hydrogen embrittlement issue. | Taken into account: Text has been revised to clarify limits (page 42 lines 17-20). |
| 3004 | 7 | 42 | 23 | | | I doubt that most of gas pipeline is able to transport H2, as written in the manuscript. This gives the reader a wrong idea. Please note that H2 embrittlement is a major corrosion issue. | Taken into account: Text has been revised to include comment on pipeline |
| 16827 | 7 | 42 | 24 | | 26 | The suggestion that it would be desirable to produce hydrogen from wind or solar seems speculative -- electrolysis of H2O to produce H2 involves efficiency losses, thus raising the cost of the energy (from an already relatively expensive electricity source). If there is "surplus" renewable energy then it is likely that it has already been deployed over the economically efficient level. The costs of this solution should be examined more closely relative to other alternatives. | Taken into account: Text has been revised to mention drawbacks. |
| 13297 | 7 | 42 | 30 | 42 | 33 | The Yang and Ogden work makes clear that the flow rate and the distance are important determinants not only of the delivery mode cost, but also of the consequent choice of delivery mode (as the flow rate and distance affect the costs of different delivery modes very differently) - it is worth making this clear, perhaps together with the implication that pipelines are favoured over shorter delivery distances and at high flow rates, while liquid hydrogen delivery is favoured by long delivery distances | Taken into account: Text has been revised to indicate differences due to distance. |
| 4450 | 7 | 42 | 33 | 42 | 34 | Specify that the 3000 km H2 pipelines is the global figure. | Editorial. Text has been revised (page 42 |
| 6431 | 7 | 42 | 36 | 42 | 36 | Does the distinction between CCS and CO2 storage need to be made? Can CCS suffice here? | Accepted: The beginning of this sentence can be shortened to "Options |
| 9507 | 7 | 42 | 39 | 43 | 2 | Evidences of these texts are not enough, one paper only, and contains too optimistic aspirations. Texts should be deleted. | Should be 7.6.4. |---|---|---|---|---|---|---|---|
| 13500 | 7 | 42 | 8 | 42 | 30 | Text : "...low pressure networks which distribute gas for power generation, industry and domestic use. Because of their ability to carry natural gas substitutes, these networks provide an opportunity to expand production of these gases. Low CO2 emitting natural gas substitutes can be produced from renewable sources such as biomass and waste...Provided the substitute natural gas meets the relevant gas quality standard (European Commission, 2001; IEA Bioenergy, 2006, 2009) there are no technical barriers to the injection of gas substitutes into the existing gas networks (European Commission, 2001). Substitutes are already being injected into natural gas networks. Examples of biomethane gas injection plants based on anaerobic production processes can be found in Canada, Finland, Norway, Sweden, and The Netherlands; Germany has over 50 operational plants injecting biomethane produced from animal waste and agricultural residues (IEA Bioenergy, 2011)...Although limited, the natural gas network also has the potential to transport and distribute hydrogen produced from biomass and fossil fuel sources, or produced to carry surplus energy generated from variable renewable sources such as wind or solar (IEA, 2006; Moriarty and Honnery, 2007; Honnery and Moriarty, 2009). Unless the amounts are small, combining hydrogen with natural gas is likely to mean gas quality standards will not be met (European Commission, 2004; Tabkhi et al., 2008). Large scale injection would require changes to gas appliances so remains a longer term option (Haeseldonckx and D'haeseleer, 2007). Additional factors limiting hydrogen injection relate to the integrity of steel pipelines and end user safety (European Commission 2004)..." Biomethane is also being injected in the UK ( IEA Task 37, "UK Experience with Gas Grid injection", John Baldwin, presentation http://www.iea-biogas.net/_download/publications/workshop/10/Experience_with.pdf 15th September 2011). For "transport and distribute hydrogen produced from biomass and fossil fuel sources, or produced to carry surplus energy generated from variable renewable sources", it should be made clear that the text means "carry surplus energy in the form of Renewable Hydrogen generated from variable renewable sources". Although there are limits on the amount of hydrogen that can be carried in the gas grids, owing to the permeability of metals to hydrogen gas, and the implications of changed Wobbe Index on end use appliances, the Dutch are actively supporting 5% hydrogen in Natural Gas - and are testing up to 20% (Kiwa Technology, http://www.kiwatechnology.com/uploadedFiles/Expert_Centre/Gas_Technology/Publications_and_Patents/Folder_AdvancedEnergySystems_A4_web.pdf, "PILOT PROJECTON HYDROGEN INJECTION IN NATURAL GAS ON ISLAND OF AMELAND IN THE NETHERLANDS", http://www.google.co.uk/url?sa=t&rct=j&q=&esrc=s&source=web&cd=3&cad=rja&ved=0CEQQFjAC&url=http%3A%2F%2Fwww.igu.org%2Figrc2011%2Figrc-2011-proceedings-and-presentations%2Fposter%2520paper-session%25201%2FP1-34_Mathijs%2520Kippers.pdf%2Fat_download%2Ffile&ei=DDxTUImWAaLB0gWZiYBQ&usg=AFQjCNF6n-NeZ8UN-OEnk7CFQYso-20c2w). In the UK, National Grid, Royal Dutch Shell, ITM Power and Kiwa are about to start testing hydrogen injection into the gas grid (http://www.itm-power.com/project/gridgas/). The upgrade of the low pressure gas grid in the UK - moving from old metal pipe to plastic pipe, is perhaps highly advantageous for the inclusion of hydrogen in the network. Even if the proportion of hydrogen in the gas grid cannot be higher than around 5%, Renewable Hydrogen would be a very valuable gas stream - it could be methanated with carbon rich flue gases from industrial furnaces, or even from power plants, to provide Renewable Methane for gas grid injection. This could even create carbon credits, if carbon dioxide is prevented from becoming emissions by being recycled into Renewable Gas. It might also be possible to use carbon dioxide to balance the burn profile of | Taken into account: Text has ben revised to give greater clarity (entire section). |
| 11940 | 7 | 42 | 35 | | | Discuss this in 7.5.5. It will make more sense to the reader | Noted. The CLAs made a decision to organize the chapter in this manner. The chapter discusses all relevant aspects of CCS (given space |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 13501 | 7 | 42 | 36 | 42 | 38 | Text : "Options for CCS and CO2 storage are presented in 7.5.5, the focus here is the infrastructure required for CO2 transport. The recent CO2 transport literature addresses the scale of the required CO2 pipeline network and potential ways to optimize these (largely) yet-to-be-built pipeline networks." It may turn out to be unnecessary to construct CO2 transport pipeline infrastructure if carbon dioxide gas is no longer regarded as waste emissions that requires pumping (to the coast) and burying undersea/underground. The various Renewable Gas processes could recycle carbon dioxide. In fact, it may be more valuable to reuse carbon dioxide than permanently sequester it. The important thing is that initial carbon dioxide production is balanced so that net emissions (after all recycling and capture) to the atmosphere from the ground (fossil fuels) are minimised. | Reject: not supported by the broad body of peer reviewed literature. There is no robust literature that would say that "using" CO2 in this manner and on this scale would be feasible. |
| 3400 | 7 | 43 | 13 | | 19 | Excess of references for simple ideas. | Noted: No change to text needed. |
| 7738 | 7 | 43 | 13 | 43 | 16 | What about the dificulties in obtaining environmental licenses for projects like this in other parts of the globe and the difficulty in assuring the safety os storage? | Rejected. Not supported by the peer reviewed literature. There is no technical literature that can be drawn upon to substantiate a broad and sweeping point like this. At this point in time the comment from the reviewer is conjecture. There is no factual data set |
| 9508 | 7 | 43 | 13 | 43 | 18 | "lowest-cost transport option" is not clear the cost level, and cause the misunderstanding of easy installation. This text should be deleted. | Rejected. The text and the supporting references clearly make the required |
| 10551 | 7 | 43 | 13 | | | Change "storage" to CCS. Also needs a comment about energy inputs for CCS | Rejected. It is not clear what the commenter is referring to here and therefore there is no way to assess the |
| 7739 | 7 | 43 | 18 | 43 | 19 | It seems that the sentence is incomplete when it says that "International institutions and would..." | Accepted - text revised. |
| 16828 | 7 | 43 | 2 | | | Suggest addition of following after "evolve." "Analysis suggest the additional CO2 price required to incentivize the construction of an extensive pipeline system could range from $10 to $15/ton CO2." See: http://www.pnl.gov/main/publications/external/technical_reports/PNNL-17389.pdf | Noted. The CLAs made a decision to organize the chapter in this manner. The chapter discusses all relevant aspects of CCS (given space |
| 13298 | 7 | 43 | 22 | 43 | 29 | This paragraph emphasises the impacts of climate change in terms of raising electricity demand for cooling, but fails to mention that it could reduce energy demand for heating in many countries - it could do with more balance | Accepted. Increase of cooling demand and decrease of heating demand are mentioned with more balance. |
| 16829 | 7 | 43 | 25 | | 33 | I find these sentences unclear -- what are you trying to say? | Accepted. Rephrased. |
| 14545 | 7 | 43 | 34 | 43 | 34 | change 'whether' to 'weather'. Sentence could be reworded | Editorial. changed |
| 11861 | 7 | 43 | 36 | 43 | 39 | Suggest deleting this paragraph. This repeats earlier assertions. | Accepted. Deleted. |
| 18077 | 7 | 43 | 36 | 43 | 36 | "grid" instead of "grip" | Editorial. The sentence is deleted. |
| 6190 | 7 | 43 | 36 | 43 | 36 | "grip" should be "grid" | Editorial. The sentence is deleted. |
| 6441 | 7 | 43 | 36 | 43 | 36 | Spelling error: grid (not 'grip') | Editorial. The sentence is deleted. |
| 16830 | 7 | 43 | 38 | | | Suggest you insert after "inflexible" the following: "i.e., peaks will become larger relative to normal demand levels." | Rejected - sentence altered such that unclear text has now been eliminated. |
| 13299 | 7 | 43 | 40 | 43 | 42 | It may be worth adding water desalination as a further example of increased energy demand as a response to climate change | Accepted. Sentence on water desalination is added. |
| 9230 | 7 | 43 | 18 | 43 | 18 | the world "missing": insernational institution and_WHAT?__would be needed---- | Accepted - text revised. |
| 3158 | 7 | 43 | 1 | | | Section 7.7 doesn't say much. I suggest delete and ask the adaptation people (WG2? or perhaps other chapters in WG3, such as chapter 15) to address. | Rejected. It is important to focus on the key climate change impacts on energy demand, as a lead-in to the next bit of text on supply side impacts. Moreover, the IPCC agreed to include this overall |

|---|---|---|---|---|---|---|---|
| 15466 | 7 | 44 | 42 | 44 | 45 | Although the issue of cable sag in the transmission lines is discussed in section 7.5.2, there is no mention direct mention of how climate change will affect its performance. Specifically, "At the transmission level, thermal expansion of transmission and distribution power lines causes line sag, decreasing the amount of power that can be securely transported through lines." http://www.dis.anl.gov/news/WECC_ClimateChange.html | Accepted - have addressed this peripherally. We may not be very specific, however, given space constraints |
| 12604 | 7 | 44 | 44 | | | Worth giving the example of how the drought in Australia has caused issues with a lack of cooling water for coal fired power plants | Rejected - We already noted that power generation facilities may experience performance problems from lack of |
| 5952 | 7 | 44 | 46 | 47 | | Objectivity: Nuclear facilities are designed to accommodate extreme weather events. Their resilience is being enhanced following safety reviews triggered by the Fukushima (geological) incident. | Noted - text eliminated |
| 17371 | 7 | 44 | 46 | 45 | 3 | In countries like France, measures have been taken to protect the nuclear facilities against high ambient temperatures during heat waves. It is expected, that there will be no need for further modifications due to the large margins that have been accounted for in the design changes. No special measures have been taken in France to protect the nuclear power plants against higher wind speeds and more frequent and more powerful lightnings. Only measures to protect the grids against higher wind speeds (storms) are needed. Also, higher ambient temperatures related to extreme weather do not pose a risk for nuclear power plants at river sites in France. Proactive water resource management is mandatory in the EU. An adaptation program is ongoing to preserve river sites in France during the lifetime of the nuclear power plants.<br>For other world regions, adaptation strategies to extreme weather events may be necessary, including, but not limited to, infrastructure relocation and reinforcement, cooling facility retrofit, and proactive water resource management (D Arent and Tol, Forthcoming; Rademaekers et al., 2011; Rübbelke and Vögele, 2011).<br>(K. Rademaekers et al. (2011): Investment needs for future adaptation measures for EU nuclear power plants and other energy generation technologies due to effects of climate change - Final report. ECORYS Nederland BV, Nuclear Research & consultancy Group (NRG), Energy research Centre of the Netherlands (ECN), 2011. | Rejected - all very good points, but section is severely space limited, and this additional detail simply cannot be added (if this detail were added, a lot more detail would also be needed). It is more appropriate for the WG2 report to go into this level of detail. Also need to focus on peer reviewed literature |
| 17372 | 7 | 44 | 46 | 45 | 3 | http://ec.europa.eu/energy/nuclear/studies/doc/2011_03_eur24769-en.pdf | Rejected - all very good point, but section is severely space limited, and this additional detail simply cannot be added (if this detail were added, a lot more detail would also be needed). It is more appropriate for the WG2 report to |
| 10552 | 7 | 44 | 7 | | | Change to ….impact of climate change on transport, including shipping and aviation, while…. | Accepted |
| 18513 | 7 | 44 | | | | Please also make use of the discussions in the IPCC SRREN on cc impacts on RE supply. This is covered in a dedicated section of each of the technology chapters. | Rejected - we already cite the summary for policymakers. Knowledgeable readers will discern that the source for the SPM are the underlying chapters of |
| 11941 | 7 | 44 | 1 | | | Everything in here should be put into the scetions where the particular technology os discussed in 7.5. | Rejected - basic structure of chapter determined by IPCC management, but |

|---|---|---|---|---|---|---|---|
| 4782 | 7 | 44 | 30 | 44 | 35 | I don't agree with this statement: "The non portability and longer lifetimes of dams used for hydropower may mean that these facilities are less adaptable to such changes.". It is true that hydropower has a long lifetime, but it's the first time I heard such a statement that long lifetime is a bad point ... the world need long term vision for curbing climate change, and a 15 year technology is maybe not enough ... ! It is a real adavantage to have those assets, as they could provide storage facility (both electricity and water), and regarding the water-energy (-and food) nexus, hydropower will thus play a key role for both mitigation and adaptation to climate change. Could the paper refered as (Roberto Schaeffer et al., 2012) be circulated in order to understand this statement? otherwise please remove the sentence. Furthermore the impact on climate change on hydropower is expected to be globally positive (but with differences from regions). | Accepted -Certainly the longer lifetime of hydropower is a positive in many respects, but with respect to the impacts of climate change / changes in precipitation patterns, the long lifetime is a downside in terms of the adaptability of the facilities themselves. We have, however, made changes to the text noting the possible climate adaptation benefits of long-lived dams from the |
| 4820 | 7 | 45 | 11 | 47 | 14 | Most of the text in this section could be summarised in a table | Accepted. A diagram has been |
| 18214 | 7 | 45 | 12 | | 16 | Delete: Significant opportunities exist to mitigate greenhouse gas emissions and other climate forcing within the energy sector. These opportunities include efficiency gains in the entire supply chain, reduction of methane and black carbon emissions, and albedo and soil carbon management; the most significant opportunity, however, is a shift in energy supply away from high-carbon energy sources, particularly coal. Comment: It certainly is a great opportunity, however, another great opportunity seen in formal education of the world population for sustainable development and rational consumption, which would impact on the reduction of energy demand and thus the decrease in supply this.<br>Alternative paragraph:<br>Significant opportunities exist to mitigate greenhouse gas emissions and other climate forcing within the energy sector. These opportunities include efficiency gains in the entire supply chain, reduction of methane and black carbon emissions, and albedo and soil carbon management; | Rejected. We prefer to remain specific as the current text is. The suggested text does not really say much. |
| 11769 | 7 | 45 | 14 | 45 | 16 | Energy must be chosen taking into  not only enviromnet but also economy and energy security. To avoid the misunderstanding, [prvided the economy and energy security is not taken into account] should be added after this sentence. Refer to No.4. | Rejected. Please note that economic and energy security aspects are taken up in other sections of the chapter (e.g. |
| 6460 | 7 | 45 | 14 | 45 | 16 | A shift in energy supply may include high-efficient usage of coal with CCS. So, the sentence should be changed to, for example;<br>“the most significant opportunity, however, is a shift in energy supply towards low-carbon, such as renewables, fossil fueled power generation with CCS, and nuclear”. | Accepted. "Capture and storage of CO2" was added to the list of important opportunities. |
| 9596 | 7 | 45 | 14 | 45 | 16 | Please, replace high-carbon energy sources with fossil fuel energy sources, and delete particulary coal. | Rejected. Note that coal is a lot more polluting than natural gas, as apparent |
| 10660 | 7 | 45 | 14 | 45 | 16 | Add a statement coal can be chosen from the view point of energy security. | Rejected. This section investigates options available for climate mitigation, |
| 10554 | 7 | 45 | 14 | | | Delete " and albedo and soil carbon management" which are not energy supply examples. | Rejected - both bioenergy, solar and hydropower systems can affect these |
| 9370 | 7 | 45 | 14 | 45 | 16 | It is more realistic and more productive to consider how to improve the efficiency of coal fired power plant than to simply encourage a shift in fuels. Therefore, the sentence should be rewritten or deleted. | Highly efficient coal fired power plants still have too high emissions to be a meaningful contribution to a stringent |
| 16831 | 7 | 45 | 15 | | | Suggest you replace "carbon energy sources, particularly coal" with "emitting fossil fuel technologies to low emitting technologies." | Taken into account. Please note that I have replaced "high carbon" with |
| 5933 | 7 | 45 | 16 | | | Life-cycle assessments of emissions from generation technologies do not significantly alter the assessment | Life cycle aspects are of crucial importance when going to very low emissions, evaluating bioenergy or |
| 16832 | 7 | 45 | 18 | | | Suggest adding after "… energy conversion technology." the following:  "In systems which rely on carbon prices to incentivize mitigation, it may be necessary to account for or include life cycle emissions as part of the price regime." | Rejected. Thanks for the suggestion, but questions of policy are not addressed in this section and there is no room for this |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |

| 10555 | 7 | 45 | 18 | | | Avoid personal pronouns | Accepted. language has been adjusted. I do not in general agree with avoiding |
| 10070 | 7 | 45 | 21 | | 34 | The methane issue should be more elaborted, with respect to the differen GWPs in different timeframes for the different GHGs .<br>See: The future of Natural Gas, E. Monitz et al, MIT (2011);<br>Shindell et al, Science 326, 716 (2009) | Taken into account. The forcing of CH4 is an important issue and we are aware of the references suggested. However, the issue of metrics is one of overall importance for this report and it should be treated consistently throughout; |
| 5953 | 7 | 45 | 21 | 30 | | Clarity: A life cycle approach is appliewd to gas generation whereas coal is treated at point of use only e.g. coal bed methane emissions are not considered in the comparison made. | Rejected. No, all data refers to life-cycle emissions. |
| 10556 | 7 | 45 | 21 | 46 | 48 | Could be better presented as a table. | Accepted. A figure has been inserted. |
| 9909 | 7 | 45 | 22 | | | "and further review papers have been published since." Please cite them. Examples for systematic reviews are:<br>Burkhardt, J.J., Heath, G. and Cohen, E., 2012. Life Cycle Greenhouse Gas Emissions of Trough and Tower Concentrating Solar Power Electricity Generation. Journal of Industrial Ecology, 16, pp.S93–S109.<br>Dolan, S.L. and Heath, G.A., 2012. Life Cycle Greenhouse Gas Emissions of Utility-Scale Wind Power. Journal of Industrial Ecology, 16, pp.S136–S154.<br>Hsu, D.D. et al., 2012. Life Cycle Greenhouse Gas Emissions of Crystalline Silicon Photovoltaic Electricity Generation. Journal of Industrial Ecology, 16, pp.S122–S135.<br>Kim, H.C., Fthenakis, V., Choi, J.-K. and Turney, D.E., 2012. Life Cycle Greenhouse Gas Emissions of Thin-film Photovoltaic Electricity Generation. Journal of Industrial Ecology, 16, pp.S110–S121.<br>Potsdam-Institut für Klimafolgenforschung, 2012. Renewable energy sources and climate change mitigation : special report of the Intergovernmental Panel on Climate Change. New york: Cambridge university press.<br>Warner, E.S. and Heath, G.A., 2012. Life Cycle Greenhouse Gas Emissions of Nuclear Electricity Generation. Journal of Industrial Ecology, 16, pp.S73–S92.<br>Whitaker, M., Heath, G.A., O'Donoughue, P. and Vorum, M., 2012. Life Cycle Greenhouse Gas Emissions of Coal-Fired Electricity Generation. Journal of Industrial Ecology, 16, pp.S53–S72. | Taken into account. Please note that none of the cited articles addresses all the technologies. Rather, they are technology specific. New data including some of these references are cited as appropriate in the discussion of each individual technology further down. I have reviewed all of the cited papers, but prefer to cite original work over review articles when review articles add little to the original work. |
| 18079 | 7 | 45 | 25 | 45 | 26 | It would be helpful to have the average CO2 emissions for both oil and gas in co2/kWh here. It says that a combined cycle gas is 60% lower than coal. What is relevant is the average of all gas power plants. Provide the figures. The average carbon emissions for the fossil fuel technologies (oil, gas and coal) should be included, to give the reader a feeling of the challenge of reducing the power sector to below 100 gCO2e / kWh by 2050 and eventually zero (line 34) | Taken into account This issue is covered by a figure. |
| 9475 | 7 | 45 | 32 | 45 | 34 | Suitable sites for renewable energy or CCS are eccentrically-located and installation of them requires great cost. It should be added that there are difficulties to make world's average emission factor of electricity to zero. | Agree that aspects of grid integration need to be better addressed. Little research available and little space. |
| 9999 | 7 | 45 | 32 | 45 | 34 | If "eventually need to go to zero" means 0℃ target, this part should be deleted completely. There is not such an international agreement to have 0℃ target. In addition, 1.5 ℃ target is not realistic and even 2℃ target is extremely difficult to attain, as described in (Höhne, 2011, conclusion) and (Rogelj, 2011, abstract). These literatures are listed in the No10 line of this table. | Ch. 6 shows that emissions need to go to zero also for a 2 deg. Target. Reference to Ch.6 is now added. |
| 16833 | 7 | 45 | 33 | | 34 | Suggest replace "eventually need to go to zero" with "in the longer term may need to incorporate a large share of "negative emissions" (biomass with CCS)" then replace "even lower" with "negative" later in the sentence. Chapter 6 makes case that if some targets are to be achieved it may be necessary to do a large amount of negative emissions via biomass/CCS as part of an overshoot strategy. | Rejected. Too long and complicated sentence. The feasibility of negative emissions is really questionable from a life-cycle perspective and not |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 10072 | 7 | 45 | 35 | | 44 | The assumptions on additional primary energy demand for CCS should be listed.<br>According to Singh et al. coal (supercritical BAT and IGCC with 43% and 44% net efficiency compared to 35% world average) has a 74 to 78% reduction and Natural gas (NGCC and partial oxidation have 58% and 56% net efficiency compared to 42% world average) 64 to 73%. This should be made clear in the text. | Accepted. Text revised. |
| 6799 | 7 | 45 | 35 | 45 | 35 | There is much discussion about carbon capture and storage in this chapter. It's very important to indicate that harnessing this approach, if it serves practical will likely take decades. A special issue of Science a few years ago talked about large scale use in the mid 2030s. But nuclear and renewable technologies are available today. This time frame issue needs to be discussed. CCS is not a near-term solution, and it is critical that we address carbon emissions immediately. | Taken into account These are issues that should be considered by the scenario analysis. It does not take longer to build a large-scale CCS facility than a nuclear facility - or to implement large |
| 6192 | 7 | 45 | 35 | 46 | 13 | Long prose summaries of numerical data are rarely more effective than a chart. Charts allow for rapid comparisons and easier lookup. Suggest cutting down on these few paragraphs. | Accepted. A diagram has been introduced. |
| 5161 | 7 | 45 | 35 | 45 | 35 | is this referring to CCS? clearifications needed - "capture plants" are used several places | Taken into account. It says CO2 capture and that sentence is correct. There is a potential to misunderstand the follow on sentence, which has been changed to "When considering emissions of non-CO2 greenhouse gases and those connected to fuel production, capture plant and CO2 transport and storage, |
| 9655 | 7 | 45 | 38 | | 44 | When referring to emissions of 180-200 gCO2e/Kwh - it is not clear what this is referring to. Is this additional emissions associated with CCS on a coal plant? If so, please elaborate. The next sentence is also confusing - is this the fuel prodcution chain in Capture plants? CCS is portrayed as being negative - even though it still has a net positive impact in overall emissions from business as usual. | Taken into account - a figure has been introduced to clarify this issue. |
| 10071 | 7 | 45 | 39 | | | 1% leakage: is this the leakage rate for the transport of CO2? What is the annual leakage of the storage? | Accepted. The leakage refers to natural gas, and the language has been |
| 15444 | 7 | 45 | 4 | 45 | 9 | It may be worth noting that the interdependices between the energy sector and other sectors can potentially result in adverse sustainability outcomes. For instance, a climate change driven increase in energy costs may favour irrigation techniques that are less energy intensive but are also less efficent in terms of water use, such as flood irrigation. This would be tend to counteract recent trends in irrigation practices in many countries (such as Australia) where water use efficiency is being pursued as a climate change adaptation mechanism, noting that any change in irrigator behaviour would be subject to their individual sensitivity to energy costs relative to water scarcity. | Rejected - a good comment, but outside scope of this subsection, in which we focus on the physical impacts of climate change (not financial). Financial impacts and related sustainability issues are better addressed in Section 7.9 |
| 3402 | 7 | 45 | 44 | | | It should be obvious that co-processing of a small fraction of sustainable biomass with coal can bring the specific emmissions of CCS systems to zero or even negative values (IPCC SR CCS, 2005). | Rejected. We would need a peer-reviewed life-cycle study that demonstrates this. As this depends mostly on the emissions connected with biomass combustion, it is not mentioned |
| 5142 | 7 | 45 | 7 | | 8 | The water and energy conflicts could also impact bioenergy! Perhaps it should be mentioned. | Accepted - water/energy conflicts impact many energy supply sources. Rather than listing all of them, we instead alter the text to allow for other non-hydro impacts. Bioenergy related impacts from climate change, including from water, |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 13038 | 7 | 45 | 7 | 45 | 9 | Suggest adding the word "potentially" before the words "impacting hydropower". Regional conflicts exist currently and can be managed to allow for hydropower negotiation. Increased water conflict across borders may indeed occur due to climate change, but asserting that this will impact on hydropower is not a given. | Accepted - text amended accordingly |
| 5160 | 7 | 45 | 7 | 45 | 9 | (Sentence starting with "Climate change---") - On the other hand - since hydropower is in the nexus of water and energy it may be seen as a mechanism to solve conflicts by providing available water - the statement here seems too one-sided negative. ref SRREN ch 5.10 | Accepted - we also note the adaptation benefits of storage hydropower, though not in exactly the way suggested by the |
| 10553 | 7 | 45 | 7 | | | Could add after "Chapter 11)." Conversely, energy-smart food can closely link agricultural production and processing with sustainable energy systems (FAO, 2011).<br>Ref is: FAO, 2011. Energy-smart food for people and climate, UN Food and Agricultural Organisation, Rome. 65 pp. http://www.fao.org/docrep/014/i2454e/i2454e00.pdf | Rejected - Due to severe space constraints, we cannot add more text to this section unless absolutely essential. The food-bioenergy linkages are |
| 13502 | 7 | 45 | 7 | 45 | 9 | Text : "Climate change may also exacerbate water and energy conflicts across sectors and regions, impacting hydropower development (Cisneros and Oki, Forthcoming; D Arent and Tol, Forthcoming; Kumar et al., 2011)." The exploitation of unconventional fossil fuels is also at risk from climate change-stressed water supplies. The production of shale gas and oil from sands are particularly dependent on water. Water and energy conflicts are likely to become more widespread for most thermal (combustion) electricity generation, particularly higher incidence of drought. | Accepted - slight revisions made to reflect this potential impact, though we do not mention the impact specifically as it is better addressed in the WGII report, where space constraints are of less concern. |
| 4783 | 7 | 45 | 7 | 45 | 9 | The sentence "Climate change may also exacerbate water and energy conflicts across sectors and regions, impacting hydropower development" should be rephrased on a more positive way. Indeed the IPCC/SRREN stated that, as hydropower is at the cross-roads of 2 pilars for the development of a country (energy & water). It is important to note that climate change will have a global positive impact on hydropower (IPCC/SRREN). Furthermore thanks to the storage provided by reservoir hydropower plants, the development of hydropower regarding multi-purpose users (and under a sustainable way) should be part of the solution for both climate change mitigation and adaptation (control extreme events such as flood or drought seasons). | Accepted - we note the adaptation benefits of storage hydropower, though not in exactly the way suggested by the comment |
| 13059 | 7 | 45 | 10 | 55 | 1 | On the Costs & Potentials issues it is difficult for the reader to access the bigger picture of the cost & potential information. Each sector has its own approach to costs and potentials, which is appropriate as each sector has its own unique qualities and considerations. Nonetheless, the information that will be most relevant to take-away for policy-makers is overarching cost information that brings these different pieces together. To help policy-makers access this information, it should be important to highlighting market realization, but also the policy aspects of cost (by policy it is meant institutional frameworks and/or market frameworks and/or capacity building arrangements, etc...). In both developing and developed countries policy can have a strong impact on cost. Simply looking across the costs & potentials sections of the sector chapters, the reader could miss this message, although the information on policies and measures is there in the chapter. Therefore it could be important to make sure that these informations are put in perspective appropriately. | Taken into account - during the Vigo lead author meeting a process was initiated that improves the intercomparability between different sector chapters. Although this is still an on going process that will be finalized for the final draft, the current text has been partially improved. Aspects of capacity building are discussed in the policy section (now chapter 7.12). |
| 18542 | 7 | 45 | | | | There is a lot of good information in this section, but a lot of it repeats and expands on what appears in 7.5. Why not break it into relevant pieces and present this information there? This would help the reader by keeping the discussion of all emission reduction measures in one place. | Rejected - 7.8.1 serves as a summary section on these issues. |
| 6548 | 7 | 45 | 16 | | | Replace "high-carbon energy sources, particularly coal" with e.g. "high-carbon emitting sources, particularly low efficient coal burning technologies without CCS", as what matters is emissions, and the latest high efficient coal burning technology with/without CCS can be an effective option to mitigate CO2 emissions, especially in developing countries. | Taken into account. The text has been changed to "unmitigated fossil fuel based technologies, particularly coal." to indicated the relevance of CCS. CCS |
| 6549 | 7 | 45 | 32 | | 33 | Replace "need to be reduced [...] to meet the 2 degrees C mitigation goal" with e.g. "need to be reduced [...] if the 2 degrees C mitigation goal is to be met", as this goal has not been agreed on globally. | Taken into account. Good point. However, the suggested language change does not really have the |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 6550 | 7 | 45 | 33 | | 34 | Replace "need to go to zero" with e.g. "need to be reduced significantly" in accordance with AR4 WG1 Report Figure 10.21, or give a reference paper. | Taken into account. Reference to Ch.6 was added. |
| 6551 | 7 | 45 | 35 | | 39 | Add description for biomass/biogas co-firing, which has potential to reduce effective net life-cycle emissions from thermal power plants even to zero or below zero if adopted in addition to CCS. | Rejected - space constraints do not allow to go into all details here. |
| 13503 | 7 | 45 | 41 | 45 | 44 | Text : "Measures to increase energy efficiency and reduce fugitive emissions in fuel production and distribution can give further emission reductions, but these gains may be offset by the need to tap lower-quality resources which result in higher fuel-chain emissions (Section 7.5.1)." Arguably, the world is already using lower-quality fossil fuel resources, although they are still mostly classed as "conventional". Even if the fossil fuels are of a reasonable quantity, their increasing inaccessibility and the distribution effort required are reducing the overall energy rate of return, the Energy Returned on (Energy) Invested (EROI/EROEI). | Taken into account. Yes, and this is mentioned in 7.5.1. We found no published studies that provide firm evidence for increasing emissions, but follow the reasoning. |
| 2973 | 7 | 46 | 1 | | | Here and in the text the importance of the subsidies on fossil fuels should be described, emphasizing that in many developing countries renewable power production would be considerably closer to competitivity if subsidies on fossil fuels would be removed. See: Tobias S. Schmidt, Robin Born and Malte Schneider, 'Assessing the Costs of Photovoltaic and Wind Power in Six Developing Countries', Nature Climate Change, 2 (2012), 548–553 <http://dx.doi.org/10.1038/nclimate1490> [accessed 13 August 2012].. | Rejected - the section is about technical aspects. Subsidies are discussed in 7.12. |
| 16834 | 7 | 46 | 1 | | 30 | This section has problems -- begin by talking about the high life cycle emissions associated with particular energy sources, primarily from the manufacture of components to deploy these technologies. It then goes on to note however that as the system emits less and less these estimates will not hold -- this would say to me these estimates are extremely flawed. Perhas better to say something along lines that in mitigation scenarios, where increasing amounts of low emitting technologies are deployed, that the associated life cycle emissions in the manufacture of these technologies continue to decline. In systems which employ a CO2 price, the cost of the technologies will reflect the associated carbon emissions -- these costs will decline then as the overall system is increasingly low emitting. | Taken into account. Text replaced by figure as per earlier comments. |
| 3789 | 7 | 46 | 1 | 46 | 13 | Extend discussion to include biomass based electricity generation and, eventually, cogeneration | Rejected. Please note that bioenergy is covered in an annex to chapter 11 and there is not sufficient space to take this |
| 2838 | 7 | 46 | 20 | | | Another reference to what scenarios "will" produce without any corrective to note that this outcome is at present unlikely and would require big changes. For the reasons given on p 24-5 and 29 and section 7.10.5, emissions from marginal production of fossil fuels are likely to increase, not decrease, as unconventional sources take an increasing share and we remain locked in to fossil capacity. | This section has changed due to a figure to be added, and the meaning was clarified. I agree that will should be replaced by would |
| 4451 | 7 | 46 | 23 | 46 | 26 | Studies exist which show how that PV modules perform at better than 90% name plate capacity after 30 years in the field [Dunlop & Halton (2006). The performance of crystalline silicon photovoltaic solar modules after 22 years of continuous outdoor exposure. Progress in Photovoltaics: Research and Applications, 14, 53 – 64.]. This has implications for the current economic lifetime assumption of 20-25 years for PV devices. Moreover, recovering the material from end-of-life PV modules avoids the need to use virgin resources and associated the associated manufacturing energy penalty. PV modules from recycled materials have up to 60% less embodied energy [ (Bombach et al (2005). Recycling of solar cells and modules - recent improvements. Published at the 20th European Photovoltaic Solar Energy Conference and Exhibition.] | This comment may suggest that not all potential improvements in PV technology are adequately considered in LCA studies, or that the performance is misrepresented. We try to cite good studied, but potential issues with the literature that we cite must be addressed through the open scientific process. |
| 3790 | 7 | 46 | 23 | 46 | 30 | When discussing the impact of manufacturing processes or as process emission it should be wise to look the impact due the transportation sector with the introduction of electric or hybrid plug-in vehicles. | Rejected. This issue is not part of the scope of Ch.7. |
| 13040 | 7 | 46 | 31 | 46 | 31 | The phrase "complex issue" needs to be qualified, especially since the values given are in line with the values for solar and nuclear earlier in the same page (lines 3-5) | Noted. The term "complex issue" does not appear in the document. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 13041 | 7 | 46 | 31 | 46 | 31 | The word 'emissions' needs to be changed to 'flux' because water bodies can absorb and degrade carbon as well. | Rejected. "Emissions" is used in the SRREN and kept here for consistency. The literature shows clearly that freshwater bodies are net emitters greenhouse gases (Bastviken et al. 2011, Science 331(6013):50), and this |
| 13039 | 7 | 46 | 31 | 46 | 48 | This topic is a complex subject to summarize but this paragraph fails to do this accurately and scientifically. | The summary has been changed after a careful reading of the more complete |
| 5162 | 7 | 46 | 31 | 46 | 48 | this paragraph should be checked against the contents of the SRREN ch 5.6.3 - many of the statements are to categorical and lacks references. | Taken into account. SRREN has been revisited, in addition to many publications on this issue. Text revised |
| 5935 | 7 | 46 | 31 | | | The discussion of emissions from hydropower facilities should reference the work done by IHA/UNESCO http://www.hydropower.org/iha/development/ghg/index.html | Rejected. This is a reference to a general website with content that shifts |
| 13042 | 7 | 46 | 32 | 46 | 32 | CO2 is not an issue with regard to hydropower. The UNESCO/IHA GHG Project has identified that CO2 is already likely to be emitted by the water body irrespective of the existence of a reservoir. The 'issue' is the conversion of CO2 to CH4. | Noted. About 0.9 PgC are transported by the rivers to the oceans. An estimated one half to two thirds of this carbon is in the form of organic carbon. In the ocean, organic carbon either is transported to the deep ocean (akin to the biological pump) or oxidized and dissolved. If dams lead to a reduction of the transport of carbon to the oceans and instead release it as CO2 to the atmosphere, this would have a climate impact within the 100 year time horizon. Cole, J. J., Y. T. Prairie, N. F. Caraco, W. H. McDowell, L. J. Tranvik, R. G. Striegl, C. M. Duarte, P. Kortelainen, J. A. Downing, J. J. Middelburg, and J. Melack. 2007. Plumbing the global |
| 13043 | 7 | 46 | 32 | 46 | 32 | Emissions of CH4 can be heavily influenced by upstream unrelated anthropogenic sources or activities, e.g., unreated releases of sewage. This has been observed in reservoir and run-of-river projects. | Taken into account. This is an important aspect but unfortunately, we do not have time to cover this here. It would be nice |
| 5163 | 7 | 46 | 32 | 46 | 32 | delete "run-of-the-river plants" or rephrase "and not" (good language?) | Accepted. Expression has been deleted. |
| 13044 | 7 | 46 | 33 | 46 | 33 | interfere' should be changed to 'influence' | Taken into account. We have replaced "interfere with" with "change" |
| 13045 | 7 | 46 | 33 | 46 | 33 | The word 'stopping' is incorrect. Reservoirs may influence the pattern of transport, but they do not stop the flow of biomass. | Accepted. This was incorrectly stated and has been modified. |
| 13046 | 7 | 46 | 34 | 46 | 35 | Accumulation of carbon does not 'slow' anaerobic digeestions. This sentence doesn't reflect current scienfitic knowledge, and furthermore, it doesn't make sense. | Rejected. In this sentence, 'slow' is an adjective, not a verb. We talk about |
| 13047 | 7 | 46 | 35 | 46 | 36 | The sentence beginning 'At the same time...' is erroneous. In the case where there are low level outlets, power stations may draw from the low-level anoxic water, which can increase methane exchange with the atmosphere, but this has nothing to do with surface water. | Taken into account. The original sentence was factually correct, but the reviewer points out that in addition to an exchange of gas between the surface water and the atmosphere, hydropower |

|---|---|---|---|---|---|---|---|
| 5164 | 7 | 46 | 35 | 46 | 35 | "---or after decommissioning." When mentioning decommissioning, there is at least a need for a reference . Historically few hydropower reservoirs have been decommissioned due to the very long life time of this technology. The SRREN found only two decommission examples globally and warned they might not be representative (SRREN 5.6.3.1) | Accepted. Reference to decommissioning has been removed also in the interest of space. Please note that the point is that the biomass that accumulates is likely to degrade and that it is a question of whether it degrades to CO2 or CH4. In addition, the question is |
| 5165 | 7 | 46 | 35 | 46 | 35 | Sentence saying "--,power stations also affect --": This is too categorical - they do not allways do this. Chanudet et. al found very low or no degassing in two reservoirs in Laos even when CH4 was found in the deep layers - (Chanudet V, et al, Gross CO2 and CH4 emissions from the Nam Ngum and Nam Leuk sub-tropical reservoirs in Lao PDR, Sci Total Environ (2011), doi:10.1016/j.scitotenv.2011.09.018). | Rejected. The existence of a single case among many examined (including two in the paper cited) does not contradict this statement. The paper does not prove that there is no effect even in the case of the Nam Ngum reservoir. The paper |
| 13048 | 7 | 46 | 37 | 46 | 37 | The concept of 'net flux' has been introduced here without any definition. Net flux represents the true impact of a water body which may then be allocated to its various water users, including hydropower among others. This approach has not been applied in the published literature to date but the scientific community recognizes the need to develop a methodology for this. | Taken into account. The sentence has been deleted. The original text included a reference to the only project where the next flux was measured. However, due |
| 5166 | 7 | 46 | 37 | 46 | 37 | "--the net flux of GHG." Ad: suggest footnote: "Net emissions are defined by the SRREN as Gross emissions minus pre impoundment emissions minus unrelated anthropogenic sources (SRREN ch 5.6.3.2 page 47 first sentence) An approach to unrelated anthropogenic sources and to the ghg issue could be found in the IEA Annex XII: managing the carbon balance in reservoirs (Draft), and in the IHA Measurement Field Guide | Accepted. At this point, we keep the reference to net emissions. However, this is a problematic term, as reservoirs take up and release GHGs. |
| 17373 | 7 | 46 | 38 | | | can act both as a sink… | Not clear what this comment refers to |
| 13049 | 7 | 46 | 38 | 46 | 38 | The word 'boreal' should be changed to 'cool' and the word 'significant' should be removed entirely. In the database of the UNESCO/IHA GHG Project, there are no examples of reservoirs that are 'signficant' sources of GHG. | Taken into account. Boreal has been removed. The cited reference shows that some projects have significant, even |
| 3791 | 7 | 46 | 38 | 46 | 38 | Replace "temperature" by "temperate". | Accepted. |
| 5167 | 7 | 46 | 38 | 46 | 39 | "in Tropical regions ---"this sentence state that anoxia and ghg emissions allways will happen in the tropical zone - this is not so, in Laos an old reservoir was found to be a sink, see: Chanudet V, et al, Gross CO2 and CH4 emissions from the Nam Ngum and Nam Leuk sub-tropical reservoirs in Lao PDR, Sci Total Environ (2011), doi:10.1016/j.scitotenv.2011.09.018 | Accepted. The explicit reference to tropical regions has been removed. The text now cites a specific review paper which illustrates the wide range of |
| 13050 | 7 | 46 | 39 | 46 | 39 | Regarding 'tropical regions' the UNESCO/IHA GHG Project has recently confirmed that the key influencing parameter on GHG transport and exchanges is temperature. It is an over-simplificaton to allocate performance to any region, tropical or otherwise. | Taken into account. Language changed. |
| 5168 | 7 | 46 | 40 | 46 | 40 | "--- leads to ---" - should say "can" or "may"(?) lead to - since the anoxia will not allways happen - factors like shape of reservoir basin, removal of forest to secure sirculation by wind and how the reservoirs are operated may secure oxygenation. Thi sstatement is not supported by the SRREN - ref is lacking | Accepted. Language changed. |
| 13051 | 7 | 46 | 41 | 46 | 41 | An older reservoirs' should be removed. GHG uptake can happen regardless of age. | Rejected. No reference is provided |
| 5169 | 7 | 46 | 41 | 46 | 41 | "Without ---": check logic in sentence | Accepted. Language changed. |
| 5170 | 7 | 46 | 42 | 46 | 42 | "Reported GHG ---" : this i snot correct - the SRREN say that "The majority of lifecycle GHG emission estimates for hydropower cluster between about 4 and 14 g CO2eq/kWh, but under certain scenarios there is the potential for much larger quantities of GHG emissions, as shown by the outliers" (5.6.3.1 page 44) - So the sentence here needs to be changed, it gives the impression that there exist a general range, valid for all HPP reservoirs of 0-150. The high end is definitely not found often (there are more than a million reservoirs globally, only a few have been investigated - it is important to have a correct picture of this issue, esp since it is not completely resolved.) | Accepted. Language changed to make clear that this is emissions that have been reported in the literature. |

|---|---|---|---|---|---|---|---|
| 13052 | 7 | 46 | 43 | 46 | 44 | The average age of reservoirs in many countries is in excess of 100 years. There are very few examples of decommissioning and it is misleading to reference these as having the highest values of GHG emissions. | Accepted. The sentence has been deleted. Please note that the original sentence referred to one specific study discussed in SRREN and is valid for that study, it was not claimed that this was an important issue everywhere. However, it is an issue that has not been |
| 5171 | 7 | 46 | 43 | 46 | 44 | "-- the decomposition from silt after decommissioning, ---" :as mentioned - the SRREN gives a clear caveat here | Accepted. Decommissioning is removed. |
| 13053 | 7 | 46 | 44 | 46 | 46 | We consider the value estimated by Barros et all (41gCO2E/kWh) to be gross emissions that have not been discounted to account for the true net impact of a reservoir and its (multiple) purposes. However, even with this exageration of gross emissions this figure confirms that hydropower is among the lowest sources of GHG per unit of energy produced. | Taken into account. This opinion of the reviewer is not supported by the literature, which rather points into the opposite direction, as noted in the |
| 5172 | 7 | 46 | 44 | 46 | 46 | "Barros et al.---" the estimates in Barros et al is Gross emissions based on data collection from the literature, ref the definition on Net emissions given in the SRREN (see another comment to this paragraph) - the Gross estimate does not sort out what is due to nature and what is due to the man-made reservoir, and not what is due to unrelated anthropogenic sources (UAS). one should at least stress that Barros et al is a gross estimate --- since both pre-impoundment and UAS should be substracted the net should be expected to be less than the gross. | Accepted. "Gross" was inserted. |
| 9656 | 7 | 46 | 46 | | 48 | How can the range be 0-40g/Kwh for the LCA? Surely 0 is not true - there must be emissions from construction materials? A definition of what is included for each of the technologies should be included to make the comparison between them | This is a range provided in SRREN and cited here. It may be that dams indeed are built for other purposes and power generation has close to no impact, or that there is a net uptake of CO2 in the |
| 13054 | 7 | 46 | 46 | 46 | 48 | The term 'fossil GHGs' is not a commonly used term. We take it this is intended to mean emissions related to construction, but the rate of emissions on line 47-48 do not carry a meaningful unit. I.e., 0-40g/kWh of what? If carbon, it seems extraordinarily high. This is the only reference we've see that indicates construction is a meaningful factor in a life cycle assessment of hydropower. | Taken into account. CO2 was added. The ranges quoted here are supported by the literature that is cited. |
| 10073 | 7 | 46 | 5 | | | The reported range for nuclear is not correct:<br>According to the given source, the harmonized range is 3.7 to 110g CO2/kWh, depending on the type of reactor. The mean values vary between 11 and 18g CO2/kWh, and the range between the 25th and the 75th quartile is: as published 5.6 to 53g CO2/kWhand harmonized 6.2 to 33g CO2/kWh.<br>In addtion, it is mentioned that "Depending on conditions (decreasing global uranium market-average ore grade), median life cycle GHG emissions could be 9 to 110 g CO2-eq/kWh by 2050." | We meant to report the interquartile range, as we did for the other technologies, and the cited numbers are from SRREN, but it is correct that the numbers from Warner differ slightly. However, they are smaller, not larger as |
| 9231 | 7 | 46 | 38 | 46 | 38 | Change temperature region by temperate or warm regions | Taken into account |
| 5173 | 7 | 47 | 10 | 47 | 10 | "--run-of-the-river " - given the comments to the last paragraph on the previous page (page 46) - delete run-of-the -river and leave only Hydropower. | Accepted. "run-of-the-river" replaced by "many cases". See also comment 13055 |
| 2839 | 7 | 47 | 16 | 47 | 19 | This discussion here should point out that levelised costs are not a good basis for comparison between intermittent and inflexible sources (ie most low carbon sources) on the one hand and dispatchable sources on the other, since the value of electricity is time dependent. Bringing the point in as an afterthought in relation to infrastructure four pages later means it can easily be lost. | Taken into account - a description of the shortcomings and caveats of the LCOE concept has been added in the main text after figure 7.10 as well as in the |
| 5955 | 7 | 47 | 17 | | | The LCOE concept applies to electricity, not "energy" per se. | Rejected - some sources (e.g. the SRREN) use LCOE for non electrical |
| 6452 | 7 | 47 | 2 | 47 | 2 | Spelling error: short (not 'sort') | Accepted |
| 3792 | 7 | 47 | 2 | 47 | 2 | Typo error. Replace "sort-term" by "short-term". | Accepted |

|---|---|---|---|---|---|---|---|
| 7740 | 7 | 47 | 21 | 47 | 24 | The sentence talks about renewable energy and states that related technologies are presented in Figure 7.12, which also presents nuclear, which is not a renewable source of energy. Please, review the text accordingly. | Rejected - the text does not say that only renewables are shown. |
| 18216 | 7 | 47 | 22 | | | Add to text: The levelised costs of many low carbon energy supply technologies have changed considerably since the release of the AR4. Even compared to the data recently published in the IPCC's SRREN (IPCC, 2011a), the decline of LCOE of important renewable energy (RE) technologies has been significant. Figure 7.12 depicts the LCOE evolution of those electricity supply technologies that Bloomberg New Energy Finance has been tracking in the past three years. The decline of LCOE of important renwable energy (RE) technologies has been significant. In the last four years the costs of renewable energy have declined significantly, especially photovoltaic (up 49%) wind (up 17%). CCS technology reduces the efficiency of power plants by 11% and increases costs by 30%. Nuclear plants have become very costly investment, but operating costs are quite low, producing zero emissions. | Rejected - after a short motivation based on renewable energies, the paragraph constrains itself to the introduction of the figure. Details for single technologies are discussed in other paragraphs. |
| 18217 | 7 | 47 | 22 | | | Alternative paragraph:<br>The levelised costs of many low carbon energy supply technologies have changed considerably since the release of the AR4. Even compared to the data recently published in the IPCC's SRREN (IPCC, 2011a), the decline of LCOE of important renewable energy (RE) technologies has been significant. Figure 7.12 depicts the LCOE evolution of those electricity supply technologies that Bloomberg New Energy Finance has been tracking in the past three years. In the last four years the costs of renewable energy have declined significantly, especially photovoltaic (up 49%) wind (up 17%). CCS technology reduces the efficiency of power plants by 11% and increases costs by 30%. Nuclear plants have become very costly investment, but operating costs are quite low, producing zero emissions. | Rejected - after a short motivation based on renewable energies, the paragraph constrains itself to the introduction of the figure. Details for single technologies are discussed in other paragraphs. |
| 5143 | 7 | 47 | 9 | | 11 | What's about  for the geothermal and ocean energy technologies? | Rejected. Studies are either higher (deep geothermal) or not sufficient |
| 13055 | 7 | 47 | 9 | 47 | 11 | The qualification of only run-of-river hydropower is not supported by text or references anywhere in this section, nor anywhere in the SRREN report.  The phrase 'run-of'river' should be removed so that the sentence indicates that wind, solar, nuclear and hdyropower can provide electricity with less than 5% of the lifecycle GHG emissions of coal power.  The vast majority of hydropower will fit in this category, not just run-of-river. | Accepted. |
| 13504 | 7 | 47 | 9 | 47 | 11 | Text : "The literature reviewed in this section shows that a range of technologies can provide electricity with less than 5% of the life-cycle GHG emissions of coal power: wind, solar, nuclear and run-of-the-river hydro power." I would expect that Renewable Gas (the class of emerging gas fuels that includes Renewable Hydrogen made from "spare" wind and solar capacity, refined and upgraded Biogas, and Syngas from such processes as gasification) when properly developed will be in this group also. | Rejected. No literature reference has been provided to support this claim. |
| 4784 | 7 | 47 | 9 | 47 | 11 | Proposition to replace the sentence "The literature reviewed in this section shows that a range of technologies can provide electricity with less than 5% of the life-cycle GHG emissions of coal power: wind, solar, nuclear and run-of-the-river hydropower" by "The literature reviewed in this section shows that a range of technologies can provide electricity with less than 5% of the life-cycle GHG emissions of coal power: wind, solar, nuclear, run-of-the-river hydropower and some reservoir hydropower". The storage (water & energy) provided by reservoir hydropower will be a key element for climate change issues (mitigation & adaptation). | Accepted. "run-of-the-river" replaced by "many cases". See also comment 13055 |
| 18543 | 7 | 47 | | | | It would be very helpful to have one summary sub-section that includes a comparison of LCOEs across RE, CCS, nuclear and to the extent possible, infrastructure costs. This would also be a major output of Ch 7 that could feed into the technical summary and SPM. | Rejected - space constraints do not allow for this comparison. In addition, the data ranges are too broad to allow |

|---|---|---|---|---|---|---|---|
| 4358 | 7 | 47 | 14 | | | As the section titel indicates, this section discusses "costs" of mitigation measures. However, a holistic, social-cost analysis of electricity cannot only focus on the average generation costs, but needs to take into account when and where electricity was generated (see my comment on LCOE). Even if a coal plant is "cheaper" as measured in average generation costs than a gas plant, that doesn't mean that it is not socially (and privately) cost-optimal to employ a gas plant (or, indeed, a mix of coal and gas plants). This is mainly due to the different variable-to-fixed cost ratios of technologies, or, in the case of solar/wind power, due to the fluctuating nature of the underlying resource. | Taken into account - a description of the shortcomings and caveats of the LCOE concept has been added in the main text after figure 7.10 as well as in the methodical annex. |
| 4356 | 7 | 47 | 14 | | | LCOE is a missleading metric when comparing dispatchable technologies with fluctuating generators, or when comparing different dispatchable generators with varying variable-to-fixed cost ratios. The reason is that electricity is not an homogenous good over time, that means that its value (private as social) depends on the point of time it is produces. Since different technologies produce at different times (e.g. peakers only at times of high prices), comparing average generation costs is highly missleading. However, trends over time are of utmost importance, of course. I propose to a) highlight this fundamental shortcoming in the text and b) change the figure such that it focuses on development over time rather than cross-technology comparison. Development over time by itself is impressive and interesting enough!<br>See Joskow, Paul (2012): “Comparing the Costs of intermittent and dispatchable electricity generation technologies”, American Economic Review 100(3), 238–241. | Taken into account - the caveats concerning the use of LCOE are emphasized by a footnote which refers to the respective discussion of these shortcomings in the Methodological Annex. In addition, caveats that should be observed while interpreting LCOE are mentioned after figure 7.10 |
| 4357 | 7 | 47 | 14 | | | References regarding renewables are limited to IPCC, IEA, and Bloomberg NEF; that seems somewhat flawed | Rejected - the cited sources are reliable ones. The reviewer is asked to provide further material that can be considered |
| 4452 | 7 | 48 | | 48 | | This graph needs a label on the x-axis | Taken into account. The units are given |
| 18215 | 7 | 48 | | | | Comment: In this figure should include costs program Implementation educational and UREE measures by region. And if not exactly apply to this figure, Similarly it should be mentioned in the text of Chapter 7 the mitigation option climate change through programs formal education from childhood, which contribute to the formation of men and Women more environmentally responsible and less consumerist. | Rejected - the figure only shows technologies cost. The general comment refers to behavioural aspects of consumers, which are to be treated in |
| 10074 | 7 | 48 | | | | As LCOE from RES change very fast, a regular update of this figure is encouraged. | Accepted - this is done. |
| 18080 | 7 | 48 | | | | The figures for nuclear seems very low. In an interview with Daily Telegraph 12/8 2012, EDF CEO de Rivaz is talking about cost around £140/MWh (US$ 225/MWh) to build Hinkley Point in the UK - more than double the highest point of the nuclear cost range in the graph. No power company will confirm that you can build new nuclear at anything close to the range indicated in the graph. Various reports for Hinkley put the cost at £7 billion per reactor (1,600 MW each) or £4,375/MW (US$ 7,100/MW). See http://www.telegraph.co.uk/finance/newsbysector/energy/9470555/EDF-chief-Vincent-de-Rivazs-nuclear-vision-aims-to-inspire-a-generation.html | Taken into account - the cost of nuclear power plants were updated according to the newest available cost data from the BNEF data base. Whereas the highest of these are close to the given specific capital expenditures, the derived LCOE deviate from the ones given in the |
| 15949 | 7 | 48 | | 48 | | Why not take the cost figures from figure 7.13 for fossil generation with CCS and include them in this figure - it would make for some useful comparisons | Taken into account. Chart is changed. |
| 5174 | 7 | 48 | | 48 | | Small Hydro/Large hydro on the Y-axis : use same wording as the SRREN: Large Scale Hydro or Small Scale Hydro- since nobody actually knows what small or large hydro is (no globally accepted definitions based on MW! SRREN ch 5.3.1 and 5.4.3.4) | Taken into account - a size limit of 10MW is used for small hydro. Text revised. |
| 10557 | 7 | 48 | | | | This is from a single reference. Better to assess the literature and produce own data and revise text accordingly. Why is nuclear such a small range for example? I don’t believe it | Taken into account - additional sources were used to describe the cost of nuclear power plants. The nuclear range |
| 9232 | 7 | 48 | | 48 | | To limited the title: Figuer 7.12 Levelised cost in $/MW.h of electricity for commercially available fossil and nuclear power plants as well asrenewable energy technologies as observedfor the second quarter of 2012 (and for the secondquarter of 2009) The rest of parragraph send to foot page | Accepted - text revised |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 12329 | 7 | 48 | 1 | | | The figure is interesting. It is, however, unclear how the cost of carbon is taken into consideration. Annex II states that carbon costs are included in LCOE. Does this mean that for coal fired plants the blend include European production with EU ETS pricing? If so, what are the assumptions about EU ETS prices? It would be useful to add a similar figure (or two) that includes carbon pricing for all fossil energy production. The point would be to show that fossil fuel power plants are operating without having to pay for their pollution costs and that, as this changes, their competitive advantage would change quite significantly. We suggest two scenarios; one with a carbon price of $20 and on at $100 per tonne CO2. | Taken into account - the cost of carbon has been excluded from the results. There is a still on going process to collect additional literature and data concerning gas and coal fired power plants in the context of the recent changes in the gas markets. The final draft will show how for coal and gas fired |
| 3793 | 7 | 48 | 1 | 48 | 8 | I am surprised with some of the results, in particular biomass gasification. Can you report where there are commercially operating power plants based in this technology? | Taken into account - numbers have been revisited and confirmed by the Bloomberg New Energy Finance database. Please provide material that |
| 13202 | 7 | 48 | 1 | | | The cost of nuclear nergy in France has recently been estimated by the "Cour des Comptes", the highest finantial juridiction in France, to 60 $/MWh, including the post Fukushima safety improvements. This value is significantly below the lower end of the bracket shown in the figure | Taken into account - IEA data now are used for nuclear. The lower end of them (referring to reactors in Korea) is below the number mentioned here. Without additional material the reliability of the |
| 10558 | 7 | 48 | 14 | | | Could add a sub-heading "Renewable Energy" here and also for "Fossil fuels and CCS" and "Nuclear" below where relevant to aid the reader. | Taken into account - the different figures are merged to become a single one. Subheadings therefore are no |
| 11942 | 7 | 48 | 15 | | | "PV proces fell…" Need reference. | Taken into account - the underlying text |
| 15543 | 7 | 48 | 9 | | 13 | Should also mention sensitivity to economic projections. | Accepted - text revised |
| 2786 | 7 | 48 | 9 | 48 | 27 | The BNEF references are generally directionally right but they do not take into account country specific costs and factors and so can be quite misleading if applied to a particular situation. The data basically shows that everything but STG and Marine are between $100 and $200 / MWh and I would say that is the granularity that you can use generic global data at. | Rejected - BNEF does take into account country specific conditions. |
| 4785 | 7 | 48 | | | | This figure is very interesting. However it could be interesting to define what is the size limit between small and large hydropower. Please also refer to IRENA, 2012 publication on LCOE with recent values provided. Year of the $ expressed for LCOE? | Taken into account - a size limit of 10MW is used for small hydro. IRENA, 2012 is cited. The dollars are those in |
| 10559 | 7 | 49 | 1 | | | A variety of….? Be specific. | Rejected - the diagram shows all of them. Repetition is not feasible due to space constraints. The underlying text |
| 18081 | 7 | 49 | 16 | 49 | 16 | Delete (if the cost of carbon is reflected in the market). To indicate that onshore wind should be less competitive than e.g. solar thermal or PV is incorrect. In Turkey, New Zealand, Brazil and other places, onshore wind is winning tenders at lower prices than any of the mentioned technologies, as well as gas. In Brazil's 2011 tender wind power contracts were awarded at BRL 100 / MWh (US$ 50 / MWh). | Taken into account - the questioned text has been deleted. |
| 17374 | 7 | 49 | 17 | | | onshore wind power plants… | Taken into account - comment is obsolete. Text has been deleted. |
| 2787 | 7 | 49 | 17 | 49 | 19 | The sentence compares the cost of supply of energy and the value of energy consumption which are two different things (say for PV on a rooftop). PV panels on a rooftop rely on the grid and associated systems as much as a remote large-scale power generator and so I believe that the comparison made is erroneous and can be misleading. | Taken into account - the underlying text has been deleted due to space constraints. The comment is obsolete. |

| 9597 | 7 | 49 | 20 | | | Please, add following information as RE is already competitive; Grau[1] reviewed the adjustments of the feed-in tariff for new solar photovoltaics(PV) installations in Germany and developed an analytic model to simulate weekly installations of PV systems≤30kW(35% market share in 2010) based on project profitability and duration. The model shows the need for (i) more frequent tariff reductions (ii) and an appropriate choice of adjustment response parameters. The analysis shows that adjustment schemes with more frequent tariff reductions would have reached development targets in 2011 more effectively.<br>[1]Thilo Grau Responsive adjustment of feed-in tariffs to dynamic PV technology development ( 2012 ) German Institute for Economic Research (DIW Berlin) Discussion Papers 1189<br>http://www.diw.de/documents/publikationen/73/diw_01.c.392871.de/dp1189.pdf | Rejected - comment is misplaced. The discussion of the feed-in tariff refers to chapter 7.11. Unfortunately, the comment cannot be taken into account there, because it addresses a very special aspect of the feed-in tariff system. These details cannot be discussed due to space restrictions. |
| 17751 | 7 | 49 | 23 | | | replace "fuel" by "plant" | Accepted - text revised. |
| 6800 | 7 | 49 | 23 | 49 | 34 | Similar comment as before. The costs and efficiency penalties associated with carbon capture and storage make it sound like this is a technology available today. It is well into the future. | Taken into account - The fact that commercial CCS power plants are not |
| 6193 | 7 | 49 | 23 | 49 | 24 | "Applied to fossil-fuelled power plants, CCS reduces the fuel efficiency of those plants. Typical efficiency differences projected for 2015 are on the order of 8 - 11 % points." the 8-11% points is a very misleading way to express changes, as its significance depends greatly on the starting efficiency. This would be better expressed as a change in overall efficiency, e.g., a change from 40% to 36% would be a 10% drop, not 4 percentage points. | Rejected - it is common scientific practice to express absolute changes of % values by %-points. |
| 6453 | 7 | 49 | 23 | | | See also Page et. al. (2009) for energy penalty data and discussion | Rejected - publication cannot be considered without additional |
| 17752 | 7 | 49 | 24 | | | replace "differences" by "penalty" | Accepted - text revised. |
| 7741 | 7 | 49 | 3 | 49 | 22 | This whole paragraph replicates what has already been published in the SRREN. What is the purpose of this? Shouldn't the AR5 provide newer findings? | Taken into account - the purpose of this paragraph is to provide a summary of the cost of renewable energies in comparison to the development of other low carbon technologies. Part of the |
| 2840 | 7 | 49 | 3 | 49 | 22 | The quotation here is selective. One could as easily quote different passages from IPCC 2011a – eg “the current levelized cost of electricity (LCOE) from solar PV is generally still higher than wholesale market prices” (p 380) “Commercial markets are not yet driving marine energy technology development” (p 522) “Though the cost of wind energy has declined significantly since the 1980s, policy measures are currently required to ensure rapid deployment in most regions of the world” (p 583) and so on – to give a completely different impression. The unbalance in the text obscures the important fact that, with some notable exceptions, most renewable sources in most parts of the world are not competitive and require subsidies. If life were otherwise, the problem of decarbonisation would be easier to deal with | Taken into account - text revised. |
| 10560 | 7 | 49 | 5 | 49 | 22 | Could add there is a cost related to integration but largely unknown for most technologies (Ref SRREN Ch 8) | Rejected - integration costs are discussed in the same section (a couple |
| 13505 | 7 | 49 | 20 | 49 | 22 | Text : "Although the gas prices went down in the last few years in many regions, the increase in capital expenditures and operation and maintenance costs is explaining the raising LCOE of natural gas combined cycle power and coal-fired power plants." For those countries with extensive gas grid and related infrastructure, it will be of benefit to invest in Renewable Gas, to displace carbon in the gas supplies, but also, potentially, to reduce the impact of potentially rising costs of the raw fuel. Lifecycle investment and operations and maintenance will still be necessary, but increasing availability of low carbon gas fuels, at reasonably low costs, should remove the operating risk of choosing to continue with gas-fired electricity generation. | Rejected - comment is misplaced. Power to gas or biogas are discussed in chapter 7.5 and 7.6, respectively. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 7476 | 7 | 5 | 1 | 87 | 24 | Biomass energy is the only energy form that is treated in two ways, namely 'traditional' and 'modern'. This separation infers that 'traditional' biomass energy is non-sustainable and has to be substituted as quickly as possible for 'modern' biomass and other forms of renewable energy (RE). For example, P. 18 line 14 states that biomass and waste (demand) are growing at 2% per annum including traditional and modern ---. P. 57, line 8. "Providing clean, affordable and reliable modern energy services is also at the heart of development challenges in many developing countries ---". P. 57 line 12 "over 3 billion people are estimated to lack access to modern fuels for heating and cooking ---". P 58 line 6 "The provision of access to clean, efficient, affordable and reliable energy services entails multiple co-benefits ---". Also, footnote 1 on page 9 talks about more comprehensive coverage of energy resources, including non-commercial ones (i.e. traditional ones).<br>Granted unprocessed biomass has a lower energy value per unit weight and is more difficult to control than liquid and gaseous fuels. But charcoal is lumped with fuelwood, residues and dung as traditional. Charcoal is a processed smokeless biomass fuel that has an energy value on par or better than most coals and has never been 'non-commercial'. To denigrate some biomass as traditional, infers that the people using it are handicapped! In my opinion, there should be no distinction with types of biomass as inputs for different end uses. | Rejected - the distinction between traditional and modern biomass is used in many peer-reviewed articles and in energy statistics. |
| 7477 | 7 | 5 | 1 | 87 | 24 | Chapter 7 keeps on mentioning energy access to modern fuels. But what it really means is access to electricity, for most people do have access to kerosene for cooking and lighting and many have access to LPG and even natural gas, especially in urban and peri-urban areas. However, for the rural population, if biomass is available within a reasonable collection area, most will use it in preference to fossil fuels. Kerosene is used sparingly for lighting in the absence of electricity and sometimes as a starter fuel for charcoal etc. | See section and references in 7.9.1.2 |
| 7479 | 7 | 5 | 1 | 87 | 24 | Although much fuelwood, residues and dung are collected, some are sold to households, the service sector and industry or grown specifically for industry (wood for tea drying) or industrial residues used for heat and steam (bagasse). Commercial biomass production is an important source of income and employment, especially for rural people. (Openshaw, K 2010a). It is estimated that about 30 million people worldwide are employed (full time) in the growing/managing of trees, and the production, transport and trade of biomass to sell so-called non-commercial energy to households and non-households. This is 26 times larger than that specified on Page 67, lines 6-12 and 2.5 times larger than the forecast for 2030! Rather than encouraging the shift away from 'traditional biomass energy' the chapter should be promoting it, for it is one important way to help poverty alleviation. | The move away is motivated by two concerns: unsustainable harvests and high PM emissions during combustion. |
| 7480 | 7 | 5 | 1 | 87 | 24 | Throughout the chapter the sustainability of supply of RE is mentioned and Figure 7.9 depicts global technical potentials of RE sources. For biomass the technical potential range is from a minimum of 50 EJ to a maximum of 500 EJ. I don't know how these figures were derived, but the net primary production (NPP) of terrestrial biomass is about 53 GtC/yr, equivalent to about 2000 EJ (Openshaw, K 2011b – citing Melillo et al 1993). The total NPP is approximately 4000 EJ including NPP in oceans and other water bodies).<br>For wood alone, the accessible NPP is an estimated 343 EJ (total 404 EJ) and the current demand for all wood products is an estimated 66 EJ. Thus, much more annual wood yield could be used without making inroads into the tree capital. (Openshaw, K. 2011b). However, P 26, lines 33/34 state "Because the theoretical potential does not take into account energy conversion losses or deployment barriers, the theoretical potential is of relatively little practical use". For biomass energy, I think this statement is wrong. Local people know their resources and if given some simple training (and tools) they could manage them more effectively, especially if they have control over them and have expanded markets. □ | Rejected - the bioenergy potential data are based on the IPCC SRREN. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 7481 | 7 | 5 | 1 | 87 | 24 | More will be said about this when discussing the Bioenergy Annex, pages 88 to 96. However, the impression is left here and in Chapter 11 that cutting down trees is reducing the forest capital (deforestation) when most is harvesting, unless land is being cleared for pastoral and arable agriculture. If the annual capture of CO2 by biomass is not used, it reverts back to atmospheric CO2 (the carbon cycle). If you don't use it, you lose it!<br>The use of crop and tree residues and such crops as Panicum sp. (switchgrass) and Miscanthus sp. (silvergrass) as a feedstock for ethanol production, is being promoted as are waste products or crops that do not compete with food crops. But, the breaking down of cellulose to simple sugars is not easy and not very efficient. Page 33 line 8 states that "lignocellulose-based transport fuels (to provide ethanol) are at a pre-commercial stage". However, the thermal breakdown of cellulose to liquid and gaseous products has been practiced for centuries. One of the first building blocks for the organic chemical industry was wood alcohol (methanol) and this can be used as a liquid fuel directly, or turned into petrol (gasoline) or diesel. Likewise, another product of dry distillation is gengas (CO + H2). This can be used to make motor fuels etc. It may be cheaper and more efficient to go this route, rather than the ethanol route for lignocelluloses products. Also, these products can be burnt directly in boilers to produce heat, steam and/or electricity. Moreover, if wood is the feedstock, the ash is a valuable fertilizer, for it has a relatively high content of potassium (K). □ | Noted - comment is obsolete as the bioenergy annex has been moved to chapter 11. |
| 7482 | 7 | 5 | 1 | 87 | 24 | It was also stated that silvergrass does not require much if any N fertilizer (P 90 line 19). Its average yield is about 14-15 dry t/ha with a rainfall of about 1500 mm. (Energy value 16.6 GJ/t. – 5% ash content). This will require 70-75 kg N/ha to maintain productivity: similarly for switchgrass.<br>Carbon capture and store (CCS) figures prominently in this chapter. Yet the costs are high and technical problems, plus leakage risks have not been solved. About 25% of the generated energy is used to compress and 'purify' the CO2. Pipelines have to be built to suitable storage sites and both have to be monitored for leaks. It may be cheaper to grow (woody) biomass to store an equivalent amount of useful energy. What is more, the annual yield from a managed plantation with an equal representation of all age groups, when fully operational, will give a product that can be used to generate electricity etc. Surely, this is better than burning coal? | Noted - comment is obsolete as the bioenergy annex has been moved to chapter 11. |
| 7850 | 7 | 5 | 1 | 7 | 20 | This executive summary is a good example how every paragraph includes a reference to tzhe underlying subchapter as well as a statement on the uncertainty in the calibrated IPCC-language. | Noted. |
| 2783 | 7 | 5 | 1 | 5 | 7 | The beginning of this sectionis quite garbled and I couldn't quite figure out what the start of the first paragraph was trying to say | Taken into account - text has been deleted. Comment is obsolete. |
| 2938 | 7 | 5 | 1 | 5 | 3 | "The energy sector...provides only 45 % of energy-related GHG emissions." So where are the other 55% ? | Taken into account - text has been deleted. Comment is obsolete. |
| 3766 | 7 | 5 | 13 | 5 | 13 | "are not yet sufficient". As written the message states that the policies in effect will be able to curb GHG emissions in the energy sector. Is this the purpose of the sentence? | Taken into account - text has been deleted. Comment is obsolete. |
| 4803 | 7 | 5 | 14 | 5 | 14 | I am not familiar with 450ppmv CO2eq - could you explain in a footnote for non-experts? | Taken into account - text has been deleted. Comment is obsolete. |
| 18160 | 7 | 5 | 16 | | | By 2050, growth in population, economic activity and energy access is expected to give rise to a 1.6 to 2.5 fold increase in energy use and energy related GHG emissions in business-as-usual scenarios [7.12, high agreement; medium evidence]. Fossil fuel resources are abundant and cost competitive with other energy forms. Since the industrial revolution, fossil fuel combustion released almost 400 Gt C into the atmosphere. Left hydrocarbon reserves alone contain two to four times that amount of carbon. | Noted - the comment repeats the original text. Please clarify on what you are commenting on. |

|---|---|---|---|---|---|---|---|
| 18158 | 7 | 5 | 16 | | 23 | Delete: By 2050, growth in population, economic activity and energy access is expected to give rise to a 1.6 to 2.5 fold increase in energy use and energy related GHG emissions in business-as-usual scenarios [7.12, high agreement; medium evidence]. Fossil fuel resources are abundant and cost competitive with other energy forms. Since the industrial revolution, fossil fuel combustion released almost 400 Gt C into the atmosphere. Left hydrocarbon reserves alone contain two to four times that amount of carbon. Therefore, limits or constraints on fossil fuel availability cannot be relied upon to limit global GHG concentrations to levels consistent with the Copenhagen Accord [7.4, high agreement; robust evidence]. Comment: The Bolivarian Republic of Venezuela does not consider the Copenhagen Accord as a legitimate document of the UNFCCC, and bad could be used as official reference. | Taken into account - the reference to the Copenhagen Accord account has been replaced by the Cancun Agreement. The remaining part which has nothing to do with the Accord, however, is not deleted. |
| 18159 | 7 | 5 | 16 | | 23 | Alternative paragraph: | Rejected - comment is unclear. Please |
| 4802 | 7 | 5 | 16 | 5 | 23 | Expected increase in energy use: are these values comming from governments/ accademia / both? | Taken into account - text has been deleted. Comment is obsolete. |
| 10042 | 7 | 5 | 16 | 5 | 17 | According to SRREN Chapter 10.3 there are scenarios which indicate a possibility to increase the energy demand significantly less than 1.6 times. Please more resources | Taken into account - text has been deleted. Comment is obsolete. |
| 4774 | 7 | 5 | 18 | 5 | 18 | Please add "still" in the sentence. Proposition "Fossil fuel resources are still abundant and …" | Taken into account - text has been deleted. Comment is obsolete. |
| 12316 | 7 | 5 | 18 | 5 | 19 | Please consider to add to the sentence : … other energy forms, as long as their externalities, i.e. GHG emissions, are not included. | Taken into account - text has been deleted. Comment is obsolete. |
| 11911 | 7 | 5 | 18 | | | fossil fuels are cheaper than most other energy forms. So they are more than "cost competitive" | Taken into account - comment is obsolete. Text has been deleted. |
| 12154 | 7 | 5 | 18 | 5 | 18 | The sentence "...Fossil fuel resources are abundant..." is too simple considering the relevance of the AR5. I understand that it'll be better to use..."...Fossil fuel resources are abundant, typically located...". Includind the term "typically located" is very important because the no uniform distribution in the terrestrial crut is fundamental any context. | Taken into account - text has been deleted. Comment is obsolete. |
| 10486 | 7 | 5 | 19 | | | "has" released | Taken into account - text revised. |
| 3383 | 7 | 5 | 2 | 5 | 5 | Puzzling and long first sentence. I sign of what is coming. There must be better ways to define the "energy sector" presented in this chapter from the remaining 55% "energy-related GHG emissions" (transport, industry, buildings... treated in the subsequent three chapters?) . | Taken into account - text has been deleted. Comment is obsolete. |
| 2388 | 7 | 5 | 2 | 5 | 2 | put percentage of energy sector emissions in parantheses in first line | Rejected - comment seems to be misplaced. It is not clear what the |
| 12315 | 7 | 5 | 2 | 5 | 5 | This sentence is somewhat confusing. Please define what is included in the energy sector. It is also unclear what percentage of emissions are the result of fugitive methane emissions etc. The sentence might benefit from being split into several sentences. | Taken into account. The scope of chapter corresponds to definition of energy industries in the IPCC inventory |
| 15789 | 7 | 5 | 2 | 5 | 5 | First sentence is too long | Taken into account - text has been deleted. Comment is obsolete. |
| 9626 | 7 | 5 | 2 | 5 | 5 | This first sentence is confusing - does the energy sector provide 45% of total global emissions or do the activities listed contribute 45% to energy related emissions? If it is the latter, what contributes the remaining 55% of energy related emissions? | Taken into account - text has been deleted. Comment is obsolete. |
| 13282 | 7 | 5 | 2 | 5 | 5 | There are two problems with this sentence (the first of the Executive Summary): a) it does not make grammatical sense ("...it provides only part of energy-related GHG emissions in form both fugitive emissions in fuel extraction...") and b) it only makes logical sense that 45% of energy-related emissions are in the energy sector if one understands that the energy sector is not in fact the entire energy system, but specific types of energy use (presumably heat and power generation) - it is essential that the energy sector is defined here for this to make sense | Taken into account - text has been deleted. Comment is obsolete. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 6162 | 7 | 5 | 2 | 5 | 5 | The energy sector is the largest contributor to global GHG emissions, but it provides only part (45%) of energy-related GHG emissions is a confusing sentence. Perhaps rephrase as "Energy extraction, conversion, storage, transmission and distribution processes, collectively comprise the energy sector and is the largest contributor to global GHG emissions." | Taken into account - text has been deleted. Comment is obsolete. |
| 3767 | 7 | 5 | 2 | 5 | 2 | Check "45% contribution". | Comment is obsolete. Statement has |
| 4800 | 7 | 5 | 2 | 5 | 5 | This first paragraph is not clear for a reader that has not read the rest of the document. | Taken into account - text has been deleted. Comment is obsolete. |
| 5144 | 7 | 5 | 2 | | 5 | unclear sentence | Taken into account - text has been deleted. Comment is obsolete. |
| 10483 | 7 | 5 | 2 | | | Suggest reword opening sentences…... contributor to "annual" global GHG emissions. It provides 45% of energy-related GHG emissions in the form of both fugitive methane emissions in fuel extraction and distribution and .... [ the word "transportation" can be confusing] BUT does the 45% include Transport? The whole chapter needs to check whether transport is included or not in many statements. | Taken into account - comment is obsolete. Text has been deleted. |
| 2391 | 7 | 5 | 20 | 5 | 20 | replace word left with word remaining | Taken into account - text revised. |
| 13283 | 7 | 5 | 20 | 5 | 20 | The word 'Left' is not standard English in this context - suggest 'Remaining' | Taken into account - text revised |
| 5145 | 7 | 5 | 20 | | 21 | unclear meaning | Taken into account - text revised |
| 11912 | 7 | 5 | 20 | | | "left" is awkward. "Remaining" is the correct word | Taken into account - text revised. |
| 10487 | 7 | 5 | 20 | | | Delete "Left" so becomes "Hydrocarbon reserves contain….." | Taken into account - text revised. |
| 7724 | 7 | 5 | 21 | 5 | 23 | Suggest replace "Copenhagen Accord" by "Kyoto Protocol". | Accepted- It was replaced by |
| 18161 | 7 | 5 | 21 | | 23 | Add to paragraph: Therefore, constrains limits or constraints on fossil fuel availability cannot be relied upon to limit global GHG concentrations to levels consistent with the Copenhagen Accord [7.4, high agreement; robust Evidence]. | Rejected - comment is unclear. Please clarify |
| 18162 | 7 | 5 | 21 | | 23 | Alternative paragraph:Therefore, constrains limits or constraints on fossil fuel availability cannot be relied upon to limit global GHG concentrations to levels consistent with the Copenhagen Accord [7.4, high agreement; robust evidence | Rejected - comment is unclear. Please clarify |
| 10488 | 7 | 5 | 21 | | | Delete "or constraints" | Taken into account - text revised. |
| 2392 | 7 | 5 | 22 | 5 | 22 | why refer to levels in copenhagen accord here and previously to 450ppmv. Chose one and stick with it. | OK. It was replaced by internationally |
| 15936 | 7 | 5 | 22 | 5 | 22 | shouldn't this cite the Cancun Agreements rather than the Copenhagen Accords, since the latter were never adopted by the UNFCCC, merely 'noted'. | Taken into account - text revised |
| 10489 | 7 | 5 | 22 | | | Not sure if all readers will understand "the Copenhagen Accord" so could add "to limit global temperature rise to below 2oC." | Taken into account - text revised. The legally binding Cancun Agreement now |
| 2820 | 7 | 5 | 24 | 6 | 17 | These paragraphs understate the scale of the challenge (see detailed comments below). They also read oddly after paragraph 1, which notes that despite a wide array of mitigation policies, we are not on track. I would have expected to see some explanation for this failure. | Taken into account - text has been rewritten considerably. Comment is obsolete. |
| 18037 | 7 | 5 | 24 | 5 | 24 | Define "low carbon" | Rejected - low carbon is a usual |
| 6163 | 7 | 5 | 24 | 6 | 4 | This paragraph reads like a grocery list. While there are a lot of concerns the ES needs to address, this would be better if it were split it apart and the transitions smoothed, or turned into a table or more readable figure. As an example, from 5,31 to 5,34 we move from emissions reductions from replacing old coal plants with new gas generation to a comparison of the technical renewable potential to primary energy supply. Not only is “RE” not previously defined, but these two things seem only tangentially connected. | Taken into account- ES has been rewritten |
| 16770 | 7 | 5 | 24 | 8 | 4 | I don't find these paragraphs that helpful as part of the executive summary -- it reads a bit like a list without real context and I don't see how this is helpful to policymakers or the public. In this chapter, I find sections 7.12.3 and 7.13 the most important parts and likely most helpful to negotiators who should have better understanding of this pathways concept. | Taken into account - general statements were replaced by quantitative ones when possible. |
| 3769 | 7 | 5 | 24 | 5 | 28 | Long sentence and no clear meaning. | Taken into account - text has been deleted. Comment is obsolete. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 12155 | 7 | 5 | 25 | 5 | 25 | It's more polite to use "relevant", than "deep". | Rejected - the text is about deep emissions reductions, i.e., those higher |
| 3768 | 7 | 5 | 27 | 5 | 27 | "Reduced production cost". It should be more useful to add a plot showing past costs and a trend line for the scenario. | Taken into account - text has been deleted. Comment is obsolete. |
| 18163 | 7 | 5 | 28 | | 30 | Replace: Although there may be constraints at a regional level, and for individual technologies, at the global level, the combined technical potential of low carbon technologies in the energy supply sector is not the factor limiting their widespread deployment high, despite their limited widespread deployment [7.4, medium agreement; robust evidence]. Alternative paragraph: Although there may be constraints at a regional level, and for individual technologies, at the global level, the combined technical potential of low carbon technologies in the energy supply sector is high, despite their limited widespread deployment [7.4, medium agreement; robust evidence]. | Rejected - the global potential might be high, but it does nevertheless allow to achieve high renewable market shares at some locations. The chosen phrasing has been improved to clarify this. |
| 2393 | 7 | 5 | 29 | 5 | 30 | strange wording about technical potential not being the limiting factor. Of course not that is true by definition. Rephrase. | Taken into account - text has been deleted. Comment is obsolete. |
| 2389 | 7 | 5 | 3 | 5 | 3 | word form is incorrect there | It is not clear why it is incorrect. |
| 15935 | 7 | 5 | 3 | 5 | 3 | should read '…emissions in the form of both fugitive methane emissions from fuel….' | Taken into account - text has been deleted. Comment is obsolete. |
| 11909 | 7 | 5 | 3 | | | "in form of"? | Taken into account - comment is obsolete. Text has been deleted. |
| 4095 | 7 | 5 | 30 | 5 | 36 | The bland statements about the combined technical potential of local carbon technologies not being a constraint; the regional technical potential of RE as a whole being a multiple of global primary energy supply requirements, do not stand up to examination. There should be here and elsewhere in this chapter a proper examination of the power densities of the various forms of renewable energy (a la Vaclav Smil). There should be a proper examination of the implications of these (a la Frederick - Ted - Trainer). There should be, somewhere in this chapter and reflected in the Executive Summary, an examination of each source/form of RE. Only CSP with UHVDC transmission has fair technical potential to meet the chapter's claims. The IPCC Special Report on RE did not withstand careful critical scrutiny (e.g.the work of Graham Sinden is referenced, without mention of the fact that other authors - David MacKay, Chief Scientific Advisor to UK DEFRA (2009), Michael Jefferson in 'Energy Policy' (2008) and IAEE Spring 2012 Bulletin, et al have shown his findings to be at odds with evidence provided by wind energy operators and the Met Office.) | Reject - As the Executive Summary is severely space limited, we simply do not have the space here to go into details on the various literatures. However, many of these controversial issues are addressed in the various sections of the chapter - the idea that technical potential may be constrained by competition, declining resource quality with deployment, land use issues, etc. We do stand by the so-called bland statements as a solid reflection of the literature on technical |
| 12317 | 7 | 5 | 31 | 5 | 33 | Please consider to move the sentence "Significant and relatively…." to line 45 before the sentence about CCS. | Rejected - the text is about fuel shifting, which is different to CCS. |
| 12318 | 7 | 5 | 31 | 5 | 33 | When describing the advantage of fuel switching, we would like to see a comment about the danger of carbon lock-in (ref section 7.10.5) and the importance of CCS (ref section 7.5.1. line 40-42). | This is discussed at section 7.10.5, but space constraints do not allow to |
| 15754 | 7 | 5 | 31 | | 33 | While this may be true, what is the likelihood that China would retire recently built coal plants anytime soon? Also, replacing the internals of a coal plant (I assume boilers and steam turbines) with a natural gas fired turbine with duct heating doesn't sound as inexpensive as this makes it out to be. | Taken into account - cost statements were deleted. |
| 11759 | 7 | 5 | 31 | 5 | 33 | Energy must be chosen taking into not only enviromnet but also economy and energy security. To avoid the misunderstanding, [prvided the economy and energy security is not taken into account] should be added after this sentence. Also refer to No.4. | Rejected - space constraints do not allow to qualify efforts to reduce GHG. The cost statement, however, has been |
| 6244 | 7 | 5 | 31 | | | better reference to low cost | Taken into account - comment is obsolete. No cost information is given |
| 10653 | 7 | 5 | 31 | 5 | 33 | Add a statement coal can be chosen from the view point of energy security. | Rejected - the paragraph is about options to mitigate climate change. Space constraints do not allow for mentioning all side-effects everywhere. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 11845 | 7 | 5 | 32 | 5 | 33 | Current research is demonstrating the potential for unconventional natural gas sources to result in high fugitive methane emissions. This seems to suggest there is significant risk of failing to meet mitigation goals by relying on/investing in natural gas fired power plants to reduce GHG intensity of electricity emissions when upstream (extraction) emissions are accounted for. In fact this very issue is addressed in 7.5.1 - it might be worth noting this earlier in the chapter, since it seems a bit inconsistent. | Taken into account - text revised. |
| 2394 | 7 | 5 | 33 | 5 | 34 | what does regional technical potential as a whole mean? | Taken into account - text has been deleted. Comment is obsolete. |
| 6245 | 7 | 5 | 33 | | | Why just efficient gas and not a first step more efficient coa, the text states that there are merits in chaging less efficient coal by more efficient coal plants.l | Taken into account - switching to coal is now mentioned as well |
| 15937 | 7 | 5 | 33 | 5 | 33 | I believe 'regional' here should be 'global' | Taken into account - text has been deleted. Comment is obsolete. |
| 10490 | 7 | 5 | 33 | | | Suggest new para at "The regional…." and at line 41. | Taken into account - text revised. |
| 7713 | 7 | 5 | 33 | | | RE means 'renewable energy'? | Taken into account - text revised. |
| 15755 | 7 | 5 | 34 | | | This seems very optimistic regarding potential of RE supply | Taken into account - text has been deleted. Comment is obsolete. |
| 13284 | 7 | 5 | 36 | 5 | 38 | Presumably RE was nearly half of new nameplate (i.e. peak) GW installed; however on average RE technologies will tend to operate at a much lower load factor (e.g. <20% for PV, around 30% for onshore wind) than fossil capacity operating at baseload, so TWh generation from RE installed in 2011 is likely to be still consderably lower than that from new fossil plant (RE share might be e.g. 20-25%). Given that this is arguably a more accurate reflection of the share of new capacity, it would be worth adding this (probably in addition to the GW share, not instead) | Taken into account - text has been deleted. Comment is obsolete. |
| 6221 | 7 | 5 | 36 | 5 | 38 | npmic maturity | Rejected - comment is unclear - please |
| 15790 | 7 | 5 | 37 | 5 | 38 | "RE accounted for almost half of all the new electricity generating capacity added globally" - because fastest growing RE is intermittent solar and wind, actual kWh generated , not capacity installed, is the key metric since need to take the low capacity factors into account. Thus added kWh will be much less than 50%. Check IEA WEO 2011 (or 2012) for up to date data. | Taken into account - text has been deleted. Comment is obsolete. |
| 14540 | 7 | 5 | 4 | 5 | 4 | Replace 'a' by 'is' | Rejected - comment seems to be misplaced. It is not clear what the |
| 9467 | 7 | 5 | 41 | 5 | 45 | This part lacks good balance, listing only negative opinions about nuclear power. Its positive factors such as cost effectiveness and low CO2 emission in life cycle should be added. | Taken into account - there is now a positive qualifier that emphasizes that nuclear is able to provide carbon free electricity. It is however not true that |
| 15756 | 7 | 5 | 41 | | | Is nuclear considered renewable energy in this context? | Taken into account. RE, CCS and nuclear now have separate paragraphs. |
| 18164 | 7 | 5 | 41 | | 45 | Replace: Resolutions on many issues remain for the continued use and further expansion of nuclear energy worldwide as a response for mitigating climate change, including efforts to improve overcome most of its the safety, economics, resource sustainability, waste management, and proliferation concerns. Significant efforts are underway to develop new fuel cycles and reactor technologies that address the concerns of nuclear energy use, and the fusion reaction, trying to reduce the unsolved problems of nuclear energy use. Alternative paragraph: Resolutions on many issues remain for the continued use and further expansion of nuclear energy worldwide as a response for mitigating climate change, including efforts to overcome most of its safety, economics, resource sustainability, waste management, and proliferation concerns. Significant efforts are underway to develop new fuel cycles and reactor technologies and the fusion reaction, trying to reduce the unsolved problems of nuclear energy use. | Taken into account - text has been rephrased to increase its readability. Fusion technology is not taken into account as it is not yet demonstrated to be feasible on a commercial scale. |

|---|---|---|---|---|---|---|---|
| 11760 | 7 | 5 | 41 | 5 | 43 | Adding the [Meanwhile nuclear energy would be still cost effective compared with others(Tidball et al. 2010), ] before this sentence is well ballanced.<br>1.R. Tidball et al.:[Cost and Performance Assumptions for Modeling Electricity Generation Technologies], send attachment by another e-mail. | Taken into account - there is now a positive qualifier that emphasizes that nuclear is able to provide carbon free electricity. It is however not true that |
| 9501 | 7 | 5 | 41 | 5 | 45 | It was shown only the disadvantages of nuclear power, advantages should be shown like cost efficiency , smallness of life-cycle co2 emission (less than PV), reliability, energy security.<br>[1] R. Tidball et al. (2010) Cost and Performance Assumptions for Modeling Electricity Generation Technologies,(attached on email) | Taken into account - there is now a positive qualifier that emphasizes that nuclear is able to provide carbon free electricity. It is however not true that |
| 9589 | 7 | 5 | 41 | 5 | 45 | Please, provide merits of nuclear power in exective summary likewise CCS and RE technologies; nuclear power is stemmed from the need to cost-effectively satisfy rapidly growing electricity demand in the emerging economies, as well as efforts to achieve energy and environmental policy objectives, including mitigating greenhouse-gas emissions and providing a secure, diversified and lowcost electricity supply. (WEO 2011, IEA) | Taken into account - there is now a positive qualifier that emphasizes that nuclear is able to provide carbon free electricity. It is however not true that nuclear is chapter than other mitigation |
| 18165 | 7 | 5 | 45 | | 48 | Add to paragraph: It is argued that... the capture and storage of CO2 (CCS) provides a means by which fossil fuel emissions can be reduced, with applications including can be dramatically reduced. Applications include most large point sources of CO2 emissions, e.g. fossil fuels production sites, power plants, refineries, chemical processing plants and cement kilns; but CCS lack yet of any kind of evaluation process, using a “large geologic storage capacity” to introduce and keep trapped huge amounts of CO2, regardless of the social and enviromental consequences. Alternative paragraph: It is argued that the capture and storage of CO2 (CCS) provides a means by which fossil fuel emissions can be reduced, with applications including most large point sources of CO2 emissions, e.g. fossil fuels production sites, power plants, refineries, chemical processing plants and cement kilns; but CCS lack yet of any kind of evaluation process, using a “large geologic storage capacity” to introduce and keep trapped huge amounts of CO2, regardless of the social and environmental consequences. | Rejected - It is not at all clear what text this comment is referring to nor is it clear what perceived problem this comment is trying to address. It is not true that CCS "lack of any kind of evaluation process…" |
| 5738 | 7 | 5 | 45 | 5 | 45 | I think it should be made clear that CCS technology is not mature therefore "CCS MAY provide a means by…" | Rejected -- no scientific evidence or publications offered to support this comment. As the more detailed text in the body of Chapter 7 (as opposed to the few sentences allotted to this topic in the ES), CCS components are mature. There is no economic rationale to deploy CCS systems at present as they can only be used to reduce CO2 emissions. The term "can" is a sufficient caveat for the executive summary. These "may" |
| 10491 | 7 | 5 | 45 | 6 | 4 | Change line 45 to "Carbon dioxide capture and storage (CCS) ….". This section seems biased - what about risks, legal liability, costs, loss of available power generated etc? | These other issues for CCS are dealt with throughout the chapter. The executive summary can not bring |
| 5130 | 7 | 5 | 48 | | | The statement "all of the components of integrated CCS system are in use" needs to be substaintiated by references | Taken into account. Please see section 7.5.5 where this issue is addressed in much more detail than is possible in an Executive Summary. The Executive Summary is summarizing what is in the |

|---|---|---|---|---|---|---|---|
| 4096 | 7 | 5 | 48 | 5 | 49 | Storage capacity has been shown to be a constraint well within a century in previous Assessments. | Rejected - not supported by the broad body of peer reviewed literature. Please see section 7.5.5. Yes this is true but we have accumulated new knowledge since the previous IPCC assessments were published. That society learns more as we move forward in time is a good and fortunate thing. The sections on CCS in the chapter discuss this in detail. The executive summary can not bring |
| 4521 | 7 | 5 | 48 | 5 | 48 | While components are in use, integrated systems have not been applied to most applications. Suggest adding "…are in use, but integrated systems have not been applied to most potential applications." Otherwise this statement gives a distorted view of the maturity of CCS technology. | Accepted. The text in the ES has been revised to bring forward this nuance more explicitly. |
| 17356 | 7 | 5 | 48 | | | exist and are in use… | Taken into account - text revised. |
| 2390 | 7 | 5 | 5 | 5 | 6 | swings in our political systems? Rephrase or delete | Taken into account - text has been deleted. Comment is obsolete. |
| 14541 | 7 | 5 | 5 | 5 | 5 | pre-sets? | Not clear comment. There is no such |
| 3765 | 7 | 5 | 5 | 5 | 5 | "our economy". What does it means? Be more precise using "global economy" for example. | Taken into account - text has been deleted. Comment is obsolete. |
| 4801 | 7 | 5 | 5 | 5 | 15 | It would be helpful for people not familiar with previous documents to have some infor on the dates covered in the AR4 and AR5. | Taken into account - text has been deleted. Comment is obsolete. |
| 10484 | 7 | 5 | 5 | | | Needs a statement to clarify where Chapter 7 stops and chapters 8, 9, 10 begin. Maybe "Use of the transport fuels, heat and electricity produced are discussed in Chapters 8 (Transport), 9 (Buildings) and 10 (Industry)." | Taken into account - comment is obsolete. Text has been deleted. The introduction now clarifies this point as |
| 18156 | 7 | 5 | 7 | | 10 | Replace: "decarbonize the global fuel mix" by "rationalize the energy sector". Comment: The failure to rationalize the energy sector, i.e., to implement a better fuel use in transport, industry, etc.; driving a progressive rational and efficient use of energy, diversification of energy sources, technologies and system configurations (including ICT, DG, smart grids, etc.). In this framework, decarbonization is at best a piece of the whole picture of energy and development. | Taken into account - text has been deleted. Comment is obsolete. |
| 18157 | 7 | 5 | 7 | | 10 | Altervative paragrapah: Energy-related GHG emissions continue to grow; they have increased even faster in the last decade than the three decades previous to this period [7.3, high agreement; robust evidence]. Rapid economic development along with the failure to rationalize the energy sector has driven most of the acceleration in emissions growth in the last decade. | Taken into account - text has been deleted. Comment is obsolete. |
| 10485 | 7 | 5 | 8 | | | TSU needs to standardise Exec Summary formats. E.g. should "7.3" be here or not? | Noted. |
| 16768 | 7 | 5 | 9 | | | Suggest insertion of "has driven demand for energy services" after "economic development" as this helps more clearly decouple economic development as a culprit in growing emissions (we don't want to give impression we dislike economic development). | Taken into account - comment is obsolete. Text has been deleted. |
| 16769 | 7 | 5 | 9 | | | Suggest we delete "decarbonize the global fuel mix" and replace with "deploy low and non-emitting energy technologies". Analysis cited in chapter 7 -- point made that CCS is important component of lower cost mitigation paths. Saying we want to decarbonize the global fuel mix misses that point or negates it and is not supported elsewhere in report via economic analysis. | Taken into account - comment is obsolete. Text has been deleted. |
| 11910 | 7 | 5 | 9 | | | better to say "failure to move toward decarbonzing the …" Sounds less negative and pejorative | Taken into account - comment is obsolete. Text has been deleted. |
| 6161 | 7 | 5 | | 6 | | The ES isn't effective in explaining the overall arguments and goals of the chapter. This should be clearly established from the opening paragraph. The first sentence is exceptionally egregious – a massive run-on with multiple basic grammatical errors and little clear direction. This section needs to be rewritten to clearly explain the conclusions reached are, and how they are arrived at. | Taken into account - the ES has been completely written in order to increase it s accessibility. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 12314 | 7 | 5 | 1 | | | Please consider to use shorter paragraphs to make the Executive Summary easier to read. (See chapter 5 for format). | Taken into account - text has been revised. |
| 9236 | 7 | 5 | 18 | 5 | 19 | Is very stron the sentence:"Fossil fuel resources are abundant and cost competitive with other energy forms" Is necessary said that is true only for the externalities yet are not internalizate in the cost of the fossil fuel and the carries energetics | Taken into account - text has been deleted. Comment is obsolete. |
| 13451 | 7 | 5 | 20 | 5 | 21 | Text : "Left hydrocarbon reserves alone contain two to four times that amount of carbon." There is mounting evidence to suggest that not all reserves can be converted into fossil fuel products within the current economic system - particularly in certain regions and for certain fuel types. Of special concern is the stress on global coal supplies from rapidly increased demand for power generation from China and India. Also, the weaknesses in the global oil supply are a risk to sustainable trade relationships. The cost of the fuel may not indicate the full extent of production inflexibility (scarcity), owing to the importance of energy in all economies, leading to suppressed prices either through policy or market manipulation. | Noted - unfortunately space constraints do not allow a extended discussion of these issues in the ES. |
| 17282 | 7 | 5 | 31 | 33 | | In section 7.5.1, it is clearly stated that emssions from NGCC are too high to meet long-term stabilization targets. If the mitigation potential of gas-fired power plants is mentioned, this part of the story should make it to the executive summary as well. | Taken into account - text revised. |
| 9237 | 7 | 5 | 31 | 5 | 33 | The affirmation is true but unrealistic in the case of replacing coal fired power plants with modern, highly efficient gas fired ones, because China and India will not renounce to use the indigenous coal for to use gas imported if nobady give some guaranties or incentives, or in the actual conditions of technologies transfers | Rejected - the paragraph is about technical options. It does not judge whether there is a willingness to change |
| 10999 | 7 | 5 | 41 | 5 | 43 | It is quite unfair since there are only negative point of views regarding nuclear energy. Nuclear energy has also the advantage in terms of cost and low CO2 emission, so such the advantage should be described equally. | Taken into account - there is now a positive qualifier that emphasizes that nuclear is able to provide carbon free electricity. It is however not true that |
| 8843 | 7 | 5 | 42 | 5 | 43 | Why are the issues that nuclear energy has to put effort into improving put in the order that they are? Namely, what justification is there for putting safety first instead of economics? Surely alphabetical order would be preferable. | Rejected - the sequence does not mean that some are more important than others. |
| 8844 | 7 | 5 | 45 | 5 | 46 | Even though the next sentence addresses the issue, it may be preferable to note from the outset that CCS addresses "fossil fuel emissions" from large point sources. If a vehicle runs on natural gas, there is little CCS can do with a multiplicity of point sources. | Rejected - space constraints do not allow to emphasize everything in the ES. That CCS is applied to large point |
| 7012 | 7 | 5 of 135 | 18 | 5 of 135 | 19 | Modify sentence beginning in line 18, for the following one: "Fossil fuel resources are relatively abundant compared to other energy forms". | Taken into account - text has been deleted. Comment is obsolete. |
| 7013 | 7 | 5 of 135 | 22 | 5 of 135 | 22 | Substitute "Copenhagen Accord" for "Kyoto Protocol", or "IEA's Scenario 450". I propose to completely delete from the Report the phrase "Copenhagen Accord", because it hasn´t been subscribed, nor ratified by many countries, especially developing ones, which represent the major part of IPCC members. | Taken into account - text revised. Copenhagen Accord is replaced by the Cancun Agreement. |
| 7014 | 7 | 5 of 135 | 24 | 5 of 135 | 24 | Add "zero," after the first word of this line. | Rejected - there is a difference between low carbon and zero carbon |
| 7015 | 7 | 5 of 135 | 29 | 5 of 135 | 29 | Add "zero and", after the word "of", and before the word "low", at the final part of the line. | Rejected- it is standard to use low carbon in the sense that it includes zero |
| 7016 | 7 | 5 of 135 | 41 | 5 of 135 | 45 | Delete all text from the beginning of line 41 to the phrase "of nuclear energy use.", which ends the paragraph, beginning line 45, because it isn't relevant to stress the further expansion of nuclear energy, taking into account the current prices of nuclear electricity, as well as the overall risks associated to this technology. | Rejected- nuclear is a mitigation option. The ES does not have to judge whether it will be used or not in the future. |
| 10075 | 7 | 50 | | | | Please add the fuel cost assumptions for coal and gas as LCOE depend on it. | Taken into account - the cost of carbon has been excluded from the results. There is a still on going process to collect additional literature and data concerning gas and coal fired power plants in the context of the recent |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 11862 | 7 | 50 | | 51 | | These pages can be significantly reduced in length. Also, rather than showing table 7.13 which include industrial CO2 emitters, why not convert these values to be comparable to values reported in 7.12? As a reader what I want to know is whether coal (or NGCC for that matter) is cheaper than renewable sources. That isn't answered by what is reported in table 7.13 or the text. | Accepted - the text is revised accordingly. |
| 18082 | 7 | 50 | | | | To indicate prices for CCS at $117-131 is way off compared to the budgets of the demonstration projects and the general consensus on what CCS would costs if it were operational anywhere. Some peer reviewed documentation would be helpful or fact checking with the developers. Otherwise delete. | Rejected - the reviewer is asked to provide some literature to support his assessment. |
| 18544 | 7 | 50 | | | | Blast furnce steel production and cement production are topics that belong rather in Chapter 10. Please liaise with Ch 10 authors accordingly. | Taken into account - the CCS of industrial processes are not shown anymore. They are to be treated in the |
| 9491 | 7 | 50 | 1 | | | For the levelised cost of production the same "logic" must be applied to both power generation and industrial applications; i.e. the cost of production WITH CCS must be the sum of the cost WITHOUT CCS plus the cost of CCS. E.g. the cost of sement with CCS FOAK should be 100 - 122 USD/tonne cement (not 34 USD). | Taken into account - the CCS of industrial processes are not shown anymore. They are to be treated in the |
| 11863 | 7 | 50 | 12 | 52 | 7 | This section on nuclear comes out of nowhere - jumping from RE, to CCS, to nuclear in this section without transitions makes it hard to follow. Also it seems like the 3 paragraphs on nuclear can be shortened and the key data and conclusions stated more simply. | Accepted - the text is revised accordingly. |
| 3794 | 7 | 50 | 12 | 51 | 7 | Too much attention dedicated to nuclear power as compared with other conventional and RE sources. This occurs here and in many other parts of this Chapter | Accepted- the discussion of nuclear now is presented in a more concise way. |
| 18083 | 7 | 50 | 15 | 50 | 18 | EDF CEO de Rivaz is talking about cost around £140/MWh (US$ 225/MWh) to build Hinkley Point in the UK - more than double the highest point of the nuclear cost range in the graph. http://www.telegraph.co.uk/finance/newsbysector/energy/9470555/EDF-chief-Vincent-de-Rivazs-nuclear-vision-aims-to-inspire-a-generation.html | Taken into account - the cost of nuclear power plants were updated according to the newest available cost data from the BNEF data base. Whereas the highest of these are close to the given specific capital expenditures, the derived LCOE deviate from the ones given in the |
| 10076 | 7 | 50 | 16 | | | LCOE calculated by Bloomebrg only cosisder CAPEX and fuel prices. This should be made clearer. | Rejected - the BNEF's LCOE analysis does take into account the O&M costs, both fixed costs ($/MW) and variable |
| 18084 | 7 | 50 | 19 | 50 | 21 | These ranges (US$ 42-137) should be reflected in figure 7.12. They are more in line with current reality in the power sector. | Accepted - the figure is revised accordingly. |
| 17375 | 7 | 50 | 19 | 50 | 21 | in the range of 42 - 48 USD/MWh (Korea) to 97 – 137 USD/MWh (Switzerland). | Accepted - the text is revised |
| 3795 | 7 | 50 | 19 | 50 | 27 | Use coherently MWhel or MWh. Not both. | Accepted - the text is revised |
| 3796 | 7 | 50 | 19 | 50 | 27 | How is possible to understand total nuclear electricity cost at US$ 47/MWh in South Korea, when only back-end costs are US$ 52.33/MWh | Rejected - the given back-end costs are $ 2.33 per MWh and not 52.33 per MWh |
| 10561 | 7 | 50 | 20 | | | Fig 7.12 shows $90-100/MWh present costs - does not seem consistent with projected costs of $42-137/MWh | Taken into account - the chart is updated to show the entire cost range of |
| 2788 | 7 | 50 | 20 | 50 | 20 | $42-$137 / MWh for LCOE for nuclear looks extremely low compared to what we are hearing it may cost in the UK and what the recent Finnish and French experiences will come out at. I would look for other references or caveat it. At these costs the only reasonable thing to do is to go for nuclear power. | Rejected - the recent cost estimate in UK, Finland and France are quite close to the upper boundary. The lower |
| 9598 | 7 | 50 | 27 | 51 | 2 | Please, delete here due to duplication of page 50, line 16 to 18 after indicative. | Taken into account - a repetition now is |
| 4453 | 7 | 50 | 5 | 50 | 11 | Explain the difference between cost of CO2 avoided and cost of CO2 captured. | Taken into account - costs of CO2 captured are not discussed anymore. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 13507 | 7 | 50 | 23 | 51 | 2 | Text : "Back-end costs include spent fuel storage, reprocessing and disposal and are estimated at $2.33 per MWhel...Not included in the levelised costs presented here are the costs associated with low probability - high consequence events such as nuclear accidents and limited operator liability." The extensive and expensive clean up costs of both the Chernobyl and Fukushima Dai-ichi nuclear power plant accidents suggests that decommissioning nuclear reactors and disposing of their radioactive waste stores is for a minority of possible scenarios very much more costly than normal end-of-life procedures - and may interfere with business viability, with knock-on effects on the industry as a whole. For example, there is a lack of qualified nuclear power engineers, considered a direct side-effect from the nuclear power anxiety of the late 1980s. | Noted - the chapter says that the cost associated with the related low probability events are not taken into account in the LCOE. |
| 9233 | 7 | 50 | 3 | 50 | 3 | After industrial applications to add "Note" | Taken into account - text has been deleted. Comment is obsolete. |
| 13506 | 7 | 50 | 9 | 50 | 11 | Text : "The additional LCOE costs exhibited by CCS plants (compared to traditional fossil fueled power plants) are to be compared with the LCOE increase of the latter once significant CO2 costs (e.g., via carbon taxes or permit prices) are to be taken into account." To my mind there is a risk that significant CO2 charging is unattainable, through any policy mechanism or treaty - "significant" in this sense meaning a level of CO2 charging/pricing/taxation that could facilitate/stimulate/incentivise a change of direction in energy plant investment. I remain to be convinced that any mechanism in the economy can be used to leverage a carbon price sufficiently high to enable widespread Carbon Capture and Storage. | Rejected no evidence/publications are provided to support the comment. Reviewer is expressing personal opinion about how future climate mitigation policy will evolve. |
| 4454 | 7 | 51 | 15 | 52 | 11 | This section could be shortened and combined with previous discussions on infrastructure limits, particularly expansion of the transmission network and power plant siting. | Rejected - This material is meant to be presented in the context of the levelized cost comparison, it wouldn't make sense to move it to another section, as suggested by many other comments |
| 10077 | 7 | 51 | 15 | | 43 | Even an electricty system without any RES needs back-up and balacing capacity. There is no reference what these costs are pr MWh. | Rejected - These costs are pretty minor in existing energy markets. They will be more substantial for resources with low capacity credits. The present section focuses on a range of incremental costs |
| 18085 | 7 | 51 | 15 | 51 | 43 | This paragraph only gives the estimated additional balancing cost for one technology (wind). Provide the figures for other technologies to have a fair comparison. | Accepted - We have searched for additional estimates of balancing costs for other technologies, but peer reviewed literature is very limited so we will not be able to present a comprehensive comparison. We have, however, added |
| 2789 | 7 | 51 | 22 | 51 | 22 | I would be inclined to caveat the costs of balancing. These costs look very low and even today in the UK the cost of commercial balancing is double these figures and we are at nothing like 30% penetration | Accepted - We are reporting the peer reviewed literature faithfully here; however, there are some studies that show higher costs, typically the result of various institutional barriers. We added a caveat that costs may be higher in some |
| 9599 | 7 | 51 | 23 | | | Please, describe here correctly as EDF operates nuclear plants with load following, which means a flexible operation. | Accepted - text deleted. |
| 10564 | 7 | 51 | 31 | | | Could add ref to SRREn ch 8 again here after "contentious" | Accepted - the text is revised |
| 10078 | 7 | 51 | 36 | | 39 | The additional transmission costs for wind are mentioned, but not those for other large scale power plants. These data are available from Transmission operators and should be specified as well. | Rejected - no peer-reviewed assessments of transmission costs for |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 9600 | 7 | 51 | 39 | 51 | 40 | Please, delete here due to duplication of page 40, line 40 to 45. | Accepted - At line 39-40 page 51 add that the transmission costs of nuclear and CCS are not expected to be high on a $/MWh basis due to the base loaded nature of these technologies. This |
| 10562 | 7 | 51 | 7 | | | Is also the case for large hydro. Could mention | Rejected -the paragraph refers to economic aspects of nuclear usage. The economics of renewable energies are |
| 10563 | 7 | 51 | 8 | | | If add sub-headins as suggested above add one here "Infrastructure" | Rejected - space constraints do not |
| 13508 | 7 | 51 | 40 | 51 | 43 | Text : "If mitigation technologies can be deployed near demand centres on the distribution network or if these are intended to serve isolated autonomous systems, those technologies may defer or avoid transmission and distribution needs, potentially reducing infrastructure costs relative to a BAU scenario." For this reason, rather than transporting carbon dioxide away for Carbon Capture and Storage, it seems sensible to attempt to recycle waste carbon dioxide at the point of its production - siting Renewable Gas and biorefinery (for liquid renewable fuels) facilities close to gas power plants would be recommended. | Noted - the comment is valid, but the information is to specific to be taken into account in the report. It refers to technical aspects, not to the costs of transmission lines discussed here. |
| 2841 | 7 | 52 | 12 | 53 | 21 | The discussion of renewables here is unbalanced. While technology costs for renewables do tend to go down over time, the capacity cost curve tends to go up, for the obvious reasons that the cheapest sources and sites tend to be used first (as pointed out on p 28) and integration costs increase with the level of penetration. How this balances out depends on the situation. There is only passing recognition of this inherent tension, in the last paragraph of 7.8.2.2. But it is not a marginal or exceptional situation, as the text implies. In Europe, for instance, as far as the main renewable sources are concerned, we have got almost to the end of the capacity curve for hydro, as remaining sites are increasingly environmentally sensitive, and we are on the upward sloping part of the capacity cost curve for wind as incremental investment moves increasingly offshore. In the US, the marginal cost of meeting an RPS increases rapidly with volume according to at least one study (Crane et al. Energy Policy 39 (2011) 2730-39). Again, the authors may not agree with this assessment but they should at least recognise the underlying tension and the debate. | Rejected - the dependency of integration costs on the market penetration is discussed. The LCOE chart (figure 7.12) shows decreasing and increasing costs depending on the technology. There is no bias in the discussion. |
| 11864 | 7 | 52 | 12 | 53 | 21 | As with the preceding section, this one is hard to follow. It jumps from topic to topic with long quotes from other source for most of the text. If the goal is just list facts/data then a bulleted list with key findings from each of the quotes would be preferable. | Accepted - text is changed. |
| 18218 | 7 | 52 | 13 | | | Add to text: Altrough recently detailed studies on CCS costs have been published, the assessment of the cost of large scale plants is still plagued by many difficulties. The CCS technology has been applied to commercial scale projects, however, is not built into any plant carbon, steel or cement therefore large scale costs still have many uncertainties. The costs of renewable energy have been falling steadily since various factors such as best in manufacturing processes and operations, as well as the economic scale. Not so with nuclear plants, whose competitiveness is thought decrease after Fukishima events. Finally, it should be clear that learning cost reduction as a fail safe, the increase of raw materials in recent years has adversely affected the cost of offshore wind power plants and nuclear plants.<br>Alternative paragraph:<br>The CCS technology has been applied to commercial scale projects, however, is not built into any plant carbon, steel or cement therefore large scale costs still have many uncertainties. The costs of renewable energy have been falling steadily since various factors such as best in manufacturing processes and operations, as well as the economic scale. Not so with nuclear plants, whose competitiveness is thought decrease after Fukishima events. Finally, it should be clear that learning cost reduction as a fail safe, the increase of raw materials in recent years has adversely affected the cost of offshore wind power plants and nuclear plants. | Rejected - the paragraph to which the comment refers is addressing the cost of CCS solely. The cost aspects of nuclear and renewables are discussed in other paragraphs. Mixing all technologies would destroy the logical sequence of the section. From a content point most of view the statements referring to nuclear and renewable energies are given in the respective paragraphs. |

|---|---|---|---|---|---|---|---|
| 18086 | 7 | 52 | 13 | 52 | 14 | It would helpful to a reference to cost/kWh from the references study in the text - or a range from the studies. | Accepted - the numbers of these studies are taken into account in a revised |
| 6454 | 7 | 52 | 13 | 52 | 24 | See also Page et. al. (2009) for discussion on the paucity of real data | Rejected - publication cannot be considered without additional |
| 3404 | 7 | 52 | 27 | | 28 | It is wrong-unfair to "pick up a winner" in this example. Delete from "e.g…." I could produce tens of respected references with a different opinion about where R&D has to go to reduce cost… | Taken into account - the comment is obsolete, the underlying text has been |
| 16836 | 7 | 52 | 3 | | 4 | It is unclear what this sentence means: "Whether costs will be higher for …." | Accepted - text is changed. |
| 6194 | 7 | 52 | 33 | 52 | 43 | It's unclear what this lengthy series of quotes is doing here – if there's another place that makes arguments for the market viability of renewable technologies, point to it in a reference or footnote rather than in this method. | Accepted - text is changed. |
| 9657 | 7 | 52 | | | | Would read better to adress each tehnology in the same order in each section (applies to all sections) | Accepted - text is changed accordingly. |
| 6195 | 7 | 52 | | | | The purpose of this section is unclear – why experience curves for ethanol? Many of the other conclusions fall on the obvious side – that nuclear power may increase post-Fukushima is not surprising. Cut. | Taken into account - the experience curve for ethanol is removed. In order to allow for a balanced treatment of the historic cost evolution and short-term |
| 4455 | 7 | 52 | 12 | 52 | 32 | The continued discussion on CCS barriers, costs and potentials could be combined with paragraphs on previous pages. | Rejected - the TSU has asked us to constrain cost discussions to chapter |
| 10079 | 7 | 53 | | | | Why is there no figure on cost developments for the different thermal power plants? | Noted - there is no figure on the cost development of thermal power plants as their cost evolution has been quite stable |
| 2790 | 7 | 53 | 1 | 53 | 3 | There is recent work by the Crown Estate in the UK on offshore wind cost reduction in the coming years which would be a better reference to use than BNEF | Noted - the literature will be assessed once more information on the source is |
| 17376 | 7 | 53 | 14 | | | offshore wind and… | Accepted - text is revised. |
| 16837 | 7 | 53 | 21 | | | It may be helpful to add to end of paragraph: "To conclude this section, it should be stated that under a CO2 constraint that includes a CO2 price, the cost of operating conventional, high emitting technologies increases. Experience demonstrates that as low emitting technologies evolve as they deploy, their costs decrease. This combination causes low emitting technologies to become competitive vs. high emitting technologies, thereby becoming preferred by investors and consumers." | Rejected - the text is not supported by the text (see Figure 7.12) - the LCOE of some low carbon technologies rise. |
| 17753 | 7 | 53 | 22 | | | the title of the section is "economic potential", but the subsequent discussion is on estimates | Noted - it is unclear what the reviewer |
| 16125 | 7 | 53 | 23 | 54 | 2 | The uncertainty of fossil, nuclear and renewable resources are fairly different in nature : on fossils it is partly an interest in states or firms to leave uncertainty on the resource; on renewable energy the evolution of technology and industrialization, but also uncertainties in local acceptation by decision makers dominate; in the case of nuclear, financing and acceptance are key. Thus a bias affecting cost curves mixing the three types of resources. | Accepted - cost curves for fossil fuels are deleted. |
| 18087 | 7 | 53 | 3 | 53 | 5 | We should not talk about "grid parity" in a section that deals with LCOE. Comparing cost of a technology with the retail price (which is more oftenthan not a reflection of political dictate) makes no sense. Use LCOE - also for PV. | Rejected - from a macroeconomic perspective LCOE should not be compared with grid prices. However, for private investors who are capable to |
| 11548 | 7 | 53 | 3 | | | Please compare this with what you said on p47l20-22. | Noted - the text is not contradicting. |

|---|---|---|---|---|---|---|---|
| 6700 | 7 | 53 | 6 | 53 | 12 | Even if the price of nuclear power will increase, it will not lose its cost-competitiveness against other energies. But this text make impressions that nuclear power is inferior to CCS and renewable energies. This text should be deleted. | Rejected - The text does not state that nuclear power is inferior to CCS and renewable. The verbal quotation of a IEA paragraph says that "the relative economics of nuclear power compared with other generating technologies may deteriorate". On many places on earth, the bunch of other technologies mainly includes conventional ones (gas, coal, hydro). New renewables and CCS are not mentioned here explicitly. At various |
| 4456 | 7 | 53 | 6 | 53 | 12 | This paragraph repeats much of what has already been discussed in the context of barriers to deploying nuclear-powered electricity generation plants. | Accepted - text is revised. |
| 16124 | 7 | 53 | 6 | 53 | 12 | Costs of nuclear may also be driven up by exit of more suppliers, e.g. Siemens of Germany or one or several suppliers in Japan. | Noted - this seems obvious, but no literature is provided to support the |
| 11770 | 7 | 53 | 6 | 53 | 12 | These sentence should be deleted. It is too much uncertain expression. | Taken into account - the view expressed by the IEA is conserved, while the other statements are deleted. In order to allow for a balanced assessment Joskow is cited, who does not expect a major |
| 9509 | 7 | 53 | 6 | 53 | 12 | delete this paragraph - Global nuclear generation will be expanding after Fukushima Daiichi accident (The Future of Nuclear Power After Fukushima/Agstract in page 1)(attached on email) | Taken into account - the view expressed by the IEA is conserved, while the other statements are deleted. In order to allow for a balanced assessment Joskow is cited, who does not expect a major |
| 10661 | 7 | 53 | 6 | 53 | 12 | Please delete this sentence because it is vague with a lot of "may"s. | Taken into account - the view expressed by the IEA is conserved, while the other statements are deleted. In order to allow for a balanced assessment Joskow is cited, who does not expect a major |
| 18545 | 7 | 53 | 6 | 53 | 12 | The focus on the economic situation for nuclear post-fukushima seems strange. Why is there no more general discussion of historical trends or declining costs for nuclear? | Taken into account - the view expressed by the IEA is conserved, while the other statements are deleted. In order to allow for a balanced assessment Joskow is cited, who does not expect a major |
| 10000 | 7 | 53 | 6 | 53 | 12 | This part should be deleted completely because the content often uses "may" word and looks speculated. The effects on nuclear plants of Fukushima accident appear to be quite modest at the global level, as described in (Joskow, 2012, page1).<br><br><Reference><br>[1] Joskow, P.L. & J.E. Parsons (2012). The Future of Nuclear Power After Fukushima. MIT Center for Energy and Environmental Policy Research Working Paper 2012-001. | Taken into account - the view expressed by the IEA is conserved, while the other statements are deleted. In order to allow for a balanced assessment Joskow is cited, who does not expect a major change in the economics of nuclear power. |
| 18088 | 7 | 53 | 8 | 53 | 8 | Replace "may decide" with "have decided". Siemens stopped in 2011; RWE stopped in 2012; EON and RWE polled out of UK nuclear in 2012. | Taken into account - the underlying text has been deleted due to space |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 8845 | 7 | 53 | 3 | 53 | 5 | The FOD states, "By 2020, grid parity (i.e., competitiveness with grid retail prices) of PV can be expected in many countries provided that sufficient policy support is available (IPCC, 2011a)". It may be worth explaining, perhaps in a footnote, that while residential or small commercial PV systems are competing with the delivered retail price of electricity through the grid -also known as "socket parity" - larger-scale PV systems may be assessed against wholesale generation, sometimes refered to as "busbar parity". Furthermore, Bazilian et al.(2012) note that "contrary to the view that the arrival of grid parity is still decades away, numerous studies have concluded that solar PV grid parity has already been achieved in a number of countries/regions", citiing articles by Breyer and Gerlach (2010), Zweibel (2010), Branker et al. (2011) and Darling et al. (2011). [Bazilian, Onyeji, Liebreich, MacGill, Chase, Shah, Gielen, Arent, Landfear, Zhengrong. Reconsidering the Economics of Photovoltaic Power, BNEF. 2012] [Breyer, C., Gerlach, A., 2010. Global Overview on Grid-Parity Event Dynamics. Presented at the 25th EU PVSEC/WCPEC-5, Valencia.] [Branker, K., Pathak, M.J.M., Pearce, J.M., 2011. A review of solar photovoltaic levelized cost of electricity. Renewable and Sustainable Energy Reviews 15, 4470–4482] [Darling, S.B., You, F., Veselka, T., Velosa, A., 2011. Assumptions and the levelized cost of energy forphotovoltaics. Energy Environ. Sci. 4, 3133–3139.][Zweibel, K., 2010. Should solar photovoltaics be deployed sooner because of long operating life at low, predictable cost? Energy Policy 38, 7519–7530.] | Accepted - text is revised. |
| 8846 | 7 | 53 | 3 | 53 | 5 | Bazilian et al.argue that, "Grid parity is now largely an outdate concept […] it is not useful in real-world power sector decision [...] it does not take into account the value of solar PV to the broader electrical industry." The "value of (distributed, non-utility) solar PV to the broader electricty industry" is elucidated by Keyes and Wiedmen (2012) and can include: avoided energy costs; avoided capacity costs; avoided line losses; avoided fuel volatility;and, avoided transmission and distribution costs. [Bazilian, Onyeji, Liebreich, MacGill, Chase, Shah, Gielen, Arent, Landfear, Zhengrong. Reconsidering the Economics of Photovoltaic Power, BNEF. 2012] [Keyes and Wiedman, Interstate Renewable Energy Council, "A Generalized Approach to Assessing the Rate Impacts of Net Metering", January 2012] | Rejected - space constraints do not allow to go into the details here. |
| 11001 | 7 | 53 | 6 | 53 | 12 | It is seriously problematic since negative indications regarding nuclear energy are described on supposition. Explanation based on clear facts is necessary and important. | Taken into account - the view expressed by the IEA is conserved, while the other statements are deleted. In order to allow for a balanced assessment Joskow is cited, who does not expect a major |
| 18644 | 7 | 54 | | | | Page 54: Once again a comment on MACs. Here they are said to be a useful summary mechanism but more sophisticated modeling of how supply and demand markets work and interact with each other is required for an analytical underpinning of mitigation policy. | Taken into account - Chapter 6.3.4 with its consistent and sophisticated modelling is now referred back to. |
| 11865 | 7 | 54 | 1 | 54 | 2 | A useful comparator to what? This is an odd statement, and the reported values aren't compared to anything. | Taken into account - this text is removed as this paragraph has been deleted for reasons of space with reference now made to section 7.4, and the broader |
| 3798 | 7 | 54 | 10 | 54 | 10 | Typo error. Replace "sort-term" by "short-term". | Editorial |
| 10080 | 7 | 54 | 12 | | 16 | The uranium cost are for mining. How much would it change if enrichment is added? What is the energy neded for the enrichement, and which energy source will be used? | Taken into Account - the underlying text on nuclear costs has been removed due to space constraints due to space |
| 9601 | 7 | 54 | 28 | 55 | 1 | Please, move here to page 49 in Chapter 3. | Taken into account - Table 7.5 has been deleted for reason of space and to better link to the MAC discussion in Chapter 3 |
| 4457 | 7 | 54 | 3 | 54 | 16 | Resource estimates for various fossil-fuels have been discussed already. | Taken into Account - the underlying text on fossil fuel resources has been removed due to space constraints, and |

|---|---|---|---|---|---|---|---|
| 16127 | 7 | 54 | 3 | 54 | 27 | Maybe the two paragraphs are redondants and could be summarized in one sentence. | Taken into Account - the underlying text on fossil fuel resources has been removed due to space constraints, and |
| 9658 | 7 | 54 | 3 | | 16 | Is it necessary to repeat this? | Taken into Account - the underlying text on fossil fuel resources has been removed due to space constraints, and |
| 16838 | 7 | 54 | 3 | | 27 | Can your replace this with a graph or table with short explanation? The lists embedded in a paragraph are less helpful. | Taken into Account - the underlying text on fossil fuel resources has been removed due to space constraints, and |
| 10565 | 7 | 54 | 3 | 54 | 16 | EJ or ZJ issue again | Noted - EJ are preferred as one can span the largest (coal) to smaller types |
| 2791 | 7 | 54 | 35 | 54 | 37 | Another weakness of the MAC curve approach is that they tend to look at the simple NPV of the investment rather than what it actually takes to make an investment decision. Real life experience of the MAC curve tends to be very different from the theoretical ones published. | Taken into account - these additional details are referenced back to the discussion in chapter 3 (3.10.2) |
| 3797 | 7 | 54 | 6 | 54 | 8 | Please, clarify what costs are included in oil production cost. Does it include exploration and transportation to refineries? | Taken into Account - Essentially yes, the text has been reviewed for clarity (and in |
| 9234 | 7 | 54 | 13 | 54 | 13 | Nuclear resources don't in table 7.2, it is in table 7.3 | Taken into Account - this discussion is removed for reasons of space, referring |
| 13509 | 7 | 54 | 4 | 54 | 6 | Text : "Total resources of hard coal and lignite (IEA, 2011g) are very large (Table 7.2), and are estimated to cover future demand for many decades at up to 400,000EJ." Although there may be large reserves of coal, they are not necessarily economically viable to mine. If strong coal demand continues, it could be that future demand will not be met, and that even current demand might not be met "for many decades" to come. Some researchers are pointing to Peak Coal being imminent (for example, "A global coal production forecast with multi-Hubbert cycle analysis", Patzek and Croft, Energy 35 (2010) pp 3109 - 3122). | Taken into account - This section has been removed and now refers to section 7.4.1 Note that the overwhelming majority of IPCC and other global scenario and forecast studies find coal supply to be abundant in the decades to come. However there is a small literature on the possible future date of peak coal |
| 13511 | 7 | 54 | 40 | 54 | 42 | Text : "The use of consistent and transparent scenarios (Chapter 6) is one mechanism to make the MAC more transparent to policy makers." MAC curves suffer from one problem that is not discussed here : there is an underlying assumption that the costs of carbon in the graphs can be imposed by a combination of regulatory and general policy means. Since there are many competing forces that will oppose high carbon prices, it is unlikely that the cost of carbon will be higher than $20/t in today's dollar values. If the price of carbon does rise above that, it will be because the general economy has devalued, and so even if the carbon price does reach the region of $40/t, it will no longer be possible to incentivise the decarbonisation prospects given by today's MAC curves, because everything will cost more in number terms. It is more likely that the cost of energy in general will create a pseudo-carbon price, rather than it being created by a deliberate policy suite. This will come about as the cost of low carbon energy drops to be less than high carbon energy prices. I think it very unlikely in any eventuality that a carbon price instituted by policy, tax or other governance measure, will raise the value of carbon dioxide to the region of $100/t. I think the cost of carbon in tax or credit trade terms will remain marginal, and the signal of a carbon price or tax will continue to be lost in the economy. | Rejected - no publication provided to support this assertion. It is not just a tenant of environmental economics that a government can price a public externality such as GHG emissions (via a tax or a trading system), it is also a practical element as well and experience with GHG and CO2 pricing is discussed in section 7.12.1. It does not hold that imposing a carbon price will raise the value of "everything" - only those resources and technologies that have substantial carbon requirements in their construction and use will rise and this price increase will be relatively much |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 13510 | 7 | 54 | 6 | 54 | 8 | Text : "Technically recoverable reserves of oil (summarized in Figure 7.8) and Table 7.2) have been classified into a production cost curve with 18,300EJ at a cost of <$40/barrel to 39,700EJ at a cost of <$100/barrel (IEA, 2010c)." It is possible that even at this higher end of oil prices, that much oil will remain unrecovered. Since the global economy is so dependent on oil, any price change has to be absorbed, and will cause inflation in general, or contraction in some economic sectors - both of which will affect how much oil can be produced. | Rejected - no publication provided to support this assertion. In fact it has been striking how the rise in global oil prices over the last 10 years has had such a muted impact of global inflation. Furthermore, any rise in global oil prices should boost the investment in relevant economic sectors for oil and hence help to increase supply capacity. However |
| 10277 | 7 | 55 | | 55 | | MAC is not estimated in energy systems, but also in other sectors. I do not think that the table is better to be located in Chapter 7. | Rejected - comment no longer relevant as table 7.5 has been deleted. |
| 4458 | 7 | 55 | | 55 | | This table does not show the MAC of specific technologies. Therefore, the reader cannot assess quickly or easily the relative costs of different technologies and their abatement potential (mass of CO2). | Rejected - comment no longer relevant as table 7.5 has been deleted. |
| 16126 | 7 | 55 | | | | Very useful table and explanations | Rejected - comment no longer relevant as table 7.5 has been deleted. |
| 17811 | 7 | 55 | | | | The following paragraph - I have been unable to delete - as accidentally copied - please delete. The point which was under development that there are many forms of transition from very developed to non developed - even in hour developed we have pockets of poverty and gaps in access to energy | Rejected. Not clear what the reviewer is suggesting here. |
| 2235 | 7 | 55 | 1 | 55 | 1 | In the first line of the table it should be changed to "Expert, BU model" as the McKinsey model is a bottom-up model of the power sector and with expert inputs; and change author to "McKinsey" (instead of Naucler/Enkvist) | Rejected - this comment is no longer relevant as this table has been deleted |
| 18089 | 7 | 55 | 16 | 55 | 16 | Add ", renewables and efficiency" after "natural gas" | Rejected. The statement represents a specific example of coal to natural gas |
| 18219 | 7 | 55 | 19 | | 23 | Add to text: The challenges to achieve energy security differ for developed and developing countries (Cherp et al., forthcoming). In addition to securing energy services in the expanding industrial and service sectors, the drive for improved energy services for increasing food security, health, education, and living conditions of the poorest is an important dimension of energy security in developing countries (Kuik et al., 2011). The challenges to achieving energy security differ for developed countries and developing ones. For the latter needs energy supply growth is much higher and therefore the contribution of renewable energy may not be sufficient and will increase reliance on local resources and specific social priorities of the nation As the largest integrated RES ratios in existing power grids, these exert a greater pressure on the stability of the network. Comment: It is important to note the point of view of developing countries in this matter.<br>Alternative paragraph:<br>The challenges to achieving energy security differ for developed countries and developing ones. For the latter needs energy supply growth is much higher and therefore the contribution of renewable energy may not be sufficient and will increase reliance on local resources and specific social priorities of the nation. As the largest integrated RES ratios in existing power grids, these exert a greater pressure on the stability of the network. | Taken into account. This section has been rewritten to reflect this request. |
| 2842 | 7 | 55 | 25 | 56 | 3 | Not clear why lack of trade is said to contribute to diversity; a priori, it reduces it by restricting access to indigenous sources only. | Taken into account. Text has been rewritten to reflect this request. |
| 6197 | 7 | 55 | 25 | 56 | 2 | "With renewable energy resources more evenly distributed around the globe than fossil fuels (WEC, 2007) and being, in general, less traded on the world market, renewables can contribute to diversify the portfolio of supply options." the statement is correct, but limited. In addition to the effect of renewables on the immediate markets, their presence anywhere helps to reduce pressure everywhere on globally-traded commodities. | Taken into account. Text has been rewritten to reflect this request. |

|---|---|---|---|---|---|---|---|
| 6196 | 7 | 55 | 8 | 55 | 13 | "Policies for improving energy security tend to focus on the interconnected factors of availability of resources, affordability of energy services, efficiency of energy use, and minimizing energy-related environmental degradation. In meeting these criteria of energy security holistically, there will be trade-offs between technology options that are effective along one dimension, which will have implications for other aspects of security." These statements point to both the importance and complexity of energy security issues. These points could be enhanced by incorporating concepts embodied in the "Index of U.S. Energy Security Risk" (Institute for 21st Century Energy, 2011, http://energyxxi.org/energy-risk-index). This index reflects a comprehensive methodology for identifying, quantifying, tracking, and projecting U.S. Energy Security Risks. The methodology takes into account 37 individual metrics that collectively define sub-indexes for Geopolitical, Economic, Reliability, and Environment risks, which in turn define the composite U.S. Energy Security Risk Index. The methodology and data are transparent, primarily using U.S. Energy Information Administration statistics to quantify risks as far back as 1970. Additionally, using forecasts such as those in EIA's Annual Energy Outlook, energy security risks are projected out at least twenty years into the future. | Rejected - space constraints do not allow to go into the details here. |
| 3455 | 7 | 55 | | 64 | | General comment: it should be included a subsection devoted to analyse the opportunities that energy efficiency proccess have | Rejected. Chapter 7 addresses energy supply. |
| 2792 | 7 | 55 | 5 | 63 | 42 | If you are looking for ways to cut down the Chapter, I personally wasn't sure that this section added much to the debate. | Rejected - reviewer should provide more specific information what should be deleted. According to the approved |
| 6198 | 7 | 55 | | | | The connections to climate change ar unclear. In this section there are multiple full-page graphs which don't seem necessary. Cut, if connections cannot adequately be justified. | Accepted. Adjusted according to the suggestion. Some sentences that do not have connections with climate change |

|---|---|---|---|---|---|---|---|
| 9602 | 7 | 55 | | | | Please, add nuclear contribution on energy security as follows; in the journal STAIR published by the University of Oxford (UK), Ilnyckyj points out that [1] two factors have resuscitated interest in nuclear power throughout the developed world: high hydrocarbon prices and concerns about climate change. He also argues that [2] political support for nuclear energy exists for several reasons, among them concerns about maintaining secure access to energy. He further notes that [3] the most significant uranium producers globally are Canada and Australia, states likely to be stable suppliers, in contrast with some of the volatile regimes exporting hydrocarbon fuels. Certainly, states such as the U.S., France, and Japan would prefer to be able to secure long-term contracts for access to fuel from rich and stable democracies, as opposed to facing the need to buy [fossil] fuels at volatile prices from states facing both significant internal and regional security challenges.<br>Similarly, in a 2011 peer-reviewed article Corner et al. state that [4] with global energy consumption predicted to increase substantially in the short to medium term, and serious question marks over the longevity of traditional (fossil-fuel based) energy sources, the notion of 'energy security' has become an increasingly important part of energy policy debates; although securing energy has always been a central goal for national governments, energy security has become particularly prominent in discussions about energy policy and environmental sustainability in recent years. Furthermore, the link between energy security and nuclear power is not particularly new. Energy security was part of the justification for the building of the world's very first commercial nuclear reactor at Calder Hall, Cumbria in 1956 and the decision to greatly expand the UK's Magnox reactor program following the Suez crisis. A further program of British nuclear power stations in 1979 again included energy security as a primary motivation. However, while societies have always asked questions about the security of energy supplies, it is only relatively recently that the concept of energy security has played such a prominent role in public policy debates about energy. Spurred on by the parallel debate about climate change, energy security has become an increasingly visible component of the nuclear discourse [5].<br>[1] M. Ilnyckyj (2009) Climate Change, Energy Security, and Nuclear Power, STAIR 4:2 (2009)<br>[2] Ibid.<br>[3] Ibid<br>[4] Adam Corner, Dan Venables, Alexa Spence, Wouter Poortinga, Christina Demski, and Nick Pidgeon (2011) Nuclear power, climate change and energy security: Exploring British public attitudes, Energy Policy 39 (2011)<br>[5] Ibid<br>See downloaded file "Ilnyckyj 2009.pdf" and "Corner Venables 2011.pdf" | Rejected. The text is a discussion about energy security and not about a specific technology |
| 11943 | 7 | 55 | 12 | | | What does "holiostically" mean in this context?? I don't think the usage is correct here. | Accepted. The term 'holistically' has |
| 17934 | 7 | 55 | 12 | 55 | 13 | Usage of the term 'trade-off' is not consistent with agreements reached in Wellington (p. 35) whereby the term 'trade-off' might convey the impression "that a balancing of positive and negative side-effects of mitigation measures is being carried out... Such decision-making aspects" should be left to the policy chapters. | Rejected. It makes perfect sense to talk about 'trade-offs' in the context of energy security. It is relevant in this section. |
| 4786 | 7 | 55 | 13 | 55 | 16 | This sentence is wrong or partlty right "Such trade-offs include the construction of regional interstate natural gas pipeline and hydroelectric projects that are aimed at enhancing availability of supply, but may be accompanied by unintended social and environmental impacts". This sentence should be more balanced or remove as not all HPPs have negative impacts. Indeed there are numerous example of good practices for trans-boundary hydropower projects (examples could be provided on request). If the project is developed in a sustainable way, using adequate guidelines, the trans-boundary approach should have been undertaken! Reference to international sustainable guidelines, such as the Hydropower Sustainability Assessment Protocol from International Hydropower Association could be relevant (+ IPCC/SRREN as reference). | Taken into consideration. The section has been re-written to address this request |
| 6701 | 7 | 55 | 4 | | | It should be noticed that nuclear energy contributes to energy security. | Rejected. The text is a general statement about energy security and not |

| 9371 | 7 | 55 | 4 | | | This section should also mention the importance of nuclear power plant from the energy security perspective. | Rejected. The text is a discussion about energy security and not about a specific |
| 11538 | 7 | 55 | 5 | | | The authors may wish to consider to frame the issue of energy security at different scales: global, regional, national, sectoral, individuals/family. This may help to structure the problem and aspects policies may be aimed at. | Rejected. This is outside the scope of the chapter |
| 9620 | 7 | 56 | 1 | | | Please, insert the following sentense after (WEC, 2007); and renewables are supplied by balancing services of flexible generation, smart grids, strong interconnections between grids or energy storage technologies, such as pumped hydro, compressed-air and large-scale batteries.(IEA, WEO 2011) | Taken into consideration. The text has been deleted in the interest of having a shorter and sharper section |
| 11944 | 7 | 56 | 1 | | | Use WEC 2010. It is a much newer survey of resources. Other than year, same reference | Noted |
| 11946 | 7 | 56 | 13 | | | Think you mean just return, not "marginal return" | Taken into consideration. The section has been re-written to address this |
| 11541 | 7 | 56 | 13 | 56 | 15 | This may be misleading. The figure shows indeed that (eg 2005 data) that up to 100 GJ a higher HDI is associated with a higher energy consumption. However, beyond that there is not even a marginal increase in the data points, it is only because the fitting curve is monotone that you draw that conclusion. Similarly in the lower half: beyond 2.5 tC there is no trend, at most a negative trend: this is an artefact of the fitting curve. | Accepted. The text has been adjusted to address the reviewer's question. |
| 18220 | 7 | 56 | 15 | | 17 | Furthermore, for constant energy and carbon levels the HDI increases over time, indicating that certain levels of human development are achievable in an increasingly efficient manner (Steinberger and JT Roberts, 2010).<br>Comment: It is possible to achieve high levels of impact of life without necessarily increasing power consumption as outlined in the design capitalist. With a policy of rational use of energy can meet this goal.<br>Alternative paragraph:<br>Furthermore, for constant energy and carbon levels the HDI increases over time, indicating that certain levels of human development are achievable in an increasingly efficient manner (Steinberger and JT Roberts, 2010). | Rejected. The reviewer's amended sentence is identical to the one in the chapter. |
| 4460 | 7 | 56 | 18 | 56 | 32 | Elements in this paragraph repeat earlier discussions of cost-competitiveness and LCOE of electricity generation from various energy sources. | Accepted. The sentence has been deleted |
| 18090 | 7 | 56 | 20 | 56 | 20 | write "hydro, wind or solar" | Taken into account. Wind has been added but small-scale remains. |
| 18091 | 7 | 56 | 20 | 56 | 20 | Replace "can be" with "are in many places" | Accepted. The text has been adjusted to reflect the reviewer's suggestion. |
| 18092 | 7 | 56 | 22 | 56 | 24 | Mentioning nuclear while excluding (some) grid-based renewables contradicts previous sections and does not seem to be in accordaance with the electricity cost of new capacity? Add "onshore wind" after "fossil fuel based generation". Delete "along with nuclear". Unclear sentence: "less costly options" than what? Delete reference to externalities. | Taken into account. The section has been re-written to reflect this request |
| 3799 | 7 | 56 | 22 | 56 | 22 | "Fossil fuel based generation are often the less costly option". I understand this is only true for coal or, in special circumstance, for NG if there is no exportation market for this fuel. | Taken into account. The section has been reflect the reviewer's request. |
| 10081 | 7 | 56 | 23 | | | change "are often the less …." to were often the less …."<br>This would be in line with Figure 7.12 (updated with Q3 202 values) | Taken into consideration. The text has been deleted in the interest of having a |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 18093 | 7 | 56 | 24 | 56 | 26 | Delete or adjust the sentence: Comparing levelized cost with energy prices is comparing apples and oranges - especially since this sentence reltes to the previous sentence which talks (more correctly) about the cost of new build cpaacity. Levelized cost of many conventional technologies are higher than existing energy prices in many markets, as well - energy prices are to a great extent a function of policy, rather than technology costs. In a section that seems to describe the competitiveness of the various technologies it is confusing that electricity prices (which are often subject to taxes, regulation or other politically motivated tampering) enters the picture. We need to decide whether we want the paragraph to be about energy poverty or cost competitveness of technologies. Including both elements in one makes the readercon fused and makes her draw the wrong conclusions, from what seems to be intended with the paragraph. | Accepted. The sentence has been deleted. |
| 10082 | 7 | 56 | 25 | | | existing energy prices: Does this include fuel subsidies and other suport mechanisms mentioned by the Joint report by IEA, OPEC, OECD and World Bank on fossil-fuel and other energy subsidies: An update of the G20 Pittsburgh and Toronto Commitments<br>http://www.oecd.org/env/49090716.pdf | Taken into consideration. The text has been deleted in the interest of having a shorter and sharper section |
| 18094 | 7 | 56 | 25 | 56 | 32 | Delete "renewable" in line 25. LCOE of all technologies are higher than the retail prices in markets with regulated prices - and that is most markets of the word, including the EU (referenced in line 30). If you want to make reference to energy affordability and fuel powerty in the EU (which is probably not the worst affected place on the globe), the main reason for the emerging problem should be clarified: it is rising gas prices! The section is structured to give the impression that renewables cause fuel poverty, by confusing prices and cost, while ignoring that gas prices are the reason for the worstening of the situation. | Taken into account. The section has been re-written to reflect this request |
| 4459 | 7 | 56 | 26 | 56 | 32 | There have been criticisms of the fuel poverty threshold of 10% of household income [cite] | Taken into account. The section has been re-written to reflect this request |
| 16128 | 7 | 56 | 29 | | | Boardman 2010 is not in the bibliography | Noted. |
| 11539 | 7 | 56 | 29 | 56 | 32 | Suggest to delete - if you want to shorten text | Accepted. The text has been deleted in the interest of having a shorter and |
| 9603 | 7 | 56 | 3 | | | Please, replace limit with alleviate and remove the heavy as the following reason; the contribution of variable renewables to the adequacy of a system is often significantly lower (per MW of installed capacity) than that attributable to other energy options. Because only a fraction of total capacity has a high probability of running consistently, variable renewables have limited capacity value. (IEA, WEO 2010) | Taken into consideration. The text has been deleted in the interest of having a shorter and sharper section |
| 16840 | 7 | 56 | 31 | | | What is the formal definition of "sustainable energy"? Is not the goal CO2 emissions reduction? | Taken into consideration. The section has been re-written to address this |
| 16841 | 7 | 56 | 32 | | | Would it be helpful to add to end of paragraph: "It may be noted that as household incomes increase as economies grow that the "affordable" energy bill can include a growing share of low emitting energy supply." | Taken into consideration. The text has been deleted in the interest of having a |
| 9372 | 7 | 56 | 5 | 56 | 7 | Renewable energy resources are not technologically stable enough and having higher shares of them do not necessarily improve energy security. Therefore, it should be deleted. | Rejected. The text does not read as the reviewer indicated. In fact, the text partly agrees with what the reviewer has |
| 11945 | 7 | 56 | 6 | | | What does "stability" mean in this context? | Taken into consideration. The text has been changed to 'system stability' |
| 16839 | 7 | 56 | 9 | | 10 | Is this true? Have you demonstrated that it is not instead that higher levels of development drive greater energy use -- energy availability may be needed for development, but it does not in itself drive development. | Accepted. The text has been adjusted to address the reviewer's question. |
| 17935 | 7 | 56 | 4 | | | Please insert 'domestic' between 'existing' and 'reserves' to clarify the sentence. | Taken into consideration. The sentence has been taken off in a new section |
| 9659 | 7 | 56 | | | | I think this is an appropriate section to discuss the issues around developing countries not having the financial, technical or institutional capacity to manufacture or install RE. The financial and Eurozone crisis have impacted significantly on the funding and support available. | The financial barriers are discussed in 7.10.2. The correctness of the second part of the comment can not be assessed due to lack of references |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 15130 | 7 | 56 | 18 | 56 | 18 | It seems to me that is neccessary to explain as weel that in a lot of developing countries, in rural areas, the highest percentage of expenditure on energy respect to the level of income, is observed in the population that has the lowest income and expenditure on energy. As well is neccesary consider that to attend the needs of energy for cooking important areas of forests are deforested, it means emission of GEI | Taken into consideration. This issue is picked up in a separate box on least developing countries |
| 11542 | 7 | 56 | 8 | | | This section should be coordinated with Chs 2-4 authors | Taken into consideration. |
| 18221 | 7 | 57 | | | | Comment: The table and the quoted text makes clear that maintaining patterns of energy production and consumption of the capitalist system, achieve less and less impact on the human development index (high energy consumption patterns, and declining incidence in IDH). This indicates that energy savings and an appropriate policy for the reduction of GHG, in developed countries, only marginally sacrifice the welfare of their inhabitants. | Noted |
| 11540 | 7 | 57 | 12 | | | define 'modern' | Rejected. This is a reference to reflect a common use of work in energy literature to mean the opposite of traditional, i.e.. Informal harvesting of bioenergy, and |
| 11947 | 7 | 57 | 5 | | | "per capita" not "per capital" | Noted |
| 4651 | 7 | 58 | | 58 | | I would argue with the number of 2.663 billion people dependent on biomass for cooking. My estimate is about 3 billion. Also, many people in developed countries rely of biomass for heating the house and water. The stove may also be used for cooking and beverage preparation! Thus, a figure for cooking and heating should be well in excess of 3 billion. The population in Africa may well double by 2050 to reach 2 billion. If nothing is done to increase agricultural productivity, the effect on biomass resources (and water availability) may be serious. | Rejected. The reviewer does not produce the reference apart from his own estimate |
| 4652 | 7 | 58 | 6 | 58 | 6 | ”The provision of access to clean, efficient, affordable and reliable energy services entails multiple benefits ---“. There is no such thing as ‘efficient’ energy. It is the way it is used that determines efficiency. Leaving a light on all day and night is generally not an efficient use of electricity! Granted unprocessed biomass usually has a lower energy value than other forms of energy, and at present it is mainly used in relatively inefficient devices. However, there is considerable scope for improving their efficiency and lowering pollution from them, see Barnes D.F., Priti Kumar, Keith Openshaw (2012). The above statement implies that current biomass use is bad. But its use in existing and new forms will be around indefinitely and be a major RE. This is not conveyed in this chapter. | Rejected. This is intended to suggest system efficiency, i.e. using improved cook stoves is more efficient use of resources than traditional systems. Also what the reviewer is suggesting to add is way beyond the scope of the chapter |
| 11948 | 7 | 58 | 4 | | | It is really "population distribution" not population. Figure would be improved is total population without access was shown. As such it is somewhat meaningless. | Accepted. |
| 17937 | 7 | 58 | 8 | | | Please add 'for GHG mitigation' after 'renewable energy' to clarify that is is about co-benefits of GHG mitigation rather than energy policy. | Accepted. |
| 17828 | 7 | 59 | | | | The development of the environment and health effects of energy is rather disappointing - we invite to consider the following papers: Markandya in Lancet 2007 and 2009; Kirk Smith in Global energy assessment and Menne and Kreisel, energy and health in the European Region (forthcoming) | Taken into account. The GEA chapter was already cited, the Markandya paper has been added to the list of similar |
| 17754 | 7 | 59 | 28 | | | replace "important source" by "major emitting source" | Rejected. I can see what this is getting at; distinguishing anthropogenic emissions from other sources, but I do |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 13204 | 7 | 59 | 29 | 59 | 30 | This sentence should be clarified : what is meant by categories ? An estimate of the number of deaths would be more informative,showing that coal is the most dangerous energy source for humanhealth | Rejected. The sentence says that fossil fuel causes a large number of different types of impacts and that overall fuel use explains these impacts well. To explain this study in detail would require more space than we have available here, but going to the abstract of the reference provided will tell the reviewer exactly |
| 11772 | 7 | 59 | 30 | 59 | 32 | Nox and Sox ,dust removal technologies for coal power plant have already been established so there are no big difference of condition between coal power and others. [especially coal combustion] should be deleted. | Rejected. No reference cited clearly demonstrate that reducing coal combustion offers the largest co-benefits |
| 16843 | 7 | 59 | 30 | | | Suggest adding after "fossil fuel combustion," the following: "from sources with no pollution control technology" Many coal fueled power plants operate with very low emissions of other pollutants if they have the appropriate technologies and are operated correctly. | Rejected. Thank you for the suggestion. We would like to explore this further, but there are several issues and we are under very tight space constraints here. |
| 10001 | 7 | 59 | 30 | 59 | 32 | This part should be deleted totally. Generation facility that has impacts on human health and ecosystem is not only coal fired power plant. For example, wind power plant has also impact on the environment. Therefore, it is not appropriate to mention only about coal combustion. | Rejected. Coal clearly has the highest impacts, even cleaner coal technologies still have relatively high impacts |
| 9373 | 7 | 59 | 30 | 59 | 32 | It should be deleted because the risks related to health and ecosystem are not exclusive to coal combustion but common to any kind of energy use. | Rejected. Coal clearly has the highest impacts, even cleaner coal technologies still have relatively high impacts |
| 11543 | 7 | 59 | 33 | 60 | 3 | Could be streamlined | Rejected. The comment was too brief to |
| 16129 | 7 | 59 | 35 | 59 | 37 | SRREN did not compare nuclear and renewable energy, but did the full assessment of the latter. The two kinds of resources do not have the same kind of advantages or drawbacks, in particular regarding irreversibilities and long term impacts. Nuclear should appear in another sentence. | Taken into account. SRREN did review all published LCAs of nuclear power, but did not take into consideration other environmental assessments, as it did for the renewables. Language has been |
| 9660 | 7 | 59 | 35 | | 43 | By not mentioning what the impacts of RE and nuclear energy are in this report and simply referring to the SRREN, it gives an unbalanced view in comparison to fossil fuels. | Rejected. The claim for an unbalanced treatment would need to be better substantiated. Here, additional material demand is discussed. There is no space |
| 7742 | 7 | 59 | 36 | 59 | 37 | In nluclear,again, being treated as renewable energy here? | Taken into account. Nuclear is treated as an energy source with low GHG |
| 18095 | 7 | 59 | 39 | 59 | 40 | It would be difficult to find a study justifying this sentence. Renewables have significantly lower environmental and health effect than fossil fuels, including gas. Replace "have impacts comparable to clean natural gas systems and much lower than coal or oil" with: "have impacts much lower than coal, gas or oil". | Taken into account. SRREN did review all published LCAs of nuclear power, but did not take into consideration other environmental assessments, as it did for the renewables. Language has been |
| 16844 | 7 | 59 | 39 | | | Suggest adding after "pollutants" the following: "many of which can be controlled at a reasonable costs with pollution control technology." | Rejected. A longer discussion would be necessary here. Emissions are still substantial even after SOTA pollution |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 11867 | 7 | 59 | 44 | 59 | 44 | While it is true that some energy technologies require special materials, I don't think it is defensible to say they need "additional materials". For example, steel and concrete use in nuclear power plant construction outstrips the mass required for just about every other application (except perhaps large hydro) but certainly biomass power plants. Rare earths are used in permanent magnets - and while such magnets are used in wind turbines, they are used in greater volume in consumer electronics (and perhaps in hybrid and electric vehicles in the future...which are best referred to as energy efficiency technologies).These are just 2 examples that seem to contradict the statement regarding "renewable energy technologies...require additional materials". Anyway, the point is that while the issue of critical energy materials is important, it needs to be reframed in terms of "energy technologies" rather than "renewable energy technologies". | Rejected. The reviewer should consult the cited references to see an analysis of these issues. |
| 16845 | 7 | 59 | 44 | | 46 | This analysis very likely leaves out the fact that as inputs become more scarce from existing sources that the price increases -- when this occur, more costly supply sources are then exploited so that you never actually "run out of" the particular material. Before you run out, prices go up and you look elsewhere for supply --- if prices go and stay really high, you find a different material or figure out how to do w/much less of it. | Rejected. For some metals, this is correct. For other metals, there are real access issues because you either reach the mineralogical barrier or because the metals are co-produced with other metals whose demand may not increase. See the literature cited here and the references therein for a more detailed treatment of these concepts. In |
| 16842 | 7 | 59 | 5 | | | Would it be helpful to policymakers to see this at end of paragraph? "The fact that local economies can grow while absorbing the higher cost of renewable energy resources may provide some evidence that economic growth can still occur with a modest CO2 price that would drive lower cost CO2 reductions." | Rejected - please provide peer-reviewed literature that supports the statement. |
| 5956 | 7 | 59 | 6 | | | Balance: It should be acknowledged that the health benefits of access to secure energy/electricity supplies signficantly outweighs the damages associated with electricity production (as evidenced by life expectancy rates). While a discussion of the relative health impacts of different technologies has value, net health impacts (improvement) deends on their relative costs (affordability) | Taken into account - Please note that the benefit of energy access is extensively discussed in section 7.9.1. We cannot afford to repeat this here. Also, this section compares different |
| 4787 | 7 | 59 | 35 | 59 | 36 | I am not sure that "nuclear" issue was addressed in the report SRREN … the renewable technologies presented were: bioenergy, direct solar energy, goethermal energy, hydropower, ocean energy, wind energy | Taken into account. SRREN did review all published LCAs of nuclear power, but did not take into consideration other environmental assessments, as it did for the renewables. Language has been |
| 17938 | 7 | 59 | 40 | 59 | 41 | It would help to clarify that the impacts do not relate to GHG emissions but to other impact categories. Additionally, particularly bioenergy technologies (rather than RE technologies in general) have a range of ecological impacts. | Taken into account. SRREN did review all published LCAs of nuclear power, but did not take into consideration other environmental assessments, as it did for the renewables. Language has been |
| 13203 | 7 | 59 | 6 | 62 | 26 | Rather than having those two paragraphs, It woiuld more policy relevant to devote one paragraph to health effects and a second one to environmental effects and to discuss in each paragraph the possible effects of normal fuctionning and technical risks | Rejected. There are many different impacts and no way to aggregate ecosystem-related ones into a single category, so that a presentation on a |
| 12625 | 7 | 6 | 1 | 6 | 1 | The statement "unevenly distributed" needs clarification as it is a relative term. It should also be referenced. | Rejected - unevenly simply means that there are different storage capacities at |
| 12668 | 7 | 6 | 1 | 6 | 1 | The statement "unevenly distributed" needs clarification as it is a relative term. It should also be referenced. | Rejected - unevenly simply means that there are different storage capacities at |
| 15757 | 7 | 6 | 1 | | 2 | This sounds expensive. What would the carbon price have to be to make this economic? | Taken into account - comment is obsolete. Text has been deleted. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 15801 | 7 | 6 | 1 | 6 | 4 | Moving CO2 by ship will not be practical given trasnport costs. Also biomass-CCS ill be limited in impact due to limited supply to meet demand and air quality control issues | Taken into account - the first comment on ships is obsolete. Text has been deleted. Issues related to bioenergy |
| 18168 | 7 | 6 | 12 | | 17 | Comment:.....for least developed countries, their dissemination will imply a massive technology transfer coupled with financial support. In favourable settings, some of the low carbon energy supply technologies are already economically competitive: for example, larger-scale RE power supplies can be competitive with fossil fuel alternatives, while smaller-scale hydropower, solar photovoltaics, and modern bioenergy systems can sometimes be less expensive than other alternatives to increasing energy access in off-grid, remote and rural areas [7.8, medium agreement; medium evidence]. Comment: Although it is stated Actually, it would be equally valid mentioned to developing countries (not only the least developed) relative the issue of technology transfer and financial support necessary for the dissemination of technology mitigation. Such as it appears in the text, it suggests that businesses Commercial are ahead of the technology transfer agreements and financial support. | Taken into account - comment is obsolete. Text has been deleted. |
| 18169 | 7 | 6 | 12 | | 17 | Alternative paragraph: In favourable settings, some of the low carbon energy supply technologies are already economically competitive: for example, larger-scale RE power supplies can be competitive with fossil fuel alternatives, while smaller-scale hydropower, solar photovoltaics, and modern bioenergy systems can sometimes be less expensive than other alternatives to increasing energy access in off-grid, remote and rural areas [7.8, medium agreement; medium evidence]. | Taken into account - comment is obsolete. Text has been deleted. |
| 16771 | 7 | 6 | 12 | | | Suggest you insert "or purchases" after "technology transfer" -- the agreement could include trade in emissions with BAU paths for developing countries which would provide the means to pay for the technology purchases. Technology movement need not depend on the goodwill of the wealthier countries. | Rejected- a technology transfer will be required anyway - independent of the source of the financial means to pay for it. The financial transfers stated may well |
| 13034 | 7 | 6 | 13 | 6 | 17 | The sentence beginning with "In favourable settings....." implies that only small-scale hydropower can be cost competitive and only in off-grid locations. The sentence could be improved by splitting into two sentences and rephrasing as follows: "In favourable settings, some of the low carbon energy supply technologies are already economically competitive: for example, larger-scale RE power supplies including hydropower, wind energy, and others can be competitive with fossil fuel sources. In addition, smaller-scale projects including hydropower, solar photovoltaics, and modern bioenergy systems can sometimes be less expensive than other alternatives to increasing energy access in off-grid, remote and rural areas." | Taken into account - comment is obsolete. Text has been deleted. |
| 18039 | 7 | 6 | 15 | 6 | 16 | Small wind should be added here.<br>Used with diesel generators, the cost of the turbine are often much lower than the extra fuel costs that would be incurred without the turbine. | Taken into account - comment is obsolete. Text has been deleted. |
| 5939 | 7 | 6 | 17 | 15 | | The inference that large scle RE systems can be competitive with fossil fuel technologies is subject to a number of qualifications. In particular in relation to variable RE sources, this statement does not appear to encompass the total costs of ensuring continuity of supply | Taken into account - text has been deleted. Comment is obsolete. |
| 18170 | 7 | 6 | 18 | | 23 | Comment: Power production is the largest single emitting sector (40% of energy-related GHG emissions) and it will play a major role in transformation scenarios with deep cuts of GHG emissions [7.12, high agreement; robust evidence]. The diverse characteristics of various forms of low-carbon energy supply suggest that combinations of options rather than a single dominant source will minimize the cost and technical integration challenges of achieving low GHG concentrations. Comment: It is necessary to promote integrated planning of energy use of different regional energy options, so that traditional sources of fossil energy and alternative energy sources complement each other, achieving greater energy efficiency to better meet the challenges related to the emissions of greenhouse gases. | Taken into account - comment is obsolete as the referenced text has been deleted. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 18171 | 7 | 6 | 18 | | 23 | Alternative paragraph: Power production is the largest single emitting sector (40% of energy-related GHG emissions) and it will play a major role in transformation scenarios with deep cuts of GHG emissions [7.12, high agreement; robust evidence]. The diverse application characteristics of various forms of low-carbon energy supply suggest that combinations of options rather than a single dominant source will minimize the cost and technical integration challenges of achieving low GHG concentrations. | Taken into account - comment is obsolete as the referenced text has been deleted. |
| 5940 | 7 | 6 | 18 | 33 | | Lack fo clarity as to what is being stated | Taken into account - text has been deleted. Comment is obsolete. |
| 6164 | 7 | 6 | 18 | 6 | 20 | Tie back to page 5, lines 2-3. Perhaps rephrase as "Among the energy sector activities of energy extraction, conversion, storage, transmission and distribution processes, power production is the largest single activity." | Taken into account - comment is obsolete as the referenced text has been |
| 6444 | 7 | 6 | 18 | 6 | 18 | The sentence should begin: "Electric power production…" or "Electricity production…"since power is a generic term. I suggest the use of the word 'power' be considered carefully throughpout the report and that 'electricity' or electric power' are used when electric power is what is meant . See also page 13, ln 4; page 16, ln 6; page 18, ln 29; p75, ln 10 | Rejected - power is a term that is well known in the energy sector literature. |
| 5146 | 7 | 6 | 18 | | 33 | This paragraph could be made more to the point - it is difficult to understand - for instance the sentence starting a line 25: what is ment by " --- will necessitate systemic changes in the remaining set of ---" the relationship between "key low GHG ---" and "remaining" needs clearifying (ES needs to have a precise, easy to comprehend message - this is not always so) | Taken into account - the entire paragraph has been rephrased in order to address concerns of this and other reviewers. |
| 10492 | 7 | 6 | 18 | | | Page 6 states energy sector has 45% of energy-related GHG emissions yet here states 40% for power generation alone - BUT page 15 line 16 says 40% is "electricity and heat generation alone". So which is correct? And what is the 5% for? Not transport. Need to check. | Taken into account - text has been deleted. Comment is obsolete. |
| 14407 | 7 | 6 | 2 | | | This sounds more upbeat on CCS than the usual view | Accepted - text on CCS has been |
| 5131 | 7 | 6 | 22 | | 24 | The sentence is not clear! | Taken into account - comment is obsolete as the referenced text has been |
| 2395 | 7 | 6 | 24 | 6 | 27 | That is one strange sentence. Shorten and rephrase | Taken into account - comment is obsolete as the referenced text has been |
| 18172 | 7 | 6 | 24 | | 33 | Add to paragraph: The unavailability of any one key low GHG energy supply option will necessitate systemic changes in the use of the remaining set of low GHG resources, technologies and demand measures, for emissions will rise, increasing both marginal and total cost of achieving a prescribed emissions limit [7.12, high agreement; medium evidence]. Infrastructure and integration issues vary by mitigation technology and region, and while they are not generally technically insurmountable, such issues must be carefully considered in energy supply planning and perations to ensure reliable and affordable energy supply and may require changes in patterns of energy production and use. and consumer expectations, and result in higher energy costs [7.6, medium agreement; robust evidence]. These factors may also apply to deployment of fossil fuels [7.4, high agreement; robust evidence]. | Taken into account - the entire paragraph has been rephrased in order to address concerns of this and other reviewers. |
| 18173 | 7 | 6 | 24 | | 33 | Alternative paragraph: The unavailability of any one key low GHG energy supply option will necessitate systemic changes in the use of the remaining set of low GHG resources, technologies and demand measures, for emissions will rise, increasing both marginal and total cost of achieving a prescribed emissions limit [7.12, high agreement; medium evidence]. Infrastructure and integration issues vary by mitigation technology and region, and while they are not generally technically insurmountable, such issues must be carefully considered in energy supply planning and operations to ensure reliable and affordable energy supply and may require changes in patterns of energy production and use. | Taken into account - the entire paragraph has been rephrased in order to address concerns of this and other reviewers. |

|---|---|---|---|---|---|---|---|
| 6793 | 7 | 6 | 28 | 6 | 29 | "Infrastructure and integration issues vary by mitigation technology and region, and while they are not generally technically insurmountable…" Grid integration of renewable energy is far from insurmountable. Numerous utility studies have shown grid integration costs of less than a half-cent US per kWh for penetrations up to 25%. In the U.S. many utilities have easily met many renewable energy penetration goals associated with renewable portfolio standards far ahead of schedule. And installing the infrastructure is a welcome opportunity when jobs are badly needed. | Rejected - space constraints do not allow to go into the details in the ES |
| 4097 | 7 | 6 | 3 | 6 | 3 | At every point in this chapter the source of bioenergy needs to be provided in view of the already seriously adverse effects of using some forms for bioenergy/biofuel purposes - including impacts on food availability, food prices, social stability, and water resources. | Taken into account - there is a new annex to chapter 11 which deals with the issues related to bioenergy usage. Space constraints however, do not allow |
| 3770 | 7 | 6 | 31 | 6 | 31 | "consumers expectations". Usually the consumer is only concerned with the availability of some energy services and not with the primary energy sources. Thus, "consumer expectations" must be better clarified. | Rejected - some options to deal with variable input from RE sources are realized at the consume level (e.g. |
| 3771 | 7 | 6 | 32 | 6 | 33 | This sentence is not necessary. It is already included in the previous one. | Accepted - text revised. |
| 15802 | 7 | 6 | 34 | 6 | 41 | Co-benefits are valuable but how do you quantify these, both physically and economically? Just talking about these will drive technology deployemtn or convince policy makers. | Noted - the fact that co-benefits are hard to quantify does not mean that they are |
| 18174 | 7 | 6 | 34 | | 40 | Add to paragraph: There are often co-benefits from the use of mitigation technologies in the energy supply sector, such as reduction of air pollution, employment opportunities, lower energy production related fatality rates, better energy security, improved energy access and reduced vulnerability to price volatility [7.9, high agreement; robust evidence]. At the same time, however, many low carbon technologies can have substantial negative ecological impacts, though social and cultural appropriate technology selection, in the context of neighborhood itsthose impacts can be mitigated to a degree through the appropriate selection, design and siting of the technology [7.9, high agreement; robust evidence]. Comment: Meaning the territorial (in a geographical wide sense) and environmental (in its whole sense) conditions of the project. | Taken into account - the entire paragraph has been rephrased in order to address concerns of this and other reviewers. |
| 18175 | 7 | 6 | 34 | | 40 | Alternative paragraph: There are often co-benefits from the use of mitigation technologies in the energy supply sector, such as reduction of air pollution, employment opportunities, lower energy production related fatality rates, better energy security, improved energy access and reduced vulnerability to price volatility [7.9, high agreement; robust evidence]. At the same time, however, many low carbon technologies can have substantial negative ecological impacts, though social and cultural appropriate technology selection, in the context of neighborhood. | Taken into account - the entire paragraph has been rephrased in order to address concerns of this and other reviewers. |
| 5327 | 7 | 6 | 34 | 6 | 37 | The co-benefits of “employment opportunities” and “better energy security” are highly questionable. Where does the alleged high evidence come from? Employment effects are predicted mostly by bottom-up models, but not by CGE models. If energy becomes more expensive through deployment of renewable energy, aggregate employment typically goes down.<br>Energy security: Coal is highly abundant on the world market and prices are rather stable. (This is a driver for global warming). By contrast, the supply of renewable energy, notably wind and solar is highly volatile, leading to additional costs for storage and/or backing up of energy supply gaps by flexible power plants, notably gas turbine power plants. So the increase of energy security by the deployment of renewable energy sources is highly questionable. Where is the evidence from scientific research? | Taken into account - the dispute on this issue now is shown in chapter 7.10.4. The level of confidence of the paragraph in the ES has been reduced. The wording however is the same as it is true that job creation opportunities exist. Lost jobs are counted under "negative impacts" a couple of lines later. |
| 12029 | 7 | 6 | 35 | 6 | 35 | There must be both positive and negative opportunities for employment. | Rejected - co-benefits comprise employment opportunities. Lost jobs are to be counted under negative side- |
| 12917 | 7 | 6 | 35 | 6 | 35 | add 'cost savings' | Rejected - in general low carbon technologies are still more expensive |

|---|---|---|---|---|---|---|---|
| 6222 | 7 | 6 | 36 | 6 | 36 | Many mitigation technologies increase price volatility - cf negative power prices in FRG due to excess wind | Rejected - what is meant here are the prices of imported energies. |
| 16772 | 7 | 6 | 36 | | | Can you somehow highlight the "vulnerability to price volatility" point? This is important and could be overlooked. | Taken into account. |
| 18040 | 7 | 6 | 37 | 6 | 40 | Because the term "low-carbon technoologies" is not defined (which it should be), the statement becomes very unclear. I suggest splitting the sentence up in 1) renewables; 2) Nuclear; 3) CCS (and other technologies that may be defined as "low carbon"). I would question whether RE technologies can have "substantial" negative impacts (locally, perhaps). Nuclear and CCS are the technologies that can have "substantial" impacts, as stated on 61 whic says: "Concerning maximum consequences, those renewable sources clearly outperform all other technologies because their decentralised nature strongly limits their catastrophic impacts". | Rejected - not supported by the broad body of peer reviewed research. The reviewer is reading the term "low-carbon technologies" in a very narrow manner that is not consistent with how the term is applied throughout Chapter 7 or for that matter in previous IPCC assessments. If "low-carbon technologies" includes biomass plantations producing 100 EJ/year then there is literature that speaks to significant ecological concerns that |
| 6792 | 7 | 6 | 37 | 6 | 38 | Saying "many low carbon technologies can have substantial negative ecological impacts " significantly overstates the case. Renewable technologies generally have low impacts. The 2010 US National Academy study on the true cost of the US energy system stated that environmental impacts costs of renewables were assumed low. | Rejected - not supported by the broad body of peer reviewed research. The reviewer is reading the term "low-carbon technologies" in a very narrow manner that is not consistent with how the term is applied throughout Chapter 7 or for that matter in previous IPCC assessments. If "low-carbon technologies" includes biomass plantations producing 100 EJ/year then there is literature that speaks to significant ecological concerns that |
| 10044 | 7 | 6 | 4 | | | CCS high agreement, robust evidence? | Rejected - the reviewer's comment is not supported by the peer reviewed literature. There is a large literature that speaks to the potential for biomass + CCS to create negative emissions. This hasn't been done in practice as there is no disincentive on venting GHG to the atmosphere that is stringent enough to call for measures like this. As more |
| 2396 | 7 | 6 | 40 | 6 | 41 | last sentence makes no sense at all. | Taken into account - text has been |
| 18176 | 7 | 6 | 40 | | 46 | Add to paragraph: Additionally, at high penetration, GHG emissions from low carbon technology can act to limit penetration if a low GHG stabilization target is desired [7.8, high agreement; robust evidence]. Considerable populations do not have access to modern energy resources and technologies, especially in Africa and Asia [7.3, high agreement; robust evidence]. Providing universal access to modern affordable energy services will require understanding of local conditions, and removing of different kind of barriers removing different cultural, institutional and legal barriers, but not necessarily lead to any significant changes in GHG emissions [7.9, high agreement; limited evidence]. | Taken into account - the entire paragraph has been rephrased in order to address concerns of this and other reviewers. |

|---|---|---|---|---|---|---|---|
| 18177 | 7 | 6 | 40 | | 46 | Alternative paragraph: Additionally, at high penetration, GHG emissions from low carbon technology can act to limit penetration if a low GHG stabilization target is desired [7.8, high agreement; robust evidence]. Considerable populations do not have access to modern energy resources and technologies, especially in Africa and Asia [7.3, high agreement; robust evidence]. Providing universal access to modern affordable energy services will require understanding of local conditions, and removing of different kind of barriers removing different cultural, but not necessarily lead to any significant changes in GHG emissions [7.9, high agreement; limited evidence]. | Taken into account - the entire paragraph has been rephrased in order to address concerns of this and other reviewers. |
| 13285 | 7 | 6 | 40 | 5 | 41 | It is not clear what this final sentence of the paragraph means - if it means that residual emissions from coal CCS generation might still be too high to be consistent with stringent emissions limits, this could be made clearer (possibly with an example) | Taken into account - text has been deleted. |
| 16773 | 7 | 6 | 40 | | 41 | This reference to section 7.8 should be corrected -- reading 7.8 shows there are significant problems insofar as it 1st claims that life-cycle analysis of lower carbon techs could result in increased emissions because of the energy used to make these technologies, but then later in section makes the very good point that as the system lowers it's emissions these estimates do not apply. This section seems flawed and inclusion of this point in the summary is not helpful. | Taken into account - text has been deleted. Comment is obsolete. The underlying text in chapter 7.8.1 has been improved. |
| 3772 | 7 | 6 | 40 | 6 | 41 | Sentence is not clear. | Taken into account- text has been deleted. Comment is obsolete. |
| 5147 | 7 | 6 | 40 | | 41 | there is a kind of paradox or bewildering message in this sentence - it states that low carbon technologies are not low carbon - also "Additionally --" points back to the previous sentence , however there is no direct link between "negative ecological impact" and GHG emissions from low carb techs - sentence should be rephrased to clearify message | Taken into account - text has been deleted. Comment is obsolete. |
| 2397 | 7 | 6 | 42 | 6 | 46 | This needs a more sensitive treatment. It should read sub-Sharan Africa first of all. Second it is not a matter of removing the barriers mentioned alone, that is a small sub set of the issue. | Taken into account - the entire paragraph has been rephrased in order to address concerns of this and other |
| 2398 | 7 | 6 | 42 | 6 | 46 | At least one of my publsihed papers in 2010 2011 or 2012 should be cited in the access sections. | Taken into account - references are not shown in the ES. In 7.9.1. the work of |
| 5132 | 7 | 6 | 42 | | | what are "modern energy resources" ? Should it be "modern energy services"? | Accepted - text revised. |
| 4776 | 7 | 6 | 42 | 6 | 46 | I don't always agree with this paragraph, as it clearly depends on the choice of the technology. Indeed the cheapest power technology could emit more GHG emissions than other technologies (low- or no-CO2) | Taken into account - the entire paragraph has been rephrased in order to address concerns of this and other |
| 16774 | 7 | 6 | 42 | | 46 | Should qualify the statement that improving access to energy resources does not necessarily lead to changes in emissions -- should use this as opportunity to say "provided such systems rely on lower emitting energy technologies." If these populations are served with older coal technology (as an example) it is very true that emissions could increase significantly. | Taken into account - the entire paragraph has been rephrased in order to address concerns of this and other reviewers. |
| 12543 | 7 | 6 | 45 | | | The wording is somewhat misleading. Universal access to affordable low carbon energy resources would "not necessarily lead to any significant changes in GHG emissions," it is true (emphasis added). But it is more likely, and of course more desirable, that the considerable amount of the world's population unserved or poorly served at present gain access to modern affordable low-emission energy services, substituting solar PV and other resources for high-emission high-cost ones (biomass for cooking, diesel, gasoline, bunker fuels, coal) that tend to move down the income ladder as they are displaced by lower-emission resources. While their emissions would increase slightly, that would be greatly outweighed by the emissions reduction from adoption of clean technologies and resources across societies as a whole. | Taken into account - the entire paragraph has been rephrased in order to address concerns of this and other reviewers. |

| 12156 | 7 | 6 | 9 | 6 | 9 | I think that it's opportune and necessary to include "cultural aspects" in the context of the focused factors. | Taken into account cultural aspects are discussed in chapter 7.9. There is now an extended paragraph on these aspects |
| 18498 | 7 | 6 | | | | The discussion of developing countries (lines 12-13 and 43-45) seems to miss the importance of decoupling growth (including an increase in energy access) and GHG emission increases, whereas mitigation of emissions is more of a priority for developed countries. The discussions of technology transfer and barrier removal would need to fit into that overarching framework. | Rejected - space constraints do not allow to highlight every interesting point. |
| 17887 | 7 | 60 | | | | please refer to the WHO analysis of the Chernobyl accident as well as Fukushima - consult www.who.int | Taken into account. Please note that there are no formal reports or publications on Fukushima. There is an evaluation of Chernobyl on |
| 11868 | 7 | 60 | 1 | 60 | 3 | Again, these studies addressed very particular materials, and I strongly believe that some qualification of the statement is required for example "…in the future could increase the energy cost and…" There are other futures that could be envisioned -for example robust recycling infrastructure due to increased value for critical materials as well as signficant reductions in critical material use per unit energy generated (i.e. the kinds of significant reductions we've seen in solar panels and even electronics in terms of material use). | Taken into account: Cite Norgate and Eckelman work |
| 16846 | 7 | 60 | 1 | | 3 | If the energy includes the cost of CO2 via a CO2 price, the CO2 in the life cycle should be accounted for. | Taken into account. |
| 17755 | 7 | 60 | 11 | | | delete the words "that is not well represented in the literature" - this is not correct | Accepted. The passage has been added. |
| 12549 | 7 | 60 | 13 | | | A useful reference: Jordan Macknick, Robin Newmark, Garvin Heath, and KC Hallett, 2011. A Review of Operational Water Consumption and Withdrawal Factors for Electricity Generating Technologies. NREL/TP-6A20-50900 | Taken into account. This section to be revised based on some of this new data. |
| 10084 | 7 | 60 | 16 | | | Fukushima-Daiichi Block 1 to 4 | Accepted |
| 4824 | 7 | 60 | 26 | 62 | 24 | This section should be subdived by technology to ease reading and quick comparison of risks by technology | Editorial comment. |
| 11869 | 7 | 60 | 32 | 61 | 28 | This first paragraph of 7.9.3 seems to be a continous list of potential accidents from different types of power generation systems. It is, however, incomplete. For example, while coal extraction deaths from collapses and underground explosions are high, the number of miners that die from exposure to coal dust, CO, etc. is probably much larger. Ignoring this but then listing exposure to coal fired power plant pollutants seems like an incongruency. Also, while coal is bad for air quality and consequent emissions in the US (as indicated by the quote in the paragraph), there are many other places, like China, where air pollutants from coal combustion are much worse and likely cause more illness/death. Overall, this section on risk seems like it need a great deal of refinement, including a plan for how to discuss risks from different fuels/technologies. Further along, in the third paragraph, the list of nuclear accidents comes after what seems to be a summary of risks, and mention of chernobyl and fukushima. This whole section needs reorganization to clarify the desired background information and key points/concepts the authors want to convey. I suspect it could be very much shortened if this was done. | Taken into account. Please note that pollution issues are addressed in section 7.9.2 |
| 4821 | 7 | 60 | 34 | 60 | 34 | Add full stop after "may take place" | Editorial comment. |
| 16849 | 7 | 60 | 36 | | 38 | Is this claim of 10,000 deaths substantiated via other studies? It is very controversial and pushed hard by advocacy community -- other high quality citations could strengthen the point. | Accepted. Sentence deleted. These deaths are not due to major accidents. |
| 13205 | 7 | 60 | 37 | 60 | 37 | This figure of 10 000 coal related deaths is not reflected in figuer 7.17 | Taken into account. These were not accidental deaths and the sentence has |

| 17940 | 7 | 60 | 9 | | | The cross-reference to Section 7.9.1 appears to be wrong. In general, it would be a good idea to bring the different discussions of CCS impacts across chapters (5, 6, 7, and 11) together. | Action: look for CCS impacts in the other chapters! The reference must now |
| 9606 | 7 | 60 | | | | Please, import a sentense from line 37 to 41, page 29 in chapter 9 as follows; premature deaths from biomass smoke in households accounted for 1.5 million people in 2008, a number - above those from tuberculosis and malaria - that may change little until 2030 according to projections following the present trends. | What is the source of this information? |
| 11949 | 7 | 60 | | | | Ths section could be shortened substantially since it relies heavily on a recent IPCC report. Suggest just giving a half page summary with reference. | Rejected. We think the material warrants to be presented in the present, |
| 10961 | 7 | 60 | 25 | 62 | 24 | Confer: Torvanger, Grimstad, Lindeberg, Rive, Rypdal, Bieltvedt Skeie, Fuglestvedt, Tollefsen (2012), Quality of geological CO2 storage to avoid jeopardizing climate targets, Climatic Change, 114, 245-260; showing that leakage even under large-scale CCS-based CO2 storage is not likely to have significant effects on future global temperature. | Taken into account. We have chosen not to address CO2 leakage from reservoirs in this section due to space constraints. Thank you for the reference! |
| 4788 | 7 | 60 | 41 | 60 | 44 | I am surprise of this data that hydro has the highest death rate for all technologes. I can understand that a dam failure may be dangerous. I have in mind a study that compared death to electricity generated (death/TWh) and the highest rate if or coal (technology & death/TWh): coal (world) = 161 ; coal (China) = 278 ; Coal (USA) = 15 ; Oil = 38 ; Solar PV = 0.44 ; Wind = 0.15 ; Hydro = 0.1 ; Hydro (with Banqiao) = 1.4. Please check your figures for all technologies | Rejected. The data summarized here is referenced. No source was given by the reviewer. Not helpful. |
| 10055 | 7 | 60 | 44 | 61 | 2 | There are sveral hundred nuclear accidents reported with medium to high environmental impact, including those in fuel supply facilities such as the accident(s) in Majak - e.g. on 29 September 1957. Today the region around Majak / Tscheljabinsk is still amoun the most radioactiv contaminated regions world wide. More references must be added to make the complete the information about nuclear accidents of the past. | Rejected. The intention here is not to provide a complete account of the entire past. Given that we want to make informed decisions about future energy systems, it is important to avoid too |
| 9163 | 7 | 61 | | 62 | | Why developed countries only? Many labors are killed by accidents in coal mines in developing countries. | Rhetorical question. Please note that non-OECD countries are presented in |
| 9164 | 7 | 61 | | 62 | | Show full externatlities of the world, not the casulity in the developed countreis. Rare metal industires are damaging the local environment in developing countries. | Noted. Why are rare metal industries relevant here? Could you please point us |
| 5931 | 7 | 61 | | 62 | | It would be important to show the fatalities also in relation to the amount of electricity generated, not only in relation to nominal capacity, by using typical average full -load hours of each technology. | Rejected. The difference due to the load factor would not be apparent given the |
| 16131 | 7 | 61 | 15 | 61 | 28 | The cumulative operation of 14,500 reactor years should be compared with the initial doctrine of probability of events of one accident with loss of coolant every 100 000 reactor years and one large catastrophic accident for one million years. This means the present doctrine of redundancy and multiple protection is not adequate. This paragraph is strange because it argues on nuclear safety increasing in time, but is based on data (14 500 y.reactors;three catastrophic accidents) contradicting obviously that record. | Rejected. The 100 000 reactor year claim is not relevant here. |
| 9605 | 7 | 61 | 15 | 61 | 28 | Please, delete here due to redundant, or discuss with the reason why modern nuclear and OECD hydropower plants show the lowest fatality rates. | Taken into account. Please note the section has been shortened. |
| 4112 | 7 | 61 | 15 | 61 | 18 | As the causes of these three 'nuclear accidents' are indeed 'fundamentally different' it would be worth reviewing the wording here. | Noted. This review comment is unclear, but the wording has been reviewed. |
| 3801 | 7 | 61 | 15 | 61 | 28 | Too much discussion on nuclear energy compared with other energy sources. This reflects report unbalance. | Rejected. The focus on nuclear in this section is warranted due to the potential for large accident and the dread these |
| 17377 | 7 | 61 | 2 | | | Reliable fatality data… | Accepted. Section revised. |
| 9477 | 7 | 61 | 24 | 61 | 28 | This part should be left in this report, as it is correct description about efforts to enhance safety of nuclear power. | Taken into account |
| 9511 | 7 | 61 | 24 | 61 | 28 | Good text. It's very important safety policy of nuclear reactor. This text should be referred to executive summary too. | Taken into account. This is not likely to make it to the summary. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 18096 | 7 | 61 | 24 | 61 | 28 | The distinction between the safety of the oparting plants and the designs that are on the drawing board should be made clearer. | Rejected. As we discuss new designs that are remarkable for their safety features, it should be clear that existing |
| 16850 | 7 | 61 | 29 | | 32 | How good are the statistics for small, highly decentralized systems? How many deaths from installation of rooftop solar and how do these compare with roof install or repair? Are there no health impacts from exposure to toxic materials for workers in factors that produce solar cells? What about exposure to toxic material (resins, bonding agents) for workers in factories that make large wind turbine blades? No reported deaths for workers on very tall wind turbines (I hope these are all minimal, but these systems are new and I wonder if we just haven't gotten around to checking). All the numbers discussed here would be more useful if also put into context of risks or deaths/1000 worker hours or something similar, or perhaps more helpful deaths per unit of energy produced. | Accepted. Please note that we do not make claims regarding smaller accidents. We would very much welcome data sources and studies addressing these issues. |
| 7744 | 7 | 61 | 30 | 61 | 32 | What renewable sources is the text referring to? Nuclear is not renewable... | Accepted. "those" has been deleted. |
| 18097 | 7 | 61 | 30 | 61 | 32 | The sentence leaves the impression that "other low carbon technologies" are only more safe because of their "decentralised nature". That leaves much to add, e.g. that they do not use dangerous or polluting elements (fuel, uranium, ...) or extreme temperatures for combustion (and, therefore, explosion hasards); less particles, mercury, water use, riwsk of polution etc. | Rejected. These issues are addressed in section 7.9.2 |
| 4823 | 7 | 61 | 5 | 61 | 5 | Explain maximum consequences index | Rejected - space constraints do not allow to go into the details here. |
| 10056 | 7 | 61 | 15 | 61 | 28 | see above | Rejected. We do not understand this |
| 4653 | 7 | 62 | | 62 | | Is this table necessary? Could it not be summarized in a short paragraph? In my opinion the whole section on technical risks could be condensed. | Editorial comment |
| 10566 | 7 | 62 | | | | Bullets on bottom right of figure should become a foonote in caption. Where they are placed now is not easy for the reader to link with the numbers in left hand column | Editorial comment |
| 13206 | 7 | 62 | 1 | | | This figure is misleading and should be checked. It does not reflect the fact that coal is by far the most harmful energy source | Reject. No reference provided to justify the assertion made. |
| 10085 | 7 | 62 | 14 | | 21 | There is no mentioning of gas exploration and production accidents like recently in the north sea. In additon there no remark about the possible contradictions between hydraulic fracturing for shale gas, natural gas or geothermal operations and the storage of CO2. | Reject. No reference provided. Gas accidents are taken into account in Fig. 7.17. We do not understand what the |
| 15293 | 7 | 62 | 19 | 63 | 14 | I am surprised to see that hydr fracturing (fracking) is only mentioned as a health & water issue. The 2011 Cornell (Howarth et al.) LCA suggests it is worse than coal, & presumably others have followed us with such analyses. I think such issues should be mentioned, unless the authors feel they don't exist. | Reject. The Howarth study refers to GHG not catastrophic risks and this issue is addressed in section 7.8.1 and |
| 2974 | 7 | 62 | 25 | | | The cited PSI data has several flaws. By considering only accidents with more than 5 deaths, technologies leading to many but not large accidence like coal mining are heavily underestimated (see: Lirong Wu and others, 'Major Accident Analysis and Prevention of Coal Mines in China from the Year of 1949 to 2009', Mining Science and Technology (China), 21 (2011), 693–699 <doi:10.1016/j.mstc.2011.03.006>.). For fossil fuels in addition an outlook on future risks from new exploration and depletion technologies such as fracking would be useful. | Noted. The reviewer has identified a major gap in the current analysis, i.e. accidents with less than 5 fatalities. No systematic, comparative information of the type presented here is currently available. Thank you for pointing out a |
| 11950 | 7 | 62 | 25 | 64 | 4 | Since this is discussed in other Chapters, a one sentence referral is warrented, not 2 whole pages. This is not on the main topic of Energy Systems | Rejected - we are following the outline dictated by the IPCC, but have reduced |
| 2843 | 7 | 62 | 25 | 64 | 2 | The discussion of public acceptability does not cover transmission lines, though these can raise significant acceptability issues. | Accepted - we note in a footnote that transmission is NOT covered here. While a relevant topic, we do not the |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 9283 | 7 | 63 | | | | Footnote 18 states "Knowledge about the social acceptability of CCS is limited due to the early state of the technologies' deployment. Recent research has, in part, focused on the need to fully educate respondents about CCS if meaningful insights are to be gained about public acceptance issues".<br><br>The extent to which a local community has confidence in the regulatory frameworks that undeprin and govern any standard industrial activities (such as CCS, refer to WGIII FOD Chapter 2, page 43 lines 2 - 23 which states that CCS is no more riskier than other fossil fuel applications) often means that the community does not have be "fully" educated om a particular technology for it to have acceptance of its deployment.<br><br>The prevailing footnote statement seems to offer quite a subjective statement. I suggest delete it. | Accepted - We have shorten the footnote substantially to address the concern, but still retain it. |
| 3407 | 7 | 63 | 10 | 63 | 13 | IPCC SR on CCS already reports these basic ideas. Therefore no need for 7 new references ¡. Footnote 18 states the obvious and introduces again four references. Similar problems in lines 23-24. | Rejected - these references are from after the CCS special report, and a key purpose of AR5 is to update the literature from previous IPCC reports. While the concepts may not be |
| 16851 | 7 | 63 | 10 | | 12 | There are undoubtedly other costs associated with the use of fossil fuels -- however, the fact that CCS tech cost calculations don't include other social costs is not the point is it? The effort is to reduce CO2 emissions while still providing energy. Other social costs can be internalized via market pricing systems independent of climate policies, but if we try to make climate mitigation account for all social ills, do we risk asking it to solve too much. | Rejected - Though we agree with the comment in many respects, this section's purpose is simply to identify concerns related to public perception and acceptance for each of the core energy supply technologies. For all technologies, those concerns extend well beyond carbon, and indeed, some concerns may not even be technically "accurate" in some respects. We agree |
| 9282 | 7 | 63 | 11 | 63 | 12 | It is not clear what the following statement is actually referring to: "… CCS technologies do not avoid the non-GHG social and environmental impacts of fossil energy sources …"<br><br>The statement would benefit from further information to assist clarity of meaning. | Rejected - we feel that this language is clear. CCS avoids carbon; it does not avoid other social/environmental impacts associated with fossil energy plants. |
| 16859 | 7 | 64 | 15 | | | Where have "new market mechanisms" been defined? I don't know what these are. | Rejected - comment seems to be misplaced. Please clarify where you |
| 10086 | 7 | 64 | 18 | | 19 | This is not only an issue for renewables but large thermal power units as well | Taken into account - comment is obsolete as the underlying text has been |
| 11870 | 7 | 64 | 18 | 64 | 32 | The bulleted list provided here seem to be a strange subset of barriers - but the text implies that they are an exhaustive list - perhaps it can be made explicit that this is just a subset or list of examples? | Taken into account - comment is obsolete as the underlying text has been |
| 5957 | 7 | 64 | 20 | 24 | | The inference that the difference between average thermal plant efficiencies and best available is a barrier to mitigation lacks balance. It is an economic consequence of the large scale of the required capital investments and the length of the cost recovery periods. The situation is not a technical barrier. The same argument can be applied to network infratructure investments | See 7.10.1 |
| 16852 | 7 | 64 | 20 | | 22 | Does this really limit mitigation potential? I don't believe this point has been demonstrated -- the discussion of conversion efficiencies and energy penalty of CCS does not seem to understand or take into account how this works in a world with carbon prices. It is also inconsistent with results of most models that look at the energy system -- | Taken into account - comment is obsolete as the underlying text has been deleted due to space constraints. |
| 10568 | 7 | 64 | 20 | 64 | 22 | This is two bullet points | Taken into account - comment is obsolete as the underlying text has been |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 9910 | 7 | 64 | 3 | 64 | 4 | An analysis of 104 empirical studies of innovation to change showed the following barriers, that could refine and structure the discussion of barriers:<br>Issues of resourcing (76%), for instance, “not enough resources” (Post and Altman 1994), “lack of adequate resources such as time and staff” (Adams and McNicholas 2007), limited or no budgeting (e.g. Harris 2000 and Anumba et al. 2006), access to capital and lack of time (Rohdin and Thollander 2006).<br>Issues of capabilities (75%), for instance, “low technology literacy” (Stewart, Mohamed and Marosszeky 2004), “ill-equipped in terms of training and expertise” (Whitaker 1987), “employees are not trained” (Tamimi and Sebastianelli 1998), “lack of understanding” (Waldron 2005), “lack of technical skills” (Rohdin and Thollander 2006), “lack of skill, knowledge and expertise” (Kirkland and Thompson 1999), etc.<br>Issues of communication (64%), for instance, “communication barriers” (Heide, Grønhaug and Johannessen 2002), “communication overload and distortion” (Allen 2002), “lack of communication within the team” (Attaran and Nguyen 1999), “lack of communication among those sharing responsibility for different aspects” (Kunda and Brooks 2000), “poor communication practices that damaged employee commitment to projects” (Jacobs et al. 2006), “tension among departments arising from the incompatibility of actual or desired responses” (Aggarwal 2003), etc.<br>Issues of organizational structure (62%), for instance, bureaucracy (e.g. Molinsky 1999; Borins 2000; Abdul-Hadi, Al-Sudairi and Alqahtani 2005), “salary structure” (Al-Qirim 2007), “complexity, centralization, and formalization”(e.g. Allen 2002), “rigid organizational boundaries” (Butler 2006), “departmental fortresses” (Cicmil 1999), and organizational structure (e.g. Scarbrough and Lannon 1988; McGaughey and Snyde 1994; Yauch and Steudel 2002).<br>Abdul-Hadi, N., Al-Sudairi, A. und Alqahtani, S. (2005): Prioritizing barriers to successful business process re-engineering (BPR) efforts in Saudi Arabian construction industry, In: Construction Management \& Economics, Vol. 23, Nr. 3, S. 305-315.<br>Adams, C.A. und McNicholas, P. (2007): Making a difference: Sustainability reporting, accountability and organisational change, In: Accounting, Auditing and Accountability Journal, Vol. 20, Nr. 3, S. 382-402.<br>Aggarwal, N. (2006): Ten Lessons Learned: Data Warehouse Development Project, California Department of Fish and Game, In: CrossTalk: The Journal of Defense Software Engineering, Vol. 19, Nr. 10, S. 16-20 | Rejected - although the information provided by the reviewer is correct, space constraints unfortunately do not allow to go into the details here. |
| 5958 | 7 | 64 | 33 | | | The analysis in Section 7.10.2 should be strengthened as it is a critical aspect of mitigation | Noted. |
| 2844 | 7 | 64 | 34 | 64 | 38 | Should point out that it is not so much the barriers in themselves, as the fact that renewables are thereby less attractive than fossil sources, which leads to a need for policy support. | Noted. The sentence has been deleted to focus more on investments barrier. |
| 18098 | 7 | 64 | 35 | 64 | 35 | Unclear what is meant by "limits of market capacity". Delete "(ii) Uncertainty of energy prices". The uncertainty of future fuel prices is one of the biggest drivers for zero fuel cost renewables - not a barrier (unless it is wrongly assumed that gas and CCS are low-carbon) | Noted. The sentence has been deleted. |
| 16853 | 7 | 64 | 37 | | | suggest insert after " … among stakeholders" the following: ", vii) absence of a price on CO2 emissions to change the relative competitiveness of low emitting energy systems." | Taken into account. CO2 price is mentioned with energy price. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 2845 | 7 | 64 | 39 | 64 | 40 | Unbalanced – while some studies show lower overall costs, others show higher costs. Should point out that these results depend on assumptions, inter alia about future fossil fuel prices, whose accuracy is inherently unknowable. | Noted. The sentence has been deleted. |
| 6199 | 7 | 64 | 39 | 64 | 40 | "Various studies indicate that investing in low carbon energy technologies would end up costing less than continuing to invest in older technologies." This sentence, particularly in using the word "would", sounds much more conclusive than may be warranted. It does not say which low-carbon energy technologies would cost less, and thereby clumps together technologies that may be cost-effective with others that are not. It does not describe whether it is referring to overall social costs, or costs that a user would see. Additionally, it needs to tie into reasons why they are not being adopted, and what market failures and/or barriers are maintaining these inefficiencies. | Noted. The sentence has been deleted. |
| 16854 | 7 | 64 | 39 | | 40 | This statement is not supported by the literature UNLESS there is a CO2 price on emissions. | Noted. The sentence has been deleted |
| 16856 | 7 | 64 | 39 | 65 | 2 | This ignores fact that all economic modeling show this change has a cost relative to the no policy scenario. See chapt 6 and 13. | Noted. The sentence has been deleted |
| 9662 | 7 | 64 | 40 | | 41 | Be explicit that the new systems would reduce the demand for fossil fuels | Taken into account. This subsection has been revised focusing more on |
| 16855 | 7 | 64 | 40 | | 41 | 2nd sentence ignores the economic costs created by such a change -- it is not free. Nor does it "save money" -- this does not make it unaffordable, but we should not cross line and claim it is free either. | Noted. Rephrased. |
| 18099 | 7 | 64 | 41 | 65 | 2 | Important point but somewhat unclear sentence. Is it $7 bn savings in fuel costs; is it annually, capital expenditure compared to what ? | Taken into account. The paragraph has been revised. |
| 16857 | 7 | 64 | 6 | | | What is definition of "sustainable" energy? Suggest something more precise. | Rejected - comment seems to be misplaced. Please clarify where you |
| 10567 | 7 | 64 | 6 | 64 | 15 | Suggest delete - repetitive | Rejected - the reference to the objective serves as an introduction for the entire |
| 13207 | 7 | 64 | 8 | 64 | 8 | Delete any reference to a specific mitigation objective which is irrelevant in a chaper devoted to the technical constraints in implementing new energy sources | Rejected - the reference to the objective serves as an introduction for the entire |
| 16858 | 7 | 64 | 9 | | 11 | Institutions or private investors will not finance projects unless they are confident they can earn a sufficient risk adjusted return -- this includes risk not only from technology, but from particular project, country risks, energy market risks and so on. | Rejected - comment seems to be misplaced. Please clarify where you would like to see this being reflected. |
| 18546 | 7 | 64 | | | | The sub-sections in 7.10 vary in terms of their treatment of the different technologies (e.g. with some focusing heavily on RE and ignoring other options) and structure, and in some sections strays to topics covered in other sections (e.g. there is a long policy discussion in 7.10.2). Some kind of conformity would be useful - perhaps structuring sub-sections according to the options presented in 7.5, i.e. fuel switching, energy efficiency, ccs, RE and nuclear. | Rejected 7.10 is on barriers and adopting structure along technologies won't work. The focus on RE is justified because the barriers are high for RE. |
| 3159 | 7 | 64 | 1 | | | Section 7.10 deals with barriers issues that are already discussed, for example, in chapter 3. TSU needs to advise on where barriers should be addressed. Here I repeat a comment I made in chapter 6: "BECCS plays a huge role in the IAMs that can meet goals like 2 degrees. Given that, why not use BECCS as a case study/box in chapter 3 since that would help tie together the issues discussed there with the large role that is assumed for BECCS in some scenarios." | Noted. |
| 11951 | 7 | 64 | 3 | | | Where is economic? And using etc. is very sloppy - makes it seem as is the authors are looking for filler material, when they are already over the limit given by a great deal. And why is physical here in the title since it does not have a section of its own? | Taken into account - economic aspects are discussed in an own chapter (7.8). The things that are mentioned in the title do not necessarily require an own |
| 4461 | 7 | 64 | | 65 | | This section repeats a number of barriers already discussed, including capital cost investment and uncertainty | Noted. This subsection has been revised focusing more on investments. |
| 3456 | 7 | 64 | 33 | 64 | 38 | Among the barriers should be mentioned the existance of regulatory barriers to allow consumers to introduce and sell electricity into the elecitrcity grids | Accepted. Rephrased. This subsection has been revised focusing more on |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 15492 | 7 | 64 | 33 | 65 | 32 | Financial barriers and investment barriers and opportunities - Quote (even if this point will probably be treated elsewhere, financial solution combining "mix of technologies with special bank condition" (for example the French Zero per cent loan) | Noted. |
| 15493 | 7 | 64 | 33 | 65 | 32 | Financial barriers and investment barriers and opportunities - Introduce citizen's initiative (such as energy cooperative) to support local investment in RES – wind for example) | Taken into account. Because of space limitation, the suggestion is not explicitly |
| 17945 | 7 | 64 | 39 | 65 | 8 | It is of crucial importance to specify which concepts of cost underlies the claims in this paragraph. Instead of referencing UNFCCC and ADB, the SRREN would provide a much more natural reference with slightly different key messages on the cost side. The numbers of investment in renewable energy are also more recent than the year 2007. | Noted. The sentence has been deleted |
| 2588 | 7 | 65 | 12 | 65 | 17 | Personally, I strongly believe that the introduction of Feed In tariffs "mechanisms" is a participatory approach for developing renewable energy? Such mechanisms would also increase environment awarness among population | Noted. The paragraph has been deleted. |
| 2846 | 7 | 65 | 12 | 65 | 17 | This offers only an incomplete checklist. More detailed analysis is needed of the problem of mobilising investment, drawing attention to the scale of the problem, the capital intensiveness and consequent riskiness of low carbon sources, and the uncertainty facing investors and showing how these can be overcome. | Very important comments, but because of the space limitation, a detailed explanation cannot be done. |
| 10002 | 7 | 65 | 12 | 65 | 17 | This part should be revised to explain that "voluntary target scheme" can be more effective for development of low carbon energy, compared to other mitigation policies such as carbon tax, emission trading, and FIT. There are successful examples of "voluntary target scheme" in the world. Each industry in Japan has voluntary target and the voluntary target scheme has played a big role, as described in (Yamaguchi, 2012, page35 and 154), (Manuel, 2010, page 6 and 13), and (Yamaguchi, 2010, abstract). In addition, there is also a successful example of "voluntary target scheme" in Netherlands, as shown in (Martijin, 2002, page162). These literatures are listed in the No63 line of this table.<br>On the other hand, market-based mechanism such as emission trading has several problems. Volatility of emission permit prices affects volatility of product prices as evidenced by fluctuating price developments in the EU-ETS. Therefore, the market-based policy tools of cap-and-trade cannot provide credible incentives for the technological change, as described in (Montgomery, 2005, abstract) and (Baldursson, 2009, page29). These literatures are listed in the No62 line of this table.<br>In addition, CO2 leakage caused by the implementation of the ETS happened actually through international transfer of industry , as shown in (Rosendahl, 2011, abstract), (Aichele, 2012, page336), and (Peters, 2011, page1). These literatures are listed in the No50 line of this table. | See 15.5.5 for voluntary scheme. |
| 9374 | 7 | 65 | 12 | 65 | 17 | Voluntary action policy also plays an important role in implementing low carbon energy system therefore should be added as one of the options. | Taken into account. Added. |
| 18101 | 7 | 65 | 15 | 65 | 15 | replace "feed-in tariffs" with "support mechanisms" (feed-in tariffs are one of several types, as stated elsewhere). | Noted. The paragraph has been deleted. |
| 16132 | 7 | 65 | 18 | 65 | 22 | The example of the CDM should be taken with more distance, because too large a share of the mechanism has been allocated to futile or fraudulent cases (i.e. production-destruction of specialty chemicals with N2O "abatement") with a limited share in actual technology transfer with local benefits. A more sober introduction is in order, for example "[The best examples in] the CDM show that such mechanism can work effectively... | Taken into consideration. The paragraph on CDM is deleted. CDM issues are covered in other sections, e.g. Section 4.3.8, Section 7.12 and Section 14.3 |
| 15356 | 7 | 65 | 18 | 65 | 32 | The passage gives the impression of effectiveness of CDM across developing countries however looking at the countries that have benefited from CDM, the statement cannot be made cross cuttingly as e.g. Africa has a very low CDM success rate due to issues related to methodologies, grid emission factors and high transactional costs. These are issues worth highlighting as on line 28 reference to the need for further efforts to alleviate poverty while addressing climate change would better be phrased/captured by indicating need for further "effort and support" | Taken into consideration. The paragraph on CDM is deleted. CDM issues are covered in other sections, e.g. Section 4.3.8, Section 7.12 and Section 14.3 |

|---|---|---|---|---|---|---|---|
| 11773 | 7 | 65 | 18 | 65 | 22 | CDM doesn't necessarily work well. Rosendahl et al. shows that overall leakage typically will be positive and sizeable, thus leading to an overall increase in global GHG emissions when CDM projects are undertaken. These sentense should be deleted.<br>1. Rosendahl et al.:[Carbon Leakage from the Clean Development Mechanism. Energy Journal], send attachment by another e-mail. | Taken into consideration. The paragraph on CDM is deleted. CDM issues are covered in other sections, e.g. Section 4.3.8, Section 7.12 and Section 14.3 |
| 15494 | 7 | 65 | 18 | 65 | 22 | Delete this part and refer to the forthcoming chapter 7.11.2 GHG pricing policies OR Give figures about geographical repartition and technological repartition. Suggest comparison China with African countries (cross comparison – Geographic-technology). Many reports on this issue (RISOE, UNEP…). Otherwise quote that this part will be completed with a specific chapter later | Taken into account. The part was deleted. |
| 9375 | 7 | 65 | 18 | 65 | 22 | It should also mention the challenges that CDM mechanism faces such as overconcentration of project types and project host countries. There is also an analysis that overall increase in global GHG emissions with CDM projects undertaking.(Rosendahl,K.E, J.Strand, 2011). | Taken into account. This paragraph is deleted. CDM issues are covered in other sections, e.g. Section 7.12 and |
| 5959 | 7 | 65 | 28 | 32 | | It has previsouly been identified that most RE technologies involve high capital cost. This makes them unnatractive to least developed countries. Lack of energy capital stock can only provide an opportunity for low carbon investments if extensive external support mechnaisms are put in place | Noted. |
| 16860 | 7 | 65 | 35 | | | Climate policy does not mean the energy system must be or should be renewable energy sources only -- rather, economic modeling suggest that that the lowest costs approach is focused on low emitting energy technologies. Renewables only is possible, but incurs much higher costs than a system that is open to other technologies. See chapter 6. | Taken into consideration. We are saying large penetration of RE and NOT ONLY RES. We included low emitting energy technologies after checking with |
| 10087 | 7 | 65 | 7 | | 8 | 2011 Figures are $ 263 billion . A regular update is encouraged. (source: BNEF) | Accepted. Updated. |
| 18100 | 7 | 65 | 9 | 65 | 11 | Delete paragraph. Onshore wind cannot be considered "high risk". Offshore wind perhaps, as well as coal or gas with CCS, nuclear, ocean energy, solar thermal. | Noted. The paragraph has been deleted. |
| 10057 | 7 | 65 | 1 | 65 | 11 | outdated sources, newer publications are available such as Global Renewable Status Report 2012 /REN 21 | Noted. The paragraph has been deleted. |
| 17946 | 7 | 65 | 11 | | | It is not clear what 'early stages' is supposed to mean here. If this is targetted at the stage of innovation, the reference would need to be more rencent than 2009, since wind energy technology is rapidly maturing. | Taken into account. The sentence is deleted. |
| 17947 | 7 | 65 | 12 | 65 | 17 | The policy recommendations provided here rather belong to the policy section and do not consitute a comprehensive assessment of various policy options. | Deleted. |
| 15066 | 7 | 65 | 18 | 65 | 22 | Many literatures have found that substantial share of the CDM projects actually do not have "additionality". See, for example, L.Schneider (2009), "Assessing the additionality of CDM projects: practical experiences and lessons learned", Climate Policy, 9(3) pp.242–254; S. Ferrey (2011), "Can the CDM catalyze renewable energy?" in Mehling et al. (eds), Improving the Clean Developing Mechanism: Options and Challenges Post-2012, Lexxion, Berlin; M. Bogner and L. Schneider (2011), "Is the CDM changing investment trends in developing countries or crediting Business-as-Usual?: A case study on the power sector in China, in Mehling et al. (eds), Improving the Clean Developing Mechanism: Options and Challenges Post-2012, Lexxion, Berlin; J. Zhang and C. Wang(2012). "Co-benefits and additionality of the clean development mechanism: An empirical analysis", Journal of Environmental Economics and Management, Vol.62, pp.140–154. Therefore, in my view, it is not appropriate to conclude immediately that CDM has worked effectively to deploy low carbon energy technologies in the developing countries as stated in the present text. It is really no matter how many tons of CO2 have been issued as CERs, since they are likely to be just "Business-as-usual" of GHG reductions if they are non-additional projects found by the above literatures. | Taken into consideration. The paragraph on CDM is deleted. CDM issues are covered in other sections, e.g. Section 4.3.8, Section 7.12 and Section 14.3 |
| 17948 | 7 | 65 | 28 | 65 | 29 | This sentence should provide a cross-reference to Chapter 4 that is supposed to frame all SD discussions in WGIII AR5. | Taken into account. The sentence has been deleted. |
| 6552 | 7 | 65 | 7 | | 8 | Firstly, "148.4 billion" instead of "184.4 billion" is correct. Secondly, add a conditional clause to "more investments are required to stabilize climate change", as the Stern Review, cited by UNEP (2008a), only gives the cost for stabilizing at 550 ppm CO2-eq. | Taken into consideration. Rephrased. Data is updated. |

|---|---|---|---|---|---|---|---|
| 3457 | 7 | 65 | 34 | 66 | 37 | Among the barriers mentioned, it should be included those regarding behavioural change on rational use of energy in developing countries as well as it should be mentioned the need to change high energy consumption style of life in countries like USA | Accepted. Behavioural aspects in high consumption countries is included |
| 15495 | 7 | 66 | 10 | 66 | 11 | Delete « not because they are a poor alternative to fossil fuels » as this is simply not true. | Taken into account. The focus of the perception is the lack of understanding why the technologies may be needed |
| 15496 | 7 | 66 | 15 | | | Not sure to get the good understanding of “free access” explanation - Rewording may be necessary? | Accepted. Rewording is done: "For instance cooking fuels particularly firewood is widely used in rural areas because it is a suitable fuel for these communities in addition to its access |
| 16862 | 7 | 66 | 18 | | 24 | Suggest delete. The policy in question is concerned with climate and CO2 emissions. Sustainability is not well defined or broadly understood. | Accepted. suggest to delete line 18 to avoid further text on definition of |
| 17378 | 7 | 66 | 22 | | | and implementation of energy policies | Noted |
| 16861 | 7 | 66 | 8 | | 12 | This sounds like a stereotype and patronizing. It may also be they simply want reliable energy and may not be convinced of the reliability or durability of these new systems. It may also be that they think these systems are more costly, or that it is easier to find technicians or parts when systems fail if they have older, more conventional technology. | Accepted. These considerations were included. |
| 10003 | 7 | 66 | 8 | 66 | 12 | This part should explain that wind power and photovoltaic are not suitable for alternating fossil fuel firing power plants in terms of supply stability and electricity quantity, as described in (DeCarolis, 2006, page 395 and 403). This literature is listed in the No26 line of this table. | Taken into consideration. The whole paragraph need to be reconsidered. Need to find better argument |
| 17949 | 7 | 66 | 1 | 66 | 7 | These claims would need to be substantiated by references; I recommend to cross-reference to the discussions in the SRREN where these issues were assessed at length in chapters 8 and 9 and the assessed references therin. | Accepted. Chapter 8 and 9 are considered |
| 17950 | 7 | 66 | 13 | 66 | 24 | Again, these results would need to be substantiated by references, e.g. SRREN chapters 9 and 11 and the assessed references therin. | Accepted. |
| 10058 | 7 | 66 | 38 | 67 | 26 | outdated sources, newer publications are available such as Global Renewable Status Report 2012 /REN 21 and Energy [R]evolution June 2012 | Rejected. Sources are not outdated. However lines 18-24 are modified after |
| 9478 | 7 | 67 | 10 | 67 | 14 | When employment effects of renewable energy is considered, not only direct effects of the renewable investment, but also broad and long effects on the economy should be counted.<br>Hillebrand et al. published a study about the renewable energies' expansion beginning in 2004 and employment effects in Germany [1] . They note that they distinguish two effects: (1) an expansive effect resulting from additional investments and (2) a contractive effect resulting from an increase in the production cost of power. The first effect will dominate during the first years and lead to an increase in employment of approximately 33,000 new jobs. However, the contractive effect will offset these gains and lead to a slightly negative employment balance by 2010.<br>[1] B. Hillebrand et al. (2006) The expansion of renewable energies and employment effects in Germany, Energy Policy 34,<br>[1] page 3484, Abstract lines 5-8. | Taken into consideration. Most of the comments to this section are focused around the issue of the net employment benefits of investment in RES systems. I agree that there are both positive (direct) and negative (indirect) employment effects. Although, in absolute terms, the number of jobs created by RES may not be that high, the direct employment effects associated to renewable energy deployment is the most significant contribution to local sustainability and the need for human capacity |
| 10089 | 7 | 67 | 10 | | | Employment in 2011 in the RE sector was estimated at 5 million jobs (REN21 2012)<br>A sentence like: "Employment more than doubled from 2.3 million in 2006 to 5 million in 2011"could be added. | Accepted. Good suggestion as it would be helpful to show the trend |

| 10004 | 7 | 67 | 10 | 67 | 14 | This part should include the employment effect of nuclear power. There are many job opportunities relating to nuclear power in the world and those will increase potentially in future, as described in (M. Wei, 2010, page922, Table2).<br><br><Reference><br>[1] M. Wei et al. (2010). Putting renewables and energy efficiency to work: How many jobs can the clean energy industry generate in the US? Energy Policy 38. | Taken into consideration. Most of the comments to this section are focused around the issue of the net employment benefits of investment in RES systems. I agree that there are both positive (direct) and negative (indirect) employment effects. Although, in absolute terms, the number of jobs created by RES may not be that high, the direct employment effects associated to renewable energy deployment is the most significant contribution to local sustainability and the need for human capacity |
| 9608 | 7 | 67 | 12 | 67 | 14 | Please, discuss here from a positive and a negative side by using following information;.many of the claims regarding the positive employment effects of renewable energy introduction only count the direct effects of the renewable investment, without taking into account the broader effects on the economy as a whole. Several studies have indicated that the creation of “green jobs” leads to destruction of jobs in other sectors of the economy. For example, in a peer-reviewed study on the economic impacts of renewable expansion beginning in 2004 in Germany (Europe’s largest economy) Hillebrand et al. found that [1] there are two effects: (1) an expansive effect resulting from additional investments and (2) a contractive effect resulting from an increase in the production cost of power. The first effect will dominate during the first years and lead to an increase in employment of approximately 33,000 new jobs. However, the contractive effect will offset these gains and lead to a slightly negative employment balance by 2010.<br>[1] B. Hillebrand et al. (2006) The expansion of renewable energies and employment effects in Germany, Energy Policy 34,<br>See downloaded file “Hillebrand Buttermann 2006.pdf” | Taken into consideration. Most of the comments to this section are focused around the issue of the net employment benefits of investment in RES systems. I agree that there are both positive (direct) and negative (indirect) employment effects. Although, in absolute terms, the number of jobs created by RES may not be that high, the direct employment effects associated to renewable energy deployment is the most significant contribution to local sustainability and the need for human capacity development is there, which is the |
| 16864 | 7 | 67 | 21 | | 26 | The issue of lack of human capital or skilled labor is true for non-climate policies as well. This problem is not unique to climate mitigation -- highlighting it in the context of this document makes the climate task seem even harder. I believe it is not helpful to policymakers. Those who will deploy the tech will deal with this problem at the proper time. | Taken into consideration. I agree that this issue is not unique to climate mitigation and that a well functioning market should help correct any imbalance over time. In the US there is a TV program on the "Weather Channel" that is about how the wind industry is growing so fast that people from other industries are being trained to construct |
| 10090 | 7 | 67 | 28 | | 35 | To stop in 2009 is missleading because the rapid development of RES power generating capacitis over the last years is neglected. Power market share of renewables from 2000 to 2010 including Hydro was 26% [Greenpeace, Energy [r]evolution, 4th edition 2012 world energy scenario]. In 2010 and 2011 almost 50% and 40% respectively of new power capacities were renewable, increasing the renwable capacities to 1,360 GW (390 GW without Hydro) at the end of 2011 [Ren21 2012]. In addition, the figures for retired high carbon power plant capacities should be given as well.<br>The conclusion could be that despite the fact that there is still massive investments in high carbon stock, the situation is changing gradually and there is a huge potential for low carbon tachnologies replaing the 1,266 GW of fossil caapcity which is scheduled to retire in the next 25 yaers [IEA 2011a]. | Taken into account - the latest year available (2010) for recent investments has been updated and discussed. However it is extremely problematic to get data on retired power plant, which is further complicated given many old plant are mothballed for possible restart. |
| 5960 | 7 | 67 | 29 | | | Clarity: there is greater certainty regarding effective carbon lock-in than is stated | Taken into Account - the effectiveness of lock-in due to energy investments has |

| 9663 | 7 | 67 | 6 | | 14 | No mention is made of the capacity building, employment etc in the fossil fuel industries. A comparison between the industries should be given. How many jobs etc would be lost with the downscalng of the fossil fuel industry in relation to the opportunities provided by the RE industry? | Taken into consideration. A balanced treatment of employment in fossil fuel industries and RE industries is attempted. The new paragraph says: "Renewable energy has a high potential for direct employment generation, including R&D, engineering, consultancy, auditing, quality control, and installation and maintenance. Although there are some reports indicating that large scale renewable energy deployment could have offsetting effects on the conventional energy sector and the overall economy, resulting in net job losses (Hillebrand et al., 2006; Frondel et al., 2010), several studies report net positive employment effects (Lehra et al., 2008; del Rio and Burguillo, 2009). In developing |
| 10088 | 7 | 67 | 6 | | | insert "local" in front of employment | Noted |
| 2847 | 7 | 67 | 6 | | | Should also mention that the employment benefits have been disputed – eg Hillebrand et al Energy Policy Vol 34 issue 18 p 3484-94 for Germany; http://www.juandemariana.org/pdf/090327-employment-public-aid-renewable.pdf for Spain. Again the authors may not agree with these studies but balance requires that they acknowledge them. | Accepted, in similar vein to line 105, 107-109 |
| 16863 | 7 | 67 | 6 | | 20 | If you replace renewable section with "low CO2 emitting technologies" you would be able to shorten this section. | Noted |
| 10663 | 7 | 67 | 6 | 67 | 14 | It should be shown to what type of energy renewable energy potential for employment is better. There is the case a number of jobs lost because of the too much subsidies. See " Study of the effects on employment of public aid to renewable energy sources" by Calzada et al. | Taken into consideration. Most of the comments to this section are focused around the issue of the net employment benefits of investment in RES systems. I agree that there are both positive (direct) and negative (indirect) employment effects. Although, in absolute terms, the number of jobs created by RES may not be that high, the direct employment effects associated to renewable energy deployment is the most significant contribution to local sustainability and the need for human capacity |
| 4654 | 7 | 67 | 6 | 67 | 11 | “RE has a high potential for employment generation ---“. Line 10/11 “Globally, it is estimated that in 2006 more than 2.3 million people were employed in the RE sector; about half of which in biomass ---“. Not only does RE have a high potential for employment generation it already does. The employment in existing fuelwood, charcoal and residue trading has been completely ignored. From my work in various countries, especially Malawi, I estimated that about 30 million people are employed (full time equivalent and many more part-time) in growing, production, transport and trade of biomass energy, of which about 77% are rurally based. (Openshaw, K. 2010a). If poverty alleviation is a goal, then this should be encouraged. | Accepted. Will be included to the additional references that will be cited as mentioned in line 105. |
| 3802 | 7 | 67 | 7 | 67 | 7 | Replace "auditoring" by "auditing". | Noted |

|---|---|---|---|---|---|---|---|
| 18548 | 7 | 68 | | | | This section has a very clear description of policy mechanisms and how they relate to and address market failures. However, a lot of this is already covered in the policy chapters. As such, the section could be shortened to focus more strictly on energy - ideally linking more directly to the energy options outlined in the AR4 and in Section 7.12 of this chapter on p. 85, fuel switching, ee, RE and CCS. | Taken into account - the description of the instruments and their economic justification is left to the policy chapter (13- 15). |
| 3160 | 7 | 68 | 10 | | | section 7.11 deals with policy choice, but those issues are addressed in many places in the WG3. I suggest TSU advise on how to consolidate. | Taken into account - the description of the instruments and their economic justification is left to the policy chapter |
| 11952 | 7 | 68 | 14 | | | "nature of instruments" is very vague. What is actually discussed in 7.11.1 is RD&D investments. In truth the following paragraph is a better description. Suggest dropping this paragraph. | Taken into account - text revised. |
| 13219 | 7 | 68 | 28 | 69 | 24 | The discussion that is not specific for the power sector could perhaps be integrated in chapter 15.6, and the focus of this section be dedicated on the aspects RD&D policies specific to the power sector. In particular (i) public and private actors have similar level of information and similar priorities about the overall needs for technology thus facilitating a public policy (ii) more homogeneous nature of product limits the ability to price discriminate and charge premium for new technologies (see e.g. 44. Neuhoff, K., 2005, Large-scale deployment of renewables for electricity generation, Oxford Review of Economic Policy, 21 (1), p. 88-110). | Taken into account - the description of the instruments and their economic justification is left to the policy chapter (13- 15). |
| 6553 | 7 | 68 | 31 | | 32 | Give a reference paper for the description "carbon emissions to ultimately peak and decline toward zero for any stabilization concentration". | Taken into account - the text of the paragraph has been deleted as a result of suggestions to restructure the entire |
| 14546 | 7 | 69 | 1 | 69 | 7 | This is a very insightful paragraph. We have an opportunity to use the Green Climate Fund for the public good. A significant portion should be devoted to R&D to transform RE technologies that are not yet economicaly viable into viable one, instead of being divided up among many countries for small projects. | Taken into account - the text of the paragraph has been deleted as a result of suggestions to restructure the entire |
| 9609 | 7 | 69 | 11 | 69 | 15 | Please, check figure 1.1 as the reference of Tracking Claen Energy Progress as the trend of graph starts to increase from 1999, not the release of AR4. Of importance is global public energy sector RD&D spending remains a small share of total RD&D budgets and spending levels have seen a recent decrease from peak spending in 2009. (IEA, 2012b p.13) | Accepted - text revised. |
| 10091 | 7 | 69 | 16 | | 18 | The Battele Institute publishes annualy the Global R&D Funding Forecast (2012: http://www.battelle.org/aboutus/rd/2012.pdf). There the figures from the pat and current forecasts are given: Industrial R&D in the energy sector comprises a broad portfolio of technologies, including fossil, nuclear, and renewable generation; smart grid or other transmission and distribution; and energy-efficiency technologies. Worldwide spending on energy R&D is forecasted to increase by roughly 10% from $ 15 billion in 2010 to $ 17.9 billion in 2012. | Noted - the comment confirms the assessment that private R&D expenditures are a large share of the overall R&D spending. |
| 18103 | 7 | 69 | 21 | 69 | 24 | Delete paragraph. This holds for all technologies that have reached commercialisation. Alternatively add "nuclear, coal and gas" which have received (and still does) far higher government R&D funding than PV and wind or other renewables. | Accepted - text revised. |
| 5937 | 7 | 69 | 25 | | | It is peculiar not to mention the practical drawbacks of tax policies to price GHG emissions, while discussing EP extensively. To name one obvious drawback, taxes are often set in annual budgets, which introduces a very clear political risk. | Taken into account - The comment is obsolete as the underlying text has been deleted. |
| 9610 | 7 | 69 | 26 | 70 | 8 | Please, move here to somewhere in chapter 13 to 15 as this part consists of general idea of pricing policy. | Taken into account. The first paragraph has been removed as suggested. The second paragraph is related to the |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 6200 | 7 | 69 | 30 | 69 | 34 | "Tax regimes fix the tax rate and allow markets to determine emissions, while EP regimes fix emissions and allow markets to determine the EP price. In a world with certainty it is a matter of indifference which approach is taken as both can be implemented so as to deliver the same distribution of economic activates in the economy. However, the two policy instruments differ importantly in their implications for income distribution." the first two sentences are important points, highlighting the concept that the two approaches can be designed to achieve the same effect in a world of certainty. However, the third sentence discusses differences, suggesting that these differences are inherent. Both cannot be true at the same time. the differences in income distribution need not be inherent, but arise from choices in implementation, specifically whether and how permits are freely distributed. | Taken into account. The comment is obsolete as the underlying text has been deleted. |
| 15545 | 7 | 69 | 41 | | | As well as Weitzman, Pizer has written key articles on this issue e.g. Pizer, WA (2002). 'Combining price and quantity controls to mitigate global climate change,' Journal of Public Economics, Vol 85, pages 409–434; Pizer, WA (1997). 'Prices vs. Quantities Revisited: The Case of Climate Change' Discussion Paper 98-02, Resources for the Future, Washington DC. W. Nordhaus and G. Metcalf have also written extensively on the advantages of taxes over cap and trade. A different view is reflected in the Stern Review (2007). | Taken into account. The comment is obsolete as the underlying text has been deleted. |
| 15480 | 7 | 69 | 41 | 69 | 42 | The citation to Weitzman is too absolute - the 1974 paper showed that the balance of advantage depends on the relative slope of the marginal damage and the marginal cost of abatement - subsequent papers summarised in Hepburn (2009) in Eds Helm and Hepburn "The Economics and Politics of Climate Change" OUP show that this will normally imply taxes are the best choice for carbon, but Hepburn points out that this is NOT inevitable. Weitzman 2007 is irrelevant here. | Taken into account. The comment is obsolete as the underlying text has been deleted. |
| 15544 | 7 | 69 | 25 | | | Should this discussion be here or in Ch 15, on Policy Instruments? Is there a danger of repetition? | Taken into account. The text has been deleted as it refers to general aspects of policies which are discussed in Chapter |
| 13220 | 7 | 69 | 25 | 72 | 11 | A closer coordination with chapter 15 section 5.4 could help to reduce overall length of report. (Have not been involved in discussions, so not clear what arguments for discussion of CDM in chapter 7 rather than 15.). | Taken into account -overlaps between this section and chapter 15 - 17 has been removed as far as possible and |
| 15497 | 7 | 69 | 25 | 72 | 8 | GHG pricing policies – Too long – Recommend to create at least 3 sub chapters – (1) General items & (2) ETS and others trading schemes & (3) Flexible mechanisms and NMM New Markets Mechanisms | Taken into account - The text has been reduced and structured as suggested |
| 15498 | 7 | 69 | 25 | 72 | 8 | Add a special item somewhere on NAMA, NMM and MRV requirements | Rejected- space restrictions do not allow for these extensions. The related instruments are discussed in chapter 15. |
| 2848 | 7 | 69 | 26 | 72 | 8 | This section is longer and more theoretical than needed and it overstates the impact of carbon trading – see below. | Taken into account - The section has been shortened. The impact of carbon |
| 10955 | 7 | 69 | 41 | 69 | 42 | Imprecise; depends on type of uncertainty. Weitzman (1974) shows that tax is best choice if mitigation cost uncertainty is more important than uncertainty w.r.t. impacts of human-induced climate change. | Taken into account. The comment is obsolete as the underlying text has been |
| 4777 | 7 | 7 | 1 | 7 | 8 | I support this statement. On request I can provide a box explaining the hydropower sustainable assessment protocol, published by IHA, and developed with NGOs, Governments, Banks, utilities, etc. | Noted - unfortunately space constraints do not allow for a detailed discussion of |
| 2940 | 7 | 7 | 11 | 7 | 16 | It is good to see these key conclusions so strongly expressed. I agree strongly that the evidence is strong that "Transition to low GHG concentrations will NOT be achieved by current energy investments nor simple evolution of business-as-usual..." and that "Strong policy support of low carbon energy supply options will be necessary to achieve this goal , [which requires] energy-related GHG emissions to peak by 2020". | Noted. |
| 13035 | 7 | 7 | 12 | 7 | 12 | suggest adding the word "levels" after the phrase "current energy investments" so that the sentence reads: "Transition to low GHG concentrations will not be achieved by current energy investment levels nor simple evolution of business-as-usual of energy supply systems." Without this, the sentence implies that current investments in specific projects will have no impact. | Taken into account - comment is obsolete as the underlying text has been deleted. |

|---|---|---|---|---|---|---|---|
| 17204 | 7 | 7 | 13 | | | The lock-in of emissions is ignoring the possiblity of early retirement of existing capital stocks. This is an economically meaningful option that is realized if CO2 prices increase the variable costs so that the continuation of the operation of the plant makes losses. So far, there are no publications on the issue, but they are in the making. | Taken into account - comment is obsolete as the underlying text has been deleted. |
| 15541 | 7 | 7 | 13 | | 14 | This depends on scrapping and depreciation rates, which are not purely technologically determined. | Taken into account - comment is obsolete as the underlying text has been |
| 6794 | 7 | 7 | 13 | 7 | 15 | "Existing energy-related capital stock has already locked in 80% of the permissible 2035 CO2 emissions under a 450ppm CO2eq stabilization scenarios [7.12, high agreement; robust evidence]." I have two concerns with this. First, capital stock should not be considered "locked in." The cost of replacing this stock is less than the cost of addressing the climate change damage resulting from it. When we finally enact carbon pricing, the cost of coal electricity will go up. US utilities have already idled coal plants to operate cheaper natural gas plants. We can't afford to "lock in" climate change damage. Second, there is little scientific evidence that stabilization at 450 ppm will prevent unacceptable consequences. It is more likely that we will need to eventually reduce atmospheric CO2 to lower levels. (James Hansen's 350 target is more scientifically defensible, in my opinion.) The IPCC goals should be re-evaluated in light of the latest scientific results based on measurements, model results, and paleoclimate studies.The goals should be based on science and not based on what is (or was) believed to be politically and socially achievable. I realize this is a Working Group I decision, but I think it is entirely appropriate for members of Working Group III to advocate for a more scientifically-based goal, because that goal has an enormous impact on the solution strategy, both in terms of its content and the required speed of implementation. | Taken into account - the first comment is obsolete as the underlying text has been deleted. The second comment on the rationale behind the 450 ppm stabilization level is outside of the scope of WGIII. It is to be inferred by considerations that have to come from IPCC WG I and IPCC WG II. WG III does not advocate for any stabilization level. It simply investigates the implication of some of these levels. As statements of the IPCC have to be policy relevant (but not prescriptive), the 450 ppm level which is broadly consistent with the Cancun Agreement |
| 6223 | 7 | 7 | 13 | 7 | 15 | This does not take into account the possibility of retrofitting CCS | Taken into account - comment is obsolete as the underlying text has been |
| 18180 | 7 | 7 | 15 | | 20 | Comment: Strong policy support of low-carbon energy supply options will be necessary to achieve this goal requiring energy related GHG emissions to peak already by 2020 [7.12, high agreement; robust evidence]. Energy policies consistent with ambitious long-term greenhouse gas concentration levels, such as are described in Chapter 6, are not observed in most of the world at present, though governments have pledged to reduce emissions in line with the Copenhagen Accord [7.3. and 7.12, high agreement; robust evidence]. Comment: Again the Copenhagen accord is referenced as if it were a formal and official document of the UNFCCC, and the Bolivarian Republic of Venezuela expressed herein public rejection. COP-15 took notes of this document. | Taken into account - Copenhagen Accord is replaced by Cancun Agreement. |
| 18181 | 7 | 7 | 15 | | 20 | Alternative paragraph: Strong policy support of low-carbon energy supply options will be necessary to achieve this goal requiring energy related GHG emissions to peak already by 2020 [7.12, high agreement; robust evidence]. Energy policies consistent with ambitious long-term greenhouse gas concentration levels, such as are described in Chapter 6. | Taken into account - Copenhagen Accord is replaced by Cancun Agreement. |
| 6545 | 7 | 7 | 15 | | 16 | Replace "will be necessary to achieve this goal requiring" with e.g. "will be necessary if this goal is to be achieved, which requires", as "this goal" has not been agreed on globally. | Taken into account - although the Cancun Agreement is legally binding the statement has been rephrased in order |
| 7725 | 7 | 7 | 17 | 7 | 20 | Suggest replace "Copenhagen Accord" by "Kyoto Protocol". | Rejected - what is meant is the 2°C goal. The Copenhagen Accord is |
| 7851 | 7 | 7 | 19 | 7 | 20 | The statement that governments have pledged to reduce emissions in line with the Copenhagen Accord is ambigous and lacks clarity because the pledges do not match with the 2 degrees goal agreed in Copenhagen. A more appropriate langauge would be to say: .., though governments have pledged to reduce emissions as part of the Copenhagen Accord. It is suggested to add: However, those pledges fall short to meet the 2 degrees goal and might result in a temperature increase above 3 degrees C. | Taken into account - text has been deleted. Comment is obsolete. |
| 15759 | 7 | 7 | 2 | | | what are "benefit sharing mechanisms"? | Noted - benefit sharing provides money to those who are affected by additional |

| 5941 | 7 | 7 | 20 | | | The Summary should note, as per Chapter 7.12 and otyher studies (EURELECTRIC (2009), Power Choices: Pathways to a Carbon Neutral Electricty in Europe by 2050. Avaialble at www.eurelectric.org ) the decarbonsiation of electricity and eletrification of the transport and heating and cooling sectors, presents a cost optimised means of reducing emissions. | Taken into consideration - electrification now is discussed in detail in 7.11 (formerly 7.129. Space constraints however do not allow for a detailed |
| 2968 | 7 | 7 | 21 | | | In the introduction the system boundary of the energy system should be drawn. I suggest to focus on the power sector. | Accepted - a diagram now shows the system boundaries. |
| 6414 | 7 | 7 | 22 | 7 | 32 | I know that this is talking about big global issues, but this may be a place to introduce how the rapid expansion of hydraulic fracturing in the United States has also lead to large revisions or changes in the energy system. | Taken into account - comment is obsolete as the underlying text has been deleted. |
| 6165 | 7 | 7 | 22 | | | No parenthetical remarks in subject headings. | Accepted - text revised. |
| 18182 | 7 | 7 | 23 | | 32 | Add to paragraph: After relatively stable development in 2000-2005 (the period covered by the WG3 IPCC AR4) the global economic and energy systems entered times of high turbulence and uncertainty. Deep global economic recession of 2008-2009; extremely volatile energy prices; Arab Spring of 2011 with concerns on stability of oil supply from the Middle East and North Africa; devastating earthquake and tsunami in Japan, which remembered that a stable made the nuclear power future more uncertain; slow and uneven pace of global economy recovery impacted by the debt crisis in Europe and the USA, and finally breaking the tradition on consensus proposals for failure to reach binding agreement of GHG emission control in Copenhagen, and at following UNFCCC COPs meetings - all those events significantly altered both recent trends in energy systems developments and energy related GHG emissions, as well as assumptions for the projections and visions of the near and long-term future. | Taken into account - comment is obsolete as the underlying text has been deleted. |
| 18183 | 7 | 7 | 23 | | 32 | Alternative paragraph:<br>After a relatively stable development in 2000-2005 (the period covered by the WG3 IPCC AR4) the global economic and energy systems entered times of high turbulence and uncertainty. Deep global economic recession of 2008-2009; extremely volatile energy prices; Arab Spring of 2011 with concerns on stability of oil supply from the Middle East and North Africa; devastating earthquake and tsunami in Japan, which remembered that a stable nuclear power future more uncertain; slow and uneven pace of global economy recovery impacted by the debt crisis in Europe and the USA, and finally breaking the tradition on consensus proposals for GHG emission control in Copenhagen, and at following UNFCCC COPs meetings - all those events significantly altered both recent trends in energy systems developments and energy related GHG emissions, as well as assumptions for the projections and visions of the near and long-term future. | Taken into account - comment is obsolete as the underlying text has been deleted. |
| 10276 | 7 | 7 | 24 | 7 | 32 | The description of "finally failure to reach binding agreement of GHG emission control in Copenhagen" should be revised. The word "failure" should not be used. | Taken into account - comment is obsolete as the underlying text has been |
| 7726 | 7 | 7 | 28 | 7 | 29 | Hasn`t the certainty of the continuity of the Kyoto Protocol and the establishment of the commence of the second commitment period been taken into account? | Taken into account - comment is obsolete as the underlying text has been |
| 12030 | 7 | 7 | 30 | 7 | 31 | Not clear what this sentence wants to say. What are actually alterned significantly? Please present evidences. | Taken into account - comment is obsolete as the underlying text has been |
| 17202 | 7 | 7 | 33 | | | The authors cite CO2 emissions from IEA and Enerdata. This is an important issue in the international context because IEA and Enerdata do not collect these numbers from all countries, but derive them from the energy statistics by applying IPCC methods. The problem is simply that national CO2 statics lack in several countries. China is preparing national CO2 emission statistics, but has not yet published the figures by a governmental agency. International climate policies with binding targets at the national level require national statistics. The LCAs are recommended to discuss this issue and consider a special paragraph or a box on the topic. The same is obviously the case for non-CO2 GHG emissions. | Noted - the suggestion made by the reviewer is unclear. What are the suggestions? Not to use numbers? We use data available from different sources (see section 7.2). We do agree that data quality need improvement. Additional comments on these issues are made in |

|---|---|---|---|---|---|---|---|
| 18184 | 7 | 7 | 33 | | 45 | Add to paragraph: The global energy related CO2 emissions growth accelerated from 1,1% per year in 1990-2000 to 2,6% in 2001-2010, and 3% in 2011 (IEA, 2011a; Enerdata, 2012). This acceleration was mostly driven by emissions from non-Annex I countries, which in 2008 for the first time surpassed those of the Annex I countries, who managed to keep emissions since 2008 below 1990 levels (IEA, 2011a). The gap in per capita energy related CO2 emissions between Annex I and non-Annex I countries is still large, but shrunk from 6:1 to 3.7:1 in 2000-2009. Annex I countries are not any more at the top of CO2 emitting countries list. In 2007 China took the leading position in this list and in 2010 it emitted already 40% more than the second largest emitter – the USA. In 2009 it took over the USA the position of leading energy consuming nation, and in 2011 – position of the largest global electricity consumer (Enerdata, 2012). In 2010 India overcame the Russian Federation to become the third largest CO2 emitter position (IEA, 2011a). With such acceleration the global community is approaching the estimated no-return point for 450 ppmv like scenarios leaving little additional room for maneuver and scaling up the need to introduce zero- and low-carbon technologies (IEA, 2011a). | Taken into account - comment is obsolete as the underlying text has been deleted. |
| 18185 | 7 | 7 | 33 | | 45 | Alternative paragraph: The global energy related CO2 emissions growth accelerated from 1,1% per year in 1990-2000 to 2,6% in 2001-2010, and 3% in 2011 (IEA, 2011a; Enerdata, 2012). This acceleration was mostly driven by emissions from non-Annex I countries, which in 2008 for the first time surpassed those of the Annex I countries, who managed to keep emissions since 2008 below 1990 levels (IEA, 2011a). The gap in per capita energy related CO2 emissions between Annex I and non-Annex I countries is still large, but shrunk from 6:1 to 3.7:1 in 2000-2009. Annex I countries are not any more at the top of CO2 emitting countries list. In 2007 China took the leading position in this list and in 2010 it emitted already 40% more than the second largest emitter – the USA. In 2009 it took over the USA the position of leading energy consuming nation, and in 2011 – position of the largest global electricity consumer (Enerdata, 2012). | 15286 | 7 | 7 | 33 | 7 | 34 | “1,1%" and "2,6%" to be "1.1%" and "2.6%" | Accepted. Commas were replaced. |
| 4099 | 7 | 7 | 36 | 7 | 42 | This section is a nonsense, due to its complete overlooking of 'embedded emissions'. The transfer of manufacturing capacity from a number of industrialised nations since 1990, and their import of manufactured goods from countries such as China and India, have completely falsified emissions accounting on any intellectually honest basis. The USA, Germany, France, and the UK are clear examples. Thus instead of the UK claiming to have reduced its carbon emissions by over 20% since 1990, it has in fact increased them by over 20% once 'embedded emissions' are taken into account. | Taken into account - comment is obsolete as the underlying text has been deleted. |
| 2821 | 7 | 7 | 36 | 7 | 38 | This comment should perhaps point out (as on p 16) that the average is driven by the low emissions of ldcs. There is already a significant degree of overlap between Annex 1 and non-Annex 1 countries. For instance, in 2009 (IEA 2011c) per capita emissions in China, at 5.14t, were not that different from OECD Europe (6.85t). It is likely that China’s per capita emissions today are above, not just those of France (as noted on p 21 – it could have added Sweden and others) but above the OECD Europe average. | Taken into account - comment is obsolete as the underlying text has been deleted. |
| 9780 | 7 | 7 | 39 | 7 | 40 | suggest to delete"In 2007 China took the leading position in this list and in 2010 it emitted 40 already 40% more than the second largest emitter – the USA.",because there is no china emission data from 2007 to 2010 of GHG Data - UNFCCC, the china emission from IEA data is not The inventory data . | Taken into account - comment is obsolete as the underlying text has been deleted. |
| 17357 | 7 | 7 | 40 | 7 | 41 | it took over the position of leading energy from the USA, and in 2011 the position… | Taken into account - comment is obsolete as the underlying text has been |

| 6445 | 7 | 7 | 45 | 7 | 45 | Spelling error? manoeuver (not 'maneuver') | Taken into account - comment is obsolete as the underlying text has been |
| 18186 | 7 | 7 | 46 | | 48 | Add to paragraph: Chapter 7 is dealing with energy systems, which dominated global GHG emissions and includes activities on energy sourcing, conversion, storage, transmission and distribution to supply energy to downstream energy consumers. Technical complexity of energy systems is scaling up and involves more and more conversion and delivery stages, with increasing automation and "smart" control. They are designed to produce primary energy, to convert it into secondary energy carriers, store them and deliver to final users to provide energy services in forms allowing improving both the quality of life and overall economic productivity. | Taken into account - comment is obsolete as the underlying text has been deleted. |
| 18187 | 7 | 7 | 46 | | 48 | Alternative paragraph: Chapter 7 is dealing with energy systems, which dominated global GHG emissions and includes activities on energy sourcing, conversion, storage, transmission and distribution to supply energy to downstream energy consumers. Technical complexity of energy systems is scaling up and involves more and more conversion and delivery stages, with increasing automation and "smart" control. They are designed to produce primary energy, to convert it into secondary energy carriers, store them and deliver to final users to provide energy services in forms allowing improving both the quality of life and overall economic productivity. | Taken into account - comment is obsolete as the underlying text has been deleted. |
| 6166 | 7 | 7 | 46 | 7 | 46 | "Chapter 7 is dealing with energy systems". "Is dealing with" is poorly worded; "addressing" or "concerns" is better. | Accepted - text revised. |
| 6167 | 7 | 7 | 46 | 8 | 3 | The purpose of this paragraph is unclear. The first sentence seems like an introduction, and the final two are both vague and obvious. Cut. | Accepted - text revised. |
| 2939 | 7 | 7 | 46 | 8 | 3 | The inadequate discussion of this para (and of the first para of the chapter summary) suggests that "energy systems" in line 46 to the authors means "energy SUPPLY systems ", whereas the full energy SYSTEM to me is more like "well to wheels", i.e it includes how energy is used as well as how it is supplied. And in the phrase "energy [supply] systems includes [list of examples]" is this list meant to be comprehensive? Are there other aspects also included? In short this section is fails to clearly define the "boundaries of this chapter", and consequently of its relation to the other chapters on transport, buildings, industry , etc. | The scope of the chapter corresponds to definition of energy industries in the IPCC inventory Guidelines. It was made clearer. The boundaries of the system considered in chapter 7 now is explained by using a diagram. |
| 10493 | 7 | 7 | 47 | | | Throughout the chapter there is confusion over the definition of "energy sector" and what it includes. For example page 15 line 14 says energy sector is only electricity and heat - yet earlier in 7.1.1 it implies it includes some transport - up to distribution . The whole chapter needs to be checked for consistency in terminology. Suggest a small side-meeting at LAM3 | Accepted - a diagram now shows the system boundaries. |
| 16776 | 7 | 7 | 48 | | | Suggest delete sentence beginning with "Technical complexity of energy systems …" and replace with "The transformation of the energy system also provides the lowest costs opportunities for reducing CO2 emissions (chapter 6). | Taken into account - comment is obsolete as the underlying text has been deleted. |
| 4778 | 7 | 7 | 9 | 7 | 20 | Power system is a very long term business, which requires important amount of money. It is therefore important to have a long term vision, that is shared between all stakeholders, in order to provide confidence to investors and for theme to choose the best solution (climate/energy issue). | Noted. |

| 11546 | 7 | 70 | | | | This page is a mix of journal article-type text and quotations from the IEA. Please harmonize style, and make sure you understand what you want to say and why. Fig 7.19 is not well-explained and could be dropped as it is not essential. Better: drop figure, move caption to main text and provide appropriate references. This is what an assessment should do. | Taken into account - text revised. Figure 7.19 is deleted. |
| 10569 | 7 | 70 | 1 | 70 | 8 | Needs updating with references added | Taken into account. |
| 2849 | 7 | 70 | 14 | 70 | 18 | This is unbalanced. The studies cited do not justify the conclusion that GHG prices were effective in changing investment decisions. A more neutral summary of Ellerman et al 2010 said that it concludes that “the EU ETS did deliver operational changes, resulting in CO2 emission reductions of 3–5% during the pilot phase relative to a counter-factual without the ETS. The authors argue that it is too early to assess the additional impact on investment choices.” (Karsten Neuhoff: Reflections on implementing EU ETS, Climate Policy, 11:1). In any event the Ellerman studies relate to the pilot phase of the ETS (2005-2007) and events since then would cast doubt on whether the current scheme has even the minor impacts suggested for the pilot. | Taken into account - The text now distinguishes between operational choices and the impact on investments. |

|---|---|---|---|---|---|---|---|
| 16866 | 7 | 70 | 27 | | 32 | There are oversimplifications here -- a free allocation above the operator's lost value in a CO2 market can create windfalls -- so if a generating station has lost $5 of margin with at $10 CO2 price an allocation of 1/2 allowance based on historic emissions will help cover their losses, but will not result in a windfall. A 100% allocation to the emitter (as occurred in the EU) will result in some windfall though. Also, in regard to the free allocation removing the incentive to move to low carbon generation is inaccurate -- operators respond to opportunity cost too -- it may take some time for all of them to figure this out, but they do in fairly short order - those who don't eventually go out of business because they don't understand their own economics. In fact, operators, if allowed to, can sell their future allocations on the market and use the resulting funds to finance part of the investment in the new, low emitting technology. Insofar as allocations may very well be needed to make a cap and trade program politically acceptable, it is not helpful to mischaracterize some of these points and make it more difficult to enact policies. Please see some of the literature produced by Stavins on this topic. http://www.hks.harvard.edu/fs/rstavins/Papers/Stavins'_Article_on_US_Cap-and-Trade_for_Oxford_Review.pdf and http://www.hks.harvard.edu/fs/rstavins/Papers/Policy%20Instruments%20for%20Climate%20Change.pdf and http://www.hks.harvard.edu/fs/rstavins/Selected_Articles/Three-Part_Architecture_Paper_for_Yale_by_Stavins_Revsied.pdf and http://globalchange.mit.edu/files/document/MITJPSPGC_Rpt170.pdf | Taken into account - The comment is obsolete as the underlying text has been deleted. |
| 9611 | 7 | 70 | 28 | 70 | 29 | Please, explain more politely as it is unclear why in regulated systems it can also remove the incentive to move to low-carbon generation and it may be wrong. (IEA, economics of transition of the power sector) | Taken into account - The comment is obsolete as the underlying text has been |
| 10005 | 7 | 70 | 34 | | | This figure should explain that renewable energy does not always reduce the electricity price. The situation depends strongly on countries or areas. A higher reserve margin will result in more costly structure as a whole power system. This is because it is necessary to install additional equipments for power grid stabilization if variable power sources such as wind power or photovoltaic were installed into power grid, as described in (DeCarolis, 2006, page 395 and 403). This literature is listed in the No26 line of this table. | Taken into account - The comment is obsolete as the underlying figure has been deleted. |
| 5932 | 7 | 70 | 9 | | 32 | At the Nordic electricity market, so-called windfall profits for generators caused by ETS are very substantial, 2 billion (10^9) €/yr at the Nordic market at the CO2 price of 10 €/tonne. 50% of electricity at the market is hydropower and 20% is nuclear (both have low variable costs), and most of the time the marginal generation is coal-condensing. Removing free allocation would not remove this large transfer of money from consumers to the owners of hydro and nuclear. All of this hydro and nuclear has been built far before the EU ETS. Reference: M. Kara, S. Syri, A. Lehtilä, S. Helynen, V. Kekkonen, M. Ruska, J. Forsström, En Econ 30 (2008) 193 – 211. | Taken into account - a paragraph on the profits made by energy suppliers who run a portfolio of power plants is added. Space constraints, however, do not allow to go into the details. |
| 12550 | 7 | 71 | 14 | | | While some observers may still believe the Clean Development Mechanism is “fairly credible,” the UN's own special panel concludes that the CDM is “imperilled” for numerous reasons, and makes dozens of recommendations to rebuild programme integrity. Climate Change, Carbon Markets and the CDM: A Call to Action, Report of the High-Level Panel on the CDM Policy Dialogue, http://www.cdmpolicydialogue.org/report/rpt110912.pdf | Taken into account - The comment is obsolete as the underlying text has been deleted. |
| 5963 | 7 | 71 | 17 | | | The disucssion of CDM projects and distributions has limited relevance in this section | Taken into account - text revised. The energy related aspects are now |
| 16867 | 7 | 71 | 2 | | | Suggest inserting something like this after sentence ending with "new investments." This might be helpful: "However, investors must have confidence the market will be durable and will provide a growing CO2 price for the incentive to change investor technology choices." | Taken into account - the importance of long-term targets now is emphasized (see 7.12). |

| 13696 | 7 | 71 | 9 | 72 | 8 | Focus text on energy-related aspect of CDM and delete figures (general aspects of CDM as well as of its contribution to technology transfer are covered in Ch. 13 and 14). Use energy-specific CDM references such as Michaelowa, A., Hayashi, D., Marr, M. (2009): Challenges for energy efficiency improvement under the CDM—the case of energy-efficient lighting, in: Energy Efficiency, 2, p. 353-367; Lokey, E. (2009): Renewable energy project development under the Clean Development Mechanism: A guide for Latin America, Earthscan, London; Michaelowa, A.; Krey, M.; Butzengeiger, S. (2006): Clean Development Mechanism and Joint Implementation: New Instruments for Financing Renewable Energy Technologies, in: Assmann, D.; Laumanns, U.; Uh, D. (eds.): Renewable energy, Earthscan, London, p. 196-216. The CDM is a significant incentive for expansion of renewable energy (see e.g. Purohit and Michaelowa (2007) and Restuti and Michaelowa (2007) for the potential of bagasse cogeneration under the CDM in India and Indonesia.)" References: Purohit, P.; Michaelowa, A. (2007): CDM potential of bagasse cogeneration in India, in: Energy Policy, 35, p. 4779-4798; Restuti, D.; Michaelowa, A. (2007): The economic potential of bagasse cogeneration as CDM projects in Indonesia, in: Energy Policy, 35, p. 3952-3966. Update CDM data when finalizing AR5 as per the latest edition of UNEP Riso Centre: CDM pipeline, download at www.cdmpipeline.org. In case of interest, I'd be happy to draft a para of the role of the CDM in the energy sector as a contributing author. | Taken into account - text revised. |
| 15067 | 7 | 71 | 10 | 71 | 13 | This sentence is simply a re-written of what Art.12 of the Kyoto Protocol stated without any additional elements. Therefore, the references (Boyd et al., 2009; van der Gaast et al., 2009) in the present text are not needed here. | Taken into account - text has been deleted. |
| 3459 | 7 | 71 | 17 | 71 | 37 | I suggest to include some figure and comments regarding the contribution of CER in GHG reduction | Taken into account - the energy related aspects are now emphasized. |
| 15068 | 7 | 71 | 23 | 71 | 25 | The text says "but which delivered limited sustainable development benefits other than reduced GHGs". However, this seems to be an individual view which is expressed by a single paper (Gillenwater and Seres, 2011) without any formal discussions about what sustainable development benefits are. Under the current CDM process, each developing country hosting the CDM project can determine what is meant by "sustainable development". In this context, it is not so easy to conclude that HFC and N2O projects deliver limited SD benefits since such value judgment has to be done by the developing countries hosting these projects. Gillenwater and Seres (2011) does not provide any evidence to prove this. | Taken into account - the CDM text has been rewritten. Gillenwater and Seres are not cited anymore. |
| 15369 | 7 | 72 | 1 | | | UNFCCC CDM Technology Transfer report (2010): http://ynccf.net/pdf/CDM/CDM_and_Technology_Transfer.pdf | Taken into account - the general aspects of technology transfer are discussed in |

| 9479 | 7 | 72 | 18 | 72 | 20 | It should be added that FIT system can impact civil life and economic activities by rise in the price of electricity and policies of FIT need to be decided in full consideration of such impacts.<br>In a study on FIT in Germany, Manuel Frondel et al. [1] point out the following points; a)Currently, the feed-in tariff for PV is more than eight times higher than the electricity price at the power exchange... Given the net cost of 41.82Cents/kWh for modules installed in 2008, and assuming that PV displaces conventional electricity generated from a mixture of gas and hard coal with an emissions factor of 0.584 kg carbon dioxide (CO2) per kWh, then dividing the two figures yields abatement costs that are as high as 716€ per tonne. ....abatement cost estimates are dramatically larger than the current prices of CO2 emission certificates. b) numerous empirical studies have consistently shown the net employment balance to be zero or even negative in the long run, a consequence of the high opportunity cost of supporting renewable energy technologies. c) rather than promoting energy security, the need for backup power from fossil fuels means that renewables increase Germany's dependence on gas imports, most of which come from Russia. d)… the system of feed-in tariffs stifles competition among renewable energy producers and creates perverse incentives to lock into existing technologies.<br>[1]Manuel Frondel, Christoph M. Schmidt, Nolan Ritter and Colin Vance (2010)<br>Economic Impacts from the Promotion of Renewable Energy Technologies: The German Experience. Ruhr Economic Paper #156 (Energy Policy 38 : 4048-4056)<br>a) page 6 lines 4-6, page 13 lines 20-25<br>b) – d) page 19 lines 31- page 20 line 3 | Rejected - a) the support for innovative technologies like PV is carried out via additional support schemes, because their abatements costs are higher than those observed in the carbon markets. If this would not be the case, any additional support would be not necessary. Complementary policies in addition to carbon pricing can be justified if other goals beyond climate protection (abatement of local air pollution, increased energy access, etc.) are pursued and/or technological learning is to be enhanced. Details on the issues that arise if policy instruments are applied simultaneously are discussed in detail in the policy chapter of the IPCC SRRREN. b) Space constraints do not allow the discussion of co-benefits of policy instruments. These are discussed in the subchapter on 7.9.1. c) Renewable energies displace fossil fuels. Taken together, |
| 9512 | 7 | 72 | 18 | 72 | 25 | add the bad influence for TIF in addition to the good influence<br>(Economic impacts from the promotion of renewable energies: The German experience/page 6 lines 3-6)(attached on email) | Rejected - the cited sentences summarize the outcome of a comprehensive assessment that has been made for the IPCC SRREN. Space constraints do not allow to go into the details here. The paragraph therefore is silent about specific implications of the |

| 4826 | 7 | 72 | 31 | 72 | 31 | One point missing in this section is the impact of economic crisis in the implementation of enabling policies. There is usuallly a trade-off between affordability and green targets and the affordability aspect gains importance during economic crisis. | Rejected - this implies to general aspects of mitigation policies. It therefore must be discussed in chapter 13 - 15. |
| 10572 | 7 | 72 | 31 | | | Cross reference to chapters 12-16 where appropriate | Taken into account - text revised with references to Chapter 15 and others as |
| 5966 | 7 | 72 | 34 | 35 | | Lack of policy instrument coherence is a critical point and needs further emphasis | Rejected - the coherence of policies must be judged from a general point of view. This is to be done by chapter 13-15 and chapter 3. A reference to the |
| 14896 | 7 | 72 | 42 | 73 | 8 | overlap to chpter15 | Taken into account - overlap has been |
| 17379 | 7 | 72 | 44 | | | network constraints… | Editorial |
| 11997 | 7 | 72 | 6 | 72 | 8 | I question the scientific rigour of that study because of the very evidence that over 50% of the CERs issued to date come from industrial gas projects, the technology of which has been developed in Canada, Norway and Germany. Also, the studies base their conclusions of the technology transfer description in the CDM Project Design Documentation, which is also wrong because that description is voluntary and non-scientific i.e. non-comparable. And finally, technology transfer needs to be looked at in time: As an example, the installed wind capacity in China was less than 100MW before the CDM was used to top up Chinese tax money to heavily subsidize renewable energy from 2002 onwards. The first CDM projects all used predominantly Danish, Spanish and German technology. Today, in less than a decade, there is no more technology transfer in that very sense, because the country has caught up with the development. Besides the hardship that might pose in terms of intellectual property rights etc., the bottom line is: there has been massive amount of technology transfer under the CDM and it is beneficial to mitigate GHG emissions.<br>Also, I suggest to look at the UNFCCC Secretariat's assessment of technology transfer, you can find their study here: cdm.unfccc.int/about/dev_ben/index.html | Taken into account - the reference Das (2011) has been deleted. |
| 2850 | 7 | 72 | 9 | 72 | | This section needs to be expanded, in particular the reference to wholesale market design. Market reforms are currently under way in many countries and deserve discussion. (See for example, Newbery Reforming Competitive Electricity Markets to Meet Environmental Targets in Economic of Energy and Environmental Policy vol 1 issue 1.) | Rejected - elements of a new market design are already discussed in 7.12.3 (previously 7.11.4) enabling policies. Space constraints do not allow an |
| 16868 | 7 | 72 | | | | This section is important -- should include discussion regarding how policies focused on deploying renewables (rather than reducing CO2 emissions) may be very effective at deploying renewables, but are less effective at reducing CO2 emissions. Emissions reductions they do cause cost much more in terms of the money invested than other lower costs options that would otherwise be pursued as part of the market based program. This will drive down the CO2 price in a parallel cap and trade system, but this means that reductions that would otherwise have occurred as a slightly higher CO2 price are overlooked/not done. Forcing deployment of nascent technologies still being developed can be part of an RD&D program (and dramatically lowers costs of future techs) but if they only push techs that are already fairly mature, this is an expensive diversion of resources. Suggest looking at lit by Ellerman and others. | Rejected - space constraints do not a allow for an elaborated discussion of the co-benefits and drawbacks of combining various instruments. The question of coherence is discussed in detail in the policy chapter of the IPCC SRREN. Additional information on that issue should be provided by the policy chapters 13 - 15 and chapter 3. A |
| 13222 | 7 | 72 | 10 | 72 | 14 | It might be helpful to start with the more general point that no significant deployment of grid connected renewables has been observed to date in the absence of support mechanisms. This puts then the question on efficiency/effectiveness of support mechanisms into perspective. | Taken into account - The text has been revised to be clear on which support mechanisms packages have been |
| 11002 | 7 | 72 | 18 | 72 | 22 | Not only advantages but also drawbacks as to feed-in tariff should be stated. There are several problems which should be solved in feed-in tariff system, such as increase in electricity bills or development of infrastructure by introducing renewable energies rapidly. | Rejected - space constraints do not allow to go into the details here. The sentences cited summarize the outcome of a comprehensive assessment that has been made for the IPCC SRREN. Specific merits and drawbacks of |

| 9615 | 7 | 73 | 37 | 74 | 75 | Please, delete here due to duplication in chapter 6. | Rejected. The figure and text is essential to provide the context for the required |
| 7746 | 7 | 73 | 40 | 74 | 2 | There is no reason to refer to na accord,which is not unanimitily adopted by the UNFCCC. Please,refer tothe Kyoto Protocol. | Taken into account - the Copenhagen Accord has been replaced by the |
| 6461 | 7 | 73 | 40 | 74 | 2 | Copenhagen Accord does not set the objective of limitation of global average temperature change to below 2 degrees, but just “recognizing the scientific view”.<br>Therefore, the sentence should be changed to, for example;<br>“which is broadly compatible with scientific view recongnized in the Copenhagen Accord to limit global average temperature increase to below 2°C”. | Taken into account - the Copenhagen Accord has been replaced by the Cancun Agreement. |
| 12596 | 7 | 73 | 6 | | | There is an ethical issue over smart grid technologies. Do we go down the route of somewhat invasive systems, which give energy providers control over the devices in domestic homes, or, alternatively, do we go down a more decentralized type system, using systems which monitor the local grid frequency? | Rejected - although the question is interesting, space constraints do not allow for a deeper discussion based on |
| 3460 | 7 | 73 | 1 | 73 | 30 | It should be mentioned that there is a lack of regulation among countries, on order to take advantages of some energy and environmental solutions that could be implemented among countries | Rejected - the discussion of general policy aspects is to be done by chapter |
| 2851 | 7 | 73 | 31 | 86 | 8 | As mentioned in the general section the scenarios section could be shortened. There are one or two significant findings, such as the importance of demand and electricity and the need for immediate action. However, apart from those (familiar) points, no clear or useful message emerges, given the huge range of outcomes quoted from different models, and the cursory checklist of policies. | Accepted. We made an attempt to shorten the text wherever possible |
| 9069 | 7 | 73 | 31 | 86 | 8 | 7.12 Sectoral implication of transformation pathways and sustainable development can be deleted due to limitations on the nos of pages and it's been covered in chapter 6 | Rejected. We disagree that the pages are covered in chapter 6. |
| 3161 | 7 | 73 | 31 | | | Section 7.12 covers SD, but that is addressed in detail in a whole chapter (#4, I think). | Noted - we are bound by the heading to |
| 18549 | 7 | 74 | | 75 | | Why do energy and industry appear together in this figure? The AR5 has a separate chapter for each of these sectors, and one would therefore expect this figure (and section) to therefore focus strictly on energy. | Noted. This is so since some scenarios report industrial process emissions as part of the energy related emissions. we can not exclude these emissions. Note also that energy-related emissions refer to the full energy system including emissions of all demand-side sectors. In addition, non-energy emissions from industrial processes are included, since these emissions are not provided as a separate category in the AR5 scenario |
| 14547 | 7 | 74 | 18 | 74 | 18 | Express targets also in more familiar concept of CO2 concentration (ppm) | Accepted |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 9480 | 7 | 74 | 22 | 74 | 23 | Suitable sites for renewable energy or CCS are eccentrically-located and installation of them requires great cost. It should be added that there are difficulties to make world's average emission factor of electricity to zero. | Rejected. Costs are discussed elsewhere in the chapter. Whether or not they are "great" is a matter of personal |
| 6554 | 7 | 74 | 1 | | | "2.5-3.0" instead of "2.7" is correct (see Table 6.2). The same in P.74 line18, and P.83 line5. | Taken into account - the definition of the categories has been updated. |
| 6555 | 7 | 74 | 1 | | 2 | Correct the description "stated objective of the Copenhagen Accord to limit global average temperature change to below 2 degrees C.", as the heads of state, etc. have agreed on the Copenhagen Accord only "recognizing the scientific view that the increase in global temperature should be below 2 degrees Celsius" but not on "objective to limit temperature below 2 degrees C". | Taken into account - the Copenhagen Accord has been replaced by the Cancun Agreement. |
| 6556 | 7 | 74 | 2 | | 5 | Make numbers consistent with those in Chapter 6. | Taken into account - results in chapter 6 and chapter 7 now are consistent. |
| 6558 | 7 | 74 | 16 | | 17 | Replace "The stabilization of GHG" with e.g. "the lower stabilization levels of GHG", as there seems to be scenarios suggesting CO2 emissions to peak-out and then decline even in the baselines of Figure.21. | Accepted. The section has been changed to indicate that the increase is |
| 6559 | 7 | 74 | 21 | | 22 | Delete the sentence "As discussed [...] concentrations." or replace "CO2 emissions must eventually decline to zero" with e.g. "CO2 emissions must peak and then gradually approach zero over more than 1000 years" according to Kheshigi et. al (2005) cited in 7.12.4 to make it clear, as the other discussion here is only dealing with issues in this century. | Accepted. changed to read, "in the long term decline toward zero" |
| 6557 | 7 | 74 | 7 | | 8 | Modify the description "energy-related CO2 emission are expected to continue to increase", as the lower boundary of baselines on Figure 7.21 suggests that there are scenarios that indicate CO2 emissions to peak-out and then decline even in the baselines. | Accepted. The section has been changed to indicate that the increase is relative to present levels. |
| 12333 | 7 | 74 | 6 | | | This chapter should also deal with emission of SF6 from electric transmission systems. | Accepted - Unfortunately the AR5 scenario database does not include sufficient detail to break out information about SF6 emissions from electrical transmission systems. But we acknowledge that this omission should |
| 4656 | 7 | 75 | | 75 | | I think the categories should be specified in the figure. | Taken into account - the categories now are explained in the introduction to |
| 10573 | 7 | 75 | 2 | | | Does "the energy and industry sector" include transport and buildings? Seems a strange combination. Why is industry included in this chapter? Another example of where chapter boundaries are hazy | Noted. This is so since some scenarios report industrial process emissions as part of the energy related emissions. we can not exclude these emissions. Note also that energy-related emissions refer to the full energy system including emissions of all demand-side sectors. In addition, non-energy emissions from industrial processes are included, since these emissions are not provided as a separate category in the AR5 scenario |
| 16870 | 7 | 75 | 21 | | 24 | Replacing the fossil fuel share of energy is not precise enough -- should be replacing the high emitting fossil fuel technologies with low emitting fossil fuel technologies. See chapt 6 re the importance of CCS on fossil fuels as part of low costs mitigation scenarios. | Accepted. We clarified that we mean the fossil fuel share without CCS. |
| 16871 | 7 | 75 | 25 | | 29 | Very good that you mention that the scenarios show that energy efficiency is a large contributor of emissions reductions in the first decades of a CO2 reduction program that is driven by a CO2 price -- might also be helpful to note why this is so (EE is relatively inexpensive, other larger new technologies are not quite ready or require a higher CO2 price expected in future decades, etc.). | Rejected: in the IAMs every technology is deployed up to the point at which the last ton of emissions mitigation costs the same. So, nothing is any cheaper than |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 2852 | 7 | 75 | 27 | | | The suggestion that 40-90% of reductions can be achieved via demand reduction deserves more extensive analysis – for instance, how realistic this is, how it might be achieved, and what are the implications for the various systems issues listed in the general comments above. The suggestion is far reaching in its implications, but it does not seem to be reflected anywhere in the earlier sections. | Rejected: Demand reductions are discussed extensively in the chapters on industry, buildings and transport |
| 18550 | 7 | 75 | 9 | 77 | | Please clarify why these three scenarios were chosen for focus. | Accepted - Because they represent broader GHG mitigation strategies with varying emphasis on demand vs. supply-focus of the transformation. We clarified |
| 11953 | 7 | 75 | 2 | | | Why are we repeating what is also in Chapter 6? Simply refer to it, with p. # | Noted: This section elaborates on the energy supply and transformation implications of the scenario literature as achieved in the Chapter 6 data base. It may not be possible to discuss every scenario in the literature explicitly. If scenarios include important NEW information that lies outside of the larger |
| 6201 | 7 | 75 | | 78 | | Here, there doesn't seem to be enough text to explain the charts. Pointing out the key features of the various models being presented would help a reader follow what's being shown by all the colored blocks. | Rejected due to space limitations. Key features of models would need to be discussed in the transformation |
| 17279 | 7 | 75 | 4 | 79 | 8 | In this section also attention should be paid to low energy pathways that are not part of an integrated assessment model, like the one developed by DLR for Greenpeace (Energy [R]evolution) and by Ecofys for WWF (The Energy Report). These scenario studies often provide more detail in terms of the deployment of renewable energy. | Rejected - the IPCC scenario database is an open one. Please submit the respective scenarios so that they can be included. |
| 10059 | 7 | 75 | 8 | 78 | 11 | More scenarios should be added - especially those with different technology pathways (excluding e.g. CCS) | Accepted: We consider scenarios that exclude many technologies including, CCS and nuclear, and those which limit availability and performance of bioenergy |
| 16872 | 7 | 76 | | | | Are you not going to discuss or mention possible overshoot scenarios? Chapt 6 discusses them. If the world is slow in arriving at an agreement (really, emissions trading) among major emitting countries, overshoot strategies are the only way we ultimately can arrive at a 450 or 500 ppm world. | Rejected - implications of overshoot scenarios are discussed in chapter 6. |
| 4657 | 7 | 76 | | 76 | | I had difficulty following this figure. In two of the baseline scenarios, the biomass numbers decline to 2050 and then only start to increase to reach a maximum of 200 EJ by 2100. There is nothing shown for CCS. But surely, new tree planting entail CCS? Also the existing yields from wood, agricultural residues and dung are of the order of 500-515 EJ. This is well in excess of the 200 EJ shown in the table. The tables on the left which include CCS underground, have a maximum figure of less than 400EJ, which is again less than the current accessible annual yield! | Noted. We are trying to make our message clearer and the figures easier to follow. |
| 10278 | 7 | 77 | | 77 | | The role of nuclear power for the 450 ppm stabilization scenario is slightly smaller than that for the baseline scenario in MESSAGE and ReMIND models in Figure 7.22. The results will come from the assumptions of the models which have the exogenous scenario or limitation of nuclear power capacity or generations considering the public acceptability. However, such assumptions lack a scientific basis and are determined by modelers on an ad-hoc basis. There is a concern that readers will misunderstand the role of nuclear power inadequately without understandings of such model assumptions. Therefore, the additional explanatory remarks of the figure discussed above should be added in the body text in order to avoid misunderstandings of readers. | Rejected. Reduced deployment of nuclear or solar or wind in mitigation scenarios as compared with the reference case occurs when the expanded share of nuclear in power generation is offset by reduced demands for electricity occurring because end-use sectors are conserving energy in general. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 11776 | 7 | 77 | | | | In the MESSAGE and ReMIND on the right side, nuclear power ratio is declining. If this is results from the some kind of given conditions to the model, such remark should be added. | Rejected. Reduced deployment of nuclear or solar or wind in mitigation scenarios as compared with the reference case occurs when the expanded share of nuclear in power generation is offset by reduced demands |
| 9616 | 7 | 77 | | | | Please, describe reasons for reduction of nuclear capacity in the text with regard to two models results, MESSAGE and ReMIND after 2080's; it may mislead readers to conclude that nuclear generation is no longer regarded as one of critical options. However, IEA indicates nuclear is still a significant source in some cases in 2050 (IEA, table 3.1, ETP 2010) and its trend continues. | Rejected. We don't have the space to discuss individual technology contributions in specific scenarios. (Also, see previous response.) |
| 9617 | 7 | 77 | | | | Please, describe reasons why nuclear deployment becomes low relative to other sources in the text. IEA shows two cases of normal and high nuclear deployment in table 3.1, ETP 2010, which differs from those in Figure 7.23. | Rejected. We don't have the space to discuss individual technology contributions in specific scenarios. |
| 10093 | 7 | 77 | | | | axis legends are missiong<br>"savings" is missleading as nothing is on an account to be used in the future. "Efficiency increase" suits better. | Accepted: the effect includes also other demand-side changes than efficiency. Changed the legend to |
| 10006 | 7 | 77 | | | | In this figure, there should be an explanation about the reason why the ratios of nuclear power generation are same in the 550 ppm case and the 450 ppm case. It seems that the capacity and/or generation of the nuclear is intentionally limited and set as the same in both cases. Many assessment models assume the limitation of nuclear power capacity and/or generations considering the public acceptability. It seems that the results are based on this assumption. If so, the results underestimate the contribution of nuclear power in terms of mitigation costs. | Rejected. This would require too much specific scenario detail. The interested reader needs to go back to the original source. |
| 6702 | 7 | 77 | 2 | | | In this figure, the role of nuclear energy for the 450 ppm stabilization scenario is smaller than the baseline scenario in MESSAGE and ReMIND models. It is thought that this result come from the assumptions of the models which have the exogenous scenario or limitation of nuclear energy capacity or generations considering the public acceptability. Such assumptions lack a scientific basis and are determined by modelers on an ad-hoc basis. The additional explanatory remarks of this figure are needed in order not to make readers misunderstand the role of nuclear energy. | Rejected. We are able to discuss the general nature of scenarios but not the role of specific energy supply and transformation technologies. The role of nuclear technology is discussed along with other mitigation technologies. |
| 11777 | 7 | 78 | | | | Nuclear ratio is almost same. If this results come from the some kind of given conditions to the model, such remark should be added. | Rejected. We don't have the space to discuss individual technology contributions in specific scenarios. |
| 4658 | 7 | 78 | | 78 | | For biomass, it appears that the 'low' figure is higher that the 'medium' figure. Why? | Taken into account - comment is obsolete. Figure has been deleted. |
| 17756 | 7 | 79 | | | | consider dividing this important figure into four segments - at present it is fully readable | Taken into account - comment is obsolete. Figure has been deleted. |
| 9665 | 7 | 79 | | | | this figure is completely confusing - I am not sure that it adds value | Taken into account - comment is obsolete. Figure has been deleted. |
| 7305 | 7 | 79 | | 79 | | For better reading, please, change the colour of the filling and increase the size for the Figure 7.24. | Taken into account - comment is obsolete. Figure has been deleted. |
| 6250 | 7 | 79 | | 81 | | this seems as though it should be one of the central premises of the entire chapter. But that's not the case here; it's 4 paragraphs and a couple of charts spread out over 2 pages near the end of the chapter. It is actually shorter in text than the next subsection which summarizes literature on the difficulty of long-term stabilization planning. | Noted: This is one of several important points. The fact that it is a separate sub-section means that it is important. |
| 16873 | 7 | 79 | | | | I don't find this chart very helpful or informative -- can it be simplified and parts enlarged? | Taken into account - comment is obsolete. Figure has been deleted. |

|---|---|---|---|---|---|---|---|
| 16874 | 7 | 79 | 12 | | | It might be helpful to note at the end of the paragraph the following: "In short, the electricity sector provides the new energy refining infrastructure for the low emitting future." | Rejected: We emphasize the role of power generation in emissions mitigation strategies, but reject the specific wording |
| 10574 | 7 | 79 | 17 | 79 | 20 | Suggest delete these last two sentences as they relate more to transport than to electricity sector. But if they stay, then change "Bioenergy" to "Biofuels" | Accepted: We no longer discuss the transport sector, but refer readers to the |
| 18105 | 7 | 79 | 21 | 79 | 23 | Add efficiency and demand side measures. | Reject. That does not belong in a chapter on energy supply and |
| 9165 | 7 | 79 | 4 | 81 | 5 | role of electrification is discussed in (Sugiyama 2012) - please refer. (it is in ch6 bibliograph) | Noted - space constraints do not allow to go into the details here. |
| 16875 | 7 | 79 | | | | Very good. Please make sure this is highlighted in the executive summary. | Noted. |
| 10497 | 7 | 8 | | | | No mention of the Bioenergy section in Exec Summary. If it is to stay here needs a paragraph - but will maybe move to Chapter 11 I suspect. | Taken into account - comment is obsolete. Overview of AR4 was deleted. |
| 9628 | 7 | 8 | 1 | 8 | 1 | Who or What is being referred to when you say "they"? | Energy systems. |
| 15939 | 7 | 8 | 1 | 8 | 3 | Energy systems are not designed to produce primary energy; they are designed to deliver energy services to end users. Whether or not they 'produce' primary energy is irrelevant, as in the case of wind, solar, there is no 'primary energy' involved, unless you count the kinetic energy in the wind or the fusion reaction in the sun as 'primary' energy - and in any case, the energy system doesn't 'produce' it. | Taken into account - comment is obsolete as the underlying text has been deleted. |
| 6415 | 7 | 8 | 13 | 8 | 13 | Should "intermittency" be "variability"? | Taken into account - comment is obsolete as the underlying text has been |
| 18042 | 7 | 8 | 13 | 8 | 13 | "Balancing" is a better word than "intermittency" here if it relates to the broader operation of electricity systems. | Taken into account - comment is obsolete as the underlying text has been |
| 15940 | 7 | 8 | 13 | 8 | 13 | replace 'intermittency' with 'variability', since this is what is being referred to here, I believe. Wind and solar are not intermittent - they are variable. Intermittent is a nuclear reactor which can go from 1000 MW to zero in a fraction of a second - and systems need to deal with that as well. So, add 'variability' to intermittency, or just switch intermittency to variability - the latter is I think the simplest. | Taken into account - comment is obsolete as the underlying text has been deleted. |
| 3774 | 7 | 8 | 14 | 8 | 16 | Review wording. | Accepted -text revised. |
| 5149 | 7 | 8 | 14 | | 16 | simpler sentence may clearify message | Accepted text revised. |
| 17359 | 7 | 8 | 15 | | | impacts or may impact… | Accepted - text revised. |
| 18188 | 7 | 8 | 30 | | 40 | Add to paragraph: This chapter concentrates on medium-term projections (to 2030-2035). Comparisons with stabilization pathways allow understanding the gap and challenge, including sustainable development implications of rapid transformations and disruptive changes. Local fuel supply infrastructure is the subject of Chapter 8. Building integrated power and heat generation as well as biomass use for cooking are addressed in chapter 9. Responsive load issues are dealt with by chapters 8 and 9. Chapter 7 considers mitigation options in fossil fuel energy extraction industries (oil, gas, coal, uranium etc.) while other extractive industries are addressed in Chapter 10. This chapter considers energy storage, and addresses the transformation of wood into charcoal, but not natural forest management This chapter addresses the transformation of wood into charcoal, but does not address natural forest management. This chapter also considers energy storage. Only energy sector related policies are reviewed considered in this chapter while broader and more detailed policy picture is presented in chapters 13-15. | Rejected - comment is unclear. Please clarify what you would like to change. |

| 13287 | 7 | 8 | 5 | 8 | 5 | The words 'pre sets' here is a typo - presumably should be replaced with 'presents a' | Accepted - text revised. |
| 4100 | 7 | 8 | 50 | 8 | 50 | Not just 'long-term energy security'. The problems arising from intermittency, especially of wind power, should be specifically acknowledged. | Taken into account - comment is obsolete. Overview of AR4 was deleted. |
| 9590 | 7 | 8 | 41 | 9 | 25 | Please, delete here. | Taken into account - comment is obsolete. Overview of AR4 was deleted. |
| 11914 | 7 | 8 | 41 | | | Question the need for this entire section. Should best be covered in Chapter 1 along with general summary review of everything | Taken into account - comment is obsolete. Overview of AR4 was deleted. |
| 18499 | 7 | 8 | 41 | | | Please cite the AR4 directly including references to the particular AR4 chapters, and be very careful with paraphrasing (which has the potential to be politically problematic). | Taken into account - comment is obsolete. Overview of AR4 was deleted. |
| 18500 | 7 | 8 | 41 | | | The text in this section doesn't seem to focus on the findings of the AR4 energy chapter. A reader would expect a brief summary of the main AR4 energy chapter findings, as well as the differences in this AR5 chapter, and a guidance to the AR5 sections in which a discussion of those innovations/updated results can be found. | Taken into account - comment is obsolete. Overview of AR4 was deleted. |
| 6546 | 7 | 8 | 42 | | | Indicate which part of "4AR concluded that the world is not yet on a course to achieve a sustainable energy future." | Taken into account - comment is obsolete. Overview of AR4 was deleted. |
| 10279 | 7 | 80 | | 80 | | Good figure. | Noted |
| 9482 | 7 | 80 | | | | Figure 7.25 should be left in this report, as it is a correct estimation that limiting CO2 emissions will increase share of electricity. | Accepted |
| 4463 | 7 | 80 | | 80 | | This figure is missing a legend for the bars. | Accepted: we added definitions of the categories in the introduction to section |
| 6762 | 7 | 80 | | | | Good figure. It's very important. | Noted |
| 3805 | 7 | 80 | | | | Add explanation about C4, C3, C2, and C1. | Noted |
| 10575 | 7 | 80 | | | | Define C1 to C5 as a caption footnote eg: "Categories CI to C5 are defined in Fig. 7.21." Consider whether graphs relating to electricity in transport fit in this chapter. My view is that they don't and should go to Chapter 8. But if stay, then at least give a cross reference to Ch 8. Can a breakdown be made of "other non-transport" into buildings and industry. Then these can go to Chapters 9 and 10. No rference given, or in text other than "Mitigation studies show....." Which studies? | Agreed. The figures for transport should be deleted, as similar analysis was added to Chapter 8 |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 10007 | 7 | 80 | | | | This figure should be kept in SOD. The result indicates that the rate of electrification becomes higher, as the CO2 concentration is constrained strictly. This means that it is important to make electrification rate higher for energy system in order to reduce CO2 emission. | Accepted: We agree that power generation plays a central role in cost-effective emissions mitigation. That is the point of this whole section. We have |
| 9513 | 7 | 80 | 11 | 80 | 17 | Good figure. Share of electricity is important factor in emission reduction. | Noted |
| 6703 | 7 | 80 | 13 | | | Good figure. | Noted |
| 11954 | 7 | 80 | 13 | | | Question - How much of this is new and not in Chapter 6? Make it clear. | Noted: We have coordinated with Chapter 6 to insure that we do not |
| 9481 | 7 | 80 | 6 | 80 | 9 | Suitable sites for renewable energy or CCS are eccentrically-located and installation of them requires great cost. It should be added that there are difficulties to make world's average emission factor of electricity to zero. | Rejected: Aggregate costs are discussed in Chapter 6. Specific technology costs are discussed elsewhere in the chapter. Whether or not costs are "great" or not is a judgement. IAMs deploy every technology up to the point at which its |
| 18106 | 7 | 81 | | 81 | | Clarify how "low-carbon" is defined in the table. Even more helpful would be of the bars were divided into the various low-carbon technologies, e.g. Nuclear and renewables | Accepted: Definition has been added. The split into low carbon options is provided in another figure in the same |
| 10576 | 7 | 81 | | | | No reference given for the figure 7.26 or in text other than "Mitigation studies indicate that...." | The figure summarises results from the AR5 database. Reference is added. |
| 9618 | 7 | 81 | 7 | 83 | 3 | Please, move here to chapter 6. | The chapter authors are coordinating |
| 6560 | 7 | 81 | 9 | | 10 | Replace "stable concentrations of CO2 ultimately require emissions to decline to zero" with e.g. "stable concentrations of CO2 require CO2 emissions to peak and then gradually approach zero over more than 1000 years" according to Kheshigi et. al (2005) to make it clear, as the other discussion here is only dealing with issues in this century. | Accepted: This text has been edited to be clearer. |
| 16876 | 7 | 83 | 16 | | 26 | Very important point here that if the policies are limited to only advance renewables to lower emissions the cost is much higher than if all technologies are used. This point is buried in the middle of the paragraph and should be moved to front as key point or to the end as a summary statement. In the middle it gets lost. The point is not widely understood and there are many stakeholders who push the alternative view that policy should be only renewables -- the misunderstanding will delay achievement of an agreement and, if we are in a renewables only world, it is possible the rising costs will cause the policy to unravel later. | Taken into account - this important aspect is part of the Chapter 6 discussions. |
| 11955 | 7 | 83 | 2 | | | Consider just showing the figure on the right. The one on the left really adds nothing to the discussion. | Taken into account - comment is obsolete. Figure was removed. |
| 15371 | 7 | 83 | 8 | | | Reference missing ( Luckow, 2012) | Accepted. |
| 10060 | 7 | 83 | 16 | 84 | 3 | Request to delete the entire section about the Luckow et al paper, as it is misleading and biased. Neither the assumption nor the methodology are transparent, therefore the results of this paper shown in figure 7.29 can not be reproduced. A large number of energy modells indicate, that renewable energy systems are cost efficiency by an order of magnitude as opposed to fossil fuel energy systems, especially put 2050. This section is must be seriously rewrited with more and balance informations. | Accepted - Luckow (2012) should be replaced with a citation to Edmonds, J., Luckow, P., Calvin, C., Wise, M., Dooley, J., Kyle, G., Kim, S., Patel, P., Clarke, L., 2012. Can Radiative Forcing Be Limited to 2.6 W/m2 at the end of |
| 4464 | 7 | 84 | | 84 | | This figure should be redrawn so that the two series in the top plot are joined to their counterparts in the bottom. That is, it should be explicit that both graphs share the same x-axis, even if the break in y-axis is emphasized to give resolution to the other series. | Taken into account - comment is obsolete. Figure was removed. |
| 14548 | 7 | 84 | | | | The figure needs more explanation. | Taken into account - comment is obsolete. Figure was removed. |
| 16878 | 7 | 84 | | | | Very good. | Noted. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 18645 | 7 | 84 | | | | Page 84: The discussion on investment needs due to stabilization/mitigation should be related to the needs to invest in the energy system due to other reasons to be meaningful. | Rejected. The discussion of investments focuses here on climate mitigation. Chapter 16 has additional and more |
| 16877 | 7 | 84 | 13 | | | Suggest addition of the following at end of paragraph: "This implies that pushing the system transition too rapidly via other policy instruments risks substantial short term costs increases which could undermine political support for the policy. This in turn increases the risks of policy reversal, making investors less confident in deploying technologies which require a longer timeframe to earn a return." | Rejected - we recognize that this point might be valid. But the answer is better placed in the policy and framing chapters. |
| 11956 | 7 | 84 | 2 | | | Is this figure from Luckow? If so, needs reference. | Accepted. Citation was updated |
| 6561 | 7 | 84 | 18 | | 19 | Firstly, give a reference paper for "The present investment [...] stabilization of GHG". Secondly, specify the level of "stabilization of GHGs" intended ( Category 1?). | Accepted. Reference added, and stabilization level clarified (cat 1) |
| 10094 | 7 | 85 | | | | annual investment for 2010 is not ine line with the info given on page 65. It is also unlikeley that for renewables and electricity transmission and storage there is the same number over all 41 scenarios. | Noted. The number is correct and had been taken from the source. We will |
| 18107 | 7 | 85 | | | | On renewables: "Regulation, Standards" are "essential", not "complement", according to the definition in the text. On the other hand, "Externality pricing" is "compliment" rather than "Essential" for renewables. For nuclear "carefully designed subsidies" are "essential" rather than "uncertain" to mobilise resources - no nuclear power plant in history has ever been built without subsidies. | noted. The policy information was removed from the table |
| 3806 | 7 | 85 | | | | I have serious concern with the investment cost shown at the Table for Nuclear compared with Renewables. The footnote explanation about what is included in the evaluation is not enough to provide clear information. The Table should be constructed in a way that the reader gets the full information immediately. Thus, what is quoted in footnotes must be part of the Table to avoid incorrect interpretation by readers. | rejected. Footnotes are there to provide details of definitions. The table is transparent as is. |
| 10577 | 7 | 85 | | | | Is Category 1 here the same as Category 1 in Fig. 7.21? Maybe this Table and text should be cross-reference to Fig 7.21 (or even placed in section 7.12.1 and merged to avoid confusion). However, having said that, this chapter does not have a section on policies as do other technical chapters. Should it have? This Table 7.6 does cover policies, but appears to be tacked on almost as an after thought. Should there be a section 7.12.7 on policies? | rejected. We can not change or add sections which have been subject to plenary approval at this stage. The policy discussion was removed, since there is an own chapter focusing on policies |
| 10061 | 7 | 85 | | | | This table has several factuaral errors: While it states GHG pricing is essential for the development of renewables, feed-in tariffs (FIT) are listed under "subsidies". The development of the renewables - especially wind and solar pv are entirely driven by FIT, while emissions trading (e.g. ETS) did not result in an RE market so far. Thus, there is no evidence so far, that GHG pricing will be essential for RE in the future. According to the judgment of the European Court of Justice in March 2001 to the German Renewable Energy law, a FIT is not a subsidy. These factural errors must be corrected in table 7.6. | Noted - the policy section of the table was removed. |
| 12334 | 7 | 85 | 20 | | | This is a useful table. Please consider also to put it at the end of the Executive Summary, as it summarises mitigation options, investments needed and policy mechanisms. | rejected. We removed the policy mechanisms as the issue is better |
| 2975 | 7 | 85 | 21 | | | This table is misleading. It states that for the promotion of renewables GHG pricing is key to rapid development, while feed-in tariff and tax credits for R&D or production can complement GHG pricing. However, in reality the opposite could be observed. Feed-in tariffs were key for the innovation and development of renewables. See: Tobias S. Schmidt and others, 'The Effects of Climate Policy on the Rate and Direction of Innovation: A Survey of the EU ETS and the Electricity Sector', Environmental Innovation and Societal Transitions, 2 (2012), 23–48 <doi:10.1016/j.eist.2011.12.002>.. | Noted - the policy section of the table has been removed. |
| 9666 | 7 | 86 | | | | The answer given does not really give a clear answer to the question. | Taken into account - the entire paragraph has been rewritten - together |
| 11957 | 7 | 86 | 19 | 86 | 21 | This sentence needs to reference what limited examples exist. | Rejected - the Gaps in knowledge summarizes the lack of information concerning the most important questions. It is a summary of the gaps identified during the writing process of |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 11958 | 7 | 86 | 23 | 86 | 24 | What exactly is meant by "integrated decision making support"? Same for "integrated analysis tools". Key word that needs explanation is "integrated". Integrated in what sense? Across disciplines? Policies? Governments? Continents? Regions? | Rejected - Integrated assessments and their usage to support climate policy decision making is a well known concept introduced in chapter 6. It cannot be |
| 10280 | 7 | 86 | 30 | 86 | 45 | FAQ 7.1 will be better to be discussed in Chapter 6. | Taken - into account. The frequently asked question (FAQ) has been reformulated in order to address issues |
| 7747 | 7 | 86 | 30 | 86 | 31 | Please refer to the Kyoto Protocol | Rejected - the FAQ refers to emissions reduction potentials in the future. The AR5 will be published in 2014. The commitment period of the Kyoto Protocol ended in 2012, the Kyoto |
| 2236 | 7 | 86 | 30 | 86 | 30 | This question does not belong here, as it can only be answered by looking at all GHGs and non-GHG climate forcers, and not just one sector in isolation | Taken - into account. The frequently asked question (FAQ) has been reformulated in order to address issues |
| 6462 | 7 | 86 | 30 | 86 | 34 | Copenhagen Accord does not set the 2 degrees goal, but just “recognized the scientific view”. | Taken into account - the Copenhagen Accord has been replaced by the |
| 7748 | 7 | 86 | 32 | 86 | 34 | Please refer to the Kyoto Protocol and not the the Copenhagen Accord. | Taken into account - the FAQ refers to emissions reduction potentials in the future. The AR5 will be published in 2014. The commitment period of the Kyoto Protocol ended in 2012, the Kyoto Protocol therefore is not relevant anymore within the context of future |
| 4659 | 7 | 86 | 9 | 86 | 9 | Gaps in the knowledge. The availability of more accurate data cannot be over emphasized. Good inventory information by area is required if plans and investments are to be made for the development of RE, especially biomass. FAO undertook a survey in Ethiopia in 1996 and determined that there were considerable biomass shortages: large-scale planting programs were recommended. However, a detailed inventory was undertaken in 2003, which showed an overall surplus of annual yield compared to demand. It pinpointed areas of shortage and surplus and recommended exploiting surpluses and planting/improved management etc. in shortage areas. (Openshaw, K. 2010b). Without good data information, much investment could be misdirected. (Openshaw, K. 2012). | Noted. |
| 9619 | 7 | 86 | | | | Please, delete here due to general idea not directly related with chapter 7. | Rejected - comment seems to be misplaced. Please clarify to which part of the text your comment actually refers. |
| 10619 | 7 | 86 | 10 | | | One of the reasons behind gaps in data and information may be the fragmented international regime that deals with energy issues. For example, the International Energy Agency is one of the few international institutions dedicated to energy issues, and yet its membership excludes most of the major fossil fuel producers (e.g., Saudi Arabia) and most of the big emerging consumers (e.g., China, India). See [Colgan, J, T van de Graaf, and R. Keohane. 2012. Punctuated Equilibrium in the Energy Regime Complex. Review of International Organizations. 7(2): 117-143.] | Noted - the section is about gaps, not about the reasons behind them. |
| 18551 | 7 | 86 | 10 | | | Please note that the SRREN also has a comprehensive list of knowledge gaps related to RE (See Ch 1 page 179). These would be useful to incorporate here. | Taken into account - the knowledge gaps have been rewritten by taking into account the information contained in the |
| 6562 | 7 | 86 | 30 | | | Define the meaning of "technically feasible". | Taken into account - as the FAQ has been reformulated, the comment is |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 6563 | 7 | 86 | 32 | | 34 | Explain how this sentence is correct or give a reference paper, as Chapter 6 and especially Figure 6.29 shows, depending on the technology availability that is complex and uncertain, considerable number of the models used were not able to achieve 450 ppm stabilization by 2100. | Taken into account - the paragraph has been rewritten in order to avoid any inconsistencies with chapter 6. |
| 6564 | 7 | 86 | 33 | | 34 | Correct the description "the 2 degrees goal of the Copenhagen Accord", as the heads of state, etc. have agreed on the Copenhagen Accord only "recognizing the scientific view that the increase in global temperature should be below 2 degrees Celsius" but not on "the 2 degrees goal". | Taken into account - the Copenhagen Accord has been replaced by the Cancun Agreement. |
| 6202 | 7 | 87 | 1 | 87 | 4 | FAQ 7.2 asks whether "Is there a single best solution to achieve deep emission reductions in the energy sector?" The answer addresses supply-side technologies only., and demand-reducing activities seem to be omitted. Suggest adding a new sentence into line 3: " There are also many activities that can imporove end-use energy efficiency and thereby reduce the demand for energy and the attendant emissions." | Taken - into account. The frequently asked question (FAQ) has been reformulated in order to address issues related to the energy supply sector only. |
| 6704 | 7 | 87 | 11 | 87 | 12 | It should be noticed that in order to reduce GHG emission voluntary approach is effective. Recent studies show that voluntary efforts to reduce SF6 emissions by electric power sector in Japan, which have been successfully carried out and will be a good example to show the effectiveness of gas-by-gas sectoral approaches.<br>Moreover, when introducing climate protection policies, it is necessary to consider energy prices so as not to damage family budget.<br><br>See: Nishimura et al (2008) Mitigation of Non-CO2 Greenhouse Gases., abstract lines 13-15<br>http://criepi.denken.or.jp/jp/kenkikaku/report/detail/Y07012.html | Taken into account- the original FAQ has been reformulated. The comment therefore is obsolete. It is now about barriers and not primarily about necessary policies. |
| 2237 | 7 | 87 | 11 | 87 | 12 | This answer is far too rigid and prescriptive. IPCC usually does not state in that style of "yes/no". Even if I agree that without strong decisive and long-term stable political framework conditions a low-carbon change in the energy sector will very very likely not happen, there may be other strong forces. If we look at the US for example where cheap gas reduces coal power generation at high speed, without policies, just by economics, similar changes could occur as well. So policy will not be the only driver of change as the current answer implies. | Taken into account- the original FAQ has been reformulated. The comment therefore is obsolete. The FAQ is now about barriers and not primarily about necessary policies. |
| 6203 | 7 | 87 | 11 | 87 | 12 | "Without intervention, energy systems way will not show a transition to low GHG concentrations. Specific climate protection policies will be necessary in order to achieve that goal." This is incorrect. In some instances, intervention may help in market transitions. In other case it may not be needed, or even hinder transitions. In the U.S., for example, the shale gas revolution is rapidly lowering the carbon intensity of the electric power sector, all without specific intent to produce a specific GHG profile. | Taken into account - the paragraph has been deleted as a consequence of a reformulation of the FAQ. |
| 13209 | 7 | 87 | 24 | 87 | 24 | Add after renewable "and nuclear" | Taken into account - the paragraph has been deleted as a consequence of a |
| 9483 | 7 | 87 | 9 | 87 | 12 | It should be described that GHG emission reduction in energy sector was implemented by voluntary efforts of companies without introducing polices.<br>It should be added that introducing policies can impact civil life and economic activities by rise in the price of energy, and policies need to be decided in full consideration of such impacts.<br>Nishimura et al [1]. introduces voluntary efforts to reduce SF6 emissions by electric power sector in Japan, which have been successfully carried out and will be a good example to show the effectiveness of gas-by-gas sectoral approaches.<br>[1] Mitigation of Non-CO2 Greenhouse Gases<br>http://criepi.denken.or.jp/jp/kenkikaku/report/detail/Y07012.html<br>[1]abstract lines 13-15 | Taken into account- the original FAQ has been reformulated. The comment therefore is obsolete. The FAQ is now about barriers and not primarily about necessary policies. |
| 5967 | 7 | 87 | 9 | | | The need for financial mechanisms to encourage developing economies implment high capitla cost, low-carbon technologies should also be referenced | Taken into account - text revised. |
| 6565 | 7 | 87 | 23 | | 24 | Firstly, add "and nuclear" after "renewables". Secondly, replace "a phase out of coal use" with e.g. "further emissions reductions from fossil fuel". Thirdly, explain "a smaller energy system" or give an example. | Taken into account - the paragraph has been deleted as a consequence of a |

|---|---|---|---|---|---|---|---|
| 3077 | 7 | 88 | | | | The paragraph makes strong (and good) statements where bioenergy has or will work and where it does not. I would be worthwhile backing these up by references. | The statements are quite general and are supported by the SRREN, which is |
| 18647 | 7 | 88 | | | | Bioenergy annex (page 88) – better to add to the chapter on land use? | A likely way forward. |
| 4660 | 7 | 88 | | 96 | | . Bioenergy annex. General comments.<br>In my opinion, this annex should start off with the existing potential and actual supply of biomass energy. The net primary production [NPP] of terrestrial plants is an estimated 53.2 Gt carbon, which is approximately 2000 EJ (Melillo et al 1993. Global climate change and terrestrial NPP. Nature, vol. 363 1993. Cited in Openshaw, K. 2011b). This is about half the total NPP of about 4000 EJ, the remaining NPP is from plants in oceans and other water bodies. Every year plants capture this atmospheric carbon and every year it is returned to the atmosphere through respiration, rot, burning and wildfires etc. (The carbon cycle). While a little can accumulate in woody biomass, roots of plants and in the soil, most is lost. Thus, the theoretical potential from terrestrial biomass is an estimated 2000 EJ, but using water-based algae to produce energy is now in the experimental stage; this expands the above estimate.<br>Woody biomass has accumulated over the years in closed and open formations and provides an annual yield, some of which is stored, but most of which is lost. I repeat the table that I gave in my review of chapter 11 AFOLU.<br><br>Table 1. Land use for the world 2006: units million hectares and 109 dry tonnes of woody biomass2.<br>World Forest Woodland Arable Grassland1 Desert Built up Arctic<br>14894 4021 1224 1638 4170 1787 298 1788 area<br>100 27 8 11 28 12 2 12 %<br>543.80 450.71 9.28 79.71 0 4.10 0 Growing stock<br>18.35 12.44 0.36 5.33 0 0.22 0 Annual yield<br>Note. 1. Grasslands include wetlands. 2. This is above ground biomass, total biomass is 20-33% more.<br>Annual yield is accessible yield. Total yield is 21.58 x 109 t. Carbon content is 50% of dry wood weight.<br>Net [low heat] energy value of dry wood, with a 1% ash content is taken as 18.7 GJ/tonne.<br>Source. FAO 2009 (State of the world's forests [adjusted]) and search of the WWW. Openshaw, K. 2011.<br><br>Thus, an estimated 18.35 Gt of accessible above-ground woody biomass (343 EJ) could be used every year without reducing the above-ground stock of wood (544 Gt containing more than 10,000 EJ). In contrast, the current consumption of fossil fuels is an estimated 412 EJ (IEA 2011), or 20% more than the annual yield from woody biomass. Of course, other forms of biomass are used for energy, namely crop residues, grass, animal dung, municipal waste, plant oils and grains/sugar to produce ethyl alcohol etc. Also wood and other forms of biomass are used for non-energy purposes. The following is my estimate of the biomass production and its current use.<br><br>Table 2. 2009: Estimated consumption of energy etc. and annual production of some biomass<br>Energy type Energy use EJ Total EJ Annual yield Accessible EJ Total EJ<br>Wood products 43.6 66.01 All woody biomass 343 6152<br>Residues/food 4.5 60.0<br>(food) Residues 89 -100 200 + 603<br>Dung 1.5 Grass/forage 67-70 1404 | See above. |
| 16047 | 7 | 88 | | 96 | | Why this extra anex. I would recommend to write an annex about the Power to Gas-Technology to use the surplus electricity as hydrogen or methan. My oppinion is that this will be much more important for the reduction of GHG emission in future. | Forward this comment to the TSU. |
| 16134 | 7 | 88 | 1 | 96 | 32 | The annex gives key information on potentials for mitigation. But is it not redondant with some parts of the agriculture-forestry chapter? | Moved to Chapter 11 |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 7483 | 7 | 88 | 1 | 96 | 32 | Bioenergy annex. – general comments.<br>In my opinion, this annex should start off with the existing potential and actual supply of biomass energy. The net primary production [NPP] of terrestrial plants is an estimated 53.2 Gt carbon, which is approximately 2000 EJ (Melillo et al 1993. Global climate change and terrestrial NPP. Nature, vol. 363 1993. Cited in Openshaw, K. 2011b). This is about half the total NPP of about 4000 EJ, the remaining NPP is from plants in oceans and other water bodies. Every year plants capture this atmospheric carbon and every year it is returned to the atmosphere through respiration, rot, burning and wildfires etc. (The carbon cycle). While a little can accumulate in woody biomass, roots of plants and in the soil, most is lost. Thus, the theoretical potential from terrestrial biomass is an estimated 2000 EJ, but using water-based algae to produce energy is now in the experimental stage; this expands the above estimate.<br>Woody biomass has accumulated over the years in closed and open formations and provides an annual yield, some of which is stored, but most of which is lost. I repeat the table that I gave in my review of chapter 11 AFOLU. | This is an interesting perspective, and highly valuable. However, I think it would be deeply misleading to start with these numbers. It suggests a perspective where we can start with the theoretical potential and then see how much works. But respiration, rot, burning, wildfires all have their biological and ecosystem function, including water management services for human settlements etc. Too much harm has already been done by single-mindedly focusing on a technology without its context. I think we are much better off starting with the context and that looking with sharp eyes |
| 7484 | 7 | 88 | 1 | 96 | 32 | Table 1. | 7485 | 7 | 88 | 1 | 96 | 32 | Thus, an estimated 18.35 Gt of accessible above-ground woody biomass (343 EJ) could be used every year without reducing the above-ground stock of wood (544 Gt containing more than 10,000 EJ). In contrast, the current consumption of fossil fuels is an estimated 412 EJ (IEA 2011), or 20% more than the annual yield from woody biomass. Of course, other forms of biomass are used for energy, namely crop residues, grass, animal dung, municipal waste, plant oils and grains/sugar to produce ethyl alcohol etc. Also wood and other forms of biomass are used for non-energy purposes. The following is my estimate of the biomass production and its current use. | See above. |
| 7486 | 7 | 88 | 1 | 96 | 32 | Table 2. 2009: Estimated consumption of energy etc. and annual production of some biomass<br>Energy type Energy use EJ Total EJ Annual yield Accessible EJ Total EJ<br>Wood products 43.6 66.01 All woody biomass 343 6152<br>Residues/food 4.5 60.0<br>(food) Residues 89 -100 200 + 603<br>Dung 1.5 Grass/forage 67-70 1404<br>Waste 0.4 Waste products 1-2 5<br>Total 50.0 126.0 500- 515 1020<br>Unaccounted for: 9805<br>Note 1. Includes an estimated 22.4 EJ for non-energy use in 2009. 2. This includes: inaccessible wood biomass; annual growth of roots; tree leaves; and annual plants on forest floor etc. 3. Not all residues are suitable for use. Food includes animal feed. 5. The annual terrestrial NPP is an estimated 2000 EJ. Therefore, 980 EJ has to be accounted for. It may cover all the 5 groups mentioned in the table. Thus, more NPP may be available for use. | See above. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 7487 | 7 | 88 | 1 | 96 | 32 | The accessible annual NPP is an estimated 500-515 EJ, but these may be minimum figures because some of the unaccounted for NPP may be accessible and useable. This highlights the urgent need for good biomass inventories. However, it also highlights the fact that much more existing NPP could be used for renewable energy purposes, rather than assuming that all additional biomass initiatives have to come from 'new' biomass schemes: this is what the present chapter conveys. | I think here could be a strong point: we need to look sharper at the exisiting resources for bioenergy. |
| 11959 | 7 | 88 | 1 | | | This is a very interesting section. I would question whether it belongs here or in another Chapter. In this Chapter it appears to give added weight to renewable energy. There is already a preponderance discussion on renewables which raises the wuestion of balance. Decision for the TSU but at written, Chapter 7 could easily be interpreted as arguing for massive substitution of existing energy sources with renewables. CCS is given lip service. In reality the scenarios discussion, which is excellent, and Chapter 6, cover the possibilities rather well. Consider conbining and reducing text. | Likely to be moved to Chapter 11. |
| 3076 | 7 | 88 | 15 | | | Why especially starch crops? (This seems like a US perspective)<br>How about oil crops? The latter is very important in the EU (rapeseed), Asian (palm), and South American (Soya) context. | Agreed. For space reasons we don't refer to any specific crops anymore. |
| 12158 | 7 | 88 | 23 | 25 | | Its necessary to include also "policy incentives". So, my suggestion is to use..."But policy incentives, advanced technologies and management practices,...". | Is inserted as suggested. |
| 3075 | 7 | 88 | 8 | 88 | 14 | Focuses on the importance of land management (largely); this is linked to more factors, e.g. institutional framework and governance. I suggest to explicitly make this link. | Considered. One specific sentence on land use (on sugar cane) has been deleted. Instead the following sentence has been inserted: "Success and failure of bioenergy deployment crucially hinges |
| 5742 | 7 | 88 | | | | When dealing with bioenergy (this comment applies actually to the whole report) there is a lot of work done by the FAO that should be considered. For example, regarding bioenergy iLUC I would suggest to add references to the fact that it is possible tackling this issue through certification and the need for other policy mechanisms, e.g. refer to the RSB/WWF/Ecofys work on low indirect effects certification:<br>http://rsb.epfl.ch/files/content/sites/rsb2/files/Biofuels/Working%20Groups/II%20EG/Low%20Indirect%20Impact%20Biofuels%20Certification%20Module%20-%20Field%20testing%20version%20-%20July%202011.pdf<br>http://rsb.epfl.ch/files/content/sites/rsb2/files/Biofuels/Working%20Groups/II%20EG/RSB%20IIEG%20-%20Certification%20Module%20for%20Low%20Indirect%20Impact%20Biofuels_20110907.pdf<br><br>This builds on the earlier responsible cultivation approach work, which may also be useful info:<br>http://www.ecofys.com/files/files/ecofysrcamethodologyv1.0.pdf.<br><br>More generally on ILUC, the Ecofys report prepared for GBEP is relevant:<br>http://www.globalbioenergy.org/bioenergyinfo/bioenergy-and-sustainability/detail/en/news/81766/icode/<br><br>There is also good work from Winrock, including:<br>http://www.globalbioenergy.org/bioenergyinfo/bioenergy-and-sustainability/detail/en/news/82038/icode/<br><br>There are also many more, including on ILUC but also other sustainability issues of relevance to the EST report:<br>http://www.winrock.org/clean_energy/publications.asp?BU=9054#s600. | Refer to ILUC policies (certification) in a paragraph in the last section. Cite FAO, prefer peer-reviewed literature when possible. It's difficult for product-oriented certifications to address the macro effect of ILUC adequately . The only product-level certification that seems to address ILUC is the idea of "responsible cultivation areas" in which output of prior services is maintained, but this doesn't conflates the decision to intensify with the decision to produce biofuels. Once intensification is achieved, food could also be planted... |
| 4661 | 7 | 89 | | 89 | | Merge 'traditional' and 'modern' biomass under one heading 'unprocessed biomass'. Exclude charcoal from this heading. It is processed biomass as is biogas, producer gas/water gas (gengas) and liquid products. | Good suggestion. See my suggestion. I prefer linking to GBEP and to whether the biomass is renewable or not. If you leave the two together, you lose the |

|---|---|---|---|---|---|---|---|
| 7085 | 7 | 89 | 17 | 89 | 29 | The discussion is missing an important overall point regarding the long-term benefits of biomass-based systems based on sustainable forest management principles. It is suggested that at this point in the text, the key finding from the Fourth Assessment Report be repeated - i.e. "In the long term, sustainable forest management strategy aimed at maintaining or increasing forest carbon stocks, while producing an annual yield of timber, fibre, or energy from the forest, will generate the largest sustained mitigation benefit". (Fourth Assessment Report, Report of WGIII, Executive Summary) | This section is on climate effects, not an integrated assessment statement that concludes. |
| 4662 | 7 | 89 | 17 | 89 | 17 | Stock dynamics. This whole paragraph is very misleading For example: “taking biomass out of forests, includes non-negligible stock dynamics ---“. While this may affect individual areas, for the tree population as a whole, it is neutral if only part or all of the NPP is removed. Also, there are many trees outside the forest, which are generally intensively managed and used. | This is a strong statement that we can only consider with supporting literature. RICH: if the ecosystem is approximately in equilibrium including the NPP, how does it remain so if a substantial fraction of NPP is removed? Ecosystems also accumulate C in deadwood, litter, and soil over time. Removing BAU NPP reduces the source for these pools. The only "free lunch" I see is to remove biomass that would otherwise decay quickly. Anders: Please note that the |
| 3079 | 7 | 89 | 17ff | | | Include Earles et al 2012, Nature Clim Change, to account also for C changes/fluxes of post use (forest C) | Sounds reasonable. Need to read that paper. RICH: Good point. The Earles paper is very good. Distinction between forest products use in developed vs |
| 3080 | 7 | 89 | 18 | 89 | 20 | Make clear that this is true for the outtake of any biomass, living or dead, not only for energy. Regular timber harvest creates carbon debts much "deeper" than bioenergy. This is why we need a correct baseline and a focus on residue material from such operations. | Good point. A comment has been inserted to reflect this. |
| 4663 | 7 | 89 | 18 | 89 | 20 | “The increased outtake for bioenergy purposes causes a period of increased CO2 emissions [and] carbon debt compared to leaving the forest standing and using fossil fuels ---“. This only occurs if the annual tree growth is exceeded or when there is a change of land use from forests to non-forests. Therefore, this statement should be modified. | I think the models of carbon stock dynamics take the annual tree growth into account. RICH: yes, see above. Anders: Also see above. Marginal vs average perspective. In Norway the annual sequestration of forest far exceed any bioenergy emission scenarios, but the marginal emission balance can be |
| 12914 | 7 | 89 | 24 | 89 | 24 | Could add reference (Zetterberg, L. Instruments for Reaching Climate Objectives – Focusing on the time aspects of Bioenergy and Allocation Rules in the European Union’s Emission Trading System. Ph.D. thesis, department of Earth Sciences, University of Gothenburg, 2011. SE-405 30 Gothenburg. Also available at http://gupea.ub.gu.se/handle/2077/26672. ISBN 978-91-628-8368-3) | What is the additional value of this? |
| 10754 | 7 | 89 | 31 | 89 | 31 | Change "… generally may be…" to "…is usually…." ? | Considered as suggested. |
| 2589 | 7 | 89 | 4 | 89 | 7 | Biomass production from aquatic algae is gaining interest from commercial and R&D institutions | Agreed, but that would be the wrong place to address this. Needs to go into |
| 3078 | 7 | 89 | 8 | 89 | 16 | This should be termed "carbon" neutrality (see e.g. Johnson 2009). Paragraph needs revision as the main message is blurry. E.g. the Creutzig et al. Assessment is value and appreciated but should be put in an extra sentence to avoid confusing the two phenomena that (1) biomass was considered carbon neutral in policy; and (2) in climate and economic models assessing policy choices. There are many more (recent) studies which address the full carbon aspect of bioenergy other than Hillier et al 2009; e.g. Mitchell et al 2012 and Hudiburg et al. 2011 | This paragraph focuses on climate and economic models not on policies. So I don't see any reason for confusion here. Also it should be climate neutrality, not carbon neutrality, because albedo effects are not related to carbon cycles. Citing good studies can be improved, yes. |

|---|---|---|---|---|---|---|---|
| 6695 | 7 | 9 | 19 | 9 | 22 | It should be noticed that voluntary approaches are indispensable for energy sector reform rather than regulary inteventions and creating market based approaches.<br>Recent studies show that the Japanese steel industry responded to the Kyoto target by launching a voluntary action plan in 1996 a year prior to the adoption of the Kyoto Protocol with challenging quantitative target: 10% reduction of energy consumption in 2010 compared to 1990. Since then, the steel industry has made stead progress toward achieving these goals. As a result, the energy consumption in 2008 was 11.5% less in comparison to the 1990 level (equivalent to 12.1% reduction in CO2 emissions).<br><br>See: Teruo Okazaki, Mitsutsune Yamaguchi (2011)<br>Accelerating the transfer and diffusion of energy saving technologies steel sector experience—Lessons learned<br>Original Research Article<br>Energy Policy, Volume 39, Issue 3, March 2011, Pages 1296-1304<br>http://www.sciencedirect.com/science/article/pii/S0301421510008827 | Taken into account - comment is obsolete. Overview of AR4 was deleted. |
| 9989 | 7 | 9 | 19 | 9 | 22 | Energy sector reform should include "voluntary target scheme" because there are successful examples of "voluntary target scheme" in the world. Each industry in Japan has voluntary target and the voluntary target scheme has played a big role, as described in (Yamaguchi, 2012, page35 and 154), (Manuel, 2010, page 6 and 13), and (Yamaguchi, 2010, abstract). In addition, there is also a successful example of "voluntary target scheme" in Netherlands, as shown in (Martijin, 2002, page162). These literatures are listed in the No63 line of this table.<br>On the other hand, market-based mechanism such as emission trading has several problems. Volatility of emission permit prices affects volatility of product prices as evidenced by fluctuating price developments in the EU-ETS. Therefore, the market-based policy tools of cap-and-trade cannot provide credible incentives for the technological change, as described in (Montgomery, 2005, abstract) and (Baldursson, 2009, page29). These literatures are listed in the No62 line of this table.<br>In addition, CO2 leakage caused by the implementation of the ETS happened actually through international transfer of industry , as shown in (Rosendahl, 2011, abstract), (Aichele, 2012, page336), and (Peters, 2011, page1). These literatures are listed in the No50 line of this table. | Taken into account - comment is obsolete. Overview of AR4 was deleted. |
| 9367 | 7 | 9 | 19 | 9 | 22 | It should be deleted because regulatory interventions are not necessarily needed. In Japan the voluntary action policy does work successfully in the industry sector. | Taken into account - comment is obsolete. Overview of AR4 was deleted. |
| 16781 | 7 | 9 | 21 | | | This "creating market-based approaches such as emissions trading" appears almost as an afterthought. Insofar as this is a key point of negotiation for some, could more effort be made to discuss how this impacts or interacts with the energy system, how it is likely to respond? | Taken into account - comment is obsolete. Overview of AR4 was deleted. |
| 15354 | 7 | 9 | 22 | | | Perhaps it would help to be clear that security being referred to is energy security as can be confused with other forms of security related to e.g. political unrest | Taken into account - comment is obsolete. Overview of AR4 was deleted. |
| 2256 | 7 | 9 | 22 | 28 | 14 | By far the most useful section of the whole report | Noted. |
| 18044 | 7 | 9 | 22 | 9 | 22 | add "or carbon taxation". In economic terms, an instrument based on quantities (emissions trading) is no more "market-based" than one based on prices (taxation). | Taken into account - comment is obsolete. Overview of AR4 was deleted. |
| 6173 | 7 | 9 | 28 | | | While the concerns of differing data gathering methodologies are valid, it's strange to bring it up here and not revisit it. Why point it out and then immediately start mixing and matching IEA and DOE sources? Issues like this are best addressed in a methodology section or chapter. | A reference to the Methodological Annex is made where the issue is dealt with. The point is raised here to make readers |
| 18501 | 7 | 9 | 28 | 9 | 28 | What is the IPCC's approach to deal with these different statistical sources? Have we selected one data set to use over the others? If so, why? | This is dealt with in the Methodological Annex. It is specified in the caption to |
| 17206 | 7 | 9 | 29 | | | The numbers are misleadding. Keep to the standard of energy accounting chosen for AR5. | We are assessing the literature. There are different numbers in different sources. And this disagreement |

| 17747 | 7 | 9 | 3 | | | give a reference for 20US$/ton CO2 | Taken into account - comment is obsolete. Overview of AR4 was deleted. |
| 5942 | 7 | 9 | 3 | | | The value of $20/t at which a large mitigation potential of low carbon technologies is reported to exits should be qualified to specify whether it applies to variable RE technologies and if so whether it includes the cost of backup | Taken into account - comment is obsolete. Overview of AR4 was deleted. |
| 2822 | 7 | 9 | 33 | 9 | 35 | Lumping together unconventional fuels with renewables, as in this sentence, is misleading – they do not have the same implications for diversity (or emissions). | The statement is correct. It does not sum them up. It just points on growing |
| 12588 | 7 | 9 | 4 | | | Should it be mentioned that we actually need petroleum products for the production of renewable energy systems? Plastics, rubber etc. | Taken into account - comment is obsolete. Overview of AR4 was deleted. |
| 18194 | 7 | 9 | 4 | | 11 | Add to paragraph: Conventional oil reserves will eventually peak, but it is uncertain exactly when and what will be the nature of the transition to alternative liquid fuels. Conventional natural gas reserves are larger by scale, but less evenly un evenly distributed across regions. Unconventional oil and gas resources are abundant, with uncertain future for the scale of their economic development (IEA, 2012). More reliance on coal will demand viable CCS (Comment) technologies if GHG emissions from its use are to be limited. There are many barriers for nuclear energy to contribute more to GHG mitigation: long-term fuel resource constraints without recycling; economics; real costs (Comment) safety; waste management; security; proliferation, and adverse public opinion. Comments (CCS): Some research about Carbon Capture and Use-CCU, have already started. This could be a more practical solution than CCS. Comments (real costs): Including whole decommissioning, decontamination and alternative land-use costs, and also the updated costs of the latest technology and safety. | Taken into account - comment is obsolete. Overview of AR4 was deleted. |
| 18195 | 7 | 9 | 4 | | 11 | Alternative paragraph: Conventional oil reserves will eventually peak, but it is uncertain exactly when and what will be the nature of the transition to alternative fuels. Conventional natural gas reserves are larger by scale, but un evently distributed across regions. Unconventional oil and gas resources are abundant, with uncertain future for the scale of their economic development (IEA, 2012). More reliance on coal will demand viable CCS technologies if GHG emissions from its use are to be limited. There are many barriers for nuclear energy to contribute more to GHG mitigation: long-term fuel resource constraints without recycling; economics; real costs safety; waste management; security; proliferation, and adverse public opinion. | Taken into account - comment is obsolete. Overview of AR4 was deleted. |
| 9630 | 7 | 9 | 4 | 9 | 7 | If this is a summary of AR4, why is IEA, 2012 being referred to? I agree with the statement, but was it the same in AR4? | Taken into account - comment is obsolete. Overview of AR4 was deleted. |
| 4101 | 7 | 9 | 4 | 9 | 4 | I assume "Recoverable conventional oil reserves … " is meant. | Taken into account - comment is obsolete. Overview of AR4 was deleted. |
| 6170 | 7 | 9 | 4 | 9 | 4 | "Conventional oil reserves will eventually peak …" is a misleading way to begin the paragraph. As much of the subsequent discussion makes clear, unconventional reserves are accounting for an increasingly larger share of total production, in some cases over half. See p. 40, line 30. In this context, talk about "peak production" for a portion of the total production makes no sense, suggesting looming market crises that may or may not emerge. | Taken into account - comment is obsolete. Overview of AR4 was deleted. |
| 16777 | 7 | 9 | 4 | | | Why say "Conventional oil reserves will eventually peak" knowing that many people believe this is true and a harbinger of either salvation (lower emissions) or disaster (run out of oil)? Within this chapter, in section 7.4, there is a discussion that at first seems to indicate we have a peak oil problem, but then completely refutes the point with a very sound discussion of resource economics and the fact there are huge supplies from more costly sources that become attractive to exploit as the lower cost supplies are exhausted and prices increase. Peak oil is only true if confined to discussing particular price ranges, as in "we are likely to run out of oil that is economic to exploit at market prices below $20/barrel". This chapter could be greatly improved if the debate held on the pages was clarified. | Taken into account - comment is obsolete. Overview of AR4 was deleted. |
| 16778 | 7 | 9 | 4 | | | Perhaps you can begin this discussion by simply noting the following: Nearly all energy sources involve constraints or have associated trade-offs. | Taken into account - comment is obsolete. Overview of AR4 was deleted. |

|---|---|---|---|---|---|---|---|
| 4666 | 7 | 90 | 33 | 90 | 33 | Line 33. Replace 'slow' by 'long'. | Slow is appropriate here. An alternative is "long rotation period" but that mean to |
| 11380 | 7 | 90 | 33 | 90 | 35 | The question of advantage/disadvantage of short/long rotations is in connection to bioenergy somewhat irrelevant, as industrial wood demand is usually the driver for harvesting. In energy wood harvest there is rather a choice whether in addition to industrial wood harvest to collect the residues (branches, crown, stumps) or not. Thus the relevant question is: what is difference in albedo and carbon balance between the cases of totally cleared harvest site vs. cleared site except that residues are left. | Not sure. What do others say? I read this as a particular case of estimating delta from BAU, which he assumes includes industrial wood harvesting. So the bioenergy case involves only the residues. With that baseline, I agree with him. It will be difficult to squeeze this in, though... It is well understood that industrial wood is the economic driving force for forestry activities today. In situations where no whole stem fractions are used for bioenergy |
| 5237 | 7 | 90 | 35 | | | More site specific information confirming this statement can be found in: LOHILA, A., MINKKINEN, K., LAINE, J., SAVOLAINEN, I., TUOVINEN, J.-P., KORHONEN, L., LAURILA, T., TIETÄVÄINEN, H., LAAKSONEN, A. 2010. Forestation of boreal peatlands – impacts of changing albedo and greenhouse gas fluxes on radiative forcing.. J. Geophys. Res., 115, G04011, doi:10.1029/2010JG001327. | Anders: We can add this reference. |
| 3081 | 7 | 90 | 37 | 90 | 39 | Depends on more than 2 factors: The type of biomass used (green tree vs. harvest residues vs.insect/disease affect trees) (Lamers et al 2012); Prior land use (Fargione et al. 2008; Lapola et al. 2010; Don et al. 2011); Sequestered carbon volume in the soil and plant stock prior to harvest (depending on biome, tree species, forest age structure) (Harmon et al. 1990; Bernier and Paré 2012), in combination with harvesting intensity i.e. outtake/harvest level (Mitchell et al. 2012); Plant (re-) growth rates (influenced by site-productivity and management practices) (Cherubini et al. 2011), and rotation cycles (Mitchell et al. 2012); Carbon dynamics on the site (longer payback for cold climate and coarse material) (Bernier and Paré 2012); Wood use: (1) efficiency of usage and (2) additional emissions for converting biomass into energy and non-energy products, (3) carbon emission rates and efficiency of the respective products replaced (Marland and Marland 1992; Schlamadinger and Marland 1999; Mitchell et al. 2012) | No disagreement, the 2 factors summarize the more detailed list of factors here. Also these detailed list is mostly covered in the previous section. RICH: Agreed. |
| 4667 | 7 | 90 | 38 | 90 | 39 | Most of the wood harvest systems, be they from natural forests, plantations or farm trees etc. will not cause a land use change. New planting may be in degraded areas and therefore, there should be an increase in sequestrated CO2. | Unclear how one can say "most" here. I'd say "some" is more appropriate. In any case what existed before the planation? What replaces the natural |
| 11378 | 7 | 90 | 39 | 90 | 39 | Add sentence to the end: The efficiency of the bioenergy system in displacing emissions compared to the fossil one can be characterized by the so-called displacement factor (Marland and Schlamadinger 1997). | Too technical. |
| 5236 | 7 | 90 | 4 | | | Please, for new information add the references: Pingoud, K., Ekholm, T., Savolainen, I. Global Warming Potential (GWP) factors and warming payback time as climate indicators of forest biomass use". Mitigation and Adaptation of Strategies for Global Change (3 November 2011), pp. 1-18. | 4664 | 7 | 90 | 5 | 90 | 6 | ---"a biogenic CO2 emission pulse generates radiative forcings in timescales equivalent to regrowth periods ---". This is only considering individual trees or individual areas. The dynamics of the whole population in the area have to be considered and therefore, the 'relative forcing' may be negligible or even negative! | This statements assumes that the removal of carbon stock at one place is compensated by increased uptake somewhere else. I cannot follow this logic. This is a classical landscape vs single stand discission. We have a new paper fortcomming bridging this. His take is that the net flux is zero if the |
| 11377 | 7 | 90 | 8 | 90 | 8 | Add sentences: Using GWP or other radiative forcing or temperature based metrics, emission factors for harvest-residue-based bioenergy can be estimated in proportion to the business as usual baseline where residues are left on site (Pingoud et al. 2012). In case the time interval of interest is fixed, the emission factor could basically integrate the climate impact of the dynamic carbon debt and all the non-ghg climate forcers into a single CO2 eq number. Reference: Pingoud, K.; Ekholm, T.; Savolainen, I. 2012. Global warming potential factors and warming payback time as climate indicators of forest biomass use. Mitigation and Adaptation Strategies for Global Change 17: 369–386. Springer. doi-link: 10.1007/s11027-011-9331-9 | That is interesting, can we get this into one single sentence?On the other hand, I am worried that we get too much into detail; we need to shorten rather than getting longer. They are mixing scenario analysis and characterization factor development. Their approach is not consistent with WGI definition of metrics |
| 12915 | 7 | 90 | 8 | 90 | 8 | The establishment of new forest or energy crops on fallow land may both build up new carbon stocks, thus having a negative radiative forcing, and provide bioenergy. | To be integrated, see also AF's comments. Crucial to not ignore informal land rights. depends on land use history. There may not be much soil C seq unless the land was recently cropped. Also, if in the baseline the land would return to production relatively soon, using it for energy crops could be |
| 6922 | 7 | 90 | 23 | 90 | 35 | Ensure consistency and avoid overlap with WGI AR5, Chapters 2/6/8 and the WGI assessment of the physical science basis of changes in land cover etc. on radiative forcing. | could shorten the text and refer to these chapters, but I haven't seen the WGI documents. Do not have latest version, but could not see overlap of concern in a previous version. (Please get hold of |
| 18648 | 7 | 91 | | | | Page 91: A rebound effect of bioenergy on the use of fossil fuels is discussed. The problem is in reality the same for other sorts of renewables, efficiency measures as well as fuel shifts so there is no reason to couple the challenge to biofuels. It just shows that a single policy or action will not handle the problem, that there is a need for policy packages. As indicated there are means to handle rebound effects. | Agreed. it's still not clear to me how taxing in the policy region affects macroeconomic rebound effects. Agree with the comment made. |
| 4669 | 7 | 91 | 1 | 91 | 3 | "Biospheric C losses --- can be in some cases more than 100 times larger than the annual GHG savings ---". These are extreme cases, generally, the GHG savings are much larger, and in most cases substantially larger than the C losses. This statement denigrates tree planting and management. | Literature needed here. |
| 13301 | 7 | 91 | 26 | 91 | 48 | I agree that this section should be moved to somewhere else, and should broaden the rebound effect discussion - in this context, it should also cover the downward pressure on coal prices that would result from mitigation scenarios, in addition to the equivalent situation for oil | If moved somewhere else, we should ensure that fuel market effects are covered, not just efficiency. Agree to move displacement effects out of this |
| 2853 | 7 | 91 | 26 | 91 | 48 | Although I believe the bioenergy annex could be shortened or relocated, the issue of rebounds does, as suggested here, deserve systematic discussion and this should of course include efficiency rebounds. More generally, the impact of all the various options at system level needs consideration. | Agreed about need for system discussion for all mitigation strategies. see above line. |
| 3082 | 7 | 91 | 26 | 91 | 38 | It is fair to point out this discussion, but we should still remain aware of the dimensions. So far modern bioenergy constitutes a marginal fraction as compared to fossil fuel; this is true to liquids compared to oil as well as solids compared to e.g. coal. The economic discussion is therefore largely theoretical. To my knowledge, it has not yet been proven empirically in any study that e.g. wood pellet consumption in the EU has lead to a change in (regional, EU, or even global?!) coal consumption or prices. | Exactly that is the point: If coal consumption etc. doesn't go downward, bioenergy is supplementary not complentary to fossil fuels. yes, see York, 2012 Nat. Clim. Change doi: 10.1038/nclimate1451: The problem is |

| 3646 | 7 | 91 | 26 | 92 | 4 | Move to Chapter 5.9.2. | Noted, consideration under discussion. |
| 3807 | 7 | 91 | 4 | 91 | 6 | Please, consider reading Pacca and Moreira, 2011 paper. - Pacca, S. and J. R. Moreira, 2011. A Biorefinery for Mobility? Environ Sci Technol. 2011 Nov 15;45(22):9498-505. | Noted, consideration under discussion. |
| 17380 | 7 | 91 | 48 | | | be avoided by cap… | Is related to the rebound thing. |
| 4670 | 7 | 92 | 10 | 92 | 10 | "Around 2.7 billon people relied on [traditional] biomass in 2008". This figure is an underestimate, even for household cooking. Wood and other forms of [traditional] biomass are used for heating, especially in northern latitudes. It is also used by the service sector and formal and informal industries for cooking, warming and to provide process heat, especially in developing countries. | Of no help, if no better literature is provided. |
| 4671 | 7 | 92 | 15 | 92 | 16 | '--- reducing both black carbon and CO2 emissions by 60% ---." The main causes of black carbon are: wild fires and emissions from vehicles. I agree that improved biomass devices should be a major push to improve the health of the users and reduce energy consumption for particular tasks. But, clearing the forest floor of debris and using it for energy may prevent many wild fires and provide a useful raw material. Also, black carbon and biochar help to improve the productivity of the land. Soot could be collected from chimneys and spread on the land and it may be cheaper than producing biochar. | Ok. Let's try to integrate this comment, very briefly. |
| 4672 | 7 | 92 | 15 | 92 | 16 | "Co-benefits accrue from improved indoor and local air quality and time savings for those collecting fuelwood, typically women and children ---". Fuelwood is not only collected for own use, but for sale. | Good point. |
| 3808 | 7 | 92 | 16 | 92 | 16 | Please, consider reading Pacca and Moreira, 2011 paper. - Pacca, S. and J. R. Moreira, 2011. A Biorefinery for Mobility? Environ Sci Technol. 2011 Nov 15;45(22):9498-505. | Sounds reasonable. Need to read that paper. |
| 7086 | 7 | 92 | 20 | 92 | 21 | As support for the statement "...the health and environmental gains from collection and proper management through combustion or anaerobic digestion can be significant you could cite Gaudreault ,et. al. (2012). Life cycle greenhouse gas and non-renewable energy benefits of kraft black liquor recovery. Biomass and Bioenergy, http://dx.doi.org/10.1016/j.biombioe.2012.06.027 . | Sounds reasonable. Need to read that paper. |
| 13302 | 7 | 92 | 22 | 92 | 39 | For the long-term (e.g. 2050), given high expected carbon prices and constrained biomass availability, it is useful to frame the argument around where bioenergy should be used in terms of the quantity of abatement derived from using a tonne of biomass in different applications. By doing this one can incorporate bioenergy with CCS into the same analytical framework as uses that simply displace fossil fuel consumption (and also with non-energy uses, such as using wood as a construction material). Using this framework, bio CCS provides greater abatement than most other uses, primarily due to the high carbon content of solid biomass relative to other fuels (e.g. natural gas) - see Chapter 4 of http://www.theccc.org.uk/reports/bioenergy-review for a grey literature version of such analysis | CCS is discussed somewhere else in Ch. 7. Need to refer to this. |
| 10757 | 7 | 92 | 26 | 92 | 26 | What is meant by "… lower GWP effects…" ? This should be reworded. | Specify better. Same as above. |
| 17381 | 7 | 92 | 36 | | | sugar stream goes… | Is corrected. |

| 10756 | 7 | 92 | 6 | 92 | 6 | What is meant by "… provide significant GWP benefits,…" ? This should be reworded. | True. The statement is only correct with additional conditionalities that e.g. avoid rebound effects. The thing here is terminology. Jan is a metric guru. GWP is a well defined climate metric. The use of this in some sentences in the |
| 5739 | 7 | 93 | 1 | 93 | 2 | A similar conclusion can be found in the FAO report on Algae-based biofuels - Applications and co-products (http://www.fao.org/docrep/012/i1704e/i1704e00.htm) | Add the reference |
| 4674 | 7 | 93 | 11 | 93 | 11 | "Biofuels include ethanol and biodiesel ---". Methanol should not be neglected, neither should liquid products from gengas. | Ok. |
| 4675 | 7 | 93 | 12 | 93 | 12 | Primary resource management. The most important primary resource management output has been neglected, namely improved tree management and increased use of NPP from existing woody growing stock. | Is covered in the forestry section. |
| 5740 | 7 | 93 | 22 | 93 | 22 | IRENA reports even larger variation from 8 to 400 EJ by 2050. | Noted, consideration under discussion. |
| 4676 | 7 | 93 | 22 | 93 | 22 | "--- with global estimates ranging from 25 to more than 200 EJ/yr in 2050 (Table 1 – Ch 11)". I think this is Table 11.3! However, this table is difficult to follow at present. | Not helpful. What are better references? |
| 17382 | 7 | 93 | 24 | 93 | 25 | (e.g., animal feeding) or if soil… | Is corrected. |
| 3083 | 7 | 93 | 29 | 93 | 37 | Please consider my comment No7: there are many options to create bioenergy benefits from forestry. It depends on the context, i.e. feedstock, alternative land and harvest use, etc. (see No7 for details). | Ok. Let's try to integrate this comment, very briefly. |
| 11381 | 7 | 93 | 29 | 93 | 37 | An extensive list of climate forcers associated with forests should be given. Relevant references needed. | Read his paper, and see. a reasonable point. I emailed Kim to ask for |
| 4677 | 7 | 93 | 31 | 93 | 33 | "Biomass potential estimates range from 0-100 EJ/yr in 2050. Realizing higher-end potentials --- implies increasing the forest output to several times the present global industrial roundwood production ---". Conventionally, roundwood production is divided between 'fuelwood' and 'industrial roundwood'. Fuelwood is the largest percentage. This phrase should be changed to 'global roundwood production'. However, in Table 2 above, the potential accessible wood energy is an estimate 343 EJ/yr, much larger than the maximum of 100 EJ quoted above. Therefore, in my opinion, the potential with increased plantings could be in the range of 250-300 EJ from wood alone. | the 343 EJ/yr estimate, to my best understanding, is a theoretical one, and doesn't respect ecosystem functioning, see above. |
| 5238 | 7 | 93 | 37 | | | Site specific information confirming this statement can be found also in: LOHILA, A., MINKKINEN, K., LAINE, J., SAVOLAINEN, I., TUOVINEN, J.-P., KORHONEN, L., LAURILA, T., TIETÄVÄINEN, H., LAAKSONEN, A. 2010. Forestation of boreal peatlands – impacts of changing albedo and greenhouse gas fluxes on radiative forcing.. J. Geophys. Res., 115, G04011, doi:10.1029/2010JG001327. | Sure, it's a slightly older source still post-AR4. |
| 2590 | 7 | 93 | 38 | 96 | 32 | The text does not consider the new generation of biofuels: its potential in contributing to climate changes adaptation and mitigation. Jatropha as example is promising plant, which can used for oil production, and as well as green barrier against desertification in the arid zone. Many field experiments are prominsing. | More focus on new biofuels, ok. But need references. |
| 17759 | 7 | 94 | | | | This is an extremely important chapter, lots of information in it; but the final end of it is somewhat abrupt | Noted, consideration under discussion. |
| 4678 | 7 | 94 | 14 | 94 | 14 | "---increased production of biofuels will have negative implications on biodiversity" ---. The word will should be changed to may, because biofuels can be made from existing NPP (e.g. wood and residues) by thermal distillation. | Accepted. |
| 4679 | 7 | 94 | 20 | 94 | 22 | This whole paragraph and in fact the whole section on sustainable development is very negative. How can residues be harvested at 'unsustainable levels'? | Residues have their own function in ecosystems. I (Esteve) agree with the reviewer's note. I will bring a more positive tone by highlighting benefits in |
| 17758 | 7 | 94 | 21 | | | change the words "land is converted" to "land is irreversibly converted" | It is not clear that conversion is irreversible. Hence, this adjective should |
| 3809 | 7 | 94 | 33 | 94 | 47 | Only negative impacts of bioenergy are discussed. The text has to be fair. | Very general comment. |

|---|---|---|---|---|---|---|---|
| 7749 | 7 | 94 | 45 | 95 | 2 | I strongly recommend that Brazlian papers on this issue are investigated. Palm oil in Brazil is not produced by large farmers. This is an important production in isolated communities in the Amazon. It has absolutely nothing to do with soybean production. Please, access the issue adequately. | We cannot discuss individual countries. We should have a balanced statement, citing a review paper. |
| 5741 | 7 | 94 | 9 | 94 | 99 | The recently completed Bioenergy and Food Security Criteria and Indicators (BEFSCI) project of the FAO has identified a set of good practices and policy options on sustainable bioenergy production that foster rural development and food security (including agro-forestry practices). (http://www.fao.org/docrep/015/i2596e/i2596e00.pdf but also http://www.fao.org/bioenergy/foodsecurity/befsci/en/ in general) | Read this. |
| 15357 | 7 | 94 | 12 | | | Reference to definitions of food security and food security policies would add more value to this section as this plays a significant role in policy decisions to promote large scale biofuel production | Noted, consideration under discussion. |
| 3810 | 7 | 95 | 11 | 95 | 11 | Replace "desposition" by "participation". | Participation seems to be inappropriate |
| 4681 | 7 | 95 | 17 | 95 | 18 | Again the word 'Traditional' is used. Does this include wood used for heating purposes by households, the service sector and with district heating? Why make the distinction? | See suggestion. Agree with dropping charcoal (the charcoal there was the |
| 3811 | 7 | 95 | 25 | 95 | 25 | Define what "advanced biofuelsl" means. For the USA, first generation ethanol from sugar cane produced in Brazil is known as "advanced ethanol". | agreed that "advanced" needs definition or replacement with more specific terms. |
| 3812 | 7 | 95 | 26 | 95 | 26 | Check figures regarding growth between 2008 and 2012!!! | Noted, consideration under discussion. |
| 7750 | 7 | 95 | 3 | 95 | 7 | It is also not easy to establish a pattern that needs to be reproduced for biodieselproduction for all kinds of oil seeds in all parts of the world and this needs to be addressed. Implementing certification patterns from one country in another one may be extreamly dangerous an inadequate. | Reflect this. Esteve is willing to review the most up-to-date literature on the pros and cons of certification schemes, particularly the experience of soy and oil |
| 4682 | 7 | 95 | 36 | 95 | 37 | "In the absence of growth-enhancing measures, increased biomass extraction reduces forest C stocks". I have tried to demonstrate that the existing accessible NPP, especially from wood is more than the forecasted demand for biomass energy. Therefore, I strongly disagree with the statement that 'increased biomass extraction reduces forest C stock. This only occurs when there is a change of land use. In such circumstances, it is better to salvage this stock, rather than burn it in situ. | Noted, consideration under discussion. |
| 3813 | 7 | 95 | 41 | 95 | 42 | Remove sentence since it is a repetition from above. | The sentence above (the first |
| 3814 | 7 | 95 | 42 | 95 | 44 | Check if the statement is really applicable to degraded lands. Recovery of degraded land is considered as a remarkable achievement, which had not be successful when providing food and feed at competitive cost. | Need to present both sides. |
| 4680 | 7 | 95 | 9 | 95 | 10 | "Altogether, by 2050 global primary bioenergy could contribute 20 to 250 EJ --- and by 2100, 10 to 330 EJ ---". This does not fit with the facts. At present, bioenergy consumption is an estimated 50 EJ (see Table 2 above). Thus, you are predicting that with a 'minimum' bioenergy forecast its consumption could fall to 20 EJ by 2050 and further decline to 10 EJ by 2010. This is extraordinary! What will take its place? Electricity from hydro, solar and wind? What will happen to the NPP? If it is not used, there is a good chance that 'wild fires' will consume some of it and this could seriously affect the habitat for animals, especially humans. On the other hand, the 'maximum' bioenergy forecasts predict that consumption could rise to 250 EJ by 2050 and to 330 EJ by 2100. But these numbers are still less than the accessible NPP 500-515 EJ (Table 2 above). And this does not take into account new investment in biomass planting. The minimum figures do not agree with the figures in the next paragraph (l 16-18). I think the forecasts are neglecting existing net primary production, assuming that future biomass production will come from new biomass production initiatives. I think this section should be amended to take into consideration exiting biomass growth (NPP). | Noted, consideration under discussion. |
| 3815 | 7 | 96 | 16 | 96 | 18 | There are activities being carried out by a large actor in the sugar cane sector in Brazil - ETH Bioenergia involving the use of large degraded areas for sugar cane crop. Please, check the web through the company name plus sugar plus Brazil. | Unfortunately, we don't have the space to discuss specific activities (nor should we cite company websites) |

|---|---|---|---|---|---|---|---|
| 3816 | 7 | 96 | 19 | 96 | 21 | See EPA, 2010 where it is shown that sugar cane plantation in Brazil, responsible for 1/3 of global ethanol production has excellent energy balance and saves more than 60% of the GHGs emissions due fossil fuel replacement. Thus, tour statement is not supported by credible publications. EPA, 2010 - EPA (Environmental Protection Agency). Renewable Fuel Standard Program (RFS2), Regulatory Impact Analysis. Assessment and Standards Division, Office of Transportation and Air Quality. EPA-420-R-10-006, February (2010). | The replacement effect is debatable. As pointed out, this is a more "sceptical" scenario. the EPA analysis is in a projected 2022 world that assume no more burning of sugarcane trash and other arguable assumptions about fossil fuel displacement, and yield growth, and |
| 4683 | 7 | 96 | 21 | 96 | 22 | “For example, unfavorable land-use changes associated with bioenergy development can lead to very high GHG emissions (possibly exceeding 500 Gt [C or CO2?]) Melillo et al 2009 ---“. Of course, if tropical high forests are cut down to grow soy bean or sugar cane for biofuels about 100 to 150 t of carbon will be lost per ha. Assuming that the GHG emissions are Gt C, this means that between 3,333 and 5,000 million ha of tropical high forest will be felled and converted to such crops. The land area of Brazil is 851.2 million ha. Therefore, a country 4 to 6 times the size of Brazil will be converted to biofuel crops if the C emissions are up to 500 Gt C! IF 500 Gt refers to CO2, then the area required would range from 910 to 1,364 million ha, still in excess of the land are of Brazil! It is surprising that Melillo was one of the authors of the above prediction, seeing he estimated that the NPP of land based plants is an estimated 53.2 Gt C, of which 43% is in the tropics (Openshaw, K. 2011b). Incidentally, a book on photosynthesis by Hall and Rao agree with Melillo estimate for NPP. (Hall D.O. & Rao K.K. 1994). Photosynthesis, fifth edition, Cambridge University Press. ISBN 0-521-43622-2). In my opinion, this annex does not take in to consideration existing net primary production. It assumes that existing biomass production is hardly sustainable and that increased bioenergy demand will have to come from additional investment. I have tried to demonstrate that there is a considerable surplus of existing NPP and with simple training, improved management and allowing local people access and control over forests and other lands, much more annual biomass growth could be used sustainable. This should assist in poverty alleviation. | Noted, consideration under discussion. |

|---|---|---|---|---|---|---|---|
| 2764 | 8 | | | | | Potential indicative Technical potential EL: up to 100 % is not possible => change to 30 % (because only rail and urban light vehicles are well suitable, urban buses to some degree and some applications exist in other transport modes, but most of transport energy demand can not be met by electricity) | Numbers will be revised for the Second-order Draft. |
| 2765 | 8 | | | | | Potential illustrative add methane: Pakistan: over 80 % road transport energy use methane (currently natural gas, but RM possible) | Numbers will be revised for the Second-order Draft. |
| 2766 | 8 | | | | | Cost-effectiveness best examples add carbon efficiency RM negative and energy efficiency RM negative | Text will be modified for the Second- |
| 2773 | 8 | | | | | 2. replace CNG and LNG => renewable methane (incl. CBG and LBG) | Agreed. Changed. |
| 4076 | 8 | | | | | Summary of Sustainable Transport Measures… Even at 150% zoom of the page, the table is difficult to read. Delete this table or make this better to read. There is also duplication of this with material from pages 59-61. | Accept - is only a draft |
| 4051 | 8 | | | | | Table 8.6.2 Summary of costs and potentials for the transport sector. Range of potentials are portrayed optimistically as "… up to x% efficiency or emission reduction improvement." | Table will be revised for the Second-order Draft. |
| 4067 | 8 | | | | | Item 6. Modal Shift by cycling and Walking. "Rapid short term growth already happening in many cities." "Some growth [walking]." This may be true in some cities in Europe or North America, but the urban form of many cities and the distances for commuting does not enable this. | Disagree. Always short trips even in dispersed cities. Not just commuting which is 30% of transport task. |
| 4052 | 8 | | | | | Figure 8.2.1. If this figure does not provide realistic projections for current and future emissions, then why include this? There is a significant potential for this to be mis-quoted or used by mistake by future researchers. Perhaps a qualitative comparison, ratios, or a pie-chart adapting the data would be better (Unger et al 2010). | Will check |
| 5329 | 8 | | | | | No discussion of hydrogen fuel cell HDVs. This is the only way to reduce HDV emissions to zero and could be very cost-effective given greater efficiency of fuel cells and high mileage of HDVs. This is a major omission, even if the authors take the view that technical or economic barriers are prohibitive this technology should be discussed. | Well covered in 8.3.2.2 and elsewhere. I agree….especially given cost reductions for fuel cells |
| 17889 | 8 | | | | | 5. In large cities in the WHO European Region, air pollution causes 100 000 premature deaths in adults annually[i]. Of these, several thousand are attributable to transport-related air pollution, particularly in urban areas. Exposure to air pollution leads to an increased risk of cardiopulmonary disease and a reduction in life expectancy of 9 months or more for people living in European cities[ii],[iii]. | Noted. This issue is now covered in more detail in Section 8.7, particularly the table. Further, this is summarized in Table 6.5 in Chapter 6. |
| 17890 | 8 | | | | | 5. The health effects of hazardous noise exposure are considered to be an increasingly important public health problem. About 40% of the population in the EU-15 countries are exposed to road traffic noise with an equivalent sound pressure level exceeding 55 dB(A), and 20% are exposed to levels exceeding 65 dB(A) [iv]. Long-term exposure to noise has been associated with a wide range of adverse effects on human health and well-being. | Noted. This issue is now covered in more detail in Section 8.7, particularly the table. Further, this is summarized in Table 6.5 in Chapter 6. |
| 17891 | 8 | | | | | 5. In the WHO European Region, road traffic deaths and injuries have a heavy public health burden with about 118 000 deaths and about 2.4 million injuries per year. The cost of road traffic injuries to society is estimated to range from 0.4% to 3.1% of a country's gross domestic product.[v],[vi],[vii] | Accept |
| 17892 | 8 | | | | | 5. The increasing dependence on motorized road transport has also indirect effects, notably by reducing the possibilities for active travel. On the other handHowever, there is great potential for active travel in European urban transport systemscities, 50% of trips by car being shorter than 6 km and 30% shorter than 3 km: in European cities, more than 50% of trips by car are shorter than 6 km and 30% shorter than 3 km, distances conveniently covered by cycling or walking, often at comparable speeds[viii]. | Accept |
| 17893 | 8 | | | | | 5. Promoting active travel for everyday transport has been demonstrated to lead to substantial public health gains:. Studies showed that regular commuters who walk or cycle register a reduction of 20-30% of coronary heart and cardiovascular diseases of 20-30%, of 30% of colon cancer of 30% and of almost one third in mortality[ix],[x]. | Accept |
| 17894 | 8 | | | | | 5. A shift to active transport (walking and cycling) and rapid transit/public transport, combined with improved land use, can yield much greater immediate health "co-benefits" compared withthan improving fuel and vehicle efficiency. | Relate to 8.7.1.2. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 17895 | 8 | | | | | 5. The key to a successful sustainable transport system lies in combining policies that maximize co-benefits for health through a combination of technical and non-technical measures. Action need to be calibrated at the different levels of application, efficacy and scale that can be local, urban, regional, national and international. For air pollution and climate change, all scales are involved. | Relate to 8.7.1.2. |

|---|---|---|---|---|---|---|---|
| 15741 | 8 | | | | | General remarks on Chapter 8:<br>A complete list of abbreviations is missing (CO2, BEV, LGV, ICE, EV, FCV …)<br>I like the cautious approach of the authors on the mitigation potential of the transport sector in the short-term. (This has also entered the general summarizing chapter on mitigation options: chapter 6, p.60, line 32 and ch.6, p.76, line 8.)<br>I also agree that, as a consequence, CO2-policies should focus on R&D and other preparatory measures for future changes. At the same time, policies should also speed up incremental developments of traditional road engines in order to help curbing the increase of CO2 emissions by the sector.<br>Finally, I also agree with most of the text. It gives a nice overview of the technological and other mitigation options in the transport sector.<br>However, I miss a comprehensive economic perspective. Information about the costs of different mitigation options is sparely given, and a comparison of cost-effectiveness of measures has not been attempted. In my view, this should belong to a WGIII transport chapter (and to all the other sectoral chapters 7 to 12, whereas it seems to be missing everywhere). If no or only a few background studies exist on this topic, the text should try to bridge the gap by at least highlighting the importance of this issue and the need for such studies.<br>This pertains particularly to the intermodal issues: p.30-33 (sections 8.4.2.3 and 8.4.2.4) and p.36 (section 8.6.2). In my opinion, policies aiming at substantial modal shifts (in developed countries) are extremely costly and time consuming compared to policies aiming to reduce the emissions of each mode, particularly the road. The text, in contrast, gives the impression that inducing modal shifts is in general a recommendable policy option. This impression is underpinned by quite extreme numbers on modal shift targets. Particularly the numbers taken from the EU White Paper are completely unrealistic, which is partly acknowledged in the text by the doubtful remarks on the corresponding investment needs (p.32). In fact, it is just as unrealistic as saying that in 2030 a corresponding share of cars will be electrified.<br>A clear distinction should be made between buses and rail, whereas in the text these are often lumped together (especially in the following mistaken titles: section 8.10.1 is labeled “Road transport” but is only addressing cars, section 8.10.2. is labeled “Rail transport” but also addresses light-rail and buses).<br>In my view, modal shifts to the railways should be treated with caution. The rail system suffers from a severe lack of intra-modal (i.e. on-track) competition, and the rolling stock industry cannot exploit the economies of scale and at the same time the high degree of competition as the car / truck / bus industry. As a consequence, the power and potential of the rail industry for realizing innovations (for example for CO2 reductions) is limited in comparison to that of the road industry. For that reason, a policy aiming at substantial modal shifts to the railways is risky in the long term.<br>It is a particular advantage of the roads that they are basically the same all over the world. Moreover, all over the world, roads dominate transport. As a consequence, we find a world industry for cars / trucks / buses consisting of several huge companies in fierce competition. I think it is much wiser to put this powerful industry under pressure to develop less CO2-intensive vehicles, and maybe even spend some public money to help them develop totally new technologies, rather than spending much money for a small modal shift to a much less potent and less dynamic railway industry.<br>Currently we can witness the effects of the powerful road industry: Every car maker is eager to develop new and | I like this series of comments very much…absolutely right about lack of cost effectiveness perspective…I’m sympathetic to views about modal shift, but this is a battle that must be waged among our group.<br><br>This is a very long comment addressing a range of issues. Its contentions that substantial shifts in freight modal split towards rail will be relatively difficult and costly and the critical comments about the EU modal split targets are note and may require an adjustment to the text.Agree on freght, but again this is due to the lack of published research on the subject. Several organisations have constructed marginal abatement cost curves for freight transport and reference could be made to this work in the report. Most of this additional literature is relevant and could help us elaborate. the economic perspective is important, but also very difficuklt to give over the time spans we are looking at (a century ahead basically) My feeling from many scenario studies is that economic arguments will not bring us much further as it does not really make a digference whether people or goods are transport by mode A or B as long as the passenger or ton is transported at a certain reasonable cost and time. Many economic studies show the status quo to be the best because chance is costing additional efforts. Furthermore, we must take note |
| 10950 | 8 | | | | | I unforunately did not get to read the chapter as I was busy reading other chapters! However, I expect that the emphasis on transport comparisons is based on a Global Warming Potential with a 100 year time horizon. This is a rather significant discussion, and this papers discusses some of those issues: Peters, G.P., Aamaas, B., T. Lund, M., Solli, C., Fuglestvedt, J.S., 2011. Alternative “Global Warming” Metrics in Life Cycle Assessment: A Case Study with Existing Transportation Data. Environ Sci Technol 45, 8633-8641. | Accepted. Report uses GWP-100 from SAR throughout. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 4001 | 8 | | | | | Figure 8.3.1: "Fuel Consumption Potential.." has either (1) a mis-leading/incorrect caption or else is presenting a false comparison. The caption reads: "Fuel consumption reduction potential (%) for a range of LDV technology types in 2012 and 2030, compared with a base 2012 gasoline ICE vehicle." Since BEV vehicles are not used in any substantial quanity and FCEV are not commercially available, the correct comparision is to a an advanced gasoline vehicle in the year that the BEV or FCEV would be available. The vehicles should be standardize for size and performance. The caption should either be corrected to note the correct comparison gasoline ICE, or the figure should be re-done with data using an advanced gasoline vehicle. Indeed, we see that a 2030 gasoline ICE is significantly better than a 2012 gasoline ICE. A more fair comparison would be a BEV and FCEV to a 2030 gasoline ICE. As is, this is simply wrong as it now stands. It falsely suggests a greater advantage to non-ICE powertrains which provides mis-leading guidance to policymakers. | I agree we need to normalize for size/performance, which I think we have done, but will check; however I don't see any problem with comparing to an average new gasoline car in 2012, this then allows the comparison to include how much better the best conventional vehicles are, along with new propulsion systems/fuels. The logic of the reviewer escapes me. And incidentally there are plenty of BEVs available commercially in |
| 4003 | 8 | | | | | Table 8.4.1: It might be useful to add a collum to this table showing the GHG intensity of passenger vehicles. As shown in Davis et al. (TRANSPORTATION ENERGY DATA BOOK: EDITION 30—2011, Table 2.13, p. 2-15), for the US the energy intensity per passenger mile for cars is lower than for transit buses, while trucks have a higher energy intensity. | Reject as the tabel is just about mass transit. Due to more confusion about this table may be remove the table and simply refer to the page in IEA ref where |
| 7794 | 8 | | | | | General comments on the chapter: | Reject. Comment is too general. |
| 7795 | 8 | | | | | __ Most of the information in the chapter 8 focusses on the developed world. This provide litte skewness to the useful information provided to the reader. It appears, as one reads through, that most of the alternative actions/options/adaptive/and or mitigations measures may happen in the domain of the developed word. Except at few places, examples from fast growing developing countries like India and China are cited. In India, as well as in other developing countries significant efforts are directed towards climate change related issues. Such as towards GHG emission inventory, infrastructure development etc to address climate change issues. In my opinion a few good examples from these countries could be cited. | Agree |
| 7796 | 8 | | | | | India-specific examples: | Reject. Comment is too general. |
| 7797 | 8 | | | | | __In 2006, the Ministry of Railways adopted a long-term strategic plan to develop six high capacity (planned to be completed by 2046-47), high speed dedicated freight corridors (DFC) to meet the growing demand for freight transport and induce modal shift of freight traffic from road to rail. One of the DFC, the Delhi-Mumbai DFC (also known as Western DFC) slated to be operation in 2016. This will enable higher operational efficiency in both freight and passenger services since the congestion on existing rail network would reduce significantly. In addition to efficiency improvements, the DFCs would contribute to significant reduction of GHG emissions (hence could claim carbon credits). By 2046-47, the Western DFC project alone would reportedly reduce annual CO2 emissions by nearly 81% under BAU. The cumulative emissions (six DFCs together) over 30 years period (2016-17 to 2046-47) would reduce from 222 million tons CO2 under BAU (without DFC) to 52 million tonnes CO2 under BAU (with DFC) and 18 million tons CO2 under BAU (with DFC) under low carbon pathways (LC). With a potential to reduce 170 million tons CO2 over 30 years. | From road to rail or rail to road? add if find reference. Some useful new data worth incorporating. Interesting points about the efforts to shift freight from road to rail in India. What will be the carbon penalty associated with this new infrastructural development. Could be beneficial to include reference to Indian railway initiative especially as large carbon savings have been calculated. |
| 7798 | 8 | | | | | __In 2007 alone, 772 kt of CNG and 185 kt of LPG was used in road transport vehicles (intra-city buses, taxi and private cars as well as in three wheelers) in India and substituted conventional liquid fuels (diesel and petrol) thereby reduction in resultant GHG emissions. CNG and LPG use in road transportation started in 2001 and 2003 respectively. | Could add but need reference |
| 7799 | 8 | | | | | __Transportation sector in India is the 4th largest emitter of GHG emissions after electricity, industry and agriculture and 3rd largest in terms of CO2 emissions. The share of transportation sector to the total GHG emissions in India has increased from 6.5% in 1994 to 8% in 2007 with a CAGR of 4.48% | Could add but need reference |
| 7800 | 8 | | | | | __In India, the rise in fuel prices encourage people to shift from one fuel type (petrol) to another (diesel) because significant price differential between petrol and diesel prices exist in the country (due to subsidy). The current diesel LDV share in India is about 20%. All the HDVs in India run on diesel. Diesel prices are kept low because it was the fuel of choice for agriculture, and freight transportation and not for LDVs. But now diesel is also used in LDVs and run generators (due to shortage of electricity) | Could add but need reference - Some useful new data worth incorporating |

|---|---|---|---|---|---|---|---|
| 12110 | 8 | | | | | There is a cross sector "energy" system synergies that will bring down the costs of transformation eg: namely the synergy between the transport sector (innovations in electric cars + batteries) and their potential to, through "Smart Grids", work with and enhance the transition the distributed renewable electricity supply. [Refs IEA (2011) Smart Grid Technology Roadmap. IEA at http://www.iea.org/papers/2011/smartgrids_roadmap.pdf + IEA (2011) Electric and Plug-In Hybrid Electric Vehicle Technological Roadmap. IEA http://www.iea.org/papers/2011/EV_PHEV_Roadmap.pdf ] I have published on this and can send a summary through if interested. | Noted. Please see Chapter 7 for the integration of transport integration into the wider energy system. |
| 11363 | 8 | | | | | Are the changes in the vehicle emission stantards (e.g. EUROIII, IV, V, and VI) worth being pointed out as a mitigation option in this table? | Reject. Thanks for the comment but probably not, as changes in vehicle emission standards should probably be |
| 8359 | 8 | | | | | From the perspective of development the main challenge for the sector of transport is to provide sustainable access to food, work, housing and other resources needed to cope with daily life. In most countries and cities the provision of the basic human needs is a core issue and the role of transport is to deliver access to resources of different kinds to maintain or improve quality of life. Today, living conditions are rapidly changing and systems of transport will have to respond to societal changes to confront deteriorating living conditions for an ever-increasing global population. If not, it is most likely that marginalisation, poverty and social unrest will spread.<br><br>The growing need for transport facilities, especially in developing countries, and the design of policy and planning measures to reduce polluting emissions is a paramount challenge that merits to be discussed upfront in the beginning of the chapter and, not as now mentioned towards the end of the chapter. There are some comments made towards the end but this is such an important and fundamental issue of global development that it will have to be properly addressed in a report from IPCC. The overwhelming increases in some countries and cities in Africa and Asia with low levels of income and where per capita travel rate is estimated to double and speed lowered interfere with policies that aims at a reduction of greenhouse emissions. Accordingly these issues will have to be presented and discussed up-front and not on the last pages.<br><br>Moreover, there is no definition of the notion of sustainable transport but there are several definitions that can be applied. One option is to build on the OECD way of defining sustainable transport which has been developed through regional collaboration in Asia under the guidance of UNCRD in Nagoya. See http://www.uncrd.or.jp/env/5th-regional-est-forum/doc/bangkok_declaration.pdf. The final outcome of the analysis is of course depending on the definition and the indicators that are used. This is the reason why exploring the content of various important notions of sustainable transport should be included and outlined as well. It makes a huge difference if the goal is to achieve for instance a low-carbon transport system or if the objective is to implement sustainable transport. To base the analysis on a notion such as low-carbon is not sufficient or good enough to alleviate the problems being brought up in this chapter. The various concepts will lead the different outcomes and hence you will also have to assess strengths and weaknesses of the various definitions that you apply.<br><br>So far the lead role in this text is given to technical enhancement and its potential to alleviate the problems. This is a core topic but technical fixes are far from enough and the strong emphasis on technical solutions will have to be balanced by stressing the social aspects and its potential together with political and economic regulations, laws and steering measures. About 10 per cent (or somewhat more) of global population are car owners and this chapter puts far too much emphasis on the attitude and behaviour of car owners on behalf of 90 per cent (6 billion persons) of global population.<br><br>Besides, there are no clear cut responses or fixes ready for implementation that will make a real difference and alleviate current problems associated with motorized mobility. This report will have to explore several other tracks as well. The “closure” around the car-and-road-system and the great success story of the auto-industrial complex in national strategies for development as we have seen in the Asia over the last two decades and earlier on in | Noted. Thank you very much for your various thoughts. We have taken them into account in our discussions and have tried to take up a number of the issues raised by you in the new draft, particularly improving the balance of the chapter putting more focus on non-technology aspects. Concerning suggestions on reorganizing the chapter we are bound to the first level structure provided by the IPCC plenary. For definitions of sustainable development and the usage of this term adopted in this report please see Ch.4. Please note that it is not the task of the IPCC to provide "recommendations" but rather to provide an overview on options and possible pathways for different goals. Concerning the nexus of transport and cities, please also see the respective sections in Ch.12. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 17965 | 8 | | | | | An introductory sentence along the example of Chapter 9 referring to the agreement reached in Wellington (p. 36) might be helpful for readers: "Barriers and opportunities are referred to as conditions that hinder or facilitate the implementation of the analyzed measures." | Accepted. Seems too obvious to put in but happy to do as suggested. |
| 5693 | 8 | | | | | Especially "activity" depends on external reason (e.g. economy) and not constant. This may spoil simplicity of this formula but better to suggest its complexity with some annotation. Especially, there's a positive feedback loop between activity and ecomomy. | Accept but aiming at policy makers |
| 3436 | 8 | | | | | I suggest removing this table and merging it with Table 8.8.1 - see also my general recommendation for this chapter | Table will be revised for the Second-order Draft. |
| 3425 | 8 | | | | | In the interest of shortening the chapter, this figure could be deleted | Will consider |
| 3426 | 8 | | | | | Please explain the acronyms of the regions that appear on the top of the graph | To be added |
| 3427 | 8 | | | | | In the interest of shortening the chapter, this figure could be deleted | Rejected. Providing an overview on historic global emission trend is thought |
| 18903 | 8 | | | | | Please consider changing and amending the figure in the following manner: (1) Turn this figure into a pie chart, as it adds up to 100%. Accompany the this pie chart with the following two: (2) Pie chart giving shares of the different transport modes for the same year and (3) Pie chart giving the energy sources consumed [all data is in the above paragraph, which could be the mostly cut.] | To be considered |
| 18905 | 8 | | | | | It would be very good to get global data for this! | Noted. This figure was deleted. |
| 18909 | 8 | | | | | Giving this in percentages is good to show the shift between modes, please consider to also present absolute numbers which indicate the expected increase of traffic. | Rejected. Sufficient as is to make point in text. |
| 15347 | 8 | | 6 | | | need a comma before the "of" | Can not be addressed as not stated which page this refers to. |
| 8888 | 8 | | | | | This section is too much focused on agriculture and should include other trade besides agriproducts | Not Chapter 8 |
| 6495 | 8 | | | | | General Comments - a. The main comment of this chapter is that it is written more from the developed countries perspective (except the arguments from 8.9). Arguments and examples from developing countries are lacking (in comparison to developed countries) as travel demand is growing more rapidly in such developing countries than developed countries. Need to strive for balance. Also it would be good to explain the diversity of issues and solutions in developing and developed countries in the initial sections and in solutions.<br>b. The document still needs lot of editing. The arguments keeps getting repeated – for example drivers are mentioned at 8.2.1.1 and 8.4.1.1 and not makes an easy reading.<br>c. The document is relatively silent on two and three wheelers which is the main source of transport for developing countries and current population of such vehicle exceeds more than 200 million . Except a couple of times.. no good argument has been made.<br>d. The chapter can be shortened at 8.3 Mitigation technology options, practices and behavioural aspects , 8.6 Costs and potentials and Sectoral implication of transformation pathways and sustainable development | Noted. The comment is well taken. Please note the unbalance between publications relating to developed and developing countries affecting also the weight in the chapter. We have extended the coverage of 2- and 3-wheelers. Thank you for your feedback on reducing redundancies. |
| 16224 | 8 | | | | | I guess it's good to add and spot on electric motor cycle, to encourage people to use this cycle which reduce GHG emissions specially in the high denisty population cities. | Agree. Covered |
| 4397 | 8 | | | | | The GDP/cap could be expressed in more recent USD, say 2010. All of the figures would be up to date, even if the trends displayed in the graph remain unchanged. | Agree. All costs to be in USD 2010 |
| 8877 | 8 | | | | | The sub-chapter focuses too much on shipping and does not include an overview of the indirect GHG emissions from transport. But it does touch upon non-GHG gases that are precursors for GHGs | Amended. |
| 2667 | 8 | | | | | Section 8.1.3 is poorly organized. I would recommend that this discussion be combined with the energy discussion and make the distinction there between energy and GHG emissions. A separate section could be devoted to a brief discussion of indirect GHG emissions. | Amended. |
| 17777 | 8 | | | | | this section is very good, but very long | Agree |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 2720 | 8 | | | | | This section is very repetitious of other sections. Do you want to discuss general policy options or the specifics of policies that have or could be implemented? As mentioned in comment 49, there should be more structure to how policies are presented - this section does a better job than previously, but please consider how these sections are repetitious of each other. Would be good to lay out the economic rationale for various policies somewhere in the text, and then link these to specific policy options. Section 8.10 could be a place for these specifics. | Amended. |
| 16225 | 8 | | | | | With the call for increased use of transport by rail to reduce overhead transport by road, advice for the development of rail cars for transport of goods to consist of two floors because of its advantages to reduce the cost of transportation, which reduces the burden business and shipping requirements, and the use of electric railway limitsemissions of carbon dioxide and reduces the cost of energy use and limit the use of conventional energy. | Will consider but needs a reference - and double decker trains limited by bridge and tunnel heights in many locations. |
| 16226 | 8 | | | | | I guess it'll be good to add a Matrix as a comparison between energy that could be obtained through the application of each type of new and renewable energies compared to the cost of financial investment, and by imposing a best suitable conditions for that and also impose worst, I suppose that comparison will be useful purely for developing countries and least developed countries | Such costs to be covered in 8.6. |
| 16227 | 8 | | | | | Talk more and spot on the new Aviation Techniques to enhance fuel effecieny to reduce GHG emission according to ICAO rules and try to match with EU restrictions to reduce GHGs, which made a stress on the Aviation Industry specially in Developing Countries. | Fuel covered in 8.3.1.6 etc. EU ETS discussed |
| 2779 | 8 | | | | | Remove "hybrid vehicles" since they are included in the "improved efficiency/all vehicles". | Accept |
| 3438 | 8 | | | | | In the beginning of this Section I suggest mentioning that there is a very significant gap in basic knowledge about average distance travelled by vehicle type as well as about total passenger and tonne kilometres, particularly in the developing world. As a result, the effectiveness of future mitigation policies will be hard to monitor. Moreover, there are three additional gaps in knowledge: uncertainty about the difference between test and on-road fuel economy; uncertainty about how much fuel economy regulations will lead to a rebound effect in a wider sense; and lack of knowledge about the lifecycle emissions of alternative vehicle technologies and fuels, which are crucial in order to correctly assess GHG benefits from alternative technological options. For a more detailed but still concise explanation of all this, see the following reference: Schipper L., 'Epilogue – The Future of the Automobile: CO2 May Not Be the Great Decider'. In: Zachariadis T. (ed.), "Cars and Carbon", Springer, 2012, ISBN 978-94-007-2122-7, DOI 10.1007/978-94-007-2123-4_17, pp. 409-411. | Agree. Should be amended |
| 4000 | 8 | | | | | This section: trends and drivers is missing a section on trends in petroleum carbon intensity. In particular, in certain parts of the world (US, Canada, South America, Africa, China), the carbon intensity per barrel (or unit of extracted energy) is increasing as we move to either heavier crudes (Alberta), to deaper off-shore oil (greater energy use in pumping the oil) or coal-to-oil (South Africa, China). This is likely to continue as we deplete easy-to-access conventional oil. This is a major over-looked driver in future carbon emissions and needs to be addressed. I suggest that it be moved to the summary highlight. | Reject - The changes in carbon intensity of crude oil that will be used in future years is a minor driver in carbon emissions. To the degree that this is an important driver should be covered in Chapter 10 as Chapter 8 does not |
| 14279 | 8 | | | | | This section could be significantly reduced in length. I wasn't sure of the relevance of the "Costs and prices" sub-section to climate change mitigation (especially the first paragraph). | Accept - We will reduce the length of this section but the cost and prices are important drivers in trends that are |
| 3991 | 8 | | | | | This section could be stronger. First, the section correctly notes that transportation costs and prices are major drivers (along with other factors). But, no supporting data is provided: e.g., how much have prices and costs changed in OECD and non-OECD countries; what are the projections for the future? Where's the time trend data? Also worth noting is the major increases in fuel economy standards in the US (in particular), but also in many other OECD countries. This is a major driver in decreasing the use of fuel and, hence, GHG emissions. At the same time, this lowers the cost per kilometre of driving which may exacerbate other driving related externalities such as congestion. | Accept - We will add data |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 3994 | 8 | | | | | This section could benefit from forward looking impacts from disruptive technology. While perhaps speculative, emerging technologies such as the well-publized driverless car from Google has the potential to drastically lower the time cost of driving (drivers can make their time productive) and hence spur increased driving. The use of advanced GPS and backup safety divices can extend the driving age for older people. The chapter should devote a modest amount of space to looking ahead at technology trends and what they mean for VMT and CO2. | Accept - We can add a few sentences about potential game changers |
| 3996 | 8 | | | | | This section on drivers fails to note the large increse is diesel fuel use compared to gasoline in Europe which was and is largely driven by fiscal policies (taxes) that favor diesel fuel. The impact on this shift on fuel economy has been mixed. While diesel engines are an inherantly more efficient drive train compared to gasoline engines, there is some evidence that consumers have purchased more powerful vehicles offsetting the technology gain. See Schipper 2011: "Similarly, the promise of savings from dieselization of the fleet has revealed itself as a minor element of the overall improvement in new vehicle or on-road fuel economy. And the fact that diesels are driven so much more than gasoline cars, a difference that has increased since 1990, argues that those savings are minimal. This latter point is a reminder that car use, not just efficiency or fuel choice, is an important determinant of total fuel use and CO2 emissions." Moreove, this contridicts the opening paragraph of section 8.2.1 of the WGIII "Data suggesting declines in LDV use in OECD cities since 2005 raise the possibility of a significant turning point in transport in developed countries (Goodwin, 2012; Millard-Ball and Schipper, 2011; Schipper, 2011), but this is not expected to off-set growth in developing countries." Please update/check the sources. | Accept - This will fit under economic drivers |
| 2813 | 8 | | | | | The titles of those sections ("Trends by transport sector" and "Trends by Sector") - are they intentionally differenciated? | Reject - The section and associated titles are fixed and cannot be changed |
| 3997 | 8 | | | | | This subsection correctly points out expected huge expansion in the LDV sector. The text notes an expected increase from 780 million vehicles to 2 billion vehicles in the next few decades. Actually, there is strong empirical evidence from Wards that we have already passed 1 billion vehicles - this should be updated. But the larger point is correct and needs to be emphasized in the introductory/summary material of this chapter. The world's LDV population is expected to double in 2 or 3 decades - this is a huge factor driving mobility, energy use and emissions. I urge in the strongest possible manner that the authors give significantly more weight to this trend. In some ways it a defining transition that needs to be adequately appreciated and addressed. | Accept - Will update data and references |
| 8881 | 8 | | | | | This section seems to be unfinished and is unreferenced. | Accept - Will expand and add refernece s |
| 4056 | 8 | | 26 | | 30 | This paragraph has no reference. | Accept - Will expand and add references |
| 4261 | 8 | | | | | There are major omissions of section on active travel (walking and cycling) for short journeys in urban areas and on improved urban mass transit systems. Increased physical activity has major benefits for health and there are additional benefits from reduced air pollution | not really something for tech chapter |
| 3412 | 8 | | | | | many percentages mentioned to indicate potential efficiency gains, but the reference year is hard to verify. | good point, need to address |
| 4054 | 8 | | | | | Section 8.3.1.2. LDV load reduction. How do these recommendations differ from AR4? | Rejected. Due to the significant amount of new publications since AR4 the |
| 4055 | 8 | | | | | Section 8.3.1.3 Medium and heavy-duty vehicles. How do these recommendations differ from AR4? | Added |
| 11878 | 8 | | | | | It is odd that rail is discussed mostly in terms of passenger transport while in many places (like the U.S.) the mode is dominated by freight. Are there trends in rail freight worth highlighting? For example, speed reduction (which is highlighted for ships below). Are there places where the absence of infrastructure means rail doesn't serve freight movements well? | Passenger / freight split for rail clearly varies for countries. Competition for available rail capacity between pass and freight is an important issue. Chap currently mentions the need for more rail |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 8882 | 8 | | | | | 8.3.2 could be merged with 8.3.1 to save space and the section should be looking at how the incremental changes could contribute to the absolute emission reductions from transport. Also, despite aircraft engines could be 50% more efficient by 2050 this wont be reflected in aviation emissions due to long life-span of aircraft | will look at merging opportunities; aviation - will mention turnover times of each mode |
| 8437 | 8 | | | | | The use of electric bicycle is growing very fast and thus some data could be found in literature to underline the importance that this means of transport could have in the future. | yes e-bikes and scooters deserve mention |
| 3992 | 8 | | | | | This section describing electric road vehicles can be significantly shortened. This is not the place to go into detail on this technology. The authors should refer to any of the many high-quality desciptions available elsewhere. | Accepted. |
| 3993 | 8 | | | | | This section describing fuel cell vehicles can be significantly shortened. This is not the place to go into detail on this technology. The authors should refer to any of the many high-quality desciptions available elsewhere. | Accepted. |
| 8883 | 8 | | | | | This section on low-carbon fuels is almost 100% focused on road transport. Discussion on other modes should be added. | Consistent with shortening some bits |
| 3999 | 8 | | | | | This section notes CNG's lifecycle GHG advantage at 20%-30% compared to gasoline and diesel. This figure needs to be qualified/updated to take into account newer estimates for CNG from hydrofracturing. Perhaps the text should read something like: CNG from conventional sources...20-30%, but if the rest of the world follows the trend in the US and Canada of sourcing CNG via hydrofracturing, the likely GHG benefit is likely to be ~ 5%-10%, etc. | shale gas - will add in estimates there is some controversy about fracking, but I doubt it is anywhere near settled what the GHG emissions from fracking operations are. |
| 3413 | 8 | | | | | I believe the considerable disadvantage of hydrogen (low energy density hence voluminous storage prohibiting use in aircraft) should be mentioned in this paragraph, not only in the indirect way that it is done in the next one. | will address this a paragraph on the difficulties involved in transporting and storing hydrogen would be appropriate |
| 8884 | 8 | | | | | 8.3.4 should be merged with 8.3.1 as it compares technologies | will look at merging opportunities. do not agree, 8.3.1 is about incremental |
| 2751 | 8 | | | | | The single most important quantitative information that the transportation chapter should contain is the lifecycle GHG emission comparison of various fuels, including gasoline and diesel oil and a representative set of alternative fuels. This is, however, not found anywhere in the chapter, although many have been published and are easily available. I recommend to use a German Energy Agency (DENA) bar diagram published in 2011 and available on page 5 of publication "The Role of Natural Gas and Biomethane in the Fuel Mix of the Future", at http://www.dena.de/en/publications/transport/natural-gas-and-biomethane-in-the-fuel-mix-of-the-future.html?tx_dscoverview%5Bliste%5D=1&tx_dscoverview%5Bpluginid%5D=3255. | its because we had trouble finding a good one, we will definitely have something like this in the next round. generally agree, but the range of answers is great |
| 2752 | 8 | | | | | Note that lifecycle energy consumption of BEV and PHEV may not be better than ICEs due to low efficiency of electricity production. Even is CHP is used in electricity production it is important to note that vehicle engines are also CHP engines. Their waste heat is currently used for heating, but it could also be used for cooling utilizing soption heat pumps (they are currently in demonstration stage). Lifecycle (well-to-wheel) emissions (please see DENA bar diagram mentioned in previous comment and EUCAR/CONCAWE/JRC, 2008) are relevant for AR5 instead of vehicle tank-to-whell energy efficiency. Emphasizing the latter is misleading. | both TTW and WTW efficiency (and emissions) matter, for different reasons. We need to show both in appropriate places. Agree that new technologies for ICE vehicles should certainly be in our comparisons and the most promising |
| 8885 | 8 | | | | | Again focused on road transport only | agree we want more non-LDV focus |
| 13110 | 8 | | | | | Generally, too much explanation for infrastructure modal shift and. | Reject, bit too general remark and no alternative or diection given. |
| 11889 | 8 | | | | | General comments: There seems an opportunity throughout the chapter to shorten the text by (1) avoiding repetition within the chapter and (2) avoiding repetition across chapters. For example, there is some overlap in the discussion of urban form and infrastructure between chapters 8 and 12. - Perhaps improved coordination or a clear division of topics addressed in each chapter could shorten both? | fair comment; will address the examples given. |
| 2755 | 8 | | | | | Add refueling infrastructure of renewable methane and hydrogen. They were proposed to be required by directive for all Member States of the EU by the EU expert group on future transport fuels report in December 2011. | agree indeed mention this. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 2814 | 8 | | | | | The objective of this section is not clear. More explanation is needed at the beginning the purpose of this section and the logic of the structure. It might be better to revisit the structure following the "Activity"- "Structure" framework. | Accept - add a short general introduction about the idea (path depency, slow change, sunk cost, LCA, etc) |
| 8887 | 8 | | | | | This entire section is too long. Also, the heading should be rephrased - the secton describes modal shifts and path-dependencies and not only in urban environment. The sub-sections on urban transport shoould be merged. | Accept: may be shift the 'urban form' to the current section path dependencies and infrastructure (8.4.2) and rewrite this |
| 18908 | 8 | | | | | Consider mentioning safety as an incentive to use cars (with respect that protection is greater than using two wheelers or walking and with respect to safety from e.g. robbery) | Noted. |
| 14288 | 8 | | | | | Not sure of the relevance of this section to mitigation - it could be deleted. | Accepted. However, the role of car dependce is still a very important |
| 2697 | 8 | | | | | This section could benefit from a fuller discussion that is not just about European freight transport. There are major differences in rail freight between North America and Europe (and this is briefly mentioned), but the policy implications are probably quite different. In all cases, there is probably a need for more capacity as rail freight is at capacity in North America and passenger rail is at capacity in Europe. What is happening in Asia? How feasible is it to actually shift away from road and air freight? The discussion would also benefit from considering freight reduction, mainly through local production and consumption of goods, rather than transporting across large distances. | Noted. |
| 5696 | 8 | | | | | There's no prisnor's dilemma situation in freight. The whole shift can be accelerated by applying information and communications technologies (ICT or IT). There are many patents for optimizing logistic cost using ICT. (e.g., WO2004/018116, WO2004/019242 by Deutsche Post AG ) Algorythms for efficient transportation are proposed. (e.g. Sato, "A Formal Approach for Milk-run Transport Logistics" IEICE Trans. on Fundamentals E91-A (2008) pp. 3261-3268) In Japan Sagawa Express Co., is operating fast cargo train and basic technologies are proven. The missing piece is an actionl plan. | Accepted. |
| 8889 | 8 | | | | | This section should shortened be and merged with 8.5.3 and be on infrastructure and routes for all transport modes and forms | Reject. Will shorten the section. Transport routes as described in this section are susbtantially different to the infrastructure issues dealt with in 8.5.3. |
| 14293 | 8 | | | | | Not sure if this fits best here, but an important insight is that decarbonisation itself is likely to reduce freight demand for shipping and therefore reduce shipping emissions as well. This is because a large proportion of demand for shipping is transport of fossil fuels (e.g. 50% in the UK). See Committee on Climate Change (2011), "Review of UK Shipping Emissions", p25 (http://downloads.theccc.org.uk.s3.amazonaws.com/Shipping%20Review/CCC_Shipping%20Review_single%20page_smaller.pdf). | Noted. Taken into account. |
| 2756 | 8 | | | | | Rural train transport using overhead power cables is the most vulnerable transport technology to the effects of climate change. | Accepted. See Section 8.5.3 |
| 4058 | 8 | | 29 | | 44 | Section 8.5.3 has some assessment of the interactions of mitigation and adaptation actions. What are the potential conflicts? Are there any optimal actions? | Accept. This should be highlighted more clearly. |
| 2757 | 8 | | | | | Air conditioning can also be done with waste heat of the vehicle engines using sorption heat pumps. | Taken into account. Partially agree at least for trainstations etc, not for cars. |
| 4059 | 8 | | | | | This section is about the interaction of climate change impacts with feedback from vehicle fuel efficiency but also air conditioning demand in transportation. Title of the section should be changed to "Climate impacts on vehicle fuel efficiency and emissions." | Accept. |
| 4060 | 8 | | 2 | | 13 | How will temperature and moisture changes affect Nox, CO2, and PM? | Accept. Will mention this. |
| 8890 | 8 | | | | | Too much focus on the urban form and forgetting other transport modes | Accepted. Urban form is one way to reduce demand but other forms do exist as well. We will try to ammend text |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 8891 | 8 | | | | | Too much focus on the urban form and forgetting aviation and shipping | Accepted. Urban form is one way to deal with the structure effect/modal shift but other forms do exist as well. We will try to ammend text to also better portray |
| 4062 | 8 | | | 40 | | Table 8.6.2. The range of potentials is portrayed optimistically as "…up to x% efficiency or emission reduction improvement. The range of cost-effectiveness should also reflect a wide-range in order to reflect the higher costs to achieve the higher efficiency or higher emission reductions. | Table will be revised for the Second-order Draft. |
| 4057 | 8 | | 26 | | 38 | Cost of modal shifts are not stated here. Only cost savings per household is stated. What is the net cost? | Accepted. We will try to better reflect |
| 8892 | 8 | | | | | Too much focus on road transport and forgetting rail and shipping | Accepted. We will try to better reflect |
| 11887 | 8 | | | | | The title of this section is strange - what does "effect component" mean? Also, there is quite a bit of repetition with earlier discussions of vehicle technologies - it might be an opportunity to remove some content here. | Title tries to follow the Kaya Identity logic. With respect to possible repetitions, we will try to clearly |
| 2758 | 8 | | | | | Low efficiency of electricity production and its resulting emissions have not been taken into account. The potential of increasing efficiency by better engine technological properties of many renewable fuels (compared to gasoline and diesel oil) have not been taken into account, e.g. biogas octane value 140. | Accept. |
| 2762 | 8 | | | | | Mitigaton options Fuel switch: add renewable methane (RM) | Table will be revised for the Second- |
| 14295 | 8 | | | | | This section is too long and could be significantly reduced in length. It is not clear to me how relevant many of the sub-sections are to mitigation (e.g. 8.7.1.3 traffic accidents - is this supposed to suggest that reducing demand for travel could reduce deaths as a co-benefit? If so, it needs to cite some evidence in support of that argument. Since the main route to decarbonisation of surface transport is likely to be electrification, rather than reduced demand, I find it hard to believe that reduction in traffic accidents is likely to be a significant co-benefit). | Accept. We will rewrite |
| 6387 | 8 | | | | | Chapter 8 needs a discussion of risks and uncertainties, especially with respect to the mitigation benefits of proposed alternatives. Section 8.7 seems to be more about the risks from transport (as is) rather than the risks associated with approaches to mitigation. Co-benefits and spillovers seem to be in reference to mitigation strategies, so it would seem appropriate to discuss the risks associated with these as well. | Acept. We will rewrite |
| 17953 | 8 | | | | | Introductory sentences like the ones in Chapter 10 might be a good idea to prepare the reader for the following discussions: "Besides economic cost aspects, several other aspects have implications on the final deployment of mitigation technologies. Co-benefits, co-costs, risks and uncertainties associated with alternative mitigation technologies as well as public perception thereof can affect investment decisions of companies and priority setting of governments." | Accept. We will rewrite |
| 2815 | 8 | | | | | "Co-benefits": definition should be provided in the first place as there are still some disputes over the definition. (e.g. see Zusman et al, 2011- which is already in the list of reference). | Accept. We will rewrite |
| 3429 | 8 | | | | | This section does not contain very important information in the IPCC context; it should be considerably shortened to become as long as e.g. Sections 8.7.2 or 8.7.3 | Accept. We will rewrite |
| 17954 | 8 | | | | | Although this paragraph describes the costs of traffic congestion, it does not explain how mitigation would interact with traffic congestion which is crucial to deserve mentioning here. | Accept. We will rewrite |
| 8894 | 8 | | | | | Has overlaps with 8.7.3 and should be merged | Accept. We will rewrite |
| 2767 | 8 | | | | | Use of methane as traffic fuel has been shown to decrease all public health issues and reduce lost health (measured in DALYs) drastically. Electric vehicles have even higher potential. | Noted |
| 17955 | 8 | | | | | This sub-section 'Public health' should be moved to section 8.7.3 which is suitably called 'Environmental and health effects'. | Accept. We will rewrite |
| 2768 | 8 | | | | | Electric vehicles, incl. fuel cell vehicles, have potential to increase traffic accidents due to their low noise level. | Accept. |
| 17957 | 8 | | | | | Although this paragraph describes the costs of traffic accidents, it does not explain how mitigation would interact with traffic congestion which is crucial to deserve mentioning here. | Accept |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 2769 | 8 | | | | | Renewable electricity, renewable hydrogen and renewable methane always offer these benefits. For liquid biofuels potential is much smaller and in some cases they make situation worse. | Accept. We will rewrite. Not appropriate. Marcio |
| 8376 | 8 | | | | | Most of this has already been said in other places. Especially the lines 17-21. | Accept. We will rewrite |
| 17958 | 8 | | | | | This sub-section should be moved behind the section 8.7.3 since it builds on results of health issues. | Accept. We will rewrite |
| 6490 | 8 | | | | | 8.7.2 Climate change mitigation as a co-benefit and 8.7.3 Environmental and health effects have contradictory statements. 8.7.2 suggests – "Some policies that aim to tackle the high social costs of urban transport can also result in climate change mitigation being a co-benefit. Air pollution and noise can be reduced by technological advances (such as vehicle building materials) and regulations for vehicles (Section 8.11) but such measures rarely have influence on climate change mitigation." And<br>8.7.3 - "Strategies that target the mitigation of local air pollution also show potential to reduce GHG (Yedla et al., 2005) and black carbon emissions. In designing mitigation measures to reduce specific pollutants GHG emissions reductions can also occur. For example, measures to reduce PM2.5 particulates to reduce air pollution also reduce emissions of black carbon." | Accept. We will rewrite |
| 6488 | 8 | | | | | This section needs improvement/editing. Also PM 25 is PM 2.5. | Editorial |
| 2770 | 8 | | | | | Diesel engines are the main culprit in industrial countries. E.g. in the EU the common denominator of all air pollutants, which are not decreasing, are diesel emissions. It can be solved by using gaseous fuels, i.e. bio-DME and renewable methane, in diesel engines. And by increasing the share of other motor technologies.<br>In developing countries 2-stroke engines are the main culprit. It can be solved by using renewable methane in 2-stroke engines and by increasing the share of other motor technologies. | Reject. Beyond the scope of this Section. |
| 4063 | 8 | | | | | Technological solutions, improved fuel efficiency, reduction in noise levels may improve environmental quality but mobility problems remain. | Accept. We will rewrite to clarify. |
| 17962 | 8 | | | | | The content of this section does not seem to have anything to do with either technological or operational risks which should be discussed in this section according to the agreements reached in Wellington (p. 36). The text has either introductory charachter or relates to biofuel assessment.<br>Please consider a broader discussion of risks and uncertainties along the classification of risks and uncertainties provided in Section 6.7. Please liaise with the other sector chapter LAs to discuss the process by which a more consistent approach can be reached. | Accept. We will adapt the structure of Ch 6.7 |
| 8378 | 8 | | | | | The challenges of providing access, equity and low carbon transport or sustainable transport for a growing global population is not outlined well. When it comes to defining sustainable transport -basically the developed world and its possibilities to mitigate and adapt to the new realities are highlighted. As a consequence issues of technology advancement and polices of the developed world are well presented and discussed in the text. But the substantial changes yet to come will take place in other and less developed conditions. The overwhelming growth in travelling taking place in most countries and cities in the world merits a better presentation and analysis. PIs pay more attention to this topic and outline ways of handling the issue.<br>For instance what will be the role of transport in the cities in the world? Which are the lifestyle and security issues and opportunities related to modes of transport and emissions? The social activities will define the requirement infrastructure and modes of transport.<br><br>This part of the chapter is weak. It would be good to present a couple of different cities (as mentioned earlier) and outline the typical mobility issues and how they can be transferred to match the need of low carbon policy or the kind of sustainable transport that IPCC will promote. To increase sustainability a new set of planning models and tools will have to be developed -otherwise modern mainstream transport will continue to greenhouse gases also in the future. □ | Its hard to respond specifically as this is a critique of the whole style of the chapter and report. If we did Shanghai as a case study they would be surprised how positive you could be about the future….8 million passengers a day on their Metro after ten years building. But examples can be only anecdotal to data on the whole system. |
| 2772 | 8 | | | | | 1. barriers: BEV potential only in LDV:s in urban transport (< 20 % of all transport) | Disagree. More than LDVs. But the data |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 17967 | 8 | | | | | Since the section is called barriers and opportunities, this sub-section should be more about the financial barriers of low-carbon transport than about different policy instruments that should also be discussed in the policy section. | Disagree. We do discuss finance but barriers are much more than finance. |
| 17968 | 8 | | | | | Sincce the section is called barriers and opportunites, the word 'aspects' in the title of this sub-section should be changed to 'barriers and opportunities' accordingly. | Agreed. Chair will need to agree. |
| 3430 | 8 | | | | | I don't think that this section is necessary as a whole. In the interest of shortening the text, I would suggest that a small part of Section 8.9.1 is inclused in Section 8.2 in the beginning of the chapter, and that the rest of Section 8.9 is either deleted or included in other chapters. | Rejected. Sections are fixed within the chapter. |
| 2774 | 8 | | | | | It is very worrying and against the decarbonization trend that renewable gases are not included, e.g. renewable hydrogen, renewable methane, bio-DME, bio-LPG. | Accepted. It will be considered |
| 2715 | 8 | | | | | Section 8.9.1 was very well and concisely written. One of the best in the report. | Thank you for the comment. |
| 11888 | 8 | | | | | This section could probably be shortened without loss of content. Technologies have already been described previously in the chapter, and it seems quite straightforward to indicate barriers/adoption rates, etc. either more concisely in this section or elsewhere in the chapter. Also, the term "bus rapid transport" is used - but "bus rapid transit" is used elsewhere in the chapter. Finally the discussion of modal shifts can be simplified. It seems quite obvious that shifting from bike to metro could increase energy use, so perhaps these possibilities don't need to be explicitly included? | Accept. This session will be subject to changes in SOD comments will be considered. |
| 14298 | 8 | | | | | Not sure of the relevance of this section to mitigation - it should be removed. Not to deny the importance of sustainable development, but it is a very separate issue from mitigation with very separate aims and policy implications and the two issues should not be conflated. | Rejected. Sections title is fixed by negotiation of governing body of IPCC. |
| 8438 | 8 | | | | | I suggest to move all the box in Chapter 5 | (Assume this means section 8.1.1. - not a box) It sets the scene for this chapter 8 |
| 8868 | 8 | | | | | The entire Executive summary needs to made stronger and clearer | Aiming to for next draft |
| 8898 | 8 | 0 | | | | Chapter 8 generally covers transport and climate change related issues. More focus on transport modes other that road transport is needed. Also there is significant amount of space dedicated on urban transport - this could be condensed. The sections should be better linked to each other and other chapters to avoid unnecessary repetitions and contradictions. The factual accuracy of GHG emissions related sections should be checked. In some places the chapter seems to be a repetation of IEA reports - there must be other sources out there covering the topics. Also very little attention is paid upon future transport GHG emissions scenarios by mode and explaining the feasibility of absolute reductions in GHGs from transport. I am sure that the authors were planning to address some of these issues while preparing SOD. | Agree changes will be in SOD |
| 7400 | 8 | 0 | | | | provide more assessment of uncertainty, affordability, and spillover impacts related to mitigation and mitigation policies and measures in transport sector, particularly for developing countries. | Agree will do if space is available |
| 4400 | 8 | 0 | | | | The organization of the Chapter does not appear coherent or easy to follow. For instance, the authors describe heavy goods vehicles, move on to passenger vehicle transport and back to freight transport. There is not much discussion on shipping, rail or aviation. As such, the Chapter is focused on LDV. The Chapter could be shortened by eliminating repetitious statements and combining sections, such as technological advances with costs. | Cannot merge sections which are fixed by IPCC. Agree, in progress, though this partly reflects the relative amounts of research done on the decarbonisation of the various freight modes. There has been a significant increase in the |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 11595 | 8 | 0 | | | | Chapter difficult to read and to review. It's not wrong, but has several major shortcomings: 1) Lack of focus: A holistic assessment of the full climate impact of transportation today and in the future, as well as its mitigation potential is not done. 2) Lack of balance: Most is on passenger transport, not balanced with the role of freight transport. 3) Lack of comprehensiveness: Results from single studies are highlighted in charts and figures. I would however expect summary charts and tables from a review. Exceptions and hence good examples: Tab. 8.6.2 and Tab 8.8.1 seem to summarize, but are hard to read (even because of bad reproduction quality). These tables seem to be key and should be expanded furhter, better placed highlighted. Figs 8.9.1/2 are very interesting as well, though source is missing. 4) Lack of specifics/too broad brush: Though it is acknowledged throughout the text that there are important regional differences, you do not highlight and distinguish them clearly. Suggestion: Try to identify some (country) case studies for which you pull through your quantitative results. Good countries, standing for larger country groups, could be: US/WEU/JPN; CHN/IND. Here you could nicely illustrate eg. levels of transportation (e.g. as pkm/cap and tkm/GDP; energy intensity; total transprot energy use; total transport emissions of LL and SL GHG; analysis what mitigation options would seem feasible and what impact that might have. Trying to do all at once has resulted in the current stew.5) A lot in this chapter is on energy demand. Translate this to GHG emissions and impacts, then you are better in focus. | very reasonable criticism, although it is quite difficult to do a side-by-side comparison of alternative studies…..there tend to be large differences in timing, underlying assumptions about energy prices and policies, baseline vehicles, etc etc that are hard to normalize. will do case studies if space is available |
| 11596 | 8 | 0 | | | | Useful but missing references for the whole chapter, individual sections, and particularly for impact assessment: J.S. Fuglestvedt, K.P. Shine, T. Berntsen, J. Cook, D.S. | 12335 | 8 | 0 | | | | General comment: Mobile air-conditioning and commercial refrigeration in the transport sector should be cover in more detail. Rationale: Mobile cooling is increasing and choices with regard to the phasing out of existing agents (CFCs, HCFCs anf HFCs) and the alternatives (HFCs, natural agents, natural cooling) will have significant implications on total CO2-equivalent emissions from the sector. The IPCC special report "Safeguarding the Ozone Layer and the Global Climate System - Issues Related to Hydrofluorcarbons and Perfluorcarbons" (Chapter 6 and others), as well as more recent publications, might serve as a basis for this coverage. | Accpeted. |

|---|---|---|---|---|---|---|---|
| 8558 | 8 | 0 | | | | "Travel demand and choice of transport mode depend on land use planning interventions that alter density, diversity and design (Cervero and Kockelman, 1997) of urban space can reduce travel demand (Ewing and Cervero, 2010)"<br>COMMENT:<br>Ewing and Cervero calculate an average elasticity of vehicle travel demand of -0.04, which means that when density is doubled, vehicle travel is nearly doubled. This is such a small reduction that the inclusion of this reference can be misleading. Indeed, given the greater traffic intensity associated with higher densities (Ewing and Cervero and others), it is possible that the GHGs would increase from vehicle traffic as a result of the reduced fuel efficiency. This issue should be covered<br>(See also comments 16, 17 and 18) | Rejected. This quote provided here is not part of the chapter, i.e. we do not know what you are referring to. |
| 8559 | 8 | 0 | | | | MISSING ISSUE: HOW TRAFFIC CONGESTION REDUCES THE IMPACTS OF VKT REDUCTIONS. As Ewing and Cervero (2010) show (there is also volumnous additional literature on this) as urban densities increase, vehicle demand increases. This means that there is more traffic on a road system that is virtually never expanded in such compact city programs. Thus, traffic slows down, and becomes more congested. As this occurs there is a reduction in fuel efficiency and the often presumed one to one relationship between the reduction in petrol consumed and GHG reductions is broken. This yields such strategies less effective and this should be said. See: Transport Canada Environmental Affairs, The Costs of Urban Congestion in Canada, www.gatewaycouncil.ca/downloads2/Cost_of_Congestion_TC.pdf<br>and Treiber, M. A. Kesting and C. Thiemann (2008)," How Much does Traffic Congestion Increase Fuel Consumption and Emissions? Applying a Fuel Consumption Model to the NGSIM Trajectory Data, paper presented to the Annual Meeting of the Transportation Research Board." | Accepted. |
| 8560 | 8 | 0 | | | | MISSING ISSUE: HOW TRAFFIC CONGESTION INCREASES HEALTH HAZARDS<br>Greater traffic congestion leads to higher air pollution levels at the neighborhood level and negative health risks. For example, research published by the American Heart Association indicates that "air pollution levels vary significantly in urban areas and that people who live close to highly congested roadways are exposed to greater health risks." See: Brook, R. D., B. Franklin,W. Cascio, Y. Hong, G. Howard, M. Lipsett, R. Luepker, M. Mittleman, Jonathan Samet, S.C. Smith, & I. Tager (20040, "Air Pollution and Cardiovascular Disease: A Statement of the Health Care Professionals from the Expert Panel on Population and Prevention Science of the American Heart Association," Circulation, Vol. 109, 2004, pp. 2655–2671 and USEPA (n.d.b), Health, http://www.epa.gov/air/nitrogenoxides/health.html. | Include in 8.7.1.2 |
| 8561 | 8 | 0 | | | | MISSING ISSUE: HOW COMPACT CITY POLICIES INCREASE TRAFFIC CONGESTION (TRAFFIC INTENSITY). This point emerges from the Ewing and Cervero (2010) research (and others) | Accepted. |
| 15858 | 8 | 0 | | | | Chapter appears to be more of a qualitative high-level literature review than quantitative analysis that highlights and compares the best ways to reduce transportation GHGs from transportation. This makes it hard to get to a bottom line set of conclusions. Chapter should contain more quantitative analysis that highlights and compares the best ways to reduce transportation GHGs from transportation for all modes and regions | Endeavouring to quantify SOD |
| 15860 | 8 | 0 | | | | There are numerous optimistic, academic statements, e.g., "up to", "targeted", "expected", "if", "emissions could double…". These should be tempered by using more pragmatic projections from auto or fuels industries, and perhaps presenting a range of values (P10-P90), and the most probable value in the middle (P50, median). Careful when forecasting expectations on deployment of technologies that are still in R&D (e.g., opposed cylinders). Also, need to clearly state timeframe – what are the reference characteristics (e.g., midsize LDV) and what is the reference year for baseline (e.g., 2010) and projection (e.g., 2035) | Noted. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 15864 | 8 | 0 | | | | •Cost implications need to be better addressed: customers respond mainly to 2-4 yr net paybacks for their vehicles, possibly slightly longer for fleets. If the cost of GHG technology is low and competitive, then consumers may buy it, but if not, it would be a hard to sell. Incentives can help but they generally do not last over the long term. Also, the chapter should focus on lowest $/tonne CO2 reduction options.<br>•There are some examples of new technology penetration due to incentives or regulations, but generally not due to consumer environmental "goodwill". The e-wheelers in China were generally a result of local government mandates banning gasoline motorbikes, while HEVs in Japan were spurred by incentives.<br>•I would question the realistic potential for large penetration of advanced vehicles in developing world when most customers are upgrading from scooters, bikes to small, simple (nano-type) cars that they can afford.<br>•There is customer balance/preference for vehicle performance (e.g., acceleration, amenities) over fuel economy. This needs to be recognized. Heywood et al (MIT) have studied this in detail. | Bullets 1, 3, 4: Accepted, see Sections 8.3 (behaviour) and 8.10; Bullet 2: Rejected. The transition to e-wheelers in China can be attributable to a combination of economic, technical, and political factors. The substantial driving factors are resident income growth and E-bike price decrease. The banning of gasoline motorbikes is important but not dominating factor. See Jonathan Weinert et al. (2007). The transition to electric bikes in China: history and key |
| 15868 | 8 | 0 | | | | •Ch. 8 should also better quantify short term potential for each mitigation strategy, instead of just qualitative discussions<br>• This should be study of studies – there are several examples of graphs pulled from one source (e.g., Fig. 8.4.1). These have the potential to only represent one view. Pull charts from a range of informed sources, not just from one publication, and compile into one chart to show a range.<br>• Cite more "real world" examples (systems already built) rather than potential future projects<br>• Potential sections to shorten: 8.4, 8.5 (overlap with WG2- adaptation?), 8.10.5, 8.10.6, 8.9.2 (some repetition from previous sections), table 8.8.1<br>• Use more charts and graphs to convey results, esp. in section 8.6.3, 8.6.4 | Accepted. Improved quantification and synthesis. |
| 10758 | 8 | 0 | | | | There are some papers that I think could be useful for this chapter: 1) Berntsen and Fuglestvedt, 2008. Global temperature responses to current emissions from the transport sectors. Proceedings of the National Academy of Sciences (PNAS), 105 (49): pp. 19154-19159.<br>2) Skeie et al., 2009. Global temperature change from the transport sectors: Historical development and future scenarios. Atmospheric Environment, 43 (39): pp. 6260-6270. 3) Borken et al., 2010. Specific climate impact of passenger and freight transport. Environmental Science and Technology, 44 (15): pp. 5700-5706. 4) Tanaka et al. 2012. Climate effects of emission standards: the case for gasoline and diesel car. Environmental Science & Technology 46 (9), pp 5205–5213<br><br>In addition, there are several relevant studies from the EU projects QUANTIFY (www.ip-quantify.eu) and ATTICA (www.ssa-attica.eu). | these don't sound relevant to our task but will check |
| 10759 | 8 | 0 | | | | In a few places in the chapter the unit CO2-equivalent is used without any explanation of what this is, and how it is calculated. It should be made clear that the GWP-100 is used. It should be noted which components that are inlcuded in the calcuations of CO2-eq. In addition, it could be made clear that several studies have shown limtations of GWP in the context of transportation and how alternative metrics could be used. It is important to note that other time horizons and metrics would produce a different result; see figure 2 in Fuglestvedt et al., 2010: Transport impacts on atmosphere and climate: Metrics. Atmospheric Environment 44 (2010) 4648–4677. See also WGI, chapter 8, fig 8.31. | Noted. This will be covered in Chapter 1 and the glossary (Annex I). |
| 10760 | 8 | 0 | | | | The role of non-CO2 components could be given more attention since these components are important for the total climate impact of transport. | Noted. |
| 10761 | 8 | 0 | | | | The climate impact of the shipping sector could be given somewhat more attention. In particular the cooling effect (due to SO2 and NOx) and the long term warming effect of CO2. This issue is summarized in a short paper by Fuglestvedt et al., 2009 (ES&T), but also studied and discussed in several other papers in the literature. | Noted. Already covered in 8.2 but could expand. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 10762 | 8 | 0 | | | | The climate impacts of aviation could also be given more attention. There are potentially strong warming effects of contrails and aviation induced cirrus which are very uncertain. There are several papers on this in the literature (e.g. by Ulrike Burkhardt and Bernd Kärcher in Nature Climate Change, March 2011). | Accpeted, added to 8.2 |
| 13427 | 8 | 0 | | | | In the aviation part, we should mention about the impact of the Low Cost Carrier. That business will be getting larger in the world. And its impact will be not so small. | Rejected, as reference is missing. |
| 16947 | 8 | 0 | | | | I regret I have not had time to review the Sectoral chapters in depth. It may be interesting to illuminate the hypothesis that Transport sector transitions are the most heavily dependent upon “Third Domain” characteristics of system evolution driven by innovation and infrastructural developments, and less dependent upon carbon prices than other sectors.<br>This is the broad suggestion laid out in the structure-setting Chapter 3 of Grubb, Hourcade and Neuhoff, Planetary Economics: the Three Domains of Sustainable Energy Development, Taylor & Francis forthcoming (Chapters 1 – 5 submitted, others in draft available on request).<br>Tranpsort transitions, including relationships to oil and integration with electricty developments, are discussed in chapters 3 and 11 of the book | Rejected. Need reference to be published. Reference is in the book by reviewer Grubb, Hourcade and Neuhoff, Plenetary Economics and the three domains of sustainable energy development (Ch.2), Taylor&Francis 2012. For the Transport sector that its transition depend on third domain (system) may be a good hypothesis difficult to prove or document with the |
| 8350 | 8 | 0 | | | | I suggest the summary of AR4 and what's new be added like Chapter. 9. | Accepted. Agree that we should call out "what's different" in this section |
| 2724 | 8 | 0 | | | | Please do not shorten sections 8.3.2. 8.3.3 and 8.3.4 but preferably increase their coveradge. In the other sections shortening possible. | Accepted. Need a balance. agree with this comment |
| 11272 | 8 | 0 | | | | This chapter covers a lot of very important mechanisms to mitigate climate change. In particular it does not only cover technological but also behavioral factors (see figure 8.1.2.b). However, there is still a strong focus on technological mechanisms. In the figure 8.1.2.b the area "activity" refers to all developments in society that, ultimately, affect transport; but these behavioural and structural dimensions, in my point of view, are not considered enough in their potential impact. For instance, it is not only economic wealth and development affecting kilometers travelled by persons. Nor is it sufficiently explained by adding urban form as a factor (though it is a very important factor): examples from Europe (eg. compare Copenhagen, Amsterdam and Zurich on the one side as good practices with other central European cities) show that even on the local level policy may affect "activities" and travel patterns in an important way; researchers discuss the concept of "mobility cultures" meaning that the (non-) dominance of certain modes of transport is a policy outcome (which is not closely related to economic development or other "hard" factors). Addtionally, over the last year a discussion of "life quality" and "happiness" emerged in the angloamerican literature which may shed some light on related questions. | Behaviour to be re-addressed in SOD |
| 13236 | 8 | 0 | | | | This chapter decomposes GHG emissions into activity, structure, energy intensity and carbon intensity and is grounded to latest academic literature on the subject. However we find that this approach might be counterproductive because it does not fully recognize the systemic nature of cities. It does not recognize that transportation system is fundamentaly linked with activity system. Therefore the question of transportation in not only a technical one (which instruments can lower each category) but also an economic one : to what extent can low energy cost be compatible with sustainability? | This is in Ch 12 |
| 13238 | 8 | 0 | | | | To reduce this chapter, section 8.3 could be reduced from 10 pages to 6 approx. by changing the description of each transportation technology into main challenges ; for instance : energy storage, new propulsion systems, supply chain change. Sections 8.3.4 and 8.3.5. should be kept. | Rejected. Authors don't see how they're going to cut the technology section down to 6 pages without killing off a lot of important detail (and of course many of the comments ask for more detail, |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 4046 | 8 | 0 | | | | The chapter on transport offers a virtual encyclopedia of options and possibilities, some already emerging, some are just hints at being possible. The author team did an excellent job in offering such an enthusiastic and comprehensive treatment of "transportation." At the same time, there will be places in the chapter where shortening and reformatting much text into succinct tables and graphics would help not only with understanding but also page limits. | Agree. Moving into tabular format will certainly save space…the question is, will readers actually READ the tables….I know that I tend to focus much more on text. |
| 4047 | 8 | 0 | | | | Transformation of transport is possible, but can we transform the whole system in major regions of the world in time -- especially in the context of achieving the 2 degree C rise -- by the end of this century. | probably not….but it's our responsibility to show how it might be done |
| 4048 | 8 | 0 | | | | Chapter 8 needs to convey more explanations about the key differences in outlook or projections from AR4 to AR5. For example, has the assessment of projections in technology advances and needed changes in policies assessed in AR4 become facts in AR5? Perhaps a succinct table of such items would help the reader understand the challenges and barriers in one glance. What are the drivers for or hurdles against such changes? For example, page 10, statement about AR4 begs the question about what has changed? | I agree….we really do need to define what's different…not only technology and policies adopted, but also our emphases (e.g., more emphasis on behavior and planning).….some ideas about technology and policy change: the latest round of U.S. fuel economy standards...VERY ambitious, and encouraging…stop-start systems in |
| 4049 | 8 | 0 | | | | Asking about the differences between AR4 and AR5 is another way of asking whether we are heading for and looking at second-best, no-longer-ideal scenarios and projections. I think that this question is important and needs to be posed and addressed. | As above (comment 4048). we should also, in this light, track what's happened on automobile sales since AR4 |
| 4050 | 8 | 0 | | | | There is too much text that describes data. Putting the data into tables or graphs could help reduce page length. For example: pages 11 and 12 (sections 8.1.2 - 8.1.3; page 13 (section 8.2.1) | Agree |
| 3576 | 8 | 0 | | | | Freight mitigation solutions are underrepresented. | Agree. would like to increase the freight / |
| 3577 | 8 | 0 | | | | Freight being responsible for about 35% of all transport ghg emissions, at least 20% of WGIII AR5 transport chapter authors, text length, citations, references, policies and costs statements should be also allocated to freight solutions. Now it is about 5%. | Agree |
| 3578 | 8 | 0 | | | | Only one of the CA of Chapter 8 is a recognised international freight expert. At least 2 authors should be recognised freight experts. | Agreed. Brought in further freight experts (Allen McKinnon). |
| 3579 | 8 | 0 | | | | I strongly disagree with the merging of freight and passenger mitigation statements. The types of policies might be similar, the way of implementing them is radically different and need specific approach and comments. | Not clear which section this refers to. would like to increase the freight / logistics content Most of this additional literature is relevant and could help us elaborate . This is partly true. There is certainly a need for greater harmonisation of the measurement and reporting of carbon emissions from freight transport. This should be mentioned in the report. On the other hand, there is an emerging consensus on the key measures that should be |
| 3580 | 8 | 0 | | | | There is almost no science on climate change mitigation in freight and logistics that is also mentionning passenger transport, and vice-versa. So what does not exist in reality should not be suggested in a IPCC report. | Much too negative. Under-estimates the amount and rigour of research done on this topic. |
| 3581 | 8 | 0 | | | | There is an abundant literature on freight solutions that has not been mentionned or cited. Main authors, books and articles that would need to be cited: McKinnon Piecyk: Internalisation of external costs 2008; OECD: transport and globalisation 2010; McKinnon et al: Green Logistics 2012; Leonardi & Baumgartner TRD 2004; Rizet et al, TRD 2012; Allen et al, IATSS 2012; | To include. Agree, but this is due to the lack of published research on the subject. Several organisations have constructed marginal abatement cost curves for freight transport and reference |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 3582 | 8 | 0 | | | | There is almost no literature and data on comparative costs per tonne of CO2 savings of different freight and logistics solutions. | Agree that there is a lack of published research on the subject. Several organisations have constructed marginal abatement cost curves for freight |
| 3583 | 8 | 0 | | | | Therefore, the focus of policy oriented search for innovative solutions is on testing and trialing new technologies or organisation forms, and assessing their mitigation potential. This approach allows us to go from the idea over the trial to the industry scale diffusion of innovation without being obliged to wait for a complicated political strategy development. | Point unclear. Maybe follows on from point above (comment 3582) |
| 3584 | 8 | 0 | | | | No common understanding on how to measure CO2 mitigation effects in freight: too many approaches and assessment methods are competing. No universal standard of CO2 calculation. Solution: try to organise a universal ISO standard on CO2 calculation for goods and passenger transports. | Noted. We see your argument but the task of the IPCC is to assess existing research and other data. |
| 3585 | 8 | 0 | | | | Load factor and vehicle occupancy are too low. The effects of efficiency measures on increasing vehicle load factors have been poorly recorded. New attempts of slow logistics, waiting for more goods to be distributed before starting the round trips, are promissing, and at zero additional costs. | Agree that we could say more about opportunities to improve load factors in freight vehicles. There is very little macro-level data available, particularly outside the EU, to permit assessments of current loading and the potential for improvement. Very little is known about the cube utilisation fo freight vehicles. |
| 3586 | 8 | 0 | | | | Clean electric freight vehicles and city logistics consolidation centres are currently tested in several urban freight trials in Europe (project documentations are available at SUGARLOGISTICS.eu, BESTFACT.net, SMARTFUSION.eu, STRAIGHTSOL.eu, etc). The assessments that include ghg mitigation criteria show mostly a positive cost-benefit situation. This type of solution involves behaviour change, new technologies, logistics efficiency, data collection and analysis, local policy support, European subvention at the trial stage, and involvement of manufacturers and software providers. The integrated case study approach currently in use is therefore a radical contradiction to this Chapter 8 structure that separates the different policy activities into an artificial set of different solutions. | Noted. |
| 3587 | 8 | 0 | | | | The attempts to develop a European Logistics Strategy that would be mitigating climate change have failed in 2006-2007. There is no international concerted action or strategy on mitigating clinate change in freight. The most recent EU white paper however, have taken some elements on board, that could be useful for other countries. Most prominent is the support of electric vehicle use. | Chapter already refers to the EU White Paper's ambitious freight modal split target. Could reinforce references to freight transport policy in other parts of the world. The European 2006-7 initiative is presumably the Logistics |
| 3588 | 8 | 0 | | | | There is also a pressing need for dedicated policy departments /experts dealing with freight and logistics at different governmental levels. | Need literature to support this point. There is evidence that governments around the world are attaching greater importance to logistics, though not always developing policies to address its environmental impacts. Raises wider |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 3597 | 8 | 0 | | | | Cite the new EU white paper "33. A strategy for near- 'zero-emission urban logistics' 2030<br>□ Produce best practice guidelines to better monitor and manage urban freight flows (e.g. consolidation centres, size of vehicles in old centres, regulatory limitations, delivery windows, unused potential of transport by river).<br>□ Define a strategy for moving towards 'zero-emission urban logistics', bringing together aspects of land planning, rail and river access, business practices and information, charging and vehicle technology standards.<br>□ Promote joint public procurement for low emission vehicles in commercial fleets (delivery vans, taxis, buses…).<br>" | Chapter already refers to the EU White Paper's ambitious freight modal split target. Could summarise other freight policy initiatives in this white paper as they have a clear climate change focus. Need also to bear in mind other comments that chapter is already too EU- and US-centric. |
| 7801 | 8 | 0 | | | | The chapter repeatedly writes "black carbon and aerosols". The need to focus specificly on black carbon is understandable. However, as black carbon is also an aerosol species, I would suggest writing "… and other aerosols" or just "aerosols". | Need to clarify this. |
| 12878 | 8 | 0 | | | | The chapter offers a wide perspective on climate-related transportation issues, in particular a wide range of technological and system-wide perspectives. Elaborations on policy instruments to tackle a carbon-intensive transportation path together with means to is financing do however not make up a large part of the chapter. Thus, a separate section on policy instruments and relevant studies is suggested. Changing the order of section 8.9 and 8.10 may be recommended. Strenghtening sections 8.9 and 8.10 may also benefit the chapter. Several citations are missing in the reference list. | Section 8.10 is on policy so point not clear. |

|---|---|---|---|---|---|---|---|
| 5187 | 8 | 0 | | | | The whole chapter might be more system-based. Scenario analysis might be helpful to draw general tendencies, feedbacks, rebounds, and major policies and to what exten these policies should be integrated. While this chapter could be a systemic synthesis of existing knowledge, it now tends to be more a long list of all sorts of measures that might help to reduce emissions, without showing the many interrelationships between policies that might anhance or reduce the effectivity of the individual policies. Examples are: investing heavily in road infrastructure, while campaigning to get more commuters in public transport is not effective; same for investing in cheaper air transport (liberalisation of air market) and at the same time investing in high speed rail without really improving the economics of this latter system. Such contradicting policies will make it very difficult to make the mitigation progress needed. Scenario based refs: Åkerman, J., & Höjer, M. (2006). Meeting an 80% reduction in greenhouse gas emissions from transportation by 2050: A case study in California. Transportation Research Part D: Transport and Environment, 14, 147-156. | Noted. System aspects are particularly discussed in Section 8.9. |
| 5214 | 8 | 0 | | | | The social drivers to (international) transport as outlined in Chapter 10 (tourism section) are missing here. The problem is that tourism is developing into a system highly depending on long distance air transport, while currently air transport covers only less than 20% of all tourost trips, while long haul in the order of 5%; but still causing up to 80% of all emissions (Peeters, P. M., & Dubois, G. (2010). Tourism travel under climate change mitigation constraints. Journal of Transport Geography, 18, 447–457). When air transport is considered on its own, demand falls out of the equation, because the aviation sector can not be asked to reduce its own demand. Therefore it is important to integrate analysis of torism and transport and show the large opportunities to reduce only small segments of ourism (mainly long haul) to significantly reduce demand for air transport. The same seems truye for other parts of transport where current transport demand seems to be taken as a given, making it extremely unlikely to find enough mitigation opportunities. | Noted. Tourism and the effects of its demand is covered in Ch.10. |

|---|---|---|---|---|---|---|---|
| 8016 | 8 | 0 | | | | "Policy and decision making for transport development in non-OECD countries are instrumental to meet urban sustainability and climate goals" from p64, l.11 is worth being mentioned in the Ex. Summary | Agree but space constrained. |
| 8021 | 8 | 0 | | | | "Without policy intervention, projected incremental improvements in fuel, vehicle and system efficiencies will be surpassed by annual growth in transport demand." from p.58, l.42 is worth being mentioned in the Ex. Summary | Agree but space constrained. |
| 8024 | 8 | 0 | | | | "However, a number of technology options, such as second-generation biofuels, electric- and hydrogen- powered vehicles will still require time to make substantial contributions to climate change mitigation efforts in the transport sector", "Historical analysis suggests that it takes 30-70 years to fully implement new infrastructures" and "It is likely to take the introduction of 5-10 million vehicles over 15-20 years for both BEVs and FCVs to break even in costs with ICEs" from 8.9.2 on p.55 (l.15f, l.19 and l.36f) should be mentioned in the Ex Summ. | Agree but space constrained. |
| 8025 | 8 | 0 | | | | "Achieving a 2oC stabilisation level will require major mitigation contributions to come from the transport sector over the next two decades" from p.55 l4f should be mentioned in the Ex Summ. (same for p.52, l.26) | Agree but space constrained. |
| 8029 | 8 | 0 | | | | "In turn, a transformation towards a sustainable transport system requires simultaneous changes in non-transport domains, e.g. in relevant public institutions" from p.29, l.29f should be mentioned in the Ex Summ. | Agree but space constrained. |
| 8034 | 8 | 0 | | | | "Recent trends suggest that current economic, social, or cultural changes alone will not be sufficient to mitigate global increases in atmospheric CO2 concentrations, and policy instruments, incentives, or interventions will be needed to reduce global CO2 emissions" from p.15, l.20f is worth being included in the Ex Summ. | Agree but space constrained. |
| 8036 | 8 | 0 | | | | The constant travel time budget (see p14, l. 4f: "Urban travel time budgets averaging around 1.0 hour per person per day or 1.1 – 1.3 hours per traveller per day (Zahavi and Talvitie, 1980; van Wee et al., 2006) have been found to occur in all cities where data is available, including developed and developing economies") is a fundamental rule for transport planners and thus should be mentioned in the Ex Summ. | Agree but space constrained. |
| 3162 | 8 | 0 | | | | This is hard to review because it is so far over limit. | Aiming to shorten |
| 3163 | 8 | 0 | | | | It would be useful to have more links between this chapter and others, notably on the choice of policy instrument (a topic addressed in several chapters) and on how transformation pathways play out in the transportation sector. (IN this sense, chapter 9 offers a useful model. Here is a copy of a comment I made on chapter 9 in that regard: "Section 9.9.1 is a good model of what's needed in other sectoral chapters—a link back to chapter 6 so that readers can see how a common set of transformation pathways affects each sector. ") | Have many cross-references already throughout text. Can add more. good point |
| 5692 | 8 | 0 | | | | Technologies that contribute to green transportation are not limited to energy saving. IT (Information Technologies) can reduce emission by inproving efficiencies of logistics. | Agree. Covered already but can expand |
| 18765 | 8 | 0 | | | | Please consider discussing planned obsolesence in context of sustainability or reference Ch.10 where this might be centrally discussed. | Unclear what this refers to. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 18962 | 8 | 0 | | | | General Comment: Storyline. The chapter still lacks a storyline. A storyline should take the following aspects into account:<br>(1) The transport sector is the most difficult to decarbonise. In order to avoid dangerous climate change also the transport sector is required to significantly contribute to mitigation. This requires dramatic changes – this does not come across when reading the chapter. The chapter should clearly address this challenge and outline different pathways to solve the problem. I.a. they should cover how a rebound effect can be avoided. At the current state of the chapter implications of trends and options do not become clear to policy makers. Develop own back-of-the-envelope scenarios to convey estimates for different options, e.g. illustrating expected total emissions for different scenarios (i.a. expected BAU increase of LDVs modest technological progress vs. different mitigation cases).<br>(2) What is the potential of the respective pathways? What do they cost?<br>(3) What are the policy instruments that can facilitate this? What is the role of policies in different scenarios? E.g., should the sector be included in carbon pricing? Assessment of experience with different policy instruments is needed.<br>(4) What are the trade-offs?<br>(5) Further, better carve out the barriers that hinder potentials being realized.<br>(6) Ensure that the approach you take on this is compatible with the other sectoral chapters to enable comparison and possible synthesis. | Noted. |
| 18963 | 8 | 0 | | | | General Comment: Redundancies, structure and synthesis. The chapter presents a lot of data, but in large parts lacks synthesis – this is needed, though, to substantiate key messages. The Kaya identities are used in several parts of the chapter but improvements are needed in using it as structuring element (particularly as common reference point throughout the chapter) and for synthesis (outlining key strategies, how much each component can contribute [differentiated by regions] – also quantitatively [not only for examples as in Section 8.6]), e.g. "Transportation has a low to medium reduction potential for demand reduction (0-30%), a medium potential through modal shift (X%-20%), for energy intensity reduction a potential of Y% for air travel, Z% for shipping incl. waterways, A% for rail and B% for roads. The carbon intensity can be reduced by ...". | Agree. We will amend. |
| 18964 | 8 | 0 | | | | General Comment: For all sectoral chapters there must be more clarity about what is covered in the section “Cost and Potentials” (8.6) and in “Sectoral implications of transformation pathways and sustainable development” (8.9). The coming meetings (SIE-3, LAM3) should work on this. | Agree. We will amend. |
| 18965 | 8 | 0 | | | | General Comment: In order to improve the flow of the text numbers should be moved from the text to tables and/or (better) figures. The text should focus on giving the context and interpreting. | agree…especially in early sections, too many numbers |
| 18966 | 8 | 0 | | | | General Comment: Focus. There is still too much focus on technologies (vehicle types and propulsion technologies) | Don’t agree as the balance has been discussed |
| 18967 | 8 | 0 | | | | General Comment: Length. The chapter is well beyond its page limit. | Agreed |
| 18968 | 8 | 0 | | | | General Comment: Linkage. A strategy needs to be developed of how to synthesize and possible aggregate data (incl. costs) that will function as a counter part to scenario data from Chapter 6. Explicit references to Chapter 12 are needed and clarification what is covered in this chapter and in Chapter 12 | Chapter 12 already X-referenced widely. |
| 18969 | 8 | 0 | | | | General Comment: Costs. Concerning costs, a common metric should be established, LCCEs provide such a metric. | Agree section 8.6 |
| 18970 | 8 | 0 | | | | Please consider adding a discussion on land-use, land prices and its implications to the chapter, including land area used by different modes (per passenger per time), differences of costs between running public transport underground or on the ground. | Rejected. Relevance not clear. Addressing such issues is not feasible given the limited size of the chapter. |
| 18971 | 8 | 0 | | | | Concerning policies consider discussing the consequences of ownership of land and/or transportation infrastructure for the ability to implement policies (e.g. ownership of rail networks). | Rejected. What relevance to transport mitigation? Maybe in Ch 12 and/or |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 11605 | 8 | 0 | 0 | | | Chapter difficult to read and to review. It's not wrong, but has several major shortcomings: 1) Lack of focus: A holistic assessment of the full climate impact of transportation today and in the future, as well as its mitigation potential is not done. 2) Lack of balance: Most is on passenger transport, not balanced with the role of freight transport. 3) Lack of comprehensiveness: Results from single studies are highlighted in charts and figures. I would however expect summary charts and tables from a review. Exceptions and hence good examples: Tab. 8.6.2 and Tab 8.8.1 seem to summarize, but are hard to read (even because of bad reproduction quality). These tables seem to be key and should be expanded furhter, better placed highlighted. Figs 8.9.1/2 are very interesting as well, though source is missing. 4) Lack of specifics/too broad brush: Though it is acknowledged throughout the text that there are important regional differences, you do not highlight and distinguish them clearly. Suggestion: Try to identify some (country) case studies for which you pull through your quantitative results. Good countries, standing for larger country groups, could be: US/WEU/JPN; CHN/IND. Here you could nicely illustrate eg. levels of transportation (e.g. as pkm/cap and tkm/GDP; energy intensity; total transprot energy use; total transport emissions of LL and SL GHG; analysis what mitigation options would seem feasible and what impact that might have. Trying to do all at once has resulted in the current stew.5) A lot in this chapter is on energy demand. Translate this to GHG emissions and impacts, then you are better in focus. | Repetition of comment 11595, see answer there. |
| 10442 | 8 | 0 | 0 | | | The new technologies that create the savings in Co2 are exciting, but I do not see an explicit connection spelled out here between these green technologies and exact impacts on the environment. | Noted. Section 6.9 is meant to provide a systems perspective showing the |
| 10443 | 8 | 0 | 0 | | | Need more developing country focus | Agree. |
| 7393 | 8 | 0 | 0 | 0 | 0 | This chapter should include a section (and a statement in the executive summary) that considers and discusses the role of GHG metrics (GWPs etc) for transport, particularly for lifecycle assessments of transport emissions. E.g. Peters et al, EnvSciTec 2011; Azar and Johansson ClimChan 2012; Fuglestvedt et al, AtmosEnv 2010. Such information is highly policy relevant especially for policy approaches that try to consider short-lived as well as long-lived forcing agents (an issue that also seems to have received very little attention in this draft; e.g. for regional approaches to limit transport emissions, and for lifecycle assessments). This discussion could link with Section 3.10.3 but build on it by demonstrating the particular instances where metrics are important in the transport sector. | Noted. The choice of GWPs etc. is covered in the framing chapters. We added a reference. |
| 3437 | 8 | 0 | 0 | | | You write about demand reduction in Sections 8.6.1 and 8.10.1. You write about modal shift in Sections 8.4.2.3 & 8.4.2.4 and in Section 8.6.2 (and ignore modal shift in Section 8.10.1). I understand that Sections 8.4, 8.6 and 8.10 deal with different aspects, however all this multiple reference to the same topics is confusing. | Demand reduction is more than modal shift. |
| 3443 | 8 | 0 | 0 | | | You write about demand reduction in Sections 8.6.1 and 8.10.1. You write about modal shift in Sections 8.4.2.3 & 8.4.2.4 and in Section 8.6.2 (and ignore modal shift in Section 8.10.1). I understand that Sections 8.4, 8.6 and 8.10 deal with different aspects, however all this multiple reference to the same topics is confusing. | Accept. Chapter will be revised and repetitions will be avoided. However, in some cases, because different aspects of a same issue have to be dealed with from a different perspective in the different sections of the chapter, the |

|---|---|---|---|---|---|---|---|
| 3444 | 8 | 0 | 0 | | | General comment: Obviously the chapter contains essentially all the important information about the transport sector - especially with regard to passenger transport with which I am more familiar. The authors are experts in the field and are very well aware of the literature. However, the organization of the chapter could be improved in my opinion because I found it confusing from Section 8.4 onwards. Therefore, when writing about mitigation costs and potentials, opportunities and barriers, I suggest following the ASIF structure shown in Figure 8.1.2.b: Adrress one Section to each one of the four parameters of the equation - demand reduction, modal shifts, changes in energy intensity and changes in carbon intensity respectively. The latter two parts are very well covered by the excellent Section 8.3. Subsequent sections and subsections dealing with behavioural aspects, urban form, infrastructure, costs etc. could be grouped together in line with the ASIF structure; this would greatly improve the clarity of the messages of this chapter. Policy options should be described in a similarly structured and clear manner. Table 8.8.1 could be extended to include potentially more policy options plus a column on cost-effectiveness of each measure, and thus it would become the key summary table of the whole chapter. | worth considering but cannot change level 1 sub-headings as set by IPCC Plenary. |
| 17778 | 8 | 1 | | | | somewhere in the text there should be a mention of the EPA 2017-2025 light duty vehicle rule - does t discourage alternative fuel use? | Accept - will need a reference |
| 17779 | 8 | 1 | | | | For the executive summary - consider the formats used in chapters 16 and 10 | This version based on past IPCC |
| 13872 | 8 | 1 | | 100 | | Authors often refer to future when estimating the interest/potential of a specific measure, then it may be useful to clearly define which kind of baseline is used. + It could also be useful to better define "Cities" (versus urban area) and to link the definitions used with chapter 12 (Human settlement) + There is no need to start (as always) with technology first as a solution: to avoid main emissions in the future through urban form should be stronger emphasized. □ | Accepted. Please note, though, that as chapter is based on various studies, it is not possible to refer to a consistent baseline throughout and that using one would also be not inspirit of a |
| 11183 | 8 | 1 | 1 | 1 | 1 | Chapter 8 is well-organized and very informative. It contains many new important subjects. | Agree |
| 2438 | 8 | 10 | 10 | | 13 | This definition is a good one - but accessibility is not mentioned again (apart from passing - p29 and 38) - until the end (p58) and then not in terms of sustainable mobility - issues of affordability, equity and efficiency are also not referred to again in the context of this definition. | Accept. |
| 17708 | 8 | 10 | 10 | | | Is transport about mobility or access? The chapter emphasizes the first rather then the second. But surely mobility is a means to an end, rather than a value in its own right? There is little in the chapter that tackles explicitly what might be done to reduce travel (without reducing welfare). | Both. I thought there was quite a bit about density and urban planning |
| 15320 | 8 | 10 | 13 | | | I think "between" will sound better as "across". :-) | Accept |
| 15321 | 8 | 10 | 14 | | | "whereas" needs a comma in front of it. | Accept |
| 15322 | 8 | 10 | 15 | | | open parens in front of Zegras should be removed. | Accept |
| 15323 | 8 | 10 | 16 | | | "Diminishing" should probably be "Reducing" (since that is a more active/appropriate verb & is simpler to read & quickly understand). | Accept |
| 8871 | 8 | 10 | 2 | | | Not sure that HDVs are used in urban regions only | Agree. sentence doesn't say this |
| 11607 | 8 | 10 | 2 | 10 | 2 | HDV increase in urban areas. What's the evidence? | Amended. good question |
| 15805 | 8 | 10 | 20 | 10 | 25 | suggest omitting this paragraph. Does not add much value | To be considered in next draft. agreed…unless we add something later |
| 15324 | 8 | 10 | 20 | | | "assessing" should be "assess" | Accept |
| 14751 | 8 | 10 | 20 | 10 | 20 | Please name indicators. Furthermore a lot of transport indicators are uncertain (travel activity, load factors, on-road fuel economy) and data collection needs improvement (especially on-road fuel consumption) to obtain a better picture of todays transport system | Accept |
| 15325 | 8 | 10 | 21 | | 23 | all those references need to be in one set of parentheses | Amended |
| 15326 | 8 | 10 | 25 | | | citation is imperfect (should only have one last name, no initials, etc.) | Amended |
| 15327 | 8 | 10 | 26 | | | cross cutting needs a hyphen | Accept |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 15330 | 8 | 10 | 26 | | 35 | I am not sure why a "this chapter does this & this" paragraph suddenly shows up in the middle of all these paragraphs. It is out of place (& those "this chapter" refs can probalby be deleted, since they're a bit generic). Of course, an intro to a chapter's contents is always nice to see (but that should be plainly in the chapter's intro). | Moved |
| 14752 | 8 | 10 | 26 | 10 | 35 | Something like this should maybe occur at the beginning of the chapter? | Moved |
| 2809 | 8 | 10 | 26 | 10 | 30 | What this sentence intends to convey is not clear. This para seems to explain the structure of the chapter. Then, the sentence should be rewitten to indicate that this chapter first discusses a system-based framework of indicators. It would further need what specifically mean "a system-based framework of indicators" | Amended |
| 5186 | 8 | 10 | 26 | 10 | 30 | I feel the "system-based framework" is not very well presented nor developed. Such a framework should make use of systems thinking and show, e.g. through causal loop diagramming, the feedback mechanisms between transport quality, transport cost, transport speed, energy efficiency, spacial structure and transport volumes (a tourism related sample in Peeters, P. (2010). Tourism Transport, Technology, and Carbon Dioxide Emissions. In C. Schott (Ed.), Tourism and the Implications of Climate Change: Issues and Actions (Vol. 3, pp. 67 - 90). Bingley (UK): Emerald. Furthermore my suggestion would be to mch more base this chapter 8 on the many scenario based literature and its conclusions (see general chapter remark nr 6). | Agree that this paragraph doesn't work here, and it's not clear we've used a system based framework. Tourism in Ch 10. |
| 15328 | 8 | 10 | 28 | | | comma needed before "including" & this whole sentence (which is very confusing & unusually long) should be overhauled (& shortened, to get to the point) | Amended |
| 15329 | 8 | 10 | 31 | | | comma missing before "along with" | Amended |
| 12884 | 8 | 10 | 34 | 10 | 35 | This sentence is not very comprehensible and should be elaborated. It could help to refer to the chapters where the subject/the distinction is implemented. Or is it meant that behavioural aspects of mitigation in the transport sector are treated marginally, e.g. chapter 8.3.5 is just about one to two pages in contrast to several pages of technological options? Please clarify. | Amended. and technology doesn't belong in a sustainable perspective? This sentence shows a distinct bias against technology |
| 11609 | 8 | 10 | 36 | 10 | 49 | You miss behavior change and demand reduction among the mitigation options. | Amended |
| 15331 | 8 | 10 | 36 | | | colon is needed after "factors" (rather than a comma) | Accept |
| 14753 | 8 | 10 | 36 | 10 | 49 | Why fuel switch is always mentioned first? I would start with vehicle efficiency measures as these include cost efficient, near term action. | Is no ranking order intended. not important |
| 4290 | 8 | 10 | 36 | 10 | 37 | Three main factors, carbon intensity (CO2eq/MJ), energy intensity (MJ/km), and activity (km/capita) are correct. However, actual vehicles transports the passenger or freight fewer than a capacity. Transport efficiency (road factor) affects the GHG emissions per capita or per ton. Therfore, I propose next decompose.<br>GHG emissions = carbon intensity (CO2eq/MJ) × energy intensity (MJ/capacity-km) × activity (man-km, or ton-km) / road factor(real number of passenger/capacity, or real tons of freight/capacity) | Good point included. This is correct for freight and reflected in the current references to carbon intensity in the chapter. worth considering |
| 16279 | 8 | 10 | 37 | 10 | 37 | Energy intensity is usually defined in terms of MJ per passenger-km (pkm) or MJ per tonne-km (tkm), and activity is usually defined in terms of pkm or tkm. | Amended |
| 15332 | 8 | 10 | 38 | | | Bongardt should not have a parenthesis in front (both citations' years should be in parens, but not the author names, in this case). | Accept |
| 15333 | 8 | 10 | 39 | | | I'd remove "(energy carriers)". There's on need for it here & it's not a term I would use. (A carrier is usually a freight carrier, sent by a shipper. So energy carrier reminds me of a system or firm to carry energy, not a material or substance. ;-) ) | Common term for fuels etc. Editorial. the term "energy carrier" usually refers to electricity or hydrogen, not to all fuels, I |
| 5396 | 8 | 10 | 39 | | 40 | why would varying carbon intensity affect activity? Perhaps this would be true once a strong carbon tax were in place, but otherwise why would this matter? | eg limited range of electric vehicles but deleted |
| 15316 | 8 | 10 | 4 | | | "as" should be ", since". | Accept |
| 15334 | 8 | 10 | 40 | | | "on" should be struck in *both* instances. I also don't understand why a fuel type would affect activity (though I realize that a battery limits range, so BEVs don't really allow for long-distance vacations, for example). Specifics are importnat throughout this chapter. There is too much generic info on this page, I feel. | Editorial. Deleted. Agree |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 15335 | 8 | 10 | 40 | | | "therefore" should be struck | Accept |
| 15336 | 8 | 10 | 42 | | 43 | the "thereby" clause should be struck ("switching modes" is the only change in the list that has a specific example, and it's rather obvious why switching modes could be helpful, so no example is needed). | Accept |
| 16280 | 8 | 10 | 42 | 10 | 43 | The phrase "thereby reducing the shares of less efficient modes" is redundant and should be deleted. | Accept |
| 15337 | 8 | 10 | 44 | | | "whereas" needs a comma in front of it. Please seek & replace throughout the chapter. There may be other instancesI'm not catching. | Accept |
| 15338 | 8 | 10 | 45 | | | comma belongs after the parenthetical (not before) | Accept |
| 15339 | 8 | 10 | 46 | | 47 | comma needed after "chapter" (this is a long sentence, and the reader needs a breath break here ;-) ) Or you can just remove the "in order to give…" clause. | Accept |
| 15340 | 8 | 10 | 48 | | | "on" should be struck | Editorial |
| 15317 | 8 | 10 | 6 | | | "public transport" should be "use of public transport" (to be consistent with other items in sequence), and "systems, related" should be "systems and related". | Accept. Editorial |
| 15318 | 8 | 10 | 7 | | | "intensive" should be removed. | Editorial |
| 8872 | 8 | 10 | 9 | 10 | 10 | unfinished sentence | Amended |
| 14273 | 8 | 10 | 9 | 10 | 25 | Not sure of the relevance of these two paragraphs - they could be removed without affecting the narrative. | Accept |
| 11608 | 8 | 10 | 9 | 10 | 35 | Suggest to delete. You don't need the SD debate here - and you don't take it up later anyway. | Accept |
| 15319 | 8 | 10 | 9 | | 10 | This odd first sentence of the paragraph should be removed (or overhauled). | Amended |
| 14750 | 8 | 10 | 9 | 10 | 19 | Please re-phrase | Amended or eliminate |
| 12883 | 8 | 10 | 9 | | | The second paragraph of this page begins with a sudden onset of the term "sustainable transport". It would help the flow of the text if the term was introduced. | Defined there. or deleted |
| 5185 | 8 | 10 | 9 | 10 | 19 | Suggest to add reference to e.g. Åkerman, J. (2005). Sustainable air transport - on track in 2050. Transportation Research - D, 10, 111–126 and Åkerman, J., & Höjer, M. (2006). How much transport can the climate stand?--Sweden on a sustainable path in 2050. Energy Policy, 34, 1944-1957. This is also linked to my comment number 2. | Agree. to include |
| 17167 | 8 | 10 | 1 | 10 | 8 | Good to highlight what the AR4 was saying; would be good also to show to what extent and how the AR5 is different | Will add |
| 6475 | 8 | 10 | 1 | 10 | 2 | Not sure as to why “urban” is indicated. Heavy duty trucks ownership and VKT has increased due to high rate of growth of expressways and road construction in rural areas when compared to improvement of railways and thereby road freight movement increasing its share and tonnage. | Agree. There is an important inter-urban dimension to road freight traffic growth which needs to be mentioned. This growth has not only be due to the expansion of road expressway capacity, however. needs to be |
| 2663 | 8 | 10 | 1 | 10 | 2 | Implication in this sentence is that the cause of freight transport growing more rapidly than passenger transport is 'the use of HDV in urban regions and ships for international movement of freight'. Please rephrase this sentence. | Agreed. There is a need for a more comprehensive explanation of why freight traffic volumes have been |
| 2665 | 8 | 10 | 26 | 10 | 35 | The discussion of sustainability indicators (other than co-benefits of GHG mitigation) seems out of place and unnecessary. | Amended |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 8362 | 8 | 10 | 35 | | | PIs define what you mean by sustainable transport here (alt give a reference to the place in this report where you define it) and highlight the implications of sustainable transport on freight services. Otherwise the reader cannot follow your arguments and understand the separate meanings related to the technological perspective versus a sustainable transport perspective. And when implemented -what kind of results will the two different strategies lead to? | Agree, though this is clearly a matter of opinion and only one reviewer has made this point with reference to freight transport. A distinction is made between technological and sustainable transport perspectives. It is assumed that the reviewer is using the latter term to describe behavioural initiatives. It is probably true that, relative to the discussion of behavioural options for carbon mitigation in the freight sector |
| 2666 | 8 | 10 | 44 | 10 | 45 | "…whereas sustainable transport options, including behaviour, tend to focus on activity and structure." There are multiple definitions of 'sustainability', 'sustainable transport', etc. I disagree with how this is being defined and would recommend that this be deleted to avoid confusion. | agree |
| 13875 | 8 | 10 | 45 | 10 | 49 | Life Cycle Analysis should be considered for teh different transportation modes. See articles of Dr. Arpad Horvath (Professor, University of California, Berkeley) and Chester, Mikhail, UC Berkeley Center for Future Urban Transport) | Add to 8.1.3 |
| 2664 | 8 | 10 | 9 | 10 | 25 | These paragraphs seems out of place. Suggest this be deleted. | Amended |
| 17760 | 8 | 100 | | | | 33 pages of references, two-third of the chapter is references, just too many. Some references are of lttle significance. | It is a review of the literature. probably a a fair comment |
| 8873 | 8 | 11 | | | | It might be better to use a 2D graph here. Current figure seems to suggest that there is some passenger transport using pipelines going on. | Editorial. there's no reason for the 3-D effect |
| 2439 | 8 | 11 | | | | The key figure here misses one element - occupancy: either in terms of load (is the freight full or empty) or in terms of passengers - activity is only looked at here as a measure of distance - not what is going to be done at the destination - the figure needs rethinking. | Accept - amended in text. Allowance should be made for vehicle loading. good point |
| 4336 | 8 | 11 | | | | need emissions data for passenger only | Noted. Figure was replaced by different |
| 4337 | 8 | 11 | | | | need to provide original source: this is from Schipper (various IEA publications) | Assume this refers to Fig 8.1..2b but to |
| 11274 | 8 | 11 | | 11 | | I like this figure for disentangling certain mitigation options in 4 steps; however, there are some negative feedback mechanisms that may occur and that are not covered with this scheme (eg. Reductions in energy intensity may induce reductions in travel costs and, thus, increase the total amount of travel, as mentioned later in the report); moreover, the "activity" dimension could be elaborated further, see remark No. 1 | - rebound effect to be included. don't agree that negative feedback is not "covered"….it just isn't called out explicity, but nothing says the four |
| 14755 | 8 | 11 | - | 11 | - | The share of rail seems very small, compare e.g. ETP 2012, chp 13, fig 13.1 | To be revised. worth checking |
| 8351 | 8 | 11 | 1 | | | Kaya identity is shown almost in every sector such as transport (Ch.8), building (Ch.9) and industry (Ch.10). Therefore I think figure 8.1.2.b is deletable for shortening the volume. | Is outlined in detail in an earlier chapter. Here it will relate only to transport (figure to be replaced). if there is a discussion |
| 5188 | 8 | 11 | 1 | 11 | 1 | This figure, though in itself correct, is too linear, actualy stating that activity is a given, while activity (pkm, tkm) is a function of mode choice, energy source and associated cost, system efficiency (speed, cost), infrastructure development and maintenance, social sructure, car and biycle (and airplane) ownership. Furthermore, most of these parameters have feedbacks to the activity and to each other. By making the current figure the basis of the chapter, you run the risk to be unable to show many opportunities as well as threats to the success of mitigation policies, (including strategies aiming at car ownership and bicycle ownership policies and also season tickets for public transport; large shifts in infrastructure investments, road transport speed policies (increased recently by the Dutch government, which simply adds some 5-10% of emissions to the system). | Noted. We agree with the concerns - ASIF is used as a structuring element only. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 4291 | 8 | 11 | 1 | | | For a reason same as the above,<br>Total GHG emissions = ∑Structure(% share of mode) × carbon intensity (CO2eq/MJ) × energy intensity (MJ/capacity-km) × activity (man-km, or ton-km) / road factor(real number of passenger/capacity, or real tons of freight/capacity) | Accept - new figure amended. This is correct for freight and reflected in the current references to carbon intensity in the chapter. Same as comment 457. we DO need to account for load factor….although it may just be |
| 8430 | 8 | 11 | 10 | 11 | 10 | Please specify in a note that LDV include both passenger cars and light commercial vehicles, since in a lot of references on road transport emission assessment (i.e. Copert program) the term LDV is used only for light commercial vehicles. | Accept. we should have defined LDV up front |
| 15341 | 8 | 11 | 10 | | | I'm not a big fan of "modal choice". I would never state it that way; I would just say "mode choice". | Editorial |
| 14754 | 8 | 11 | 10 | 11 | 12 | Re-phrase please | Accept |
| 17168 | 8 | 11 | 14 | 11 | 14 | The energy demand for rail freight is higher than for passenger rail according to IEA/UIC stats, figures needs to be updated for rail | The UIC Railway Handbook 2012 of Energy Consumption and CO2 Emissions (Figure 23), this is not true provides a break-down of rail passenger and freight energy use and CO2 by |
| 15342 | 8 | 11 | 15 | | | I don't know what "indicative" means; I'd strike that from the title. | Accept |
| 15343 | 8 | 11 | 17 | | | IEA reference needs parens removed & semicolon added | Accept |
| 8874 | 8 | 11 | 18 | 11 | 22 | these are tonnes carried and not t-km carried | Rejected. t-km is correct |
| 11613 | 8 | 11 | 18 | 11 | 22 | Good references:<br>Jens Borken, Heike Steller, Tamás Merétei, Filip Vanhove: Global and Country Inventory of Road Passenger and Freight Transportation: Fuel Consumption and Emissions of Air Pollutants in Year 2000. Transportation Research Record: Journal of the Transportation Research Board. Volume 2011, 1, 127-136. DOI - 10.3141/2011-14. http://trb.metapress.com/content/X2223425H545K651<br><br>Jens Borken-Kleefeld, Terje Berntsen, and Jan Fuglestvedt: Specific Climate Impact of Passenger and Freight Transport. Environmental Science & Technology 2010 44 (15), 5700-5706 | Noted. Most of this additional literature is relevant to freight and could help us elaborate . |
| 11614 | 8 | 11 | 18 | 11 | 22 | Only freight ? Add traffic volume figures also on passenger transportation. | Aiming to do that |
| 16281 | 8 | 11 | 18 | 11 | 18 | As shown in Azar et al. (C. Azar et al., 2003. "Global Energy Scenarios Meeting Stringent CO2 Constraints - Cost-Effective Fuel Choices in the Transportation Sector." Energy Policy 31, pp. 961-976), freight movement is dominated by international shipping. | Noted. |
| 8038 | 8 | 11 | 19 | 11 | 19 | I doubt if the '5100 bn tkm per year for global road freight' is correct, and I know that 'rail is moving globally 350 bio tkm' is wrong: In China alone in 2008 2500 bio tkm freight have been moved, in US and in Russia a similar number of tkm per year. This is 6000 or 7000 bio tkm freight by rail in these three countries alone. From wikipedia I learn that in 2010 9.281 billion tkm were transported on rail. | The statistics quoted in the chapter need to reviewed and if necesssary amended. as earlier comments noted, they think this is tonnes carried, not tonne-km. Agree. The rail transport volume is 9,281 billion tkm in 2010 globally (see world |
| 14274 | 8 | 11 | 20 | 11 | 21 | The average distance of international shipping cargo is known, and was around 4500nm per tonne in 2006. Reference is Committee on Climate Change (2011), "Review of UK Shipping Emissions", Figure 4 p19 (http://downloads.theccc.org.uk.s3.amazonaws.com/Shipping%20Review/CCC_Shipping%20Review_single%20page_smaller.pdf). This is calculated as global tonne-miles/global tonnes shipped. | The statistics quoted in the chapter need to reviewed and if necesssary amended. UNCTAD's annual review of Maritime Transport may be another authoritative |
| 15344 | 8 | 11 | 21 | | | The "and" should become a semicolon. | Accept |
| 2440 | 8 | 11 | 23 | | | A figure of 980 million LDVs is used here - on p15 li11 a figure of 780 million is used | Accepted. |
| 14275 | 8 | 11 | 23 | 11 | 30 | The information in this paragraph could be very usefully represented in a graph - this would make it easier to digest. | Agree |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 15807 | 8 | 11 | 23 | 11 | 30 | Might mention that petroleum demand is leveling off in OECD nations but increasing in devleoping world | Reference? thought we did say this |
| 11615 | 8 | 11 | 30 | 11 | 30 | Cities don't consume, only people and their machines. Mind the language, as it transports images and possibly perpetrates concepts, for better or worse. | Accept |
| 12885 | 8 | 11 | 7 | | | The sequence of 'passenger' and 'freight' transport is opposite to that in the main heading 8.1 . As passenger shares of total transport demand are greater than for freight, passenger transport should figure first, as well in the main headline. | Accept |
| 11611 | 8 | 11 | 8 | 11 | 13 | marine shipping has as high a share as aviation. Hence single out and don't hide in rest. Besides, it unusual to lump agric., construction machinery into this. These categories do neither show up in Fig. 8.1.3, hence correct and delete | Agreed. Need separate energy estimates for each mode and exclusion of agric, construction and machinery. |
| 15806 | 8 | 11 | 8 | 11 | 13 | are %'s quoated here on energy, mass or volume basis - should specify | Energy shares. I think it's adequate as it is, % of oil consumption |
| 18902 | 8 | 11 | 8 | 11 | 13 | Consider making figure from data in this paragraph, for details see comments to Figure 8.1.3 | Accept. worth considering….this whole section uses too many numbers in the |
| 4398 | 8 | 11 | 20 | 11 | 20 | The lack of data to compare shipping freight t-km to road, rail and air is a severe. While normalizing measures hide absolute behaviour, this work is unable to compare the impacts of shipping to other modes of freight transport. | Is a work in process. Drawn attention to some new data-bases some which we should use for the next draft. The comment is unclear. Improving tonne-km data for the various modes is a work in process. Rather negative view on the |
| 4399 | 8 | 11 | 30 | 11 | 30 | Is the per capita energy use in cities for transport services only or all energy? | Transport demand quoted. good catch….text is unclear, will improve |
| 6477 | 8 | 11 | 18 | 11 | 18 | “Although data are uncertain, freight movement is dominated by road transport” - the same can be said about passenger transport activity and emission numbers atleast from the developing countries perspective | Agree though this may not be correct…freight ENERGY USE is dominated by roads, but rail and |
| 8363 | 8 | 11 | 25 | 26 | | Aren't the numbers for China and Africa referring to average numbers of cars in Chinese and African cities and not countries? | Country data. The numbers for China and Africa are country average but not |
| 6476 | 8 | 11 | 8 | 12 | 8 | Maybe it’s good to suggest that freight energy demand exceeds passenger energy demand in many Asian developing countries and diesel consumption exceeds gasoline. The trend is different in different regions based on the penetration of the road passenger vehicles. | Agree but needs references and access to more hard data on the relative energy use by freight and passenger services in |
| 4404 | 8 | 11 | 23 | 15 | 12 | Inconsistency between the current 780 million LDV in line 12 and 980 million LDV in 2009 in line 23, page 11 | Accepted. |
| 8431 | 8 | 12 | | | | I would delete this figure and substitute it with a more comprehensive figure (or table) showing average GHG emission factors for different means of transport, both passenger cars and freight. These data are of a great importance | Agree. Also need aviation Comment 528. agree…figure contains too little info to justify a separate figure |
| 8545 | 8 | 12 | | | | OUT OF CONTEXT (AND POTENTIALLY MISLEADING) CHARACTERIZATION. TEXT READS<br>"there is a clear but non-linear association between higher densities and greater public transportation use, with the largest effects taking place at up to 70 people per kilometre, beyond which returns are marginal (Rickwood et al., 2008)."<br>COMMENT: This characterization omits an important qualification in the very next sentence.... Here is the complete quote from (Rickwood et al, 2008, 18):<br>there is also a clear, and non-linear, association between<br>higher density and greater public transport use, with the largest effects taking place at<br>up to 70 people/ha, beyond which returns are more marginal. However, given that<br>population densities typically decrease with distance from the central business district<br>(CBD), the true underlying effect may partly or wholly relate to distance from the CBD,<br>rather than density.<br>As in comment #1, the issue may be distance from the CBD, rather than density. □ | Noted. Comment can not be addressed as there is a discrepancy between the reference provided and the content. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 8546 | 8 | 12 | | | | IMPORTANT ISSUE MISSED (AS IN RICKWOOD COMMENT, LINE 2)The CBD qualification by Rickwood, et al (2008) is further supported by Turcotte (2008) of Statistics Canada, who finds that "Above 10 kilometres from the city centre, however, the impact of neighbourhood density on automobile use dwindles until it almost vanishes" http://www.statcan.gc.ca/pub/11-008-x/2008001/article/10503-eng.pdf | Noted. |
| 15808 | 8 | 12 | | | | Missing Air (planes) emissions | Agree |
| 8037 | 8 | 12 | | | | The broad range of specific emissions for freight rail is not helpful. Suggestion: Please insert a table including the big rail freight countries (China, Russia, US, India) and others and numerating the CO2 emissions per tkm for these countries. | The UIC / IEA Handbook for Rail 2012 Energy Consumption and CO2 Emissions provides a break down of railfreight energy use by country and region. Including this data will provide a more comprehensive picture. . even that would be problematic, given the differences in the type of cargo transported…U.S. numbers greatly aided by the huge volume of coal transported. I suspect. Agree. This |
| 17767 | 8 | 12 | 10 | | | there is no mention of "well-to-tank" in chapter 7 at present | Noted. |
| 16255 | 8 | 12 | 10 | 12 | 13 | Transparent links to other chapters. However, not all of the aspects listed here are explicitly addressed in the mentioned chapters. E.g., roads, ports, and airports are not treated individually in Chapter 12. Coordination needed. | Links being covered. |
| 11616 | 8 | 12 | 14 | 12 | 19 | You miss the impact from SLCFs, most important for aviation and shipping. Hence these references are not sufficient here. You find much better values in Jens Borken-Kleefeld, Terje Berntsen, and Jan Fuglestvedt: Specific Climate Impact of Passenger and Freight Transport. Environmental Science & Technology 2010 44 (15). or<br>Jan Fuglestvedt, Terje Berntsen, Gunnar Myhre, Kristin Rypdal, and Ragnhild Bieltvedt Skeie: Climate forcing from the transport sectors PNAS 2008 105 (2) 454-458; published ahead of print January 7, 2008, doi:10.1073/pnas.0702958104 | Noted. The central historic emission database used covers the Kyoto gases. |
| 3819 | 8 | 12 | 14 | 12 | 14 | Replace "100GT" by "100kt". | GT is gross tonnage. refers to line 7, I |
| 4401 | 8 | 12 | 15 | 12 | 23 | Reconcile the statements in lines 15 and 23 as it relates to total GHG emissions from transport. In the former, it is assigned to LDV at 45%. The latter statement assigns 45% of GHG emissions from transport to freight (assumed not LDV?) | Freight is part of LDV, all of HDV, some aviation, some marine, some rail and pipeline. no contradiction….other 10% is |
| 14756 | 8 | 12 | 17 | 12 | 17 | Please cite more up-to date source, e.g. IEA ETP 2010, IEA ETP 2012 | Accept |
| 11618 | 8 | 12 | 20 | 12 | 22 | see also Elmar Uherek, Tomas Halenka, Jens Borken-Kleefeld, Yves Balkanski, Terje Berntsen, Carlos Borrego, Michael Gauss, Peter Hoor, Katarzyna Juda-Rezler, Jos Lelieveld, Dimitrios Melas, Kristin Rypdal, Stephan Schmid, Transport impacts on atmosphere and climate: Land transport, Atmospheric Environment, Volume 44, Issue 37, December 2010, Pages 4772-4816, ISSN 1352-2310, 10.1016/j.atmosenv.2010.01.002. | Noted. |
| 8876 | 8 | 12 | 24 | 12 | 25 | the 13% here is not correct | Accepted. Corrected. |
| 18227 | 8 | 12 | 26 | | | It is suggested to conclude line 26 with a reference to the IMO. All information until the full stop does nothing for the document drafting. If the volume of CO2 emissions by small fleet and fishing vessels is already supported with statistics, it is not relevant to stress that data of small boats is hard to gather and, therefore, uncertain. | Stats are crude. reasonable comment |
| 4292 | 8 | 12 | 27 | 12 | 28 | About Figure 8.1.4, we should write the reason there is a difference in the amount of CO2 emissions by Road and Rail and Shipping. Because the scope of the modal shift would have been limited, the possibility of a new mode of transport would have been rejected. The main reason is explained by the following.<br>The difference by the transportation mode of rolling resistance and water resistance, air resistance due to the drag coefficient (CD) and moving speed, gross weight / net weight. | Noted. Figure was replaced. |
| 17169 | 8 | 12 | 29 | 12 | 29 | fig 1.6 in IEA, 2009a provides a more complete picture for this graph, including aviation | To be updated. worth examining |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 14276 | 8 | 12 | 3 | 12 | 8 | Make aviation and shipping comparable (i.e. for aviation, need to state how much fuel in Mt or EJ, with international and domestic split, rather than % in each region). | Accept |
| 15346 | 8 | 12 | 3 | | | need to remove first initial of author | Accept |
| 14277 | 8 | 12 | 34 | 13 | 5 | Not sure that this paragraph is needed - it's just an intro to section 8.2, but that section already has a perfectly suitable intro. So I would suggest deleting this paragraph. | Noted. |
| 11619 | 8 | 12 | 34 | 13 | 5 | For aviation you need to discuss contrails and cirrus clouds, as the main effects. D.S. Lee, G. Pitari, V. Grewe, K. Gierens, J.E. Penner, A. Petzold, M.J. Prather, U. Schumann, A. Bais, T. Berntsen, D. Iachetti, L.L. Lim, R. Sausen, Transport impacts on atmosphere and climate: Aviation, Atmospheric Environment, Volume 44, Issue 37, December 2010, Pages 4678-4734, ISSN 1352-2310, 10.1016/j.atmosenv.2009.06.005. For shipping you should mention the cooling effect of SO2 aerosols. Cf Shipping Emissions: From Cooling to Warming of Climate—and Reducing Impacts on Health. Jan Fuglestvedt, Terje Berntsen, Veronika Eyring, Ivar Isaksen, David S. Lee, and Robert Sausen. Environmental Science & Technology 2009 43 (24), 9057-9062 | Agree |
| 5189 | 8 | 12 | 34 | 12 | 40 | Be very careful with the Fuglestvedt reference in this context: this study gives only the long term climate impacts of current (cumulative) emissions and tells nothing about the impact of nitrogen and methane in case transport activities are growing at current or increased levels. Actually, the paper's results are based on a scenario where all transport emissions would stop now for the next 100 years. This is interesting from a scientific point of view, but of not much practical use in a mitigation policy context. Please remove here (or at least thoroughly explain the context). | Accepted. |
| 11874 | 8 | 12 | 36 | 12 | 36 | Methane is referred to as a long-lived emission here (which I believe is correct) but in Chapter 7 it is referred to as a short lived climate forcer. I suggest that someone verify how the IPCC wants methane referred to and ensure it is consistent throughout the chapters in the report. | Noted. Here correct. |
| 10766 | 8 | 12 | 37 | 12 | 37 | The effect on stratospheric ozone is small and this effect does not need to be mentioned here. See papers from the ATTICA assessment for a good overview of effects of transport on climate. See: www.ssa-attica.eu | Rejected. |
| 8712 | 8 | 12 | 38 | 12 | 38 | Emissions of black carbon are particularly damaging in Polar Regions where they may accelerate melting of snow and ice. The rate of Arctic summer thaw has increased to the point where new shipping lanes are now considered viable. (IMO, 2009. Shipping GHG study) | Accepted. See Section 8.5 |
| 8875 | 8 | 12 | 6 | | | what did shipping consume? Heavy oil? Diesel? | A fuel mix. Added. mostly heavy |
| 12886 | 8 | 12 | 9 | 13 | 5 | The chapter 8.1.3 omitts GHG emissions that derives from mode-specific infrastructure and infrastructure maintenance; they should be indicated here. The relevant literature should be cited, e.g. Mikhail V. Chester, Arpad Horvath, Samer Madanat (2009), Comparison of life-cycle energy and emissions footprints of passenger transportation in metropolitan regions, and/or a reference to section 8.4 should be given. Additionally it is not clear, why GHG emissions/tkm are indicated but GHG emissions/pkm are omitted? | Noted. Section restructured/rewritten. |
| 7714 | 8 | 12 | 20 | 12 | 22 | The emissions of F-gases are mainly from refrigerants' are understandable but the amounts of around 10,000 metric tonnes of leakage look like too large. Please confirm the amounts come from emission or consumption. | Accepted. |
| 10772 | 8 | 12 | 9 | | | This paper could be relevant here: Peters et al. 2011: Alternative 'Global Warming' Metrics in Life Cycle Assessment: A case study with existing transportation data. Environmental Science & Technology, 45: pp. 8633-8641. | Accept |
| 7802 | 8 | 12 | 9 | 13 | 5 | Suggest changing the title of the section. The section is confusing as is also covers emissions of NOx and aerosols, which are not GHGs. The section also does not give values for indirect emissions from transport. | Indirect included. Nox/ aerosols moved to 8.2. I see no problem with |
| 17768 | 8 | 13 | | | | consider changing the title to "Current emission trends and drivers" | Reject - The section and associated titles are fixed and cannot be changed by the chapter working group. no…..no discussion of drivers…but also, no |

|---|---|---|---|---|---|---|---|
| 8549 | 8 | 13 | | | | RESEARCH NOT INDICATIVE OF ACTUAL TRENDS<br>"A rising fuel price combined with stagnating incomes can force people to abandon their LDVs. (Newman and Kenworthy, 2011b) suggested that increased fuel costs have led to the major shift from LDVs in developed countries."<br>The use of the terminology "major shift" is an exaggeration. There has been, at best, a modest reduction in vehicle travel in developed countries, and no major "shift" has been documented. It would be fair to suggest that there has been a leveling off of vehicle use (or in some countries a slowing down of the rate of increase). It should also be noted that this effect has been in the context of the worst downturn in the economy since the 1930s (and may well have been deepened by the rise in petrol prices themselves.).<br>This conclusion of the cited research is an exaggeration and the reference should be deleted. □ | Accept I agree….and note that the discussion illustrates only past trends, does not discuss what will happen in the future |
| 18524 | 8 | 13 | | | | In this section it may be useful to refer to the discussions on tourism that appear in Chapter 10 (particularly section 10.3.3), which discusses e.g. international and domestic air travel in more detail. | Accept - We can add references to Chapter 10 if possible |
| 16283 | 8 | 13 | 12 | 13 | 23 | In Section 8.2.1, the definition of CO2 emissions should be clarified, e.g., by replacing the phrase "CO2 emissions" with total CO2 emissions, transport CO2 emissions, etc. | Accept - Will define and use consistently in Chapter |
| 8878 | 8 | 13 | 13 | 13 | 14 | It should be mentioned that these are transport co2 emissions | Accept - if true….needs clarification. Will make this explicity clear |
| 14278 | 8 | 13 | 13 | 13 | 14 | These are annual growth rates (the 4.3%, 1.2%)? If so, make clear. | Accept - Will check and update numbers |
| 16282 | 8 | 13 | 13 | 13 | 13 | The phrase "at a rate of 4.3%" should be modified to "at an annual rate of 4.3%". | Accept . agree…or 4.3%/year |
| 10767 | 8 | 13 | 2 | 13 | 2 | Stratospheric cooling is not an important element of mitigation policies and this may be left out here. | Reject - We need to address climate change mitigation and not only emissions that have positive forcing. |
| 3439 | 8 | 13 | 20 | | 23 | The possibility for 'peak travel' in developed countries is mentioned (with the same words and same references) many times in the whole Chapter 8. Please consider revising to avoid duplication. | Accept |
| 14757 | 8 | 13 | 24 | 15 | 4 | Maybe restructuring, beginning with travel time budget, travel money budget, costs&prices esp. the fuel cost influence | Accept |
| 2977 | 8 | 13 | 25 | | 26 | Income should figure as the main driver, this is used in nearly all models as key driver (see: a Schafer, 'The Future Mobility of the World Population', Transportation Research Part A: Policy and Practice, 34 (2000), 171–205 <doi:10.1016/S0965-8564(98)00071-8>; Lew Fulton, Pierpaolo Cazzola and François Cuenot, 'IEA Mobility Model (MoMo) and Its Use in the ETP 2008', Energy Policy, 37 (2009), 3758–3768 <doi:10.1016/j.enpol.2009.07.065>; Page Kyle and Son H Kim, 'Long-term Implications of Alternative Light-duty Vehicle Technologies for Global Greenhouse Gas Emissions and Primary Energy Demands', Energy Policy, 39 (2011), 3012–3024 <doi:10.1016/j.enpol.2011.03.016>; Andreas Schafer and others, Transportation in a Climate-constrained World (Massachusetts: MIT Press, 2010); Bastien Girod, Detlef P van Vuuren and Sebastiaan Deetman, 'Global Travel Within the 2 Degree Climate Target', Energy Policy, 2012.). In contrast travel time budget is not a driver but a constant (see also next comment). | Accept - We discuss income in the context of costs and prices. strongly agree!...sort of implied in "economic drivers," |
| 11620 | 8 | 13 | 25 | 13 | 26 | Substitute: "costs and prices" against "costs and prices versus disposable income" | Accept - May need to wordsmith. not necessary IF income is recognized as |
| 11621 | 8 | 13 | 25 | 13 | 26 | This seems to have passenger transprot in mind. I suggest that you identify drivers for passenger and for freight transport explicitely. | Agreed. Would like to increase the freight / logistics content |
| 15809 | 8 | 13 | 25 | 13 | 26 | "costs and prices" and "economic" are same drivers, not different - might argue that drivers are are all related to economics (fuel and tehcnology costs, costs of time), social trends (also impacted by economics), vehicle km traveled, and technology advances | Reject - Need to separate Macro-enocmic factors and drivers of personal preference. perhaps….but defining income as a key driver will do a lot to |
| 2442 | 8 | 13 | 27 | | 47 | The income question needs to be clearer - and elasticities of income - less importance of costs as incomes rise. | Accept - See comments above |
| 11622 | 8 | 13 | 27 | 13 | 31 | Delete from "Capital costs…" to "….(Rolon, 2008)." | Accept - Need to re-write this paragraph. agree…doesn't seem to serve the |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 3989 | 8 | 13 | 27 | 13 | 31 | The sentences: "Capital costs…..,2008)" is confusing and can be eliminated. | Accept - Need to re-write this paragraph. |
| 5190 | 8 | 13 | 31 | 14 | 23 | Cost/price is important but really shaping transport is transport speed and travel times, certainly for passenger transport, to some extend also for goods transport. I would replace the order of this section with the next one about travel time budget. TTB is leading. See extensive literature on TTB from Schafer, and e.g. Metz, D. (2008). The limits to travel. How far will we go? London: Earthscan. | Accept - Will change order of sub-sections and emphasize travel time budget and other drivers over costs and prices. perhaps, but rising incomes |
| 11623 | 8 | 13 | 36 | 13 | 47 | This section suggests that fuel price and oil price are linked. But in countries with highest fuel efficiencies the fuel price is dominated by taxes. Hence mention this important measure that governments have! | Accept - Need to better address fuel pricing. worth stressing this |
| 11624 | 8 | 13 | 36 | 13 | 47 | Too much emphasis on prices, given that transport demand is relatively price insensitive | Accept - Will restucture as noted above. But certainly not for freight….don't |
| 15810 | 8 | 13 | 36 | | | add" or shift to more fuel efficienct vehicles" after "LDVs" | Accept. well, yes, but basically reviewers feel this whole point is quite |
| 14758 | 8 | 13 | 36 | 13 | 47 | This paragraph needs to be reworked substantially. LDVs, HDVs, rail, ships and aircrafts are kind of mixed up. | Accept |
| 5397 | 8 | 13 | 36 | | 38 | Has there really been a "major shift from LDVs in developed countries?" Not clear what this refers to? Even in Europe, car share, as a fraction of total pkt, is very high | Accept - Need to make that include better coverge of the literature |
| 3990 | 8 | 13 | 36 | 13 | 37 | The statement: "A rising fuel price combined with stagnating incomes can force people to abandon their LDVs. (Newman and Kenworthy, 2011b) suggested that increased fuel costs have led to the major shift from LDVs in developed countries." Is generally not supported by the literature. Except for a very brief period (2 years?) the trend is for increased kilometres driven in OECD countries. The reference supporting this statement is a valid reference, but it stands alone in the literature against significant evidence that does not find this effect. This statement should be removed or supported with additional per reviewed evidence. At the very least the broader trend towards greater driving should be noted as a major challenge. | Accept |
| 3995 | 8 | 13 | 40 | 13 | 42 | Is there something wrong with this sentence: "(Rubin and Tal, 2008) estimated that the cost of transporting a single unit container from Shanghai to Columbus, Ohio, increased by 265 %, from USD3,000 to USD8,000, when oil rose from USD20 to USD130 per barrel." In particular, is the price rise really $20 - $130? Really $20? If this is correct, then this sentence seems unbalanced (not relevant) since the consensus estimate on oil prices has them in a more narrow band of $80 - $150 for the foreseable future. | Accept - We will check primary reference and other reference to get a better sample of data. I agree that the statement says little about shipping charges in the range of likely |
| 15811 | 8 | 13 | 43 | | | after 'engines", add "smaller vehicles" | Accept |
| 8714 | 8 | 13 | 45 | 13 | 45 | However, given that fuel costs are a relatively high share of total aviation costs, improving fuel efficiency makes good economic sense. Fuel costs also account for a significant proportion of operating costs for maritime transport, and periods of high fuel costs have led to spontaneous uptake of GHG abatement options such as speed reduction and hull coatings (AEA, 2008) - AEA, 2008. Greenhouse Gas Emissions from Shipping: Trends, Projections and Abatement Potential. | Accept - We can add a statement to this effect but the capital costs of aircraft has a large impact on fleet replacement. good addition, although we're not supposed to be adding |
| 8713 | 8 | 13 | 47 | 13 | 47 | Replace "reasons" with "sense" | Accept |
| 4402 | 8 | 13 | 13 | 13 | 13 | The rate of emissions growth is per year or over the 2000-6 period? | Accepted. It is per year. |
| 4403 | 8 | 13 | 21 | 13 | 23 | The notion of peak travel exists for km travelled/GDP, rather than absolute transport demand. As before, such a normalized metric hides the growth in km travelled in OECD countries, even if it is not as fast as GDP. | Accept - Need to make this point clear. whole issue of peak travel must be |
| 9070 | 8 | 13 | 6 | 16 | 30 | 8.2 New developments in emission trends and drivers can be deleted due to limitations on the nos of pages | Reject - We will shorten but not eliminate this section as this provides an |
| 6478 | 8 | 13 | 13 | 13 | 14 | It would be good to show the latest data sets as the current information from 2000 to 2006 is relatively old | Accept - We will obtain updated data |
| 6479 | 8 | 13 | 24 | 13 | 26 | Maybe suggest that there are other major drivers also – urbanization, infrastructure, motorization, ageing of society/demographic changes, Globalization. | Accept - these need to be explained in the context of the current drivers and not added as new drivers.true….though |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 13900 | 8 | 13 | 25 | 15 | 4 | I would strongly recommend to include the ASIF framework here (The total activity (A), mode share (S), fuel intensity (I), and fuel type (F) (ASIF) framework(Schipper, L., Marie-Lilliu, C., Gorham, R., 2000. )Flexing the link between transport and greenhouse gas emissions: A path for the WorldBank. International Energy Agency) is the world recognized methodology to break down the influence of urban policies on transportation energy consumption drivers. See also Zegras, C., 2007. As if Kyoto mattered: The clean development mechanism and transportation. Energy Policy, 35. | Accepted. |
| 13896 | 8 | 13 | 33 | 13 | 35 | Elasticity of car use to fuel price should be discussed, notably because it can be very low: see Ewing, R., K. Bartholomew, et al. (2008). Growing Cooler: The Evidence on Urban Development and Climate Change. Washington, DC, Urban Land Institute: elasticities of VMT to real fuel price = -0,17 in US and -0,11 in California; See Rodier, Caroline. U.C. Berkeley, Transportation Sustainability Research Center, "A Review of the International Modeling Literature: Transit, Land Use, and Auto Pricing Strategies to Reduce Vehicle Miles Traveled and Greenhouse Gas Emissions," August 2008; See Weidner, T. and S. Seskin (2001). California Smart Growth Energy Savings MPO Survey Findings, Parsons Brinckerhoff Report P600-01-021F, California Energy Commission. Sacramento, CA; □ | Accepted. |
| 3463 | 8 | 13 | 36 | 13 | 47 | The exportation of used cars from developed countries to developing countries, is as well one of the main problems regarding low efficiency and high emission vehicles fleet in developing countries. Address this issue in the future can contribute to reduce GHG emissions from the road transport sector | Accepted. |
| 8364 | 8 | 13 | 25 | 26 | | In this part the implications of the modem urban lifestyle should be outlined because the urban social activities (work, school, family life and so on) set the agenda of travel demand and where, when and how individuals need to travel. The modern lifestyle is rapidly spreading affecting millions of families (and billions of individuals) on all continents. Mobility is not an end activity in itself but an expression of the social life of a person and when it comes to define needs for travelling and the actual travel patterns the social activities often overrule other drivers (technical, economic, safety concern and environmental values). Depending on the socio-economic status of a family the income might also be decisive in defining the transport mode of a person.<br><br>Age and sex are other determinants decisive for travel patterns as well as modes of travelling since it largely defines the activities of a person. An example: In some cultures or social classes women's options of transport are decided by prevailing social norms. This means that in some places women cannot go by bicycle, are not supposed to walk alone or, do not have enough money to buy a car impeding on their choices of means of travelling. In other parts of the world walking and bicycling is seen as a healthy and positive exercise for females of all ages. Cultural norms and socio-economic conditions are closely related to number of travels and distances travelled as well as modes of travelling. | Accepted. As too large of a topic to address fully in this section focussing on clarifying importance of lifestyle and providing references. |
| 13880 | 8 | 13 | 25 | 14 | 51 | Regarding urban transportation, real estate and housing markets are also recognised in the littérature to have a structuring effect on mobility and transport infrastructure deploiement. See Bertaud, A., Renaud, B., 1997, Socialist Cities without Land Markets, Journal of Urban Economics, vol.41, n° 1.; Bertaud, A., 2004, The Spatial Organization of Cities: Deliberate Outcome or Unforeseen Consequence?, World Development Report 2003, Washington, DC.: World Bank, Background Paper, http://alain-bertaud.com; Lefèvre, B., 2008, Visión a largo plazo e interacciones "transporte-urbanismo", los excluidos en el éxito del SBR TransMilenio de Bogotá, CIUDAD Y TERRITORIO Estudios Territoriales, XL (156); Ascher, F., 1995, Métapolis. L'avenir des villes, Éditions Odile Jacob; Ascher, F., 1998, La République contre la Ville : essai sur l'avenir de la France Urbaine, Edition de l'Aube. | Accepted. Incuded as a driver linked to urban form under social and cultural drivers. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 2980 | 8 | 14 | | | | This figure is very misleading, it can be read as that radiative forcing from aviation could be negative by 2020, which is against all robust model projections (a Schafer, 171–205; Fulton, Cazzola and Cuenot, 3758–3768; Kyle and Kim, 3012–3024; Andreas Schafer and others; Girod, van Vuuren and Deetman.). | Noted. Wrong page, but important comment. |
| 2441 | 8 | 14 | 1 | | 23 | The travel time section is weak on a variety of counts: Is aviation used in the 60 minute budget? The city is not one hour wide - as journeys are return, so it would only allow travel to the city centre, not across the city; Where is the evidence on needing space between where you live and other activities? Perishable freight products have the same limitations? What is infrastructure development - does it include management as well as investment? But overall the links made between cities and travel time is far too strong - cities have not developed on the basis of travel time - but for many other more important reasons. | Noted. |
| 2978 | 8 | 14 | 1 | | 13 | The travel time budget is very relevant for future GHG emissions, but not as a key driver, since travel time budgets are more or less constant they do not drive travel demand. It is a passive anthropological invariant, which makes that lower price and higher speed lead to rebound effects (cf. Bastien Girod, Peter de Haan and Roland Scholz, 'Consumption-as-usual Instead of Ceteris Paribus Assumption for Demand', The International Journal of Life Cycle Assessment, 16 (2011), 3–11 <doi:10.1007/s11367-010-0240-z>; Andreas Schafer, 'The Global Demand for Motorized Mobility', Science, 32 (2010), 455–477; Mathias Binswanger, 'Technological Progress and Sustainable Development: What About the Rebound Effect?', Ecological Economics, 36 (2001), 119–132 <doi:10.1016/s0921-8009(00)00214-7>.). In addition the combination of travel time budget with the constant travel money budgets (constant in share of income but increasing in expenditure) causes a shift towards faster transport modes with increasing income (Girod, van Vuuren and Deetman; Andreas Schafer and others.). But again here income is the driver. The whole section should shifted to trends in the transport sector (next section), to explain the shift towards faster transport modes, which is very relevant for GHG emissions because faster transport modes are also more GHG intensive (Girod, van Vuuren and Deetman; Andreas Schafer and others.). | Rejected. The fact that travel budget is constant is an important driver for GHG emissions. |
| 11625 | 8 | 14 | 1 | 14 | 23 | Urban travel is about 1/3 of total pasesnger travel. You need to address long-distance travel as well. | Accept |
| 11626 | 8 | 14 | 1 | 14 | 23 | This does not explain anything on freight | Noted. Increased the freight and logistics |
| 2810 | 8 | 14 | 1 | | | "Travel time budget" - this word should be firstly defined. | Accept. sort of self explanatory |
| 13239 | 8 | 14 | 11 | 14 | 13 | Travel speeds of 20-30 km/h for transit and 40-50 km/h for cars are announced without acknowledgment of the variability of travel speeds between countries, and between cities within a country. We suggest to write : "at speeds of around 5 km/h for walking, 10-40 km/h for transit and 30-60 km/h for LDV, the latter values being subject to great variability among cities" - database from UITP, 2001 (Union Internationale des Transporteurs Publics) show these ranges. | Accept. seems reasonable |
| 17710 | 8 | 14 | 12 | | | In the history of cities, did the use of different modes of transport lead to variations in land use (as suggested here), or was it the other way round? | Noted. |
| 14281 | 8 | 14 | 13 | 14 | 15 | Sentence beginning "Road infrastructure..." does not seem relevant to travel time? | Rejected. Increase of average speed |
| 8210 | 8 | 14 | 15 | 14 | 16 | This section (and the whole chapter) is lack of considering "internal congestions", meaning the impact of congestions within public transport modes (e.g. congestions in bus and subways). The impact to the public health due to in-mode internal congestions in some developing ciites could be huge. Please add this concern and do more literature reviews. | Rejected. Not directly relevant for the topic of this chapter and not a prominent issue in the scientific literature. |
| 12887 | 8 | 14 | 16 | | | What is walking/bicycling congestion? | Accept - awkward, but self explanatory, I guess. We will make this clearer |
| 14282 | 8 | 14 | 18 | 14 | 20 | Sentence beginning "The basis of..." does not seem relevant to mitigation. Also, it is too black and white - road rage does not automatically set in once a certain threshold has been passed! | Accept - Agree that this is not well connected to the section. statement does seem a bit extreme…in terms of relevance to mitigation, it's relevant if it means getting work and home closer together would be thwarted by this |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 5331 | 8 | 14 | 18 | 14 | 19 | Reference to biological or psychological need. Biological need seems very unlikely. What is the confidence that there is a psychological need, and what is the evidence? Alternative explanation of better house prices and living conditions further from employment centres seems more plausible. | Accept. I think we're hand waving on this "need" |
| 5399 | 8 | 14 | 18 | | 19 | The biological or psychological basis for travel times seems unlikely to be an established fact or based on strong analysis…..sounds like speculation | Accept - Need to rework this section |
| 2979 | 8 | 14 | 22 | | 23 | I also strongly disagree with this sentence. Using more time can result in a shift towards slower transport modes, which are generally less energy and GHG intensive (Girod, van Vuuren and Deetman; Andreas Schafer and others.). The crucial point is how many money is spend with in the travel time, hence income is the main driver (see comment above). | Accept |
| 14283 | 8 | 14 | 22 | 14 | 23 | Last sentence beginning "Travel time..." does not seem relevant to mitigation - in a decarbonised transport system, whether travel time remains within budget is irrelevant to climate change. | Rejected. Travel time is directly indicative for fuel/energy used and might |
| 11627 | 8 | 14 | 22 | 14 | 23 | Last sentence normative and incomprehensible. Delete! | Accept . I'm sypathetic, but travel time budgets may limit options….but we need to be more robust about the real |
| 2443 | 8 | 14 | 24 | | 51 | Missing elements here include population growth - one of the main drivers of increased mobility - and the changing population structure, including the ageing of the population. | Accept |
| 11628 | 8 | 14 | 24 | 14 | 29 | Good! Very succinct. | Thanks, |
| 12888 | 8 | 14 | 24 | 14 | 26 | This sentence reads as if growing female job participation is repsonsible for growing transport demand, in particular together with the following sentences that starts with the word "shopping". Changing the formulation is recommended as it is foremost rising income (GDP) that drives demand for transport. | Accept - We will rewrite to avoid such implications. rising income IS the primary driver…but if we have evidence |
| 5191 | 8 | 14 | 24 | 15 | 4 | The problem with these social drivers seems, to my humble opinion, that it actually is the quality and cost of the transport system itself that allows for most of these social drivers, so they are not the drivers perse, but mainly the result of the transport system and sometimes mutally part of a positive feedback loop. Just imagine we can only walk, what would then be the shape of our social networks, emancipation, urban areas design, etc, etc? The drivers to travel larger distances as soon as transport speed allows, seem pretty fundamental in humans, but are not at all well understood from a psychological point of view and only to some extend from an evolutionary point of view. | Reject - he does have a good point but such a discussion would not fit in this section. This section seeks to explain drivers and not to critique social drivers. |
| 17711 | 8 | 14 | 26 | | | Is there any information on the effect of the growth in internet shopping on travel? | Noted. |
| 14759 | 8 | 14 | 30 | 14 | 51 | In my opinon this is too much detail and could be significantly shortened. | Accept - This section needs to be re-written given comments above and will potentiall not be shortened but will add |
| 5245 | 8 | 14 | 33 | 14 | 51 | Again no recognition that in rural areas, even in industrialised countries, 4X4 vehicles are a necessity if winter road conditions are to be faced safely. This paragraph needs to be explicit about the full range of 'social factors' - including decisions to seek to safeguard the lives of the driver and family. | Accept - We will acknowledge these drivers but these driver are not a large driver of personal transport in most |
| 17712 | 8 | 14 | 34 | | | There is no mention here of the role of industry in promoting the "symbolic and affective functions" associated with motorized 2-, 3- and 4-wheelers. There is plenty of literature on this, from the time of Henry Ford onwards. | Noted. See section 8.4. |
| 11629 | 8 | 14 | 37 | 14 | 44 | Delete from "In some societies…" to "…Bamberg et al. 2011)." | Rejected. This is social driver that |
| 14280 | 8 | 14 | 4 | 14 | 8 | Line 4 refers to a travel time budget of 1hr per day, but it's not clear whether line 8 ("1hr for commute between work and home") is per day or just one way. | Accept - Will clarify and update numbers |
| 15812 | 8 | 14 | 4 | 14 | 5 | 1 hr per person and 1.1-1.3 per traveler seem to refer to same data. This is confusing. | Accept - Will clarify. this sounds like time/capita and time/actual traveler, e.g. the latter leaves out babies, the infirm, |
| 5285 | 8 | 14 | 46 | | | ADD: While comfort also plays a role, a study in Lyon, France shows that time constraints and complexity of itinerary associated to work are fundamental factors At issue is the fact that daily mobility is in a very large part structured by work which is difficult to modify for climate purposes. (S. La Branche. « Les déplacements quotidiens face à la schizophrénie écologique. Le cas de Lyon ». special issue Vertigo. 2011.) | Accept. interesting but we have too many space limitations |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 3440 | 8 | 14 | 46 | | 48 | You could add here: "For example, detailed mobility surveys have revealed a clear change in mobility preferences in German cities among younger generations, where people under 30 years old show a declining ownership and use of cars (Chlond 2012). The reference is: Chlond (2012), Making People Independent from the Car - Multimodality as a Strategic Concept to Reduce CO2-Emissions. In: Zachariadis T. (ed.), "Cars and Carbon", Springer, 2012, ISBN 978-94-007-2122-7, DOI 10.1007/978-94-007-2123-4_17, pp. 269-293. | Noted. Too much detail. |
| 11630 | 8 | 14 | 50 | 14 | 51 | I doubt, but if really growing then please provide more evidence. | Accept - We will provide a more balance and supported perspective. I might agree that young people might have different habits….but people prepared to |
| 17709 | 8 | 14 | 6 | | | lots of old references in this paragraph (pre-2007) | Accept |
| 5330 | 8 | 14 | 7 | 14 | 9 | Need to clarify whether 1 hour commute is 1-way or 2-way. City is 1 hour wide if 1 hour commute is 2-way (i.e. 30 minute one way from outer suburb to centre). | Accept - Will Clarify. but in most cities, the suburbs to center model no longer |
| 5398 | 8 | 14 | 7 | | 9 | The logic of a 1 hour wide city is not clear….if one considers the development of cities, they tend to grow in physical space at the same time that traffic slows from congestion….so they should be expanding in "time space" | Accept - This section needs to be re-written and better supported. agree….logic isn't clear for our 1-hour |
| 2668 | 8 | 14 | 1 | 14 | 23 | Most transport researchers discount the idea that travel time budgets are fixed. These are usually seen as being sensitive to the generalized costs of travel, which include primarily monetary cost and time cost, but can also include various more difficult to quantify effects, such as reliability, aesthetics, comfort, etc. Of most relevance for this report is how these concepts affect the design of policies, such as road or fuel pricing and policies that increase or decrease infrastructure. I would refer the authors to the literature on induced travel, specifically the following papers: Noland, Robert B., and Lewison L. Lem, "A Review of the Evidence for Induced Travel and Changes in Transportation and Environmental Policy in the US and the UK", Transportation Research D (Transport and Environment), 7(1), (2002), 1-26; . Noland, Robert B., "Relationships between Highway Capacity and Induced Vehicle Travel", Transportation Research A (Policy and Practice), 35(1), (2001), 47-72.; and, Robert Cervero (2003), "Road Expansion, Urban Growth, and Induced Travel: A Path Analysis." Journal of the American Planning Association Vol. 69, No. 2, pp. 145-164. | Accepted. Added this perspective. |
| 2669 | 8 | 14 | 48 | 14 | 48 | Reference to Parkany et al. is incorrect. This study did not analyze social media and transport behaviour. | Accept - Will review and correct |
| 8365 | 8 | 14 | 51 | | | This point is far too vague and sharper formulations are required. The paragraph continuous on the next page and the argument needs to be further outlined here. I am aware of the shortage of suitable statistics but you can refer the spreading of the urban lifestyle and link it to the presentation of economic growth in Chapter 1 Section 1.2.1.2. The world macroeconomic situation, pp 7, 8 and so on and connect the analysis to the part on urbanisation and trend in Chapter 14, Section 14.2.3 page 20 line 7 and on. I miss linkages between the social aspects related to transport and mobility and the other chapters in this report. There are many more highly relevant connections to make as to strengthen the argument put forward in the text.<br><br>Which are the dominating location trends for the growing middle class? In successful city planning such information is compiled together with preferences, estimations about future changes, fruitful scenario building and so on. The analysis of social trends can be divided into different areas for instance: lifestyle changes, changes in family structure and size, employment patterns and so on. □ | Accept. not sure what to do with this…..though clearly deserves attention |
| 12889 | 8 | 15 | 10 | 15 | 14 | Add literature to IEA citation, e.g. Meyer, Ina; Scheffran, Jürgen, Kaniovski, Serguei (2012), Scenarios for regional passenger car fleets and their CO2 emissions, Energy Policy, 41, 66-74; Meyer, Ina; Leimbach, Marian; Jaeger, Carlo C (2007), International Passenger Transport and Climate Change: A Sector Analysis in Car Demand and Associated CO2 Emissions from 2000 to 2050, Energy Policy, 35, 12, 6332-6345 | Accept |
| 3820 | 8 | 15 | 11 | 15 | 11 | Here the reference year is 2009, implying in 780 million LDV. At the begin of the paper the figure quoted is 980 million in 2009. Check consistency. | Accept - Will check and update numbers |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 8035 | 8 | 15 | 13 | 15 | 13 | you may include also Germany (e.g. http://www.germanwatch.org/klima/mt07stag.pdf) | Accept |
| 14285 | 8 | 15 | 14 | 15 | 16 | For air transport, it is not just US, Canada and Australia where demand has continued to rise. Demand is increasing across all world regions as it is strongly linked to income growth. Fastest growth is in developing countries (e.g. India, China), but demand is still growing in developed countries as well (including UK) although some short-term falls due to the recession. | Accept |
| 14761 | 8 | 15 | 20 | 15 | 23 | This seems to be a quite random phrase | Accept - We will edit to make a stronger connection to the section. This is a key |
| 12890 | 8 | 15 | 20 | 15 | 23 | Well, in the recent economic and financial crisis 2007/08/09 emissions in particular from freight transport dropped substantially in several countries. The sentence must thus be reformulated. | Accept - The key point is that decreased do to the econimic downturn will not lead to long term mitigation of GHG from transport. Alan: The recent recession has dramatically used freight volumes, particularly for air and sea freight, though in both cases volumes 'bounced back' quite quickly on many routes and services. Sentence will be amended. Steve: irrelevant….recessions hopefully will not last forever. Alan: in the ASIF framework that we have adopted, A stands for avoiding transport, but I would agree that the chapter does not adequately explore the various ways in which companies and economies decouple freight demand from output. Reference should be made, for example, |
| 11634 | 8 | 15 | 24 | 16 | 15 | For aviation you need to discuss contrails and cirrus clouds, as the main effects. D.S. Lee, G. Pitari, V. Grewe, K. Gierens, J.E. Penner, A. Petzold, M.J. Prather, U. Schumann, A. Bais, T. Berntsen, D. Iachetti, L.L. Lim, R. Sausen, Transport impacts on atmosphere and climate: Aviation, Atmospheric Environment, Volume 44, Issue 37, December 2010, Pages 4678-4734, ISSN 1352-2310, 10.1016/j.atmosenv.2009.06.005. For shipping you should mention the cooling effect of SO2 aerosols. Cf Shipping Emissions: From Cooling to Warming of Climate—and Reducing Impacts on Health. Jan Fuglestvedt, Terje Berntsen, Veronika Eyring, Ivar Isaksen, David S. Lee, and Robert Sausen. Environmental Science & Technology 2009 43 (24), 9057-9062 | Accept |
| 8879 | 8 | 15 | 25 | 15 | 28 | Jump from methane and n2o to f-gases. How much ch4 and n2o are emitted by transport globally? | Accept - Will clarify |
| 17769 | 8 | 15 | 25 | | | state what are the non-CO2 pollutants, should include NOx | Accept - Will clarify what is included and |
| 11875 | 8 | 15 | 25 | 15 | 27 | It isn't clear why methane is listed as a significant agricultural GHG for biofuels production. Methane emissions from agriculture are dominated by rice cultivation and ruminants - neither of which are significant sources of biofuels. | Reject - Fuel production is included in Chapter 10 and is not included in Chapter 8. Not appropriate |
| 5332 | 8 | 15 | 25 | 15 | 25 | Needs re-wording. Currently reads as if methane arises from production of vehicles. | Accept |
| 3998 | 8 | 15 | 25 | 15 | 26 | I found this sentence mis-leading: "Methane emissions are largely associated with leakage from the production and filling of natural gas powered vehicles." In the context of transportation emissions this is probably true, but I do not think it is correct at face value: methane emissions from CNG vehicle refueling etc. dwarf agricultural and landfil sources of CNG. Please check and verify that this is correct. Plus, the source appears to be the USA; what is true for the USA is not likely to be correct for the world as a whole. | Accept - Will clarify this statement |
| 12336 | 8 | 15 | 27 | 15 | 28 | The sources of transport-related f-gas emissions should be mentioned. | Accept |
| 8211 | 8 | 15 | 28 | 15 | 28 | "EPA, 2006": this source is old. | Accept - We will find updated references |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 10768 | 8 | 15 | 29 | 15 | 29 | It should be made clear that significant positive forcing applies to the direct effect of BC. Thus, I suggest adding "direct" after "significant". (And "have" should be changed to "cause") | Accept . no on direct, yes on "cause" |
| 14745 | 8 | 15 | 29 | 15 | 34 | Include IEA ETP 2012 Figure 13.7 p.437, rates of dieselization? | Accept but trying to CUT |
| 14760 | 8 | 15 | 29 | 15 | 34 | You might include IEA ETP 2012 Figure 13.7 p.437, rates of dieselization? | Accept |
| 3442 | 8 | 15 | 3 | | 4 | The fact that absolute and relative emissions from transport rise with rising incomes is mentioned several times in the whole Chapter 8. Please consider revising to avoid duplication. | Accept. I'm not concerned….this relationship is crucial, I don't believe |
| 2811 | 8 | 15 | 31 | 15 | 34 | The reference is old-dated (2004). I would recommend to refer to the UNEP's report on SLCF. The overview of emissions of black carbon can be found in para 2 of page 9 of "Near-term Climate Protection and Clean Air Benefits: Actions for Controlling Short-Lived Climate Forcers: A UNEP Synthesis Report (2011) <http://www.unep.org/pdf/Near_Term_Climate_Protection_&_Air_Benefits.pdf> | Accept. worth looking at this source |
| 15813 | 8 | 15 | 32 | | | 2004 refernece may be old - US has now reqiured ultra low sulfur diesel (<15ppm S) which has reduced diesel related PM emissions significantly | Accept. as has Europe….we need to be sure we're not outdated here |
| 11631 | 8 | 15 | 33 | 15 | 34 | Delete sentence | Reject - This sentence helps from BC emissions from transport. |
| 4037 | 8 | 15 | 34 | | | after "(Bond et al. 2004)." add the following text: "It is essential that the relative proportion of black carbon and organic carbon in diesel road transport and off-road diesel emissions is very low (0.2–0.8) as compared to other sources. Therefore measures to reduce black carbon emissions in this sector will almost certain reduce net anthropogenic forcing (UNEP and WMO 2011)." Source: UNEP and WMO (2001). Integarted Assessment of Black Carbon and Tropospheric Ozone. Available at http://www.unep.org/dewa/Portals/67/pdf/BlackCarbon_report.pdf | Accept- Will include this point but not necessairly this wording. too much detail…. |
| 15746 | 8 | 15 | 35 | | 39 | As far as I have understood, the role of aerosols in general is two-sided – they contribute to the green house effect, but they also lead to stronger reflection of sun radiation. In WGI of AR4, aerosols are qualified as having a net cooling effect (like volcanic ashes). This paragraph refers to “aerosols that do not absorb light“ and contribute to warming. There should be a footnote on this and, if possible, a reference to WGI where these different sorts of aerosols are discussed. Also, the following Figure 8.2.1 seems to imply that the aerosols from aviation have a cooling effect; maybe this should be taken up in the paragraph. | Accept - We do not seek to restate what is stated in WGI but need to reference what is presented by WGI. |
| 5400 | 8 | 15 | 35 | | 39 | no mention here of whether these emissions have positive or negative feedback….quite important, obviously | Accepted. |
| 17713 | 8 | 15 | 4 | | | The statement that rising wealth is associated with increased emissions from transport should be qualified, I suggest. This relation has applied in the past, but as a consequence of a particular pattern of development. There is no necessary link between wealth and emissions from transport. A comparison of North American countries with Europe would demonstrate this. | Accept - This is an important point that needs to be clarified. ouch….probably true once full industrialization has been achieved, e.g. Europe/US |
| 11632 | 8 | 15 | 40 | 16 | 3 | Unger et al. 2010 miss the biggest part for aviation, namely AIC & contrails. Hence this figure is misleading. Better replace by figures from Skeie et al. AtmEnv 2009 (43), see above. | Accept - We will find a different presentation of this data to show the relative importance of emissions in the short and long term horizons. |
| 10769 | 8 | 15 | 40 | 15 | 48 | It should be made clear that the various effects not only differ in sign (i.e. warming and cooling) but that they also operate on very different time scales (see e.g. figure 1 in Berntsen and Fuglestvedt, PNAS, 2008, vol 105 no 49. This is also shown in a recent paper by Aamaas et al. for the response in temperature and not only RF. See http://www.earth-syst-dynam-discuss.net/3/871/2012/esdd-3-871-2012.pdf. In addition, see figure 8.32, 8.33 and 8.34 in WGI. | Accept - This point needs to be made better |
| 10774 | 8 | 15 | 40 | 15 | 51 | It is not the relative contributions that are shown in fig 8.2.1. Thus, delete "Relative". | Accept |
| 12891 | 8 | 15 | 41 | 15 | 42 | Why does the study not provide realistic projections? | We will replace this graph and add new |
| 3821 | 8 | 15 | 41 | 15 | 41 | What is the definition of "perpetual constant emissions from 2000". | Accepted. |
| 14762 | 8 | 15 | 43 | 15 | 46 | The list of climate forcing gases and pollutants might be redundant | Accepted. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 5192 | 8 | 15 | 46 | 16 | 3 | The use of Unger, 2010 is not vey useful, could even be misleading, in this context for two reasons. (1) If we want a realistic outlook on total RF in 2100, we cannot escape the use of realistic emission scenarios. (2) if we want realistic outlooks we will have to include contrail and contrail induced cirrus for aviation (as clearly outlined in Lee, 2010, you refer to, but also in ten-twenty recent papers (since 2009) about contrails and cirrus and resulting from the QUANTIFY study.<br>With respect to (1): the impact of non-carbon RF of aviation has been shown to be very much depending on the growth scenario chosen. This is clearly explained in my double blind reviewed book chapters Peeters, P., & Williams, V. (2009). Calculating emissions and radiative forcing: global, national, local, individual. In S. Gössling & P. Upham (Eds.), Climate change and aviation: Issues, challenges and solutions (pp. 69-87). London: Earthscan and Peeters, P., Williams, V., & Gössling, S. (2007). Air transport greenhouse gas emissions. In P. M. Peeters (Ed.), Tourism and climate change mitigation. Methods, greenhouse gas reductions and policies (Vol. AC 6, pp. 29-50). Breda: NHTV.<br>To give some examples (see figure 3.2 in the 2009 reference): the current best estimate of RF multiplier is 2.1 and will be reduced to 1.2 in the case of constant aviation emissions, meaning that by 2100 the historic cumulated carbon will dominate aviation's RF and total 2100 RF in your figure needs to be increased by 20% of the carbon part of it. However, in a more realistic scenario, with 4% aviation volume growth but less emission growth due to a more efficient fleet by 2100) the multiplier (excluding average cirrus) will reach a level of 3.3. Of course the carbon related amount of aviation in 2100 in your figure would incease extensively under 4% aviation growth per year, roughly by a total factor of 3.7, thus causing overall in<br>2100 an additional RF of a factor 8.5 higher than your figure thus some additional 360 mW/m2. So, while the Unger calculations have theoretical value and are correct, the politicy relevance is rather limited. Based on the above rough calculation aviation would almost equal road RF in the same graph (and road carbon emissions are not growing by far as much as aviation is). The priority to reduce aviation impacts would be much more clearly shown based on real RF scenarios. My strong advice: first give a clear overview ofemissions and RF in 2100 based on real scenarios, not these constant, yotally unrealistic, figures, because only then it is possibble to valuate the size of the mitigation assignment in transport and specifically in aviation with its technical limitation to reduceemission by at most some 50% there is no way to accomodate aviation's volume in the long term future (see e.g. Bows, A., Anderson, B., & Peeters, P. M. (2009). Air transport, climate change and tourism. Tourism and Hospitality: Planning & Development, 6, 7-20). | Accepted. Replaced this with a different graph to show the relative short term and long terms impacts of different transport related pollutants on radiative forcing. |
| 10775 | 8 | 15 | 47 | 15 | 48 | I think the effects of aviation need to be better explained. And for many readers the RF number given here does not give much information. See Skeie et al., 2010 (Atmospheric Environment) for effects of aviation in terms of temperature (and contributions to total man made warming) - which is easier to understand for many readers. | This is Working Group I's role. WG III is dealing with mitigation. |
| 14284 | 8 | 15 | 7 | 15 | 8 | Demand for transport of goods and people is increasing in line with increasing incomes. | Agreed. Recent TR D paper contains a graphs which shows clearly how freight tonnes per capita rises with per capita income. Worth mentioning. not clear |
| 3441 | 8 | 15 | 7 | | | With regard to reference Bleijenberg (1993): A more recent article by the same author, enriched with much more recent data and policy suggestions, is the following.: Bleijenberg (2012), 'The Attractiveness of Car Use'. In: Zachariadis T. (ed.), "Cars and Carbon", Springer, 2012, ISBN 978-94-007-2122-7, DOI 10.1007/978-94-007-2123-4_17, pp. 19-42. Therefore I suggest changing the citation to Bleijenberg (1993) to Bleijenberg (2012). | Accept. sounds reasonable |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 13876 | 8 | 15 | 3 | 15 | 4 | "As people become richer, absolute CO2 emissions from transport rise, as well as their relative share of total emissions" suggest a correlation which is at least debatable. As Litman and Laube(2002) show: "Many wealthier regions have balanced transportation systems while porrer are quite automobile dependent. The differences result from public policies that affect transport choices and land use patterns" (Litman, T., Laube, F., 2002, Automobile Dependency and Economic Development, Victoria Transport Policy Institute) | Noted. Statement is about absolute emissions and shares relative to other sectors. |
| 4405 | 8 | 15 | 12 | 15 | 17 | These sentences repeats the earlier sentiments from p13, line 21. My criticism from above and suggested caveat remains. | Accept - Need to make this point clear. repeats earlier criticisms |
| 6480 | 8 | 15 | 20 | 15 | 22 | I am not sure if this is written based on developing Countries or developed Countries perspective. In developing Countries – changes In economic, social and cultural factors are driving the increase In emissions | Accept. correct, but not clear what should be changed |
| 3464 | 8 | 15 | 6 | 15 | 17 | There is a very importan increase in the motorcycle fleet, mostly in Latinamerica and Asia. It should be mentioned that the emissions from this fleet will increase in the future | Accept |
| 2670 | 8 | 15 | 25 | 15 | 26 | production and filling of natural gas powered vehicles' - I believe this should read: 'production of natural gas and filling natural gas powered vehicles' | Accept. yes…and it's "production and distribution" |
| 7715 | 8 | 15 | 27 | 15 | 28 | The emission number 350 Mt CO2-eq is consistent to the amounts 10,000 metric tonnes? | Accept - We will double check the |
| 7803 | 8 | 15 | 29 | 15 | 29 | Suggest adding "direct" after "significant" as the magnitude and even sign of the net effect of black carbon including all indirect effects is highly uncertain. | Reject - We will leave this debate to WGI and use these assessment of BC |
| 6923 | 8 | 15 | 29 | 15 | 39 | Please provide a more specific reference to WGI AR5. | Accept |
| 6481 | 8 | 15 | 33 | 15 | 34 | "Black carbon emissions are also significant in parts of Asia, but mainly stem from biomass and coal combustion and not from transport (Bond et al. 2004)" – This statement is not entirely true. The BC emissions from poorly regulated vehicle fleet especially in Asia having lax emission standards are a major source of BC emissions. The intensity and magnitude of emissions are high in Asia. Its quoted in many reports now including - http://nexleaf.org/surya/papers/USAID%20RDMA_Black%20Carbon%20Emission%20in%20Asia%204-2010.pdf Overall, the transportation sector is the third largest source of black carbon emissions in Asia and it is expected to become the second largest source by 2030. □ | Accept - Agree that future impacts of transport will be greater with reduction in biofuels and coal combustion emisisons. assuming this is correct, we need to revise |
| 7804 | 8 | 15 | 35 | 15 | 39 | The effect of contrail-cirrus from aviation should be included here, as current best estimates give a strong positive RF from aviation induced cloudiness (see e.g. Burkhardt & Kaercher (2011). Global radiative forcing from contrail cirrus. NATURE CLIMATE CHANGE Volume: 1 Issue: 1 Pages: 54-58 DOI: 10.1038/NCLIMATE1068. I could not find any mention of this impact in the chapter. | Accept |
| 7805 | 8 | 15 | 40 | 15 | 41 | This figure does not give contributions relative to CO2 (as in CO2-equivalents or Global Warming Potential), but the absolute impact in mW/m2 | This is correct. For reasons stated above, we will repalce this figure with a different presentation. agree…..most |
| 7806 | 8 | 15 | 46 | 15 | 47 | This is an important point and more should be said here (e.g. Berntsen & Fuglestvedt (2008). Global temperature responses to current emissions from the transport sectors, PNAS Volume: 105 Issue: 49 Pages: 19154-19159 DOI: 10.1073/pnas.0804844105 and Fuglestvedt et al. (2009). Shipping Emissions: From Cooling to Warming of Climate-and Reducing Impacts on Health. ENVIRONMENTAL SCIENCE & TECHNOLOGY Volume: 43 Issue: 24 Pages: 9057-9062 DOI: 10.1021/es901944r. . | Accept - Will add these references. probably needs to be left to the other report |
| 7807 | 8 | 15 | 47 | 15 | 48 | Is this including contrail-cirrus? Using the same emissions? Should be made clear. | Accept - We will clarify |
| 7808 | 8 | 16 | | 16 | | This figure gives absolute RF, not relative contributions as stated in the text. | Accept - We will be replacing this figure with a differnet presentation but will be clear. and RF not especially useful to the |
| 8033 | 8 | 16 | | | | To me it seems that contrails and cirrus clouds from aviation are not included in the global radiative forcing shown in this figure. Neglecting them does not map a good comparison of the different modes. This should be changed (see literature e.g. of David Lee, compare p.15, l.47 - 48) | Accept - We will address this issue |

| 12894 | 8 | 17 | 4 | | | heavy duty vehicles (not high duty) | Accepted. |
| 16284 | 8 | 17 | 4 | 17 | 4 | The phrase "high duty" should be modified to "heavy duty". | Accepted. |
| 2445 | 8 | 17 | | | | This is one Section that can be reduced in length - it is all about the potential and not the reality - what progress has been made since AR4? It is also mainly targeted at the long term and not the next 10 years. The importance of LCA is made, but it does not come through in terms of the energy and carbon sunk in the system - the infrastructure, the maintenance, the vehicles and the processes - the potential transition costs to any new technological system is vast - issues relating to niche markets (not replacements), the lead time required, the necessary conditions for economies of scale, and market penetration do not come through - these are just as important as the technological - there also needs to be comment on where the potential 'big hits' or 'low hanging fruits' are - where are the low risk and high return technologies. This means that several of these Sections could be reduced in length - and perhaps comment made on their risks and returns. | Noted. |
| 13901 | 8 | 17 | 1 | 26 | 48 | Simlarly, it is supprising that the Avoid, Shift and Improve strategy (See Dalkmann, H., Sakamoto, K., 2011, Transport, Investing in energy and resource efficiency, UNEP Green Economy Report) is not mentioned here. | Noted. ASI (or ICCT's new ASIT, that adds "transformation" to "Improve") is |
| 13902 | 8 | 17 | 1 | 26 | 48 | It is strongly recommended to refer to the ASIF framework as a key reference and ground breaking work in the field of transportation. Schipper, L., Marie-Lilliu, C., Gorham, R., 2000. Flexing the link between transport and greenhouse gas emissions: A path for the WorldBank. International Energy Agency; Zegras, C., 2007. As if Kyoto mattered: The clean development mechanism and transportation. Energy Policy, 35. | Done |
| 13903 | 8 | 17 | 1 | 26 | 48 | This section could effectively mention the three-pronged investment strategy proposed in the Transport Chapter of UNEP Green Economy Report (Dalkmann, H., Sakamoto, K., 2011, Transport, Investing in energy and resource efficiency, UNEP Green Economy Report) : promote access instead of mobility; shift to less harmful modes of transportation; and improve vehicles towards lower carbon intensity and pollution | Noted. These comments seem to refer to whole chapter, not technology section |
| 11284 | 8 | 17 | 1 | | | Studies should be done here before we talk about increased use of automobiles in developing countries. Who are using cars? Is there a gender- and income sensitive documentation on this? Normally in the developing world it is not "the man in the street" that is the owner of the car. Low in-come people or people with no income has a bicycle (if they can afford it) and risk their life every day in the traffic. It is normally people in the middle class, organizations or governemet officials that are owners of cars. The large group of low/no-income people using bicycle are very seldome taken into consideration when new roads and transport systems are planned and implemented. In example there is only one bicycle lane functioning in East-Afrika and that is in Nairobi at UN-Avenue. Bicycle lanes and footpaths should always be a part of the road-profile when new roads are implemented, even in fragile states or in emergency situations as well as in the developed world. Decition makers, governments, organizations and large companies should encourage their employees to use a bicycle and also think of the signal effect when people at the very top, bike to work, instead of driving a car. For reference, see the bicycle lane project in Guatemala City implemented by Design Without Borders at: http://norskform.no/en/Themes/Design-as-development-aid/Avsluttede-prosjekter/Cycle-lanes-and-bus-stops/ | Noted. These comments seem to refer to whole chapter, not technology section |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 8366 | 8 | 17 | 3 | | | In the introduction to this part the role of transport to make it possible to cope with daily life and the human basic needs should be stated. In modem societies access to food, medical care, schooling and other community activities often means that individuals study or work away from home and need to go from A to B. Besides sleeping, eating, basic protection and so on the lifestyle of person is defined somewhat different depending on religion, social norms, cultural belongings and so on. An understanding of the crucial impact of social norms and for instance how the reproductive social role of women is linked to travel pattern is left out but it needs to be included. In chapter 8 too many of the social aspects and their impact on travelling and emissions is missing impeding on a realistic analysis of travel needs, increases and the demand management. | Noted. These comments seem to refer to whole chapter, not technology section |
| 15866 | 8 | 17 | 1 | | | Show more summary plots: levelized all in costs in $/km (where costs include 1st cost (capex), opex, fuel, GHG taxes, …), well-to-wheel CO2e (gCO2e/km, BTU/km), $/gge for fuels<br><br>Each technology section is not consistent in content – some show more details than others, some include costs, others, not □ should standardize content.<br><br>Opportunities for technologies discussed, but also need to include balanced discussion of challenges | I agree with this one - we need about 4 really good tables/figures that synthesize stuff. good comment. same as the above, not relevant here |
| 2673 | 8 | 17 | 11 | 17 | 11 | compared to a 2010 base vehicle' - would this be a base US or EU vehicle as the base would be quite different as would the estimate of potential percent reductions from that base. This comment applies in many other parts of this section. | It is generic, but yes we should define it clearly - probably use a couple of models as examples. technology not so different, except for diesels…key difference is |
| 4406 | 8 | 17 | 9 | 17 | 12 | The estimate of 40-50% improvement is dependent on the base vehicle, the driving cycle and how the drivetrain is hybridized. The extent of improved energy intensity may not be the same across all vehicle sizes. | Noted. |
| 4407 | 8 | 17 | 31 | 17 | 31 | I'm not sure if HCCI qualifies as a new thermodynamic cycle. It may be implemented to address the temperature of the fuel-air charge at combustion, addressing NOx formation. | Noted. HCCI got deleted in new draft when rewriting. |
| 4408 | 8 | 17 | 38 | 18 | 7 | It is worth mentioning the effect of mass decompounding in the discussion of reducing vehicle mass. Specifically, reducing body in white mass means that other gross vehicle mass dependent components can be reduced. Examples include suspension, tyres, engine, gearbox and so on. Therefore, for each 1kg saved, a further 1.04 kg of secondary mass can be avoided. Reference: C. Bjelkengren. The Impact of Mass Decompounding on Assessing the Value of Vehicle Lightweighting. PhD thesis, Massachusetts Institute of Technology, Massachusetts, June 2008 (http://msl.mit.edu/theses/Bjelkengren_C-thesis.pdf). | yes, worth mentioning….though 1.04 factor is one of many estimates |
| 12337 | 8 | 17 | | 26 | | This chapter should also deal with issues related to the cooling agents used in air-condition equipment and commercial refrigeration in the transport sector. Rationale: Mobile cooling is increasing and choices with regard to the phasing out of existing agents (CFCs, HCFCs anf HFCs) and the alternatives (HFCs, natural agents, natural cooling) will have significant implications on total CO2-equivalent emissions from the sector. | Noted. |
| 11876 | 8 | 18 | 1 | 18 | 1 | Might be worth noting magnesium which already plays a significant role in lightweighting in vehicles, and will likely also play a lareger role in the future. | perhaps. This will be discussed in 8.2, not here |
| 16285 | 8 | 18 | 10 | 18 | 11 | The word "GJ" should be modified to MJ. The term "fuel economy" is usually used to refer to MJ/km. Throughout this chapter, the definition of "energy intensity", "energy efficiency", "vehicle efficiency", "fuel efficiency", "fuel economy", and "fuel use/consumption" seems confusing. It is better to clearly define these terms at the beginning of this chapter. To aboid confusion, I propose that the terms "energy intensity" and "fuel economy" be used and other similar expressions (e.g., vehicle efficiency) not be used. | good point |
| 16287 | 8 | 18 | 10 | 18 | 12 | First, in this sentence, the phrase "or more" is used twice, one of which should be deleted. Second, the phrase "vehicle energy" is ambiguous, so other concrete expression (such as on-road fuel economy) should be used. Third, it is better to modify the expression "if there are breakthroughs in weight reduction technologies" to "if breakthroughs in these weight reduction technologies would be achieved." | Noted. Changed "vehicle energy" to "vehicle loads"; "about 25% in vehicle loads, or considerably more if…." |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 15774 | 8 | 18 | 11 | | 12 | This is very speculative, i.e., "if" there are breakthroughs... | Rejected. It is the opposite of speculative, refuses to predict whether |
| 16288 | 8 | 18 | 12 | 18 | 14 | This sentence should clearly describe which types of LDVs could reduce their fuel economy by up to half by 2025 comared to 2005, gasoline ICE LDVs, global average new LDV, or others. | Rejected. We chose not to detail this specific issue but have gone into more |
| 14766 | 8 | 18 | 17 | 18 | 23 | You might include IEA ETP 2012 Figure 2.25 p.91, Light-duty vehicle fuel economy and new vehicle registrations, 2005<br>and 2008, by region. In non-OECD coutries the inverse trend towards higher fuel consumption due to a shift to larger cars can be examined | Noted. |
| 17715 | 8 | 18 | 19 | | | suggest change to "the size distribution of vehicles offered to consumers" | disagree…ultimately, companies offer |
| 15775 | 8 | 18 | 20 | | | "Preference" comes down to payback period for the increased cost of fuel economy technology. If the consumer doesn't see a payback in 2-4 years, they are unlikely to select the more expensive technology. | correct, but this is the wrong place to expound on this |
| 11877 | 8 | 18 | 25 | 18 | 27 | This seems like a very U.S.-focused section. For example, is it true that most long haul trucks have "streamlined spoilers" around the world? Maybe it's OK to have a section that uses mostly U.S. data if it is all that is available, but it seems like that should be made explicit. | well, we said long haul trucks "often" have spoilers….didn't claim "most" do….but critic is probably correct, this is somewhat U.S. focused…I'm not sure |
| 16289 | 8 | 18 | 25 | 18 | 25 | According to Fulton & Eads (L.Fulton and G.Eads, 2004. "IEA/SMP Model Documentation and Reference Case Projection."), 60% of medium-duty trucks and 100% of heavy-duty trucks were estimated to have diesel engines at the global level. Reflecting this, the phrase "Modern medium and HDVs" should be modified to "Over half of medium-duty vehicles and almost all of HDVs". | I agree. In Europe, most of big trucks have spoilers, but there is a difference in the length of tractors, since the USA regulates the length of the trailer but not |
| 4293 | 8 | 18 | 25 | 18 | 38 | I suggest that as improvements of Midium and HDVs, add the following case.<br>・ Study in Sweden highways, Trolleybuses and Trolleytrucks, by Svenska Elvägar AB's project.<br><http://www.nordicgreen.net/startups/transportation/svenska-elv-gar-ab><br>Without installing expensive and heavy batteries, electric load can be achieved.<br>・ Inner city electric cargo train system in Utrecht, Netherlands.<br><http://www.cargohopper.com/><br>By reducing the air resistance and the gross weight, improve energy efficiency.<br>We can also combine these to make up trolley convoy. | Noted. |
| 11639 | 8 | 18 | 27 | 18 | 27 | 55% thermal efficiency? Pls clarify! | Not addressed as not clear what |
| 8715 | 8 | 18 | 30 | 18 | 42 | Some of the sources quoted are rather old and may benefit from using some newer sources. For example: Technologies in the drivetrain and vehicle categories have the potential for the greatest impact on fuel consumption. However fuel consumption benefit is highly dependent on vehicle duty cycle. While some technologies can provide benefit across a range of vehicle duty cycles, others have much greater benefits for some cycles and none for others. For vehicles operating on urban duty cycles with frequent stop/start behaviour, hybrid vehicles offer the most potential with benefits of between 20% and 30% reduction in CO2 emissions. For vehicles with a large portion of constant high speed operation, aerodynamic aids such as aerodynamic trailers and fairings can offer the greatest benefits of up to 10% reduction in fuel consumption. Source: AEA & Ricardo, 2010. Reduction and testing of Greenhouse Gas Emissions from Heavy Duty Vehicles http://ec.europa.eu/clima/policies/transport/vehicles/docs/ec_hdv_ghg_strategy_en.pdf | Accepted. |
| 16290 | 8 | 18 | 34 | 18 | 34 | Same as the comment No. 22. | Accepted. Clarified tat NRC report refers |
| 16291 | 8 | 18 | 34 | 18 | 35 | This sentence should clearly describe which types of medium and heavy-duty trucks can achieve a reduction in fuel consumption per km of 30-50% by 2020, diesel ICE trucks, global average new trucks, global truck fleet, or others. | ditto….report is referring to U.S. trucks |
| 8214 | 8 | 18 | 36 | 18 | 36 | rolling resistance tires | Accepted. Improved wording of |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 15776 | 8 | 18 | 39 | | 40 | True, but heavy-duty hybrid technology is very expensive. Here and elsewhere: very optimistic statements need to be balanced with a rational discussion of costs and technology readiness. It serves no purpose to have this chapter appear to be an advocacy piece. | Noted. Yes, it's expensive, but lots of fleets are buying this technology….not only saves fuel but also reduces emissions and reduces brake repairs….it |
| 13240 | 8 | 18 | 45 | 18 | 46 | No mention is made on the fact that reducing train speed may also reduce energy consumption. Therefore no clear recommendations can be derived from that section : what technology is more appropriate to reduce energy consumption, considering physical characteristics of the train, and travel speed. | Noted. |
| 15773 | 8 | 18 | 5 | | 7 | At what cost? This has got to be very expensive. | Rejected. Actually, not so much….though perhaps the real cost is shifting away from the production |
| 15818 | 8 | 18 | 9 | | | need to consider new vehicle penetration rates base don fleet turnover of 7-8% per year (see US DOT data for typical vehicle lifetime and VMT per yr) | Rejected. This is relevant for establishing scenarios of total LDV energy use and emissions….but not |
| 17714 | 8 | 18 | 9 | | | More efficient on-board appliances would reduce loads; so would doing without features such as air conditioning. | Rejected. More efficient appliances already discussed….doing without a/c would improve fuel economy but |
| 2674 | 8 | 18 | 13 | 18 | 14 | Again, in comparing reductions from 2005 to 2025, what is the base of the new vehicle? Is it US or EU? | Rejected. Discussed above.,…Bandivadekar source refers to 2035 LDVs, not 2025…..considers both |
| 3428 | 8 | 18 | 17 | | | "Test" fuel economy should be explained with a short phrase | Accepted. Rephrased. |
| 2675 | 8 | 18 | | | | This section should mention speed limitation devices on trucks being required in EU. | Noted. |
| 12111 | 8 | 18 | 24 | 18 | 42 | Medium and heavy-duty vehicles - additional strategies not covered in this subsection include 1) Improved Driver behaviour and practices + review speed policy of fleets - "Reducing speed can yield significant fuel savings. Aerodynamic drag increases exponentially and becomes the major contributor to power requirements at speeds faster than 80 km/h. Reducing highway speed from 100 to 90 km/h can reduce fuel use by nearly 10%, and can lower tyre wear and crash risk." see refs at Australian government's road tranport site http://eex.gov.au/industry-sectors/transport/road-transport/opportunities/#Review_highway_average_speed_policy)<br>2) Load Consolidation 3) Replace ancillary equipment with more efficient models 4) Optimise gear settings<br>5) Solar panels – For details + refs please see official Australian government peer reviewed web portal at http://eex.gov.au/industry-sectors/transport/road-transport/ to save you time, I can send you refs for each of these - michaelh.smith@anu.edu.au | Agree. Reference needs to be made to these other ways of cutting CO2 emissions from the movement of freight in medium and heavy goods vehicles. Again, speed reduction is not a technology, it's a policy or behavior….2 and 3 seem to have been covered…..4 and 5 seem interesting . In Europe all trucks have their road-speed governors set by the factory to a specified value which is determined by law. (NRC,2010:Technologies and Approaches to Reducing the Fuel Consumption of Medium- and Heavy- |
| 17770 | 8 | 18 | | | | indicate one example form Chinese fast trains | Agree. The major improvement of China's rail system is the shift from non-electric rail to electric rail and high speed rail. The utilization of electric rail and high speed rail makes CO2 emission intensity of China's rail system decline by 86.7% from 1975 to 2007. (He et al., Energy Consumption of locomotives in |

|---|---|---|---|---|---|---|---|
| 12112 | 8 | 18 | 43 | 19 | 8 | Rail - virtually no attention and coverage for specific GHG mitigation opportunities for Freight Rail. Strong recommendation to cover both passenger rail and frieght rail here separately. Here are the major GHG mitigation strategies for freight rail 1) Fuel efficiency strategies (driver assistence software, speed management, idle management devices, weight reduction, aerodynamics, double staking, auxillary power systems, electronically controlled pneumatic brakes) and Alternative Drivetrains (Engine Switching Locomotives, AC Traction, Hybrid Drivetrains, Dynamic Breaking, Battery Storage) - Ref Rare Consulting Pty Limited (2011) Potential Energy Efficiency Opportunities in the Australian Road and Rail Sectors– Supplementary information for EEO participants. The Commonwealth of Australia Department Of Resources, Energy And Tourism Available at http://eex.gov.au/files/2012/03/Fuel-for-Thought.pdf This report has undergone alot of peer review + industry peer review. | This and the following comments are good - we will add a paragraph on GHG mitigation for rail. Alan: Agreed. Technological opportunities for reducing rail freight emissions need separate discussion for the reasons mentioned. Most of this additional literature is relevant and could help us elaborate . Much of the literature to which we refer present overall values for transport as a whole |
| 16293 | 8 | 18 | 43 | 19 | 8 | I propose that large differences between passenger and freight railways (such as the current electrification rate, required investment in complete electrification, etc.) be mentioned in this section. | Agreed. There are important distinctions between passenger and freight rail operations which need to be brought out more clearly in the chapter.Would like to increase the freight / logistics content. Agree, though this partly reflects the relative amounts of research done on the decarbonisation of the various freight modes. There has been a significant increase in the amount of research done on carbon mitigation in the maritime and |
| 7716 | 8 | 18 | 43 | | | Regarding the railway situation, the case study in China should be necessary because of the recent rapid expantion of Shinkansen-type trains in China. | Agree. In fact, the China case was introduced at page 62 line 1. Difference |
| 12161 | 8 | 19 | | 39 | | All the section 8.10.4 should be rewritten , after all, the text sounds weak and simplistic to the AR5. | Noted. |
| 8716 | 8 | 19 | 10 | 19 | 13 | Note that shipping is only efficient if load factors are high - while this is true for any mode of transport, the enormous carrying capacity of large ships means that it is a much more important factor. Suggested rewording: Shipping is a comparatively efficient mode of freight and passenger ferry transport in terms of fuel consumption per unit of work. | Accepted. |
| 8717 | 8 | 19 | 10 | 19 | 13 | Do the currently referenced projections account for the new IMO measures? See the following: In 2011, the International Maritime Organization adopted new regulations which make mandatory, for new ships, the Energy Efficiency Design Index (EEDI) and the Ship Energy Efficiency Management Plan (SEEMP). An annual reduction of about 600-1000 million tonnes of CO2 is foreseen in 2050 due to the EEDI. For SEEMP, an annual reduction of about 103-325 million tonnes of CO2 is foreseen by 2050. Source: IMO, 2011. An Assessment of IMO mandated energy efficiency measures for international shipping. http://www.imo.org/mediacentre/hottopics/ghg/documents/report%20assessment%20of%20imo%20mandated%20energy%20efficiency%20measures%20for%20international%20shipping.pdf | Rejected. More explicit reference needs to be made to the projected impact of EEDI and SEEMP on energy consumption and emissions (e.g. In recent study by Lloyds for the IMO). |
| 16294 | 8 | 19 | 11 | 19 | 12 | The phrase "increase by 50% or more to 2050" should be modified to "increase by 50% or more from XXXX to 2050". | this is good information, but situation is still fluid. But the projection in our draft is derived by accounting some policy |
| 17772 | 8 | 19 | 15 | | | what is the reference (“Chapter 4 - Ship Structures,” 2008) | will check. from 2007 |
| 16295 | 8 | 19 | 20 | 19 | 22 | The phrase "reduce CO2 emissions by up to 43% per t-km by 2020" should be modified to "reduce CO2 emissions by up to 43% per t-km from XXXX to2020". | Will amend to clarify time scale. Anthony F. Molland, 2008: The Maritime |
| 11640 | 8 | 19 | 22 | 19 | 27 | Section 8.3.1 is on technology, not on operational changes. Either enlarge scope of section or move to appropriate place. | Interesting point - operational interactions with technology is important and there is no where else for it but we |
| 12897 | 8 | 19 | 22 | | | Alternative drive trains and alternative fuels do not play a role in emissions mitigation in shipping? | they do - will add |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 15819 | 8 | 19 | 29 | | | Might describe fleet - e.g., small vs large planes, gasoline vs jet. Also give some concrete examples such as savings of B787 over B757 or A380 over a A340 or B747, etc… Might also quote recent biofuel jet trials and the cost of these biofuels (not cheap) | Accepted. But large commercial aircraft dominate fuel use. Can compare new models to old. |
| 12898 | 8 | 19 | 29 | | | Alternative fuels may play a role in air transport but are missing in the text. | in different section (biofuels) but will try |
| 14767 | 8 | 19 | 3 | 19 | 3 | Please emphasize that rail emissions heavily depend on the level of electrification and the primary energy source for power generation | okay - but large commercial aircraft dominate fuel use. Can compare new models to old, yes. Alan: : Obvious |
| 8032 | 8 | 19 | 37 | 19 | 40 | It is worth to mention that the design decision on the range of a plane (there is a trend that planes can fly on long distances) has negative impacts on efficiency (if the aircraft is designed for longer ranges fuel consumption is higher). As well as if they are designed for lower speeds (then the fuel consumption decreases). | can mention this if room |
| 11641 | 8 | 19 | 39 | 19 | 40 | I think you mean "potential to reduce CO2 emissions _per passenger_, but it sounds like absolute reduction. Clarify and correct! | will do |
| 12159 | 8 | 19 | 39 | 19 | 40 | My recommendation is include "a broad ranging integrated air traffic control system", because this strategy is very effective in terms of emission reduction as I showed, with the cooperation of ) in the paper doi:10.1016/j.enconman.2004.06.017 ("The Brazilian air transportation sector in the context of global climate change: CO2 emissions and mitigation alternatives"...this paper was published in 2004 in Energy Conversion and Management" and the co-author was Prof. Roberto Schaeffer, CLA of the present Chapter 8). So, my suggestion is to use "...The use of larger airplanes (and hence less flight frequency), the implementation of a broad ranging integrated air traffic control system has the potential...". | okay will do |
| 11642 | 8 | 19 | 45 | 20 | 2 | ATM for contrail avoidance! That's the biggest and immediate mitigation potential. Check results of REACT4C project.(http://www.react4c.eu/) | okay will do |
| 5193 | 8 | 19 | 5 | 19 | 8 | What is missing here is the very low abatement cost of electric rail (see e.g. Table 3 in Peeters, P. M., & Dubois, G. (2010). Tourism travel under climate change mitigation constraints. Journal of Transport Geography, 18, 447–457. ), as that equals the abatement of reducing carbon intensity of electricity production combined with one to reduce energy intensity of the rail transport itself. As rail is still in many places a declining secto and with a very large emphasis on commuting, causing very high peak hour factors, occupancy rates are currently generally much lower than could be achieved in ascenario where non-commuters are added to the system and the system is growung, i.e. lacking in capacity, and thus much better used. When a real modal shift would take place that would also reduce peak loads and improve occupancy and thus emissions per p-km. I suggest to add the link with electricity production, abatement costs and efficiency impact of total share of rail (the more you shift the more you also save per unit of transport activity pkm, tkm). | agree |
| 5196 | 8 | 19 | 5 | 19 | 8 | The remark about the modal shift, though true in itself, should not be posed in a way that further decarbonising of the rail system is less urgent. The point is that electric rail has the potential to be zero emissions with current technology (e.g. the Swiss railways run almost zero carbon; SBB. (2007). SBB environmental topics - energy. SBB CFF FFS. Available at: http://mct.sbb.ch/mct/en/umwelt/umwelt-umweltbereiche/umwelt-umweltbereiche-energie.htm). As the challenge; reduce emissions of transport by some 80% this century while transport volumes globally grow by a factor of 3 to 6 is almost impossible to realise so any chance to go to really zero carbon systems, which is most cheaply the case for electric rail, should be given high priority (electric cars are given high prioity, but, as cars are not grid-connected, this causes large technical and efficiency challenges due to the need for batteries, large amounts of resorces for those, much energy loss due to conversions of energy a several places, etc). | agree |
| 16292 | 8 | 19 | 5 | 19 | 6 | It is better to modify the phrase "the biggest" to significant. I can't understand the scientific basis of the view that this modal shift can make a "biggest contribution". | agree |
| 5694 | 8 | 19 | 6 | 19 | 8 | The reviewer strongly agree with the idea. | okay |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 12896 | 8 | 19 | 8 | | | …and the energy source of electricity (whether it is of renewable or fossil nature). | okay |
| 2676 | 8 | 19 | 4 | 19 | 4 | Note that carbon-free rail travel by 2050 is highly dependent on carbon-free electricity generation. | agree |
| 12113 | 8 | 19 | 10 | 19 | 27 | Shipping - A number of strategies for GHG mitigation missing here 1) Passenger Ferry - big savings from lightweighting. "Significant energy is used by ferries to push against the drag caused by water. This drag increases exponentially as the speed of ferries increase. Therefore, the light-weighting of high speed ferries has been shown to yield significant fuel efficiency savings by reducing the submerged surface area of the ferry. Over the lifetime use of a ferry, light-weighting results in energy savings in the range of 1,400 GJ for a 100 kg weight reduction. This is about ten times higher if compared to rail vehicles, but considerably lower as for aircrafts" Reference - Helms, H (2006) The Potential Contribution of Light-Weighting to Reduce Transport Energy Consumption. International Journal of Life Cycle Analysis, available at http://www.ifeu.org/verkehrundumwelt/pdf/Helms%282006%29_light-weighting.pdf | ferries use a tiny amount of fuel compared to int'l shipping but can mention this. |
| 12114 | 8 | 19 | 10 | 19 | 27 | Shipping - A number of strategies missing for GHG mitigation - 2) Anti-fouling coatings : antifouling coatings can increase fuel efficiency by preventing organisms such as barnacles and weeds adding additional resistance to the ship's progress through the water - REF- Pianoforte, K. (2008) 'Marine coatings market: Increasing fuel efficiency through the use of innovative antifouling coatings is a key issue for ship owners and operators', Coatings World, May | no room to mention lots of specific measure but will try to highlight a couple |
| 12115 | 8 | 19 | 10 | 19 | 27 | Shipping - a number of strategies missing - 3) Air floatation (15 per cent): by pumping air through cavities along the bottom of a ship, ships can effectively float on a thin bed of air, rather than water. Dutch company DK Group is investigating ways in which to reduce the frictional drag of water on large ocean faring vessels, estimating that fuel consumption can be cut by 15 per cent, while consuming only an additional 1 per cent of the ship's power. The first demonstration ship is being built, and it is predicted that this system would add approximately 2–3 per cent to the total cost. Ref - Kleiner, K. (2007) 'The Shipping Forecast', Nature, 20 September, vol 449, pp272–273 | I agree air floatation is a great one, needs mention. |
| 12116 | 8 | 19 | 10 | 19 | 27 | Shipping - a number of strategies missing - 4) Renewable energy for ships in port (90 per cent): renewable energy from onshore can be used for essential functions and services, such as lighting on ships while they are in port, potentially avoiding almost all emissions. Usually ships use onboard power generation by auxiliary diesel engines. In Göteborg Port in Sweden, renewable wind energy is being used to run essential services on ships in port, cutting emissions by 94–97 per cent. | okay |
| 12117 | 8 | 19 | 10 | 19 | 27 | Shipping - a number of strategies missing - 5) Wind propulsion systems (up to 30 per cent in larger freighters): kites can act as parafoils and provide lift and propulsion to reduce fuel consumption by 10–30 per cent, with a return on the initial US$700,000 investment of 3–5 years. (Reference at Kleiner, K. (2007) 'The Shipping Forecast', Nature, 20 September, vol 449, pp272–273) | yes kites is a good one to mention. some useful suggestions which will be separately evaluated and would be worth incorporating e.g. need more discussion of the impact of just-in-time and the opportunities of relaxing it to cut energy |
| 12118 | 8 | 19 | 10 | 19 | 27 | Shipping - Wind propulsion systems (up to 70 per cent for small freighters): highly efficient designs are emerging, capable of powering cargo freighters. Wind propulsion systems have been available for more than two decades. The Maruta Jaya, a 63m long freighter is able to rely on its indosail rig to provide up to 70 per cent of its propulsion, in combination with a diesel-electric engine. The Greenpeace schooner Rainbow Warrior II uses an indosail rig, consuming 40 per cent less fuel. (Reference at Kleiner, K. (2007) 'The Shipping Forecast', Nature, 20 September, vol 449, pp272–273) | yes kites is a good one to mention. some useful suggestions which will be separately evaluated and would be worth incorporating e.g. need more discussion of the impact of just-in-time and the opportunities of relaxing it to cut energy use and emissions. |

|---|---|---|---|---|---|---|---|
| 8212 | 8 | 19 | 9 | 19 | 27 | The authors need to refer the IMO regulation, policy measures, reports, documents, etc. and use into this section (Shipping) | Agreed. More explicit reference needs to be made to recent initiatives to cut CO2 emissions from shipping (not just by the |
| 5197 | 8 | 19 | 28 | | | I have some fundamental comments on this section:<br>1. In most literature the 'new aircraft' fuel efficiency development is given by a certain percentage per year improve,ent (generally between 0.7% and 1.5% for future projections). However, most authors acknowledge that this percentage is not a constant over time, but reduces itself due to the fact that the efficiency of engines and aerodynamics are reaching physical limits (see e.g. Peeters, P. (2010), costs are increasing as wll as develoment times. Tourism Transport, Technology, and Carbon Dioxide Emissions. In C. Schott (Ed.), Tourism and the Implications of Climate Change: Issues and Actions (Vol. 3, pp. 67 - 90). Bingley (UK): Emerald). A better regression, that has no arbitrary transfer years for going from reduction per year a to reduction per year B is given in Peeters, P. M., & Middel, J. (2007). Historical and future development of air transport fuel efficiency. In R. Sausen, A. Blum, D. S. Lee & C. Brüning (Eds.), Proceedings of an International Conference on Transport, Atmosphere and Climate (TAC); Oxford, United Kingdom, 26th to 29th June 2006 (pp. 42-47). Oberpfaffenhoven: DLR Institut für Physic der Atmosphäre, which is based on the data given in the IPCC special report on aviation (Penner, J. E., Lister, D. H., Griggs, D. J., Dokken, D. J., & McFarland, M. (1999). Aviation and the global atmosphere; a special report of IPCC working groups I and III. In. Cambridge: Cambridge University Press). From this regression it also can be learned that halving the emissions of the 2000 new aircraft standard, by 2100 is about the best to be achieved with current engine cycles and fixed wing aircraft and within current constraints of cruise speed, safety, range, etc. (see also Peeters, P. M. (2000). Annex I: Designing aircraft for low emissions. Technical basis for the ESCAPE project. In ESCAPE: Economic screening of aircraft preventing emissions - background report. Delft: Centrum voor Energiebesparing en Schone Technologie and Dings, J., Peeters, P. M., Heijden, J. R. v. d., & Wijnen, R. A. A. (2000). ESCAPE: Economic screening of aircraft preventing emissions; main report. In (pp. 57). Delft: Centrum voor Energiebesparing en Schone Technologie). One reason for the slowdown of efficeincy improvement per year is the very strong increase of the aircraft development time between manufacturer launch and first delivery: from data from Boeing, Airbus, Jackson, P. (1998). Jane's All the world's aircraft 1998-1999. In (Vol. 89, pp. 847). London: DPA and several jet aicraft wikipedia sites it can be learned that the first jets (with exemption of DC-8 and B707, being new concepts and having to wait long times for launching orders of the rather conservative airlines) required 3.5 years for B727, DC9 and B737, which now has increased to nine years for the B787 and ten years for the A350. If this exponential trend continues, the last new aircraft to be launched in this century would take 30-50 years from drawing board to delivery and bring improved fuel efficeincy develoment almost to a standstil 9generally new arcraft are 10-205 at most better than the aircraft they replace.<br>2. The cost of fuel of direct aircraft operational costs ranges between 22% and 38% (Airbus. (2011). Delivering the future. Global market forecast 2011-2030. In. France: Airbus S.A.S) and might become even higher with carbon trading costs added (ETS), which means that halving fuel cost means that cost of flying will reduce by between 10-20% causing increased demand. On short-medium haul fast rail does compete with air, but reducing rail's energy consumption has much lower impact on its cost because energy is only a few percent of rail cost (Smith, S., Chan, E., & Wainwright, S. (2006). Air and rail competition and complementarity. Final Report. In. London: Steer Davies Gleave, page 38). Therebound here is that, assuming an equal energy reduction for rail and air, rail will have a competitive disadvantage with respect to air causing a shift towards air and further reducing the economic basis for (high speed) rail. Such feedbacks cause serious rebounds of efficiency measures and | Thanks for all the suggestions and possible sources, will try to reflect this in the revisions |
| 2677 | 8 | 19 | 45 | 19 | 45 | Discussion of air traffic management policies should note that these can also be aimed at reducing contrails and contrail-cirrus from aircraft, and more specifically that there are trade-offs between CO2 emissions and contrails. See, for example: Williams, Victoria and Robert B. Noland, “Variability of Contrail Formation Conditions and the Implications for Policies to Reduce the Climate Impacts of Aviation”, Transportation Research D (Transport and Environment), 10(4), (2005), 269-280. | agree |

|---|---|---|---|---|---|---|---|
| 2976 | 8 | 2 | | | | The structure of the chapter should be revised and structured according to equation in Figure 8.1.2.b.<br>1.Global and regional GHG emission trends from transport<br>2. Service demand projections, including mode shares.<br>3. Energy use and energy efficiency<br>4. Carbon intensity, and different available fuels. | Rejected. Sub-headings fixed by IPCC Plenary |
| 11146 | 8 | 2 | 1 | 106 | 50 | I am surprised that I can find no section/mention on vehicle mobile air-conditioning which is a major source of HFC emissions and under which there is EU legislation. | It is discussed in several sections. |
| 14739 | 8 | 2 | 4 | - | - | The table of content is too detailed, paragraphs with five lines only (e.g. 8.2.2.2) occur in the TOB. The chapter is too scattered - restructuring? There's also some reducdancy, 8.2-8.3 | Chapter structure set by IPCC Plenary.Contents to be standardised. |
| 8436 | 8 | 20 | | | | The use of electric bicycle is growing very fast and thus some data could be found in literature to underline the importance that this means of transport could have in the future. | Noted. Mainly in China, but worth mentioning. Especially in China, this is a |
| 11879 | 8 | 20 | 10 | 20 | 12 | The phrase "very low vehicle and fuel-production emissions" is ambiguous and confusing. It implies that vehicle production emissions are low, but that is not true. Suggest stating something like "...very low vehicle operation emission when low-carbon electricity is used for vehicle battery charging". | I agree…this is a better phrasing |
| 15821 | 8 | 20 | 13 | | | Min PHEV range is closer to Prius PHEV of only 18km (not 20) , but in reality could be lower. | yes, the EPA rating is 18 km….but 50 km is sort of low on the high side; the Volt's range is 61 km on the EPA cycle, |
| 14768 | 8 | 20 | 14 | 20 | 15 | Better to mention this before line 23 on the same page. | Rejected. Earlier is better for this. |
| 15777 | 8 | 20 | 16 | | | Comparison of drivetrain efficiencies is very misleading without also noting the significant losses associated with converting natural gas or coal to electricity, transmission losses, and charging inefficiencies. | Rejected. Nothing wrong with discussing drivetrain efficiencies, discussion here doesn't imply that this automatically yields lower GHG emissions….obviously, when emissions |
| 15865 | 8 | 20 | 16 | 20 | 17 | In general, should include more well-to-wheel life cycle analyses in Ch. 8 to help compare pathways on equal basis. Tank to wheel analysis can be deceiving: e.g., "BEVs operate at a drive-train efficiency of around 80% compared with about 20-30% for conventional vehicles". If you consider the power plant efficiency to make the electricity (30-50%), then BEVs are in the same efficiency range as ICEs. | again, well to wheel analysis IS crucial and must be discussed |
| 3822 | 8 | 20 | 16 | 20 | 17 | Note that drive-train efficiency of 20-30% probably applies to LDV and not to HDV, for which efficiency are quoted just a few paragraphs before as 45%. | Rejected. The 45% refers to engine thermal efficiency, leaves out all non-engine drivetrain losses and internal |
| 11880 | 8 | 20 | 18 | 20 | 18 | The new Ford Focus Electric charges in 4 hours…maybe removing the reference to 8-hours would be good since new technologies seem to already be reducing charge time. Though the basic issue of not being able to stop and fill up a tank of gas in 3 minutes is obviously still the big problem, and should be highlighte. | agreed that the eight hour recharge time should be modified….clearly is related to voltage and amperage levels….and rapid |
| 15822 | 8 | 20 | 27 | 20 | 28 | statement not true - if battery prices drop for BEVs, they will also drop for PHEVs so cost of PHEVs will always be cheaper than BEVs. Might speificy if cost refers to first cost of vehicle or levelized cost per mile including fuel, O&M, etc | Agree but need references |
| 15778 | 8 | 20 | 29 | | 39 | A lot of "targeted" and "expected" in this discussion. | well, yes….and how else does one talk about technologies that are at an early stage of development. I'm not |
| 16296 | 8 | 20 | 29 | 20 | 39 | I propose that the necessity of overcoming safety issues associated with Lithium-ion batteries be mentioned in this paragraph. Also, I propose that R&D activities and potential for polst Lithium-in batteries (such as all solid batteries, Li-metal batteries, Li-S batteries, and Li-air batteries) be mentioned in this paragraph. | Noted. Did not include as we were already too detailed on this given page constraints. |
| 2729 | 8 | 20 | 3 | | | Better to say "Alternative and new", since almost all alternative motive powers have a very long history, e.g. renewable methane in cars and trucks Finland since 1941 and synthetic kerosene in jet planes in Germany since 1942. | or just say "alternative propulsion systems"…I agree that not much is new under the sun |
| 5334 | 8 | 20 | 32 | 20 | 33 | Need to clarify whether energy density is specified at cell or pack level. Pack level is most informative. | Accepted. We clarified. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 15791 | 8 | 20 | 33 | 20 | 33 | Add "at pack or system level" after "currently 80-100Wh/kg" | yes..at pack level |
| 15792 | 8 | 20 | 34 | 20 | 34 | Change "Improving vehicle energy efficiency" to "Improving battery energy density" | yes, though better to use "improving battery specifric energy (kWh/kg)" |
| 15793 | 8 | 20 | 35 | 20 | 35 | Add "electric vehicle lifecycle" after "a major factor affecting" | I agree |
| 15794 | 8 | 20 | 36 | 20 | 36 | Change "battery is about 1000 charges under 80% depth of discharge, typically enough for 5 years" to "battery can exceed 1000 charges under 80% depth of discharge, enough for 5~6 years or longer" | Rejected. We give a span as *average* ("typically"), adding "or longer" is not |
| 5335 | 8 | 20 | 37 | 20 | 39 | Need to clarify whether cost is specified at cell or pack level. Pack level is most informative. Not sure if targets are appropriate indicator of likely future costs as these are aspirational. Suggest reference to studies forecasting future costs e.g. Element Energy work for UK Committee on Climate Change, suggesting just over $200/kWh for BEV batteries and over $400 for PHEV batteries at the pack level in 2030. Note the higher cost of PHEV batteries. http://www.element-energy.co.uk/wordpress/wp-content/uploads/2012/06/CCC-battery-cost_-Element-Energy-report_March2012_Finalbis.pdf | Accepted. |
| 15795 | 8 | 20 | 38 | 20 | 39 | Change "...early high-volume production (e.g. 2012-2013) is expected to be about USD500-700/kWh but is targeted to drop to USD300/kWh or below in the 2015- 2020 time frame (IEA, 2010b)." to "...early high-volume production (e.g. 2014-2015) is expected to be about USD500-700/kWh but is targeted to drop to USD300/kWh or below in the 2020-2025 time frame (Bloomberg New Energy Finance 2012; IEA, 2010b). | Agreed. Will check references again and adjust if needed accordingly. |
| 13111 | 8 | 20 | 39 | | | Reference should be latest (IEA, 2012) (ETP2012, page 508) | Accepted. |
| 15820 | 8 | 20 | 4 | | | might add fleets powered by CNG and LPG which are significant in world as well | Rejected. Sentence already includes |
| 2730 | 8 | 20 | 4 | | | In addition to ICEs many other heat engines are also used in all transport modes, including ECEs (like stirling engines which in commercial applications have proven higher thermal efficiency (48 %) than diesel engines and all other ICEs) and many types of turbines. ECEs and turbines have better fuel flexibility than ICEs. Therefore, their increased use improves possibilities to use alternative fuels. | Rejected. No relevant use of stirling engines/turbines on roads. |
| 11778 | 8 | 20 | 40 | 21 | 1 | Neithir coal only nor renewable noly case is realistic condition and those may imagine the negative impact on the coal and too much expectation to the renewable energy. This kind of comparison should be calculated by using more reliable condition. Refer to FEPC estimatinon of the CO2 emssions intensity in major economics which can deploy the EV by using IEA Energy Ballances.<br>1.FEPC:[Environmental Action Plan by the Japanese Electric Utility Industry, P6], http://www.fepc.or.jp/english/library/environmental_action_plan/__icsFiles/afieldfile/2012/05/16/actionplan_E_2011.pdf | Rejected/Accepted. Rejected: While it is correct that EV electricity will rarely be from one source only, it seems reasonable to compare the effects from different individual sources. Accepted. Will add something to note that all regions use multiple electricity sources, and that there are large differences |
| 15779 | 8 | 20 | 44 | | | What's the current fraction of electricity from renewable sources and what is it expected to be in 2030? A general statement that BEVs can achieve near-zero lifecycle emissions when operating on renewable energy is not relevant unless it is put into perspective. The same proclaimation can be made for nearly anything that runs off of electricity. | again, I don't really have a problem with what's in the text….but it might be reasonable to point out that in most countries, renewable electricity is |
| 5336 | 8 | 20 | 44 | 20 | 44 | Not only renewable energy - nuclear and CCS also result in near-zero emissions | Partially accepted. Will add nuclear. But: CCS in general not yielding "near- |
| 16297 | 8 | 20 | 44 | 21 | 1 | First, the phrase "from renewable energy" should be modified to "from renewable energy, nuclear energy, and fossil fuels with CO2 capture and storage". Second, the term "life-cycle" should be deleted or modified to "well-to-wheel", because producing BEVs generate non-negligible amounts of GHG emissions. | Accepted. Will replace. But please note: CCS yields near-zero emissions. |
| 2731 | 8 | 20 | 6 | 20 | 7 | The largest share of alternative fuels in the world is found in Pakistan, where over 80 % of road vehicles use methane (currently fossil methane, but could be renewable methane). | Rejected. Methane does not qualify as alternative fuel by our definition. |
| 4339 | 8 | 20 | 29 | 29 | 39 | what does "aggressive mean? please provide actual breakdown of costs for an electric vehicle | Accepted change of language (removed "aggressive"). Rejected going further into detail due to space constaints and |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 4409 | 8 | 20 | 27 | 20 | 28 | This sentence implies that if battery prices were to fall, the BEV may become less expensive than the PHEV. | Accepted. As comparison is difficult between range-limited and full-range vehicles, this sentence was |
| 4410 | 8 | 20 | 35 | 20 | 37 | The 1000 charges is also dependent on the C-rate and temperature that the battery operates within. The variable currents required to satisfy a driving cycle implies different C-rates. This affects the number of total cycles which the battery can deliver and the number of driving years which can be expected from a single battery pack. | Accpeted. Rephrased the sentence to incorporate this. |
| 6482 | 8 | 20 | 40 | 21 | 2 | – On the issue of electric cars powered by coal power plants – CO2 emissions are not the main critical point but PM, NOX and associated health impacts. It has been established that such electric cars when compared to gasoline cars can have an adverse impact of 3.6 times higher. See http://pubs.acs.org/doi/abs/10.1021/es202347q | Rejected. The reference cited actually establishes the opposite…yes, PM2.5 health impacts are 3.6 times higher, but overall environmental health impacts are |
| 4411 | 8 | 20 | 42 | 20 | 44 | Is the BEV with efficiency 200 Wh/km comparable to the conventional vehicle with emissions < 150 g/km? The overall sentiment is correct that GHG intensity of electricity can lead to more WTW emissions for a BEV than the equivalent conventional vehicle. However, the example given appears weak in its lack of detail to make the comparison robust. Also, the WTW emissions from the BEV are near zero from renewable electricity sources. Life cycle emissions should be defined carefully. Life cycle emissions should include those associated with vehicle production, including battery manufacture, which may be non-trivial. Instead, WTW emissions should be used. | we definitely should be using WTW rather than "lifecycle" emissions…as for CVs with emissions less than 150 g/km, I don't find this a poor comparison….the most likely CV competitor to an EV is a hybrid. |
| 4294 | 8 | 20 | 9 | | | The external power supply(OLEV：Online Electric Vehicle) and Capacitor(CaEV) should be added in electric vehicle.<br>Capacitor is effective to reduce the weight and cost of the vehicle like delivery trucks and buses which starts and stops repeatedly.<br>External power supply(include contact and contactless) is also effective to reduce the weight and cost of the vehicle. | Noted. |
| 15796 | 8 | 21 | 1 | 21 | 1 | Change "the liquid or gaseous fuel used" to "the type and amount of fuel used" | agreed |
| 2732 | 8 | 21 | 10 | 21 | 33 | Only hydrogen fuel cells mentioned. Also methane fuel cells are in commercial transport use, currently in ship transport, but they would be suitable for other types of transport, e.g. rail, too. | Accepted. Added in 8.3.3.2. |
| 8031 | 8 | 21 | 16 | 21 | 16 | Is it possible to give data for the range of CO2/km for these conditions? | should be possible, and useful….by the way, change "lifecycle" to "fuel cycle" again…we don't include vehicle |
| 15781 | 8 | 21 | 18 | | 19 | But the vast majority of H2 is from natural gas and will be for the foreseeable future. Again, these types of pronouncements need to be balanced with a rational assessment of the likelihood that zero-GHG electricity sources will be in place specifically for generating H2 for transportation use. | we do have a large number of statements that seem to foresee huge increases in renewables….somewhere we do need to say that hydrogen and |
| 4295 | 8 | 21 | 18 | 21 | 19 | When making hydrogen by natural-power-sources + electrolysis for a fuel cell, total energy efficiency is very bad. Therefore, I think that the electricity made by natural power sources should be used by EV ( BEV, PHEV ) . | I agree with this reviewer…. |
| 16298 | 8 | 21 | 20 | 21 | 25 | I strongly recommend you to pay attention to the estimate of the current cost of the PEM fuel cell stack. I think that this value is too optimistic. The IEA Energy Technology Perspectives 2008 (IEA, 2008, p. 446) indicated that the specific cost of a mobile PEM fuel cell stack is at least US$ 500/kW in volume production. The IEA (IEA, 2009. "Transport, Energy and CO2") estimated the long term "incremental" cost of the mobile PEM fuel cell system to be US$ 4560 per vehicle. | the low cost estimates for fuel cells are quite recent, but seem widely accepted….BUT balance of system will add to costs, so I don't agree with the "almost competitive with a gasoline |

|---|---|---|---|---|---|---|---|
| 14769 | 8 | 21 | 21 | 21 | 21 | "Over the past decade, the cost of PEM fuel cells suitable for LDVs has decreased from about USD275/kW to under USD100/kW, with the possibility to reach USD50/kW by 2015 under conditions of large-scale production (DOE, 2011a)." That's wrong - these numbers refer to high volume production of 500,000 FC systems per year. Today, costs of somewhere around 1000 USD/kW at low prodcution capacties are achieved. See ETP 2012. High on board storage costs needs to be further emphasized. | Rejected. The sentence clearly states this is "under conditions of large-scale production"….I certainly would be willing to add "at production levels above 500,000 units/year," if that's the correct |
| 5402 | 8 | 21 | 22 | | 23 | a $4000 fuel cell system wouldn't be close to competitive because of the electric motors, controllers, etc required….that's why DOE target is $30/kW, not $50/kW….and the "similar output" is somewhat misleading, because generally an electric drivetrain will have lower kW than a competing gasoline drivetrain because of the torque characteristics of the motor. | Accepted. |
| 4413 | 8 | 21 | 26 | 21 | 28 | This is a very good point, analogous to battery lifetime: 2500 hours at 50 km/h does not represent the variability in power requested from a fuel cell during driving. That is, the fuel cell does not operate at one load point in a vehicle powertrain as it might in a stationary device. Therefore, the real-world lifetime of fuel cells remains unknown, to a degree. | Noted. The text does not imply that lifetime was tested at constant speed but that the average over the test cycle was 50 km/h. |
| 16299 | 8 | 21 | 28 | 21 | 29 | I strongly recommend you to pay attention to the technical maturity of compressed hydrogen on-board storage. The IEA Energy Technology Perspectives 2008 (IEA, 2008, p. 433) indicated that vehicle on-board storage of hydrogen is very expensive and is not technically mature. | we certainly need to look at complete system costs, not just fuel cell costs |
| 15797 | 8 | 21 | 3 | 21 | 3 | Change "currently" to "In 2009". What about electric buses elesewhere in the world? Might find a more updated reference. | agree |
| 15782 | 8 | 21 | 31 | | 32 | AT LEAST another 5-10 years. | agree |
| 2735 | 8 | 21 | 34 | 22 | 2 | Gas turbines are not mentioned. They are used in aeroplanes, helicopters, ships, trains, trucks and buses. LBG and CBG are suitable for them. | Noted. Turbines briefly mentioned in 8.3.3 intro, but otherwise not covered. |
| 6705 | 8 | 21 | 35 | 21 | 41 | When it comes to enegy policies, every nations must consider various aspects, for example, energy-security, influences on their economies. It is uncertain whetehr electric generation will be decarbonaized for next few decades. So, it should be noticed that "electricity generation has been depply decarbonized" isn't necessarily true. | yes we need to be clear that a lot depends on electric gen decarbonisation |
| 3824 | 8 | 21 | 35 | 21 | 35 | When talking about diesel hybrid locomotives it is worthwhile to distinguish them from diesel electric ones that are been used for long time. Thus, it is useful to explain the differences between the two types. | agree |
| 16300 | 8 | 21 | 38 | 21 | 41 | Introducing hydrogen fuel cell trains may also be attractive to decarbonize the railway sector, especially in areas where extensive electricity transmission network does not yet exist. | agree |
| 8030 | 8 | 21 | 38 | 21 | 38 | Hybrid systems (electric and Diesel), e.g. in Kassel or soon in Chemnitz are worth being mentioned | agree |
| 4414 | 8 | 21 | 42 | 21 | 43 | Onboard solar PV can only provide a portion of the auxiliary loads for a ship. Solid oxide fuel cells are well suited to heavy duty loads and operate at temperatures which do not require an auxiliary fuel reformer. | we can mention this |
| 2733 | 8 | 21 | 44 | 21 | 45 | LNG and LBG do not require on-board reformers, because they can be used in methane fuel cells. Please note that LBG (liquefied biogas) also exist in the market, not only LNG. | we can mention this |
| 2734 | 8 | 21 | 45 | 22 | 1 | Also mechanical wave power can be used. Demonstrations have been built and commercial applications have been planned. | we can mention this |
| 15780 | 8 | 21 | 6 | | 7 | Would be good to note what drove this large expansion -- I assume it was the value proposition to the consumer. Can it be replicated any time soon with passenger cars? Very, very unlikely. | yes quite a specific application |
| 3823 | 8 | 21 | 6 | 21 | 9 | The number of two-wheeler electric vehicles for China probably includes electric bikes. If this is the case make it clear. | yes its all electric bikes, will clarify. Yes, electric bikes were included. |
| 4412 | 8 | 21 | 8 | 21 | 9 | Note that many of the two-wheelers used lead acid batteries. This has created issues with battery disposal in China (problem shifting) See: C. R. Cherry, J. X. Weinert, and Y. Xinmiao. Comparative environmental impacts of electric bikes in China . Transportation Research Part D: Transport and Environment, 14(5):281–290, July 2009. | will mention if room. Agree. This aspect can be complemented to the 8.7.4 technical risks section. |
| 2678 | 8 | 21 | 18 | 21 | 19 | Claiming that H2 can be produced from electricity at very low life cycle CO2 is misleading. It is very unlikely that any marginal renewable electricity would be devoted to H2 production - it would be better used to off-set existing coal-fired electricity production. | not really a transport chapter issue. But, it does have an impact if we presume low carbon alternative fuels when the |

|---|---|---|---|---|---|---|---|
| 2679 | 8 | 21 | 31 | 21 | 33 | 5-10 years seems very optimistic for FCVs to be commercially viable. I don't have access the IEA(2012) reference, but please check how this estimate of viability was done. | disagree - we did use ETP 2012 - IEA now thinks commercially viable in 2015-2020 time frame, but will take time to build the market - not many FCEVs on |
| 15824 | 8 | 22 | 10 | | | drop-in biofuels are another option | Agree. Sure, and while we're at it, butanol could be added, too. |
| 13112 | 8 | 22 | 11 | 24 | 41 | Different expressions such as "life-cycle"CO2 emission , "fuel cycle" GHG ratings, or "net" emission should be unified into (e.g.) "WTW" CO2 emissions. | agree we need a unified term, will fix this. RICH: Agreed about unifying. My preference would be to use "life cycle CO2e emissions" (or "life cycle CO2 emissions" when only that one gas) |
| 2738 | 8 | 22 | 16 | 22 | 17 | Modification needed are not significant. Methane has been used in dualfuel diesel engines commercially since 1973 and this technology is currently spreading to many transport applications. | will try to clarify this, but conversions do cost signficiant $$$ |
| 15825 | 8 | 22 | 19 | 22 | 20 | bio CNG systems will require lots of gas cleanup and heating value boosting to be practical | agree but only marginally a transport issue. yes, but not clear that needs saying here….as long as it's stated in |
| 14770 | 8 | 22 | 2 | 22 | 2 | Maybe mention EEDI and SEEMP which should be enacted by Jan 2013 (according to IMO, 2011) | As mentioned in response to comment 8717, more explicit reference needs to be made to the projected impact of EEDI and SEEMP on energy |
| 2739 | 8 | 22 | 22 | | | Otto engine is a gas engine. Therefore, conversion is needed if liquid fuels like gasoline is used, not when gaseous fuels are used. | incorrect(Otto cycle is for gasoline engines) and misses the point that the main part of the conversion is installation |
| 2740 | 8 | 22 | 22 | | | Refueling times of compressed and liquefied gases are approximately the same as with gasoline and diesel oil, i.e. minutes. It is very curious that long refueling times are attributed to gas vehicles (incorrectly), but the problem of typical 8 hour charging time of electric vehicles is not mentioned in chapter 8.3.3.2. Inhaling of toxic fumes is a health hazard of gasoline and diesel oil use. This is avoided in gas and electric vehicles. | refueling can be quite fast at high pressure stations, long times associated with home (and often depot) refueling. Long recharge times are discussed in earlier section on vehicles, so not really necessary here. Since there isn't a |
| 15784 | 8 | 22 | 23 | | 24 | Cost of storage tanks is also an issue. | well, key part of "conversion cost" mentioned here IS storage tank costs….but perhaps it makes sense to have a parethetical mention, e.g. |
| 15826 | 8 | 22 | 25 | | | many studies suggest that most economic use of NG for trasnport in US and EU is as LNG for HDVs (long haul trucks for example) | should be looked into |
| 2741 | 8 | 22 | 25 | | | Quantitative information of the Pakistan case is needed, i.e. 3.2 million vehicles and over 80 % share of road vehicles is a proof that crude oil domination in traffic fuel market can be overcome. | agree |
| 2743 | 8 | 22 | 25 | 22 | 30 | It is not mentioned that methane is the only fuel suitable for all engine types used in all transport applications: road, rail, water, air and space as well as mobile engines like agricultural tractors, street maintenance machines etc. Also it is not mentioned, that methane is considerably cheaper than gasoline and diesel oil in almost all countries. Biogas is the only biofuel that currently is cheaper than gasoline and diesel oil even if they have same tax level. There are more than hundred OEM methane LDV models available. | fair comment….although the vehicles themselves can be expensive, the fuel is fairly cheap….discussion may be too negative |
| 3826 | 8 | 22 | 25 | 22 | 30 | When discussing NG use, mainly in non-original equipped LDV it is important to consider CH4 leakage due incomplete combustion or poor control of the fuel handling system. | correct, but if NG use grows, more OEM models will become available and fewer vehicles will be conversions….not sure |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 2742 | 8 | 22 | 26 | | | Australia has not so far had success in NGV use, like the other countries mentioned. i.e. it does not belong to the group. But Iran and China are big success stories. | if correct, worth revising. China has made considerable progress on NGV use, with about 1 million NGV population. But NGV use in China is still |
| 15785 | 8 | 22 | 27 | | 28 | Need to be careful with conversions. If they are done poorly, the increase in tailpipe methane emissions could negate the perceived GHG benefits of this fuel relative to gasoline. | see above |
| 4415 | 8 | 22 | 3 | 22 | 5 | For aviation, there are geared turbofans and unducted turbofans which can deliver efficiencies close to the limit. Further efficiency improvements can be obtained by fly by wire or fly by light control, recuperative cores and exhaust gas recovery. | okay can try to add mention of these if we have room |
| 2736 | 8 | 22 | 3 | 22 | 5 | Text "In aviation, no serious alternative to jet engines for propulsion has been identified" is incorrect. Currently also otto engines, gas turbines and mechanical wind power are used. Airships are not mentioned. They have large potential especially in freight transport (big energy efficiency advantage compared to aeroplanes) and they can use many types of heat engines and fuel cells, and in addition they are especially suitable for solar power use. For jet engines, the higher they fly the better liquefied gases (renewable methane and hydrogen) work, in comparison to kerosene, due to their suitability to low temperatures. Tropospheric pollutant emissions are much worse problem than ground level pollutant emissions due to their long lifetime. Therefore, renewable methane and hydrogen are the fuels of choice in aviation. Even more this applies to space tourism, which is now just in a starting phase but expected to grow. It means the use of rocket engines in troposphere and especially in stratosphere, where pollutant lifetimes are even longer than in tropospheric emissions. Therefore, renewable methane and hydrogen are needed in rocket engines, too. | will try to reflect these points - but it seems clear that commercial passenger air travel will be dominated by jet engines for decades to come. Alan: Some useful suggestions which will be separately evaluated and would be worth incorporating. Air ships have had a chequered history as a freight transport mode. This essentially a niche freight mode but may need to be re evaluated as part of a low carbon logistics strategy. Is there any data on the carbon intensity of air ship heavy freight operations? Alan: Some useful suggestions which |
| 13113 | 8 | 22 | 32 | 22 | 34 | This paragraph (At least ,,,,,,,,,countries) is not necessary. No relation with the rest of the paragraph. Please cut it for simplicity. | agree. it might not fit well in this paragraph, but it's a crucial point for |
| 16301 | 8 | 22 | 33 | 22 | 33 | It is better to modify the phrase "power plant" to electricity production and delivery". | will check on agreed terminology. a |
| 4416 | 8 | 22 | 34 | 22 | 35 | Quantify “fairly slow” and “low voltage” | agree we should do this. good |
| 15798 | 8 | 22 | 34 | 22 | 34 | Add "assuming an ideal charging pattern and without peak time charging" after countries | agree something clarifying like this would help. correct….it could be misleading to blithely assume off-peak charging, except where there is a "smart |
| 2744 | 8 | 22 | 37 | 22 | 38 | They can not provide full recharge in under an hour, at most 80 % (and they will never recharge fully). | more importantly, is it really true that lots of fast charging systems are being installed? Lots of locations are putting in "level 2" chargers, i.e. 220V (standard in Europe, but 110V is the U.S. |
| 5198 | 8 | 22 | 4 | 22 | 5 | Auxiliary power consumes a few promiles of overall aircraft fuel; suggest to remove this detail. | will check on this |
| 4417 | 8 | 22 | 41 | 22 | 42 | How much more expensive are fast charging units to the 240V/120V versions? | important to quantify….early estimates are $25K-$50K per charger vs. perhaps |
| 3825 | 8 | 22 | 42 | 22 | 44 | It is useful to make a back of the envelop calculation regarding the availability of solar energy and the amount of energy required to propel it. I suspect this proposal is almost unfeasible. | Rejected. Unclear what this comment is referring to. There is nothing on PV in |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 8718 | 8 | 22 | 45 | 22 | 45 | Additional note: It is possible that inadequate charging infrastructure will delay a widespread shift to electric vehicles. Public charging infrastructure is an important means of counteracting “range anxiety”, which is the fear of being stranded due to insufficient battery capacity. Although most trips can easily be accommodated by modern electric cars, consumers prefer to buy cars that are capable of much longer distances. Source: AEA, 2012. Next phase of the European Climate Change Programme: Analysis of Member States actions to implement the Effort Sharing Decision and options for further community wide measures: Transport Sector Policy Case Studies http://ec.europa.eu/clima/policies/effort/docs/esd_case_studies_transport_en.pdf | I agree, though not clear what to say about this….at least, we might want to note that it remains unclear just how much of a problem is created by the lack of travel flexibiility caused by EV range limitations…we don't know how many consumers will be willing to put up with this |
| 6706 | 8 | 22 | 46 | 23 | 2 | When it comes to enegy policies, every nations must consider various aspects, for example, energy-security, influences on their economies. It is uncertain whetehr electric generation will be decarbonaized for next few decades. So, it should be noticed that “during which time electricity grids could be decarbonized” isn't necessarily true. | correct, but we're writing a report whose underlying assumption is that GHGs are a problem and we need to find solutions. |
| 15783 | 8 | 22 | 7 | | 9 | This does not ring true and needs to be verified. GREET says WTW GHGs for methanol from natural gas is greater than for gasoline. It wouldn't surprise me if DME was similar. | I suspect this is correct….yes, natural gas yields GHG reductions…but the conversion efficiency to get the products is not very good. My quick look at some GREET results shows that methanol from natural gas yields higher net emissions; DME is lower, but I suspect that's because the baseline vehicle is a gasoline vehicle and DME is in a |
| 2737 | 8 | 22 | 7 | | | Text "There are relatively few low-carbon fuel options for transport applications" is incorrect. There is no lack whatsoever on technical options for all transport applications, in excess of 100 are available. 23 generations of traffic biofuels have been identified. Some of these represent a group of many different feedstocks, production methods and chemical structures. In addition more than 10 other (non-biofuel) technological options for using all renewable energy forms in transport applications are available. | Accepted. The text statement has little meaning and seems overly negative. Agreed that "relatively few" isn't meaningful, but the implication in this comment that all biofuels are "low |
| 15823 | 8 | 22 | 8 | | | add LPG to methanol and DME list | agree we can mention these |
| 7488 | 8 | 22 | 9 | 22 | 12 | “Electricity, hydrogen and biofuels (including biomethane, DME, ethanol and methanol), all could provide operation with very low life-cycle CO2 emissions, but this depends on their feedstocks and conversion processes (see 8.3.3.4)”. There is ample feedstock from the existing net primary production of woody biomass and residues to provide biomethane, DME, methanol, producer gas/water gas and gengas through the dry distillation processes for converting ligncellulose to these gaseous and liquid fuels. | Noted. Certainly not enough to replace liquid fuels in transport. |
| 6483 | 8 | 22 | 13 | 22 | 30 | It has been established that such conversions may or may not have any positive impact at all. See http://www.greencarcongress.com/2011/02/reynolds-20110220.html and http://sa.indiaenvironmentportal.org.in/files/air%20quality%20policy_0.pdf. Also the fuel efficiency of diesel is better than CNG/LPG conversions. | good points, will reflect |
| 3465 | 8 | 22 | 14 | 22 | 28 | It must be mentioned as well the utilization of natural gas together with diesel | it IS mentioned, on lines 16-17 |
| 2680 | 8 | 22 | 18 | 22 | 20 | There is some evidence that methane leakage from fracking may lead to natural gas having a larger climate impact than coal. Please check the literature on this and what other parts of AR5 are saying on this issue, which is rapidly developing. | we do need a short paragraph on methane leakage, but presumably the chapter on energy production will deal |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 5199 | 8 | 22 | 31 | | | No objection to discuss electricity with respect to electric cars, but please, do not forget the grid connected transport modes as electric (conventional and high speed) rail, urban rail, trolley bus. Globally these transport modes represent a much larger share than electric vehicles, have a very efficient and straight forward way to use the electricity (no batteries, etc.) and have a potential to reach very high shares by the end of this century and probably are needed to reach the 80% reductions and provide several times more transport volume as current. Another important caveat in all EV literature seems to me the cost aspect. For instance, peak shearing can be reached with storing off-peak electricity in car batteries, but the question needs to be answered why electricity producers do not use such batteries to store their electricity by themselves. The answer of course is that the cost of batteries is several orders of magnitude to high to do so. Then, the question remaining is why car drivers would be willing to pay for this high cost without heavily subsidising (or de-taxing) by governments. Actually, tax exemptions is currently the way in e.g. the Netherlands EV's are promoted. Economically this is really not efficient (batteries are far too expensive for large scale storage). | good point…..this section is supposed to deal with electric vehicles in transport, and this certainly includes rail and trolley. As for cost….cost is high today, hopefully much less so in the future. |
| 2681 | 8 | 22 | 40 | 22 | 41 | Reference to Axsen & Kurani is incorrect. This study did not survey those with Electric Vehicles - only those with potential home recharging, thus the conclusion stated in the text does not match with what this study analyzed. | also, the text implies home rechargers WILL use publich chargers….is that a correct interpretation of the source? |
| 2682 | 8 | 22 | 41 | 22 | 45 | This text strikes me as largely speculative. Would prefer to see a discussion of Israeli battery switching, see: https://betterplace.com/ | well, there's not much evidence available, so speculation is about all we have…as for battery switching (A Better Place), its president just resigned….but we shouldn't ignore the battery switching |
| 5403 | 8 | 23 | 1 | | 2 | The idea that an electric grid can be decarbonized in "at least one or two decades" seems a bit optimistic…..yes, you have the "at least," but a sweeping change of a nation's electric grid is a 40-50 year challenge, at least for developed countries. | I agree….way too optimistic |
| 2745 | 8 | 23 | 11 | | | Remove “modified”: otto engine is a gas engine, i.e. suitable for hydrogen with ease (and is already so used). And hydrogen is also used in wankel engines. | I'm not quite sure what the reviewer means by "otto is a gas engine"…it's a |
| 15799 | 8 | 23 | 2 | 23 | 2 | Add "to some extent" after "could be decarbonised" | or something like that…."decarbonized" |
| 15786 | 8 | 23 | 22 | | 24 | But it's $1 to $2 trillion more than the existing infrastructure. Unless there are significant govt incentives/mandates, this is unlikely to occur on its own. There is little value proposition for station owners to install these systems. | I think lines 17-24 don't do a bad job of describing the infrastructure problem, but we could be somewhat more forceful in explaining that fuel suppliers will NOT |
| 15827 | 8 | 23 | 25 | 23 | 27 | replace "quite high" with "very high". Also check NREL USDOE tests (CDP#15): http://www.nrel.gov/hydrogen/cdp_number.html | not sure why we should make that change….USD!/litre is about the U.S. price of gasoline today, admittedly |
| 17125 | 8 | 23 | 25 | 23 | 27 | DELETE: The current cost of hydrogen production and delivery to vehicles is quite high compared with gasoline or diesel fuel, with steam reforming at point of use estimated to be about USD 1 per litre gasoline equivalent, and electrolysis at point of use about USD 1.50 per lge (IEA, 2012).<br>REVISE TO: Hydrogen cost is not necessarily ‘quite high’, when large improvement of vehicle efficiency is considered. Vehicle efficiency of FCV is expected to be 2.5 – 3 times better than conventional vehicles. Eventually energy cost per a km of FCV may be cost competitive to conventional vehicles.<br>CONCAWE, EUCAR, EUROPEAN COMMISSION (2008). Well-to-wheels analysis of future automotive fuels and powertrains in the European context. Available at: http://ies.jrc.ec.europa.eu/uploads/media/V3.1%20TTW%20Report%2007102008.pdf | I don't agree with the 2.5-3 times stuff, because the appropriate comparison is to a hybrid vehicle, with a considerably smaller multiple….plus, although natural gas-based hydrogen produced at the station won't be super expensive, we probably need centralized production with CCS to get the GHG emissions reductions we need. Certainly, though, |
| 14771 | 8 | 23 | 26 | 23 | 27 | The mentioned 1 to 1.5 $/lge is only H2 generation. With distribution/delivery it sums up to some 3 to 3.5 $/lge. | no…..production AT POINT OF USE! |
| 3827 | 8 | 23 | 27 | 23 | 27 | Explain the meaning of "lge". It is the first time it shows up. | LITRE OF GASOLINE EQUIVALENT |

|---|---|---|---|---|---|---|---|
| 5404 | 8 | 23 | 28 | | 29 | a US 0.50/lge hydrogen price sounds like an (optimistic) "at the plant" cost….the delivered price would be MUCH higher | yes….production cost by itself is misleading…as for "much higher," that depends…if the scale is large enough for pipeline delivery, delivery costs will be |
| 15787 | 8 | 23 | 29 | | | Does the 50 cpg value include the levelized cost of the compressed fuel (including the cost of compression equipment), or is the just the cost of H2 from the reformer? The station/compression cost will be a substantial component of delivered cost and needs to be included in these kinds of comparisons. | good point, what's included in the cost estimate must be specified |
| 16302 | 8 | 23 | 37 | 23 | 38 | It has been recognized that a small percent blend of hydrogen with natural gas, called "hythane", can be transported by existing natural gas pipelines without causing problems such as embrittlement. | true, I believe….but a "small percent" won't make much of a dent….and the hydrogen can only move through NG pipelines to the delivery point FOR THE |
| 12899 | 8 | 23 | 39 | | | A reference to chapter 11 (agriculture) must be introduced in chapter 8.3.3.4 in order to refer to the tade-offs in land-use with respect to food production. Additionally, recent evidence on substantial indirect land-use changes due to feedstock production must be addressed as well as unfavourable life-cycle GHG emissions from bioenergy. Cite relevant studies, for example Leopoldina (2012), Bioenergy, Chances and Limits must be added. | I agree |
| 2446 | 8 | 23 | 42 | | | Risen fairly rapidly to 3% - this is very small scale and has made a negligible contribution to CO2 reduction | it's probably correct that contribution to CO2 reduction is negligable…but increase is interesting…the key is what fuels we're talking about….palm oil, for example, is probably not sustainable, nor |
| 7489 | 8 | 23 | 42 | 23 | 45 | However, [biofuels] production in 2012 grew little compared to 2011 possibly due to concerns regarding sustainability of feedstock production along with the slower than projected development of advanced biofuels, which are still in the development stage (IEA, 2012). There is ample feedstock from existing NPP. Also the dry distillation of biomass has been used for centuries. | Noted. |
| 2746 | 8 | 23 | 45 | | | Some, not all, are in the development stage. E.g. biogas and many types of synthetic biodiesel are commercial. | but presumably these are not |
| 11881 | 8 | 23 | 47 | 23 | 47 | The phrase "compatible with all types of vehicles" seems misleading, particularly given the discussion that follows. | perhaps we should say "compatible -- with minor modifications in some cases - |
| 15800 | 8 | 23 | 6 | 23 | 7 | Change "EV recharging can yield the benefits of "peak shaving" and "valley filling" (charging from grid when under low grid load)." to "EV discharging and recharging can yield the benefits of "peak shaving" (discharging to grid when electricity is in high demand) and "valley filling" (charging from grid when grid load is low). These power service functions, however, can shorten EV battery life due to more frequent cycling and are unlikely to be accepted by EV owners and/or manufacturers in the near future." | a good rewrite….I'm concerned about the last sentence, though….I imagine the effect on battery life depends on the degree of discharge….if small, might not be consequential. We need to check |
| 2447 | 8 | 23 | | | | There is too much reliance on one publication - IEA 2012 | it shouldn't be hard to find additional sources for some of these statements |
| 2683 | 8 | 23 | 2 | 23 | 2 | 10-20 years seems like overly optimistic timeframe for decarbonization. | Noted. |
| 2684 | 8 | 23 | 3 | 23 | 5 | This section seems repetitious. | true, this was stated in earlier |
| 2685 | 8 | 23 | 6 | 23 | 9 | V2G is still speculative; it is mainly useful for helping to manage transient load fluctuations. Would be better to discuss these issues. Good overview is provided here: Guille, Christophe, and George Gross, 2009, A conceptual framework for the vehicle-to-grid (V2G) implementation, Energy Policy, 37: 4379-4390. | agree that it is somewhat speculative, will take time to develop |
| 2686 | 8 | 23 | 35 | 23 | 35 | Deng et al 2010 is missing. | will correct |

|---|---|---|---|---|---|---|---|
| 5239 | 8 | 24 | 30 | | | The following reference makes an overview of the various studies on the results concerning the EU sustainability criteria for biofuels. According to the reference, the criteria will not guarantee low ghg balance for the biofuels. Ref.: Soimakallio, S. & Koponen, K. 2011. How to ensure greenhouse gas emission reductions by increasing the use of biofuels? – Suitability of the European Union sustainability criteria. Biomass & Bioenergy 35, 3504–3513. | Will amend. but we have more than enough references here already. |
| 7490 | 8 | 24 | 31 | 24 | 35 | "All land-competitive biofuels potentially induce emissions from indirect land-use change, though the magnitude of this effect is quite uncertain ---. The production of land-competitive biofuels can also have negative direct and indirect impacts on biodiversity, water and food availability (see Bioenergy section in Chapter 7)". This is not true if existing net primary production (NPP) is used more fully. | i.e. ag wastes? True…Will amend.See remarks above about using existing NPP |
| 16305 | 8 | 24 | 34 | 24 | 35 | Takeshita and Yamaji (T.Takeshita and K. Yamaji, 2008. "Important Roles of Fischer-Tropsch Synfuels in the Global Energy Future." Energy Policy 36, pp. 2791-2802.) have shown that biofuels produced from feedstocks cultivated on excess cropland that can be used for energy purposes without conflicting with other biomass uses such as the production of food, paper, lumber, and traditional fuelwood could make a large contribution to avoiding dangerous climate change without negatively affecting food availability. | we will point this out. Agree. It's not clear what "excess cropland" means in practice with growing populations eating higher on the food chain, and with extreme weather potentially reducing crop output. All purpose-grown energy crops potentially compete with food production. In some cases the areas |
| 2748 | 8 | 24 | 36 | | | Because gene manipulation technologies are commonly used in algae fuel development (although natural algae would work), potential ecological and other risks of GM algae deserve to be mentioned. | agree but not really a transport chapter issue |
| 5337 | 8 | 24 | 36 | 24 | 36 | Algae cannot grow at sufficient volumes using atmospheric CO2 alone. Algae production therefore requires a very significant input of CO2 from a non-atmospheric source, i.e. fossil CO2 from power or industry sources. The GHG benefits of algal biofuels are therefore very limited, and only appropriate if either CCS or alternatives to the use of fossil fuels are not available in the industry or power sectors. | Noted. |
| 3830 | 8 | 24 | 36 | 24 | 37 | It looks unfair to quote sugar cane ethanol in the same place as lignocellulose crops and algae. These last crops are not yet commercial for energy production, while sugar cane ethanol is presently the only advanced ethanol commercially available. Thus, it should be treated in another sentence where its merits should be explicitly listed. | Noted. Ethanole now also otherwise mentioned in Sectin 8.3.4.4. |
| 3831 | 8 | 24 | 36 | 24 | 37 | When discussing sugar cane ethanol it is worthwhile to make reference to its significant capability of fuelling "plug-in" hybrid vehicles. This issue is discussed, starting already in pg 24 and it should make a link with the sugar cane feedstock. Please, see Pacca and Moreira, 2011 for further information, and use the words Pacca+Moreira+biofuel+2011 to see paper repercution in several sites. Please, also consider the relevance of sugar cane ethanol regarding GHG emissions, when used to feed a fleet of plug-in hybrid vehicles. - Pacca, S. and J. R. Moreira, 2011. A Biorefinery for Mobility? Environ Sci Technol. 2011 Nov 15;45(22):9498-505. | yes but true for any ethanol or drop-in biofuel. I don't see how this issue is already "started" in p.24, but the general idea is a good one…..the community has been talking about combining PHEVs with biofuels for the last few years….since the amount of liquid fuel required could be fairly low if the PHEV range was reasonably high (more like the VOLT than the Prius plug-in)…useful |
| 7491 | 8 | 24 | 36 | 24 | 38 | "Advanced biofuels from ligno-cellulose crops (e.g. grasses, short-rotation trees) and algae, along with sugar-cane ethanol, offer potentially lower life-cycle emissions than grain-based or oil-seed-based biofuels, with better opportunities to avoid large direct and indirect land-use change impacts". If existing NPP is used more fully and the lignocelluloses is broken down by dry distillation to methanol etc. then much if not most land-use change could be avoided. | Noted. |
| 2749 | 8 | 24 | 39 | 24 | 40 | Word "also" gives a very wrong impression. It should be made clear that biowastes, forestry waste and agricultural and forestry residues makes much larger GHG emission reduction possible than energy crops, including lignocellulosic energy crops. In addition, their ecological problems are much smaller and they do not require land use, i.e. no land use change problems. E.g. the source (EUCAR/CONCAWE/JRC, 2008) used in this chapter shows that GHG emission reduction of -200 % is possible when utilizing biogas made from biowaste sources that otherwise would be atmospheric methane emitters. | a reasonable point, though a bit overstated….if we're comfortable with the conclusion that waste utilization yields.lower GHG emissions, we probably should reword this. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 2750 | 8 | 24 | 40 | 24 | 42 | Text "the alternative fate of wastes and residues must also be considered: net emissions can rise if waste diversion releases carbon that would otherwise be flared, sequestered, or utilized for energy" is misleading. Use of bioresource for transport does not increase emissions compared to its use in other energy production (but has a potential to decrease them because transport is now almost completely crude oil based). Use of bioresources for transport decreases emissions when compared to resource wasting flaring. Flaring should not be recommended. | well, certainly the words about flaring in our text are incorrect….if the waste would otherwide be flared, its diversion to fuel can't produce MORE carbon…flaring releases all of it….as for energy use, depends on what the biomass energy substitutes for...if it substitutes for coal, then using it as a transport fuel might indeed yield higher net GHG emissions. I do recommend we rework this a bit, agreed that the |
| 17771 | 8 | 24 | 44 | | | Biofuels - test flights by airlines Qantas, United, Boeing should be included | agree |
| 15788 | 8 | 24 | 7 | | 9 | You might be able to get the vehicles on the road, but processing the billions of tons of biomass required in such a scenario into liquid fuels would be an incredible challenge. | the reviewer is correct, but that's not what the sentence says….it only says that obtaining the vehicles wouldn't be too difficult…which is |
| 2568 | 8 | 24 | 7 | 24 | 9 | Biofuel blends higher than 5.75% face the difficult barriers posed by standards such as the World Wide Fuel Charter. Tracing back these guidelines one can see from which studies these came from. More at http://cenbio.iee.usp.br/download/publicacoes/STC_Ethanol_SEPT2005.pdf | but many manufacturers warrant vehicles to 10%, US EPA estimates 15% is safe except in quite old vehicles. Maybe the reviewer's point is to change |
| 2747 | 8 | 24 | 8 | | | Text “given slow vehicle stock turnover rates”gives a wrong impression. Vehicle lifetimes, especially road vehicles, are much shorter than lifetimes of power (5x) and heating plants (2x). Therefore, new technology, including ability to use renewable energy, can be taken into use in transport sector faster than in other energy sectors. | Noted. |
| 3418 | 8 | 24 | | | | I miss a notion in this paragraph or a previous one that urban modal choices differ among countries, regions, continents because of substantially different urban transport systems. E.g. cheap and abundant forms of private and collective transport (taxis, rikshas, motorized two- and threewheelers, minibuses) in Asia and Latin America. The volumes are such that this report needs to recognize this sub-sector (its associated efficiencies and inefficiencies, its private LDV growth mitigation potential, its pollution etc.). Making a difference between LDV and HDV is rightful when talking about vehicle and fuel technology, but it falls short when viewed from a more socio-economic and spatial angle. In 8.9.3 there is reference to this notion but it is a bit late. | seems this reviewer is referencing another text from ours….comment otherwise makes no sense |
| 2450 | 8 | 25 | | 27 | | Good succinct review | yay thanks! |
| 8432 | 8 | 25 | | | | Please specify the average emission factor considered for the reference vehicle (“a base 2012 ICE gasoline vehicle), or else change the y-axis considering not the percentage change in l/km but absolute CO2emissions (g/km) expected from the different technologies | good comment…I'd prefer the former |
| 4524 | 8 | 25 | | | | Not sure what lge is in the label on the y-axis. Should show WTW ghg emissions which for BEVs is highly dependent on the carbon emissions in power generation. It is not transparent, and therefore a misrepresentation to equate energy in electricity to energy other fuels which is perhaps done in this figure. (e.g. see NRC report on “Hidden Cost of Energy” for examples of WTW studies for BEVs) | yes, but showing WTW adds greatly to complexity…I'd stick with fuel consumption here, unless we're willing to greatly expand the number of data |
| 5405 | 8 | 25 | | | | the 2012 and 2030 values for the BEV and FCEV seem much too similar, given the very large load reductions possible in this timeframe | Agree |
| 16307 | 8 | 25 | | | | Same as above. | Agree - referring to his last comment |
| 11644 | 8 | 25 | 10 | 25 | 19 | Make a comprehensive figure including biofuel options and at the level of GHG emissions! | as above (comment no 16307) …a good idea, but you'll need lots of data bars to make it comprehensive (or the bars will |
| 11645 | 8 | 25 | 10 | 25 | 19 | Add by similar chart for HDV otherwise lack of balance. | good idea |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 15830 | 8 | 25 | 10 | | | the low GHG values shown for BEVs and FCEVs are only possible if using low-carbon electricity and hydrogen. Should also consider using BTU/km, not gge/km, since the BTU would capture any electricity used in the fuel, in addition to liquid fuels. should really show totoal BTU or Joule / 100 km, not just liquids since would represent BEVs and PHEVs more accurately. | don't agree, BTU presents us with the problem that the efficiency of conversion varies widely…and what's the "efficiency" of nuclear? |
| 4296 | 8 | 25 | 11 | | | Since this section shows the analysis for reduction of fuel consumption and CO2 emission, we should also indicate comparison of the CO2 emissions in well-to-wheel in each vehicles. | same issue as comment no 15830 ….this would be nice, will take up |
| 2449 | 8 | 25 | 15 | | 19 | A very important point is made here, but this is not followed up in the rest of the Chapter. The W2W comparisons are central to CO2 estimates - as are the embedded energy and carbon in the construction of the infrastructure. | agreed, though the last sentence states we can't yet do this well |
| 16308 | 8 | 25 | 16 | 25 | 16 | The term "life cycle" should be deleted because emissions caused by vehicle manufacturing are not accounted for. | yes, we're talking about the fuel cycle here |
| 15831 | 8 | 25 | 18 | 25 | 19 | not clear about this last sentence. Many studies have been done to measure WTW emissions for many pathways, inc; biofuels. Not sure what this issue is here? | good question….it's true that some controversy remains, e.g. land use change, but certainly there are many WTW studies (GREET, for example) that are reasonably well accepted. will |
| 11882 | 8 | 25 | 18 | 25 | 19 | The statement that a "suitable comparison capturing all contingencies (including LUC for biofuels) has not yet been satisfactorily achieved and further analysis is required" needs elaboration if it is to be included. This is a sweeping statement, but the phrase "all contingencies" is vague making it difficult to understand current research/analysis needs. There are many studies that have attempted to do well-to-wheel analyses, so it seems like an explanation of which aspects need more analysis (beyond LUC) should be pointed out. | same point made again (see answer to comment no 15831) |
| 2754 | 8 | 25 | 18 | 25 | 19 | Uncertainty has not prevented showing other quantitative diagrams in the chapter and should not prevent showing lifecycle GHG emission data either, whether LUC effects are included or not. When showing the DENA bar diagramme (see my comment 28) it is advisable to mention that LUC effects have not been taken into account in energy crops (ethanol and biodiesel) shown in the diagramme, but they have been taken into account in biowaste based biomethane, because it does not need land. Therefore, biomethane WTW emissions can be compared to fossil fuels, electricity and hydrogen in the diagramme. Because fertilizer value and much of its carbon is easily recovered from biowaste, when anaerobic digestion is used for biogas production, there are very little concern over fertilizer and soil carbon loss, unlike when using forest residues (as correctly mentioned on page 24 lines 42-44 of the draft). | Noted. Introduced Figure 8.3.2 with LCA data now. |
| 3832 | 8 | 25 | 18 | 25 | 19 | I understand that some comparison is already available. Look for EPA, 2011 - EPA (Environmental Protection Agency). Renewable Fuel Standard Program (RFS2), Regulatory Impact Analysis. Assessment and Standards Division, Office of Transportation and Air Quality. EPA-420-R-10-006, February (2010). | and again… |
| 3431 | 8 | 25 | 28 | 26 | 11 | Unlike what is mentioned here, I don't think that the literature is unanimous that consumers undervalue fuel economy. Several additional references can be provided here, but pages 96-97 of the following article provide a good overview of the findings of many studies: Anderson, Parry, Salee and Fischer, 'Automobile Fuel Economy Standards: Impacts, Efficiency, and Alternatives'. Rev Environ Econ Policy (2011) 5 (1): 89-108. doi: 10.1093/reep/req021. Moreover: Even if fuel economy undervaluation is true, this does not automatically make fuel economy standards a preferred policy tool - see again Anderson et al. | Noted. Issue is complex (there are other factors involved, like power, size, industry strategy (the high fuel economy models are usually the "cheap" ones), etc), still core factors are covered. |
| 4418 | 8 | 25 | 4 | 25 | 6 | A 2012 baseline vehicle is used here compared to a 2010 baseline vehicle used earlier on p17, line 9 | this would be OK if we were simply using a graph from an existing study…but this is a constructed graph…and by the way, we used a 2005 baseline also, in referencing Bandivadekar…..although by itself this |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 16306 | 8 | 25 | 4 | 25 | 6 | These sentences should clarify the definition of fuel economy, or more specifically, whether it denotes test fuel economy or on-road fuel economy. | given that the values stated are in percentages, this might be ignored…..though if one wanted to get precise, it does seem that onroad correction factors tend to be more severe for higher fuel economy vehicles. We probably could say that the percentage differences relate to test fuel economy, |
| 2753 | 8 | 25 | 5 | | | Fuel economy advances applicable to gasoline vehicles are also applicable to renewable fuel vehicles. In addition, many renewable fuels have engine technological advantages compared to gasoline (higher octane value) and diesel oil (higher setane value). E.g. biogas has an octane value of 140 making it possible to increase fuel economy of otto engines substantially compared to gasoline use. Many such examples are already in the market and there are large potential for more. | generally correct observation….though I'm not aware that OEM natural gas vehicles have gotten higher (gasoline equivalent) fuel economy than competing gasoline vehicles (VW does have a turbo/supercharged vehicle, I |
| 8367 | 8 | 25 | 21 | | | In the first part it says: 'some behavioural concepts are introduced ... ' There is nothing about how to handle the immense increases of low-cost travelling in developing countries that do not have adequate transport infrastructure. The spreading of the urban lifestyle means that there is a huge pressure for access in rapidly growing cities with only dismal infrastructure, insufficient budgets and lack of management capacity to cope with the emerging transport challenges. Far too many cities and countries have not been able to respond to the growing need for transport facilities and how will they be able to meet the travels needs and introduce reductions of greenhouse gases at the same time? In this part the structural conditions, policy approaches and different strategies to manage huge increases in demand for transport and transport energy will have to be described and discussed. Pls integrate such analysis as to increase the quality of the debate. | worth contemplating some additional discussion |
| 8550 | 8 | 26 | | | | RECOMMEND ADDITIONAL EVIDENCE TO CITE<br>"Driving rebound effects: Changes in driving in reaction to changes in the fuel cost of travel, e.g. due to fuel efficiency increases or shifts to cheaper fuel, is commonly called the (direct) “rebound effect”<br>COMMENT: The new USEPA impact analysis of the proposed 54.5 miles per gallon fuel efficiency standard finds the rebound effect to be -0.1. See: www.epa.gov/otaq/climate/documents/420r12016.pdf. This is important because it is the basis of public policy in the world's leading automobile oriented economy | I assume this comes from Small and Van Dender (2007)….worth citing. |
| 13114 | 8 | 26 | | | | Not only for conventional gasoline vehicle, but also HEVs/PHEVs/Evs/FCVs/CNGs/should be compared to mass transportation (Bus, Rail, Air,,,), if those data are available. Especially, Evs/FCVs with low carbon electricity and hydrogen. | good idea….though all modes will change quite a bit in the future….so perhaps we should focus only on |
| 8719 | 8 | 26 | 11 | 26 | 11 | Additional note: Evidence suggests that the form of the incentive is also an important factor, in addition to the total subsidy amount. Consumers are highly sensitive to upfront costs, and less influenced by total cost of ownership, which may explain why schemes which deliver up-front incentives tend to be more effective than those which offer savings post-purchase. Source: AEA, 2012. Next phase of the European Climate Change Programme: Analysis of Member States actions to implement the Effort Sharing Decision and options for further community wide measures: Transport Sector Policy Case Studies<br>http://ec.europa.eu/clima/policies/effort/docs/esd_case_studies_transport_en.pdf | useful information, but not here….should be discussed in policy section |
| 5246 | 8 | 26 | 12 | 26 | 29 | The same point as made above needs to be inserted. | It is not clear what this refers to. For this reason the comment could not be |
| 5338 | 8 | 26 | 17 | 26 | 19 | Even with generous incentives, electric vehicles are significantly more expensive than conventional vehicles. It is likely that high cost is an important driver of slow market introduction, so difficult to attribute this to negative perceptions about vehicle attributes or range anxiety. | Noted. |
