| 17127 | 8 | 26 | 25 | 26 | 29 | COMMENT: Well understood "Various studies (e.g. (IEA, 2009) suggest that a 5-10% improvement in on-road fuel economy can be achieved through efforts<br>to promote "ecodriving"; another 5-10% maybe be achievable by an "integrated approach" including better traffic management, intelligent transport systems, better vehicle and road maintenance, etc."<br>REASON: McKinsey describes:<br>In 2020, more than 50 percent of CO2 abatement potential could come from the combined impact of second-generation biofuel, traffic flow, shifts to public transportation, and eco-driving measures. Such measures are essential for near-term abatement because of the potentially shorter time and relatively lower incremental cost associated with their implementation, as well as their applicability to the entire fleet, not just new vehicles.<br>Figure: (p.3 & p.6 Exhibit1, Roads toward a low-carbon future, McKinsey&Company, 2009)<br>(Roads toward a low-carbon future: Reducing CO2 emissions from passenger vehicles in the global road transportation system, March 2009, McKinsey & Company.<br>Available at: http://www.mckinsey.it/idee/practice_news/roads-toward-a-low-carbon-future-reducing-co2-emissions-from-passenger-vehicles-in-the-global-road-transportation-system.view) | I'm not sure that the reviewer wants here….more detail? With our space constraints, perhaps we shouldn't do that. |
| 12900 | 8 | 26 | 35 | 26 | 44 | Another rebound should be mentioned here: The purchase rebound; growing engine size and mass of passenger cars have offset (and are still offsetting) parts of fuel economy improvements (if not addressed by relevant policies). Cite related literature, for example Amela Ajanovic, Lee Schipper, Reinhard Haas (in press), The impact of more efficient but larger new passenger cars on energy<br>consumption in EU-15 countries, Energy, xxx, 1-10; Meyer, Ina; Wessely, Stefan (2009): Fuel efficiency of the Austrian passenger vehicle fleet—Analysis of trends in the technological profile and related impacts on CO2 emissions, Energy Policy, 37, 10, 3779-3789. | good point…it is an oversight not to discuss how vehicle performance, size and features have shifted over time and their effect on fuel economy…this seems to be a universal trend, though especially pronounced in the U.S. |
| 5200 | 8 | 26 | 35 | 26 | 44 | Add same rebound for air transport efficiency improvements and relation with rail (see my note 16). | Covered in 8.10 |
| 16309 | 8 | 26 | 37 | 26 | 40 | This sentence should clarify the time span during which this elasticity value holds true. In other words, it should be clarified that this elasticity value was estimated in the short-, medium, or long term. | agree |
| 15833 | 8 | 26 | 45 | | | this bullet repeats point from previous bullet right above it on rebound effect. Could be merged or deleted. | I don't really agree…suggest we keep |
| 4002 | 8 | 26 | 45 | 46 | 2 | The paragraph on oil market response seems (1) out-of-place - but maybe there is no better spot for this important material, (2) a bit vague - what is the range of oil price supply elasticities, what does it depend on?, (3) does not take into account non-competitive behavior on the part of OPEC. Since oil/fuel price is a key driver in all modes of transportation, this material should be significantly expanded. Perhaps, it should be moved to it's own sub-section. | Noted. |
| 15832 | 8 | 26 | 6 | 26 | 8 | another explanation is prefernece of vehicle performance over fuel economy. See heywood et al for more references on this. | here's this issue again….it needs to be discussed |
| 4342 | 8 | 26 | 22 | 26 | 24 | need to include the "vehicle mix" as an additional factor in the overall fuel economy (on road) | agree |
| 2687 | 8 | 26 | 45 | 27 | 2 | Oil market response paragraph does not fit this section on 'behavioural aspects'. | agree |

|---|---|---|---|---|---|---|---|
| 8567 | 8 | 27 | | | | ADDITIONAL CITATIONS RECOMMENDED<br>"If rail systems achieve modal shift from road vehicles, life-cycle emissions from rail infrastructure may be partially counterbalanced by reduced life-cycle emissions of road infrastructures,<br>COMMENT: This is RE high speed rail. Two additional sources should be included and summarized. (1) Booz, Allen, Hamilton (2007), "Estimated Carbon Impact of a New North-South Line," which estimated a very long GHG payback period for infrastructure (http://webarchive.nationalarchives.gov.uk/+/http:/www.dft.gov.uk/pgr/rail/researchtech/research/newline/carbonimpact.pdf). and (2). Jean-Noel Chapulet and Jean Pierre Taroux, "Trens Ans LGV: Comparison de Prevision et Realisations," Tranports, July-August 2010. This work shows the diversion from cars to high speed rail to be modest, even in an environment with high petrol prices and expensive highway tolls. | will read those sources and consider. in developed nations at least, road infrastructure isn't growing with increased vehicle use…it's not all that clear that reducing slightly the growth in vehicle use will have much of an effect on inffrastructure development, except perhaps for repairs . Care to be taken with Booz, Allen Hamilton report - is very much grey literature and based on grey literature. Also typical UK where e.g. emissions from electric rail can be abated at a fraction of cost of e.g. air and even car. Not much technical |
| 17716 | 8 | 27 | 11 | | | Again, this sentence might be misleading. Car-oriented transport has increased with rising incomes, but this has been the result of certain policies and investment choices (eg subsidised fuels). | The sentence is not specific to car transport. the reviewer's assertion might be correct, but what's the basis for it? solved as whole section 8.4.1.1has been deleted. The authopr has a point of couse that there is no specific causal relation between income itself and car use or mobility: there are some based on |
| 10770 | 8 | 27 | 32 | 27 | 38 | It should be made clear which components that have been included in the results behind figure 8.4.1 (only Kyoto gases or short-lived forcers also?) and how the effects have been transformed to CO2-equivalents. I assume it is by GWP. Which time horizon that is used should be given. It is important to note that other time horizons and metrics would produce a different result; see figure 2 in Fuglestvedt et al., 2010: Transport impacts on atmosphere and climate: Metrics. Atmospheric Environment 44 (2010) 4648–4677. See also WGI, chapter 8, fig 8.31. | Figure will be reconsidered. it does make sense to specify such things, e.g. time horizon….as for 'noting that other time hoizons and metrics would produce a different result," we need a methodology discussion somewhere in the overall report, not in the transport section, about LCA. actually I believe we should always give both CO2 |
| 4419 | 8 | 27 | 36 | 27 | 36 | Be more specific on the statement “probably large” | Will consider more literature to specify here. the current version doesn't concern me. indeed lots of literature with contradicting results; will draft a table with this all recalculated to |
| 15834 | 8 | 27 | 40 | 27 | 42 | Calif high speed rail is a poor example / case study since this is still a very uncertain and early stage project. Why not draw from hi speed rail projects already done such in Taiwan or China or EU and compare these to non-high speed systems. Use real life example sbased on real existing operating data | Will consider according to data availability. if such project data are readily available, they might be better….but otherwise I don't have a problem using the CA example. There is lots of literature here; the Chester ref |
| 11883 | 8 | 27 | 44 | 27 | 45 | I believe the finding from Chang and Kendall was recuperation time of just over two years (not within 2 years) | This is correct and changed accordingly. |
| 18904 | 8 | 27 | 45 | 27 | 46 | recycling of rail track materials: Are there numbers to what degree this is ususally done? As I would have expected that gravel is always reused and rails always recycled. | There is some literature e.g. {von Rozycki, 2003 #797}, {Westin, 2012 #3372}, {Du, 2012 #3764}, and combining with steel literature like {Damgaard, 2009 #3765} and |

|---|---|---|---|---|---|---|---|
| 5201 | 8 | 27 | 28 | | | In essence this section is important, but be careful: much is based on the Chester & Horvath 2009 reference and I am afraid this reference is not valid for the current state of the art regarding life-cycle analysis of infrastructure and based on very a-typical cases to be of general vallidity or transport in the world. it even could be misleading.<br>My objections are:<br>1. It compares apples and pears: air transport is used for trips above 100 km at least (averaging 1500) while urban rail systems are for distances to at most 35-40 kms. These are totally different markets and now the impression is created that rail is not toop efficient compared to air, while long range rail is performing much better than these specific urban rail systems (see my refs below).<br>2. I checked the basic data for the rail systems and found they stem from the 1970s, describing new rail systems build in the 1960s with very typical USA characteristics like an enormous amount of enery used by lighting the stations up to almost day-light level during nights (because of safety regulatins that do not exist in this way in other parts of the world), a low ridership and low train frequencies of a new not matured system. Actually current urban rail systems are much better (or for air transport the DC9-30 should have been used for comparing).<br>As you do refer to Akerman 2011 already, please check my rough calculation from data from that paper that infrastructure share of emissions per pkm is just about 5-7% at the 25 billion pkm prognosed for the high speed railway in Sweden. Based on data from Amos, P., Bullock, D., & Sondhi, J. (2010). High-speed rail: The fast track to economic development? In. Beijing: World Bank, the real capacity of this line could be at least double the 25 billion, halving the percentage for infra to be some 3-4%, which is substantially different from 33% given by Chester et al. My recommendation: do not use the Chester & Horvath 2009 reference but make use of the data given in e.g.the followig papers: Åkerman, J. (2011). The role of high-speed rail in mitigating climate change - The Swedish case Europabanan from a life cycle perspective. Transportation Research Part D: Transport and Environment, 16, 208-217.<br>Chang, B., & Kendall, A. (2011). Life cycle greenhouse gas assessment of infrastructure construction for California's high-speed rail system. Transportation Research Part D: Transport and Environment, In Press, Corrected Proof.<br>IWW/INFRAS. (2004). External costs of transport. Update study. Final Report. In. Zürich/Karlsruhe: UIC.<br>Milford, R. L., & Allwood, J. M. (2009). Assessing the CO2 impact of current and future rail track in the UK. Transportation Research Part D: Transport and Environment, In Press, Corrected Proof.<br>Tuchschmid, M. (2009). Carbon Footprint of High-Speed railway infrastructure (Pre-Study). Methodology and application of High Speed railway.<br>and, though not really LCA:<br>Peeters, P., Szimba, E., & Duijnisveld, M. (2007). Major environmental impacts of European tourist transport. Journal of Transport Geography, 15, 83-93.<br>As LCA has still many uncertainties, please add figures for direct CO2, direct RF, and same LCA based. | invite peters to become CA to solve this issue. |
| 8433 | 8 | 28 | | | | In this figure of this paragraph I suggest to show only the % increase in GHG due to transport infrastructure, and not all the emissions from fuel combustion that has its own variation and uncertainty | It is valuabe to have the context, but we need to recompile a new graph. Will try to develop a table/graph including all |
| 11277 | 8 | 28 | | | | It should be made clearer in the text that the figure is only showing the specific US case, not claiming representativeness of the data for other regions.<br>Furthermore, the figure might be better understood with further explanations (in the text), since the illustration - even though it refers to a particular take on GHG emissions - might convey at first glance the picture of strongly better aircraft performance over, e.g., urban diesel buses - discussed holistically, this is phrased differently on, e.g., page 30 (lines 9-11) (since flight over road transportation should probably not be recommended). | Agreed, we need to draw a new graph. |

| 15835 | 8 | 28 | 1 | | | Horvath studies have been controversial for several reasons. This is supposed to be a study of studies so suggest showing a graph based on data from several sources. Could be an average of several studies or something like that, but don't just cut and paste from a single source. Similar chart was shown in SRREN report Chap. 8 on Integration for trasnportation sector. might check that. | agreed, problem is to find more data here. Scarcely availale. Will check SRREN Ch. 8 |
| 17717 | 8 | 28 | 12 | | | suggest a stronger word than "may": there is plenty of evidence that building roads increases VMT | accepted |
| 11646 | 8 | 28 | 16 | 28 | 17 | Delete, it's misplaced here. | Accepted. Moved to 8.9.2.1 |
| 18906 | 8 | 28 | 19 | 28 | 20 | Channels are line infrastructures for shipping - please take this into account. | Accepted |
| 11276 | 8 | 28 | 26 | 28 | 30 | The notion on airport congestion management should include a critical comment on the extension of flight operation hours into the early mornings and evenings (or even nights), resulting in environmental, social, and health repercussions on adjacent environments and settlements that might not be offset by economic and efficiency concerns. | agreed. |
| 5202 | 8 | 28 | 3 | | | Please remove this figure and replace with one based on refs given in my note 20. | consider. |
| 8886 | 8 | 28 | 30 | 28 | 32 | This is a quite old paper focusing on tourism. There are many papers out there showing that aviation demand is relatively price inelastic. | if we find better literature, we will consider. Mayor et al., is about tourism but is not the reason to not take it up as, 90% of air transport is basically tourism transport as tourism comprises not only leisure travel, but also visting friends and relatives and business trips outside ones own usual environment (UNWTO definition); where this includes same day visitors, but for 'tourists' it includes only visitors staying at least one |
| 5204 | 8 | 28 | 30 | 28 | 32 | I feel this general taxing remark belongs not in this section. | Agreed. Sentence deleted. Figure out |
| 14287 | 8 | 28 | 31 | 28 | 31 | To note that the EU now does have a price on CO2 emissions from aviation, as all flights to/from the EU are covered by the EU ETS. | Sentence deleted. |
| 11884 | 8 | 28 | 31 | 28 | 31 | I am not sure it is clear what "in contrast to a boarding tax" means in this sentence, or what is meant by a boarding tax in the first place. | Sentence deleted. |
| 18907 | 8 | 28 | 31 | | | "taxing jet fuels": Consider mentioning that most other transport mode fuels are taxed in most countries so that the current state causes market distortion | Sentence deleted. |
| 11647 | 8 | 28 | 33 | 29 | 8 | Check for analysis by Scheiner & Holz-Rau. They are very careful not to jump to conclusions. See e.g. http://www.vpl.tu-dortmund.de/cms/Medienpool/PDF_Dokomunte/Publikationen/Ursache_Wirkung.pdf | will check this paper. |
| 5247 | 8 | 28 | 33 | 30 | 7 | Of course urban systems are important, not least because the proportion of the world's urbanised population is rising, but why is there no section of the various important needs of rural dwellers? | Accept. Add key references on the rural side. |
| 11184 | 8 | 28 | 33 | | | The sections in relation to urban form are overlapped with some sections in Chapter 12. The sections in Ch.8 could be moved to Ch.12 because Ch.12 might not exist without the subject. | Noted. This is discussed in both chapters, here with details on transport not covered in Ch.12 and in Ch.12 in a |
| 5286 | 8 | 28 | 42 | | | ADD: Ecodriving has also obtained reduction of about 15% and can be maintained in time when companies offer part of the gains in energy costs to drivers (Stéphane La Branche, « La réduction des émissions de GES des entreprises dans la région de Lyon : freins, blocages et opportunités. Report for the City of Lyon, France. », 2010°. | Accept. But need peer-reviewed literature.there is like {Barkenbus, 2010 #3773}. Point here is that the 15% is for those drivers that accept the eco-driving |
| 2452 | 8 | 28 | | | | Has shipping in the title - but no mention of shipping in the text. | Accept. Change title. |
| 2689 | 8 | 28 | | | | Nothing about shipping in this section, despite sub-title. | see above (i.e. answer to comment no |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 5203 | 8 | 28 | 18 | | | The quote of 5-10% of fuel burn on the ground is a very high number and really non-typical (also it is based on a conference presentation of which the sheets seem not publicly available, but I feel it will be based on a very short flight with extreme hig taxi times). Even in heavily congested airports as JFK with average taxi times of 30 minutes, the total fuel share of this taxiing will be, at 7% power rating and assuming 75% power rating during the flight and average flight duration of some 90 minutes, give 2-3% of total fuel burn. But the JFK is rather non-typical: in most airports taxi times are generally in the order of 5-10 minutes. So please remove this and add that overall taxi fuel for the global fleet is just a few promiles (that still can be reduced in some heavily congested airports). | Need to reread the literature. add also {Nikoleris, 2011 }, {Simaiakis, 2011} and {Simaiakis, 2010}. |
| 8213 | 8 | 28 | 18 | 28 | 32 | There is very limited write up of "shipping", while the main section (8.4.1.3) is for 'aviation'. The in-port congestion (incl seaports and inland waterway ports) can be as serious as airports, which lead to heavy emissions and time lost. | Accept. Need literature. {Balkanski, 2010 ;Haites, 2009}, {Wit, 2004}, {Corbett, 2009}, {McCollum, 2009} |
| 2453 | 8 | 28 | | | | Cross reference to Ch 12 | Accept. |
| 8547 | 8 | 29 | | | | CHARACTERIZATION OF RESEARCH IS AT VARIANCE WITH THE SOURCE....<br>RE: "Both self-selection and the built environment can explain travel behaviour with slightly more emphasis on the latter" (Cao et al., 2009).<br>COMMENT: This characterization gives undue weight to one of 38 studies that were reviewed. See the following in Cao et al:<br>"The studies adopting a structural equations modeling approach (e.g.Bagley and Mokhtarian, 2002; Cao et al., 2007b) found an influence of residential selection, although the influence of the built environment appeared to be stronger than that of self-selection in the latter study."<br>They continue...<br>"Unfortunately, given the various limitations discussed throughout this paper, we are unable at this point to confidently specify the nature and extent of the causality between the built environment and travel behavior."<br>From the cited research, the following would be a far more faithful reading of the conclusions.<br>"Both self-selection and the built environment can explain travel behaviour (Cao et al., 2009)." | Reject. The reviewer is right that Cao 2009 is an insufficient reference for this statement. But see also Ewing Cervero 2010. Furthermore, there is path dependency in mobility choices (see Goetzke 2008). Need to be cited though. |
| 5205 | 8 | 29 | 13 | 29 | 14 | If we accept travel time budgets, than transport infrastructure is leading deterining the overall travel speed and urban form will follow this. I feel priority should be that every new urban develoment chooses to base itself on public transport and bicycle infrastructure and adapts to the opportunities of those, not compromising it with private car use. As far as I can follow from non-scientific literature, the Chinese made two decades the error to partly forbid cycling to make room for cars, but have found already that in that way the whole trabsport system collapses. In japan, cities like Tokyo, they do forbid cycling because urban rail systems are even more space efficient. Sorry, have not now literature available about this. | Accept. Is not really in contradiction what has been written. Will accomodate. section 8.4.2.1 has been moved to 8.6? |
| 11885 | 8 | 29 | 16 | 29 | 31 | This paragraph stands in stark contrast both in style and content than previous paragraphs/sections. On its own this is no a problem, but the paragraph seems to jump from one sweeping conclusion to another without enough information or detail for the reader to make sense of all the topics. Is there a way to make this paragraph more accessible and straightforward for the reader? | Accept. Is deleted (also space reasons). |
| 5206 | 8 | 29 | 16 | 29 | 31 | Very good section, but add here means to break the circle: the best are car ownership policies (like very high parking rates for citicens in Amsterdam) and of course limiting road investments, which will help people to choose other transport modes. The large differences in modal split between e.g. Ireland (some 2-3% public transport) and Switzerland (some 20-25% public transport) show what consistent infrastructure policies can do. | Accept. No space though for this section. Suggest to move part of this to the introduction. Add what the reviewer suggests to 8.6. if you are writing in a section about systemic aspects of infrastructure this kind of feedback |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 5695 | 8 | 29 | 16 | 29 | 16 | The reviewer strongly agree with the idea. This aspect should be emphasized in other places. Especially link to activity in fig. 8.1.2.b | The idea might be to framed more shortly here. suggest to rewrite a new 8.4.2.1 about role of infrastructure, transport speed and for all modes of |
| 16310 | 8 | 29 | 27 | 29 | 31 | The two sentences "For example, … public institutions (Unruh, 2000)." are not so important and should be deleted. | Accept. |
| 5287 | 8 | 29 | 28 | | | (Unruh, 2000)… ADD: Since 2012, French Territorial Climate and Energy Plans impose on cities with over 50 000 people norms and principles aiming at reducing GHG through urban planning, land management and mobility practices and infrastructures integrated with one another. The approach that seems to be merging is the urban multifunctional, multiservices polycentric model. | Reject. Here not appropriate. But take up the idea further below. if you are writing in a section about systemic aspects of infrastructure this kind of feedback structurres is typical for it and |
| 17133 | 8 | 29 | 29 | 29 | 31 | DELETE: In turn, a transformation towards a sustainable transport system requires simultaneous changes in non-transport domains, e.g. in relevant public institutions (Unruh, 2000).<br>REVISE TO: A new set of innovations is necessary to mitigate CO2 emissions from road transportation, maintain the sustainable development of society, and achieve a higher QOL. These innovations have three aspects: Energy efficient vehicles and their collectively optimized control, Efficient traffic flows achieved by functional urban design and traffic management and Multi-modal transportation.<br>(T. Okazaki, M. Yamaguchi, H.Watanabe, A. Ohata,, H.Inoue, and H. Amano(2012), Climate Change Mitigation, Springer, Chapter 9: Technology Diffusion and Development, 210-211) □ | Reject. The whole point was to speak about institutions. |
| 17718 | 8 | 29 | 44 | | | Does the balance of "self-selection" and "the influence of the built environment" depend on the setting? In high quality environments, self-selection might perhaps play a weaker role. | Accept. Need literature. |
| 5406 | 8 | 29 | 45 | | | self selection tends to make the effect of compact development on transit use and travel seem larger than it is….since people who would prefer to travel less and use transit will gravitate to compact development…..the statement says exactly the opposite | Accept. Wording must be accurate. But there is also a dubious revealed preference assumption in the self- |
| 3414 | 8 | 29 | 7 | | | Public transit system: Check whether Frank and Pivo mean supply-driven systems here. Lower population densities may be better served by demand-driven services (e.g. On call). | check. |
| 2690 | 8 | 29 | 2 | 29 | 7 | Ewing & Cervero, 2010, is a meta-analysis of studies that evaluates elasticities of different measures; Cao et al. (2009) examines whether self-selection bias is a major problem (and concludes it is not). These key points of both these studies should be emphasized. | Accept. |
| 8368 | 8 | 29 | 6 | | | Urban sprawl is seen as a way of modernizing cities and sprawl has been strongly supported by politicians in collaboration with business communities. A heterogeneous and compact city growth will lead to changes in mobility patterns. PIs connect urban sprawl, city planning and with overall goal of equity, the MDG's and social inclusion presented elsewhere in this report. | Accept. The idea of connection urban settlement patterns with various goals is valid. Otherwise it is a little bit unclear what the reviewer want to say here. |
| 8369 | 8 | 29 | 16 | | 31 | This part can be shortened because the information is already well known. The quality of the text is fine but all this info is not really needed. | Accept. |
| 2691 | 8 | 29 | 9 | 29 | 31 | Delete this section as it is irrelevant. | well, it is certainly not irrelevant (reviewer does not show why it is). |
| 13899 | 8 | 29 | 32 | 30 | 7 | The debate on urban form and GHG emissions could be enriched by other views, which are not considering a direct/systematic link between density and sustainability. See Marcial H. Echenique, Anthony J. Hargreaves, Gordon Mitchell & Anil Namdeo (2012): Growing Cities Sustainably, Journal of the American Planning Association, 78:2, 121-137 | Accept. the reference has a point to some extent: density seems not to do really much when irt is speed dictating distances and thus transport patterns. However, the density has an impact on those speeds and to some extend on the necessity to possess a car, whicgh has definitely an impact on speed and thus distances. Might try to see if this is |

|---|---|---|---|---|---|---|---|
| 2692 | 8 | 29 | 32 | 30 | 7 | This section starts with a discussion of population density. As research has shown (Ewing & Cervero, 2010) this is probably the least important of the many urban form and design features that affect travel. These points are mentioned in this paragraph, but I would recommend that these key points be the starting point for discussion, rather than the end of the paragraph. Additional recent reference to look at: Salon, Deborah, Marlon G. Boarnet, Susan Handy, Steven Spears, and Gil Tal, 2012, How do local actions affect VMT? A critical review of the empirical evidence, Transportation Research part D, 17: 495-508. | Reject. Population density is still a proxy for the other more fine-grained things. But will consider rewording to avoid being unclear here. |
| 6484 | 8 | 29 | 33 | 30 | 7 | The issue of urban form needs more attention then what is provided in the report. For example link with urbanization and urban form. It has been established that - Asian cities are growing rapidly and another 1.1 billion people will live in the region's cities in the next 20 years (ADB). Majority of growing cities do not have proper plans promoting smart growth and hence urban form and structure can be very powerful to avoid future transport growth or shift future motorized travel to more sustainable modes. ( example – only 24% of cities in India have developed master plan (Ministry of Urban Development India). | Accept. |
| 15294 | 8 | 3 | 2 | | | I was expecting a CO2 equivalent value, rather than CO2-only statistics for transport's contribution. I believe 5 to 15% of transport's GHG contributions are non-CO2, which is not so negligible. I also wonder about all the embodied energy implications of transport (in the form of vehicles, road & port provision & maintenance ,etc.). Those probably add another 15% to 100% of GHG contributions (depending on mode: e.g., car vs. a high-end subway system, based on Chester & Horvath's published work). Is there a way to make this distinction clear early on, since the 6.4 Gt only speaks to running emissions, I believe. | Accepted. Change Fig.8.1.1 to CO2eq. Further, different sections of chapter also cover well-to-wheel emissions, etc. |
| 8552 | 8 | 30 | | | | INCORRECT REFERENCE: SHOULD BE REMOVED<br>"In Delhi, India, a transition to a bus-system would result in a decrease in energy use of 31% and a transition to metro-rail based system would result in a decrease of 61% (Khanna et al., 2011).<br>Citation is about biofuels, and not about Delhi. Khanna M., C.L. Crago, and M. Black (2011). Can biofuels be a solution to climate change? The implications of land use change-related emissions for policy. Interface Focus 1, 233–247. (DOI: 10.1098/rsfs.2010.0016). Available at: http://rsfs.royalsocietypublishing.org/content/1/2/233.abstract. | Accept. Will amend |
| 8553 | 8 | 30 | | | | UNCLEAR, POTENTIALLY MISLEADING STATEMENT<br>Urban transport is particularly susceptible to modal shift as it is subject to a prisoner's dilemma: an individual's rational choice of private car (non-cooperative behaviour) leads to CO2 emissions, congestion, air pollution and noise, whereas the use of public transport and non-motorized transport (co-operative behaviour) is comparably socially advantageous (Camagni et al., 2002)<br>COMMENT: The sentence could be wrongly interpreted to support the view that modal shift in urban transport can easily occur. The clause " is particularly susceptible to modal shift" is not supported by the balance of the sentence. The sentence should simply say:<br>"Urban transport is subject to a prisoner's dilemma: an individual's rational choice of private car (non-cooperative behaviour) leads to CO2 emissions, congestion, air pollution and noise, whereas the use of public transport and non-motorized transport (co-operative behaviour) is comparably socially advantageous (Camagni et al., 2002) | Accept. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 8554 | 8 | 30 | | | | "To stay within an average daily travel time budget of 60 to 70 minutes a day (Zahavi and Talvitie, 1980; Newman and Kenworthy, 1999; Schäfer, 2000), transit requires a fast service networked to serve the majority of the city. Compact settlement structures support fast transit by reducing distances and increasing accessibility..." COMMENT: The difficulty of achieving this should be acknowledged. Indeed, there is no major metropolitan area in in North America, Western Europe or Oceania in which mass transit carries the majority of motorized travel. The difficulty of designing such a system is illustrated in Ziv and Cox, 2007 ("Megacities and Affluence: Transport and Land Use Considerations," paper presented to the World Conference on Transport Research, Berkeley, 2007: http://www.publicpurpose.com/ut-wctrs2007.pdf). The huge shortfall in mass transit access is indicated is illustrated by the fact that in US metropolitan areas of more than 1,000,000 population, the average worker can access only 6 percent of the jobs within 45 minutes by mass transit (average automobile travel time is 25 mintues). This calculated from data in Tomer, A, E. Kneebone, A. Berube, & R. Puentes, R. (2011), "Missed Opportunity: Transit and Jobs in Metropolitan America," Brookings Institution. Even in Paris, with perhaps the best mass transit system in the West, mass transit access is far below that of cars in suburban new towns served by the regional metro (RER), see: Fouchier V. & S. Michelon (1999), "Isochrones autour des villes nouvelles aux heures de pointe." DREIF & Groupe Central des Villes Nouvelles. No serious proposal has yet been tabled to establish a mass transit system that would replicate the mobility of the automobile in a modern Western metropolitan area. A fast service "networked to serve the majority of the city" has never been shown to be feasible, theoretically or in reality. The entire paragraph, beginniing on line 18 is misleading and should be deleted. | Accept the criticism and be more precise in the wording. there are a few relationships important here: (1) the longer the distance the higher the average transport speed; (2) the lower the density the lower the number of road junctions etc and the higher the speed; (3) the TTB suggests that the distances travlled will be larger in low density urban areas because the transport speeds there will be much higher on average. |
| 8555 | 8 | 30 | | | | CONTINUTATION OF LINE 11 COMMENT....The huge shortfall in mass transit access is indicated is illustrated by the fact that in US metropolitan areas of more than 1,000,000 population, the average worker can access only 6 percent of the jobs within 45 minutes by mass transit (average automobile travel time is 25 mintues). This calculated from data in Tomer, A, E. Kneebone, A. Berube, & R. Puentes, R. (2011), "Missed Opportunity: Transit and Jobs in Metropolitan America," Brookings Institution. Even in Paris, with perhaps the best mass transit system in the West, mass transit access is far below that of cars in suburban new towns served by the regional metro (RER), see: Fouchier V. & S. Michelon (1999), "Isochrones autour des villes nouvelles aux heures de pointe." DREIF & Groupe Central des Villes Nouvelles. No serious proposal has yet been tabled to establish a mass transit system that would replicate the mobility of the automobile in a modern Western metropolitan area. A fast service "networked to serve the majority of the city" has never been shown to be feasible, theoretically or in reality. The entire paragraph, beginniing on line 18 is misleading and should be deleted. | Misleading is a very strong statement. Also: the US is not really a role model here, and neither can results from the US easily transfered to other parts of the world. |

|---|---|---|---|---|---|---|---|
| 8568 | 8 | 30 | | | | INCOMPLETE AND POTENTIALLY MISLEADING INFORMATION<br>Given relatively slow rates of improvement in average carbon intensity of car and air modes, a 25% reduction in car and air travel by 2050 (relative to baseline growth), with half the travel shifted to rail, bus, and non-motorised travel and half the travel eliminated through better urban planning and telematic substitution, results in an estimated 20% reduction in transport energy use and CO2 emissions (IEA, 2009; (Cuenot et al., 2012).<br>COMMENT<br>The improvement in auto carbon intensity is by no means slow. The US Department of Energy, Energy Information Administration estimates that CO2 emissions from light vehicles will decline 19 percent from 2005 to 2035, despite a large increase in driving. This is assuming the new 35.5 MPG fuel standard adopted in 2010 for 2016 ("Annual Energy Outlook: 2012). This is before the new 54.5 MPH standard just adopted. No official estimates are out yet, but I am modeling a decline of 35 percent based upon the projected experience with the 35.5 MPG standard. This is very rapid and should be cited favorably. Telematic substitution is in addition to this and has potential to increase this reduction. | Accept. Reword the beginning of the sentence. be careful as for aviation the progress is limited to some 30-40% on a theoretical basis. For automotive the progress might ber much stronger as for surface transport the laws if physics are much less ,imiting as for aviation 9in air transport you need speed to stay aloft and the same forces that create lift also create unavoidable amounts of drag). |
| 8569 | 8 | 30 | | | | IMPLAUSIBLE EXPECTATION<br>half the travel eliminated through better urban planning and telematic substitution, results in an estimated 20% reduction in transport energy use and CO2 emissions (IEA, 2009; (Cuenot et al., 2012).<br>COMMENT<br>The US studies on the potential of urban planning to replace (reduce) travel indicate much smaller potentials. The mid-point vehicle reductions in two major US reports over 45-50 years was estimated at about 5 percent, with one report (TRB) expressing doubt that its higher scenario could be achieved. Similar results from the UK See: (1) Board on Energy and Environmental Systems (2009), Driving and the Built Environment: The Effects of Compact Development on Motorized Travel, Energy Use, and CO2 Emissions, Transportation Research Board. (2) Cambridge Systematics (2009), Moving Cooler: An Analysis of Transportation Strategies for Reducing Greenhouse Gas Emissions, Urban Land Institute.<br>and (3) Echenique, M. L., A. J. Hargreaves, G. Mitchell & A. Namdeo (2012), Does Urban Form Really Matter? Journal of the American Planning Association, V. 78, Issue 2, pp. 121-137.<br>□ | Accept. Cite the relevant work. There are however caveats to this literature as well: The US starts from a very low density setting, often with decentralized commuting. In such settings relative compactification is less effective than in more traditional urban forms. The Echenique paper is good but also has its shortcoming (see a discussion of the paper at Env Res Web: http://environmentalresearchweb.org/blog/2012/07/does-urban-form-really-matter-2.html). should make a clear distinction in the world between the two Americas (they have discarded almost all public passenger transport, |
| 12901 | 8 | 30 | 12 | 30 | 13 | Delete the sentence regarding CO2 co-benefits | Reject. No explanation is given for this |
| 16312 | 8 | 30 | 12 | 30 | 12 | The word "efficiency" should be modified to "energy intensity". | Accept. |
| 3433 | 8 | 30 | 12 | | 13 | The CO2 benefits depend not only on the relative efficiency of each mode (in energy use per pkm) but also on the carbon content of the energy form used in each mode. | Accept. |
| 3415 | 8 | 30 | 14 | 30 | 17 | Sentence is difficult to understand. Half the travel plus half the travel is all th travel so how does this tally with 25% reduction in travel? | Accept. Reword. |
| 8040 | 8 | 30 | 17 | 30 | 17 | It is worth to mention that already today in OECD-countries like Japan there is a modal split of 50 - 50 (cars and public transport). In other OECD countries (e.g. Germany) scenarios for diminishing the modal split of cars (80 % today to 50% in 2050 for Germany) are being discussed (see http://lowcarbon.inforse.org/files/resource_1/ENCI-Report_Scenarios_Germany_2012_EN.pdf, page 20 or http://lowcarbon.inforse.org/files/resource_1/ENCI-Report_Stakeholders_Germany_2012_EN.pdf, page 3) or http://www.germanwatch.org/klima/mt10lv.pdf | Accept. Can we cite this? PAUL P: ENCI reports are funded in FP7 research so should be OK. Germanwatch is an NGO, may be avoid if not necessary. Furthermore, there are some other strong transport scenarios |

|---|---|---|---|---|---|---|---|
| 17128 | 8 | 30 | 18 | 30 | 22 | DELETE: Urban transport is particularly susceptible to modal shift as it is subject to a prisoner's dilemma: an individual's rational choice of private car (non-cooperative behaviour) leads to CO2 emissions, congestion, air pollution and noise, whereas the use of public transport and non-motorized transport (co-operative behaviour) is comparably socially advantageous (Camagni et al., 2002) (Creutzig and He, 2009) see also 8.7).<br>REASON: Current vehicle does not contribute to air pollution anymore due to the improved catalyst and quality of fuels. Rather, old used vehicle with insufficient maintenance and pollutant emissions from the stationary source often contribute to air pollution. Public transports such as trains and buses also have noise issue for residents near public systems. Sound abatement shields could be applied along the highway as a countermeasure. | Reject. While technology proves to alleviate some of the calamaties in some countries, it doesn't change the nature of car use a prisoner's dilemma. |
| 16313 | 8 | 30 | 18 | 30 | 22 | I think that the word "susceptible" should be modified to "unsusceptible" in the light of possible lock-in. If my understanding is wrong, I propose that these sentences be modified so that readers can easily understand them. | Accept. |
| 17720 | 8 | 30 | 19 | | | Is use of the private motor car in urban settings really the "rational choice" (for the individual)? In many cities, the "effective speed" of car travel is less than that for other modes (given work-time required to cover the costs of fuel, maintenance and vehicle purchase). | Accept. the problem is that the first car user is certainly at an advantage, but as soon as the numbers of car users rise above a certain level, the road capacity fails and using a car becomes very slow; but than we have habots with status. So |
| 14289 | 8 | 30 | 22 | 30 | 22 | Not sure that modal shift from cars reduces land use - it may reduce utilisation of roads, but the roads still exist so land use is not changing. | Reject. |
| 3416 | 8 | 30 | 22 | | | reduces land use FOR CARS | The land used for cars is reduced but total land use of course is not (the world is not shrinking). So may change using ".. makes space available for other urban |
| 5407 | 8 | 30 | 23 | | | using "% of trips" as a measure of how important a travel mode is can be misleading….yes, the fraction of trips is important, but the fraction of actual person kilometers traveled may be more important…..depends on the context….yes, cars account for 33% of trips and use 94% of road space in Paris (assuming the author is correct), but cars probably account for a MUCH higher % of actual distance traveled. This chapter devotes a considerable amount of space to urban planning and other "soft" measures, which probably makes perfect sense, but it must be careful to use available statistical data in a way that doesn't appear to be putting a thumb on the scales. | Accept. In an urban context the average distance by car is certainly not much different from other motorised modes; might even be shorter than bus because it is very inconvenient to take a bus for 500 m, but cars are still used much on such short distances. an issue |
| 13241 | 8 | 30 | 24 | 30 | 27 | « to stay with average travel time budget » appears to be a deterministic formulation. We suggest to replace this sentence by "Travel time budget of 60-70 minutes a day (ref) can be only achieved if transit provides a fast service networked to serve the majority of the city". | Accept. may be this is reversing the idea; society is not so much trying to travekl as much kilometers within 60-70 minutes, but, given a certain urban density, infrastructure, etcm, the travel time is a constant so only distances are the outcome; if yopu have a dense city with a very fast transport system you will |
| 17721 | 8 | 30 | 33 | | | why will there be a "strong pull towards increasing car ownership and use"? If growing cities follow the model of Singapore, or Shanghai, rather than Chicago or Sydney, then patterns of transport growth might be quite different in the future than they have been in the past. | Accept. |
| 17719 | 8 | 30 | 4 | | | Heavy use of US examples in this section. Perhaps it would be helpful to broaden the range - there have been plenty of innovations in Europe and South America, for instance, that might be worth citing. | Accept. and certainly also in Asia. |

|---|---|---|---|---|---|---|---|
| 8570 | 8 | 31 | | | | IMPORTANT POINT OMITTED<br>McCollum et al (2010) also say....<br>A rigorous study by Jamin et al. (2004) shows that if high speed rail systems were to connect major metropolitan areas throughout the United States, the energy and emissions benefits would be relatively modest due to insufficient traffic volumes in many cases: less than a 3 percent reduction in total U.S. domestic air traffic volume would be achieved, with consequently modest reductions in energy use and emissions. On the other hand, recognizing that connecting major downtowns is not the only potential market for HSR....<br>COMMENT<br>objectivity requires citation of this point. | Reject. That is a right observation. But most of the world is not the US. is Mcollum et al. Not the 2009 report (not 2010)? The point with jamin is they keep the travel pattern itself constant and assume that just offering HSR does the trick, while it ius known that such model studies of new modes are generally not performing too well... (e.g. the Madrid Barcelona railway line performed several times better than envisaged in model studies |
| 14290 | 8 | 31 | 18 | 31 | 21 | Potential for emissions reduction from modal shift from air to high-speed rail may be limited. Although a significant number of passengers may shift, the impact of this in emissions terms may not be large due to the relatively short distances involved (the majority of aviation emissions are long-haul flights which cannot be substituted by rail). For example, in the UK modal shift to high-speed rail could reduce passenger demand by up to 8% by 2050 but this would only reduce emissions by around 2%. See Committee on Climate Change (2009), "Meeting the UK aviation target - options for reducing emissions to 2050", Chapter 3 p77-78 (http://downloads.theccc.org.uk/Aviation%20Report%2009/21667B%20CCC%20Aviation%20AW%20COMP%20v8.pdf). | Accept. Reword. entirely true except: there is much scope for changing destinations, certainly in the leisure tourism market where a beach is the central thing to achieve, not the exact kilometrage to the beach (if tourism is a section in Ch 8 or 10, then this will be covered in that section). The idea is that modal shift should also be accompanied by shorter distances thus increasing its |
| 11648 | 8 | 31 | 18 | 31 | 29 | The shift from short-haul flight to HSR only saves GHG if the liberated airport slot is not filled up again. However in fact it is often substituted by a more profitable and more polluting long-haul flight. Hence from the total system perspective the shift without a backstop is a bad idea. Please add this caveat! See e.g. Clewlow: Impacts of high-speed rail on air transportation in Europe: an analysis of demand and emissions. ETC 2011 https://etcproceedings.org/paper/impacts-of-high-speed-rail-on-air-transportation-in-europe-an-analysis-of-dema | Accept. also this is an example of inconsistant policies by expanding airport capacity and aiming with new HSR development at less short haul air transport. On the other hand: the substitution is only true if currently long |
| 5207 | 8 | 31 | 18 | 31 | 29 | It might be interesting to consider through backcasting what might be necessary in long distance (tourism, i.e. leisure, visiting friends and relatives and business all is tourism; see UNWTO definition) travel to achieve 70% reduction of GHG at increased numbers oftrips by 2050. From our research it appears there will be a systemic limit to aviation's growth at current levels, but under the condition that about 80% of car trips is replaced by train, or the projected growth of car can be kept, but then at a strong reduction of current aviation volumes to the level of about the 1970s (see Peeters, P. M., & Dubois, G. (2010). Tourism travel under climate change mitigation constraints. Journal of Transport Geography, 18, 447–457). This may set the challenge for the modal shift policies proposed (which will be hard to achieve anyway). | Accept. |
| 16315 | 8 | 31 | 18 | 31 | 29 | First, this paragraph should clarify whether or not comparisons of GHG emissions and energy intensity between high-speed rail and air travel were made from a life-cycle perspective, or more specifically, whether or not GHG emissions and energy consumption associated with high-speed railway network are taken into account. Secound, it is better to mention the potential and future prospects for Maglev in this paragraph. | Accept first part, Reject second part: no good literature on Maglev, costly concept. agree magLev seems not a really viable option due to e.g. The necessity to have all trrains on a certain track driving exactly the same speed thus stations need to be separated at |
| 8434 | 8 | 31 | 2 | 31 | 17 | I suggest to better underline the importance of NMT (non-motorized transport), expanding the 15 lines written in this paragraph. If we consider the whole world, and not only industrialized countries, cycling and walking are still today the most frequent way people use for moving in the everyday life. Maybe a specific paragraph could be created. | Accept. |

|---|---|---|---|---|---|---|---|
| 13116 | 8 | 31 | 2 | 31 | 17 | Do not give too much explanation for cycling and walking issue in "modal shift" paragrapph. Modal shift from personal vehicle to cycling and walking may decrease energy use, however, it does not play important role of global modal shift. Please cut most sentences for simplicity. | Reject. See example comment above. and there is a systemic link here: a cycling/walking based city requires less car possession and thus less car use also indiirectly on longer distances. |
| 16314 | 8 | 31 | 2 | 31 | 17 | This paragraph should clarify whether or not such increases in cycling and walking could restrain the growth in automobile ownership and the modal share of automobiles. | Accept. |
| 3417 | 8 | 31 | 20 | 31 | 21 | Correct, but new infra induces new use, new demand for it. Creating the high-speed railway city to city connections in Europe certainly has generated a lot of new travel that would otherwise not have been there at all. Worth to check whether there is literature on this, probably considerable, rebound effect. | I would reject this argument, because every investment in transport causes mobility that would not have been there without it. So a shift in investment always will cause that mobility at one hand is reduced and other mobility is generated. the idea of this is that some form of mobility is necessary to keep the economy going. If such a new mode trip is a new trip is actually not relevant. The |
| 3595 | 8 | 31 | 30 | | | There is no need for emphasis on modal shift solution for freight. All trials and intermodal projects have had limited impacts so far, since rail have at best maintained its market share, and shipping and aviation have no serious competitor. Other solutions are far more sucessful in terms of ghg reduction per tonne delivered and far more cost-efficient if considering external costs internalisation (Leonardi and Baumgartner 2004; SUGARLOGISTICS.EU; Piecyk&McKinnon 2008; McKinnon et al: Green Logistics 2012). | include more caveats about the likely impacts of particular measures. Some useful suggestions which will be separately evaluated and would be worth incorporating e.g. need more discussion of the impact of just-in-time and the opportunities of relaxing it to cut energy use and emissions. Clearly mode shift is only one of a series of 'decarbonisation' options for freight transport. Greater |
| 13428 | 8 | 31 | 33 | 31 | 36 | We need to mention about the "Just in Time system". | Needs a reference. |
| 6485 | 8 | 31 | 18 | 31 | 29 | The table misses one critical point which was discussed in the section GHG emissions impacts of transport infrastructure . LRT and Metro since grade separated and thus the infrastructure provision involves high emissions when compared to systems like BRT. More good discussion can be found @ http://www.adb.org/sites/default/files/EKB-REG-2010-16_0.pdf. Discussions on High Speed rails in 18 to 29 statements in page 31 also need to provide link with infrastructure construction and cost especially for developing countries and cities. | Accept link with infra. |
| 12121 | 8 | 31 | 18 | 31 | 29 | Video-conferencing as an alternative to air-travel completely ignored. Discussion of passenger model shift from air travel to very fast trains completely ignores another major alternative to air travel - video conferencing. A six hour videoconference can save<br>some 99 per cent of energy and material resources that would be consumed by<br>the transatlantic trips required to hold the same meeting in a single location. Ref von Weizsäcker, E., Lovins, A. B. and Lovins, L. H. (1997) Factor 4: Doubling Wealth,<br>Halving Resource Use, Earthscan, London | it is mentioned in table 8.8.1 and on p 43 of the original draft. May be add it here as well. Interestingly the recent financial crisis did impact on business flights and vid-conf, e.g. {Smeral, 2010} though not well founded in empirics.. |
| 12119 | 8 | 31 | 2 | 31 | 17 | Modal shift opportunities for passengers - excellent section - missing key point that suggests there is a huge potential here - REF see IPCC AR4 2007 Transport chapter "As the IPCC has stated, “While the trend has been away from non-motorised transport (NMT), there is considerable potential to revive interest in NMT as more than 30% of trips made in cars in Europe cover distances of less than 3 km and 50% are less than 5 km ." | accept. As in other comments above; direct impact on emissions not high (only short distances0 but indirect impacts on car ownership and shorter overall distances might have a |

|---|---|---|---|---|---|---|---|
| 12120 | 8 | 31 | 2 | 31 | 17 | Car sharing Schemes do not seem to be discussed at all in this transport chapter. Yet they compliment and help enable passenger modal shifts and help reduce the costs to citizens of transport services overwell, whilst also reducing GHG emissions. Now there are car sharing schemes in operation in some form in over 600 cities. | Accept. |
| 4297 | 8 | 31 | 30 | | | As the example of modal shift opportunities for freight, I propose adding electric cargo train system or external power supply convoy. Low-carbon investment in freight transport can be less than the railway. | Not clear what is being proposed here. A large proportion of railfreight already |
| 2696 | 8 | 31 | 35 | 31 | 36 | Provide evidence for statement that deregulation has favored road transport. | This sentence will need to be reworded. The intention was to argue that trucking operations have benefitted from the liberalisation of freight markets around the world over the past 40 years. There |
| 12902 | 8 | 32 | 16 | 32 | 19 | Does the faster rate of incremental technical innovation and faster vehicle replacement rate of HDV compensate for higher emissions/tkm with respect to rail? What is the situation when full life-cycle analysis is applied, including infrastructure? | This comment poses interesting questions that will require further investigation. On the long term the replacement rate is not the factor determining the outcome but mainly the |
| 4420 | 8 | 32 | 33 | 32 | 36 | Check on inconsistency in earlier part of the chapter re last mile freight | Rather vague. Not clear what this relates |
| 8028 | 8 | 32 | 4 | 32 | 6 | The White Paper 'Roadmap to a Single European Transport Area – Towards a competitive and resource efficient transport system' is the reference for the contents of this sentence. Why not refering to it? | Agreed. Need to add a reference to this EU White Paper |
| 6486 | 8 | 32 | 26 | 32 | 29 | This may not be entirely true from developing cities perspective (shift to better modes not exactly roads to rail but inefficient trucks to better modes is possible). The last mile vehicles are often the most polluting i.e. vehicles which are very old and cannot be used for longer distance and thus load from such vehicles could be shifted to more efficient vehicles and non motorized transport modes. Many Chinese cities over last two years have used sticker concept to prevent old inefficient vehicles from accessing urban space. To reduce air pollution in cities, the diesel trucks are labeled green and yellow in China. Green labels are applied to diesel vehicles which correspond to China National III emission standards or above (new), whereas yellow labels are for diesel vehicles below China III standards (old). By restricting the entry of yellow label vehicles, the authorities are trying to reduce pollution (black carbon emissions) in some big cities by allowing only cleaner vehicles inside the cities. Nearly 20% of vehicles are "yellow-label vehicle" . The other important factor in securing better urban freight is the urban form and structures. By having better landuse policies, freight movement can also be impacted. | Makes a good point about the relative energy / CO2 efficiency of long haul and local delivery ('last mile') trucks, which clearly varies around the world. Efforts in Chinese to raise the efficiency of delivery fleets may merit a mention. HAO: Agree. Freight transport mode shift can be promoted by banning inefficient trucks, as China has implemented.<br><br>Alan: include more caveats about the likely impacts of particular measures. Agreed, but this partly reflects the |
| 4262 | 8 | 32 | | | | Recent research shows that increased active travel can avert costs to the National Health Service from seven major conditions that are related to sedentary lifestyle. Jarrett J, Woodcock J, Griffiths UK, Chalabi Z, Edwards P, Roberts I, Haines A. Effect of increasing active travel in urban England and Wales on National Health Service costs. Lancet 2012; 379:2198-205 | Accept. Thanks for the reference. |
| 14291 | 8 | 33 | 3 | 33 | 5 | Slow steaming has not necessarily widened the time gap between sea and air. The purpose of slow steaming is to utilise spare capacity in the fleet and save fuel costs (since slowing down uses less fuel). Although journeys take longer, there are more ships being used on routes. Therefore, service levels are maintained even though individual journeys are slower. | Unclear comment. It concedes that sea journeys are taking longer as a result of slow steaming. Assuming that air freight is moving at its previous speed, the time gap must be widening. In practice this issue is much more complicated that this comment and the current text in the chapter suggest. The |

|---|---|---|---|---|---|---|---|
| 3261 | 8 | 34 | | 59 | | 1. 8.4.2. Urban forms of mobility is good indicator of global divide. This section may address the specificities of African countries for instance dominated by informal transport systems with huge implication in GHG emission. In the same section urban structure imposed some special transportation systems such as bikes and motorbikes (a new market for Indonesia and India) and not a cultural behaviour such as in Scandinavian countries.<br>a. In 8.4.2.2 implications of urban growth in GHG emission include land cover changes (positive? e.g. Las Vegas or negative e.g. Dakar, Ouagadougou, etc). Positive means greener cities compared to baseline or greyer-browner cities when vegetation is cleared for buildings. It can relate to the energy needed to build new cities or extend new ones depending to emerging use of new technologies and new materials.<br>b. 8.4.2.3. Apart from emerging economies (India, Brazil, China), modal shift did not happen in Africa because cities and urban population have not been prepared for that (shanty towns, twisted and tiny roads). NB. Denmark is regretting the removal of tramway in its transportation system, a new behavioral need for an old practice.<br>2. 8.10.1. Also needs some African (LDC) perspectives with another concept of common transportation influenced by poverty, urban structure (working areas in one location), road systems, aging vehicles park (a huge proportion of transportation systems are used cars from developed countries). In particular the change of behaviour in Europe and US, gave new opportunities to import cheap used cars that have some implications in air pollution, health and GHG emission… Unfortunately there are no clear statistics on imported second (sometime fourth hand) car in Africa. In Some countries with improved wealth imported used cars are declining (Latin America, EAU, etc.)<br><br>4. Statistics of imported (new and used) cars in Senegal from 1980 to 1997 (source, Ministry of Transport-Republic of Senegal) no update of these data, but we could try to have global picture of used car export in Developing countries<br>a. In Kenya at 2008 a total of about 30000 used cars have been imported from Japan alone (http://www.autoassista.com/import_guide/japanese_used_car_import_statistics.html)<br>5. At the same time new changes are occurring because of changing legislations (the use of non CFA fridge after Montreal Protocol, the change in regulation of used equipment imports in Africa including cars). This underlines how international binding agreements have depicted in national regulation, and therefore a change in decision making and behaviour.<br>6. 8.10.5. It might be good to bring in the picture the raising “second chance” in the African urbanization through emerging new cities (new development platforms such as the transition in Asian Dragons in the 1970ties). In Gonza City for Kenya, Diamniadio for Senegal, Ouaga-2000 for Burkina Faso, etc.<br>7. Finally Africa has the highest economic growth during the last 5 years, this pulls down many investors who are generally established in cities for their business. The change in behaviour related to this influence of GLOBALIZATION can be addressed as well. | Related to 8.5? Useful comments though some dated. Will incorporate where relevant if room in text. |
| 14294 | 8 | 35 | 14 | 35 | 19 | This is really only an issue to the extent that surface transport is not decarbonised. | Taken into account |
| 12338 | 8 | 35 | 14 | 35 | 19 | This paragraph might also include some considerations as regards the cooling agents used in air-conditioning systems. | Taken into account. This would be more an additional mitigation factor, rather than an aspect that relates to linkages between adaptation and mitigation. This point here relates to the relative energy |

|---|---|---|---|---|---|---|---|
| 15867 | 8 | 35 | 2 | 35 | 5 | This paragraph indicates that global warming will increase vehicle emissions. This is statement is questionable because some emissions increase with colder weather (for example, unburned hydrocarbon, particulate, and CO emissions in vehicles), and the potential GHG-driven changes in ambient temperatures and humidity are in general not enough to really change the combustion processes. Also vehicles operate in wide ranges of temperatures (summer, winter) so not clear how you could differntiate climate chnage impacts from seasonal variation in engine performance and also fuel formulation (winter, summer fuels) | Accepted. Will need to follow up. |
| 12903 | 8 | 35 | 20 | | | Change headline to: Mitigaton costs and potentials | Reject. Thanks for the comment but this first-level heading cannot be changed. |
| 3434 | 8 | 35 | 28 | | 30 | A nice phrase, with a strong policy message, is one said by Lee Schipper ( I don't have a reference but I am sure he would like it to be included): "Transport matters a lot for CO2, but CO2 matters little for transport. High CO2 emissions are only one of the symptoms of poor urban transport in most developing cities". Therefore, the polycentric approach mentioned elsewhere in Chapter 8 makes very much sense in the case of mitigationg GHG emissions from transportation. I think that this is worth mentioning at this point. | Reject. Thanks for the comment but only if the reference was provided this could be included. |
| 16316 | 8 | 35 | 45 | 35 | 46 | The sentence "Optimizing ~ a reduction of 8 Mt CO2/yr" shoul clarify where and when this level of reduction was estimated to be achieved (in Beijing?). | Accept. We will amend text. |
| 2455 | 8 | 35 | | | | The missing element is the subsidisation of fuel - for road transport, but also for rail and aviation - any form of subsidy or exemption from taxation means that people and firms are shielded from market forces and from paying the real social costs of the carbon (and other costs). | Accept. We will amend text. |
| 17773 | 8 | 35 | | | | consider changing the title to "Costs and potentials for GHG reduction" | Reject. This heading cannot be changed according to IPCC rules. |
| 13878 | 8 | 35 | | 39 | | This section need to be linked with chapter 16 "cross-cutting investment and finance issues" in order to avoid overlapping between chapters | Accept. We will amend text. |
| 13060 | 8 | 35 | 20 | 40 | 3 | On the Costs & Potentials issues it is difficult for the reader to access the bigger picture of the cost & potential information. Each sector has its own approach to costs and potentials, which is appropriate as each sector has its own unique qualities and considerations. Nonetheless, the information that will be most relevant to take-away for policy-makers is overarching cost information that brings these different pieces together. To help policy-makers access this information, it should be important to highlighting market realization, but also the policy aspects of cost (by policy it is meant institutional frameworks and/or market frameworks and/or capacity building arrangements, etc...). In both developing and developed countries policy can have a strong impact on cost. Simply looking across the costs & potentials sections of the sector chapters, the reader could miss this message, although the information on policies and measures is there in the chapter. Therefore it could be important to make sure that these informations are put in perspective appropriately. | Accept. Thanks a lot for this very useful comment. We will amend text to try to address this very important issue. |
| 2699 | 8 | 35 | 20 | 40 | 3 | This section is very poorly written and is poorly structured. Is the intent to discuss costs and benefits of policies? Or is it simply describe potential policies? I would suggest dropping what is very confusing terminology: 'activity effect component', 'structure effect component', etc. Instead I would structure this section by grouping specific policy approaches into sections. 1. Pricing and taxes, 2. Subsidies for transit, 3. Urban form and design, 4. Non-motorized, 5. Other TDM (parking, carpooling, telecommuting, etc.), 6. Technologies (vehicle and fuel), 7. Need for synergies and integration of all policies for maximum impact. | Reject. Thanks for the comment. However, it has been agreed that the Kaya identity should, somehow, provide a storyline for the different sections of the report. In this case, since this section is about Costs and Potencials, it has been agreed by the authors that this |
| 11275 | 8 | 35 | | | | This section reads very much economic (see remarks in No.1 above), what about people and their (real) behaviour (and, thus, needs and activities)? | Accept. We will amend text provided there is literature to support it. |
| 16319 | 8 | 35 | 27 | 36 | 20 | I propose that estimates of the long-term price elasticities of transport activity demand be mentioned in this section to point out the price-inelastic nature of the transport sector. | Accept. We will amend text provided there is literature to support it. |
| 13879 | 8 | 35 | | 37 | | These two sections focus on potentials without dealing with cost. Cost-effectiveness is key to be policy relevant. See Sweeney, J., Weyant, J., 2008, Analysis of Measures to Meet the Requirements of California's Assembly Bill 32, Precourt Institute for Energy Efficiency, Stanford University | Accept. Thanks a lot for this very useful comment. We will amend text to try to address this very important issue. |

|---|---|---|---|---|---|---|---|
| 8551 | 8 | 36 | | | | TEXT INDICATES - ALSO CRITICIZED COST METHODOLOGY<br>Any change in benefits associated with modal shifts must also be factored in. An Australian study showed redevelopment around transit and walking reduced GHG emissions by 4.4 t CO2-eq per household per year compared with developing a car dependent suburb (Trubka et al., 2010) . Cost savings for each new transit-oriented household were for infrastructure savings (non-transport), USD85,000; for public and private transport savings, USD250,000 over 50 years; for GHG emissions, USD2,900 assuming USD25/tCO2-eq or USD24,990 at USD 215/tCO2-eq (social cost); for health savings, USD4230 from reduced obesity; plus USD34,450 from increased productivity due to increased walking.<br>COMMENTS:<br>(1) This paragraph does not accurately reflect the Trubka et al research. Trubka et al reaches its 4.4 CO2-eq per household per year by comparing urban development within 3 km of the CBD to fringe development 60 or more kms from the CBD. The finding is not about "redevelopoment around transit and walking" but rather redevelopment within 3 km of downtown.<br>(2) The costs cited (from " Cost savings for each new transit-oriented household were for infrastructure savings ...") are not in the cited work but are consistent with previous work by the same authors. Considerably lower costs have been developed for the Sydney area by Center for International Economics (2010), which also includes comparisons to the Trubka, et al. costs. See: The benefits and costs of alternative growth paths for Sydney: Economic, social and environmental impacts<br>http://www.metroplansydney.nsw.gov.au/Portals/0/pdf/AlternativeGrowthPaths.pdf<br>(3) The cost methodology (under subpoint 2 above) is from Trubka, R., Newman, P. and Bilsborough, D., 2008. Assessing the costs of alternative development paths in Australian cities. Fremantle: Curtin University Sustainability Policy Institute., which is criticized in the New Zealand Productivity Commission "Housing Affordability Inquiry." The exception taken to these costs by the Commission should be cited<br>http://www.productivity.govt.nz/sites/default/files/Summary%20Version%20-%20Final%20Housing%20Affordability%20Report_0.pdf | Accept. Thanks a lot for this very useful comment. We will amend text. |
| 3833 | 8 | 36 | 10 | 36 | 10 | Define ICT the first time it appears. | Accept. We will correct text. |
| 11187 | 8 | 36 | 13 | 36 | 20 | To keep higher density in urban areas of developing countries is also important. In reality, once low-density development prevails, it is quite difficult to densify the area. | Accept. We will amend text. |
| 5408 | 8 | 36 | 16 | | 17 | what does it mean to say "compact neighborhoods use cars a third as much as……suburbs"? Actually a third of the PKT by private vehicles one sees in the suburbs? If so, say so. | Accept. We will amend text. |
| 18910 | 8 | 36 | 18 | | | "10 Gt CO2": Are these annual emission reductions? If so, for what year? Please clarify. | No. These are accumulated emission reductions for the period. |
| 3435 | 8 | 36 | 19 | | | When using the term 'polycentric policies' in this chapter, I think it would be appropriate to cite the Economics Nobel Laureate Elinor Ostrom for using the term. E.g.: Ostrom E., A Polycentric Approach for Coping with Climate Change. Background Paper to the 2010 World Development Report, Policy Research Working Paper 5095, The World Bank, Washington, DC, 2009. | Accept. We will try to amend text to reflect this, although we may end up with a problem of having to cite "grey" literature, which IPCC is trying to avoid. |
| 8215 | 8 | 36 | 24 | 36 | 25 | High-speed rail in China is controverisal, esp. on the safety issue. Moreover, high-speed rail sometimes do not have many stops in certain distance, it connects mainly first and second tier cities in China that are remoted from each other. Shifting short-medium haul air trips to high-speed rail cannot satisfy travelers in 3 or 4 tier cities. Therefore, I suggest to delete the half sentence 'particularly high-speed rail including in China (Akerman, 2011).' | Disagree. Although it is true that not all short-medium air trips could be shifted to high speed rail (as the reviewer stated), a considerable shift has been achieved. See Xiaowen Fu, Anming Zhang, Zheng Lei, Research in |
| 5409 | 8 | 36 | 32 | | 34 | I would think that the average reader would draw virtually nothing from knowing that each household used 4.4 t CO2 less…..it would be much more useful, I think, to talk about percentage reductions in emissions, since most people haven't a clue how much carbon is actually emitted by the average household. | Accept. We will amend text. |

|---|---|---|---|---|---|---|---|
| 7399 | 8 | 36 | 39 | 36 | 45 | use comprehensive measure to assess cost. The statement of negative costs based on the cited study can't be generalized. | Reject. Text is very clear on refering to India and in not generalizing it. |
| 17129 | 8 | 36 | 46 | 36 | 48 | DELETE: Taking into account the total societal cost of vehicles, fuels and infrastructure, a significant cost reduction could occur from a shift away from growth in car and air travel and toward mass transit and non-motorised travel, along with changes in urban form and increased use of ICT (IEA, 2009).<br>REASON: This language is not appropriate because terrible impacts of personal mobility demand reduction on economies is not clarified. | Accept. We will amend texto to better reflect this. |
| 7398 | 8 | 36 | 5 | 36 | 20 | Need to use comprehensive measures to assess costs. For example, densifying suburbs negatively impacts propoerty values. | Accept. We will amend texto to try to address this. |
| 16317 | 8 | 36 | 5 | 36 | 7 | Same as the comment No. 9. | Reject. Comment could not be found. |
| 17722 | 8 | 36 | 5 | | | The examples here are almost all from Australia and the US. What about cities elsewhere in the world, where the majority of population growth will occur in the 21st century? What studies are there from Africa, for example? | Accept. We amend text provided that we can find literature. |
| 16318 | 8 | 36 | 9 | 36 | 13 | This fails to constitute a sentence due to grammatical mistake(s). | Accept. We will amend text. |
| 5208 | 8 | 36 | 21 | | | In general all elemenst are mentioned within this section, but what I miss is the overarging impact of infrastructure policies: if we do not manage to significantly reduce investing in airport and road capacity and increase investing in high speed rail, than there will be no cost or other measure effective enough to avoid further growth of air an dcar and stand still or even decline of rail; based on logics, not so much the scientific literature (though many show the inability of prices to reduce growth so there is an urgent need to follow different policies, see e.g. aviation, see Mayor, K., & Tol, R. S. J. (2007). The impact of the UK aviation tax on carbon dioxide emissions and visitor numbers. Transport Policy, 14, 507-513.<br>Mayor, K., & Tol, R. S. J. (2010). Scenarios of carbon dioxide emissions from aviation. Global Environmental Change, 20, 65-73.<br>Pentelow, L., & Scott, D. J. (2011). Aviation's inclusion in international climate policy regimes: Implications for the Caribbean tourism industry. Journal of Air Transport Management, In Press, Corrected Proof. | Accept Thanks for the comment and for the references. We will amend text. |
| 8372 | 8 | 36 | 22 | | | A simplistic view is put forward here because most likely the consequences of climate change will be very different in the Global North and the Global South. Heat and/or rain impede on walking and bicycling and the same goes for cold, wind and rain in the Global North. In larger cities distances and time spent on roads are also growing A considerable group of (some 2, 5 billion individuals) cannot afford to take a BRT bus or travel with a gentrified system of transport. Also because they do not run to places that women have to go. | Reject. It is not clear what exactly is the suggestion here. |
| 3419 | 8 | 36 | 42 | | | Especially systems that truly integrate public transport and cycling have a lot of potential. | Accept. We will try to amend text. |
| 5288 | 8 | 37 | 14 | | | ADD: But, information is not enough: in a qualitative and quantitative study on mobility in Lyon, hte publci interviewed considered itslef to be well informed (81% said that CC was the number one challenge of the 21st century, 81% also said that the best way for an individual to fight CC was to stop using the car, yet, 56% used their car for all activities on a daily basis (96% had a public transport accessible within 400 meters). Thus, information related to climate change did not lead to changes in mobility modes (Stéphane La Branche. « La gouvernance climatique face à la mobilité quotidienne. Le cas des Lyonnais ». Revue Environnement Urbain/Urban environment. 2011). | Accept. We will try to amend text to reflect this. |
| 3420 | 8 | 37 | 21 | | | While this is right, you may consider to show a notion of mobility careers here; i.e. trying to influence groups to postpone or abstain from the next step in their mobility career. | Accept. We will try to amend text to reflect this. |
| 5410 | 8 | 37 | 21 | | 23 | asserting that something is a "critical part" of a package is probably too strong for an IPCC report, but besides, I suspect there's little evidence that "broad public and institutional education initiatives" do lots of good. | Accept. We will amend text. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 3596 | 8 | 37 | 24 | 37 | 33 | This section is not on structural effects, but on system efficiency and sustainable goods transport management. This section should include comments and list all business/public sector efficiency measures leading to a better use of existing capacity and to less CO2 per unit delivered (night deliveries, increased load factor, multi-use lanes, delivery windows etc); and an indication on how to promote them in order to increase the market uptake. | Accept. We will amend text to try to incorporate these important suggestions, particularly relating to the loading of freight vehicles which needs elaboration. |
| 4298 | 8 | 37 | 30 | 37 | 33 | Just-in-time delivery has also caused small lot size of distribution and aggravation of the load factor. It is regarded as one of the important issues. As solution, there are downsizing of vehicles, formation of cooperative transportation, and ICT practical use (logistic information system). | Accept. But we would need literature to amend text. |
| 15838 | 8 | 37 | 49 | | | Do the $/tCO2 values include capex and fuel costs? Negative numbers suggest improvements cost less than current technology which is not very probable. Again, more data would be useful - IEA has done $/tCO2 analyses too. Might include some of that. (ETP, WEO) | Accept. We will try to amend text. |
| 4061 | 8 | 37 | 24 | 37 | 33 | Section 8.6.2. These sentences discuss the cost-effectiveness and benefits of "just-in-time" logistics. However, just-in-time logistics may suffer from climate change impacts when disruptions occur. What is the net benefit of changing to just-in-time logistics? | Accept. We will amend text if we can find literature. |
| 8373 | 8 | 37 | 38 | | | Yes, especially in cities in emerging economies. Therefore, pls map out 4-5 different kinds of urban areas and clarify the conditions and possibilities in cities with different political and economic systems. | Accept. We will try to amend text provided we can find literature to back it. |
| 8720 | 8 | 37 | | | | Note: Comparison of mitigation options for US and European HDVs is available in this recent report(Table 3.9) Cost reductions for each technology for each vehicle category in Table 4.22<br>AEA & Ricardo, 2010. Reduction and testing of Greenhouse Gas Emissions from Heavy Duty Vehicles http://ec.europa.eu/clima/policies/transport/vehicles/docs/ec_hdv_ghg_strategy_en.pdf | Accept. We will amend text to better reflect this. |
| 4421 | 8 | 37 | 39 | 38 | 30 | Could much of section 8.6 be combined with the earlier section vehicle technologies? The consequence of separating the cost of powertrain improvements from the technology is that much of the earlier discussion is repeated to allow costs to be discussed. Additionally, costs of technological improvements for shipping, rail and air have been omitted. | Accept. We will amend text. The reviewer has a good point, although we must stick with the agreed outline. |
| 11649 | 8 | 38 | | | | Add also the cost analysis in Lutsey 2009, and Borken-kleefeld 2010: http://webarchive.iiasa.ac.at/Admin/PUB/Documents/XP-10-014.pdf | Accept. We will amend figure. |
| 5339 | 8 | 38 | 1 | 38 | 1 | increases in efficiency ARE possible | Accept. We will try to amend text. |
| 2456 | 8 | 38 | 16 | | 24 | Lots of data here, but there is no comment on the potential for any combination of migitation measures and the total costs that this would result - over what sort of time period. | Accept. We will try to amend text to better reflect this. But in fact there is a table for this in the earlier section, though it can be greatly improved. An issue with figure 8.6.1 is that we do not |
| 2759 | 8 | 38 | 16 | 38 | 24 | Mitigation cost may be negative. E.g. biogas vehicles may be cheaper than corresponding diesel vehicles and their fuel is also cheaper. In addition, octane value of 140 makes substantial engine efficiency increase possible reducing energy consumption per km. | Accept. We will amend text and find literature to better reflect this. |
| 5340 | 8 | 38 | 16 | 38 | 24 | Need to clarify what modes this para refers to: all LDVs? Cars? References to "short term" and "long term" need to be defined. Time frame not specified for EV costs, so not clear what "in the same timeframe" refers to for FCVs | Accept Thanks for the comment. We will improve text. |
| 16320 | 8 | 38 | 16 | 38 | 21 | CO2 mitigation costs for ICEs, ICE-hybrids, and plug-in hybrids must differ by fuels, so fuels used in vehicles in question must be clearly described, such as advanced gasoline ICEs. | Accept. We will modify/clarify text.However, the authors doubt this is |
| 3834 | 8 | 38 | 17 | 38 | 17 | Explain in a footnote what advanced spark-ignition ICE means. | Accept. We will clarify. |
| 3835 | 8 | 38 | 18 | 38 | 19 | I recommend to consider the PHEV coupled with sugar cane ethanol as a low cost and high intensity GHG emission mitigation alternative. See Pacca and Moreira, 2011 and consider that the technology is already in the market. - Pacca, S. and J. R. Moreira, 2011. A Biorefinery for Mobility? Environ Sci Technol. 2011 Nov 15;45(22):9498-505. | Accept. We will try to ammend text. |
| 15840 | 8 | 38 | 21 | | | add "low cost and" before "low carbon" | Accept. We will ammend. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 15841 | 8 | 38 | 21 | 38 | 22 | $80-120/tCO2 look like very long term costs, not near term (i.e., cheap batteery prices). Might clarify assumptions | Accept. We will clarify. |
| 5341 | 8 | 38 | 22 | 38 | 22 | Depends on battery cost. UK Committee on Climate Change analysis suggests cost could be near-zero by 2030 if charged off-peak with low-carbon electricity. See CCC (2012) International Aviation & Shipping Review Technical Report http://hmccc.s3.amazonaws.com/IA&S/CCC_IAS_Tech-Rep_2050Target_Ch4_Transport.pdf | Accept. The problem is that one can always find a very high and very low cost with the right assumptions about battery costs. That's the key, and we probably |
| 16321 | 8 | 38 | 25 | 38 | 25 | This sentence should be modified to "~ achieve a reduction in fuel consumption per km of 38-51% from XXXX (2015?) to 2020". | Accept. We will clarify. We.need to look at the NRC report. Probably 2010 at the |
| 15839 | 8 | 38 | 7 | | | Might add a chart showing $/tCO2 vs. tCO2/km, or $/passenger km traveled vs L/km charts to capture full life cycle costs (vehicle capex + fuel + opex). Also not clear if same vehicle class assumed (mid sized LDvs? Compact cars? Keep consistent | Accept. We will try to improve figure. |
| 4340 | 8 | 38 | 8 | 38 | 11 | legend is missing "G-adv" label? What does it mean?? | Accept. We will clarify (advanced |
| 13881 | 8 | 38 | 16 | 38 | 24 | If discount rate is discussed in page 25, mitigation cost for electric vehicle are provided without any indication on the discount rate hypothesis used. It seems that IEA (reference provided) takes a quite low 3% discount rate, which could explain the relatively low mitigation cost. It could be useful to discuss the effect of high discount rate on deployment | Accept. We will try to improve text. |
| 13897 | 8 | 38 | 16 | 38 | 24 | Only one reference is provided for EVs and PHEVs mitigation cost. Here is another reference, with much higher costs: Oscar van Vliet, Anne Sjoerd Brouwer, Takeshi Kuramochi, Machteld van den Broek, André Faaij, Energy use, cost and CO2 emissions of electric cars, Journal of Power Sources, Volume 196, Issue 4, 15 February 2011, Pages 2298-2310, ISSN 0378-7753, 10.1016/j.jpowsour.2010.09.119 | Accept. We will try to incorporate new, authoritative references. |
| 17774 | 8 | 39 | | | | retype the table; also there is another table with the same table number | Accept. We will correct this. |
| 15842 | 8 | 39 | 11 | | | why have efforts been usuccessful? Important to know | Accept. We will clarify. |
| 2760 | 8 | 39 | 12 | 39 | 14 | In addition to black carbon, diesel engine emission problems include other particles etc. These are not solved by liquid biofuels, i.e. biodiesels, synthetic biodiesels and pure plant oils, even if they can reduce lifecycle GHG emissions. But these problems can be solved by using gaseous fuels (renewable methane and bio-DME) in the diesel engines. Those fuels also reduce lifecycle GHG emissions compared to biodiesels, synthetic biodiesels and pure plant oils. | Accept. We will try to improve text if we can find good references for it. |
| 2458 | 8 | 39 | 15 | | 23 | This is almost a repeat? | Accept. We will amend text to improve it. |
| 3837 | 8 | 39 | 15 | 39 | 23 | This is another place where the technology discussed in Pacca and Moreira, 2011 could be considered for analysis. - Pacca, S. and J. R. Moreira, 2011. A Biorefinery for Mobility? Environ Sci Technol. 2011 Nov 15;45(22):9498-505. | Accept. Thanks for the reference. |
| 16322 | 8 | 39 | 15 | 39 | 15 | The phrase "renewable- and non-renewable-electricity based" seems redundant and shall be deleted. | Accept. Will amend text. |
| 2761 | 8 | 39 | 17 | 39 | 19 | Here the 20 % limit means liquid biofuels. The EU expert group on future transport fuels has estimated (in January 2011) that biogas (BG) and synthetic biogas (SBG) resources in the EU are larger than transport energy consumption in the EU. And still biomethane resources are very small part of all renewable methane resources. Solar and wind methane are much larger: their use also solves the storage problem of intermittent renewable energy sources (also Chapter 7 issue, see comment 59). In Finland 40 % share of renewable methane in transport energy consumption in 2050 has been proposed in a sustainable development path. Most would be wind and solar methane because they have crucial contribution to sustainable energy system. BG has been used commercially in transport in Finland and Sweden since 1941. SBG use in transport has been demonstrated in Austria since 2009 and wind methane use in transport has been demonstrated in Germany since 2009. Commercial SBG production for transport will begin in Sweden in 2013 and commercial wind methane production for transport will begin in Germany in 2013. | Accept. We may try to amend text but we really need literature to back this. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 5342 | 8 | 39 | 17 | 39 | 18 | ~20% is in IEA scenario but this is not indicative of what is likely or desirable. If ILUC is ignored there could be much more biofuels, but if ILUC is addressed there could be much less. Also UK Committee on Climate Change analysis indicates over the longer term bioenergy should be prioritised in other sectors, and zero-emission vehicles deployed to decarbonise road transport. See CCC (2011) Bioenergy Review. http://www.theccc.org.uk/reports/bioenergy-review | Accept. We will try to improve text. |
| 12904 | 8 | 39 | 17 | 39 | 18 | This number might be outdated due to recent scientific findings on the non-sustainability of biofuels. | Accept. We will try to find more recent |
| 16323 | 8 | 39 | 17 | 39 | 18 | This sentence should clarify the region where it holds true, e.g., at the global level. | Accept. We will clarify. |
| 16338 | 8 | 39 | 17 | 39 | 18 | Takeshita (T. Takeshita, 2009. "A Strategy for Introducing Modern Bioenergy into Developing Asia to Avoid Dangerous Climate Change." Applied Energy 86 (Suppl. 1), pp. 222-232) estimated that the amount of biomass feedstocks that can be used for energy purposes without conflicting with other biomass uses such as food production would decrease significantly in the second half of the century because of the growth of food demand, particularly in now-developing regions. Therefore, it is likely that the share of biofuels produced from plantation-based feedstocks will not be so high in the long term. | Accept. We will improve text. |
| 3836 | 8 | 39 | 2 | 39 | 4 | Please, explain the meaning of all vehicles classes. | Accept. We will clarify. |
| 16324 | 8 | 39 | 24 | 39 | 24 | The phrase "varies across regions and raw materials" should be modified to "varies across regions, raw materials, conversion processes, and final products". | Accept. Thanks. We will modify. |
| 13117 | 8 | 39 | 31 | 39 | 34 | This paragraph (Emissions from EVs ,,,,,,,,,ICE-based vehicles) is not necessary. Similar paragraph is seen line 40 page20 . Please cut it for simplicity. | Accept. We will try to improve text. But a reference to electric vehicle is important here since this section is |
| 4422 | 8 | 39 | 32 | 39 | 34 | The point of WTW emissions from EV being linked to the carbon intensity of power generation was said earlier in p 20, line 42. | Accept. We will cross-reference with there. But it is important to have this in here, as this subsection is about carbon |
| 2457 | 8 | 39 | 5 | | 9 | With statements like this, it is very hard to see transport making any substantial contribution to CO2 stabilisation targets - if 2% fuel efficiency is set against a growth of 4.8% in aviation - these inconsistencies need to be reconciled if the document is to have any credence. | Reject. There seems to be no inconsistency here, as this part of the text only refers to aviation. We are |
| 17723 | 8 | 39 | 8 | | | does this mean that there must be a reduction in air traffic to meet climate change targets, even with the most optimistic scenarios for efficient technologies? | Accept. Thanks for the comment. In fact there are other possibilities as well, as low/zero carbon fuels that could be used |
| 6487 | 8 | 39 | 11 | 39 | 14 | One of the main reasons why dieselization of fleet is happening in Asia is the availability of subsidies which keeps the price of diesel less than gasoline. This has a negative impact on carbon emissions due to rebound effects and black carbon emissions. | Reject. Thanks for the comment but it does not conflict with what is already in the text. |
| 2459 | 8 | 40 | | | | This table is important - and perhaps needs some sort of commentary on risks and returns | Accept. We will try to incorporate that. |
| 16325 | 8 | 40 | | | | For the upper left cell (raw 2, column 2), hydrogen should be included in fuel switch options. | Accept. We will amend. |
| 16326 | 8 | 40 | | | | For the cell (raw 3, column 2), the assumption that electricity can account for 100% of the global transport fuel demand is clearly unrealistic. As described in the IEA Energy Technology Perspectives 2008 (IEA, 2008), long-haul trucks, international shipping, and aircraft are unlikely to operate on electricity. | Accept. The same way as we have amended the text already we will amend table. |
| 16327 | 8 | 40 | | | | For the cell (raw 4, column 2), it should be confirmed that 17.3% share holds for the entire transport sector or the specific transport subsector (e.g., the road transport subsector) in Brazil in 2010. | Accept. It is for the entire transport sector as indicated in the table. |
| 16328 | 8 | 40 | | | | For the cell (raw 3, column 3), the phrase "50% improvement by 2050" should be modified to "50% improvement from XXXX to 2050". | Reject. This is a rough number. It is up to 50% as compared to today. But table |
| 16329 | 8 | 40 | | | | For the cell (raw 4, column 3), the same comment as No. 58 is applied. | Reject. This is a rough number. It is up to 51% as compared to today. But table will be improved anyway. and, in NEW |
| 17724 | 8 | 40 | 16 | | | what is meant by "consciousness"? | Accept. We will modify/clarify text. We will change to "environmental awareness" |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 4423 | 8 | 40 | 17 | 41 | 2 | This paragraph on externalities should join the earlier discussion on externalities. The sentences on p41 could be removed as they repeat the information given previously with regard to externalities from road transport. | Accept. |
| 15843 | 8 | 40 | 2 | | | mitigation options: missing H2 as a fuel. also add smaller/lighter/aerodynamic vehicles as another efficiency option. For Potential: Electric vehicles could only be used for LDVs - not practical for HDVs. 100% of global demand is very unlikely. | Accept. We will amend table. |
| 4299 | 8 | 40 | 3 | | | We should also add the potential about carbon intensity (percentage of GHG emission reduction) to the table8.6.2. Also, please add the potential of GHG reduction by comprehensive four columns. | Accept. We will amend table. |
| 5248 | 8 | 40 | 5 | 40 | 16 | clear reasons for wishing to change existing habits … adapt lifestyles and transport behaviour? What do the authors think rural dwellers do, faced as so many of them are by high transportation costs to meet their basic needs of food, etc? Again, an urban mentality seems to override all in this chapter. | Taken into account |
| 2700 | 8 | 40 | 4 | 40 | 17 | The sub-header 'socio-economic effects' does not fit and neither does the first paragraph of 8.7.1 I would recommend that this introductory paragraph basically focus on externalities, as this is what the following sections are about - not about socio-economic effects. | To take into account. |
| 17888 | 8 | 41 | | | | Transportation affects every aspect of our lives and daily routine, including where we live, work, play, shop, go to school, etc. It has a profound impact on residential patterns, industrial growth, and physical and social mobility. However, uUnsustainable transport leads to an increase in the burden of disease in the short and in the long-term due to air and noise pollution, consequences of reduced physical activity, social disruption, and climate change. | Agree. |
| 17725 | 8 | 41 | 12 | | | Perhaps this section could be reviewed and re-written with input from public health colleagues. There are plenty of recent, primary references on the health effects of vehicle emissions that would be worth citing, for instance. The list reported here of symptoms associated with emissions is a little confusing, and may be inaccurate. Costing the impacts of air pollution, compared with those of congestion, rests on judgements, necessarily arbitrary , about the value of human life. And there is a host of references on the health gains resulting from more active transport, apart from Woodcock and Trubka. | Taken into account |
| 4038 | 8 | 41 | 14 | 41 | 15 | suggested wording: "lead particles in few countries (UNEP 2011) and particulate matter (PM) that includes, among others, black carbon". UNEP 2011=Global Status of Leaded Petrol Phase-Out. United Nations Environment Programme, Nairobi. http://unep.org/transport/pcfv/PDF/leadprogress.pdf (accessed 26 May 2011) | Accept. We will amend. |
| 17726 | 8 | 41 | 34 | | | What has happened historically is that the incidence of road crash injury rises with increasing motorized traffic, but only to a point, and then injury incidence diminishes with further increases in traffic. The peak occurred in Australia around 1970, for example. | Taken into account |
| 8026 | 8 | 41 | 35 | 41 | 35 | Not every year 1.27 mio people are killed - please specify the year for which this was valid | Accept. We will clarify. |
| 8027 | 8 | 41 | 4 | 41 | 4 | For some scientists (e.g. Rothengatter) the costs from congestion are no externalities because they are internalised - the drivers who cause them have the 'damage'. | Accept. We will modify/clarify text. |
| 16330 | 8 | 41 | 6 | 41 | 10 | This sentence should clarify the time point where it holds true, e.g., in 2000. | Accept. We will clarify. |
| 2460 | 8 | 41 | | | | Issues relating to quality of life are mentioned, but not picked up in the text - and there is very little on substitution of trips by technology or through doing many different things on one trip (chaining) - or on the need to keep distances as short as possible - this again relates to the travel time budget where people have substituted faster modes for slower ones - and they can travel further - but the costs are that more CO2 and energy is used. | Reject. Beyond the scope of the section. Refer to sections 8., 8.4, 8.10. |
| 2461 | 8 | 41 | | | | These figures are very dated - can newer ones be used - or a note that most are over 10 years old - there is also dispute over how they have been calculated and whether any transport system allows congestion free travel - what are society's expectations? | Accept. To take into account |
| 8205 | 8 | 41 | 3 | 41 | 10 | The average percentage of traffic time lost accounded to GDP in the world as whole is lacking. | Reject. Out of the scope of this Chapter. |
| 13882 | 8 | 41 | 4 | 41 | 10 | it would be interesting to present in parallel the costs (or benefits) -for individuals and for an economy/society - associated with slower transport modes (walking, cycling, bus, 30 km/h urban zones) | Reject. This is outside the scope of the section |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 2462 | 8 | 41 | | | | See latest WHO (2012) paper on transport and health | Accept. Thanks for the reference. |
| 8206 | 8 | 41 | 11 | 41 | 32 | I do not think there are enough literature reviews in this section (8.7.1.2 Public Health). There are much more other literatures that have not been well exmined. | Reject. It is not the purpose to cover a public health review. We seek to providesome examples of cobenefits of |
| 8374 | 8 | 41 | 11 | | | The impact of road transport on public health in emerging urban areas is not studied much and the impact of cutting emissions on people's health is still under researched. The side-effects of noise and vibrations on human health and the fauna is another area with knowledge gaps. | Reject. This is outside the scope of the section |
| 17956 | 8 | 41 | 25 | | | Are these numbers based on scenarios rather than experience? If yes, simple past is not the appropriate tense. | Editorial |
| 8375 | 8 | 41 | 47 | | | About 10 per cent of global population have a car so there is another 90 per cent that are not car owners (not only the poorest ones). Many of them perhaps some 75 percent are women, children, elderly and so on. PIs re-write this phrase. □ | Noted |
| 2463 | 8 | 41 | | | | Note this is particularly important for young people | Noted |
| 4424 | 8 | 41 | 36 | 41 | 37 | Road traffic injuries kill more people than those who die from those three diseases combined or individually? | Noted |
| 2464 | 8 | 41 | | | | Part of this is the availability of space (in cities) for transport - often very limited (under 10% in most Chinese and other Asian cities) and how this is used - for people, for traffic, for work, for markets, for open space etc - it is an allocation and ownership question - the availability of space is cities for traffic is not mentioned here (cp Ch12). | Adress to coord Ch 12 |
| 4425 | 8 | 41 | 42 | 41 | 47 | I appreciate that the costs associated with land use in car-dominated cities are externalities. However, this section may be placed better when discussing the urban form more generally. | Accept |
| 2701 | 8 | 41 | 42 | 43 | 8 | Note that rail can be a barrier also, but is normally less intrusive than high-speed roads. Airports also consume very large quantities of land. I would recommend a discussion of the land take associated with parking (see the work of Donald Shoup for more on parking). | Noted |
| 15844 | 8 | 42 | 10 | | | why don't more cities use congestion charges? | Refer to 8.10 |
| 4426 | 8 | 42 | 15 | 42 | 21 | The benefits of reducing congestion on human health in general and in Australia in particular were given earlier on p 41, line 31. Most of this paragraph discusses congestion which could be placed with 8.7.1.1. | Accept |
| 16331 | 8 | 42 | 17 | 42 | 21 | The two sentences "Beyond time saving, … due to greater walking (Trubka et al., 2010)" should be deleted or moved from this section, because these sentences don't have a relation with climate change mitigation as a co-benefit and because the latter sentence already appears in Section 8.7.1.2. | Accept |
| 16332 | 8 | 42 | 28 | 42 | 34 | The four sentences "Strategies that target … exacerbated in them (Lindley et al., 2006)" should be moved to Section 8.7.2 because they mention climate change mitigation as a co-benefit. I propose that the co-benefits of climate change mitigation on transport-derived local environmental issues and health effects be mentioned in this section (Section 8.7.3) in the following manner: Takeshita (T. Takeshita, 2012. "Assessing the Co-Benefits of CO2 Mitigation on Air Pollutants Emissions from Road Vehicles." Applied Energy 97, pp. 225-237) concluded that the co-benefits of climate change mitigation on local air pollutants emissions from road vehicles would certainly exist. He estimated that global cumulative emissions of SO2, NOx, and PM from road vehicles during the period 2020-2100 in the 400 ppmv CO2 stabilization scenario would be reduced by 22.1%, 10.8%, and 14.4%, respectively, compared to the no climate stabilization scenario. | Accept |
| 2465 | 8 | 42 | 30 | | | Is this PM25? | Editorial |
| 4039 | 8 | 42 | 31 | | | after "black carbon" add "(UNEP and WMO 2011)". Reference: UNEP and WMO (2001). Integarted Assessment of Black Carbon and Tropospheric Ozone. Available at http://www.unep.org/dewa/Portals/67/pdf/BlackCarbon_report.pdf | Accept |
| 7401 | 8 | 42 | 35 | 42 | 38 | These lines shoul belong to section 8.7.4 discussing transport technologies. | Accept |
| 6388 | 8 | 42 | 35 | 42 | 38 | This paragraph could use editing, both for readability and for content: it's not clear what this paragraph is trying to convey. Also, it seems out of place here. It might be more at home in a section on risks and uncertainties (w.r.t. mitigation options) | Accept. We will rewrite |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 16333 | 8 | 42 | 35 | 42 | 38 | The two sentences "To evaluate … and implementation (Larsen et al., 2009)" should be moved to Section 8.7.4 because this section focuses on the potential risks of biofuels deployment. | Accept |
| 16334 | 8 | 42 | 40 | 42 | 42 | The two sentences "Improving vehicle efficiency … mobility problems (Steg and Gifford, 2005)" should be moved to Section 8.7.3 because they mention environmental effects. | Accept |
| 2466 | 8 | 42 | 41 | | 42 | Word missing here? 'create' | Editorial |
| 8207 | 8 | 42 | 7 | 42 | 7 | Limited literature review: "Creutzig and He, 2009" is highly and sololy refered in this section to discribe China's case. Please review and refer more literature to avoid risk. | Accept. Thanks. We will modify. Agree. MAYBE HAO CAN PROVIDE |
| 8208 | 8 | 42 | 7 | 42 | 7 | "7.5% to 15% of GDP". This number is big. Please refer other literatures (studies) to avoid mistake. | Accept. We will rewrite |
| 13883 | 8 | 42 | | 42 | | This section seems not to fit well. Main points already presented in other well structured sections. | Accept. |
| 2702 | 8 | 42 | 22 | 42 | 34 | This section is repetitive of other parts of the report, suggest it be deleted. | Noted |
| 17959 | 8 | 42 | 23 | 42 | 31 | This paragraph has to my mind rather introductory character to 'climate change mitigation as a co-benefit' and might be placed at the beginning of section 8.7.2. | Accept |
| 8389 | 8 | 42 | 26 | | 27 | This phrase is feeble and will have to re-phrased. Passengers often have to go by buses that are old, insecure and poorly maintained. | Accept |
| 17960 | 8 | 42 | 32 | 42 | 34 | This paragraph has to my mind rather introductory character and would be well suited to be placed before section 8.7.1.1. | Noted |
| 17961 | 8 | 42 | 35 | 42 | 38 | This paragraph rather belongs to the assessment of biofuels and seems somehow misplaced here. | Accept. Agree |
| 2703 | 8 | 42 | 39 | 42 | 46 | This section is not needed. Please delete. | Reject but we will rewrite. Agree |
| 6489 | 8 | 42 | 40 | 42 | 42 | suggest rewording following statement – “Technological solutions, improved fuel efficiency, reduction in noise levels, may improve environmental quality but mobility problems (Steg and Gifford, 2005). “ - to - “Technological solutions, improved fuel efficiency, reduction in noise levels, may improve environmental quality but would increase mobility problems ". and the para needs editing. | Editorial |
| 5289 | 8 | 43 | 17 | | | ADD: Some modern anthropological works suggest strongly that permanent modal change is caused by a rupture (induced or accidental such as car engine failure) in habits, followed by positive reinforcements (from pleasure reading in the TC). Permanent change seems more difficult to achieve without both factors. (A. Rocci. De l’automobilité à la multimodalité ? Analyse sociologique des freins et leviers au changement de comportements vers une réduction de l’usage de la voiture. Le cas de la région parisienne et perspective internationale. Dec. 2007. PhD thesis, INRETS ; S. Vincent. « L’altermobilité : un geste écologique ? » In S. La Branche, Le changement climatique dans tous ses états, Presses universitaires de Grenoble, 2008. | Reject. Out of the scope of this Chapter. |
| 17775 | 8 | 43 | 2 | | | any reference for this statement? | Accept. We wil delete the sentence |
| 6389 | 8 | 43 | 2 | | | It's unclear what this sentence means, and in any case, it's doubtful this claim can be supported as written. | Accept. We will delete the sentence |
| 12905 | 8 | 43 | 31 | | | This paragraph does not seem to be related to the subject of the subsection (8.7.5 Public perceptions) and could thus be deleted or moved to another subsection. | Accept. We will rewrite |
| 2704 | 8 | 43 | 1 | 43 | 36 | The premise of this section is that people face barriers to altruistic voluntary actions to reduce climate change. People do respond to economic incentives, and this should be the focus of any discussion, not bemoaning the fact that people are not altruistic in their behavior. | Accept. We will rewrite |
| 17963 | 8 | 43 | 2 | 43 | 10 | This paragraph discusses structural and psychological and should thus be placed in the barrier discussion in section 8.8.3. | Accept. We will rewrite |
| 8377 | 8 | 43 | 31 | | 33 | Food security and access to medical care and other of the human basic human needs is a core issue in most countries of world. Conditions of life are rapidly changing and the sector of transport will have to respond to the human basic needs of the growing population such as access to food, work, medical care and clean air. Given the importance of the issue and it should be stressed earlier on. | Noted |
| 17964 | 8 | 43 | 31 | 43 | 36 | According to the classification of different types of risks provided by Section 6.7, this paragraph could be moved to the risk section 8.7.4. | Accept. We will rewrite |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 9912 | 8 | 44 | 1 | | | An analysis of 104 empirical studies of innovation to change showed the following barriers, that could refine and structure the discussion of barriers:<br>Issues of resourcing (76%), for instance, “not enough resources” (Post and Altman 1994), “lack of adequate resources such as time and staff” (Adams and McNicholas 2007), limited or no budgeting (e.g. Harris 2000 and Anumba et al. 2006), access to capital and lack of time (Rohdin and Thollander 2006).<br>Issues of capabilities (75%), for instance, “low technology literacy” (Stewart, Mohamed and Marosszeky 2004), “ill-equipped in terms of training and expertise” (Whitaker 1987), “employees are not trained” (Tamimi and Sebastianelli 1998), “lack of understanding” (Waldron 2005), “lack of technical skills” (Rohdin and Thollander 2006), “lack of skill, knowledge and expertise” (Kirkland and Thompson 1999), etc.<br>Issues of communication (64%), for instance, “communication barriers” (Heide, Grønhaug and Johannessen 2002), “communication overload and distortion” (Allen 2002), “lack of communication within the team” (Attaran and Nguyen 1999), “lack of communication among those sharing responsibility for different aspects” (Kunda and Brooks 2000), “poor communication practices that damaged employee commitment to projects” (Jacobs et al. 2006), “tension among departments arising from the incompatibility of actual or desired responses” (Aggarwal 2003), etc.<br>Issues of organizational structure (62%), for instance, bureaucracy (e.g. Molinsky 1999; Borins 2000; Abdul-Hadi, Al-Sudairi and Alqahtani 2005), “salary structure” (Al-Qirim 2007), “complexity, centralization, and formalization”(e.g. Allen 2002), “rigid organizational boundaries” (Butler 2006), “departmental fortresses” (Cicmil 1999), and organizational structure (e.g. Scarbrough and Lannon 1988; McGaughey and Snyde 1994; Yauch and Steudel 2002).<br>Abdul-Hadi, N., Al-Sudairi, A. und Alqahtani, S. (2006): Ten Lessons Learned: Data Warehouse Development Project, California Department of Fish and Game, In: CrossTalk: The Journal of Defense Software Engineering, Vol. 19, Nr. 10, S. 16-20 | Accept. We will rewrite |
| 2771 | 8 | 44 | 4 | 44 | 6 | Many developing countries have showed example on how to decouple crude oil based mobility from wealth generation. Natural gas based traffic in Pakistan (> 80% share in road transport) and Bangladesh (>60%) are two examples. Of methane used in transport over 60 % in Sweden and 100 % in Iceland is renewable. | Noted |
| 16335 | 8 | 44 | 5 | 44 | 5 | Significantly less increases in what? It should be clearly described. | Accept. But we would need literature to |
| 13884 | 8 | 44 | | 51 | | This section need to be linked with chapter 16 "cross-cutting investment and finance issues" in order to avoid overlapping between chapters | Noted. Section has been significantly restructured and rewritten. Section 8.8.2 |
| 13885 | 8 | 44 | | 51 | | Methodological barriers should be discussed: lack of harmonized / standardized methodologies to assess transportation GHG emissions; lack of "Measurable, Reportable, Verifiable" (MRV) procedures; lack of methodology to assess cost-effectiveness of transportation (+land use) package (see Lefèvre, B., 2012, Incorporating cities into the post-2012 climate change agreements, Environment & Urbanization, vol 24(2) ) | Useful reference if transport infrastructure included |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 13886 | 8 | 44 | | 51 | | This section could mention that there are already existing relevant decision-helping tools to take up the climate change challenges in the transportation (+land use) sector : LUTI models (see Wegener, M., Furst, F., 1999, Land use transport interaction : State of theart, Deliverable 2a of the project TRANSLAND of the 4th RTD Framework Programme of European Commission; Masson, S., 2000, Les interactions entre le systeme de transport et systeme de localisation en milieu urbain et leur modelisation, These pour le doctorat de sciences economiques, Mention economie des transports, Dir. Bonnafous, A., Universite´ Lumiere Lyon 2, Faculte de Sciences Economiques etde Gestion; Lefèvre, B., 2007, Long-term energy consumptions of urban transportation: A prospective simulation of "transport - land uses" policies in Bangalore, Energy Policy, Volume 37, Issue 3, March 2009, Pages 940-953) | Agree. It could go in here or in 8.4 |
| 13887 | 8 | 44 | | 51 | | The rebound effect (and the lack of knowledge on its determinants) should be discussed here. See Schipper, Lee & Grubb, Michael, 2000. "On the rebound? Feedback between energy intensities and energy uses in IEA countries," Energy Policy, Elsevier, vol. 28(6-7), pages 367-388, June; Small and van Dender, 2007, Fuel Efficiency and Motor Vehicle Travel: The Declining Rebound Effect, Energy Journal, vol. 28, no. 1 (2007), pp. 25-51. | Agree. Helpful references provided. |
| 3165 | 8 | 44 | 1 | | | Section 8.8 is complicated and unfocused and the table uses a lot of space. It has lots of info but little analysis. integrate with table 8.10.1 | Disagree. Cannot merge with a table just on Integration. Words not ticks are needed to explain Barriers and |
| 2467 | 8 | 45 | | | | This is important - but it gives the impression that options are discrete alternatives - needs more on complementarity, the use of policy packages, and the phasing of implementation. More also needed on the 'soft' measures - car sharing, renting bikes and cars, use of technology for timetables and real time information, company plans, and involvement of all stakeholders in debates over low carbon transport. Also more needed on regulations and standards. | Agree. But this is not the place for 'complementarity', apart from mentioning it perhaps. These comments are also really about Policy section. All actions suggested are in the Table. |
| 6491 | 8 | 45 | | | | 8.8.1 Table , Page 45, Barriers in deployment of electric vehicles and even in discussion 8.3.3.2 Electricity and 8.3.2.1 Electric-drive road vehicles – please do consider the availability of limited electric supply in many developing cities. The blackout is very severe. A good example for this is the battery powered vehicles in Kathmandu. The movement of promoting electric vehicles started in early 1993. However even with great support from the government, the promotion of electric vehicles could not result in huge impact due to load shedding. There is a severe shortage of electricity and though electric vehicles low in number may or may not influence grid calculations (though vehicles are generally charged in night where the peak requirement is high..) but the charging becomes difficult. The other problem is the disposal of lead batteries. | Agree. Will add something. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 17130 | 8 | 45 | | | | COMMENT: Current Table8.8.1 contains technology and practice<br>-Fuel carbon Intensity: Fuel switching<br>3 items (EVs and PHEVs, CNG, Biofuels)<br>-Intensity: Energy Efficiency of Technology<br>1 item (Improve fuel efficient)<br>-Structure: System infrastructure efficiency<br>9 items (6 Modai shift, 2 Urban planning,<br>1 System optimize)<br>-Activity: demand reduction<br>3 items (1 Mobility service substitution<br>2 Behaviour change)<br><br>This table describes many items of modal shift in 'Structure', but just 1 item in 'Intensity'.<br>There should be more practice items such as eco-driving, road infrastructure to improve traffic flow, to improve on-road fuel efficiency as a stock-base of vehicles, but it only refers to new (sales-based) vehicles.<br><br>ADD: Proposed texts in the table will be sent to comments@ipcc.ws3 | Disagree. The items mentioned like Eco Driving are in the Behavior Change section and the road infrastructure to improve fuel efficiency is a highly contentious policy which we have proved to be a myth. Will amend |
| 4064 | 8 | 45 | | | | Item 1. BEV and PHEVs. "Rapid increase in use likely over next decade…" This statement about "rapid increase…" is too optimistic given the significant barriers. | Disagree. It is very rapid so already toned down but Chevron may want it |
| 4065 | 8 | 45 | | | | Item 2. CNG and LNG. "Infrastructure available in some cities can allow a quick ramp-up of CNG and LNG vehicles." This is an optimistic statement. At best, the statement should be restated as "Infrastructure available in some cities can allow a quick ramp-up of CNG and LNG vehicles in the same cities. | Agree. Will change. |
| 4066 | 8 | 45 | | | | Item 3. "Advanced and drop-in biofuels likely to be significantly adopted around 2020, mainly for aviation." We are already in 2012. For aircraft engine manufacturers to accept these new fuels, more testing will have to be done. | Unsure - will need to ask the team. |
| 3589 | 8 | 45 | | | | It is almost impossible to read this table. Introduction in text would be better. Instead of separating the different policies it would be better to show a more pragmatic, realistic approach and to try integrate them. | Disagree. Its not the Policy section. |
| 3838 | 8 | 45 | | | | Last row, 3rd. Column - Check wording. | Seems OK wording to me. |
| 16336 | 8 | 45 | | | | Hydrogen fuel cell vehicles should be included in fuel switching options. Renewable electricity should be modified to low-carbon electricity because BEVs and PHEVs based not only on renewable electricity but also on nuclear-generated electricity and fossil-generated electricity with CCS can be viewed as effective fuel switching options. | Agree. Have changed in 1. |
| 16337 | 8 | 45 | | | | The word "pof" might be "of". | Agree. Fixed. |
| 4300 | 8 | 45 | | | | The external power supply(OLEV : Online Electric Vehicle) and Capacitor(CaEV) should be added in No.1 line (based on renewable electricity). | Noted. Not covered due to space constaints and limited role. |
| 15845 | 8 | 45 | 1 | | | In general this tabel is too long. Also, there is a disconnect between content and text in previous sections. Some content not discussed in text and vice versa, also several hand-waiving statements. Might combine tables 8.6.2 and 8.8.1 and streamline. Specific comments pertain to (row#, column #): (3,2): rapid increase in BEV and PHEV likely only in some OECD countries and China, not rest of world. Be more specific. (3,4) Another barrier are high carbon grids, (4,1): CNG infrastructure is not discussed in text. should add this; (4,5): opportunitie salso include low NG prices in US, HDVs | Disagree. Costs are not the same as Barriers and Opportunities. Will see if more on CNG infrastructure in text is needed. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 5290 | 8 | 45 | 1 | | | To: BFs displacing gasoline, diesel and jet fuel; ADD TO BARRIERS: AND may increase inequalities due to impacts on food prices (the case of corn in Mexico)…<br>To: MS by public transport displacing private motor vehicle use; ADD TO BARRIERS: AND time of transport + public perception of transportation modes<br>To UP by reducing the distances to travel within urban areas, ADD TO BARRIERS: lack of diversity of services and high density centres with low density suburbs;<br>To UP by reducing the distances to travel within urban areas, ADD TO OPPORTUNITIES: Favouring multifonctionality and polycentric urban lay out. | Agree. All suggestions added. |
| 2705 | 8 | 45 | | | | Row 1: Under barriers for BEVs/PHEVs, emphasize the need to decarbonize electric sector. Row 2: CNG/LNG barriers, emphasize potential leakage of CH4 | Agree. Both changed. |
| 15846 | 8 | 46 | | | | (1,3): drop in fuels possible for road too, not just planes | Will check with team. |
| 10771 | 8 | 46 | | | | Which paper by Fuglestvedt et al. 2009 is referred to? I cannot find it in the list of references. | Will find. |
| 3839 | 8 | 46 | | | | 1st. Row, 2nd column. Take care with first generation biofuel market share. Here it is stated as 2%. In the text it is 3% and in Chapter 7 - Energy Systems it is quoted as 5%!!! | Will check and fix. |
| 3840 | 8 | 46 | | | | Please, consider also the possibility of using biofuels and bioelectricity produced from the same feedstock and at the same site. This is the case of sugar cane ethanol. See Pacca and Moreira, 2011. - Pacca, S. and J. R. Moreira, 2011. A Biorefinery for Mobility? Environ Sci Technol. 2011 Nov 15;45(22):9498-505. | Agree. Added this. Agree |
| 17966 | 8 | 46 | | | | According to SRREN, the global share of biofuels on total road transport fuel was 3% in 2009. Has it dropped since? | Will check. Will amend |
| 2706 | 8 | 46 | | | | Row 3: BF barriers, instead of 'environmentally poor', state indirect land use impacts and affect on food prices. Row 4: ICE technology, under barriers list problem of on-road performance not matching test results on fuel economy. | Agree. Added. |
| 13889 | 8 | 46 | 1 | 46 | 1 | Concerning EV technology, no mention is made of emerging new business models, especially those based on sharing (and not on private ownership). It could represent a way to facilitate their deployment. See: Thomas Budde Christensen, Peter Wells, Liana Cipcigan, Can innovative business models overcome resistance to electric vehicles? Better Place and battery electric cars in Denmark, Energy Policy, Volume 48, September 2012, Pages 498-505, ISSN 0301-4215, 10.1016/j.enpol.2012.05.054; Fabian Kley, Christian Lerch, David Dallinger, New business models for electric cars—A holistic approach, Energy Policy, Volume 39, Issue 6, June 2011, Pages 3392-3403, ISSN 0301-4215, 10.1016/j.enpol.2011.03.036; Alessandro Luè, Alberto Colorni, Roberto Nocerino, Valerio Paruscio, Green Move: An Innovative Electric Vehicle-Sharing System, Procedia - Social and Behavioral Sciences, Volume 48, 2012, Pages 2978-2987, ISSN 1877-0428, 10.1016/j.sbspro.2012.06.1265. | Agree. Have added. |
| 15847 | 8 | 47 | | | | (2,4) and (3,4): weather (e.g., cold climate?) and urban vs country environment can affect cycling and walking as well | Agree. Added climate. |
| 3421 | 8 | 47 | 6 | | | system infrastructure, cycling infrastructure: cycling requires physical measures to create perceived cycling safety and to take these measures in a coherent, integrated way to show that cyclists are being taken serious. This comprises more than infrastructure; it is about creating a cycling system, a network that is safe, direct, comfortable, correctly signed and contains parking facilities. Linking to/integrating with public transport certainly is an opportunity to be mentioned in order to create a serious alternative to private car use. See the Cycling-Inclusive Policy Development - A Handbook. Interface for Cycling Expertise, GTZ, April 2009 http://www.bikepartners.nl/index.php?option=com_content&task=view&id=166&Itemid= | Agree. Added. |
| 3422 | 8 | 47 | 7 | | | the same requirements of safe, direct, comfortable, correctly signed and short waiting times apply to walking. Also, tapping the potential of integration with public transport is an opportunity. Www.livingstreets.org.uk/expert-help/resources/ | Agree. Added. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 2707 | 8 | 47 | | | | Row 6: Opportunity for cycling, source of growth is rapid deployment of city-bike sharing systems. Row 7: Walking, long-term, I would not say 'significant' displacement of MV trips, much of this depends on transit availability and is very dependent on car ownership levels (reference: Sehatzadeh, Bahareh, Robert B. Noland, and Marc D. Weiner, "Walking frequency, cars, dogs, and the built environment", Transportation Research A: Policy and Practice, 45, (2011), 741-754.) | Agree. Added bikeshare. Disagree on walking, it can be significant. |
| 5209 | 8 | 48 | | | | In line 10: why not add that high speed rail also competes with private car, which is does efectively and would, if high speed rail is well integrated in conventional rail and urban public transport, offer a door-to-door alternative for private car use. | Agree. Changed. |
| 4301 | 8 | 48 | | | | As the transport technology or practice of modal shift of freight, I propose adding electric cargo train system or external power supply convoy. | Agree. Added. Like 1072 not clear what is being proposed here. A large proportion of railfreight already moves on |
| 2708 | 8 | 48 | | | | Row 8: Success of TOD highly dependent on good quality transit. Row 9: Parking, barrier is that planning codes typically require too much parking (see Donald Shoup). Row 10: Plane vs. Rail: there was no discussion of safety as a barrier in text - what evidence is there that HSR has a safety problem? | Agreed to all three. All fixed. |
| 15848 | 8 | 49 | | | | (5,2):show some data on traffic density or at least a reference | Agree. Added eg London. |
| 2709 | 8 | 49 | | | | Row 13: Freight opportunity - note that private sector welcomes efficiency improvements. Row 14: Communications, note that instead of communciations substituting for transport it can induce new trips (see work or Mokhtarian and colleagues). This issue was not discussed in text. | Agreed. Changed. Point about private sector welcoming efficiency improvements hardly needs stating. Links between communication and transport could be elaborated. need |
| 2432 | 8 | 5 | | 6 | | A general point on the executive summary and Ch8 is that scale of the problem being faced in transport with respect to CO2 - the growth in travel that is taking place, the time needed for real reductions, the lack of progress made so far (the tenor is too optimistic about the future, particularly when past progress is reviewed), the inertia and huge costs sunk in the current mobility system, and the difficulty of implementation due to institutional problems - lack of powers and too many intrerested parties. | Good point for 8.1 |
| 16266 | 8 | 5 | 10 | 5 | 12 | Schafer & Victor (A. Schafer and D.G. Victor, 2000. "The Future Mobility of the World Population." Transport Research Part A 34, pp. 171-205) projected a continuous increase in transport demand in all OECD regions through to 2050. The phrase "be reversed" might be overstatement. | Useful comment but reference too old. |
| 8863 | 8 | 5 | 14 | 5 | 20 | It is not clear how the list achives 'Transport mitigation measures' . New technologies etc can achieve reductions in emissions via policies that enforce them. I think this phrase should be replaced by 'mitigation of GHG emissions in the transport sector' or similar. Also, point 1) 'deploying new technologies for low-carbon fuels' seems to exclude just low-carbon fuels and just new carbon fossil fuel based technologies. It might be better to say 'deploying new technologies AND/OR low-carbon fuels' | Will amend |
| 11597 | 8 | 5 | 14 | | | delete: "measure" | Accept |
| 3985 | 8 | 5 | 14 | 5 | 21 | Add "GHG" in between "Transportation Mitigation" otherwise is sounds like transport demand reduction | Accept |
| 15763 | 8 | 5 | 15 | | | There is a general over-confidence by low carbon fuel standard supporters and advocates that low carbon fuels are just around the corner. On a global basis, one can't assume that Brazilian sugarcane ethanol will be available for everyone. | Low C fuels can also include green electricity and hydrogen |
| 14740 | 8 | 5 | 15 | 5 | 17 | Please order measures along impact/viability: 1st efficiency and technology switch, 2nd fuel switch | Accept |
| 17120 | 8 | 5 | 18 | 5 | 20 | DELETE: modal shift and the reduced need for motorized transport relative to a reference case. [High agreement; robust evidence]REVISE TO: well harmonized multi-modal transport. | Declined. Phrase does not include reduced demand |
| 11598 | 8 | 5 | 2 | 5 | 13 | I think it would be fair to highlight as follows: "The biggest emitters of GHG in the transport sector are LDV, trucks, aircraft and marine ships." | Re-ordered |
| 15803 | 8 | 5 | 2 | 5 | 3 | statement of doubling is too vague. Should give range based on say 10-50-90% probability | Details in main text. Usage of doubling is |
| 6473 | 8 | 5 | 2 | 5 | 4 | The argument on emissions becoming double by 2035 has not been provided in the chapter | Agree. Text modified |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 2258 | 8 | 5 | 2 | 5 | 4 | There is no evidence that emissions of greenhouse gases hav any harmful effect on the climate. This information is thus not a cause for concern so the whole Chapter is unnecessary. It is also surprising that while the supposed, unproven theory relies on changes in the atmospheric concentioin of greenhouse gases. you seem here to be exclusively concerned with emissions. which are not necessarily related to concentrations | Rejected. This comment refers to content that is covered by IPCC Working Group I. |
| 14741 | 8 | 5 | 21 | 5 | 41 | The distinction in demand and supply is a bit odd. I would recommend to follow the scheme: 1) Vehicle technology (i.e. efficiency improvement, technology switch - reducing energy intensity); 2) Fuel switch (i.e reducing carbon intensity) 3.) Avoid/Shift strategies (i.e. behavioural measures to reduce activity) | Will amend to match ASIF structure |
| 5182 | 8 | 5 | 22 | 5 | 35 | Transport behaviour is very much shaped by infrastructure, transport system speeds and prices. Supply indeed needs to become more efficient with energy and using lower carbon energy sources, but the main challenge is to change the infrastructure. If you want people to use rail on medium distances than invest in rail and not in additional slots on airports. Strong example is the fast change from air to rail on the Madrid-Barcelona route, that went far beyond scientific prognoses of an absolute maximum of 35% between rail in rail+air market (Roman, C., Espino, R., & Martin, J. C. (2007), Competition of high-speed train with air transport: The case of Madrid-Barcelona. Journal of Air Transport Management, 13, 277-284) (while it reached already 60% by 2011 just after opening of the line (McWhirter, A. (2011). No pain by train. Available at: http://www.businesstraveller.com/archive/2011/may-2011/special-reports/no-pain-by-train#). So it really is important to add supply on the level of infrastructure choices as well. The very large investments in high speed rail in Japan, China and Europe have strong impacts on modal split and carbon emissions. Furthermore there is an important link between electric rail and supply of electricity, which means that sustainable energy production directly affects the emission factors of rail (e.g. see Åkerman, J. (2011). The role of high-speed rail in mitigating climate change - The Swedish case Europabanan from a life cycle perspective. Transportation Research Part D: Transport and Environment, 16, 208-217). | Agree Modal shift driven in part by investment |
| 3986 | 8 | 5 | 23 | 5 | 24 | The suggestion of CNG as a lower carbon transportation fuel needs qualifying. CNG from hydrofracturing may not be significantly lower than gasoline. | Amended |
| 17124 | 8 | 5 | 24 | | | ADD: Good quality of fuel (e.g. lower sulphur in the fuel) is critical for advanced powertrain with aftertreatment system. High sulphur level in the fuel may penalize fuel economy penalty to regenerate the catalyst.<br>INBETWEEN: redece emissions. & New technologies<br>(UNEP. The Role of Low Sulphur Fuels. Available at: http://www.unep.org/transport/pcfv/PDF/SulphurReport.pdf) | Too detailed or Exec Summary. Add to 8.3.3 |
| 16267 | 8 | 5 | 24 | 5 | 24 | It is better to modify the phrase "such as to compressed natural gas (CNG)" to "such as to biofuels" because substitution of biofuels for petroleum products is easier to implement and can reduce larger amount of GHG emissions from the transport sector. | Some debate on biofuel emissions covered elsewhere - but CNG should be mentioned. Agree. |
| 15764 | 8 | 5 | 26 | | 31 | Some of these technologies are currently very expensive. When the business model for developing countries is the Tata Nano, it's hard to envision a lot of expensive, advanced technologies for non-OECD countries. This is especially true for areas that have price controls on gasoline and diesel. | Too detailed for Exec Summary. Add to 8.3.3 - fair comment. |
| 17121 | 8 | 5 | 26 | 5 | 28 | ADD: Reduced energy intensity on road can be achieved by eco-driving and improved traffic flow. AFTER: "Reduced energy intensity can result from 26 improved designs of internal combustion engines, power trains and vehicles, including the use of 27 new lightweight materials and better aerodynamics." [8.3.5] | Point included |
| 2725 | 8 | 5 | 28 | 5 | 31 | It is better to say: "Sustainable renewable energy based propulsion systems (such as battery electric, hydrogen and methane fuel cell, and various heat engine drive-trains) coupled with low-CO2 energy carriers (electricity, methane and hydrogen produced from renewable energy sources) can reduce lifecycle greenhouse gas emissions almost to zero." All these already exist in the market. | Not only renewable energy for low C carriers. |
| 18898 | 8 | 5 | 28 | 5 | 29 | It is my understanding that with the e-bikes in China this is actually not anymore a matter of the future but already practiced today. Please consider changing taking this into account. | Agree. Reworded. I think the original sentence "in the longer-term..." is a |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 16268 | 8 | 5 | 29 | 5 | 29 | It is better to modify the phrase "coupled with low-CO2 energy carriers (electricity, methane and hydrogen produced from low GHG sources)" to "and/or low-CO2 energy carriers (electricity and hydrogen from low GHG sources and biofuels)". | Agree. Amended |
| 16264 | 8 | 5 | 3 | 5 | 3 | According to the IEA Energy Technology Perspectives 2010 (IEA, 2010, p. 73), the share of the transport sector in the global CO2 emissions is projected to be almost unchanged from 2030 to 2050 in the Baseline scenario, although it is projected to increase from 2030 to 2050 in the Blue Map scenario. A further explanation should be added to this view. | Agree. Reworded. Scenarios covered in Ch 6. |
| 15862 | 8 | 5 | 32 | | | "iso-butanol drop-in fuel for aircraft" – hard to see this happening since isobutanol has a lower energy density than jet fuel | Agree, But not necessarily for aircraft |
| 15765 | 8 | 5 | 32 | | 33 | Is iso-butanol truly a drop-in fuel for aircraft? Seems like there would have to be a lot of work done before that would be approved for use. Plus, the lower energy density relative to jet fuel would likely be considered a significant disadvantage. | Deleted, |
| 17122 | 8 | 5 | 32 | | | DELETE: such as iso-butanol ;<br>REASON: Iso-butanol is not drop-in fuel. A researcher has indicated that blend of ethanol (component in existing fuel) and butanol may cause dry corrosion of aluminum parts in the fuel line. (Takashi Tchida (2004), Corrosion Engineering, Sangi Co. Ltd. 53, 44-49) | Deleted, |
| 5243 | 8 | 5 | 32 | 5 | 32 | Conventional biofuels are already straining the global food system and prices. Do not encourage. | Noted. There are different positions on this. The role of biofuels is covered thoroughly in Ch.11 respective the annex |
| 2803 | 8 | 5 | 32 | 5 | 32 | The perspective regarding biofuels is a very controversial issue (as discussed in page 24 line 26-27) and does not seem to be relevant to be discussed under [High agreement, robust evidence]. | This high agreement statemrnt was just for first paragraph - but point taken. |
| 5391 | 8 | 5 | 32 | | 35 | variations always exist; statement lacks information without some qualifier | Agree, Reworded |
| 16269 | 8 | 5 | 32 | 5 | 32 | It is better to modify the phrase "including "drop-in" fuels such as iso-butanol" to "including microalgal biofuels and "drop-in" fuels such as iso-butanol". | Accept |
| 11599 | 8 | 5 | 36 | 5 | 41 | You mention only costs, but e.g. infrastructure provisions (e.g. cycle paths) as well as non-provisions (e.g. no parking spaces) has also decisive impact. Please add and balance. | Accept |
| 11600 | 8 | 5 | 36 | 5 | 41 | Please add demand side measures on freight transportation. | Already included. in the ASIF framework that we have adopted, A stands for avoiding transport, but I would agree that the chapter does not adequately explore the various ways in which companies and economies decouple freight demand from output. Reference should be made, for example, to the |
| 5244 | 8 | 5 | 36 | 5 | 41 | Here, as elsewhere, there is no mention of the challenges for rural populations. Nor is there any recognition of the challenges of rural dwellers in those latitudes (or heights) where inclement winter weather conditions require for safety reasons 4X4 vehicles or the additional costs of winter tyres. One gets the impression that the authors are all from comfortable urban situations. | Accept |
| 16272 | 8 | 5 | 36 | 5 | 37 | Schafer & Victor (2000) indicate that modal shares are determined by non-political factors, such as fixed travel time budget, path dependence, and land-use patterns. Furthermore, Schafer & Victor (A. Schafer and D.G. Victor, 1999. "Global Passenger Travel: Implications for Carbon Dioxide Emissions." Energy 24, pp. 657-679) indicate that if policy advanced or retarded the natural selection of modes, the transport system would recover its natural dynamics over time. Therefore, I doubt if policy interventions in modal choices could bring about a significant reduction in GHG emissions from the transport sector, especially from a short- to medium-term perspective. | Accept but too old references |
| 8864 | 8 | 5 | 38 | | | (number of journeys (km or t-km))' - this needs to be corrected. As it stands it has almost no meaning. | Accept |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 5183 | 8 | 5 | 38 | 5 | 38 | There is ample evidence that we should not aim at reducing the number of trips, but at reducing average distance per trip. So please replace "(number of journeys (km or t-km))" with "(p-km and t-km)". In most transport modes the amount of emissions is equivalent to amount of p-km and t-km not the number of trips itself (only in aviation shorter distances might increase average emissions per pkm/tkm). Furthermore, reduction of the number of trips would directly affect the mobility of people and have strong negative impacts on economy and social aspects, while the distance at which we do our shopping, have our holidays and choose to live from our work depend very much on the speed of the transport system and to a lesser extend the cost of travel. See e.g. Banister, D. (2011). The trilogy of distance, speed and time. Journal of Transport Geography, 19, 950-959.<br>Hupkes, G. (1982). The law of constant travel time and trip-rates. Futures, 14, 38-46.<br>Peeters, P., & Landré, M. (2012). The emerging global tourism geography – an environmental sustainability perspective. Sustainability, 4, 42-71.<br>Schäfer, A. (1998). The global demand for motorized mobility. Transportation Research - A, 32, 445-477.<br>Schäfer, A. (2000). Regularities in travel demand: an international perspective. Journal of Transportation and Statistics, 3, 1-31.<br>Schäfer, A., & Victor, D. G. (1999). Global passenger travel: implications for carbon dioxide emissions. Energy, 24, 657-679.<br>Zahavi, Y. (1976). The Unified Mechanism of travel (UMOT) model. report to Mr. Harold B. Dunkerley. Available at: http://www.surveyarchive.org/Zahavi/TheUMOTModel.pdf.<br>Zahavi, Y., & Lang, P. J. (1974). Traveltime budgets and mobility in urban areas. In. Washington DC: US Department of Transportation. | Accept. Some evidence trips being avoided due to combining trip objectives, internet shopping, video conerencing ,use of social media. |
| 8039 | 8 | 5 | 38 | 5 | 38 | please add after '(...) of journeys (km or t-km)': "by making them more attractive through infrastructure improvements and improving their quality". | This wouldn't reduce distance travelled. |
| 17706 | 8 | 5 | 38 | | | I suggest the balance of the executive summary deserves re-thinking. To my eye, the influence of the transport environment on how people get around is under-sold. There is mention of infrastructure elsewhere in the summary, but the sentence on behaviour change does not mention what is obvious - what people choose will depend on what is available. Price signals are important, and might be applied in the short-term, but operate at a superficial level. If radical changes are required, then surely substantial changes will be needed in urban design, land use and regulation. | Accepted. Reworded |
| 18899 | 8 | 5 | 38 | | | "t-km": Please define. | Accept |
| 15766 | 8 | 5 | 39 | | | Education can only do so much. If there is not a tangible value proposition for the consumer, it's not going to happen. | Agree |
| 12879 | 8 | 5 | 39 | | | Not the costs of transport tend to be inelastic, but transport demand tends to be inelastic with respect to variations in costs. Change formulation. | Accept |
| 5392 | 8 | 5 | 39 | | 39 | it is the demand for transport, not its costs, that are inelastic | Accept |
| 8360 | 8 | 5 | 41 | | | Price signals, demand management fixes and so on will not be enough to manage travel demand. Infrastructure for non-motorised and other modes of mobility will have to be built as well. | Accept |
| 2804 | 8 | 5 | 42 | 6 | 15 | This paragraph only highlights "short term and cost effective mitigation strategies (p5 line 42-44). However, also important in this section are "the technologies which require RD&D investment but also expenditure on infrastructure" - which we can call "long-term measures". Statement on the long-term measures should be also highlighted in bold. | Accept |
| 17761 | 8 | 5 | 44 | | | before suggesting mitigation measures, indicate how much reduction are we talking about | Accept |
| 7397 | 8 | 5 | 45 | 5 | 46 | This statement is very critial to be included in the excutive summary and the evidence provided in the chapter does not really support the statement. | Accept. I agree….we haven't done a great job of establishing $/ton values in |
| 15767 | 8 | 5 | 45 | | | What is considered "substantial"? Short-term will be easier than long-term, barring a significant breakthrough in technology (batteries, fuel cell technology, etc.) | Accept |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 15861 | 8 | 5 | 45 | 5 | 47 | “The potential is substantial" what does this mean? Quantify! | Accept |
| 17123 | 8 | 5 | 45 | 5 | 46 | DELETE: and at relatively low mitigation costs ($/t CO2).<br>REVISE TO: however, incur additional costs and might not be a viable in every county.<br>(McKinsey & Company (2009). Roads toward a low-carbon future: Reducing CO2 emissions from passenger vehicles in the global road transportation system, p.10 -11. Available at: http://www.mckinsey.it/idee/practice_news/roads-toward-a-low-carbon-future-reducing-co2-emissions-from-passenger-vehicles-in-the-global-road-transportation-system.view) | Accept |
| 17762 | 8 | 5 | 46 | | | how much is "low mitigation cost" | Will quantify. good question |
| 11601 | 8 | 5 | 46 | 5 | 46 | What's a low carbon price? | Will quantify "low mitigation costs". good |
| 16270 | 8 | 5 | 46 | 5 | 46 | The phrase "at relatively low mitigation costs ($/t CO2)" should be deleted. This is because the IEA Energy Technology Perspectives 2008 (IEA, 2008, pp. 80-82) estimated that the marginal CO2 emission reduction costs might be higher for the transport sector than for the other sectors, and because the IEA World Energy Outlook 2010 (IEA, 2010, pp. 54) indicated that the transport sector is more costly to cut CO2 emissions than in most other sectors. | Will amend accordingly. Because of the high price of transport fuel, much mitigation can be accomplished at low cost IF one uses a low discount factor to account for fuel savings….but things get pretty uncertain at higher levels of |
| 16271 | 8 | 5 | 46 | 5 | 46 | The phrase "Incremental developments" should be described more clearly. I can't understand what this means as it is. | Amended. |
| 13210 | 8 | 5 | 6 | 5 | 6 | Are not some mechanical actions also energy consuming, e.g. for crushing ? | Not on page quoted. Not clear |
| 16265 | 8 | 5 | 9 | 5 | 9 | These transport sub-sectors were also major emitters of NOx, a precursor of ozone (T. Takeshita, 2012. "Assessing the Co-Benefits of CO2 Mitigation on Air Pollutants Emissions from Road Vehicles." Applied Energy 97, pp. 225-237). | Section 8.1 to be amended |
| 15859 | 8 | 5 | 1 | | | The Exec Summary should be more quantitative and succinct. For example, include some quantitative results, via a table or chart, such as $/tonne CO2 mitigation costs, well-to-wheel gCO2/MJ or gCO2/passenger km-traveled intensities (e.g., results from sections 8.6.3, 8.6.4). Might consider using the “bullet point” format used in Chap. 10. | Agree needs to be more quantitative but data limited. Format of exec summaries to be determined. Tables not usually included. probably one of the reasons we |
| 2651 | 8 | 5 | 2 | 5 | 2 | The doubling of transport emissions by 2035 is presumably absent any mitigation policies beyond what is currently in place. It should be noted that this growth trajectory is absent future policy intitiatives. | Amended. |
| 2652 | 8 | 5 | 23 | 5 | 24 | CNG may be a bad example to use, given some recent suggestions that methane leakage from fracking is potentially quite bad. Suggest the example of CNG not be highlighted in the text of the executive summary. | Amended. handle this with an "if fuel cycle emissions can be appropriately |
| 2653 | 8 | 5 | 39 | 5 | 39 | "costs of transport tend to be relatively elastic". It is not the cost response rather the response of consumers to price. Suggest rephrasing as: "response to price change is relatively inelastic". | Amended. |
| 2806 | 8 | 5 | 1 | 7 | 21 | Several terms are used after "mitigation", such as, "mitigation measures", "mitigation strategies", and "mitigation actions." Please make sure if they are properly defined and consistently used throughout the chapter. | Noted. |
| 3461 | 8 | 5 | 5 | 5 | 9 | Include the annual growth rate observed from AR4 and AR5 regarding the GHG transport emissions | Will quantify |
| 2710 | 8 | 50 | | | | Row 16: Does this education include eco-driving initiatives? | Yes |
| 12906 | 8 | 51 | 11 | | | The section on Financing low carbon transport looks rather short and is mainly dealing with funding - and not with financing. The latter may include transport- and energy-realted taxes | Disagree. Value capture is financing. Could be longer…. |
| 6492 | 8 | 51 | 12 | 51 | 20 | The section needs to describe the local government financing for good low carbon transport instead of only looking at international mechanisms. By promoting cobenefits, the low carbon transport can be financed by the same means as traditional financing of transport projects. For promoting low carbon transport, not only projects which reduce emissions needs to be promoted but the projects which increase emissions when built needs to be stopped. | Agree. Added a sentence. |
| 2468 | 8 | 51 | 16 | | 18 | These figures need updating - there are more transport CDM projects now (still mainly BRT). | OK |
| 13697 | 8 | 51 | 16 | 51 | 16 | Share of CDM projects in transport sector should be updated according to UNEP Riso Centre: CDM pipeline, download at www.cdmpipeline.org, updated monthly | Have looked them up and changed text. Still very low % |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 11185 | 8 | 51 | 16 | | | Now more than 3 transport CDM projects are registered. | OK |
| 5411 | 8 | 51 | 16 | | 20 | It is hard to argue that the Global Environment Facility and the World Bank's Clean Technology Fund have played a crucial role in climate change mitiation…..so it seems a bit of overkill to argue that, unless these specific funds start to focus on transport, then transport uniquely will not reduce its carbon emissions and will become the major carbon emitter while the other sectors benefit from these terrific initiatives. Tone this stuff down. | Disagree. CDMs have saved 1 billion tones of ghg and the others all matter. |
| 15849 | 8 | 51 | 20 | | | 80% transport-related GHGs seems too high. Cross check reference with others (e.g., IEA) | Will check. |
| 13906 | 8 | 51 | 21 | 51 | 22 | Regarding NAMA for Transport, see Lefevre, B., 2012, Incorporating cities into the post 2012 climate change agreements, Environment & Urbanization, Vol 24(2): 1–21; Bakker, S., Huizenga, C., 2010, Making climate instruments work for sustainable transport in developping countries, Natural Resources Forum, Vol 34, Issue 4, pages 314 - 326; Huizenga, Stefan Bakker, S., 2010.<br>NAMAs in the Transport Sector: Case Studies from Brazil, Indonesia, Mexico and the People's Republic of China,IDB Publications 8603; Dalkmann, H., Binsted, A., Lefevre, B., Huizenga, C., Avery K., Bongardt, D., 2011, Cancún can, can land transport?, Bridging the Gap, GIZ; | Added Lefevre reference. Thanks. |
| 5412 | 8 | 51 | 26 | | 30 | Revenues around a rail station may well go up, but this means little unless the TOTAL land value goes up….otherwise, it's just a redistribution…..welcome, but the local governments don't get a windfall. | Disagree. They are extra value due to agglomeration economies. |
| 15850 | 8 | 51 | 28 | 51 | 30 | Not clear why owners would want to pay higher taxes to live right beside a rail system that generates more noise and congestion in their backyard???? Seems like this would decrease property values. Unless you are referring to urban homes served by rail within a walking distance of say 1-2km? | Added 'near to' instead of 'around'. Can be very close as well. |
| 4427 | 8 | 51 | 3 | 51 | 6 | The technology-based solutions may face barriers of availability of capital and unwillingness to pay. These barriers exist in both developed and developing regions. Key examples are the slow adoption of HEV and dithering on EV rollout in developed world LDV fleets. | Agreed. Added. |
| 11186 | 8 | 51 | 30 | | | Land adjustment also contributed to capital investment to support mass transit in Japan (Tsukuba Express Rail). | Agreed. Added. |
| 5413 | 8 | 51 | 35 | | 38 | this list is a list of solutions, not barriers | Disagree. They are policies which illustrate institutional barriers. |
| 5291 | 8 | 51 | 38 | | | ADD: Also included sectorial, are a non transversal approach to urbanism as well as economic and political perceptions of the costs of reducing car mobility. | Don't understand the english. |
| 4068 | 8 | 51 | 42 | 51 | 43 | This new world economy is described in glow terms but seems more like a scenario. | Disagree. Widespread acceptance |
| 5414 | 8 | 51 | 42 | | 47 | this is far too promotional, esp. the OECD cite | Ditto (i.e. as in comment answer no 4068). Have added ADB new report. |
| 2469 | 8 | 51 | 48 | | | The decoupling argument is central to sustainable transport - and seems only to occur here. | Agreed. |
| 7402 | 8 | 51 | 11 | 51 | 33 | Note that in the context of green growth and greening the transport sector emphasis has to be on low emissions rather than only low carbon | Agreed. Changed. |
| 13893 | 8 | 51 | 11 | 51 | 33 | This section schould emphasis the key importance of redirecting investments (instead of looking for new money). See Dalkmann, H., Sakamoto, K., 2011, Transport, Investing in energy and resource efficiency, UNEP Green Economy Report | Agreed. Added a sentence. |
| 13904 | 8 | 51 | 11 | 51 | 33 | On current state of (Public + Private // National + International) financial flows see Sakamoto, K., Dalkman, H., Palmer, D., 2010, A paradigm shift towards sustainable low-carbon transport. Financing the vision ASAP, ITDP | Grey literature. |
| 13905 | 8 | 51 | 11 | 51 | 33 | This section should emphasis the necessity 1) to analyse the impacts of financing decisions, 2) to reallocate budget and redirect investments (instead of looking for new money) towards sustainable transportation. See Sakamoto, K., Dalkman, H., Palmer, D., 2010, A paradigm shift towards sustainable low-carbon transport. Financing the vision ASAP, ITDP | Ditto. |
| 2711 | 8 | 51 | 11 | 51 | 33 | Discussion is very much focused on developing countries. Would be good to say something about how US, EU, and Japan finance more sustainable transport - what are political difficulties?, etc. | Disagree. Value capture section is developed world. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 13888 | 8 | 51 | 24 | 51 | 24 | "ADB and eight other big banks pledged to invest $175billion for the creation of sustainable transport worldwide" needs reference | Agreed. Added. |
| 2712 | 8 | 51 | 38 | 51 | 39 | Where is the evidence that 'auto dependence' is built into a culture? I see this much more as being an outcome of economic incentives. | Huge evidence. Just look at TV ads. |
| 2713 | 8 | 51 | 42 | 52 | 4 | This paragraph and discussion of a 'Sixth Wave' strikes me as highly speculative, suggest this be deleted in the name of brevity. | Disagree. Its critical. |
| 17776 | 8 | 52 | | | | there is a loose sentence at the end | Line is in 8.9 should be fixed. |
| 2471 | 8 | 52 | 18 | | 27 | There are two sets of figures here - one the 4x increase and the other a total decarbonisation of transport by 2070 - both need very careful presentation as it is not clear how they have been arrived at - and whether they both encompass the expected increase in travel over that period - or whether the numbers are based on current levels of travel - I have not seen any figures to suggest that transport can be decarbonised by 2070 - even if we just consider the use of carbon in fuel - let alone the embedded carbon in the system and vehicles and the carbon costs of manufacturing the fuel to be used. Do these figures include aviation (and shipping)? | Text says sector "could be practically decarbonised by 2070", but comment is accepted, a more direct language will be attempted and clear specification that this is a conclusion obtained from top-down scenario analysis. Should be considered |
| 4069 | 8 | 52 | 20 | 52 | 26 | The assessment that 2 degree C is no practical to achieve in this century should be made clear here and in Chapter 6. | Reject. Both Chap 6 and 8 are working on the assumption that a stabilization |
| 18911 | 8 | 52 | 23 | | | "the sector could be practically decarbonised by 2070": Looking at the ranges in Figure 8.9.1 it seems that there are only very few sceanrios that show decarbonization at that time, so it seems that it would be good to put this statement in context - particularly as other parts of the chapter state that decarbonizing the transport sector is more challenging that other sectors. So increasing the coherency would be good. | Accepted text will be revised. ….the path to total decarbonization of this sector is pretty hairy….especially from a full lifecycle view…you have to do things like adding CCS to biomass fuel production, getting electricity completely off even natural gas, etc…..and make amazing progress in a variety of fields…..quite unlikely, I suspect. of course it does, just from simple |
| 4070 | 8 | 52 | 25 | 52 | 26 | Also, this should be a key message. "Top-down scenarios analysis demonstrates that a transformational pathway to achiee a stabilization at 2 degrees Celsius relies heavily on transport sector mitigation. | Agree. No stabilization path to 2C can be envisioned without major mitigation from transport (proportion will need to be |
| 15851 | 8 | 52 | 27 | | | dangling sentence… | Accepted. Will be corrected. |
| 5343 | 8 | 52 | 27 | 52 | 27 | Sentence incomplete. | Accepted. Will be corrected. |
| 11650 | 8 | 52 | 5 | | | Whole section. Uherel et al, AtmEnv 44, 2010 made a good summary of transport scenarios and impact on GHG. Please take note and reference. | Accepted. Thank you for this reference. |
| 7403 | 8 | 52 | | | | Add a subsection on synergies related to transport impacts on other sectors growth and mitigation opportunities | Interesting suggestion.Several cross-cutting discussions between chapters are attempting this type of discussion (e.g. Impacts of Tourism) potentially seeking to understand synergies. Some key results may be reflected in here but most likely in the other chapters/sectors. No separated section is planed for |
| 7406 | 8 | 52 | | | | Assess consistency between top-down and bottom-up results and how down-scaling is achieved in the reported results from the IAM models | Accepted. This work is under way should be reflected in SOD |
| 2470 | 8 | 52 | | | | This Section is too weak as the scale and speed of change needed in transport to meet (or help meet) CO2 targets is not here - the approach suggested is too dirigiste - it needs a strong introduction | Accepted. Introduction can better reflect on the scale and needed speed of |
| 3164 | 8 | 52 | 1 | | | I though section 8.9 could be compressed and put up front with other discussions of drivers. | Rejected. Section 8.9 cannot be replaced within the Chapter. Under |
| 2714 | 8 | 52 | 5 | 52 | 6 | Title of sub-section: I found this type of terminology confusing and loaded with jargon. Please simplify title of sub-section. How about simply: "Pathways to Sustainability". | Rejected.Section 8.9 Title is fixed for all Chapters. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 2472 | 8 | 53 | | 54 | | The 3 key figures here are also confusing - are they linked or independent of each other? The first 2 seem to relate to the 3 scenarios, but the 3rd talks only about transport futures (high technology, high efficiency and the middle pathway). The credibility of this chapter is reliant on this section and it needs to be totally transparent in what it is saying. Also there is the question of the relative contributions (to what target) that can be made by less travel (not really discussed), shorter journeys (not really discussed), urban form and modal shift (discussed to some extent) and technological change. | Accepted. A renewed discussion on existing and top down scenarios is to be approached for the SOD. Agree new info should be added. important comment….how credible are these scenarios…are the scenarios from the first two figures simply normative, i.e. |
| 15852 | 8 | 53 | 8 | | | 2011? Did you mean 2100? | Accepted. Typo it should be 2100. or 2050…clearly one or the other, probably |
| 3841 | 8 | 53 | 8 | 53 | 8 | Replace "kilometers travelled by 2011" by "kilometers travelled by 2050". | Accepted. It should say "by 2100" |
| 5210 | 8 | 54 | 1 | 54 | 3 | Suggestion to make a separation between physically impossible solutions, economically unlikely ones and pure political choices. I feel that building certain infrastructure is 90% a political choice, a choice that can not really be substantiated by economic or social research. Why chose Switzerland to go for its highly efficeint rail system and did Brazil braek it down? Why is China investing heavily in high speed rail and USA not at all? Seems mainly politically founded, not environmentally or even socio-economically. | Interesting suggestion. A wild card type of scenario, maybe possible as scenario methodologies evolve. However, difficult to see it in practice for this report. Agree. a terrific thing if we could do it….but the |
| 11652 | 8 | 54 | 20 | 55 | 10 | Uherek et al, AtmEnv 44, 2010 made a good summary of transport scenarios and impact on GHG. Please take note and reference. | Accepted. Thank you for this reference. OK |
| 3842 | 8 | 54 | 26 | 54 | 26 | Replace "switching on a massive scale from liquid fuel to " by "switching on a massive scale from fossil liquid fuel to". | Accepted. |
| 3843 | 8 | 54 | 26 | 54 | 26 | Switching from liquid fuels to gaseous fuels is a well known technology and usually cost-effective, already used in many countries. Why shall it require long time to be deployed? | Reject. Comparatively the infrastructure system for gas for vehicles is not as advanced as liquid fossil fuels even in the places where currently distribution is more advanced. even natural gas might not be cost-effective in most places, given the cost of the tanks, but for large |
| 15854 | 8 | 54 | 30 | 54 | 33 | Might consider a chart showing impact of sectoral analysis on GHGs so it does not get lost in text | Accepted. This willl be done. |
| 5415 | 8 | 54 | 30 | | 31 | The 20% seems, in context, to be 20% of total demand….is it?....or is it 20% of a portion of total demand? | Accepted. This percentage will be reviewed and better supported with |
| 7404 | 8 | 54 | 31 | 54 | 33 | Model shifts and behavioral changes are represented in top-down models through elasticities -- so their impacts on transport demand might have already been included. | Not clear what the reviewer suggest to do. |
| 13118 | 8 | 54 | 31 | | | Fig.8.9.4 is from IEA2012, (not IEA2009). | IEA 2012 not then published?! Since |
| 15853 | 8 | 54 | 8 | | | Not clear what GEA scenarios refer to? Are these used elsewhere? Consustent with IPCC? Might inckude link or explain. Also what does "fossil liquids" refer to? LPG? LNG? Be clear on this. | GEA Scenarios refer to the bottom-up pathway development exercise published as Global Energy Assessment in 2012. Parallel with ETP 2012 |
| 8379 | 8 | 54 | 20 | | 25 | This has already been said and can be removed. | Accepted. Repetition will be avoided in |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 8380 | 8 | 54 | 32 | | 33 | The enormous growth rates in Indian cities means that there are important uncertainties about what to expect in the future. For instance the Nano car was believed to be a big hit for millions of Indian families and now it seems that it will not. There are simply too many unknown aspects and this will have to be discussed up-front such as mentioned on line 37. One of the uncertainties is the role of public transport; trains, buses and so on. Trips by public transport are forecasted to be cut by half – what means of transport is likely to replace busses and trains in growing cities in India? The reduction of travel on public transport is a global trend and as such a reality that should be discussed in chapter 8 in relations to emission and sustainable transport.<br><br>The various processes of gentrification of public space and of systems of transport by means of expensive BRT's and metros bring about more of marginalisation and social divide. The phenomenon of peak car use is still very limited and taking place in a certain socio-political setting. So far, peak car, is a small trend with limited impact and not a global trend. The reduction of public transportation is a global and significant trend. | The scenarios or pathways for transport transformation in this session will be further elaborated in SOD. Some of the uncertainties described by the reviewer wiill be further discussed. |
| 2473 | 8 | 55 | | | | Issues of path dependence and lock in need a higher profile - they need discussion earlier in the Chapter, and whether any technology should be looked at as a replacement or a niche - the future will probably have many elements - there is no replacement for the car and the best option is probably for a super efficient ICE? But issues relating to transition from one well established technology to another new one are not covered, nor the potentially huge costs of such a transition. | Accepted. The reviewers rasises some important issues that will be addressed in the reivew of pathways in SOD. |
| 3844 | 8 | 55 | 13 | 55 | 15 | This chapter is being prepared by scientific-minded people that traditionally have their major interest in new technologies. The discussion in section 8.9.2.1 has only 3 lines dealing with mitigation technologies already in commercial use, while more than one page is dedicated to second generation biofuels, electric and hydrogen powered vehicles. Readers will be very much interested in the ones that are already available (first generation biofuels and hybrid cars) | The priority depends on whether we should be focusing on moderate GHG reductions or on large ones |
| 2775 | 8 | 55 | 21 | 55 | 36 | But Pakistan has achieved over 80% share (3.2 million units) for methane vehicles in less than 20 years. Reasons are: 1) road vehicle lifetime is very short compared to power and heat plants, b) conversion into methane capability is very easy and fast, c) technology is mature and widespread, with over 16 million vehicles now globally, d) almost all major manufacturers offer OEM methane vehicles, e) fuel is obtainable globally. Therefore, with political will transformation can be done quickly. Technology is mature and affordable. No need to allocate time for research, development, innovation or reaching large cumulative production volumes. Transition requires proper policy only. | Well, perhaps, but given limits on how much natural gas is available, and the problem with proliferation of coal fired generation plants, the best use for gas is likely to be replacement of coal-based generation |
| 5211 | 8 | 55 | 21 | 55 | 23 | This long development time for new technology again necessitates to consider to use more current low carbon technology by investing in it. E.g. in stead of trying to make the global car fleet fully electric, switching to zero carbon rail transport can be done right from 2012 onwards, as all technology is there and existing infrastructure is underused. Same for trying to get complicated technical and bio-fuel solution for air, while high speed zero carbon rail is an existing and proven technology. | I can't agree…..massive mode switching seems highly unlikely….it's worthwhile to get what we can get, but I don't see this as a real substitute for developing major new technologies. will amend |
| 4071 | 8 | 55 | 22 | 55 | 23 | "It can take 25-60 years from the start of research and development until an innovation achieves wide spread use, such as in the road vehicle fleet." This is one of the more sobering, realistic statements I have read in this chapter. How does this historical analytic fact play out in the rest of the section 8.9.2 sectoral transformational pathways - implications from a bottoms-up perspective? This seems to be a disconnect with the "New World Economy" scenario on page 51, lines 42-48. | Noted. Section has been significantly restructured, now covered in Section 8.9.2.1. Section covering Sixth Wave rephrased. For assumptions of IAM scenarios see mainly Ch.6. |
| 5344 | 8 | 55 | 24 | 55 | 26 | Not sure sunk investments applies to EVs. Electricity production and delivery infrastructures are well-established given potential for home charging, and PHEVs will make use of existing petrol/diesel infrastructure. | Reject.It does apply to public charging. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 5416 | 8 | 55 | 5 | | 7 | The McCollum and Yang study is normative….it asks, what would have to happen to achieve an 80% reduction. It doesn't spend a lot of time (or any time?) trying to ask, how likely is this? (Not meant as a specific criticism of this study….virtually none of these studies ask such a question, at least explicitly). However, it becomes a bit tricky how to use this type of study.....do we really want to imply that somebody has done an analysis that this is a realistic possibility, when that question has hardly been asked? | Accepted. Uncertainties will need to be highlighted. |
| 11653 | 8 | 55 | | | | Appears like a duplication of 8.3.1. Delete redundancies | reject.It is not normative.It presents a |
| 13890 | 8 | 55 | | 57 | | Public budget reallocation from non-sustainable transport funding to climate-friendly transportation funding should be discussed here. | Accepted. |
| 8381 | 8 | 55 | 36 | | | At the end of this chapter on page 57 one of the most important issues is finally formulated. The challenge that this chapter will have to deal with is presented but it is far too late to do this on page 57. This is what you should present at the beginning so pls, introduce this part at the beginning and outline the chapter accordingly to answer this question. | Structure fixed. Section will be reviewed and placement considered but also covered in the revised storyline |
| 2776 | 8 | 56 | 1 | 56 | 5 | The cost of North African unrest in 2011 on EU transport was equal to building cost of 130.000 methane filling stations. It is multiple times the amount needed for a comprehensive filling station network. | Not clear what the reviewer suggest to do. |
| 2475 | 8 | 56 | 18 | | 19 | BRT does not mimic metros - it is a very different concept. | Accepted. Will be rephrased. Yes we can write a few lines to explain this |
| 11282 | 8 | 56 | 18 | 56 | 25 | Also worth citing here for a discussion of public transit and bus rapid transit systems in various countries and cities: UN-Habitat (2009): Global Report on Human Settlements 2009: Planning Sustainable Cities, pp. 162-163; as well as UN-Habitat (2011): Global Report on Human Settlements 2011: Cities and Climate Change, p. 100-103. [available for download at http://www.unhabitat.org/pmss/listItemDetails.aspx?publicationID=2831 /// http://www.unhabitat.org/pmss/listItemDetails.aspx?publicationID=3086 | Accepted. Thank you for this reference. Discussions from these docs could be included |
| 2474 | 8 | 56 | 3 | | | The evidence cited here is not convincing - needs to be more specific - based on one study? | Accepted. More references will be |
| 5292 | 8 | 56 | 31 | | | ADD: A study for Lyon shows that the car's major advantages over TCs are its speed and flexibility in complex itineraries. Hence, indirect measures which 'pressure' without coercing may be more political feasible and yet efficient in creating a modal transfer: reducing car speed limits – but not TCs'-; increasing the number of lanes reserved for TCs and bikes; decreasing number of parking places increases travel time through research for parking place; pedestrian friendly traffic lights…) (Stéphane la Branche. « La gouvernance climatique face à la mobilité quotidienne. Le cas des Lyonnais ». Revue Environnement Urbain/Urban environment. 2011). | Accepted. Reference willl be included. |
| 2778 | 8 | 56 | 32 | 56 | 34 | Electric cars may create a modal shift away from public and non-motorized transport, since they are appropriate in urban light traffic only. Also, they may not replace ICE cars for the same reason, but instead lead to additional car demand in households. | Accepted. No disagreement on this. |
| 3590 | 8 | 56 | 43 | 56 | 45 | This sentence is another illustration of far too ambitious expectations, showing the need to come back closer to reality when making recommendations to policy makers. | Disagree with reviewer. No action suggested by reviewer. .I think the statement is obvious and perhaps a bit |
| 2777 | 8 | 56 | 8 | 56 | 10 | Text "The lead time for transport infrastructure development is considerable, which makes swift changes in the capacity of for example, public transport hard to achieve" is incorrect. Very many cities (both industrial and developing) have shown that diesel buses can be replaced by methane buses within a few years. Some cities (both industrial and developing) have shown that also diesel taxis can be replaced by methane taxis within a few years. These have been achieved using many different kinds of policies. | Reject. The text referst to infrastructure leading to increasing capacity. The reviewer's comment refers to fuel switching feasibility. Different points. I don't think the term "capacity" is about |
| 13891 | 8 | 56 | 22 | 56 | 25 | Indeed, TransMilenio has been successful in many ways, but the absence of integrated land use has also lead to minimize its positive impacts (see Lefèvre, B., 2008, Visión a largo plazo e interacciones "transporte-urbanismo", los excluidos en el éxito del SBR TransMilenio de Bogotá, CIUDAD Y TERRITORIO Estudios Territoriales, XL (156)) which is a pity given the . The nowadays situation is far to be idyllic. It is one of the reasons why Bogotanos are voting against BRT and why the last two mayors were elected to build a metro . | Accept. It will be considered. Either add the need of integrating NMV and land use plans or drop this. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 2716 | 8 | 56 | 42 | 57 | 35 | Section 8.9.2.2 is very speculative, suggest this be shortened significantly. | Entire section will be reviewed in SOD. |
| 17780 | 8 | 57 | | | | "Massive GHG increase" - how much increase? | Accept. More precision in next SOD |
| 8565 | 8 | 57 | | | | CITED STUDY NOT IN REFERENCES<br>"For example, a detailed survey in<br>the US has shown this phenomenon to be as much a cultural change as the result of rising fuel prices<br>(David et al., 2010).<br>COMMENT:<br>should be deleted...<br>ADDITIONAL COMMENT: The US Department of Energy, Energy Information Agency does not anticipate a "cultural shift," and is projecting an increase in light vehicle travel of 37 percent from 2012 to 2035. | Accepted. Will be considered. New references are available. |
| 2476 | 8 | 57 | 20 | | | More needs to be made of this - it is now quite a widespread phenomena in many developed countries - including many in Europe | Accepted. Will be considered. |
| 5345 | 8 | 57 | 26 | 57 | 26 | Developed nations of Asia is very small % of Asia. Not clear you can generalise the experience of Japan, South Korea, Taiwan and small city-states (HK+Singapore) and apply to China, India, and elsewhere. | Accepted. Will be considered. |
| 3423 | 8 | 57 | 5 | | 17 | a very vital alinea for this chapter | Agree. |
| 2717 | 8 | 57 | 23 | 57 | 23 | David et al reference is missing. I'm skeptical of the conclusion that US culture has changed; what was the basis for the research in David et al? | Accepted. Will be considered. David et al is a large survey of young population. Other studies are available Florida R (2010) The Great Car reset……..the only culture shift I can see is some signs that young people are not so quick to learn to |
| 2718 | 8 | 57 | 28 | 57 | 29 | EKC does not predict how wealth (or income) affects environmental policy. Rather it is an association and is critically dependent on democratic procedures. For example see the following reference:<br>Mariano Torras, James K Boyce, 1998, Income, inequality, and pollution: a reassessment of the environmental Kuznets Curve, Ecological Economics, Volume 25, Issue 2, May 1998, Pages 147–160 | Accepted text will be revised. |
| 2719 | 8 | 57 | | | | This section could be shortened. You really just need to state key points, i.e., that climate policy must take into account the development needs of poorer countries, but these policies could lead to better outcomes on all sustainbility critiera if implemented now. | Accepted Will be considered. |
| 4072 | 8 | 58 | 27 | 58 | 31 | This statement is very close to being policy-prescriptive - "… follow clear political vision and agenda …" Instead, I recommend using words like "Assessment of effective strategies show…" | Accepted Will be considered. |
| 4073 | 8 | 58 | 38 | 58 | 40 | "The efforts for building and reinforcing regional networks and links to disseminate the various strategies … remain of paramount importance." No reference to this statement. This statement borders on being a policy-prescription, almost a policy recommendation. | Accepted Will be considered. |
| 15855 | 8 | 58 | 4 | | | "live" not "leave" | Accepted. Will correct. |
| 8022 | 8 | 58 | 4 | 58 | 4 | this should be 'will live in 2050' | Accepted. Will correct. |
| 3593 | 8 | 58 | 41 | 65 | | This chapter is incomplete. There is a need for an integrated policy sub-chapter, targeting organisational solutions, public private partnerships, supply chain solutions, customer purchasing behaviour changes, etc. | Will refer to Policy chapters |
| 8382 | 8 | 58 | 4 | | 19 | Pls develop further. GOOD! Up front -State of art is described but not what should be done to reverse this development. Pls go ahead and develop this part! | Under consideration |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 13892 | 8 | 58 | 4 | 58 | 11 | "Urban areas where 70% of the population will leave in 2050 have a central role to play in global efforts for climate mitigation". Yes and what should be discussed here is if yes or not cities have the capacity to act (competences, funding, legal right to innovate etc.) which is often not the case. (See C40, ICLEI lobby; HAMMER, Stephen, Kamal-Chaoui, Lamia, and Alexis Robert. Cities and Green Growth: A Conceptual Framework. OECD Regional Development Working Papers 2011/08. Organization for Economic Cooperation and Development. December 2011. ; Lefèvre, B., 2012, Incorporating cities into the post-2012 climate change agreements, Environment & Urbanization, vol 24(2) ) | Accepted. Will use reference and expand discussion within limits of space. Thank you for reference. |
| 8383 | 8 | 58 | 40 | | | In this final paragraph a crucial phrase is formulated that underlines magnitude of the challenge of IPCC to deal with. Why is it hiding back here? Important points should be mentioned much earlier according to academic practices. | Accept. Some text in session will inspire some of the key summary for policy makers. |
| 15744 | 8 | 59 | 19 | 61 | 32 | Wrong titles: section 8.10.1 is labeled “Road transport” but is only addressing cars, section 8.10.2. is labeled “Rail transport” but also addresses light-rail and buses. | Will amend but HDVs also covered in 8.10.1 and light-rail comes under rail. there is one paragraph on HDVs, but |
| 3424 | 8 | 59 | 26 | | | if integration of services is possible. This is not clear enough for me. The statement is followed by policy examples that, in my understanding, do not really serve as examples of integration of services. | Will amend. it's not clear if the author intended the next sentences to be examples of integration of services….I |
| 4074 | 8 | 59 | 26 | 59 | 30 | Does the reference Hao et al 2011 describe and quantify the "significant co-benefits"? | Yes, the paper quantifies the energy saving (which can be easily converted to GHG reduction) from vehicle purchase |
| 6707 | 8 | 59 | 3 | 59 | 12 | Adding to market-based mechanisms, it should be noticed that voluntary CO2 emission reduction approaches are effictive for the transport sector. Recent studies show that voluntary CO2 emissions reduction schemes and, in particular focuses on the voluntary plan by the Japanese airline industry. Econometric analysis identifies statiscally significant improvement of 3-4% in CO2 emissions intensity (CO2/PRK) subsequent to initiation of the voluntary plan in 1998.<br><br>See:Katsuhiro Yamaguchi ( 2010 ) Voluntary CO2 emissions reduction scheme: Analysis of airline voluntary plan in Japan<br>Transportation Research Part D: Transport and Environment, Volume 15, Issue 1, January 2010, Pages 46-50<br>http://www.sciencedirect.com/science/article/pii/S1361920909000856 | worth looking at, but remember that Japanese culture is quite different from Western cultures….."voluntary" might not mean the same thing…might have quite a bit of societal pressure |
| 10008 | 8 | 59 | 3 | 59 | 5 | This part should include "voluntary target scheme" because there are successful examples of "voluntary target scheme" in the world. Each industry in Japan has voluntary target and the voluntary target scheme has played a big role, as described in (Yamaguchi, 2012, page35 and 154), (Manuel, 2010, page 6 and 13), and (Yamaguchi, 2010, abstract). In addition, there is also a successful example of "voluntary target scheme" in Netherlands, as shown in (Martijin, 2002, page162). These reference sources are same as for No63. | To be amended. worth looking at, but remember that Japanese culture is quite different from Western cultures….."voluntary" might not mean the same thing…might have quite a bit of societal pressure |
| 6708 | 8 | 59 | 31 | 59 | 36 | Adding to market-based mechanisms, it should be noticed that voluntary CO2 emission reduction approaches are effictive for the transport sector. Recent studies show that voluntary CO2 emissions reduction schemes and, in particular focuses on the voluntary plan by the Japanese airline industry. Econometric analysis identifies statiscally significant improvement of 3-4% in CO2 emissions intensity (CO2/PRK) subsequent to initiation of the voluntary plan in 1998.<br><br>See:Katsuhiro Yamaguchi ( 2010 ) Voluntary CO2 emissions reduction scheme: Analysis of airline voluntary plan in Japan<br>Transportation Research Part D: Transport and Environment, Volume 15, Issue 1, January 2010, Pages 46-50<br>http://www.sciencedirect.com/science/article/pii/S1361920909000856 | To be amended. worth looking at, but remember that Japanese culture is quite different from Western cultures….."voluntary" might not mean the same thing…might have quite a bit of societal pressure |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 14299 | 8 | 59 | 37 | 59 | 39 | Fuel efficiency standards in the EU have made a significant difference to reducing road transport emissions, and the role they have played should be acknowledged as one of the areas where regulation has made a large contibution to reducing carbon intensity. For example, in the UK the distribution of new car CO2 has significantly moved to lower levels. See Committee on Climate Change (2011), "Meeting Carbon Budgets - 3rd Progress Report to Parliament", Fig 4.12, p155 (http://hmccc.s3.amazonaws.com/Progress%202011/CCC_Progress%20Report%202011%20Single%20Page%20no%20buttons_1.pdf). | To be amended. well, "widely used effectively" is pretty strong already….but concrete examples always help. |
| 5417 | 8 | 59 | 37 | | 39 | Compromised is a bit too strong…..a 10-20% rebound effect is important, but too many critics of standards use the rebound effect as an excuse to say standards are not worthwhile. | Rebound effect covered in chapter. Differs between OECD and LDCs |
| 9167 | 8 | 59 | 37 | 61 | 31 | I am curious with the cost consequence of the efficiency standards - are there any alanlyses available? | Most studies of standards provide some idea of effectiveness, but this is ambiguous because lots of other things affect fleet fuel economy…like gasoline and diesel prices. most studies of standards provide some idea of effectiveness, but this is ambiguous |
| 7405 | 8 | 59 | 6 | 59 | 12 | From economic perspectives, unless there are seious market failures, market-based mechanisms will outperform vehicle efficiency and fuel standards on controlling GHG emissions in the transport sector. | Needs supporting references |
| 15856 | 8 | 59 | 6 | 59 | 9 | other options include fee-bates and fuel taxes | Amended. these are discussed….we can ignore this comment |
| 11003 | 8 | 59 | 3 | 59 | 4 | It is indicated that emission trading or carbon tax is effective in transporting sector, but emission reduction by voluntary approach must be also effective. | True where it works - eg Japan. Needs references. apparently so in Japan, but I wouldn't think they'd be that effective |
| 8722 | 8 | 59 | | | | Additional reviews of implemented policies (if required) can be found in this document for completeness: AEA, 2012. Next phase of the European Climate Change Programme: Analysis of Member States actions to implement the Effort Sharing Decision and options for further community wide measures: Transport Sector Policy Case Studies http://ec.europa.eu/clima/policies/effort/docs/esd_case_studies_transport_en.pdf | Accept. if appropriate, this could be added to citations |
| 4075 | 8 | 59 | | 61 | | Section 8.10.1. Road transport. Reduce page length by making a table, brief description of policy types: Demand Reduction; Energy Intensity; GHG Intensity; Short-Lived GHG Species. | Accept |
| 8385 | 8 | 59 | 24 | | 36 | This part is simply not good enough and it needs to be strenghened. | Agree but space constrained. Link to Policy chapters. perhaps, but would require more space…I do agree that this |
| 8384 | 8 | 59 | 28 | | 29 | Demand reduction examples - referring to TDM is not enough since the social activities of a person seems to be neglected.<br>Why bringing up Beijing and Shanghai as nice cases dealing with the issue? This is an elite version of traffic policy and there are other more democratic ways of dealing with the issue that serve as good examples. □ | The cases of Beijing and Shanghai were selected as representatives of reducing vehicle use through strong policy intervention. Till now, four cities in China has implemented similar policies, with many more cities likely to follow. agreed, limiting vehicles is not a likely solution for most democracies….perhaps add to pricing discussion, show where it's used and level of success. HAO: The cases of Beijing and Shanghai were selected as representatives of reducing vehicle use through strong policy intervention. Till |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 13894 | 8 | 59 | 31 | 59 | 36 | Inequality and social acceptability of carbon tax should be discussed (See Deroubaix, J.F., Leveque, F., 2004, The rise and fall of French Ecological Tax Reform: social acceptability versus political feasibility in the energy tax implementation process, Energy Policy 34 (2006) 940–949) | Agree |
| 3466 | 8 | 59 | 31 | 59 | 36 | Subsidies in oil destilates are widespread in the Word. It should be mentioned that this issue should be addressed in the future in order to contribute with the reduction of GHG emissions from transport sector | Will address fuel subsidies (IEA data). I agree that fuel subsidies should be |
| 8435 | 8 | 59 | | | | I suggest to discuss with major details all the policies and examples that have been used in the world to promote NMT (i.e., traffic calming, etc). In a lot of towns cycling is one of the most important strategies to reduce car use, and the co-benefits are enormous as stated elsewhere in the Chapter. Furthermore, the importance of intermodality must be better highlighted. | Also see Policy chapter 13-15 |
| 2433 | 8 | 6 | | | | Much more of a leadership role is needed from the developed countries as their emissions levels are far higher than those elsewhere - also real scope for reduction | Agree. Added later in text |
| 2434 | 8 | 6 | | | | Note interconnectedness between transport and energy (and CO2) as most of transport energy is carbon based, and between transport and the Built Environment (Ch12). | Is covered in text Page 6 line 26 |
| 2435 | 8 | 6 | | | | Related to the general point above is the more than doubling of transport related CO2e - how can the authors see any major change in the future, based on the past trends? | Covered in text. Too detailed for Exec summary |
| 2436 | 8 | 6 | | | | The risk of failure in the transport sector is high - this is not apparent in this Chapter - there is too much talk about choices and optimal packages - the importance of non motorised transport and public transport is totally underplayed in Ch8. | Noted. |
| 11602 | 8 | 6 | 1 | 6 | 1 | Behaviour change can also be cost-effective, not only technology. Too one-sided | Amended. also, which ones? Some developments would be very |
| 11603 | 8 | 6 | 10 | 6 | 15 | "Improvements need investments…" That is the industry logic, but this means that you precanonise a high-tech path. Low tech is cheap and effective! Think of a small, low-weight, low power car…. | Agree needs to be included |
| 4338 | 8 | 6 | 10 | 6 | 12 | need to provide actual figures (millions of US$) on R & D n energy efficient transport | Try to quantify |
| 2726 | 8 | 6 | 10 | 6 | 12 | It is better to say: "Developing innovative and improved transport technologies will require RD&D investment but also expenditure on infrastructure, such as high-speed rail networks, methane and hydrogen filling stations, public recharging points for electric vehicles, cycle lanes and bus rapid transport systems." In EU compulsary methane and hydrogen filling station requirement for all Member States has been proposed. | Rejected. The ES was restructured. Hydrogen is mentioned. |
| 15288 | 8 | 6 | 10 | 6 | 10 | "RD&D" to be "R&D" | Rejected. RD&D means RD and |
| 15295 | 8 | 6 | 11 | | | I'm surprised we are promoting high-speed rail. Specialized equipment, high-speed drag, largely vacant track, big stations, etc. generally means (much) higher LCA energy requirements per person-mile traveled than cars (& most airplanes). Best thing in developed countries is probably to fill up energy-efficient cars; best thing in developing countries is probably conventional rail; so I'd change to dynamic ride-sharing as an (ICC) technology in this line. | Noted. See discussion in 8.3.2.4 |
| 16880 | 8 | 6 | 11 | | 12 | Re public recharging for electric vehicles -- recently published papers seem to make case this is less critical than previously thought. Most people who have plug in electric vehicles charge them at home. They do not feel the need for public recharging stations. | Noted. See inclusion in section 8.3.4.2. Still, need to take global view with very different settlement structures. |
| 18900 | 8 | 6 | 11 | | | It is my understanding that besides "high speed rail" there are other important options, e.g. better integrated rail networks, so please consider widening the focus here. | Agree - in text but not a complete list of examples |
| 15769 | 8 | 6 | 14 | | 15 | Re: plug-in hybrids -- true, but currently very expensive and unlikely to come down in price any time soon. | Possible - but exemplifies transitional steps. unclear…..tell me what happens |
| 2727 | 8 | 6 | 14 | 6 | 15 | Full electrification can not be a goal for urban road transport, since it is not applicable at all to heavy freight transport and can only partially cover heavy personal transport. Renewable methane and hydrogen are needed, using them in ICEs and fuel cells, including plug-in-hybrids. | Hydrogen and methane added. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 8866 | 8 | 6 | 16 | 6 | 20 | The way this pargraph reads now seems to suggest that people find diffucult to change their travel habits what I am sure it is not what the authors mean and there is no additional text supporting this statement. If there are appropriate alternatives available and incentives in place, then people in developed countries will also change their travel habits. | Noted. This is one of our key messages being questioned - World regions with existing and mature transport infrastructures in place may find mitigation options through improving technologies easier to implement than changing travel patterns, whereas regions with rapidly developing infrastructures are more dynamic in terms of travel demand and modal |
| 17763 | 8 | 6 | 16 | 20 | | ensure that the bolden statements are consistent with the message in other chapters? | Noted. This is one of our key messages being questioned - World regions with existing and mature transport infrastructures in place may find mitigation options through improving technologies easier to implement than changing travel patterns, whereas regions with rapidly developing infrastructures are more dynamic in terms of travel demand and modal |
| 11604 | 8 | 6 | 16 | 6 | 20 | That's contentious. You can argue that in DEV supply lacks behind demand. Hence there is no time, money and capacity for mitigation in addition to demand satisfaction, hence no real flexibility. Vice versa, affluent countries have the means, time, liberty, capacities for change! | Noted. This is one of our key messages being questioned - World regions with existing and mature transport infrastructures in place may find mitigation options through improving technologies easier to implement than changing travel patterns, whereas regions with rapidly developing infrastructures are more dynamic in terms of travel demand and modal |
| 15770 | 8 | 6 | 16 | | 20 | This sounds good, and makes sense, but it would require a commitment on the part of govt to ensure the most cost-effective, from a GHG perspective, technologies are employed. | Noted. This is one of our key messages being questioned - World regions with existing and mature transport infrastructures in place may find mitigation options through improving technologies easier to implement than changing travel patterns, whereas regions with rapidly developing infrastructures are more dynamic in terms of travel demand and modal |
| 2805 | 8 | 6 | 16 | 6 | 38 | In order to make the logic clearer to readers, I think this section looks better better if moved after p7 line 7. Then, it reads:<br>"Optimal mitigation packages, and barriers differ between world regions due to variations in local transport demand"<br>→ "World regions with existing and mature transport infrastructures in place may find ..., whereas regions with rapidly developing infrastructures are ..." | Will consider but bold are the key messages |
| 5184 | 8 | 6 | 16 | 6 | 20 | Even in countries with mature infrastructures very large sums are invested in road, rail and (air)port infrastructures, funds that can still be redirected to low carbon transport modes. Furthermore, most of these countries are rich, so have the means to invest additionally in new low carbon infrastructures. | Will consider but bold are the key messages |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 17707 | 8 | 6 | 17 | | | Readers would be interested to see in the summary a statement on whether present technologies could deliver sufficient savings in efficiency to meet carbon targets, given "business as usual" trajectories in km travelled, or whether there will need to be reductions in VKT. | Noted. |
| 16273 | 8 | 6 | 18 | 6 | 22 | Same as above. | Accept but too old references |
| 8361 | 8 | 6 | 19 | | | But perhaps some of the rapidly developing countries are less flexible when it comes to implementing alternative policies? Political ambitions and leadership skills are prerequisites for success. The experience of managing motorisation in different political, economic, cultural and technical contexts is largely missing in this part. PIs include. Political scientists seem to have been missing in the writings of chapter 8? | Accepted. |
| 14742 | 8 | 6 | 2 | 6 | 3 | Phrase is redundant | Amended |
| 16276 | 8 | 6 | 24 | 6 | 25 | The IEA (IEA, 2001. "Saving Oil and Reducing CO2 Emissions in Transport") indicates that the vehicle market is becoming increasingly global. Hence, I can't agree that there are also major regional differences in "available" technologies. | Not just road vehicles being referred to |
| 15296 | 8 | 6 | 26 | | | I don't think hyphens between built environment & land use are needed here. That's really only when those terms are modifying another noun. | Accept |
| 16274 | 8 | 6 | 26 | 6 | 32 | Same as above. | Not just road vehicles being referred to |
| 5393 | 8 | 6 | 28 | | 29 | quantitatively, technology has far greater potential, in a much faster timeline, than does land use policy….there's no doubt such policy is important, but don't oversell it | Needs to be mentioned. "in the longer term" added |
| 15297 | 8 | 6 | 29 | | | I don't know why "However, there are" is used here. These ideas are not in conflict. I would say "There are also…". | OK. I don't have a problem with the "however" |
| 15298 | 8 | 6 | 33 | | | The reader doesn't understand why climate change feedbacks would make light rail more likely. (I don't either. :-) ) I'd rewrite this sentence to give a more specific example. Perhaps you mean to say, "If highways are flooded, only rail systems may be operational"? Hard to imagine, but I'm not an expert on climate change accommodation. (I just remember the Loma Prieta earthquake taking out a section of the Bay Bridge, so BART & ferry became important modes across that bottleneck point.) | Amended |
| 2728 | 8 | 6 | 33 | 6 | 38 | Rural train transport is the most vulnerable transport technology to the effects of climate change. | Noted. |
| 5394 | 8 | 6 | 33 | | 34 | not at all clear why climate change would push people into light rail and away from private vehicles…is this backed up in the text?.....light rail's lack of flexibility could be a hindrance as the climate evolves | Agree. Amended |
| 3987 | 8 | 6 | 33 | 6 | 34 | The statement that "Positive mode transport change (e.g. from private vehicles to light-rail)…." Need justification. What is the empirical basis for this statement? | Agree. Amended |
| 14743 | 8 | 6 | 35 | 6 | 36 | This phrase is odd and implies a strange message! | don't agree, but need references to other |
| 16881 | 8 | 6 | 35 | | 38 | Can you provide context? How large are these impacts relative to today or relative to projected emissions if no change had occurred in polar region? | Too detailed for exec summary. Is in text |
| 3988 | 8 | 6 | 39 | 6 | 43 | The bold summary on optimal mitigation packages seems out of place. In particular it ends with "high agreement, medium evidence." But the immediate preceeding paragraph on feedback loops refers to section 8.5 where the evidence is characterized as: "Impacts are very dependent on regional climate change and the nature of local transport infrastructure and systems. Such impacts have not been well studied and sufficient information does not exist to determine their net positive or negative forcing impacts on many feedback scenarios." Thus, this summary section should either move or the statement of evidence and agreement should better reflect the text below. | Rejected. There is a difference between the paragraphs. The summary is about mitigation, the preceding paragraph is about climate feedback - somewhat related, but not a great deal. |
| 8865 | 8 | 6 | 4 | 6 | 9 | This paragraph needs to revised: transport also emits SO2 and other substances and by no means emits aviation ozone. | Accept. at least: yes, ozone is NOT an emitted gas, it's produced in the |
| 10763 | 8 | 6 | 4 | 6 | 9 | It is also important to mention that these effects operate on very different time scales. See e.g. figure 1 in paper by Berntsen and Fuglestvedt, PNAS, 2008, vol 105 no 49. | In text section 8.2 |
| 14269 | 8 | 6 | 44 | 6 | 45 | I'm not sure what the relevance of sustainable development as an objective is in this context. It might be desirable for various reasons, but in the context of mitigating climate change the long-term pathway should meet objectives solely relating to climate. | meeting a single climate objective seems pretty unrealistic….disagree |
| 17764 | 8 | 6 | 45 | | | state what are the "multiple objectives" | Too detailed for exec summary. See text |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 14744 | 8 | 6 | 46 | 6 | 46 | The non-OECD class needs to be further disaggregated: BRICS and developing countries. | Rejected. For the issues highlighted in the ES a further differentiation is not |
| 18901 | 8 | 6 | 46 | | | The listed ragions "OECD, DCs, non-OECD" overlap. | It is EITs - not DCs |
| 15863 | 8 | 6 | 5 | 6 | 9 | Note that retrofits invalidate warrantees and if done poorly can actually worsen emissions. | Reworded |
| 15768 | 8 | 6 | 7 | | | Retrofits would need significant govt support to implement unless there is a financial incentive for the consumer, e.g., natural gas might work in some areas with cheap gas, but particulate traps for diesels would need a govt mandate. | Agree but too detailed for exec summary. Section 8.3 |
| 13873 | 8 | 6 | 28 | 6 | 29 | "Transport Demand Managementpolicies to frame urban expansion due to demographic growth" could be added in "such as facilitation of growth in city centres rather than urban fringes" | Amended |
| 2655 | 8 | 6 | 10 | 6 | 12 | The ability of infrastructure spending on rail, cycle lanes, BRT, and other alternative modes is really very dependent on getting the walking environment right. Should emphasize that detailed planning is needed to achieve the benefits from these systems. | Amended |
| 2656 | 8 | 6 | 33 | 6 | 38 | Second sentence in paragraph seems out of context. I'm unsure how relevant adaptation is to this chapter, could be a place to save pages by deleting some of this. | Adaptation relevant to transport |
| 2654 | 8 | 6 | 9 | 6 | 9 | Ozone is not emitted, but is caused by photochemical reactions. NOX emissions from aircraft affect ozone levels. | Amended |
| 17131 | 8 | 60 | 18 | 60 | 21 | ADD: Scrapping scheme reduces air pollutant emissions (NOx, PM) at the same time. For example, in Italy, due to the full replacement of EURO 0, EURO 1 and EURO 2 vehicle by newer technology models, total CO2 saving would amount to 8.74 million tons per year.<br>( Sustainable Mobility CO2 in the Road Transport Sector, The Integrated Approach A study by OICA, 2010, p.5-6, International Organization of Motor Vehicle Manufactures (OICA)<br>Available at: http://www.oica.net )<br><br>AFTER ORIJINAL TEXT: Policies that encourage the early scrapping of vehicles and restrict imports of older vehicles can help decrease the average fleet age, and hence carbon intensity (g CO2/km). Conversely, extending the life of a vehicle can help reduce its life cycle emissions (Kagawa et al., 2011). | Amended but scrapping schemes are expensive with a lot of "free riders". I'm a bit dubious that we should push scrapping schemes….expensive, a lot of "free riders" |
| 13119 | 8 | 60 | 2 | | | Please show 2015 (target enacted) and 2020(target propsed) in Japan, if available. | Check if legislation enacted. depends on whether standard is enacted |
| 13426 | 8 | 60 | 5 | | | Japanese government has not decided the new standard after 2016 yet. | Will update if they do. depends on whether standard is enacted |
| 5249 | 8 | 60 | 6 | 60 | 7 | Would feebates reflect (and moderate) the situation and costs for rural dwellers facing occasionally deplorable road conditions in winter or as a result of flooding? Why should they be penalised for buying, for example, a 4X4 to seek to safeguard their lives against deplorable road conditions? | Will consider but hard to incorporate without references. all regulations and broad pricing schemes are problematic for some portion of the population….not |
| 8721 | 8 | 61 | 20 | 61 | 20 | In a number of Asian and southern European cities, motorized two-wheelers are banned from city centres to prevent excessive particulate emissions. | Accept but need references. car-free areas should be mentioned, along with this….though this is an anti-pollution |
| 3845 | 8 | 61 | 26 | 61 | 31 | Probably, it may deserve to quote the efforts on GHG mitigation through the use of biodiesel and ethanol used in diesel type engines. For the last technology see the site BEST - Bioethanol for Sustainable Transportation at the web. | Covered elsewhere but can mention |
| 8020 | 8 | 61 | 32 | 62 | 4 | Please mention and describe shortly 'Integraler Taktfahrplan' ('integrated regular timetable') which is a central quality to increase the attractivity of passenger rail in many countries. | Accept |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 11364 | 8 | 61 | 9 | 61 | 19 | Could the following point be considered in this paragraph? "Carbon taxes for new vehicle registration and fuels strengthen the consumer preferences toward diesel vehicles over gasoline vehicles. It was shown that the shift from gasoline to diesel contributes to the climate mitigation when all the components including short-lived climate forcers are considered (Tanaka et al., 2012, Environmental Science and Technology, 10.1021/es204190w). However, such a climate benefit becomes smaller when newer vehicle emission standards are introduced." | To be amended. perhaps, but I suspect the net GHG benefit is variable…hare do use just one reference here |
| 6924 | 8 | 61 | 17 | 61 | 19 | Please provide a more specific reference to WGI AR5. | Accept. sounds reasonable |
| 2721 | 8 | 61 | 33 | 61 | 33 | Rail transport is affected not just by relative travel time; comfort and convenience can be a major factor. | Accept. sure, but not sure this is necessary…travel time and probably |
| 2477 | 8 | 62 | | | | ETS is only mentioned here - surely this is one of the most important potential measures that needs to be introduced globally - and not just for aviation, but for all transport? | Accept but references needed. I would think emissions trading works best for larger entities (like airlines)….not clear to |
| 2478 | 8 | 62 | | | | The institutional and organisational issues - the decision making processes and the involvement of the huge number of stakeholders in transport must feature in this Chapter - it is no use having a solution to a problem and find that it cannot be implemented. The questions of governance at all levels - global, regional, national and local - cannot be ignored. | Accept |
| 8018 | 8 | 62 | 11 | 62 | 11 | I did not find (Kuhn, 2011) in the References | To be deleted as not peer reviewed. |
| 18229 | 8 | 62 | 15 | | | On this data it is important to highlight that technical measures taken by the IMO in 2011, through which are created the Energy Efficiency Index and the Management Plan for Energy Efficiency of Ships (SEEMP), will entry into force internationally from 1 January 2013. Afterwards, from 2013 to 2014, all necessary measures must be implemented to start decreasing, by 2015, up to 10 % of ships CO2 emissions, in accordance with that prescribed in Annex VI of the MARPOL on regulations for the prevention of air pollution from ships, through the inclusion of new regulations on energy efficiency. | To be amended. OK if we can understand the EEDI better |
| 15117 | 8 | 62 | 20 | 62 | 21 | There are no standards for age of aircraft even for Safety. The standards relate to the airwothiness (design, manufacture, certification and maintenance) and operation of aircraft. | Amended |
| 8019 | 8 | 62 | 20 | 62 | 39 | From the Special Report 'Aviation and the Global Atmosphere' we have known the warming effects of contrails and cirrus clouds (e.g. RFI = 2.7). Please add state-of-the-art intelligence on this issue in 8.10.4 | Amended |
| 15118 | 8 | 62 | 23 | 62 | 25 | Implementation of emissions reduction measures is not limited to EU States. States in other regions are also acting to reduce emissions from civil aviation through various measures. | Accept |
| 8017 | 8 | 62 | 23 | 66 | 23 | please add: '(...) fuel-efficiency standards. But even 15 years after the adoption of the Kyoto Protocol and asigning a mandate to ICAO to address mitigation no global mitigation measures in aviation are in affect.' | Accept |
| 15119 | 8 | 62 | 25 | 62 | 25 | For more clarity, this sentence should start with: ICAO member States.... | Accept |
| 15120 | 8 | 62 | 27 | 62 | 27 | The list of economic measures adopted/explored by ICAO includes also emissions trading | Accept |
| 15121 | 8 | 62 | 29 | 62 | 35 | The statement in this paragraph is not accurate. In 2010, the 37th Session of the Assembly of ICAO endorsed among other things: (1) a global aspirational goal of 2 per cent annual fuel efficiency improvement up to year 2050 ;(2) a medium term global aspirational goal from 2020 that would ensure that while the international aviation sector continues to grow, its global CO2 emissions would be stabilized at 2020 levels and (3) develop a global CO2 Standard for aircraft aiming for 2013. | Amended |
| 5212 | 8 | 62 | 29 | 62 | 32 | The reduction of 1.5% per year in energy consumption is very unlikely to be achieved for more than one decade ahead (see e.g. Peeters, P. M., & Middel, J. (2007). Historical and future development of air transport fuel efficiency. In R. Sausen, A. Blum, D. S. Lee & C. Brüning (Eds.), Proceedings of an International Conference on Transport, Atmosphere and Climate (TAC); Oxford, United Kingdom, 26th to 29th June 2006 (pp. 42-47). Oberpfaffenhoven: DLR Institut für Physic der Atmosphäre. | Amended |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 17132 | 8 | 62 | 43 | 62 | 45 | DELETE: However, this additional capacity can induce demand for transport and, over time, lead to even greater congestion. An increase in road infrastructure can increase distance traveled proportionally (Duranton and Turner, 2011).<br><br>REVISE TO: Building more roads often induces more demand, but where appropriate, the total CO2 emission will be reduced even considering such an induced demand.<br>(-Traffic Flow Improvement Measures, Ministry of Land, Infrastructure, Transport, and Tourism, Japan Available at: http://www.mlit.go.jp/singikai/infra/kankyou/2/images/shiryou3.pdf<br>-Road Infrastructures to Avoid Global Warming, Ministry of Land, Infrastructure, Transport, and Tourism, Japan Available at: http://www.mlit.go.jp/road/singi/bunkakai/5_3.pdf)<br><br>ADD: The increase of traffic volume is one of the main causes which induce congestion. However, other causes include the obvious lack of road infrastructure especially in developing countries. Appropriate design of the route and traffic signal control, peak-time shift of commuting could be the solutions. | Amended |
| 14300 | 8 | 62 | 6 | 62 | 8 | The measure the IMO has adopted (the Energy Efficiency Design Index or EEDI) is positive, but technically it may not reduce emissions from shipping, since it only affects emission intensity. If demand increased faster than intensity improved, then emissions would increase. | Amended |
| 18228 | 8 | 62 | 6 | | 8 | To enrich this report, it is recommended to enhance information referring to mandatory measures adopted by the IMO in relation with reduction of greenhouse gas emissions, since such measures are barely mentioned. This with the purpose of referring to the established in the International Convention for the Prevention of Pollution from Ships (MARPOL), the Annex VI and the amendments adopted to prevent air pollution from ships activities. | Accept |
| 14301 | 8 | 62 | 9 | 62 | 12 | While sulphur emissions are important (and the IMO has taken action to reduce them), the reason the EU are considering indepedent action on emissions is more directly related to climate change. Specifically, international shipping is the only sector which is not currently covered by the EU's climate change targets. | Accept |
| 2722 | 8 | 62 | | | | Mention lower speed for ships as a carbon reduction policy. | Accept |
| 2723 | 8 | 62 | 36 | 62 | 39 | Provide an update on the status of aviation within the EU ETS. Are airlines complying? | Will do |
| 11283 | 8 | 62 | 40 | | | The content of this section can be enriched by including elements of the section "Contemporary Appraoches to Linking Spatial Planning to Urban Infrastructure" of the Global Report on Human Settlements 2009, also with regard to its table 8.2 "Approaches linking spatial planning to urban infrastructure" (p. 161). UN-Habitat (2009): Global Report on Human Settlements 2009: Planning Sustainable Cities, pp. 155-157, 160-165. [available at http://www.unhabitat.org/pmss/listItemDetails.aspx?publicationID=2831 | Accept |
| 5419 | 8 | 63 | 19 | | 21 | "Comparing" London to Surabaya seems a strange comparison….I assume that Surabaya is a very poor city…..it is so far removed from a city like London that it's modal split has little to offer by way of comparison, at least in this discussion. | To amend |
| 3846 | 8 | 63 | 27 | 63 | 32 | Remove the sentence since it is a repetition. This text has already been discussed. Search for the reference "Trubka et al, 2010", in your paper, to identify earlier discussion. | Accept |
| 5420 | 8 | 63 | 42 | | 45 | Here and elsewhere in the text, esp. in the first two sections, a large number of citations are used to back up a fairly general comment…..this may just be a personal quirk of mine, but I prefer a bit more judicious use of citations, esp. for such general comments | Is a literature assessment |
| 5418 | 8 | 63 | 7 | | 8 | Not clear what this means…..toll projects have failed to achieve projected reductions in traffic volumes and hence revenue???? Seems that failure to achieve traffic reduction implies MORE revenue, not less. | Agreed. Accept |
| 8386 | 8 | 63 | 37 | | 40 | This part should be moved to the first pages of chapter 8. Pls move it. | Accept not policy - to 8.4. or repeat it |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 8388 | 8 | 64 | 1 | | 22 | On this last page a number of comments are made that will fit well into an early presentation of current challenges in the sector of transportation instead of written as final comments. The entire chapter would improve if you re-work the outlined and explore the content of the comments made in the last part of the chapter. | Agree. I agree…these comments are both general and important, should be moved up front |
| 8387 | 8 | 64 | 11 | | 25 | Wordings are weak and most of this has already been said. Sharper writings are required – due to the magnitude of the problems and the state of the art of existing solutions. For instance a low-carbon transport system is not sufficient or good enough to alleviate all sorts of problem being discussed. Pls elaborate on the IPCC version of sustainable transport. | Accept. agreed, although not sure how we can do this |
| 5293 | 8 | 65 | | | | COMMENT: There are cases of national levels land use and mobility measures and objectives. In 2012, the French national government established compulsory Territorial Climate and Energy Plans for all public administrations representing at least 50 000 people. The PCETs include: 1) both mitigation and adaptation measures (experimental for the last); 2) an energy component; 3) EU 20/20/20 objectives. The PCET supersede all other planning documents: mobility, urban planning, transports, land use, construction, non carbon mobility… All texts and policies related to these issues must conform to PCETs' goals. However, the legally binding aspect concerns only administrations. The plans are voluntary for other actors on the territory (industries, small firms, universities…) who are encouraged to sign a charter and act on the emission linked to transports. No penalty (so far) has been planned for communities who do not reach their targets.<br>The different PCETs are supervised from far by the National Environment and Energy Agency (ADEME, which also developed a carbon footprint evaluation method). The emphasis is on policy innovation through new linkages between services, and efforts at mainstreaming the 20/20/20 climate objectives throughout the sectors, departments and institutions. Hence, efforts at decreasing cars in daily life are impulsed by a national legislation. | Accept - to be amended |
| 3591 | 8 | 65 | | | | It is almost impossible to read this table. See comment 14 | Draft only. at the very least, expand the |
| 5213 | 8 | 65 | 1 | | | More far reaching infrastructure planning is missing. The point is that the increase of long distance passenger transport by air, including all possible theoretical technologocal efficiency improvements, still may take up 20% of current global CO2 emissions by 2050, thus blocking a sustainable emissions path for theglobal economy by then (e.g. Bows, A., Anderson, B., & Peeters, P. M. (2009). Air transport, climate change and tourism. Tourism and Hospitality: Planning & Development, 6, 7-20). | Accept |
| 8209 | 8 | 65 | 1 | 65 | 4 | What is the most 'original' source of this Table? I saw a very similar Table in GIZ's report "Sustainable Transport: A Sourcebook for Policy-makers in Developing Cities - Module 5e: Transport and Climate Change" (2007) pp35, table 16, which was written by Holger Dalkmann and Charlotte Brannigan. Please be careful to cite the sources, and do more literature review. | Will check |
| 4343 | 8 | 66 | 1 | 66 | 17 | international data of freight flows is notoriously weak. This section needs to mention that there is no data on urban logistic flows, average length of haul per commodity nor per value basis. There are no data on carbon emisssions at the level of individual supply chain sectors such as sub industries | Drawn attention to some new data-bases some which we should use for the next draft. This is partly true. There is certainly a need for greater harmonisation of the measurement and reporting of carbon emissions from freight transport. This should be mentioned in the report. On the other hand, there is an emerging consensus on the key measures that should be applied to cut freight-related emissions. The particular mix of measures will vary |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 8023 | 8 | 66 | 1 | 66 | 17 | "Developing the capacity (analytical and data) for multi-objective evaluation is an important part of the process of cultivating sustainability and climate mitigation thinking and culture in the long term." from p.56, l.39 is worth being mentioned in 'Gaps in knowledge' | Accept |
| 3592 | 8 | 66 | 10 | 66 | 11 | Add text such as: "The effects of mitigation measures are difficult to quantify for freight transport, and the trial approach under real business condition is needed in order to prove the technical feasibility and economical viability of the solution. However, poor policy support for innovation and shortage of knowledge on the collection of the right kind of data leads to a poor knowledge base on innovative and effective solutions in freight technology and organisation. Therefore, the lack of clear data leads to a slow market uptake of innovation such as city logistics and low carbon vehicles. There is also a need for comparative studies of costs-benefits of different green logistics, city-logistics and low carbon freight vehicle solutions" | Some useful suggestions which will be separately evaluated and would be worth incorporating . This is partly true. There is certainly a need for greater harmonisation of the measurement and reporting of carbon emissions from freight transport. This should be mentioned in the report. On the other hand, there is an emerging consensus on the key measures that should be applied to cut freight-related emissions. The particular mix of measures will vary with a country's level of development, size, industry structure, resource endowment etc Useful suggestions here, particularly on the role of innovation and the difficulty of getting data on the implementation of carbon |
| 11655 | 8 | 66 | 2 | 66 | 2 | Why particularly aviation? | Has specific problems |
| 17171 | 8 | 66 | 2 | 66 | 2 | Aviation data is gathered, but not publically available; there could be a plea for cost-free aviation data. | Agree - not the place here though |
| 12160 | 8 | 66 | 2 | 66 | | The sentence "...particularly for aviation" is disconnected, without good connection. So, I recommed to remove "...particularly for aviation". | Accept |
| 13895 | 8 | 66 | 29 | 66 | 38 | Cost issues should be discussed (potential reduction at what cost ?) | In earlier sections |
| 5294 | 8 | 66 | 9 | | | ADD: A study on mobility in Lyon shows that modal transfers on the same journey was one of the key factors encouraging the use of the car due to lost time and comfort (Stéphane La Branche, « La gouvernance climatique face à la mobilité quotidienne. Le cas des Lyonnais ». Urban environment. 2011° | this is too specific and limited for this section |
| 11654 | 8 | 66 | | | | I think it would be good to mention the major uncertainties for the future development: Oil price; price, capacity, lifetime of batteries; price 2nd generatin biofuels; transport demand. | Agree: could be added but space constraints. there is a difference between unknowables (oil price, future cost and performance of new technologies) and gaps in knowable knowledge….I suspect we need to focus |
| 15857 | 8 | 66 | 1 | | | This section suggests that all of the gaps are in understanding of consumer behavior. This is surprising; there are a lot more gaps than this. Actually, it seems that customers will respond to value in choosing more efficient and lower GHG transportation. Seems like the bigger gaps are in having soundly based and well-informed and analyses that accurately point out and project value to customers among various options. This type of orientation is lacking in this chapter. Additional Gaps to consider: better data for transport fleets in developing world, more data that provide well-informed analyses to allow customers to accurately gauge value and choose among various options | good comment… |
| 3467 | 8 | 66 | 2 | 66 | 17 | Regarding gaps in data, it should be mentioned that in most of developing countries, there is no accurte or reliable information about the fleet by type of engine (diesel, gasoline, LPG, etc.). This information is relevant in order to analyse substitution process and its impacts | relevant |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 6493 | 8 | 66 | 2 | 66 | 17 | The statements does not address the core problem i.e. lack of data in developing countries and cities to do accurate analysis of Carbon emissions as quoted by many researchers. The data is either not sufficient to do quality analysis and gain insights or not routinely collected to understand the impact of policies and investment. | relevant |
| 8014 | 8 | 66 | 24 | 66 | 24 | Please specify to "(...) increase into the future, if no drastic mitigation (...)": Only some mitigation won't reverse the trend. | Accept |
| 8015 | 8 | 66 | 42 | 66 | 42 | please insert 'less fatal accidents' after 'health' | reduction of fatal accidents may occur, but only with specific mitigation measures such as urban planning and increased transit share….frankly, a large shift to bicycling seems likely to increase |
| 11656 | 8 | 67 | | | | Clean up multiple duplications. | Accept |
| 17765 | 8 | 7 | 1 | | | what are these "improved techniques" | Detailed in 8.6. the current statement is |
| 15771 | 8 | 7 | 1 | | 3 | Again, unless there is significant govt intervention, this comes down to what is most cost-effective for the consumer. | Amended |
| 11273 | 8 | 7 | 11 | 7 | 12 | Are "travel cost savings" really a co-benefit of reducing CO2-emissions? If there are travel cost savings economic theory suggests that there is an increase in CO2 emissions (since cost savings are at least to a certain degree reinvested to travel) | Rebound effect discussed elsewhere. disagree….perhaps 10-20% reinvested in travel,and even that may be viewed as |
| 14270 | 8 | 7 | 16 | 7 | 17 | These factors are not specific to transport - they apply to all sectors. | Accepted. |
| 14746 | 8 | 7 | 16 | 7 | 17 | ??? | agree, statement isn't clear Deleted, |
| 14747 | 8 | 7 | 18 | 7 | 20 | Examples? | agree, statement is so broad as to be of little valueToo detailed to list in Exec |
| 16275 | 8 | 7 | 18 | 7 | 19 | Same as above. | agree, statement is so broad as to be of little valueToo detailed to list in Exec |
| 15300 | 8 | 7 | 20 | | | Comma needed before "such as". | Done |
| 15301 | 8 | 7 | 21 | | | I recommend a thoughtful statement to round up this Exec Summary, which reads like a series of generic statements that go both ways (so they can't be wrong) & don't really clue the reader into useful specifics. I imagine this Exec Summary is going to get a fair bit of editing once the body of the chapter is revised to reflect reviewer comments, and I hope its start & end can be more like an Intro/overview & Conclusion/summary. Thanks! | Agree |
| 8867 | 8 | 7 | 8 | 7 | 21 | Text in bold and the following seem to contradict each other. The text in bold talks about co-benefits of mitigation and the following text focuses on mitigation as a co-benefit, forgetting that mitigation has co-benefits in terms of reduced air pollution etc. | Differs rather than contradicts. doesn't seem contradictory, just a bit different |
| 15804 | 8 | 7 | 8 | 7 | 10 | statement about co-benefits is not quantified and no justificaiton in text given for statement that co-benefits may exceed costs | Agree. Section being re-drafted |
| 15299 | 8 | 7 | 8 | 7 | 10 | I'd love to see a section reference [8.x] for this statement. | Agree |
| 2657 | 8 | 7 | 13 | 7 | 14 | "The risks of technology failure in transport sector…" This seems like a vague comment, please be more specific about what is meant and why there may be risks. | agree…too much hand waving |
| 8870 | 8 | 8 | | | | This figure is out of date and shall be omitted (reduces also the length of the chapter). Figure 8.1.1.b is sufficient to show the regional differences | and it's not really discussed…I agree it doesn't serve much purpose here. |
| 4334 | 8 | 8 | | | | need to use GDP data expressed in purchasing parity levels rather than standard GDP | Deleted, |
| 4335 | 8 | 8 | | | | need to provide figures for freight transport emissions of carbon dioxide | This is total transport. Drawn attention to some new data-bases some which we |
| 15313 | 8 | 8 | | | | sorry to see this is in b&w. will this be color in the final report? I'm afraid I can't distinguish most of those short lines, so this is not such a useful figure to have right now. Y axis label should probably be "Transport sector's share of…" rather than Transport sector share in. | Deleted, |
| 15745 | 8 | 8 | | | | Figure 8.1.1.a needs to be coloured. | Deleted, |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 14748 | 8 | 8 | 1 | 16 | 30 | Chapter 8.1 and 8.2 needs improvement: A lot of complicated, nested phrases and redundancy. | To be re-written |
| 15305 | 8 | 8 | 11 | | | "movement of freight" reads better as "freight movement" here. (more concise writing :-) ) | Amended. Editorial |
| 15306 | 8 | 8 | 12 | | | sounds better as "the world's projected growth in transport" (rather than "the projected world growth in transport" | Amended. Editorial |
| 15307 | 8 | 8 | 13 | | | "the transition" reads better as "this transition" | Amended. Editorial |
| 12882 | 8 | 8 | 13 | 8 | 15 | Give citations for this statement. | Done. also: do most integrated assessments even CONSIDER "social |
| 15308 | 8 | 8 | 14 | | | please give an example (or two) of "stringent strategies" (in parentheses); thanks! | Amended. agree..this is just too vague |
| 15309 | 8 | 8 | 17 | | | demands overlapping with *systems* sounds odd (they are distinct things); perhaps we mean to say overlapping with "demands on the electric power system"? | Agree |
| 15310 | 8 | 8 | 21 | | | "to industry" should be "to industry's share" | Amended |
| 15311 | 8 | 8 | 22 | | | do we mean to say "anthropogenic" emissions when we say "total GHG emissions"? I find 14% unexpectedly low & wonder why it's not at least 20%. Please try to be more specific here, so the reader knows why the drop from 27% to 14%. | Amended. 14% correct. agree, but low value implies denominator is total, not anthropogenic |
| 15312 | 8 | 8 | 22 | | | ", 22%" should be "and 22%", since the final item in this list is non sequitur/distinctive (beginning with "but") | Reworded |
| 3818 | 8 | 8 | 23 | 8 | 27 | Very difficult to read the figure in black and white. | Deleted |
| 15314 | 8 | 8 | 26 | | | not sure why there are spaces on either side of the slash for GDP/capita in this title. (They are properly not in the y-axis label.) Personally, I'd say "GDP per Capita" in the title. | Deleted |
| 15302 | 8 | 8 | 5 | | | I'd say "congestion and crashes" not just congestion. Roadway crashes actually tally (in the US) to 3 times the cost of congestion (but they are less common, so people tend to neglect their serious toll). | Amended. good suggestion |
| 12880 | 8 | 8 | 6 | | | Add 'and noise pollution' after higher greenhouse gas (GHG) emissions | Added |
| 15303 | 8 | 8 | 7 | | | comma needed before "including". | Added |
| 8869 | 8 | 8 | 8 | | | This sentence seems to refer to the current situation and this needs to be made clear | Rejected. This is a general statement. |
| 16277 | 8 | 8 | 8 | 8 | 8 | It is better to modify the phrase "Each requires" to "Motorized transport modes require". | Cycling needs food energy. rather, "each |
| 15304 | 8 | 8 | 9 | | | comma before "infrastructure" should be an "and" (since the next item in this list is an infinitive, which would be inconsistent w/o the "and") | Agree |
| 12881 | 8 | 8 | 9 | 8 | 10 | The proposition of the sentence - the transport sector has the potential to decarbonize its energy supply at relatively low mitigation costs - needs to be clarified and proved by literature quote. It seems that the literature on economy-wide mitigation assessments derive the transport sector to be the least cost-efficient sector to decarbonize. | Amended. yes, we haven't shown this, and the proposition is doubtful |
| 5395 | 8 | 8 | 9 | | 10 | decarbonization certainly is possible, but it is unlikely to happen at "relatively low mitigation costs"….and I don't think you have shown this. | Agree - reworded |
| 16278 | 8 | 8 | 9 | 8 | 10 | Same as the comment No. 7. | Not clear which comment this is |
| 13874 | 8 | 8 | 10 | 8 | 10 | "relatively low mitigation costs" need to be referenced as this assertion is debatable | Amended |
| 2658 | 8 | 8 | 14 | 8 | 15 | "…that consider social acceptability and behavioural impacts." - this statement is vague, please be explicit about what you mean about both 'social acceptability' and 'behavioural impacts' | Amended. agree that it's not quite clear what this means |
| 6474 | 8 | 8 | 15 | 8 | 17 | – It is not very clear as to what is meant by “Depending upon technology developments, future transport end-use demands could overlap to a greater extent with electricity supply systems” – It’s not technology alone which would impact the future transport demand | Amended. reviewer seems to misinterpret statement….the developments affect whether batteries will be the primary driver of |
| 2659 | 8 | 8 | 15 | 8 | 17 | "Depending upon technology developments…..could overlap to a greater extent with electricity supply systems". This statement is again vague; any decarbonization strategy in transport by necessity will require electricity from renewables with a small portion of biofuels. So 'could' is a weak way to word this. | Amended text. don't agree. Not appropriate |
| 3462 | 8 | 8 | 19 | 8 | 23 | Please mention that transport efficieny is lesser than those observed in other sectors, so most of the energy used in this sector is wasted. | Rejected. Space constaints and difficulty to soundly compare (which references?), incl. other low efficiencies (coal-fired or |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 2660 | 8 | 8 | | 8 | | Delete table 8.1.1a as 8.1.1b shows intended point more clearly | Figure (not Table) deleted. referring to figures, not tables….not clear to me that the figure is all that useful…..though I'd love to see a figure that measures transport energy or GHG emissions vs. |
| 17170 | 8 | 80 | 35 | 80 | 36 | IEA 2009a and IEA 2009b are the same reference | Amended |
| 2437 | 8 | 9 | | | | This figure shows the scale of the problem - 1970 to 1990 with a 60% growth in CO2 emissions in transport and a further 36% to 2010 on a higher base - so a similar absolute increase. This is key - recent history does not suggest any reduction | Noted |
| 17766 | 8 | 9 | | | | no one can see the "indirect N2O emissions" in the figure | Agree. Will amend or incorpoate into |
| 10764 | 8 | 9 | | | 9 | It should be noted how CO2 equivalents are obtained. The picture would probably look quite different if a different time horizon or metric was used instead of GWP100. | Not in this chapter. Will be outlined in Chapter 1. suggest this be handled up |
| 10765 | 8 | 9 | | | 9 | It should be noted how CO2 equivalents are obtained. The picture would probably look quite different if a different time horizon or metric was used instead of GWP100. | Not in this chapter. Will be outlined in Chapter 1. We suggest this be handled |
| 2807 | 8 | 9 | | | | Please indicate the source. | Accpeted. |
| 2808 | 8 | 9 | | | | Please indicate the source. | Accpeted. |
| 16286 | 8 | 9 | | 9 | | I think that this figure is unnecessary as long as Fig. 8.1.2.a exists. | Shows regional differences |
| 14749 | 8 | 9 | - | 9 | - | Error in the legend - REF?. You need to explain the regional abbreviations - MAF? | Agree. |
| 15315 | 8 | 9 | 8 | | | I'd make the "from 1970-2008" into "from 1970 to 2008" (to be consistent & to remove that low-riding hyphen ;-) ). Odd to see no dark green for top band of this & the prior figure (for indirect N20 emissions). That makes readers think something is missing, or why even show that in the legend if it really doesn't factor in. Probably should have that in the "Other" categories shown. | Agree. Will amend or incorpoate into "other" |
| 15116 | 8 | 9 | 9 | 9 | 9 | To which year do the percentages 6.8% and 8.2% refer? | Amended - 2008 |
| 2661 | 8 | 9 | | 9 | | Spell out acronyms at top of table 8.1.1b | Amended |
| 2662 | 8 | 9 | 3 | 9 | 6 | Reference to AR4 - can this be updated with more recent information on growth rates? | Good to refer to earlier report- Now |
| 3411 | 8 | all | | | | Impressive piece of work! | OK |
| 17134 | 8 | Page27 | | | | COMMENTS:<br>- Only gasoline fueled Auto-motor vehicles are set to be baselines<br>- GHG emissions per passenger km travelled should be compared based on annual average occupancy of vehicles. Besides, this figure needs to also include updated PHV and BEV LCA results, otherwise this would mislead readers and societies.<br>- There is a comparison study on LCA of CO2 emission between next generation vehicle including HV and EV and public transportation including LRT, etc. (Y. Yamada, H. Kato, N. Shibata and K. Ito, Nagoya University (2011), The Institute of Life Cycle Assessment, Japan 2011, A Methodology for Choice of Low Carbon Transport Mode Fitting to Travel Scene and Transport Situation Based on LCA ). This study showed the result that automobiles can be lower carbon emitter compare to public transportation considering mass movement transportation situation, transportation situation in low DID population density and future technological innovation of fuel efficiency improvement. | Noted. Figure changed. The figure does base values on average occupancy. Assumed vehicles were empty. |
| 12576 | 9 | | | | | Legend for blue and green bars misssing (presumably these refer to the years 2006 & 2009). Also, this figure may be omitted (its objectiveness is not very clear) to meet the page limits of the chapter. | Accepted. Fix legend |
| 2901 | 9 | | | | | (Bretzke, 2005) is not in the References section at end of chapter | Accepted. Provide Henry/Katka with |
| 2902 | 9 | | | | | (Mapp, Nobbe, and Dunbar, 2011) is not in the References section at end of chapter | Accepted. Provide Henry/Katka with |
| 3508 | 9 | | | | | It is recommended to include various Green Mark Incentive Schemes, which are ongoing, but have been proven successful in upscaling the green building development take-up rate in Singapore so far. | Noted. If there are references, if there´s space |
| 2361 | 9 | | | | | The page constraint is recognized. One general idea could be to reduce text and move all key content elements to the tables. Focus the text to explain and synthesize the tables. (tricky thing…( | Accepted. Attempt more tables/figures |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 16257 | 9 | | | | | The chapter mentions in the executive summary the importance of assessing the entire lifecycle of buildings, and particularly the important role of material choice for indirect emissions saving (new construction), however, beyond these general statements, it lacks more specific information on the relative relevance of building materials for total emissions (ev. also lack of information thereof) and potential mitigation options (particuarly relevant for developing countries that are currently urbanizing). | Accepted. Reduce text and move all key facts in tables |
| 10198 | 9 | | | | | EU27: Very good that which measures and measure effects are hypothetical is stated | Noted. No action |
| 15499 | 9 | | | | | (Whole chapter) Buildings - Very well documented and complete analysis - Having said that some parts need to be completed | Noted. Not clear what reviewer wants to be completed. However, my understanding is that; after addressing all the concerns by other reviewers then |
| 7788 | 9 | | | | | Considering the huge potential through the introduction of energy-efficient appliances/equipments especially in developing countries, Chapter 9 should address more on such potentials through the introduction of highly efficient equipments. For example, Morishita & Ghishi (2010) examined the potential of energy saving in the residential sector of Brazil, through the introduction of energy-efficient household appliances such as refrigerator, air conditioning, and electric shower. According to this study, replacement of incandescent lamps by fluorescent ones corresponds to a 14.5% per year average energy saving.<br>Besides, Boardman (2004) figured out that even in the U.K., introduction of energy-efficient domestic fridges and freezers resulted in a 15% improvement in the energy efficiency in 15 months.<br><br>(Claudia Morishita, Enedir Ghishi, “Assessment of the impact of energy-efficient household appliances on the electricity consumption in the residential sector of Brazil” Congress paper 244, World Energy Council (2010))<br>(B. Boardman, “New directions for household energy efficiency: evidence from the UK”, Energy Policy, 32, 1923-1933 (2004)) | Accepted. A separate section on Appliances and equipment and a summary table have been added. Our decision has been to not discuss specific technologies, but rather, to refer to sources of detailed information. |
| 2193 | 9 | | | | | Energy intensities are given in MegaJoules/m2 year in reference (Amstalden et al., 2007). A heating energy intensity of 195 kWh/m2 year (equal to 700 MJ/m2 year) should accordingly be mentionned in Table 9.4 at the corresponding position with a reduction of energy use down to 90 kWh/m2 year (equal to 320 MJ/m2 year). | Noted. |
| 2196 | 9 | | | | | MINERGIE-P (instead of MINERGIE-P5) should be written for Reg CH and reference [18]. | Rejected. Not applicable now - this level |
| 2199 | 9 | | | | | The Minergie Standard currently very favourable situation, discussed for page 17 (see comment above), should also be mentionned here (capture of 25% of the Swiss market of new constructions in 2012). | Rejected. Short space allowed |
| 17970 | 9 | | | | | Do you think that there are comoparable metrics in other chapters that could be compared to or even included in this figure? | Noted. The other sectoral chapters do not discuss analytically the employment impacts as a co-benefit of mitigation actions (there are only simple references). In the literature there are similar metrics at least for RES technologies. However, we think that |
| 18886 | 9 | | | | | As this table holds very much information that will probably be lost to the policy maker, try to consider extracting the essence of this table into figures, e.g. there could be a figure with y-axis "difference to baseline [%]" and another with y-axis "difference to base year". On the x-axis you would have for both a continuous part "delta time [yr]" and one column without time (for before/after data giving no time frame). | Accepted. Consider suggestion |
| 18889 | 9 | | | | | Is it possible to convert numbers in this table to LCCE? If so, that would be great! | Rejected. Would lose information |
| 18890 | 9 | | | | | Please make a figure from the LCCEs contained in the table. | Rejected. Would lose information |
| 18880 | 9 | | | | | Though there was very positive feedback to this figure at the Expert Review Meeting, having this figure is problematic, as in my view it is problematic to single out one or two scenarios. | Noted. Will be considered |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 18893 | 9 | | | | | Given the arguments in line 15-19 I suggest to change (or ammend) the figure and have separate ones for the 5 world regions that we are using throughout the report (or for 3: developed, developing, EIT). As the figure is hard to read, please consider adding ranges at the right (like SRREN Figure SPM.9) for each of the six mitigation categories for the year 2050. In the text you could also take this figure as reason to discuss that the decarbonization of the electricity sector is not covered in your chapter, so that if this would take place and would be included the ranges would move downward. Please discuss with Ch.7 where you will centrally discuss this issue so that you can reference it from different points in your chapter as needed. | Noted. Will be considered |
| 18895 | 9 | | | | | Please make clearer which studies are sectoral and which IAM - this would pobably be interesting to identify possible systematic differences. (I understand that currently there is only on sectoral study.) | Noted. Will be considered |
| 7557 | 9 | | | | | This section will be eliminated because other sections can follow. | Rejected. Required FAQs |
| 7558 | 9 | | | | | This section will be eliminated or shortened because almost Q&A are contained in the body. | Rejected. Required FAQs |
| 7553 | 9 | | | | | This section will be eliminated or shortened especially 9.5.3. (For example, Soot emissions from cooking) | Accepted. Will be shortened |
| 7556 | 9 | | | | | This section will be eliminated or shortened especially 9.7.3. (For example, Environmental and health effects) | Noted. Taken into account. The text has been revised considerably and is more focued on buildings sector following the |
| 11698 | 9 | | | | | Section 9.1 contains only one subsection 9.1.1. If the summary of AR4 is only showing importance and GHG reduction potential of building sector, it should be unified into section 9.2. Alternatively, it should be outlined the "extensive discussion of the wide range of technical and design measures" of AR4, which is written at the line 22 to 23 of page 15. | Accepted. |
| 18860 | 9 | | | | | consider adding to the first paragraph the questions the chapter tries to answer | Accepted. |
| 18876 | 9 | | | | | Sort by size (either blue or green), this will help get more out of the figure. | Noted. Will consider |
| 9104 | 9 | | | | | Several statements and expressions should be described more accurately. The energy efficiency standard must be internationally harmonized. When a country's standard or measurement method is different from others, the promotion of efficient appliances will be delayed or can not be made perfectly there. The Japanese Top-runner Program is not MEPS. As the policies for market transformation depend on the status and conditions of the target market, they must be applied very carefully. Too many labels cause the confusion in the market. For example, there are detailed descriptions in the 'Good Practices Handbook for Market Transformation (Asia Pacific Partnership on Clean Development and Climate, 2008).' | Noted. Will consider |
| 3506 | 9 | | | | | It is recommended to include in this section a sub-section about building gross floor area incentive scheme. | Noted. Will consider |
| 9105 | 9 | | | | | same as above | Noted. Will consider |
| 18854 | 9 | | | | | Should it not rather be "in the building sector" rather than "in buildings"? | Editorial. |
| 8855 | 9 | | | | | Exteremely important section - There is a strong need to expand this section with statements on knowledge gaps and a summary of structured recommendations for future work; while reducing the pages other sections. Let's think about how will AR6 come back and focus in a few years compared with the completed AR5. | Rejected. Strict page allocation, unfortunately |
| 3490 | 9 | | | | | It is recommended to add a sub-session (called 9.2.3.3) to discuss about another major driver, which is the rise of household income in developing countries.<br>For more discussion about the driver, please refer to [Cam C.N.W. (2012). Technologies for Climate Change Mitigation: Building Sector. Denmark: UNEP Riso Centre.] | Noted. Urbanization and economic activity |
| 12578 | 9 | | | | | Ideas expressed here overlap with 9.2.3.1 - may be combined | Accepted. Avoid overlap |
| 9102 | 9 | | | | | There are no descriptions about Japanese frontier activities such as the CO2 zero emission house by the combination of energy-efficient equipments, solar battery, fuel cell co-generation system, Lithium ion rechargeable battery and their linkage by HEMS with efficient house insulations ( N.Shibaike and T.Hajima, Concept of a Lifestyle with Net Zero CO2 Emissions, Proceedings of Care Innovation 2010, CARE Electronics, 2010, 1.5.2. ). | Rejected. Our decision has been to not discuss specific technologies, but rather, to refer to general sources of detailed information. |
| 9103 | 9 | | | | | same asa above | Rejected. Same as above (comment no |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 2879 | 9 | | | | | Add Ft. Polk military base 4000-home retrofit study to the table: Building type & location - 1994-1995 -- 4003 homes on Ft. Polk military base in Louisiana, USA retrofited with package of energy savings measures predominantly based on ground-source heat pumps under a 20-year energy savings performance contract (ESPC) to an energy services company (ESCO); Energy savings - 32.5% reduction in pre-retrofit electrical energy use, 40% reduction in electric peak demand, complete elimination of natural gas usage in base housing (all figures apply to total base housing); Economics - estimated annual energy and system maintenance cost savings to Ft. Polk is $3.2 million ; References - (Hughes and Shonder, 1998; Shonder and Hughes, 1997a; Shonder and Hughes, 1997b) | Rejected. Old reference - we've generally stuck to post-AR4. Even the case studies already in the FOD have been eliminated, following other comments - now we present only generalized results (but for separate end use categories) |
| 3492 | 9 | | | | | If case studies are mentioned, it is more appropriate for a report at the global scale like AR5 to make an attempt to include case studies from all continents or climatic regions, rather than overtly focus on only a few countries. | Noted. If case studies are retained, we've attempted to get what we can from all regions. |
| 12847 | 9 | | | | | A prominent example that could be added here is that the Empire State Building is slated to cut energy use by 38% from 2013 on, saving an estimated $4.4 million a year. Monitoring of the effectiveness of retrofit measures so far indicates that the project is on track to meet its goals. See: http://www.esbnyc.com/documents/sustainability/ESB_2011_Annual_Savings_Report.pdf | Noted. |
| 18878 | 9 | | | | | Maybe it is possible to develop a figure on the findings in this section, either giving % savings compared to BAU or by showing a qualitative cascade (or ranges) of which measures bring which improvements. | Noted. Will be considered |
| 3493 | 9 | | | | | This section should include a few additional paragraphs, highlighting the relevant technologies that have the ability to circumvent/mitigate the issues caused by negative behavioural aspects. | Accepted. Regulation for energy saving can tackle it. |
| 7552 | 9 | | | | | Eco-point system for housing in Japan has to be mentioned:<br>http://www.env.go.jp/en/wpaper/2011/pdf/22_Chapter4-3.pdf<br>For example, insert the following sentences.<br>The eco-point system for housing is similar to the one for home appliances. The objectives of the eco-point system for housing are to promote global warming countermeasures and revitalize the economy. Under this system, users can receive points for the construction of an “eco-house” or for doing a renovation with energy saving features, and can exchange those points for various products or for additional renovations. As a result of the introduction of this system, energy saving eco-houses are increasingly widespread. Since the system started, the total number of renovations and new construction combined increased from approximately 3,000 in March 2010 to approximately 75,000 in March 2011 (MOE Japan 2011). | Accepted. Consider suggestion by Writing Team. Add ‘housing eco-point system’ to "Comments" column "Grants and subsidies are economic incentive, in the form of funds transfer" row in Table 9.10. |
| 8852 | 9 | | | | | Shorten the section, improve the subsection 9.4.4 on costs by adding some quantified data. | Accepted. 1. Shorten entire section 2. Improve section 9.4.4 |
| 3494 | 9 | | | | | This section, “Urban Form and Human Settlement”, is too superficial, and indeed needs to rewrite substantially. In this category, land use planning is only one of many important affiliate plans that influence green house gas emissions. Other climate impactful affiliate plans are (1) green and blue network plan, (2) site coverage plan, (3) plot ratio plan, (4) building height plan, (5) amenities distribution plan, etc. It is highly recommended that each of the above affiliate components/plan is deserved to have one dedicated sub-section for sufficient analysis and assessment. | Accepted. To be discussed with Chapter 12 where the substantive section should be |
| 3496 | 9 | | | | | In this section, while “heating technologies" were received much attention by the authors, various "cooling technologies", including "district cooling" have not been adequately captured. | Accepted. 1. Provide clarity about the fact that cooling is generally provided by electricity and… |
| 3497 | 9 | | | | | It is recommended to include in the discussion the principle: plan for expansion, but do not size it. Please refer to [Graham C. I. (2009). High-Performance HVAC. In Whole Building Design Guide. Washington D.C.: National Institute of Building Sciences.] | Rejected. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 4578 | 9 | | | | | Along with climate change feedbacks in energy consumption for buildings, there is also a potentially strong feedback between renewable energy policy, energy system transformations and building energy consumption. As energy systems are transformed from fossil-fuel-dominance to renewables, there may be advantages to increasing electricity shares in building energy consumption, replacing natural gas or other fossil-based direct combustion. At present, in most areas, however, increasing electricity use in the building sector would result in an increase in CO2 emissions. If buildings are constructed with current energy system parameters in mind, then the lock-in effects make changes to dramatically lower future emissions more difficult. | Rejected. Discussed in 9.4 No need in here. |
| 8853 | 9 | | | | | Very important section. However, results from limited studies cited in this section could present a bias and significant uncertainties in the predictions (e.g., 9.5.1). As a whole, we need more studies here and probably shall state knowledge gap and needs/recommendations for further studies, on global and regional levels. References and findings in section 9.5.2 (geo-engineering) seems to be US centric, shall add more validated outcomes from regional studies in developing worlds, e.g., China, India, Indonesia, etc. An example citation: Tengfang Xu, Jayant Sathaye, Hashem Akbari, Vishal Garg, Surekha Tetali. 2012. Quantifying the direct benefits of cool roofs in an urban setting: Reduced cooling energy use and lowered greenhouse gas emissions. Building and Environment, Volume 48, February 2012, Pages 1–6. http://dx.doi.org/10.1016/j.buildenv.2011.08.011. | Noted. Taken into account.<br>We didn't find additional studies on global level but several others on national and regional level confirm the results presented in our text (less heating, more cooling, increased electrification). We included in the text some additional references regarding national/regional studies. |
| 18863 | 9 | | | | | Add legend explaining which is 2005 and which 2000. Consider using colour coding for the 5 economic world regions we are using in the report, so that a (possible) clustering can bee seen. For the years 2000 could be coloured a bit greyish to distinguish the years. | Rejected. Not relevant to 9.5. It belongs to 9.4 |
| 7554 | 9 | | | | | There are global activities such as GSEP Coolrool & Pavement WG and has to be mentioned.<br>For example, insert the following sentences.<br>It is estimated that increasing the earth's reflectivity by 10 percent by adopting cool roofs and surfaces in hot climates would have a cooling effect equivalent to reducing greenhouse gas emissions by 44 billion metric tons of carbon dioxide over the 20-year life of the roof (2.2 billion metric tons annually). That is the rough equivalent of either eliminating global anthropogenic emissions for more than a year or taking 1 billion cars off the road for 11 years (GSEP 2012).<br>http://www.cleanenergyministerial.org/our_work/buildings_and_industry/cool_roofs.html | Accepted. Will see how can be addressed. |
| 7555 | 9 | | | | | Other related report can be found at a the following site.<br>http://www.miracool.jp/wp-content/uploads/thesis16.pdf | Accepted. Will see how can be addressed. |
| 18883 | 9 | | | | | Consider converting numbers in this section into a figure or table | Accepted. Will see how can be |
| 12582 | 9 | | | | | General comment: this section may be shortened (thereby reducing the overall length of the chapter) | Accepted. Has been shortened and re- |
| 8854 | 9 | | | | | Extremely important section. However, ther is a lack of cost per energy saving data with known uncertainties and consistent rigors among the data compiled. Also, while it may help reader understand the role of payback time in common decision-making practices by introducing such concept. I view this rather disturbing in the IPCC report because it is not a good metric/criterium to use, let alone to promote it whether or not it's intentional. For the worth of it, I'd suggest the section to be written surrounding the concept of cost of conserved energy as a way to judge cost effectiveness.... As a whole, we need more studies here and shall state knowledge gap and needs/recommendations for further studies, on global and regional levels, on different time frames. Again, references and findings in section 9.6 seems to be model based, with huge uncertainties not necessarily acknowledged. We shall add more validated outcomes from regional studies in developed and developing worlds, e.g., China, India, Indonesia, Brazil, etc. | Noted. LCCE will be computed where-ever possible if not already published. We genrally refer to CCE, but also mention payback time when it is short and is given in the cited literature. We agree with the point that payback time is the wrong metric when the payback time is long but the CCE is still less than the cost of energy. We have not been able to find any studies from developing countries giving the incremental cost of |
| 18864 | 9 | | | | | As the cooling/heating needs in different countries very much depend on the climate, this is besides the stage of development probably one of the main drivers. So I suggest to point this out in the text or even cluster by different climates focus on the other factors. | Rejected. Comment unclear |
| 18885 | 9 | | | | | This section has no text, please add to explain table. | Accepted. Editorial |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 17969 | 9 | | | | | Introductory sentences like the ones in Chapter 10 might be a good idea to prepare the reader for the following discussions: "Besides economic cost aspects, several other aspects have implications on the final deployment of mitigation technologies. Co-benefits, co-costs, risks and uncertainties associated with alternative mitigation technologies as well as public perception thereof can affect investment decisions of companies and priority setting of governments." | Accepeted. Text revised. |
| 18865 | 9 | | | | | Consider changing this figure in the following manner: In order to see how different the development is throughout the world (and to hint at what might be coming with business-as-usual development) giving all numbers PER CAPITA might be more insightful. To preserve the info contained in the current figure, three stacked bars could be added, one for each building type, stacking the absolute number of the different world regions (colour code should then be for these bars for the world regions). This would allow better comparision between the regions and give the total world numbers, too. | Rejected. This comment is not related to the figure included in Section 9.7 |
| 12583 | 9 | | | | | Scope of shortening with focus on building related aspects only | Accepted. Text shortened. |
| 3503 | 9 | | | | | It is recommended to include a sub-section on the benefits of application of urban green roofs and vertical green towards reduction of urban heat island effect, and biodiversity restoration in urban setting. For details, please refer to [Cam C.N.W. (2012). Technologies for Climate Change Mitigation: Building Sector. Denmark: UNEP Riso Centre.] | Accepted. Text added. |
| 17974 | 9 | | | | | This section should rather be moved to section 9.7.2 since it related to an economic effect (i.e. productivity) rather than to helath. | Accepted. |
| 17976 | 9 | | | | | This section is solely about the rebound effect which is not a technological risk, but an economic response to relative prices changes. It should thus be discussed in the section 9.7.2.<br>Please consider a broader discussion of risks and uncertainties along the classification of risks and uncertainties provided in Section 6.7. Please liaise with the other sector chapter LAs to discuss the process by which a more consistent approach can be reached. | Accepted. Taken into account. The rebound effect is now discussed under 9.7.2. We mention risks associated with mitigation (see 9.7.1) but in the buildings sector risks are less important |
| 18853 | 9 | | | | | This section and Section 9.7.5 both have "public perception" in the title - try to clarify the titles so that it becomes clearer which aspects are discussed in which section. | Accepted. |
| 17977 | 9 | | | | | This section is instutional aspects that should be discussed in the policy section; but the section does not discuss public perception of mitigation actions in the building sector which seems to be a gap in the current state of the chapter. | Accepted. Taken into account. There are some overlays between capacity building and policies, here addressed |
| 17978 | 9 | | | | | An recommended usage of the introductory sentence to this section to the other Chapters to refer to the agreement reached in Wellington (p. 36) which might be helpful for readers: "Barriers and opportunities are referred to as conditions that hinder or facilitate the implementation of the analyzed measures." | Accepted. Incorporated |
| 18894 | 9 | | | | | "compare a few selected bottom-up and top-down building sector sceanrios": Please discuss this e.g. at SIE-3, as singling out few IAM scenarios will probably be problematic. | Noted. Will consider |
| 3093 | 9 | | | | | This is quite long and uses a lot of jargon. This should be cut to around 2 pages similar to other sector chapters (e.g. industry & agriculture). For example, the last section (from line 37 on page 6 can be cut - far too much detail on methodology that is unnecessary for an exec summary) | Accepted. |
| 2908 | 9 | | | | | The following references seem to not be cited anywhere in Chapter 9: ACEEE (2010); AEA (2011); Anderson and Leach (2009); APERC (2010); BETMG (2012); BPIE (2011); Cabeza et al (2013); CB (2012); CPI (2011); Dascalaki and Santamouris (2002); DECC (2011); Dili et al (2010); DPMT (2009); ECEE (2011); Enlighten (2010); EPC (2008); EU (2002); FI (2005); GMCF (2009); Gov't of Latvia (2011); Gov't of Slovakia (2011b); Gov't of Finland (2011a); Gov't of Ireland (2011); Jarvey (2008); Hayes et al (2011); Healy (2004); Holmgren (2006); IEA (2003); Kahn (2008); Kazuari (2007); Knigge and Gorlach (2005); LDA (2011); Li and Colombier (2011); Luttmer (2006); MacKellar et al (1995); MIKR (2011); Missaoui and Mourtada (2010); MLIT (2010b); Montanya et al (2009); Pavan (2008); Price et al (2011); Schneiders et al (2009); Togeby et al (2009); Uitdenbogerd et al (2009); UK DE (2011); UNEP Risoe (2012); UNHSP (2009); Urge-Vorsatz and Tirado Herrero (2012); Van Wie McGrory et al (2006); Wiel and McMahon (2005). | Accepted. Find these references |

|---|---|---|---|---|---|---|---|
| 2854 | 9 | 0 | | | | In many places (example - Executive Summary, pg 1, line 1) there are cmments like [high agreement, robust evidence] or similar. Why are these needed? I suggest deleting and several lines of texxt could be eliminated. | Rejected. Mandatory inclusion |
| 8974 | 9 | 0 | | | | There few sections that the titles do not reflect the contents. E.g. 9.3.3.3, 9.6.3.2, and 9.7.4. Though this review shall not make any comment on the language, some sections are not easy to understand due to the structures of the sentences | Accepted. Problems fixed |
| 12339 | 9 | 0 | | | | General comment: This chapter should also deal with the cooling agents used in air-conditioning equipment, heat-pumps and commercial refrigeration. Rationale: The use of cooling equipment in buildings is increasing and choices with regard to the the phasing out of existing agents (CFCs, HCFCs anf HFCs) and the alternatives (HFCs, natural agents, natural cooling) will have significant implications on total CO2-equivalent emissions from the sector.The IPCC special report "Safeguarding the Ozone Layer and the Global Climate System - Issues Related to Hydrofluorcarbons and Perfluorcarbons" (Chapter 4 and 5), as well as more recent publications, might serve as a basis for this coverage. | Accepted. |
| 16948 | 9 | 0 | | | | I regret I have not had time to review the Sectoral chapters in depth. It may be interesting to illuminate the hypothesis that the Buildings sector is the most heavily dependent upon “First Domain” characteristic, and in particular to liaise with FOD Chapter 2 on how they relate to “System 1” decision-making systems laid out there. This is the broad suggestion laid out in the structure-setting Chapter 3 of Grubb, Hourcade and Neuhoff, Planetary Economics: the Three Domains of Sustainable Energy Development, Taylor & Francis forthcoming (Chapters 1 – 5 submitted, others in draft available on request). See also Chapters 4 and 5 on the theory and evidence respectively around energy efficiency policies.<br>The authors also really need to liaise with Chapter 3 discussion of cost curves to try and bring some consistency to the IPCC report. | Accepted. 1. Liaise with Chapters 2 & 3; 2. Check cost curves |
| 2186 | 9 | 0 | | | | Chapter 9 gives an excellent overview of the current GHG emission trends and mitigation options of the building sector for the upcoming decades. It outlines the potential of state-of-the-art green building technologies with a focus on the contribution and opportunities offered by building refurbishments. The chapter is written using a clear style and includes enough scientific references to convince most readers about the importance of the building sector for the mitigation of climate changest. However repetitions can be observed in many sections of Chapter 9 and could simply be avoided by a further text polishing in order to reduce the pages number down to 40 pages (instead of 56 pages). | Accepted. Repetitions will be dealt with. |
| 15678 | 9 | 0 | | | | Chapter 9 is party difficult to read, because not all sections and subsections are at the same "level". With that, I mean that some sections with rather relevant information are put in subsubsections, whether less relevant information or additional examples are put in sections. In my comments, I now and then tried to rearrange some sections and subsections in such a way that it became more understandable to me. But it's of course just my opion. | Accepted. Re-structure the chapter; albeit within the constraints of the headings providerd by IPCC; which we have very little room to manoeuvre. |
| 18769 | 9 | 0 | | | | Please consider discussing planned obsolesence in context of sustainability or reference Ch.10 where this might be centrally discussed. | Noted. Covered indirectly. Will be done directly if a reference is found |
| 18972 | 9 | 0 | | | | General Comment: Storyline and strategies. The chapter is already in a good state, but please try to focus it more on answering: What are the different sectoral options/pathways to reduce emissions? What is their potential? What do they cost? What are the policy instruments that can facilitate this? And what are the trade-offs? Further, better carve out the barriers that hinder potentials being realized. For this consider shortening 9.1 through 9.6, particularly 9.3, (see comment on redundancies) and reorganizing 9.7 through 9.10. Try to introduce pros and cons of different options and trade-offs between them (e.g. NZEB, Passive House). Ensure that the approach you take on this is compatible with the other sectoral chapters to enable comparison and possible synthesis. | Accepted. 1. Story lines and strategies to be strenthened; 2. Re-organized 9.3 & 9.6; 3. Shorten section 9.1 and 9.2; 4. Reorganise sections 9.7-9.10 |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 18973 | 9 | 0 | | | | General Comment: Kaya identity. The Kaya identity is already well used in structuring the chapter. There are some section, though, that would be good to also use this approach, e.g. the policy section, where for different policies it could be described to which Kaya component (and how much) they could contribute to. Also, it would be very good if now the quantitative side of the Kaya approach could be taken on – if sufficient data exists. | Accepted. Include quantitative side of Kaya identity |
| 18974 | 9 | 0 | | | | General Comment: Trends and drivers. Try to introduce forecasts/scenarios about expected increase of floor space, change of number/types of buildings, etc. and provide (e.g. back-of-the-envelope calculation) numbers incl. consequences (e.g. contributions to Kaya components). | Accepted. Introduce forecasts/scenarios about expected increase in floor space, … |
| 18975 | 9 | 0 | | | | General Comment: Redundancies. There are overlaps and redundancies between Sections 9.3, 9.6 and 9.9, especially concerning mitigation options. Technologies could be presented more briefly. | Accepted. Eliminated redundancies between 9.3, 9.6 and 9.9 |
| 18976 | 9 | 0 | | | | General Comment: For all sectoral chapters there must be more clarity about what is covered in 9.6 and what in 9.9. The coming meetings should work on this. | Accepted. Streamlined |
| 18977 | 9 | 0 | | | | General Comment: Unified metrics. Unifying metrics would allow further comparison and synthesis. Sections 9.3.3 and 9.3.4 are very detailed and should be synthesized, e.g. – if possible – by unified metrics and by giving ranges. Please also try to be transparent about and possibly standardize discount rates and economic payback time. | Accepted. Section 9.3 completely rewritten with these comments in mind |
| 18978 | 9 | 0 | | | | General Comment: Interlinkage. Improve the (explicit) linkage to Chapter 12. | Accepted. |
| 18979 | 9 | 0 | | | | General Comment: Key message. Have a more prominent discussion of the danger of lock-in including quantification if possible [Section 9.4.5] | Accepted. |
| 18980 | 9 | 0 | | | | The chapter is still over its page limit. I suggest to particularly shorten Section 9.3 | Accepted. Shorten section 9.3 |
| 18981 | 9 | 0 | | | | Try to include more bottom-up studies in the transformation pathways section. | Noted. Within strict page limit |
| 18982 | 9 | 0 | | | | When evaluation policies, more attention needs to be given to multi-level governance | Noted. Where specific to building sector |
| 3648 | 9 | 0 | 0 | | | Overuse of abbreviations. Please reduce. | Accepted. Check all abbreviations |
| 7703 | 9 | 1 | | 86 | | I appreciate that much of the literature in this field is in the grey literature, including government reports. Just relying on the white literature greatly reduces the strength of the conclusions that can be reached. Personally, I have no problem reporting grey literature. But one should be very circumspect about drawing broad conclusions about how much mitigtion can be achieved at what cost from that grey literature. I would suggest backing off on the conclusions so that only those that are clearly supported appear. | Noted. Will consider |
| 9215 | 9 | 1 | 1 | 1 | 1 | Some contents of Executive Summary are not in the body text. So corresponding descriptions are necessary in the body text. Especially, since efficient improvement of energy consumption appliances are essential for CO2 reduction, latest information of technologies should be introduced in the body text. | Noted. It is better that Executive summary and body text have the same structure. Usually readers expect the summary summarizes the body text. Therefore, it is favorable to conform the |
| 4584 | 9 | 10 | | | | (Labeled as "Table 10.1") It seems that PE demand would also be an important metric, since carbon emissions will depend on that. | Noted. Will consider |
| 9545 | 9 | 10 | 7 | 10 | 10 | Please, replace text with the following; residential electricity consumption has been growing at an average of 3.4% globally between 1990 and 2006. It is mainly consumed in cooking, water heating, space heating, space cooling, lighting, and the use of appliances and electronic equipment. The share of electricity in each end-use category varies among countries depending on country circumstances, particularly climatic conditions and economic development level. (Energy efficiency policy and carbon pricing, 2011, IEA, p17). Energy consumption in the buildings sector is reduced by around one-third of the Baseline scenario level in 2050 (Technology roadmap Energy-efficient Building,2011, IEA, p6). Energy savings in residential space heating account for around a quarter of the savings.(ETP 2010, IEA, P223) | Noted. Grey literature? These detalis have been removed in FOD for saving space. Not the place for energy savings. |
| 3110 | 9 | 11 | | | | surely there are some more up to date figures than 2005? | Accepted. Seek for recent data; It refers to Table 9.2 and figure 9.5 |

| 6624 | 9 | 14 | 30 | | 31 | The first two sentences of section 9.2.3.2 are not clear | Accepted. Delete phrase as suggested by Writing Team. DELETE "Such totals do not show, however, huge inequalities." |
| 6625 | 9 | 14 | 33 | | 35 | This sentence reads unessential | Rejected. None. It's one of our key |
| 2888 | 9 | 14 | 37 | 14 | 43 | (WBSCD, 2006) is not in the References section at end of chapter | Editorial. |
| 7492 | 9 | 14 | 38 | 14 | 43 | "Providing energy to the more than 1 billion people without access to electricity (Pachauri 2012), as well as to the 2.7 billion people, nearly 40% of humanity (Hailu 2012), who do not have clean cooking facilities is one of the world's most critical development challenges. The ways these energy services are provided will significantly determine building-related emissions, since energy sources and technologies vary greatly between regions (WBCSD 2006)". Most rural people have access to kerosene and urban people to coal, kerosene LPG/natural gas. They also have access to electricity. For rural people it is availability and cost that are the important factors and for urban people it is the coost of the various fuel type. Electricity is an expensive cooking fuel and in many cases the supply is unreliable. Simple initiatives can provide 'clean cooking facilities'. They include: better ventilation if cooking indoors: dryer biomass fuel: in improved and more efficient stoves (with chimney for indoor cooking): and better kitchen practices etc. Using unprocessed biomass and charcoal are important household fuels as Figure 9.8 indicates. They will be around for many decades so these households should be helped. I should add, that wood etc. are important fuels in the service sector in developing countries – about 10% of household energy use. This is not shown in Figure 9.8. | Rejected. Too much detail, not enough space. Biomass in services sector is actually reflected in Fig. 9.8 |
| 2889 | 9 | 14 | 39 | 14 | 39 | (Pachauri, 2012) is not in the References section at end of chapter | Accepted. |
| 2874 | 9 | 14 | 39 | 14 | 40 | delete the phrase ", nearly 40% of humanity (Hailu 2012)" -- Hailu 2012 is not in the References Section at end of the chapter | Accepted. |
| 6626 | 9 | 14 | 39 | | | I couldn't find Pachauri 2012 in the reference list | Accepted. |
| 9427 | 9 | 14 | 4 | 14 | 8 | ・ Addition is needed as shown below.<br>・ To avoid misunderstanding, following description is necessary.<br>(following the passage of "By 2050, emissions from the building sector, including those associated with electricity use, willcould nearly double from 8.1 Gt to 15.2 Gt CO2 according IEA Energy technology Perspective reference scenario (IEA, 2010). ")<br>Currently, both space heating and cooling as well as hot water are estimated to account for roughly half of global energy consumption in buildings. Most of CO2 emissions from space heating and water heating are caused by combustion of fossil fuels and also the demand for cooling is rapidly increasing in developing countries (IEA Technology Roadmap, 2011 and IEA-ETSAP and IRENA Technology Policy Brief E19, 2012). ・ Refer to the following<br>documents.<br><br>①IEA Technology Roadmap<br>Energy-efficient Buildings: Heating and Cooling Equipment<br>②IEA-ETSAP and IRENA © Technology Policy Brief E19 – March 2012 - www.etsap.org - www.irena.org | Rejected. Don't think this explanation in really necessary taking into account our space limit. |
| 2890 | 9 | 14 | 40 | 14 | 40 | (Hailu, 2012) is not in the References section at end of chapter | Accepted. |

|---|---|---|---|---|---|---|---|
| 3649 | 9 | 14 | 43 | 14 | 43 | Please add "E.g. in rural and urban China, coal lost shares as the most important heat energy supplier. Especially in urban areas, coal was substituted by natural gas. In rural areas, the trend for coal is similar, however here, coal as the main primary energy supplier was substituted by electricity as a secondary energy supplier which to a large extent is also fuelled by coal. As even high-end ultra-super critical power plants only have an energy efficiency of 45% (co-generation is not used as there is rarely district heating in rural areas), in the end, the coal consumption in rural areas did not change. Coal stoves with a low energy efficiency of maybe 50% were substituted with electricity generated with an energy efficiency way below 45%. Average rural power generation efficiency may be estimated with between 30% and 35%. However, convenience and indoor pollution decreased through the utilization of electricity for heating purposes (Oberheitmann, 2012)". Cite as: Oberheitmann, a: (2012). CO2-emission reduction in China's residential building sector and contribution to the national climate change mitigation targets in 2020. Mitigation and Adaptation Strategies for Global Change, 17, 769-791 (R). DOI 10.1007s11027-011-9343-5. | Noted. Too much detail for an example of a single country (altough a significant one) given our space restriction. I could try to get the main idea in one sentence Provide a short sentence to summarise the whole idea |
| 18867 | 9 | 14 | 5 | | | Grammar/orthography: "are expected to" instead of "willcould" | Accepted. Check and deal with grammar |
| 18872 | 9 | 14 | 6 | | | "reference scenario": I suggest to state that "reference" means "BAU" as this might not be clear otherwise to everyone - but maybe "reference" is also well enough established. | Accepted. Clarify usae of "reference scenario" or BAU |
| 2189 | 9 | 14 | 9 | 14 | 28 | Urbanization can lead to more efficient and sustainable construction forms than rural areas, in particular in regard to transportation: this should be mentionned. See reference Dujardin S. at al, Home-to-work commuting, urban form and potential energy savings: a local cale approach to regional statistics, Transpoatation Resaerch part A: Policy and Practice, 46(7), pp. 1054-1065, 2012. | Rejected. For Chapter 12. |
| 3096 | 9 | 14 | | | | I presume an important issue here is that urbanization tends to be accompanied by higher energy service requirements (e.g. air con, appliances) as people's incomes tend to be higher in urban than in rural areas? | Accepted. Review text |
| 8975 | 9 | 14 | 22 | 14 | 24 | Suggest to use the same basis of growth rate for Japan (e.g. m2 per year). That would be clearer and fair for comparisons. | Rejected. Unclear |
| 6622 | 9 | 14 | | | | This discussion does not provide an intuitive understanding of the issue of urbanization. On the one hand it seems like it increases energy consumption, but on the other hand it is stated later in the text (section 9.4.1) that compact urban forms can lower energy consumption. The two effects should be very briefly commented on | Noted. They are complementary perspectives of urbanization. 9.2 is about drivers and trends, and urbanization as a driver of energy use, while 9.4 compares urban forms and their impacts on |
| 7029 | 9 | 14 of 86 | 8 | 14 of 86 | 8 | Add "and so, it'd be worthy to transfer them modern technologies and technologies for renewable energy sources, in order to reduce those emissions". | Rejected. Don't think this is the place to such statement |
| 7030 | 9 | 14 of 86 | 18 | 14 of 86 | 18 | Substitute "industrialized" for "developed", after "with 1% in", around the middle of the line. | Accepted. For consistency replace "industrialised " with "developed" |
| 2358 | 9 | 15 | | | | Good figure, examine whether a "post abatement view" of the right hand side column (energy by usage type) is possible, will give an indication how much you can reduce each usage bucket | Accepted. Include iconic graph |
| 6627 | 9 | 15 | | | | Figure is very hard to read | Accepted. enlarge figure |
| 2875 | 9 | 15 | 10 | 15 | 10 | change ". . .buildings (Jennings et al., 2011). In OECD countries, the rate of new construction is low. Annual new. . ." to ". . .new buildings (Jennings et al., 2011). In OECD countries, annual new. . ." | Rejected. Not agree |
| 18871 | 9 | 15 | 12 | | | "0.6% - 16%": Please check whether that wide range is actually correct. | Accepted. Check correctness of range |
| 2876 | 9 | 15 | 13 | 15 | 14 | delete the sentence "Retrofit of existing buildings is an important strategy for developed stocks." | Accepted. Delete sentence s requested |
| 2877 | 9 | 15 | 15 | 15 | 16 | change ". . .the 1990s. In China, for example, more than 90% of buildings have been built since 1996." to ". . .the 1990s - more than 90% in China." | Accepted. Change as suggested |
| 12577 | 9 | 15 | 17 | | 19 | diefference between'buildings' and 'accommodation' is not clear | Accepted. Change as suggested |
| 4580 | 9 | 15 | 17 | 15 | 19 | Comment seems to be misplaced here - out of context | Accepted. Change as suggested |
| 2891 | 9 | 15 | 5 | 15 | 5 | (IEA ETP 2012 data) is not in the References section at end of chapter | Accepted. |

|---|---|---|---|---|---|---|---|
| 11711 | 9 | 15 | 20 | 24 | 3 | Compared to corresponding part of chapter 8 and 10, it is strange that there is no description on technology inventories. At least, it should be include the table of technologies.<br>“Regional specificities” in building sector means not only economic development but also difference in climate. There are different kind of applicable technologies between cold region that require insulation and energy cascading and hot region that require cooling and shading. This point should be emphasized. | Noted. Our decision has been to not discuss specific technologies, but rather, to refer to sources of detailed information. |
| 6628 | 9 | 15 | | 16 | | This section is too long. First, it is redundant (at least in its intention) with section 9.1.1. Second, even though the subsequent section states that there has not been any major technological developments since the AR4, the key points of the AR4 don't need to be described again with so much detail. | Rejected. The summary of AR4 is short compared to the material it summarizes, and all the points made here need to be |
| 3491 | 9 | 15 of 86 | 15 | | 16 | Please provide reference or source for the claim of "more than 90% of buildings have been built since 1996". | Accepted. |
| 7031 | 9 | 15 of 86 | 7 | 15 of 86 | 7 | Substitute "industrialized" for "developed" before "and developing", at the last part of the line. | Accepted. Substitude "industrialized" |
| 12579 | 9 | 16 | | 17 | | Another subsection under 9.3 may be intoduced to address the building embodied energy (EEn) issue (reference material will be e-mailed). Since urban India will undergo huge additional residential floor space in the coming years and EEn of these multistoried apartments are in the range of 10-12 GJ/Sq m, the cumulative EEn can no longer be ignored. | Rejected. We already have a subsection on LCA, which involves embodied energy. |
| 2892 | 9 | 16 | 13 | 16 | 13 | (Lewis, 2004) is not in the References section at end of chapter | Accepted. To be done |
| 2190 | 9 | 16 | 21 | 16 | 22 | Item (ii) should also include "appropriate window shadings" | Rejected. Our decision has been to not discuss specific technologies, but rather, to refer to sources of detailed |
| 7723 | 9 | 16 | 34 | 16 | 48 | Rigid polyurethane foam is one of the most efficient insulation materials for buildings. HFC(Hydro FluoroCarbon) is essential as the blowing agents for rigid polyurethane foam. The existing HFC is zero ODP, but rather higher GWP. Receently several fluorocarbon producers announced zero ODP and very low GWP HFO(Hydro Fluoro Olefin) as the blowing agents for rigid polyurethane foam. In a few years, HFO blown rigid polyurethane foam is expected to be used for the excellent building insulation materials in the world. (TEAP Report-Decision XXIII/9 Task Force, 2012, page 57-67 ; TEAP Rigid and Flexible Foam Report. 2011 May. page 43-44) | Noted. We've added a section on F-gases, which includes a reference to foam insulation. |
| 15681 | 9 | 16 | 35 | 16 | 35 | This section is called "Significant technological developments …" and starts with the sentence "There have been no major technological developments …". Maybe renaming the section in "Currently planned developments" or something like that? Maybe also rephrasing the first sentence, because it is interesting to know what happened in the last few years and not what has not happened. Other suggestion: put subsections 9.3.2 and 9.3.3 together, because 9.3.2 is something like an introduction to the examples discussed in 9.3.3. | Accepted. Re-written |
| 11700 | 9 | 16 | 35 | | | Is it really true that "There have been no major technological developments since AR4"? ICT technology (written in 9.3.6), progress in inverter technology, LED, distributed generation and efficiency improvements in appliances might have huge impact on global warming mitigation in this sector. | Accepted. Re-written |
| 7698 | 9 | 16 | 5 | 16 | 5 | Harvey is grey literature -- conference proceedings. Shouldn’t be used for what appears to be a very substantive conclusion. | Rejected. The cited reference is in a book published by the American Institute of Physics. This is a point demonstrated later by the case studies - so will refer to |
| 6629 | 9 | 16 | | | | I would remove the word 'significant' from the title of the section | Accepted. Re-written |
| 6630 | 9 | 16 | | | | The first sentence of this section comes at odds with the statement made on page 4, lines 13-15. A discussion about how the 2 ideas articulate would be welcome | Accepted. Re-written |
| 4730 | 9 | 16 | 35 | 16 | 35 | After AR4, residential fuel cell have been on the market and getting diffuse. Some technologies using ICT such as demand response using smart meter are new developments. Since 9.3.6Energy Management System and Control and 9.4.3.1 introduces demand-response, the expression "There have been no major technological development..." seems to be inadequate. | Accepted. Re-written |

|---|---|---|---|---|---|---|---|
| 3097 | 9 | 17 | | | | please clarify in each case whether these are residential or non-residential buildings. Most of these examples/sources are now quite a few years old - can't you find some more up-to -date examples? E.g. in the UK this office building (http://www.passivhaus.org.uk/page.jsp?id=96) has an energy demand of 103 kWh/m2 and CO2 reductions of 80% | Accepted. References to specific case studies have been deleted. |
| 11701 | 9 | 17 | | | | These examples (Germany, US, UK) are only in relatively cold climate. Examples in temperate or tropical region should be added in this table and description in 9.3.3.1. | Accepted. Section re-written, with a better cold:hot balance. |
| 2191 | 9 | 17 | 13 | 17 | 25 | The list of Building Standards given here should absolutely include the Swiss "Minergie" Standard created in 1996, which comprises more than 20'000 buildings and has captured 25% of the Swiss market of new constructions in 2012. This standard is described in details at http://www.minergie.ch . It is probably the first worldwide "Green Building " label, already created in the 90's, promoting heating intensities lower than 38 kWh/m2 year. The "Minergie" Standard has been regurlarly updated over the years (as Minergie-P, Minergie-P ECO and recently Minergie-A), the last update corresponding to a Net-Zero Energy Buidling Standard with a heating intensity of 0 kWh/m2 year. | Rejected. We mention only one standard, Passive House, because it is the most strict. NZEBs are discussed separately. |
| 18874 | 9 | 17 | 14 | | | "new residential buildings" - suggest to change to "new standard [or: average] residential buildings" | Noted. No longer applicable due to re- |
| 6631 | 9 | 17 | 3 | | | I couldn't find a working paper version of Harvey 2013 on the internet | Noted. We did not say that it was on the internet. What is now Harvey (2013) will |
| 18873 | 9 | 17 | 7 | 17 | 8 | "recently completed": Are these BAU references? | Noted. No longer applicable due to re- |
| 6632 | 9 | 17 | | 18 | | It seems like sections 9.3.3.1, 9.3.3.2 and 9.3.3.3 deal with the same object but differ by the methodology reviewed. Rather, these subsections could be combined in one, and a foreword could be introduced at the beginning of section 9.3.3 to say that there are different methodologies available. Note that the discussion in current section 9.3.3.3 can be removed, since it is inconclusive | Noted. Section 9.3 has been completely re-written. |
| 15679 | 9 | 17 | 1 | | | It's unclear to me how this section is build up. It's called "Exemplary New Buildings", but only gives examples of new buildings in subsections 9.3.3.1 and 9.3.3.4 (Passivhaus and NZEBs, resp.). For me, it would be better understandable to give the subsections the names of the new buildings and put subsections 9.3.3.2 and 9.3.3.3 together as measures to evaluate new buildings at the end of this section. | Noted. No longer applicable due to re-write. |
| 9428 | 9 | 17 | | | | ・ Addition is needed for the description of Japanese cases.<br>・ This is because little reference has been made to Japanese cases in the sections cited above. ・ Refer to the following documents.<br>A district heating and cooling system (DHC) is expected to be a promising energy-saving measure for high-density business areas in Japan. However, it has not been verified what advantages of the DHC are important for energy conservation. The clarification of this issue is supposed to contribute to improving the energy efficiency of the DHC.<br>This paper focuses on the electric-driven heat-pump-type DHC, which uses only electricity as its energy source. An existing DHC plant has been selected for the case study, and its energy efficiency is examined by a simulation model that uses parameters derived from the measurement data. The simulation results for the plant reveal that the DHC exhibits an energy-saving effect of 29% for cooling when compared with the individual heat source system mainly due to the following two advantages: “economy of scale in chillers/heat pumps” and “thermal storage effect”. Further, the energy-saving ratio for heating is only 5% since heat recovery chiller cannot be operated sufficiently due to the lack of cooling demand during winter.<br>Verification of the energy-saving effect of the district heating and cooling system—Simulation of an electric-driven heat pump system<br>Energy and Buildings, Volume 40, Issue 5, 2008, Pages 732-741<br>Tomoji Nagota, Yoshiyuki Shimoda, Minoru Mizuno | Rejected. Our decision has been to not discuss specific technologies, but more might be said about district cooling systems in 9.4. No action |
| 6633 | 9 | 18 | 15 | | | can be easily achieved' is vague. One wonders: 'at what cost?' | Rejected. Cost is not given in this case. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 2192 | 9 | 18 | 23 | 19 | 14 | Countries dominated by heating loads admit also another definition of Net-Zero Energy Buidings and Energy-Plus Buildings. In these cases, the heat generated on an annual basis by the solar thermal collectors installed on the building roof is equal (or resp. larger) than the building heat demand for space heating and domestic hot water; sensible heat storage are used to retrieve the solar heat produced during summertime in the winter season. Several realizations of this kind are described each year by the Solar Energy Agency at http://www.solaragentur.ch/ | Noted. This is not inconsistent with our definition. No space for elaboration |
| 6635 | 9 | 18 | 34 | | 38 | One issue mentioned in the executive summary is the absence of evidence about how a large-scale implementation of low-energy buildings can occur (page 4, line 28). How does this general idea articulate with the more precise points made here? | Rejected. The discussion here is about NZEB's, not LE buildings, and the very next sentence raises the Q of feasibility. |
| 6636 | 9 | 18 | 41 | | | the 'effective', or 'realized' reduction | Rejected. Unclear |
| 3099 | 9 | 18 | 42 | | | not sure it's true to say that net zero energy is easiest in buildings with a large roof area. Biomass CHP linked to district/communal heating is an easy and probably cheaper option - very common in Austria. | Rejected. These are not NZEBs as we have defined them. |
| 3102 | 9 | 18 | | | | rather than making this a subsection, this could be integrated into 9.3.6 (which is about control) | Noted. Will consider |
| 8976 | 9 | 18 | 18 | 18 | 22 | The title does not reflect the contents. Furthermore, 'post-occupancy evaluation' should include objective and subjective based assessments, which based on calculation and also surveys. | Rejected. Yes it does. |
| 6634 | 9 | 18 | | 19 | | This section is too long | Noted. Section 9.3 has been completely |
| 12637 | 9 | 18 | | 18 | | In Japan, a demonstration house "Life Cycle Carbon Minus House" was built within Building Research Institute on the initiative of MLIT. (http://www.kenken.go.jp/japanese/contents/lccm/kengaku.html) | Rejected. We have avoided specific case study examples here |
| 11702 | 9 | 18 | 23 | | | Is there significant potential at wind turbine in building sector? In contrast, solar water heater should be emphasized. | Noted. Probably not cost-effectively. We can refer to a couple of recent papers |
| 8977 | 9 | 18 | 38 | 18 | 41 | This statement is unclear to me. Moreover, renewable energy could be part of the 'energy saving measures', unless the author is referring to 'energy efficiency measures'? | Accepted. Clarify |
| 3100 | 9 | 19 | | | | again, these sources examples are mostly more than 5 years old. Surely, there are more up to date examples? | Rejected. Not found such examples |
| 11704 | 9 | 19 | | | | As same as table 9.3, there is only the case in the cold region. | Rejected. Not found such examples |
| 6637 | 9 | 19 | 19 | | 21 | Do these expectations take into account post-retrofit behavioral adjustment? | Noted. Will check |
| 2878 | 9 | 19 | 3 | 19 | 3 | change ". . .heat pumps, than. . ." to ". . .heat pumps, then. . ." | Editorial. No longer applicable due to re- |
| 9622 | 9 | 19 | 3 | 19 | 7 | Please, mention heat pumps are useful for space heating as well as cooling. In addition, air source heat pumps reach 6.7 of COP with the average cooling and heating efficiency of household air conditioners, and reach 7.0 of COP with centrifugal chillers for commercial and industrial uses. 1)Masanobu Sasaki(2011), Policy Trend of Heat Pump In Japan 2)ETSAP TECHDS Energy Technology Briefs http://iea-etsap.org/web/Highlights%20PDF/E19_HL_HeatPump_HN_March2012_Final_GSOK.pdf | Rejected. We do not have a general discussion of heat pumps, but only mention them in one specific context. Anything more would not fit in. |

| 6642 | 9 | 22 | | | | This section is too long | Rejected. We should actually expand the section to address the next two |
| 11660 | 9 | 22 | 12 | 22 | 48 | The potential emission reduction or energy-saving from the energy management system should be described. | Accepted. Agree. We can mention the |
| 11705 | 9 | 22 | 12 | 22 | 48 | Information and communication technology have strong impact on GHG mitigation in building sector. There are so much examples other than shown here such as high performance sensing technology, behavior change due to visualization of energy consumption using smart meter, detailed building commissioning using BEMS data and so on. | Accepted. Agree. We can mention the potential. |
| 2195 | 9 | 23 | 3 | 23 | 4 | Low-energy buidlings do not systematically show larger embodied energy and/or environmental impacts (through construction materials) than conventional buildings, as shown by reference Altherr R. and Gay J.-B., A low environmental impact anidolic façade, Building and Environment, 37(12), pp. 1409-1419, 2002. | Editorial. Inserted "generally" before "greater" |
| 2893 | 9 | 23 | 37 | 23 | 37 | (WBSCD, 2006) is not in the References section at end of chapter | Accepted. The reference was deleted in |
| 6645 | 9 | 23 | 42 | | 43 | More comments on figure 9.11 are needed | Noted. The figure has been deleted. |
| 4579 | 9 | 23 | | | | What are the total lifecycle impacts from low- to zero-energy buildings? If operating energy use is reduced 90% or more, but the embodied energy in construction is significantly higher, is there a possibility of reaching overall goals of, e.g. 90% lower emissions? | Noted. Probably not - the cited examples show much less savings on a lifecycle basis. |
| 6643 | 9 | 23 | | | | This section is informative, but the sake of clarity, the case studies should rather be summarized in a table. | Accepted. Actually, case studies have been deleted.and replaced with general conclusions form a detailed review paper. |
| 6644 | 9 | 23 | | | | Without naming it, this section implicitely deals with the rebound effect. I could be worthwhile to name it more explicitely, or at least it is consistent with what is said in Section 9.7.4 | Noted. Will check |
| 12638 | 9 | 23 | | 23 | | There are studies which show that change of life style contribute more to reduction of energy consumption than improvement of insulation in residential building. (Kenichi HASEGAWA et al., 2006) (http://ci.nii.ac.jp/els/110004809857.pdf?id=ART0007535868&type=pdf&lang=jp&host=cinii&order_no=&ppv_type=0&lang_sw=&no=1347573540&cp=) | Noted. Since there is expression that “life style has a major effect on energy use…”, no action is necessary. This depends on how much the insulation |
| 4576 | 9 | 23 | 33 | 23 | 43 | The personal behavior aspect should be emphasized far more, especially with regard to existing homes in developed countries. See for example Dietz et al. PNAS November 3, 2009 vol. 106 no. 44 pp. 18452–18456; Brecha et al. Energy Policy (39) 2011 pp. 2982-2992 etc. | Accepted. Consider suggestion by Writing Team. Since there is expression that “life style has a major effect on |
| 15213 | 9 | 23 | 33 | 23 | 43 | In this part we should point out that in developing countries we should not change our lifestyle into life style of developed country like US and Europe. This will result great energy use in buidling sector and the earth can not afford this much energy. | Accepted. Consider suggestion by Writing Team. Add text shown below to 9.3.8..<br>Building sector of developing countries has a risk to become huge emission source because of their large population. Though it is unavoidable to change their life style with modernization, the change should be guided to the life style which |
| 7032 | 9 | 23 of 86 | 43 | 23 of 86 | 43 | Substitute "industrialized" for "developed" before the word "nations", at the last part of the line. | Editorial. |
| 4731 | 9 | 24 | | | | Figure 9.11 doesn't seem to be the best graph showing "Emerging economies like China have different consumption level benchmarks from developed nations." Figure 9.11 could be deleted. | Accepted. Improve Fig. 9.11. |
| 11779 | 9 | 24 | 21 | 24 | 24 | Delete all. In Japan recent GTCC technology achieved more than 58% efficiency, thus this sentense is not nesesarily matched. | Noted. This will be revised to clarify that the total efficiency of cogeneration plant is higher where heat can be effectively |
| 9561 | 9 | 24 | 21 | 24 | 22 | This seems to be wrong as combination of high efficiency heat pumps and centralized power plants becomes more efficiently use of energy.(renewableenergy in idustrial applications, p37, UNEDO) | Noted. This will be revised to clarify that the total efficiency of cogeneration plant is higher where heat can be effectively |
| 10665 | 9 | 24 | 21 | 24 | 24 | Delete all.Japan's most recent CCGT technology achieved more than 58% efficiency, thus this sentense is not nesesarily matched. | Noted. This will be revised to clarify that the total efficiency of cogeneration plant is higher where heat can be effectively |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 4732 | 9 | 24 | 21 | 24 | 22 | Reference should be added.<br>IEA (2010) Energy Technology Perspectives 2010, International Energy Agency (IEA), Paris, France. | Accepted. Consider suggestion by Writing Team |
| 10010 | 9 | 24 | 21 | 24 | 22 | This part should be deleted or revised to explain that total energy efficiency of cogeneration is higher than centralized power plant only if waste heat could be utilized perfectly. The detail energy efficiency is described in (IEA, 2011, page15, Table4). This literature is listed in the No51 line of this table. | Noted. This will be revised to clarify that the total efficiency of cogeneration plant is higher where heat can be effectively |
| 9431 | 9 | 24 | 21 | 24 | 24 | ・ Deletion of the entire sentence is needed.<br>・ Distributed energy systems are not necessarily higher in efficiency than centralized power plant.<br>・ Cogeneration improves energy efficiency when the heat is utilized, although there are only a few applications where usages of heat and electricity can be balanced. When compared in terms of efficiency of only the power generation function, centralized power plant has higher efficiency. (e.g. Efficiency of gas burning engine CGS is about 40 to 45%, while the most advanced thermal power plant in Japan has efficiency of about 58% <MACC1, 500□C>).<br>・ Refer to the following documents .<br>Fukuda et al. introduced “heat factor” for the evaluation of the total energy efficiency of cogeneration system in Japan. According to their analysis based on exergy basis, the “heat factor” for Japan is calculated to be 0.24-0.28, which is much smaller than the factor for US and Europe, which are 0.5 or higher. This result implicates the difficulty of the use of the thermal output of cogeneration in Japan, which has little heat demand compared to the US and Europe. By comparing the adjusted total efficiency of cogeneration with the grid power plant (all average, fossil fuel average, state of art LNG combined cycle), they found that it was inappropriate to regard cogeneration as highly efficient just by the simple total efficiency. The adjusted total efficiency was calculated to be nearly equal or a little higher than the average fossil fire power plant depending on the type of demand, and much smaller than the state of art LNG combined cycle for all demand assumed in their study. ・ Evaluation of Total Energy Efficiency of CGS on the Basis of Exergy Concept ）」(2008) Journal of the Japan Institute of Energy 87, 285-290 ( 2008 )<br>・ Refer to the following documents .<br>①Masanobu Sasaki(2011), Policy Trend of Heat Pump In Japan ( Chapter4 4.2 ) | Noted. Will check. Space prevents a full analysis of the thermodynamics |
| 18879 | 9 | 24 | 22 | | | should read "thAn centralized power plantS" | Accepted. Consider suggestion by |
| 9432 | 9 | 24 | 30 | 24 | 38 | ・ Addition to the case study is needed for the description of the district heating and cooling system in Tokyo Skytree area.<br>・ The above-mentioned DHC is a good example, in that Japan’s highest comprehensive yearly energy efficiency (coefficient of performance) of 1.35 is planned (c.f. average DHC efficiency in Japan is 0.749), and that high-efficiency heat pump, large-capacity heat reservoir and ground source heat pump are employed. | Rejected. The case has just started operation. It's too early to evaluate the performance. We do not believe it is appropriate to mention specific projects. No action |
| 10011 | 9 | 24 | 32 | 25 | 1 | This part should include "heat pumps" that use underground water. Heat pump system using underground water is effective where underground water is abundant. | Accepted. Agree. Should add 'groundwater' to the list of potential heat pump sources. We will add |
| 11287 | 9 | 24 | 5 | 24 | 10 | We suggest to add to this paragraph the following sentence: Urban planning that take into consideration local climatic patterns such as: the sun path, the direction of prevailing winds, and the topography of the area, will facilitate the construction of buildings that are properly oriented and that make use of passive building elements such as natural shading, cooling and lighting, and resulting in less GHG emission. | Accepted. To be discussed with Chapter 12 where the substantive section should be. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 11706 | 9 | 24 | 9 | | | From the viewpoint of natural ventilation potential, compact urban form is not effective for passive cooling. | Accepted. will check with ch12 and see who covers this issue. This needs input from someone in the team with better expertise on passive cooling, but may be |
| 9073 | 9 | 24 | 4 | 27 | 12 | 9.4 Infrastructure and systemic perspectives can be deleted due to limitations on the nos of pages | Rejected. Disagree. This section is a requirement. Also important to understand the potential of the buildings sector to use low carbon fuels. Infrastructure and system play a very |
| 15682 | 9 | 24 | 4 | | | Does subsection 9.4.1 really belong here? It seems very much decoupled from the rest. Subsection 9.4.2 says "This section therefore focuses …", but then stops, so it seems to be more an introductionary passage, which doesn't need a subsection number at all. | Accepted. Chapter 12 is a better home for the substance on the wider built environment infrastructure. Just needs |
| 6646 | 9 | 24 | | | | With so few elements, this section is not very informative and could be removed | Accepted. Chapter 12 is a better home for the substance on the wider built environment infrastructure. Just needs |
| 11712 | 9 | 24 | 5 | 24 | 11 | This description is also shown in Chapter 12 (Section 12.3-4 especially in 12.3.2.6). In general, sections 12.3 and 12.4 have strong relationship with 9.4. Coordination between two chapters is needed. | Accepted. Chapter 12 is a better home for the substance on the wider built environment infrastructure. Just needs |
| 12581 | 9 | 24 | 8 | | | In the warm humid climate region of India, more surface-to-volume- ratio is preferred to induce natural ventilation and passive cooling - this may also be mentioned | Accepted. Will modify the text to recognise the urban heat island effect is |
| 6647 | 9 | 24 | | 25 | | This section is too long | Accepted. Agreed, can be edited. |
| 7033 | 9 | 24 of 86 | 16 | 24 of 86 | 16 | Add "zero and" before the phrase "lower carbon fuels". | Rejected. Disagree. For the foreseeable future, all external fuels to buildings in the form of electricity, gas and heat/coolth supplied through |
| 7034 | 9 | 24 of 86 | 19 | 24 of 86 | 19 | The same as 32nd Comment. | Rejected. Disagree. For the foreseeable future, all external fuels to buildings in the form of electricity, gas and heat/coolth supplied through |
| 17389 | 9 | 25 | | | | It is very interesting and useful to talk over the utilization of ground source heat pump(GSHP), I think it needs to be further discussed and explored, from the point of COP and associated costs in some typical regions, both industrialized and developing countries. Some challenges related to the deployment and scale-up potentials should be adequately assessed, since this option is quite promising and should be well analyzed for giving the audience a good view. | Accepted. This is a valid point. The section on electricity infrastructure does not see the best place for a detailed discussion of heating technologies. But there is no detail in Chapter 7 or Chapter |
| 4733 | 9 | 25 | 10 | | | The title "Electricity infrastructure" doesn't seem to fit the contents which includes heat pump. Text is too long. | Accepted. There should be a discussion of the implications for infrastructure here |
| 9546 | 9 | 25 | 17 | | | Please, add following; heat pumps use renewable energy from their surroundings (ambient air, water or ground). They achieve point-of-use efficiencies greater than 100%, i.e. they provide more useful cold or heat (in energy terms) than the electricity input. (Technology roadmap Energy-efficient Building,2011, IEA, p16, p18) | Noted. This is a valid point. However, the section on electricity infrastructure does not see the best place for a detailed discussion of heating technologies. But there is no detail in Chapter 7 or Chapter |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 9433 | 9 | 25 | 17 | 25 | | ・ Addition needed for the description of HP used at minus 25□C.<br>・ Since the most advanced air source heat pump can be used under ambient condition of minus 25□C, this case can be added as a good example.<br>・ Refer to the following documents.<br>①Masanobu Sasaki(2011), Policy Trend of Heat Pump In Japan ( chapter2 2.2 )<br>②ETSAP TECHDS Energy Technology Briefs<br>http://iea-etsap.org/web/Highlights%20PDF/E19_HL_HeatPump_HN_March2012_Final_GSOK.pdf | Rejected. This section is about decarbonisation strategy, not the temperature range within which heat pumps are viable. No action |
| 9624 | 9 | 25 | 19 | 25 | 20 | Please, replace 'and therefore …process.' with a technology has steady progressed because air source heat pumps can be used in outdoor with minus 25 degree Celsius.<br>1)Masanobu Sasaki(2011), Policy Trend of Heat Pump In Japan<br>2)ETSAP TECHDS Energy Technology Briefs<br>http://iea-etsap.org/web/Highlights%20PDF/E19_HL_HeatPump_HN_March2012_Final_GSOK.pdf | Rejected. This section is about decarbonisation strategy, not the temperature range within which heat pumps are viable. No action |
| 4734 | 9 | 25 | 22 | 25 | 24 | The market of heat pump is matured in Japan. So the text could be modiefied as follows.<br>In some countries heat pump is prevailing technology and the market is matured especially in Japan. There is a growing<br>market for low-cost air source heat pumps in mid-latitude countries, notably Italy and France (Singh, Muetze, et al. , 2010)., New Zealand(Howden-Chapman et al., 2009), some regions of China (Cai et al., 2009) are growing. | Accepted. Consider suggestion by Writing Team |
| 11780 | 9 | 25 | 27 | 25 | 30 | Agree. | Noted. Nothing to be done |
| 9547 | 9 | 25 | 27 | 25 | 30 | Good comment | Noted. Nothing to be done |
| 10666 | 9 | 25 | 27 | 25 | 30 | Good example. | Noted. Nothing to be done |
| 9548 | 9 | 25 | 30 | 25 | 31 | Please, replace here with the following due to unclear; the electricity sector is decarbonised and this enables the buildings sectors to reduce CO2 emissions by additional electrification. As a result, the share of electricity in final consumption rises to 27% in 2050 as low-carbon electricity increasingly substitutes for fossil fuels. (ETP2010, IEA, p81) | Accepted. Happy to clarify the point in the SOD. Quoting the precise estimate from IEAETP does not seem appropriate here. |
| 9549 | 9 | 25 | 31 | 25 | 33 | Please, check and accommodate analysis of sectoral energy use, 6.8.2.1, in Chpter 6 as the trend of final energy use in buildings sector looks downwards. | Noted. This will be addressed through liaison with Chapter 6 |
| 9550 | 9 | 25 | 36 | 25 | 38 | Please, describe here in a positive manner due to unclear; e.g. a high cost heating system needs a supportive scheme to shift the neregy source. | Rejected. Disagree. It is not the role of an IPCC assessment to promote a |
| 10012 | 9 | 25 | 36 | 25 | 38 | This part should be deleted because there is no evidence that the electrified heating system is more costly than other heating systems. | Rejected. Disagree. Well established that a heat pump is more expensive than |
| 9623 | 9 | 25 | 4 | | | Please, insert a good following example after (kuzuki et al., 2010); 'Tokyo Skytree district heating' is a good example as the highest annual energy efficiency of 1.35 is planned, compared with domestic DHC with 0.749, and high spec heat pumps and huge thermal storage tank and geothermal heat pumps are introduced.<br>1)Masanobu Sasaki(2011), Policy Trend of Heat Pump In Japan<br>2)ETSAP TECHDS Energy Technology Briefs<br>http://iea-etsap.org/web/Highlights%20PDF/E19_HL_HeatPump_HN_March2012_Final_GSOK.pdf | Rejected. The case has just started operation. It's too early to evaluate the performance. We do not believe it is appropriate to mention specific projects. No action |
| 9551 | 9 | 25 | 40 | 25 | 42 | Please, replace intermittent with low or zero emissions. | Rejected. Disagree. The SRREN reference is about intermittent renewables not low carbon electricity in |
| 9552 | 9 | 25 | 43 | | | Please, add hydro pumps as means of energy storage; e.g. not only hydro pumps but also thermal energy strage… | Rejected. Disagree. This section is about infrastructure for buildings. No |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 11707 | 9 | 25 | 43 | 25 | 49 | In combination with electricity infrastructure using intermittent renewable energy, electricity load curve leveling such as demand response is important. However, it seems strange that this subsection include thermal energy storage in building envelope, which is originally intend to stabilize the operation of building HVAC equipment. Since this phase is duplicate page 23, line 26-28, it should be unified. | Accepted. Thermal storage in buildings is included here because it will affect electricity infrastructure needs and therefore the viability of electricification of heating. Agree that repetiton of 9.3.7 |
| 6648 | 9 | 25 | | 26 | | This section is too long | Accepted. Agreed. Should be edited for |
| 3495 | 9 | 25 of 86 | 16 | | 16 | To add: "in the temperate region" after the first word of this line, i.e. "countries". | Rejected. Disagree. The same principles apply to electrification of water |
| 7035 | 9 | 25 of 86 | 5 | 25 of 86 | 5 | Add "zero and" after the phrase "alone deliver", at the beginning of the line. | Accepted. Precise phrasing will be revised for consistency with Section 9.3 |
| 7036 | 9 | 25 of 86 | 8 | 25 of 86 | 8 | Add "zero and" before the phrase "very low energy", at the last part of the line. | Rejected. Disagree. For the foreseeable future, all heat supplied through infrastructure systems will have some |
| 7037 | 9 | 25 of 86 | 10 | 25 of 86 | 10 | I haven't seen here issues like decentralized and distributed renewables electricity generation, smart grids, local grids, WADE, etc. I think they deserve an important place concerning "Electricity infrastructure", which is the name of the Section. | Accepted. Needs wider discussion where this fits in Chapters 7, 9 and 12. Those new technologies should be |
| 7038 | 9 | 25 of 86 | 11 | 25 of 86 | 11 | Substitute "industrialized" for "developed", before "world, around the middle of the line. | Accepted. |
| 7039 | 9 | 25 of 86 | 41 | 25 of 86 | 41 | Add "zero and" before "lower carbon off peak electricity", around the middle of the line. | Rejected. Disagree. For the foreseeable future, all electricity supplied through infrastructure systems will have some |
| 6649 | 9 | 26 | 20 | | | the concept of commissioning is not clear to me. How does it compare to maintenance? | Rejected. This is a surprising comment. They are different concepts both in everyday use and amongst building |
| 6650 | 9 | 26 | 23 | | | the economic barriers identified above': throughout the chapter, the barriers are not clearly identified (see for instance the vacuum in section 9.8) | Rejected. No action needed here as barriers addressed in Section 9.8 and there is a huge extant literature on them |
| 18881 | 9 | 26 | 47 | | | "size of the lock-in risk": define the metric used | Noted. I think Figure 9.12 is fairly clear. The potential reduction from 'sub-optimal' to 'state of the art' is 80% of the |
| 15683 | 9 | 26 | 48 | 26 | 48 | Since the word "cost-effective" is also mentioned here and subsection 9.4 deals with the "systemic perspectives" promised in its title, subsection 9.4.4 could be integrated in subsection 9.4.5. For me, it would make section 9.4 a bit more fluently; going from a general view about the energy infrastructure at the start via a more deeper view on the electricity and gas infrastructure in the middle to the political and financial barriers and challenges at the end. | Accepted. Very good point to be addessed in revsion of 9.4.4 and 9.4.5 |
| 4735 | 9 | 26 | 9 | | | Gas infrastructure is still important for high efficiency distributed energy systems described in 9.4.3. | Noted. This is a difficult sub-section. The developing literature is divided on |
| 6651 | 9 | 26 | | 27 | | Useful reference on this topic: Vogt-Schilb and Hallegatte, 2011, "When starting with the most expensive option makes sense", Policy Research Working Paper 5803, World Bank, http://www-wds.worldbank.org/servlet/WDSContentServer/WDSP/IB/2011/09/21/000158349_20110921094422/Rendered/PDF/WPS5803.pdf | Accepted. Thank you for the helpful comment. Will consider in revision. |
| 7040 | 9 | 26 of 86 | 8 | 26 of 86 | 8 | Add "zero and" before the phrase "lower carbon supplies", at the last part of the line. | Rejected. Disagree. For the foreseeable future, all electricity supplied through infrastructure systems will have some |

| 7044 | 9 | 27 of 86 | 17 | 27 of 86 | 17 | Add "zero and" before the phrase "low-carbon buildings", at the middle of the line. | Accepted. Section 9.4 |
| 7045 | 9 | 27 of 86 | 18 | 27 of 86 | 18 | Substitute "industrialized" for "developed", before the beginning of the hyphen around the middle of the line. | Accepted. Section 9.4 |
| 7046 | 9 | 27 of 86 | 27 | 27 of 86 | 27 | Add "zero and" before the phrase "Low energy consuming buildings", at the second half of the line. | Accepted. Section 9.4 |
| 7047 | 9 | 27 of 86 | 30 | 27 of 86 | 30 | Add "zero and" before the phrase "Low energy consuming buildings", at the first half of the line. | Accepted. Section 9.4 |
| 7048 | 9 | 27 of 86 | 31 | 27 of 86 | 31 | Add "zero and" before the phrase "lower-energy consuming", at the last part of the line. | Accepted. Section 9.4 |
| 6653 | 9 | 28 | 15 | | | I would remove 'and CC mitigation' from the section title | Accepted. |
| 9434 | 9 | 28 | 32 | 28 | 36 | ・ Deletion of the entire sentence is needed.<br>・ The description implying that the 0.3Gt increase in CO2 emission from the residential sector is caused by electrification is inappropriate.<br>・ It is illogical to blame electrification for this increase in CO2 emission.<br>・ The increase of 0.3 Gt occurred mainly through meeting residential demands. The problem lies in whether to meet the demands with electricity or with other energy sources. Electricity is preferable because it provides for higher amenity and enables CO2 reduction.<br>・ Refer to the following documents.<br>Sugiyama [1] found that the electrification rate increases more or less in final electricity demand by 2050; however, the final energy demand doesn't necessarily show an increase in all the studies. He suggested that climate policies can lead to reduced final energy demand. In conclusion, policy measures which decarbonize power generation and accelerate future growth of electrification are "promising" options. [1] Masahiro Sugiyama(2012), "Climate change mitigation and electrification (Energy Policy44)" Volume 44, May 2012, Pages 464-468 | Noted. Taken into account. It is not electrification that leads to these results but the assumptions of the scenario considered, which assumes that the emission factor of electricity is higher compared to those of fuels. The text was rewritten to clarify this.The suggested reference shows that the implementation of mitigation actions enhance electrification and so decarbonization of power sector is of particular importance. However, in this paragraph the focus is on the possible implications of cc on energy demand and the associated emissions and so the suggested reference is not very relevant. |
| 18882 | 9 | 28 | 48 | | | "$2B": Please spell out billion/bio. | Editorial. Consider reviewer's comment |

| 13061 | 9 | 29 | 43 | 37 | 12 | On the Costs & Potentials issues it is difficult for the reader to access the bigger picture of the cost & potential information. Each sector has its own approach to costs and potentials, which is appropriate as each sector has its own unique qualities and considerations. Nonetheless, the information that will be most relevant to take-away for policy-makers is overarching cost information that brings these different pieces together. To help policy-makers access this information, it should be important to highlighting market realization, but also the policy aspects of cost (by policy it is meant institutional frameworks and/or market frameworks and/or capacity building arrangements, etc...). In both developing and developed countries policy can have a strong impact on cost. Simply looking across the costs & potentials sections of the sector chapters, the reader could miss this message, although the information on policies and measures is there in the chapter. Therefore it could be important to make sure that these informations are put in perspective appropriately. | Accepted. The section has been redrafted, with a focus on measures to reduce costs where high, and on the fact that in many cases costs are already low |
| 12634 | 9 | 29 | | | | This paragraph may refer to Global Alliance for Clean Cookstoves at the Clinton Global Initiative(http://www.state.gov/secretary/rm/2010/09/147500.htm) and SLCF report by UNEP(http://www.unep.org/publications/ebooks/slcf/). | Accepted. Deleted a part of the section. |

|---|---|---|---|---|---|---|---|
| 7702 | 9 | 36 | 34 | 37 | 12 | again, most references here are from the grey literature. Also, what is the source of Fig 9.14? Finally, on lines 36-7, you cant simultaneously minimize energy demand and maximize efficiency--one or the other. | Accepted. Deleted |
| 15692 | 9 | 36 | 34 | | | Because this section deals with economic benefits, doesn't it fit better in section 9.6.3. This would make section 9.6.3 a bit more substantial, since it deals for a large part with what already has been written and what will be discussed in the next sections. | Noted. This section has been deleted. |
| 12122 | 9 | 36 | 36 | 36 | 38 | The statement "It requires understanding and leveraging whole-system design to minimize energy demand and maximize efficiency" is unreferenced ..... Please add a reference to the only book on Whole System Design in the world - Stasinopoulos, P., Smith, M., Hargroves, K. and Desha, C. (2008) Whole System Design: An Integrated Approach to Sustainable Engineering, Earthscan, London, UNESCO and WFEO.<br>And please also consider adding from 2007 IPCC AR4 WGIII Building Chapter - "Energy efficiency strategies focused on individual energy-using devices or design features are often limited to incremental improvements. Examining the building as an entire system can lead to entirely different design solutions. This can result in new buildings that use much less energy but are no more expensive than conventional buildings. The systems approach in turn requires an integrated design process, in which the building performance is optimized through an iterative process that involves all members of the design team from the beginning." | Rejected. These points are covered earlier in our discussion of the integrated design process. The book is only 208 pages and only one chapter in 10 deals with buildings. No room for more. |
| 12123 | 9 | 36 | 36 | 36 | 38 | The economic benefits of integrated and community-based approaches - the real economic benefit from integrated design approaches arises because it is in the front end design phase that most of the design decisions are made which will lock in the overall building energy usage long term. As Paul Hawken et al wrote in the book Natural Capitalism,<br>"By the time the design for most human artefacts is completed but before they have actually been built, about 80-90 percent of their life-cycle economic and ecological costs have already been made inevitable. In a typical building, efficiency expert Joseph Romm explains, 'although up-front building and design costs may represent only a fraction of the building's life-cycle costs, when just 1 percent of a project's up-front costs are spent, up to 70 percent of its life-cycle costs may already be committed. When 7 percent of project costs are spent, up to 85 percent of life-cycle costs have been committed'. That first one percent is critical because, as the design adage has it, 'all the really important mistakes are made on the first day'. " | Noted. We already discuss integrated design and cost reduction, moreso in the revised draft |
| 6669 | 9 | 37 | | | | This figure brings some value added but there are no details about the sources, etc. | Accepted. Figure deleted |
| 6670 | 9 | 37 | | | | Again, the existence of co-costs (loss in amenities due to efficient lighting, mercury pollution due to efficienct lighting, inconvenience due to housing works), even if they don't prevail in the cost-benefit balance, should be mentioned (and ideally some estimates of their value should be provided) | Noted. Taken into account. The issue of riks associated with mitigations actions is now mentioned in Sub-section 9.7.1. However, we consider that these risks are limited compared to co-benefits and |
| 15694 | 9 | 37 | | | | I don't understand the figure. The colors are countries, right? From the text, I understand that you want to show that there is hardly any relationship between energy savings and CCE (Page 5, line 5 and 6). Why then do you need the classification by countries? Does it make sense anyway to show a figure where you see so less? Wouldn't a sentence like "A meta-analysis of data reported by the literature showed that cost-effectieness of retrofits does not necesserily depend on the depth of a retrofit." tells the reader the same as the figure does? | Accepted. Figure has been deleted to save space |
| 12848 | 9 | 38 | 11 | 38 | 13 | The criticism of some of the studies about green jobs potentials deserves a little more prominence and a reference to an actual study that criticizes green job claims (Carley at al. only includes a reference to such studies). In addition to questioning the efficacy of using public funds for energy projects instead of other investments, the criticism has been made that several green jobs studies neglect the possible inefficiencies of investing in labour-intensive activities. An example of a study criticizing green jobs claims is: Gülen, Gürcan (2011), Defining, Measuring, and Predicting Green Jobs. Copenhagen Consensus Center: http://www.copenhagenconsensus.com/Default.aspx?ID=1542 | Noted. Taken into account. Much of the criticism about green jobs potential mainly concerns investments on RES technologies, while this section focuses on energy efficiency initiatives.<br>The suggested study will be included in the text. Also, we can refer Alvarez et al. 2009.<br>The additional point on possible |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 12849 | 9 | 38 | 24 | 38 | 28 | It is worth clarifying if lines 24-26 refer to gross or net jobs generated. A problem with stating job numbers generated by a specific amount of money is that wages differ greatly between countries. Obviously, where wages are higher, the same amount of money will generate fewer jobs, and vice versa. It has to be pointed out whether these numbers apply only to developed countries, and even if this is specified, there is still a wide range of wages. | Accepted. Accepted text - revised appropriately. |
| 12642 | 9 | 38 | | 40 | | As mentioned in 9.10.3.2, it was revealed that the higher environmental perofomance, the higher rent and occupancy rate was. Thus, the enhancement of asset value may be considered as one of co-benefits derived from improving environmental efficiency of building. | Accepted. Accepted It is included in the table in Section 9.7.1. No space for a more extended analysis. |
| 9555 | 9 | 39 | 33 | 39 | 35 | Please, reflect here by using the following information; 1) Residential appliances and equipment represent one of the fastest-growing energy loads. The IEA estimates that at least 3.7 EJ per year could be saved costeffectively by 2030. 2) Lighting represents almost 20% of global electricity consumption. This consumption is similar to the amount of electricity generated by nuclear power. The latest IEA estimates show the total savings potential in residential and services lighting at more than 2.4 EJ per year by 2030. 3) Buildings hold great potential for cost-effective energy savings. The IEA estimates that the energy savings potential in this sector in 2009 will be in the range of 20 exajoules (EJ) per year by 2030, which is the same as the current annual electricity consumption of the United States and Japan combined. (25 energy efficiency recommendation, IEA) | Noted. Taken into account. The text that the comment concerns deleted. |
| 17971 | 9 | 39 | 3 | 39 | 3 | To avoid confusion, it might be a good idea to change 'all the studies' into 'All the studies for the USA' to avoid the impression that this applies to all studies considered. | Accepted. |
| 17972 | 9 | 39 | 14 | 39 | 21 | Reduction of demand is included in both (i) and (iv) making this effect redundant. | Accepted. Text revised. |
| 17290 | 9 | 4 | | 7 | | Comment to Exective Summary. In this section, the energy policy of Appliances should be described clearer. Reducing our use of energy for buildings and appliances decreases the demand for primary energy and is a key means to deliver better economic performance, increase energy security and reduce greenhouse gas. About the energy policy of Appliances, Market Transformation should be highlighted as the concept. Market transformation is a holistic, market-based approach designed to promote the manufacturer, purchase, and use of energy-efficient products, services, and/or practice. As its core, it is an integrated and dynamic strategy that coordinates separate "technology push" and "market pull" policies and programs to trigger a permanent shift in the target market. - Technology oriented approaches are closely related to the international standars for IEC, ITU-T test procedures, etc. and the present performance of target products. policies and programs must precisery reflect the level of available technologies and be mindful of the incubation of emerging technologies with future progress and protection of their intellectual property inmind. - Market oriented approaches target improved communications between players in the target market such as governments, manufacturers, retailers and consumers. They must be analyzed with the section of tools and objects in each segment in order to evaluate the cost effectiveness of implemented policies and programs. The global of market transformation is to create structual and behavioral changes in the marketplace that are self-sustainig over time and ultimately deliver: (i) An increased market share for high energy efficient appliances,, services, and practices; (ii) Accelerated deployment of the most efficient technologies; (iii) an array of measures - such as "S & L scheme", "Monitoring & Verification scheme", "Tarining and Education", "Utility DSM programs", "Design competicions", "Financial incentives" and bulk purchasing are employed - targeted at appropriate market participants. (iv) Exisiting market or competitive forces are tapped or leveraged to acheive energy efficiency gains. For example, there are detailed descriptions in the Good Practices Handbook for Market Transformation (Asia Pacific Partnership on Clean Development and Climate, 2008). | Noted. Will consider |
| 7853 | 9 | 4 | 1 | 56 | | It is suggested to include a list of abbrecviations in each chapter to increase the user-friednlyness. | Accepted. in case the page limit allows. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 8851 | 9 | 4 | 1 | 86 | | General comments on a whole chapter: The chapters are too long, improvement shall be made to enhance the coherence and focus within and among chapters. e.g., for both chapters 9 and 10 it's important to compile/analyze/present data on the costs of conserved energy for efficiency measures in consistent manner, in comparisons with tranditional energy sources and emerging renewable energy addressed in other chapters (e.g. chapter 7). Also, indusrtrial buildings are very energy intensive (e.g., cleanrooms, laboratories) and GHG-intensive. Opportunities to improve efficiency and save energy from this subsector are abundant, and needs to be included/addressed. This may benefit from research outcomes (cleanrooms) published in archival journals for North America and Asia. | Noted. |
| 3094 | 9 | 4 | 11 | 9 | 12 | page 4 talks of potential savings of 29% by 2030 but doesn't say compared to which year, whereas page 9 talks about 40% but doesn't specify by when. Are these figures consistent? They need to clearly state by year y, compared to year x. | Accepted. |
| 2356 | 9 | 4 | 11 | 4 | 11 | Avoid qualifying wording without quantification. "cost effective" - how do you define? | Rejected. Following literature |
| 2187 | 9 | 4 | 11 | 4 | 29 | The Executive Summary gives a sound and synthetic view of the content of Chapter 9. The second alinaea should however also mention Positive Energy Buildings as recent developments in green buidling technology (even for building retrofits); its should not be only restricted to Lean and Net Zero-Energy Buildings, giving the impression that the latter are the ultimate possible targets for green buildings | Noted. Will consider |
| 2857 | 9 | 4 | 17 | 4 | 17 | change ". . . GHG storage . . ." to ". . . Greenhouse gas (GHG) storage . . ." | Editorial. |
| 2858 | 9 | 4 | 18 | 4 | 18 | delete the word "fundamentally" | Editorial. |
| 9168 | 9 | 4 | 18 | 4 | 20 | NZEB and ZEB are economical GIVEN a lot of subsidies for PVs and others - as such the costs to the owner may be negative, but the costs to the society is very high. | Rejected. Impossible to figure out all subsidies in the Energy sector |
| 14408 | 9 | 4 | 2 | | | Clarify whether emissions associated with production of electricity for heating and cooling buildings are attributed to “buildings” or to “energy sector” emissions. In other words, how is double-counting avoided? | Noted. Wherever possible. In Japan, only energy loss of generation is counted for energy sector, which means no |
| 9172 | 9 | 4 | 2 | 7 | 27 | I got the impression from this exec summary that you put too much emphasis on building hardwares and computer softwares. The source of large energy efficiency gap is lack of proper human energy management systems in place. Proper human capital development and policy intervention to facilitate the coordination among key actores are essential. | Accepted. |
| 9175 | 9 | 4 | 2 | 7 | 27 | Also I got the impression that this exec summary you put too less attention to appliance efficiency improvement. The share of heating use at building sector is much less In developing countries and appliance efficiency of non-heat use are important there. | Accepted. |
| 18855 | 9 | 4 | 2 | | | Probably you want to add "usage" after "final energy" | Editorial. |
| 2859 | 9 | 4 | 22 | 4 | 22 | change ". . . energy active . . ." to ". . . traditional . . ." | Editorial. |
| 2860 | 9 | 4 | 25 | 4 | 25 | The term "ICT" is used for the first in the chapter here. Please define it -- what is ICT? | Editorial. |
| 4575 | 9 | 4 | 25 | | | ICT introduced without definition | Editorial. |
| 6609 | 9 | 4 | 25 | | | Abbreviation 'ICT' has not been defined before | Editorial. |
| 3647 | 9 | 4 | 25 | 4 | 25 | Please explain the abbreviation "ICT" in the text. | Editorial. |
| 9625 | 9 | 4 | 30 | | | Please, replace strong with particular. | Editorial. |
| 2861 | 9 | 4 | 31 | 4 | 31 | change ". . . strong policies . . ." to ". . . strong incentive policies . . ." | Editorial. |
| 16882 | 9 | 4 | 32 | | | You note that market forces won't cause needed transformation "fast enough" -- but this is imprecise. Mkt forces under a cap and trade or price based regime? Or simply current situations in most countries where emissions have no price? Simply because emissions do not decline as rapidly as we want, is not necessarily a signal that they are behind schedule -- even under a CO2 price, not all sectors should decline at the same pace. | Noted. Will consider |
| 4789 | 9 | 4 | 33 | 4 | 33 | Could you please explain what are "plus new business and financial models"? | Editorial. |
| 9169 | 9 | 4 | 41 | 4 | 41 | Is this decrease due to policy, or economic downturn, or population decrease? | Noted. Will consider |
| 18856 | 9 | 4 | 42 | | | "many new buildings will be added": quantification by giving a range would be good | Noted. Will consider |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 2856 | 9 | 4 | 5 | 4 | 5 | change ". . ., 25-33% of black. . ." to ". . ., and 25-33% of black. . ." | Editorial. |
| 2855 | 9 | 4 | 8 | 4 | 8 | change ". . .energy carriers start using electricity. . ." to ". . .energy carriers will start using. . ." | Editorial. |
| 11147 | 9 | 4 | 4 | 4 | 4 | Halocarbon emissions are a significant part of building emissions. I am surprised that there is little mention of legislation etc. within this chapter. | Accepted. Consider suggestion by Writing Team |
| 15211 | 9 | 4 | 2 | 6 | 36 | In this part we should point out that in developing countries like China, the energy use in different climate zones and in urban and rural area is quite different. And when we are talking about the potential of different technoligies, we should recognise that different lifestyles and service demands need different technoligies to adapt. | Accepted. |
| 7020 | 9 | 4 of 86 | 40 | 4 of 86 | 40 | Substitute "industrialized" for "developed", around the middle of the line. | Editorial. Substitude "industrialized" with |
| 7021 | 9 | 4 of 86 | 45 | 4 of 86 | 45 | The same as 19th Comment. | Rejected. Unclear |
| 6672 | 9 | 40 | | | | This section mostly deals with health problems, so it is hard to separate it from the subsequent one. What makes the two sections different should be made more clear; alternatively, the two sections could be combined | Accepted.Text revised. |
| 17912 | 9 | 40 | | | | On housing please refer to the housing burden of disease and the recent publication of the WHO, 2011. Just an abstract of the executive summary: http://www.who.int/hia/brochure_housing.pdf | Accepted. |
| 6671 | 9 | 40 | 10 | | | I would remove 'equity, distributional impacts, gender' from the section title, as these issues are not addressed | Accepted. |
| 11708 | 9 | 40 | 7 | 40 | 9 | Rolling blackout after Great East Japan Earthquake on March 11, 2011 and implementation of nation-wide large-scale electricity saving activities give good example of this sentence. (Ex. Nishio and Ofuji, J. Environmental Engineering, Trans. AIJ, No.679, pp.753-759, Yagita et. al., Journal of Japan Society of Energy and Resources, Vol. 33, No. 4 pp.7-16) | Rejected. From the abstracts of these 2 papers (the main text is in Japanese) I understood that they focus on the estimation of the energy conservation effort undertaken in Japan after the big earthquake. However, the text in the |
| 8981 | 9 | 40 | 11 | 40 | 41 | The title not exactly reflects the content. Only fuel poverty has been discussed. | Accepted. |
| 3104 | 9 | 40 | 11 | | | first para is about housing issues in general but not necessarily directly linked to fuel poverty (cut be cut). Don't really understand the terms 'upliftment and up gradation' | Accepted. |
| 15695 | 9 | 40 | 43 | | | I understand why improved indoor conditions improve the health of people, but why have energy efficiency interventions have implications on the indoor conditions? Does a more energy efficient house have automatically better indoor conditions? Isn't it one aspect of building an energy efficient house to keep indoor conditions at an acceptable level (besides reducing GHG emissions, keeping the costs acceptable, etc.)? | Noted. Taken into account. Energy efficiency interventions results in fuel poverty alleviation in both developing and developed countries as less energy is need for achieving acceptable thermal coditions.<br>Also, substituting traditional biomass for cooking in several developing countries |
| 3501 | 9 | 40 of 86 | | | | This section has not addressed gender issue, as partially suggested in the section's title. | Accepted. The title changed. |
| 6674 | 9 | 41 | | | | This is an issue general to energy consumption, not very specific to buildings. It is not useful here | Noted. Taken into account. We have revised the text providing quantitative information for this type of co-benefits |
| 6673 | 9 | 41 | 18 | | 22 | this part is informative about LIME, but not about the results this tool delivers. It should be removed | Accepted. Text revised |
| 17973 | 9 | 41 | 2 | | | There is a lot more literature on cookstoves also assessed in the SRREN, the GEA and the WEO. | Accepted. Additional material has been |
| 8982 | 9 | 41 | 24 | 41 | 30 | Suggest to be discussed in terms of thermal comfort. Air-conditioning can be applied for hot climates only. The discussion is more appropriate to cover in general or different types of climates. | Noted. Taken into account. In this subsection, workspace productivity is discussed, not the thermal comfort.The subsection has been substantially |

|---|---|---|---|---|---|---|---|
| 17975 | 9 | 41 | 40 | 41 | 45 | What is the range of these monetisation of outdoor air pollution? With so many references, this could be a second candidate for a meta-analysis beyond the one provided for employment effects. | Accepted. The revised text qives some quantitative information about the magnitude of these co-benefits. |
| 15696 | 9 | 41 | 46 | | | The first part of this subsection fits better in subsection 9.7.3.3. The part about water saving is a completely new topic, never mentioned before. Either add it to another section as an additional example or skipp it (probably the topic will already be discussed thouroughly in other parts of AR5). | Accepted. |
| 6675 | 9 | 42 | 10 | | | The current title of the section is inadequate; when not simply call it 'the rebound effect'? | Accepted. |
| 3281 | 9 | 42 | 13 | 42 | 14 | For a more up to date review of rebound effects, see Maxwell et al (2011).<br>Maxwell, D., P. Owen and L. McAndrew (2011). Addressing the Rebound Effect - Final Report, European Commission DG ENV. | Accepted. |
| 3282 | 9 | 42 | 15 | 42 | 17 | The phrase ".....  caused by the additional spending....." is inaccurate. The indirect rebound effect is caused by re-use of the money saved, which is different from simply "additional spending". Re-use of the money saved will generally include investment (eg saving the money in a bank) as well as additional spending. The balance of how the money is re-used (saved or re-spent) is important for estimating the rebound effect, depending on the savings ratio. See Druckman et al 2011.<br>Druckman, A., M. Chitnis, S. Sorrell and T. Jackson (2011). "Missing carbon reductions? Exploring rebound and backfire effects in UK households " Energy Policy 39: 3572–3581. | Accepted. |
| 3283 | 9 | 42 | 29 | 42 | 31 | Chitnis et al (2012) estimate the direct and indirect rebound effect to be 5-15% for a selection of typical energy efficiency measures applied to the UK domestic building stock.<br>Chitnis, M., S. Sorrell, A. Druckman, S. K. Firth and T. Jackson. (2012). "Estimating direct and indirect rebound effects for UK households. Sustainable Lifestyles Research Group: Working Paper 01-12." available from http://www.sustainablelifestyles.ac.uk/sites/default/files/publicationsdocs/slrg_working_paper_01-12.pdf. | Accepted. |
| 6676 | 9 | 42 | 39 | | | effective energy efficiency policies can reduce the rebound': Giraudet and Quirion (2008) show that this is true for the tax, but not for other instruments (Giraudet, L.-G., P. Quirion, 2008, "Efficiency and distributional impacts of tradable white certificates compared to taxes, subsidies and regulations", Revue d'économie politique, 118(6):885-914, http://www.cairn.info/resume.php?ID_ARTICLE=REDP_186_0885) | Accepted. |
| 6677 | 9 | 42 | 44 | | | I don't see what 'public perception' means here | Rejected. No space to explain, cannot olace in a glossary either |
| 6678 | 9 | 42 | 44 | | 45 | this section is little informative | Accepted. Restructured within short |
| 15500 | 9 | 42 | 45 | 43 | 3 | Quote examples not only link with USA. | Accepted. |
| 8983 | 9 | 42 | 7 | 42 | 9 | How do the green schools reduce the water usage by 32%? Is it because of reuse the rain water or due to energy efficiency measures? If it is due to the former reason, is this part of mitigation strategies? If it is because of the latter reason, it is better to mention the technogies/ measures that applied in this case. 32% is impressive. | Accepted. Explanation added. |
| 3105 | 9 | 42 | | | | Heading is misleading - the rebound effect is neither a technological risk nor public perception | Noted. Location of the analysis of rebound needs discussion. It's no even obvious it should be in Chapter 9 at all. There are different discussions in Chapters 7, 8, 10 and 15 (but nothing in Chapter 3). I think ours is the most best (e.g. Ch 15 only considers very old literature) Noted that this is rather misleading. However, it is a risk/se |

(2006): Ten Lessons Learned: Data Warehouse Development Project, California Department of Fish and Game, In: CrossTalk: The Journal of Defense Software Engineering, Vol. 19, Nr. 10, S. 16-20 | Rejected. Old references, prior to 2007 |
| 4264 | 9 | 43 | 41 | | | Markandya et al showed that in India when the health co-benefits of reduced particulate air pollution were taken into account using EU methodology to monetise the benefits they covered the costs of mitigation. This was less so in the case of China and the EU because of lower baseline levels of air pollution but the benefits were still substantial. Markandya A, Armstrong BG, Hales S, Chiabai A, Criqui P, Mima S, Tonne C, Wilkinson P. The Lancet - 12 December 2009; 374, 9706: 2006-2015 | Accepted. The revised text gives some quantitative information about the magnitude of these co-benefits. We included a more detailed paper of the same research team concerning this |
| 3107 | 9 | 43 | | | | should mention here that barriers into energy efficiency have been widely studied. This (short) section seems to be in the wrong place - should be with 9.10 as this is about policies to overcome the barriers. | Accepted. Section structure readapted |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 12636 | 9 | 43 | | | | "Principal-agent problem(Tenant-owner problem)"should be featured as a significant barrier in building sector. Following document may have implications.<br>Owner-Tenant Engagement in Responsible Property Investing<br>http://www.unepfi.org/fileadmin/documents/TenantEngagementReport.pdf | Accepted. Consider suggestion by Writing Team. Add “Principal-agent problem(Tenant-owner problem)” to Barriers column and “Institutional, |
| 12643 | 9 | 43 | | 43 | | The complexity of interaction and visious spiral of shifting responsibilties among many stakeholders are building value chain is referred to as a major barriers to energy efficient buildings.<br>(WBCSD, "Energy Efficiency in Buildings Facts & Trends", 2007)<br>(RICS, "Breaking Vicious Circle of Blame- Making the Business Case for Sustainable Buildings", 2008) | Accepted. This comment is true, but it is difficult to respond with simple expression. Consider suggestion by Writing Team. Add “too many stakeholders interact along a building |
| 15700 | 9 | 43 | 14 | | | The table gives a good summary of the barriers and opportunities that exit. However, wouldn't it be better to put this table (it's hardly a section) more at the end of chapter 9 and call the section something containing the word "summary"? | Accepted. Section structure readapted |
| 15214 | 9 | 43 | 19 | 43 | 23 | How the lifestyle is changes in developing countries is also of importance. | Accepted. Consider suggestion by Writing Team. Add “Lifestyle change in developing countries” to “Opportunities” |
| 3504 | 9 | 43 of 86 | | | | Under "Opportunities" column of "Institutional, cultural and legal" row, it is recommended to add (1) the opportunities presented to education sector, including R&D at tertiary level, (2) Inter-governmental agencies action plans, (3) cross-sectoral relationship, (4) public private partnership, etc. Overall concept can be found in [Cam C.N.W. (2012). Technologies for Climate Change Mitigation: Building Sector. Denmark: UNEP Riso Centre.] | Rejected. Overall points were already included, found no practical case to be cited. Barriers structure was the same from AR4. |
| 2362 | 9 | 44 | | | | Taking a critical view, this chart can be interpreted that we have no clue what is needed in buildings to achieve certain pathways. Rethink if this chart is needed at all. | Rejected. Chart conveys the right messages |
| 6681 | 9 | 44 | | 45 | | the EMF25 report (http://emf.stanford.edu/files/pubs/22530/summary25.pdf) and the 2011 Special Issue of the Energy Journal on Energy Efficiency of the Energy Journal provide such modelling comparisons | Noted. Will check |
| 15699 | 9 | 44 | | | | What do the diagonal lines mean? The figure is rather complicated, due to so many lines. | Noted. Clarify |
| 15501 | 9 | 44 | 15 | | | Delete additional brackets after Krey et al., 2012 | Editorial. CSAs please check |
| 9556 | 9 | 44 | 4 | 44 | 6 | Please, take into consideration following; the buildings sector has an important role to play in CO2 emissions reduction. Energy efficiency options are available in the buildings sector that can reduce energy consumption and CO2 emissions from lighting, appliances and heating and cooling rapidly and at low cost. But achieving deep cuts in energy consumption and CO2 emissions in the buildings sector is a challenge. The implementation of these technologies will require much more ambitious policies, particularly in relation to building shells in the existing stock of buildings in OECD countries, as well as decarbonising the energy sources used. (ETP 2010, IEA, p218) | Noted. Already conveyed such message |
| 4263 | 9 | 44 | 40 | | | It is the combination of insulation with improved ventilation control for example through mechanical ventilation with heat recovery, that results in the health benefits by reducing exposure to indoor air pollution and to the ingress of outdoor pollutants if filters are fitted and maintained. In the Wilkinson study referred to it was assumed that the 20% of dwellings that were most tightly sealed and insulated were fitted with MVEHR | Noted. Checked. |
| 3167 | 9 | 44 | 3 | | | Section 9.9.1 is a good model of what's needed in other sectoral chapters—a link back to chapter 6 so that readers can see how a common set of transformation pathways affects each sector. | Noted. Thanks. No action |
| 2363 | 9 | 45 | | | | Split into "total" and "hvc" energy use | Noted. |
| 2197 | 9 | 45 | 3 | 45 | 22 | The evolution of the final energy demand for buildings in Switzerland, held constant over the period 1974 to present (see http://www.bfe.admin.ch), can be used to strongly back-up the argument that "despite all assumed increases in GDP, floorspace and service levels global building energy use can be held at least constan,t or decreas,e as a result of measures". | Noted. Will check |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 8984 | 9 | 46 | | | | What are the elements that included in 'resident others'? Heating and cooling usually play the major consumptions. Other than that are the appliances, refrigerators, TVs, etc, which is quite surprised to be the major and a lot higher than heating and cooling demands. | Noted. Clarify please |
| 15502 | 9 | 46 | | | | Add a sub chapter on initiative to reflect building performance (Common Carbon Metric from UNEP-SBCI or others) – Link somewhere this information with baseline needs - Can be in Chapter 9.10 | Rejected. No space |
| 6682 | 9 | 46 | 12 | | | the previous sections demonstrated that many strong barriers…': again, the nature of the barriers is not formally discussed, nor 'demonstrated' | Accepted. Change wording |
| 9557 | 9 | 46 | 12 | | | Please, replace strong with particular. | Editorial. |
| 15701 | 9 | 46 | 12 | 46 | 12 | "The previous sections demonstrated …" Such sentences take a lot of space and are, in my point of view, not really necessary and sometimes confusing. My sentence would be "Strong barriers prevent the full uptake of energy saving measures and market forces alone will not achieve ..." Maybe it's just a matter of opion ... | Accepted. Change wording |
| 9558 | 9 | 46 | 14 | | | Please, add the following; significant evidence shows that appliance MEPS and labelling programmes have generally been successful in terms of their effectiveness in saving energy and cost efficiency. (Technology roadmap Energy-efficient Building,2011, IEA, p22) | Noted. Will consider |
| 9559 | 9 | 46 | 19 | | | Please, add the following; McKinsey's global marginal abatement cost curve (MACC) places efficient lighting systems and air conditioning as measures that achieve GHG emission reductions at zero or negative cost (between -60 EUR/tCO2 and -80 EUR/tCO2), i.e. at no net cost to the economy. In MACC analysis developed by McKinsey for Germany, the UK, Australia and the United States, residential appliance, equipment and lighting efficiency improvements are negative cost measures across the four countries, though the specific cost varies (AP Envecon, 2009). Most of the studies emphasize the importance of policies concerning end-user efficiency (residential and industrial energy demand) and some studies describe measures in this field as crucial factors in the short run (2010 to 2030) to reach the emission targets set for the long run (e.g. ETP Blueline). The proposed measures comprise the thermal integrity of buildings and heat pumps (Energy Roadmap 2050, Impact assessment, European commission, p104 ) http://ec.europa.eu/energy/energy2020/roadmap/doc/sec_2011_1565_part2.pdf | Noted. There is a lot of controversy about Mc Kinsey´s curves |

| 6685 | 9 | 47 | 33 | | 36 | this sentence is redundant and very general. It can be removed | Rejected. Cannot accept this comment, it is very important to hav e this |
| 18897 | 9 | 47 | 5 | | | Orthorgraphy: should read "countries for example" | Editorial. Correct the spelling mistake |
| 12633 | 9 | 47 | 41 | 47 | 4 | "Tax credit" for energy efficient building seems also emerging . | Accepted. OK accepted it will be mentioned in the paragrapgh on |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 3505 | 9 | 47 of 86 | 33 | | 40 | It is recommended to start this paragraph by highlighting the importance of deploying policies that promote the implementation of the building sector's mitigation technologies to be in line with the national sustainable development goals. Detailed analysis can be found in [Cam C.N.W. (2012). Technologies for Climate Change Mitigation: Building Sector. Denmark: UNEP Riso Centre.] | Accepted. Consider reviewer's suggestion |
| 2880 | 9 | 48 | 16 | 48 | 16 | (Bertoldi, 2010) should be (Bertoldi et al, 2010) | Accepted. Consider correction |
| 6687 | 9 | 48 | 23 | | 24 | The reference to Brussels' building code seems a bit anecdotal. It can be removed | Rejected. NOT Accepted this is very good example, which I would like to |
| 6686 | 9 | 48 | 5 | | | Another pioneering publication on sufficiency is: Alcott, 2008, 'The sufficiency strategy: would the rich-world frugality lower environmental impact', Ecological Economics | Accepted. |
| 3111 | 9 | 48 | 9 | | | personal carbon allowance - this is only a potential policy instrument, it hasn't been introduced anywhere and would be politically very difficult to do. Not sure about the link between property taxation and energy sufficiency. Property taxation is usually done for other reasons, need to explain their use in this instance. | Accepted. Distinction between policies that have been implemented and those that have not. Ok to explain that propose tax proposety is set as fucntion of total eenrgy consumption of the household |
| 9514 | 9 | 48 | 9 | 48 | 12 | delete these 2 sentences - It is not acceptable to mention personal carbon allowance in IPCC report | Rejected. No action. It's a form of carbon trading, so the comment is unjustifiable. |
| 9435 | 9 | 48 | 9 | 48 | 12 | · Deletion of the entire sentence is needed.<br>· A policy that sets out carbon emission allowance per person or yearly kWh consumption per person does not have universal relevance. An IPCC document that includes this stipulation will lose relevance as a world-wide agreement applicable beyond particular countries or regions. Such a policy would also infringe on individual freedom and will not gain consensus. □ | Accepted. Partly accepted, will be challanging to have it accepted by population, but has some additional bebefits such as social equity. IPCC does not prescribe any policy nor recommend any policy, jus indicates |
| 6688 | 9 | 49 | 10 | | | there is agreement among experts and it is widely reported in the literature': further evidence should be provided on that point. All the more that I could not find Harmelink et al 2008 in the reference list | Accepted. (1) Provide more peer-reviewed literature<br>(2) Include reference in the |
| 2904 | 9 | 49 | 45 | 49 | 45 | (Harmelink et al, 2008) is not in the References section at end of chapter | Accepted. OK it will be added |
| 3112 | 9 | 49 | | | | why is this a subsection? It's one sentence and doesn't really say anything. | Accepted. OK we can delete this sub section for individual policy instruments |
| 15702 | 9 | 49 | 5 | | | This subsection holds just one sentence, which can be added around the first time table 9.10 is mentioned (page 47, line 12). As a result, the title of 9.10.2.3 can be skipped as well (the title only, not the content). If you want to keep the title, then keep it and put an extra subsection before the instruments in section 9.10.2, which can be called "Policy instruments" or something like that. | Accepted. OK we will accept this comment, see also previous comment |
| 3113 | 9 | 49 | | | | this could be merged with 'a holistic approach' on page 48 | Rejected. NO we need a section specific to policies pacakages. No action |
| 17291 | 9 | 49 | | | | Comment to Policy packages. In this section, the energy policy of Appliances should be described clearer. In many cases, policy measures of Appliances are used in combination to increase their impact. There are numerous examples, such as "MEPS and performance labels", "Endorsement labels and procurement policies" and "Labels, retailer programmes and customer insentives. However, with effectiveness of energy policy of Appliances, there is no one single model to employ; rather, each program varies in terms of structure, funding, and implementation. The specific policies, regulations, programs, and incentives needed are highly dependent on the nature of the target product or the technological area and conditions (e.g. market structure, resources, institutional capacity) of the target market area (e.g. national, state, regional grouping), and the background of each country such as its history, culture, custom, economical development, national awareness, etc. For examples, The Japanese Top-runner Program is not MEPS. As the policies for market transformation depend on the status and conditions of the target market. There are detailed descriptions in the Gadgets and Gigawatts - Policies for Energy Efficient Electronics (IEA, 2009). | Accepted. Include comment in the Text |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 3507 | 9 | 49 of 86 | | | | It is recommended to include the successful case example from Singapore government's green building policy packages, termed as Green Building Master Plan. | Accepted. OK good suggestion, it wil be included |
| 4790 | 9 | 5 | 1 | 5 | 3 | I am not sure that this sentence is correct and true. It depends on several parameters (devil in details), and pricing could be more effective than regulation/programs. Have you got evidence to prove this sentence? | Noted. Will consider |
| 16883 | 9 | 5 | 1 | | 7 | No evidence that prices influence building EE? Can you not examine energy efficiency in high price electricity markets like Germany and compare to low price markets like parts of U.S. to test? Is it really true? Generally, if there is no response or it is a smaller response than expected, it means the price has not increased enough, or else the models looking at the costs needed to become more efficient are not factoring in other costs that also influence peoples' decisions (opportunity costs, time, etc). | Noted. Will consider |
| 9170 | 9 | 5 | 1 | 5 | 7 | It is very important message to policy maker hence should be put in the exec summary. | Accepted. Will consider |
| 9171 | 9 | 5 | 1 | 5 | 7 | But energy price (not necessarily "mitigation policy instruments") does affect the energy consumption behaviour. It should be noted. I imagine Japan and EU are spending less than AUS and US and it is (at least partly) due to the difference in energy price. | Noted. Will consider |
| 18857 | 9 | 5 | 12 | 5 | 15 | This sentence is unclear. Why is "most ambitious policies" worse than "best practice standards" | Noted. Will consider |
| 7697 | 9 | 5 | 20 | 5 | 24 | This statement is unsupported by the literature (white lit anyway). I couldn't find support in the chapter but I may have missed it. | Noted. Will consider |
| 6610 | 9 | 5 | 22 | | 23 | There is no comment throughout the report about the persistence of these potential energy savings | Noted. Will consider |
| 6611 | 9 | 5 | 24 | | | The word 'risk' seems inappropriate here. Alternative suggestion: 'likelihood' | Noted. Will consider |
| 16884 | 9 | 5 | 34 | | 45 | Similar to the previous comment, I would encourage caution in claiming that price does not impact building efficiency value or investment -- I would also be very cautious in depending on engineering models that determine the value of energy savings. These will be very different from actual market potentials. The engineering or economic models frequently fail to account for other costs that dissuade people for making the investments that look like obvious energy saving winners. | Noted. Will consider |
| 6612 | 9 | 5 | 42 | | | The existence of co-costs should be mentioned, even though they might be largely offset by co-benefits | Noted. Will consider |
| 16256 | 9 | 5 | 49 | 5 | 50 | Unclear: Why should uniformization be needed in order to adress the problem of fragmented actions? Uniform solutions might be less flexible to take the specific context into account. | Rejected. |
| 3487 | 9 | 5 of 86 | 37 | | 40 | It is recommended to add: "decreased the needs to invest in additional/expansion of communal energy supply/distribution infrastructure." There are cases where more energy efficient buildings in a community are the very reason for local governments to revoke the plan of expanding/building new power plant. | Noted. Will consider |
| 7023 | 9 | 5 of 86 | 18 | 5 of 86 | 18 | Add "zero and" after the word "adequate". | Editorial. |
| 7024 | 9 | 5 of 86 | 22 | 5 of 86 | 22 | Substitute "industrialized" for "developed", after the word "In", at the beginning of the line. | Accepted. Substitude "industrialized" |
| 7025 | 9 | 5 of 86 | 25 | 5 of 86 | 25 | Substitute "industrialized" for "developed", as the first word of the line. | Accepted. Substitude "industrialized" |
| 7022 | 9 | 5 of 86 | 6 | 5 of 86 | 6 | Modify the sentence after the word "both", for the following one: "promotion of energy efficiency and reduced energy demand". | Editorial. |
| 9560 | 9 | 50 | | 51 | | Please, wrap up and simplify policies described by categories of labeling, MEPS, procurement, fiscal measures, and tradable energy and GHG saving scheme. | Accepted. Categorise as agreed in Vigo. OK (partly accpeted) we have already in each row a different policy, but we could categorise them as agreed in Vigo on |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 4739 | 9 | 50 | | 52 | | The element of Table 9.10 in the 13th row and 2nd column could be modified as follows<br>Incentives (e.g.grants and subsidies) and financing (e.g.low interest loans,) for investments in energy efficiency, an in the UK Green Deal pay as you save scheme, or Japanese housing eco-point system, provides shopping point when the consumer invest energy efficiency of housing.<br><br>The element of Table 9.10 in the 16th row and 2nd column could be modified as follows<br>Information campaign to stimulate both behavioral changes (e.g. to turn down the thermostat by 1 C during the eating season and Japanese Cool-Biz Campaign) as well as investments in energy efficiency technologies: new developments in the area of smart metering will also impact on consumer behavior | Accepted . OK accepted (we need paper reference with the evaluation of this policy) |
| 9173 | 9 | 50 | | | | good table. But it needs much more explanation in the main text to get the message across. | Accepted . Introduce a message in the |
| 9174 | 9 | 50 | | | | I will refer to this table and some numbers within in our ch15 SOD. | Accepted . |
| 9176 | 9 | 50 | | | | kazuari 2007 should be Kainou 2007. | Accepted . To be done |
| 6689 | 9 | 51 | | | | Giraudet et al 2012 in the second row, fifth column refers here to: Giraudet, L.-G., L. Bodineau, D. Finon, 2012, “The costs and benefits of white certificates schemes”, Energy Efficiency, 5(2):179-199. This should be added in the reference list | Accepted . To be done |
| 10013 | 9 | 51 | | | | In the third columns from top, Tokyo cap & trade program is mentioned. But this example should be deleted completely. Tokyo cap & trade program is currently under the special measure for the Great East Japan Earthquake, which allows CO2 emission increase caused by home generation, which means the program is not implemented under normal condition. Therefore, Tokyo cap & trade program is not considered as a good example of cap & trade policy. | Accepted. Should delete example. OK we can take it out, though I personally think it was a good policy, just suspended because of the earthquake |
| 2881 | 9 | 53 | 13 | 53 | | define ESCOs - energy services company? | Accepted . Provide definition. Definition is available in the prior draft |
| 2905 | 9 | 53 | 33 | 53 | 33 | (Milin and Bullier, 2011) is not in the References section at end of chapter | Accepted. |
| 3114 | 9 | 53 | 7 | | | The UK government is not planning to subsidise the interest rate. However, some measures installed under the Green Deal (notably solid wall insulation) will be subsidised under the separate energy company obligations (where energy companies have obligations to meet carbon targets) | Accepted. Rewrite the section |
| 2906 | 9 | 54 | 3 | 54 | 3 | (RSA, 2009) is not in the References section at end of chapter | Accepted. |
| 15504 | 9 | 54 | 38 | | | Present more in detail MRV reality and NMM opportunities link with the build environment. A dedicated sub chapter on NAMAs will make sense (see Johnson Controls or others reports) - Can be also in sub-chapter 9.10 | Rejected. NMM and NAMA new concepts still being negotiated in COP/MOP climate meetings |
| 15503 | 9 | 54 | 38 | 55 | 9 | Suggestion to add a more comprehensive chapter on this issue. This sub-chapter is a crucial one as it is link also with methodologies to report buildings performance in a climate perspective. At least explain methodologies to secure data and carbon reduction. Explain difficulties link with CDM design (see UNEP-SBCI, Risoe) | Rejected. 1. No CDM to be discussed 2: 2 sentences to explain difficulties link with CDM. No space to discuss CDM methodologies in this chapter. 1-2 sentences highlighting |
| 13698 | 9 | 54 | 40 | 55 | 9 | Replace "The CDM is regarded … SHS type of projects" by: Replace by: "However, it until recently has bypassed the sector entirely. Some of the methodological obstacles to energy efficiency projects are discussed by Michaelowa et al. (2009). However, a "whole building" baseline and monitoring methodology approved in 2011 may pave the way for more building projects (Michaelowa and Hayashi 2011). Since 2009, the share of CDM project in the building sector has increased, particularly with regard to efficient lighting schemes UNEP Riso Centre (2012)". References: Michaelowa, A.; Hayashi, D.; Marr, M. (2009): Challenges for energy efficiency improvement under the CDM—the case of energy-efficient lighting, in: Energy Efficiency, 2, 4, p. 353-367; Michaelowa, A.; Hayashi, D. (2011): Waking up the sleeping giant: How the new benchmark methodology can boost CDM in the building sector, in: Trading Carbon Magazine, 5, p. 32-34. (Data should be updated at the time of finalization of AR5.) | Accepted. Consider reviewer's comment as suggested but do not replace; agree to include, but not replace any sentence. |

|---|---|---|---|---|---|---|---|
| 9436 | 9 | 57 | 30 | 57 | 32 | · Deletion of the phrase 'on-site renewable energy generation and cogeneration' is needed.<br>· This is because it does not reflect the reality.<br>· Power generation efficiency of cogeneration is lower than that of the most advanced centralized power plant, if the usages of heat and electricity are not balanced, and therefore does not reduce dependence on imported fuel. While cogeneration has limitations on the kind of fuel (gas, oil) that can be used, centralized power plant is capable of using various types of fuel (gas, oil, coal, uranium, etc.) Take coal, for example, having the advantage of energy security in terms of both geopolitics and the amount of reserves.<br>· Refer to the following documents.<br>Pepermans et al.[1] discussed the issue of energy security of distributed generation. They say in some discussion, energy security in linked to the diversification of primary energy supplies, in others it is interpreted as the reliability of the electricity system. Under the first interpretation, energy security improves as the diversification of primary energy supplies increases. In this case, the advantage of distributed generation are limited, as most technologies – with the exception of systems based on renewables –directly or indirectly depend on natural gas. Under the second interpretation, it is felt by many authors, for example by the IEA (2002), that distributed generation can contribute to reduce the risks and costs of blackouts. Here, distributed generation is seen as an instrument that helps to reduce the private costs and risks for electricity customers of system failures. Others, like CIRED (1999)[2], claim that distributed generation does not contribute to system security. On the contrary, it would have a negative effect. Such a negative impact on the system security occurs when the share of non-dispatchable generation capacity increases. Examples of such units are wind turbines, photovoltaic systems and cogeneration units that are closely tied to heat demand. The latter units cannot be centrally controlled because of the natural variability of their power supply. As a consequence, there is an increased need for regulating (backup) power.<br>1]G. Pepermans, J. Driesen, D. Haeseldonckx, R. Belmans, W. D'haeseleer<br>Distributed generation: definition, benefits and issues<br>Energy Policy, Volume 33, Issue 6, April 2005, page 787-798<br>http://www.sciencedirect.com/science/article/pii/S0301421503003069<br>[2]CIRED (1999)<br>Disperse Generation<br>Preliminary Report of CIRED Working Group No.4<br>http://www.cired.be/WG04-Report%20.pdf<br>[1]page 794 right column lines 17-42<br>[2]page 5 left column lines 10-14 | Noted. | 2357 | 9 | 8 | | | | This is the key table people will look at. 1) Drive to fill all fields with best information (blank spaces look odd). 2) Add accompanying text that numbers include duplications (and must not be added), 3) work more on synthesis for potentials - do show synthesis ranges instead of examples 4) if you show cost, use common metric (eg. $/tCO2e) | Noted. Will consider |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 10009 | 9 | 8 | | | | "Policies"should include "voluntary target scheme" because there are successful examples of "voluntary target scheme" in the world. Each industry in Japan has voluntary target and the voluntary target scheme has played a big role, as described in (Yamaguchi, 2012, page35 and 154), (Manuel, 2010, page 6 and 13), and (Yamaguchi, 2010, abstract). In addition, there is also a successful example of "voluntary target scheme" in Netherlands, as shown in (Martijin, 2002, page162). These reference sources are same as for No63.<br>On the other hand, market-based mechanism such as emission trading has several problems. Volatility of emission permit prices affects volatility of product prices as evidenced by fluctuating price developments in the EU-ETS. Therefore, the market-based policy tools of cap-and-trade cannot provide credible incentives for the technological change, as described in (Montgomery, 2005, abstract) and (Baldursson, 2009, page29). These literatures are listed in the No62 line of this table.<br>In addition, CO2 leakage caused by the implementation of the ETS happened actually through international transfer of industry , as shown in (Rosendahl, 2011, abstract), (Aichele, 2012, page336), and (Peters, 2011, page1). These literatures are listed in the No50 line of this table. | Noted. I think the best place for describing "voluntary target scheme" is Table 9.10. |
| 4729 | 9 | 8 | 1 | | | Table9.1 shows Mitigation options such as High-performance building envelope, Efficient appliances, Efficient lighting and Efficient HVAC systems. Those items should be described in the body text. | Accepted. Will consider, given space allocated |
| 7028 | 9 | 8 of 86 | | 8 of 86 | | Substitute "industrialized" for "developed" in the first line of the fourth cell, in the fifth column. | Accepted. Substitude "industrialized" |
| 2864 | 9 | 9 | 13 | 9 | 13 | define "IT" - it is the first time used in the chapter | Accepted. |
| 3098 | 9 | 9 | 16 | | | passive house standard in Upper Austria - the 2006 figure is very out of date. I've seen figures of 25% for Austria (http://www.igpassivhaus.at/%C3%96sterreich/Wir%C3%BCberuns/tabid/63/language/de-DE/Default.aspx) | Accepted. But this material has been deleted |
| 6617 | 9 | 9 | 16 | | 17 | The sentence 'building design…mitigation strategies' reads unessential | Accepted. But this material has been |
| 12575 | 9 | 9 | 17 | | 21 | May be briefly touched upon as the same is almost repeated under section 9.2.1 | Accepted. Redundancies removed |
| 18861 | 9 | 9 | 17 | | | Grammar/orthography: "the key" instead of "be key" | Accepted. But this material has been |
| 6618 | 9 | 9 | 25 | | 27 | The last sentence of the paragraph reads unessential | Accepted. But this material has been |
| 9543 | 9 | 9 | 34 | | | Please, provide following information with text; buildings narrowly defined hold great potential for cost-effective energy savings. The IEA estimates that the energy savings potential in this sector in 2009 will be in the range of 20 exajoules (EJ) per year by 2030, which is the same as the current annual electricity consumption of the United States and Japan combined. (25 energy efficiency recommendation, IEA) | Noted. Integrated potentials are discussed in Section 9.9 |
| 15684 | 9 | 9 | 28 | | | The name "New developments in emission trends and drivers" is a bit misleading, since the section hardly deals with emissions (except for subsection 9.2.3). The section 9.2 is good as an introduction how buildings and energy use have developed. Following this section, I would put the current section 9.5, because it deals with the interaction between buildings and the climate. After making clear there is a strong interaction, section 9.3 and 9.4 follow naturally, since they deal with the results from this interaction. The costs and potentials are then discussed in section 9.6. | Noted. The links between energy drivers and trends and emissions drivers and trends can be more clearly stated. But the order and titles of the subsections are approved by the plenary and cannot be changed |
| 9544 | 9 | 9 | | | | Please, provide following infromation with text; residential appliances and equipment represent one of the fastest-growing energy loads; the IEA estimates that at least 3.7 EJ per year could be saved cost effectively by 2030. Lighting represents almost 20% of global electricity consumption. This consumption is similar to the amount of electricity generated by nuclear power. The latest IEA estimates show the total savings potential in residential and services lighting at more than 2.4 EJ per year by 2030. (25 energy efficiency recommendation, IEA) | Accepted. Include the text as suggested. This would not be the place to talk about energy efficiency and mitigation potentials. Regarding appliances, point 9.2.2.1 describes the trend on how having better living standards imply increasing demand for energy services in buildings. But this |

|---|---|---|---|---|---|---|---|
| 3489 | 9 | 9 of 86 | 8 | | | While AR4 mentions about mitigation technology options, AR5 with more profound knowledge of the systems integration approach should not use the word "options". This should also be highlighted in the suggested sub-session 9.1.2 "What's New". Please refer to {UNDP & GEF (2010). Promoting Energy efficiency in buildings: Lessons Learned from International Experience. New York: UNDP}, “great gains can also be achieved from a broader, more holistic approach to buildings. […] Large savings can be achieved by optimising the entire building system rather than improving elements individually. This can only be done at the beginning of the building’s life or during major renovations. The rest of the energy consumption is linked to the building use, through the performance of equipment used in the building (e.g., boilers, HVAC system, lighting, electrical appliances, etc.) and the behaviours of the people who use them (choice of temperature, turning off unused lights and appliances, etc.)” | Noted. The points about system approach are already covered in the discussion of the IDP. However, we cannot change the title of 9.3 |
| 3488 | 9 | 9 of 86 | | | | Although the sub-session 9.1.1 provides a good summary of AR4, details about what's new in AR5 are not clearly described.<br>It is suggested to add a sub-session (called 9.1.2), which highlights what's new in AR5. One of the items in “what's new” should be the emphasis on systems integration. This is because the concept has become more mature, and has been taken up widely in the practice. Therefore, it is worthwhile to make an assessment to its contribution to climate change mitigation from the building sector. | Accepted. |
| 11998 | 9 | all | | | | I suggest to mention the design change principle cradle to cradle (McDonough and Braungart) which is to shift from "doing less of the bad" to "doing things right already on the drawing board" i.e. About sustainable design, inexistence of the concept of waste in nature etc. | Rejected. We already highlight key issues pertaining to LCA and cite key literature. |
| 3486 | 9 | overall | | | | The Authors have done a great job for this first draft. The whole chapter provides comprehensive outline of the assessment to the building sector. It is recommended that the Authors should pay more attention to the following aspects:<br>(1) Imbalance in addressing the building sector in all climatic regions: Although the overall assessment shows the efforts to be at the global scale, many detailed analyses and discussions seem to focus much more on the building sector in temperate regions.<br>(2) The problem of using the term "options" for mitigation technologies and practices in the building sector: As the building-related professions recognised and are progressing deep into the integrated approach of building systems, many mitigation technologies and practices cannot be viewed as options nor optional. Many of them are part and parcel of larger systems that affect the energy and/or energy efficiency performance. The term "mitigation technology options", often appeared in Chapter 9 FOD, is therefore obsolete. The term can be seen as being associated with the "checklist-approach", which are outdated and known as barriers to deliver highly energy efficient buildings. Furthermore, many technologies, highlighted in Chapter 9 FOD, are not optional in the practices found in many places in the world. | Noted. We try very hard to focus also on other climates; literature is bounding this effort. 2. noted. The problem with the word is acknowledged; but no better word is found. "option" stands to replace "technology", recongising that our mitigation options are not only technologycal, but systemic, practice-wise, behavioural/cultural, etc. Team will look for more literature buildings in warmer climate zones |
| 12628 | 10 | | | | | I disagree with CCS having a high degree of risk. This needs to be clarified and referenced. | Accepted - CCS discussion has been significantly reduced throughout the chapter and is now concentrated in |
| 12671 | 10 | | | | | I disagree with CCS having a high degree of risk. This needs to be clarified and referenced. | comment is duplicate of 12628 |
| 16140 | 10 | | | | | Very interesting table 10.3. Maybe the process CO2 emissions such as those from cement production could be added in one line, as well as the total energy CO2 for comparison purpose. Or maybe combine with figure 10.3 for a single table ? | Rejected - Table 3 is for Non CO2 gases. |
| 2103 | 10 | | | | | Throughout chapter, the "EPA 2011" reference as used in the text is a different "EPA 2011" reference as listed in the references section. The EPA 2011 reference in the text appears to indicate the U.S. EPA Draft Report 430-D-11-003, "DRAFT: Global Anthropogenic Non-CO2 Greenhouse Gas Emissions: 1990-2030" August 2011. | Accepted - due to an editorial problem chapter 10 had the reference list of a different chapter. This problem has now been resolved |

| 2105 | 10 | | | | | Opportunities to reduce length of chapter: throughout chapter, less text on the services sector featuring tourism. For example, text on tourism could be reduced by half without sacrificing meaning. | Noted - cf. Response to comment 2279 |
| 2106 | 10 | | | | | Figure 10.6 does not illuminate the understanding greatly, and could be removed for chapter length reduction. | Accepted |
| 17526 | 10 | | | | | Green City | Fragment of comment 17525 |
| 17527 | 10 | | | | | Environmental and Social Responsibility in an Industrial Cluster | Fragment of comment 17525 |
| 17634 | 10 | | | | | The framing of this chapter, based significantly on the work of Allwood & Cullen is thoughtful and appropriate. Because materials extraction and processing are responsible for a disproportionate share of GHG emissions, it makes sense to take a materials-based perspective. However, some cross-cutting perspectives that capture aspects of industrial GHG emissions should also be presented. For example, emissions from semi-conductor manufacture. Also, the potential leverage provided by information and communication technology to reduce emissions is relevant. | Taken into consideration when revisiting section 10.4 |
| 17489 | 10 | | | | | The layout is confusing and nonstandard. The format of the table should make it obvious that there are 2 halves of the table side-by-side. Without such indication, readers will assume (at first) that information in the rows refers to one, single entry. | Accepted - layout has been improved in SOD |
| 17491 | 10 | | | | | As with table 10.1, the layout is confusing and nonstandard. The format of the table should make it obvious that there are 2 halves of the table side-by-side. Without such indication, readers will assume (at first) that information in the rows refers to one, single entry. | Accepted - layout has been improved in SOD |
| 17493 | 10 | | | | | Either fill in the missing value for SF6 (1990) or indicate that it is unavailable and why. | Accepted. The information is not available for 1990. Discussions underway on source data for non-CO2 gases (cf. Response to 7719). In the |
| 17499 | 10 | | | | | To what does (d) in the Total world row refer? | Was part of a footnote in the original source. The Table no longer appears in |
| 17504 | 10 | | | | | The explanation for "industrial synergies" should include a mention of geographic proximity as that is a defining feature of this notion. Otherwise there is no difference between "industrial synergies" and recycling. Also remove the caption from the original figure. | Taken into account - figure 10.5 is now deleted as the relevant ideas are covered in the intro to 10.4 |
| 17516 | 10 | | | | | To what regions and what periods do the data in this table refer? | Accepted - But table 10.5 has been |
| 17511 | 10 | | | | | Figure very difficult to read in black & white. | Noted - the figure has been deleted. The report's figures will be checked by a |
| 17537 | 10 | | | | | What is the column heading for 4th column? Horizontal alignment of entries needs more attention so that contents line up where it is appropriate and do not line up where a relationship is not meant to be inferred. Not all entries in the last column fit the label "Total" Table notes should define acronyms and abbreviations. | Accepted - Section has been revised thoroughly in SOD and will be further improved in Final Draft |
| 17513 | 10 | | | | | "Specific" needs to be defined or explained (in data legend) | Accepted - But figure 10.8 has been |
| 17520 | 10 | | | | | To what year(s) does this figure refer? | Accepted - But figure 10.9 has been |
| 17485 | 10 | | | | | Lines between boxes should indicate directionality, i.e., they should be arrows. | Rejected - this was considered but the chapter team agreed that giving |
| 17487 | 10 | | | | | Caption should include interpretative guidance. It should at least say that thickness of lines indicates magnitude of flow. | Noted - this valuable feedback will be used in completing the work of publishing this diagram. However, the position within the WG3 report will most |

|---|---|---|---|---|---|---|---|
| 7088 | 10 | | | | | it is incorrect to attribute the land use change to specific sectors (as this figure does). The causes are seldom easy to identify and often involve multiple drivers. In the words of an FAO report (FAO 2010), "The causes of deforestation are multiple, complex and vary from location to location. Although deforestation at the global scale is "mainly due to conversion of forests to agricultural land…" (FAO, 2006), the underlying causes are less well understood. The most significant underlying factors contributing to deforestation are often identified as high population density and low per capita income (e.g. Uusivuori, 2002; Kauppi, 2006), but this view may obscure the complexity of the problem. (continued below) (references are shown two lines below) | Noted - this valuable feedback will be used in completing the work of publishing this diagram. However, the position within the WG3 report will most likely be changed and the diagram included in one of the framing chapters (chapter 5) |
| 7089 | 10 | | | | | (continued from above) The Scenarios Working Group of the Millennium Ecosystem Assessment (2005) reported that "Ten years of research within the international programme on land use and land cover change of [the International Global-Biosphere Programme] concluded that neither population nor poverty alone constituted the sole and major underlying causes of land cover change worldwide". The working group cited a meta-analysis of 152 case studies, which concluded that "The multiple factors intervening in tropical deforestation … make it particularly difficult to develop generic and widely applicable policies that best attempt to control the process. Many land-use policies are underlain by simplifications on the drivers of change…. From the results of the meta-analysis it is clear that any universal policy or global attempt to control deforestation (e.g. through poverty alleviation) is doomed to failure." (references below) | Noted - this valuable feedback will be used in completing the work of publishing this diagram. However, the position within the WG3 report will most likely be changed and the diagram included in one of the framing chapters (chapter 5) |
| 7090 | 10 | | | | | (continued from two previous rows - references for those rows)<br>-FAO. (2010). Impact of the global forest industry on atmospheric greenhouse gases: FAO Forestry Paper 159. Rome: United Nations Food and Agriculture Organization<br>- FAO. 2006. Global Forest Resources Assessment 2005 – Progress towards sustainable forest management. FAO Forestry Paper 147. Rome.<br>- Uusivuori, J.E. 2002. Population, income and ecological conditions as determinants of forest area variation in the tropics. Global Environmental Change, 12(4): 313–323.<br>- Kauppi, P.J. 2006. Returning forests analyzed with the forest identity. Washington, DC, USA, National Academy of Sciences of the United States of America<br>- Millennium Ecosystem Assessment. 2005. Ecosystems and human well-being, Vol. 2, Scenarios. Washington, DC, USA, Island Press. | Noted - this valuable feedback will be used in completing the work of publishing this diagram. However, the position within the WG3 report will most likely be changed and the diagram included in one of the framing chapters (chapter 5) |
| 7091 | 10 | | | | | The figure is incorrect in that is misses the large carbon sink attributable to the growth and expansion of forests - i.e. see Pan, Y., Birdsey, R., Fang, J., Houghton, R., Kauppi, P., Kurz, W., et al. (2011). A Large and Persistent Carbon Sink in the World's Forests. Science Vol. 333 , 988-993. - which documents a large net sink for global forests, which may be partly due to atmospheric fertilization and climate change but according to the Pan et. al. study is clearly largely due to other factors. | Rejected: figure focuses on emission and not mitigation options, discussion about the mitigation potential of forest growth is covered in chapter 11. In any case this feedback has been forwarded |
| 10631 | 10 | | | | | Chemicals; GHG Intensity, "polymer synthesis" should be replaced with "steam cracking", because the steam cracking is the most energy consuming process rather than polymer synthesis. | Accepted - But table 10.6 has been removed from SOD |
| 15266 | 10 | | | | | Table 10.7 indicates total additional investment from 2010-2050. I think those amount of the investment are very important indicators to access the feasibility of each of the mitigation measure. However, at the same time, I think that the figure have to be a firm one, not to mislead the readers to inappropriate direction in any case. Therefore, I believe that those figures will also indicate its error and uncertainty like other sinarios. | Taken into account when revising the section |
| 7523 | 10 | | | | | In general, balanced description of "Material Efficiency" and "Energy Efficiency" is of key importance. | Taken into consideration when revising |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 7524 | 10 | | | | | It is little difficult to swallow "Material Efficiency", because policy measures for "Material Efficiency" could lead unexpected side-effects under the current complex competitiveness among materials.<br><br>The history in Former Soviet Union and China reveals the difficulty for "Material Efficiency".<br><br>See also:<br>Daniel Yergin, Joseph Stanislaw (1998). The Commanding Heights: The Battle between Government and the Marketplace. | Taken into consideration when revising the chapter |
| 2294 | 10 | | | | | Non-ferrous needs to consider more than just emission factors. The majority of the GHG generated in the Al industry is from the energy required for the process - not considered. Also other gases (PFCs) in Al are not quantified. Both of these areas are major considerations that were not explored. | PFC production is now quantified and indirect emissions are now discussed for aluminium production. |
| 2297 | 10 | | | | | under steel - I would either eliminate electrolysis or include note (actual GHG savings depend on carbon footprint of electricity used). Also under alternate fuels - H2? Under Al - note on inert electrodes? | Accepted but more relevant for section on mitigatino options - see revised |
| 2282 | 10 | | | | | should emphasize the role of in-process recycling, in-process capturing of energy (recuperation) - more life cycle approach | Rejected - space constraints do not allow to go into more details |
| 2299 | 10 | | | | | Can't read. Eliminate for condensing information. | Noted - but figure no longer appears in |
| 2300 | 10 | | | | | Figure and explanation in text - seem more like opinions than technical discussion - suggest eliminate | Accepted - table no longer appears in |
| 2283 | 10 | | | | | I found this diagram confusiing and not as applicable as some other types of similar diagrams. Figure 5.2.2 in chapter 5 shows all of the industries and the GHG from each - I would refer to it and eliminate this figure to save space. | Accepted - issue of double counting has been discussed among report authors as it is important for the whole report. The |
| 10202 | 10 | | | | | 1. Point 6 missing in graph, 2. waste from owners and users missing in graph | Accepted - figure 10.1 has been modified |
| 10204 | 10 | | | | | Lack reduced demand and material/resource use and reuse for textiles | Accepted - there is now a cross- |
| 15711 | 10 | | | | | I would recommend inlcuding some indication of what fraction of global anthropogenic emissions that these industry related emissions account for. It is important to the reader to understand the relative impact of these emissions to the total in terms of impact of emissions reductions. | Accepted - the relative contribution is explained in the Executive Summary, section 10.2 and FAQ 10.1 of the |
| 16048 | 10 | | | | | In cement production there can be reduced the GHG emissions more than 30% using CELITEMENT technology (http://www.celitement.de/en/celitement-binders.html) | Accepted - now mentioned in 10.7.1 |
| 3033 | 10 | | | | | Please improve the quality of the table. It is impossible to read it. Should we use a Table to depict several graphs? | Accepted |
| 3030 | 10 | | | | | I am not very comfortable with the idea of considering the Clean Air Act (or other command and control policies for local pollutants) as a barrier to industrial CHP. Local pollutants regulation is a requirement of societies and should not be removed as a barrier to mitigate GHG emissions. | Accepted -- reference to the CAA removed (note this is a repeat of comment 3029) |
| 4281 | 10 | | | | | Please note that Tanaka (2011) holds error from the reporting of policies from Sweden | Taken into consideration when revising the text. The figure used from Tanaka |
| 4531 | 10 | | | | | The reference list is missing. An incorrect reference list of another chapter has been added | Accepted - due to an editorial problem chapter 10 had the reference list of a different chapter. This problem has now |
| 4532 | 10 | | | | | The chapter states that it takes a "life-cycle" approach. While this could be interesting, the remainder of the report has a focus ons ectors. Taking this approach in a single chapter may result in doublecounting and other issues. Moreover, the approach has not been applied consistently | Taken into consideration - the discussion of double counting in the introduction of chapter 10 has been shifted to chapter 5 |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 4533 | 10 | | | | | The chapter now contains sections on the serices sector (most notably the "tourism industry"). This is ABSURD. This is totally inconsisent with previous reporting by IPCC, statistical data, and any other international reports on climate and energy. By moving these sections to those chapters were it belongs (i.e. buildings and transport) the chapter can be shortened considerably. All sections on these sectors should be deleted. Especially, as the sections that are included in this report are vague and lack any depth. | Accepted and substantial changes incorporated. Decision to include tourism was made by the IPCC plenary at ther very beginning of AR 5 process. In light of this and other reviewer comment and comments by review editors a detailed discussion took place. It was agreed to prioritise the balance and logical flow in the chapter which is primarily on the industry sector. The discussion on tourism was repositioned as a demand-side driver for industrial products and product services and now appears in the SOD as Box 10.2. Moreover we have improved and intensified coordination with the transport and buildings chapter. In the SOD tourism is used as one of two illustrative examples to show how |
| 4534 | 10 | | | | | It is strange to see that energy use to transport tourists is included in this chapter, while shipping of industrial products isn't. Hence, the life-cycle approch is is really used inconsistently. Moreover, it is absurd, to see this as part of industry. | cf. Response to comment 4533. Due to space constraints there is no room to discuss other transport related emissions having they origin in the industry sector. Chapter 8 covers the disucssion about |
| 4535 | 10 | | | | | The choice to include services and tourism in this chapter, makes that the data presented in this cahpter are incomparable to that report in statistics ans industry and in previous IPCC reports. This makes it virtually impossible to draw any conclusions by the reader on the changes in the overall knowledge basis on mitigating industrial GHG emissions. | Noted - cf. Response to comment 2279 |
| 4536 | 10 | | | | | The "life-cycle" approach is not used in a consistent manner in the various sections of the chapter. | Taken into consideration when revising |
| 4537 | 10 | | | | | Petroleum refining and coke production are currently not included in the report. In previous Ars it was finally included in the industry chapter, as the energy conversion chapter in reality hardly addresses thrse sectors (i.e. It focuses only on the power sector). I have not checked the chapter on the energy sector, but the reference list now included in cahpter 10 seems to come from the chapter on the energy sector. It does not contain any real references on petroleum refining.... | Rejected: the discussion of the provision of primary energy carriers is included in chapter 7 |
| 4538 | 10 | | | | | Throughout the report important claims are made, that are only based on a single reference. I do not thik that the IPCC can do this without reflecting on a wider body of literature. | Take into consideration: a broader set of literature has been considered when |
| 4544 | 10 | | | | | This is an example of where system boundaries become important. Are these figures with or without services, tourism.... I suspect without. This makes the whole chapter impossible to read, when the boundaries of reported data keep changing between different figures and tables. | Rejected - Table is clearly labeled as "manufacturing" |
| 4562 | 10 | | | | | The text and these tables are not clear. Just counting the number of policies and policy instruments does not give a good picture of the importance of policy as a driver in industry, especailly as regulation has been weakening in the period, but other voluntary programs have been implemented that have far less reach. | Accepted - figure no longer appears in SOD |
| 4541 | 10 | | | | | While I love this figure, I do not think it is appropriate for Chapter 10. It should be used in the more general chapters upfront in AR5 to show the interlinkages and distribution ovdr the various sectors. | Accepted - issue of double counting has been discussed among report authors as it is important for the whole report. The |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 8856 | 10 | | | | | This is a very fragmented chapter. Coherence among sections needs to be enhanced. More data would be needed, while limitation/applicability of data presented needs to be clarified with consistency. it's important to compile/analyze/present data on the costs of conserved energy for efficiency measures in consistent manner, in comparisons with tranditional energy sources and emerging renewable energy addressed in other chapters (e.g. chapter 7). | Accepted - consistency has been improved and cost and potentials section (10.7) has been revised |
| 16137 | 10 | | | | | The approach of chapter 10 in AR5 is extremely interesting, because it widens the scope of policy with a systemic approach. This part should be kept (or even expanded) even in the case of cuts in the lengh of the text. | Noted |
| 2281 | 10 | | | | | Importance of recycling should be emphasized | Taken into consideration for revision of |
| 10282 | 10 | | | | | Consistent and no redundant descriptions with Chapters 13-15 will be needed. | Taken into consideration when revising |
| 3032 | 10 | | | | | Why is EU ETS analyzed in this section instead of in Section 10.10.2, since it includes not only energy efficiency measures and is focused on emission efficiency? | Taken into account - no specific discussion of EU ETS here, but in |
| 15270 | 10 | | | | | I strongly agree with the idea to improve the material efficiency with maintaining the amount of service, i.e., increasing the added value, to reduce the CO2 emission amount. However,someone like me would wonder if it is a realistic solution for further mitigation to reduce the amount of service per person,especially in developing countries. The economical effect of the service reduction policy need to be discussed here . | Taken into account - the issue has been considered in drafting box 10.2 but macroeconomic effects cannot be covered in this chapter in detail |
| 3653 | 10 | | | | | Delete or massively reduce to save space as overlapping with chapter 6. | Rejected: focus of the section is clearly on sector- specifc issues in light of |
| 17352 | 10 | | | | | The discussion regarding global tourism needs to be cross referencing with Chapter 8, the changes in lifestyle aking to substituting leisure for long distance tourism need to be discussed in light of current studies. The trends show there is little room for substitution, one is complementing the other (leisure at home vs tourism). Please coordinate with Chapter 8. | Noted - cf. Response to comment 2279. It is true that in the short term substitution potential are limited. However we are here discussing in a long-term perspective where such considerations are far less relevant. Consider how much tourism has changed in the last 50 years there are |
| 16258 | 10 | | | | | Chapter 12 also includes a section on waste management (although much shorter). Coordination may be useful to avoid too much overlap and cover all relevant aspects. | Accepted - coordination underway with Chapter 12 on overlapping issues |
| 8862 | 10 | | | | | 10.14. waste water section may benefit from technology characterizations (cost and savings potential) of emerging technologies applicable to this sector (Xu et al. 2011):<br>Xu, T., J. Slaa, J. Sathaye. 2011. Developing Information on Energy Savings and Associated Costs and Benefits of Energy Efficient Emerging Technologies Applicable in California. Lawrence Berkeley National Laboratory Report, LBNL-4434E. | Taken into account in Costs and potentials section (10.7) of SOD. Moreover reference used in wastewater subsection. |
| 15713 | 10 | | | | | The discussion of tourism seems to fit better in other chapters. As a minimum, the text does not need to be duplicated in several chapters and the sectoral accounting needs to be clarified. | cf. Response to comment 2279 |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 3016 | 10 | | | | | As a general comment, I would like to raise the need to consider novel and original options to curb GHG emissions in industry. I feel that this section is fine, in general, but lacks the opportunity to emphasize some interesting approaches that should be included in the portfolio of options, if we want to meet ambitious targets for GHG emission reductions. Among these options, it is crucial to consider the integration of exergy flows within process chains, which can increase overall efficiency of combined industrial processes from 4 to 30%. The same is valid for the integration of processes inside the same operation of industrial facilities; for instance, the report should have explored the possibility that in the medium term, the major developments include the integration of different distillation columns into one reactor (e.g. dividing-wall column) or the development of alternative processing routes allowing for combination of conversion and distillation (e.g. reactive distillation). Please see as an example: SCHULTZ, M. et al. Reduce Costs with Dividing-Wall Columns. Chemical Engineering Progress, n. 196, p. 64-71, May, 2002. As it is, I think the report lacks the opportunity of indicating novel and disruptive approaches to curb GHG emissions in industry. These approaches can be adopted in various industrial chains. I do recognize that some of these novel approaches (e.g. process intensification) were mentioned further in other sections of the document (e.g. Table 10.7 in page 42). Yet, they should have been mentioned in section 10.4.1 too. | Noted - but this is rather a general comment, followed by a reference to a particular technology. For now, we haven't made a specific change in response to this comment - but note to changes in cement section earlier, for an increased reference to novel technologies. |
| 3017 | 10 | | | | | I recommend include advanced process control as an important option to improve production reliability and thus increased product yield, curbing GHG emissions in industry. Modern control systems are often not solely designed for energy efficiency, but rather to improve productivity, product quality and efficiency of a production line. Control systems result in reduced down time, reduced maintenance costs, reduced processing time, and increased resource and energy efficiency, as well as improved emissions control. Large potentials remain to implement control systems. For instance, Worrell and Galitsky (2005) indicate savings potential varying from 2 to 18% for US refineries, using moisture, oxygen, air flow and temperature controls based on fuzzy logic or rule-based systems. | Accepted - control systems mentioned in Executive Summary and in various instances in section 10.4 |
| 3018 | 10 | | | | | It is worth listing some measures that can be applied by all industrial facilities in order to save fuel. Section 10.4.1. summarizes opportunities for “efficiency .. in the design and operation of systems using motors”, but did not summarize opportunities for heat integration, which is even more worthwhile in industrial facilities. These opportunities include: use of waste heat in absorption refrigeration systems; use of waste heat to pre-heat feeds (e.g., through the installation of waste heat boilers or heat recovery steam generators); heat and/or mass (water and hydrogen) integration; improvement of furnaces efficiencies combined with computer controlled combustion; direct feed of “intermediary products” to processes without cooling and storage, aiming at recovering the waste heat of these hot products; use of heat pumps; and decreased film temperature and increased turbulence on heat transfer surfaces. | See responses 12124 and 15885(a) |
| 3021 | 10 | | | | | I suggest stressing that fuel switching which favours natural gas has the side effect of also favouring CHP industrial facilities. This was the case in USA and Brazilian chemical plants. Please see SZKLO, A.S., SOARES, J.B., TOLMASQUIM, M.T., 2004, “Economic potential of natural gas-fired cogeneration--analysis of Brazil's chemical industry”, Energy Policy, v. 32, pp. 1415-1428. KHRUSHCH, M, WORRELL, E, PRICE, L, MARTIN, N, EINSTEIN, D 1999 ‘Carbon emissions reduction potential in the US chemicals and pulp and paper industries by applying CHP technologies’, In: Industry & innovation in the 21th century. Proceedings of the 1999 Aceee summer study on energy efficiency in industry. American council for an energy-efficient economy, Washington DC, Washington. | Taken into account - text revised: "These shares are forecast to change to 30% and 24% respectively by 2035 (IEA, 2011) resulting in lower emissions per unit of energy. Switching to natural gas also favours more efficient use of energy in industrial CHP installations. " |
| 4547 | 10 | | | | | It is amazing that the discussion of biomass is lacking from this section, especially as the pulp & paper industry today is one of the largest users of renewable energy in the form of biomass. Also, the development of biomass as a feedstock is slowly growing; see e.g. Li Shen, Ernst Worrell, Martin Patel. ’Present and future development in plastics from biomass” Biofuels, Bioproducts and Biorefining 1 4: 25 – 40 (2010). | Taken into account - thanks for this useful reference |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 3022 | 10 | | | | | The issue of the green chemistry and the possibility of increasingly producing bio Platform Molecules (bPM – building block chemicals with potential use in the production of numerous value-added chemicals) were not stressed in the report. As I mention in another query (regarding disruptive technologies), the report lacks the opportunity of pointing out drastic changes that must be considered to the industrial sector. Green chemistry is part of the research that is being done in different countries, and there is already pilot and commercial plants producing plastics from biomass. See: Ren, T., 2009. Petrochemicals from Oil, Natural Gas, Coal and Biomass: Energy Use, Economics and Innovation. Ph.D. Thesis. Utrecht University, Copernicus Institute for Sustainable Development and Innovation. Utretch. Ren, T.,Patel, M., Blok, K., 2006. Olefins from conventional and heavy feedstocks: energy use in steam cracking and alternative processes. Energy 31, pp. 425-451. Those references are already listed in other section of the study. They should have been cited here too. | Taken into account - appropriate references to these reports have been added. |
| 17351 | 10 | | | | | This session should made cross-reference with Chapter 4 in production and consumption | Accepted - but we seemed to have lost the cross-reference during the final editing. Let's coordinate on this for the Final Draft. Some cross-links to chapter |
| 3025 | 10 | | | | | I suggest including a section for discussing briefly the case of ceramics, since in many developing countries this sector is still based on fuelwood from deforestation burnt in low-efficiency kilns. Please see as an example: Schwob, M., Henriques, M. Szklo, A. Technical potential for developing natural gas use in the Brazilian red ceramic industry. Applied Energy 86 (2009) 1524–1531 | Noted - thanks - but under space constraints we've been unable to do this. |
| 10281 | 10 | | | | | Current energy efficiency in iron & steel sector is important information in order to estimate the emission reduction potentials. Please cite the figure for energy efficiency in iron & steel sector for some countries estimated by Oda et al., Energy Policy, 2012 (http://www.sciencedirect.com/science/article/pii/S0301421512000298). | Accepted - The text has been revised to include the reference on the different specific energy intensities of regional BF-BOF production: "...furnaces before refining. The specific energy intensity of steel production varies by technology and region (Oda et al., 2012)" Reference: Oda, J., Akimoto, K., Tomoda, T., Nagashima, M., Wada, K., Sano, F. International comparisons of |
| 6740 | 10 | | | | | The section should be reduced and streamlined. What is the status, what has been done and the results followed with what can be done with risk and potential. | Noted - thanks, but risks and potentiasl are covered in other sections |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 2292 | 10 | | | | | Steel production 1490 MT in 2011. Breakthough technologies could save more than 15% quoted (line 47 page 24) if carbon base is reduced or eliminated. The 32% reduction in electric furnace is questionable unless you are only talking about process. EAFs are much closer to running at just above the theoretical. One of the greatest potentials for CO2 savings is in fuel switching. In this case we are talking about reductant switching. The idea of switching to electolysis will greatly increase the energy use over current technologies and only reduces the overall GHG if there is carbonless energy industry. Aluminum has a much higher GHG footprint than iron and steel because it uses a similar electrolysis process. | Taken into account - Text revised to "1490 Mt in 2011. In 2011, China led steel production, producing 46% of the world's steel. Other significant producers include EU-27 (12%), USA (8%), Japan (7%), India (5%) and Russia (5%) (WSA, 2012) Reference: World Steel Association, 2012 Crude steel production 2011 http://www.worldsteel.org/dms/internetDocumentList/steel-stats/2011/Crude-steel-production-2011/document/2011%20steel%20updated%20Feb2012.pdf For the second comment, the Energetics Inc. source defines the opportunitiy for energy savings as the difference between today's current use and the |
| 4549 | 10 | | | | | I am a bit confused by this section. It cites a non-peer reviewed report for DOE, to state furtherdown that nothing can be said about ULCOS, as no "peer reviewed literature" is available. Birat has published a few papers (eg. In Revue de Metallurgie, albeit these are a few years old now). Note that the quoted Energetics report has been heavily criticized by a number of experts in the field. In the past a number of electrolytic processes have been proposed, but never became commercialized due to the price of power. Just referring to one particular process does not credit the other processes. | Noted - peer-reviewed literature on ULCOS will be considered for inclusion in FD |
| 6749 | 10 | | | | | For services in general and it services specifically the energy consumption is going down from technical innovation. Intel.com | Noted - but section on services has been removed in SOD (cf. Response to |
| 3652 | 10 | | | | | Alternatively delete chapter 10.4.2.11 to save space. | Accepted - cf. Response to comment |
| 3026 | 10 | | | | | I suggest including CHP as an option for trigeneration (or CCHP) in hospitals, malls, hotels and universities. Several studies have assessed this possibility and there are commercial plants installed in developed in emerging countries. | Noted - but section on services has been removed in SOD (cf. Response to comment 2279) |
| 6742 | 10 | | | | | Start with a status to remind the reader how important this sector is. | Noted |
| 4553 | 10 | | | | | This section is very superficial. Please also use D. Saygin, M.K. Patel, E. Worrell, C. Tam, D.J. Gielen. “Potential of best practice technology to improve energy efficiency in the global chemical and petrochemical sector Energy” Energy 36: 5779-5790 (2011). This section lacks a discussion on material efficiency, while several papers in the literature discuss plasic recycling, product optimization strategies for e.g. packaging, but also fertilizer use.. | Accepted - reference has been included. Section to be further improved. |
| 6743 | 10 | | | | | Relate the values to the total emissions from industry | Noted - The request is not clear, no page or lines specified. The values provided in page 29-line 20 are emissions per unit output from the European pulp and paper industry and therefore relating |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 4554 | 10 | | | | | The report by Kramer mainly reports on commercially available technologies, not emerging technologies. Moreover, many papers have looked at paper recycling and optimization of (paper) packaging. For exampe, Laurijssen et al discuss the CO2 benefits of recycling over incinerating waste paper: Jobien Laurijssen, Marc Marsidi, Annita Westenbroek, Ernst Worrell and Andre Faaij. “Paper and Biomass for Energy? The Impact of Paper Recycling on Biomass Availability, Energy and CO2 Emissions” Resources, Conservation & Recycling 12 54: 1208–1218 (2010). | Taken into account - the term "emerging technologies" has been modified for "commercially available technologies". A brief reference to the suggested paper by Laurijssen et al has been added to the discussion. |
| 16261 | 10 | | | | | A publication that discusses the different mitigation options of the aluminium industry using a dynamic material stocks and flows model: Liu, Bangs and Müller (2012): Stock dynamics and emission pathways of the global aluminium cycle. Nature Climate Change. In press. | Accepted - the section now includes a focus on the shift from primary to secondary aluminium production and the |
| 2295 | 10 | | | | | I didn’t see reference to inert anodes (non C) and how it mininize process GHG for Al. This section is much weaker in depth when compared to the iron and steel section. | Inert anodes are mentioned at the end of the energy efficiency sub-section. |
| 4555 | 10 | | | | | The energy consumption figures for aluminium quoted in this section seem to vary with respect to system boundaries (e.g. Including alumina or not), and between primary and final energy use. Please be consistent, and specify what you use. | The system boundaries used in the referenced material is now clear in the text. |
| 4556 | 10 | | | | | The section on the food industry is primarily based on US reports. Some literaure from Europe is missing; for example papers by Ramirez. Why is there a discussion on anaerobic digestion of food wastes in MSW in this chapter. Shouldn't that be in the chapter on the waste sector? | Accepted - see comment 8860 |
| 6748 | 10 | | | | | Maybe this reference could add more possibilities in crushing equipment energy reduction. Hulthén, Erik: Real-Time Optimization of Cone Crushers. Göteborg : Chalmers University of Technology. Diss. ISBN/ISSN: 978 1 921522 28 4 http://publications.lib.chalmers.se/records/fulltext/128844.pdf or this work http://www.ceecthefuture.org/abstracts/early-rejection-of-gangue-how-much-energy-will-it-cost-to-save-energy | Noted |
| 4557 | 10 | | | | | This discussion is so generic, that it does not add any insights. Improve or delete... | Noted - section has been improved |
| 2296 | 10 | | | | | If looking for ways to reduce this chapter - I would suggest condensing this section | Accepted - section has been shortened |
| 15267 | 10 | | | | | It would be better to address the importance of assessment like life cycle assessment from “cradle to grave” ( Ref: A. Gunasekaran, A. Spalanzan, Int. J. Production Economics 140, 35-47(2012)),here . In order to achieve effective cross sectional implications, the whole supply chain assessment is necessary. | Accepted |
| 8861 | 10 | | | | | Cost of conserved energy information on steel, cement, pulp and paper, waste water management sectors can benefit from the publications listed in the comment column Chapter 10 (different sub-sections). | Accepted - some references included. Section has been revised thoroughly in SOD and will be further improved in |
| 17979 | 10 | | | | | I recommended to the other sector chapters to include similar introductory sentences with the second sentence slightly differently worded: "Co-benefits, co-costs, risks and uncertainties associated with alternative mitigation technologies as well as public perception thereof can affect investment decisions of companies and priority setting of governments." The usage of the term public perception was recommended by Chatper 2 LAs in Wellington to replace the terms "social acceptability" (heading of sub-section 10.8.3) or "public acceptability/acceptance" where possible to reflect some additional aspects discussed in Chapter 2. | Noted |
| 17981 | 10 | | | | | Please consider a broader discussion of risks and uncertainties along the classification of risks and uncertainties provided in Section 6.7. Please liaise with the other sector chapter LAs to discuss the process by which a more consistent approach can be reached. | Taken into account |
| 4559 | 10 | | | | | There is a ider body of literature on spill overs that is not used in this chapter, e.g. Papers by Michael Grubb or the paper by Vlasis Oikonomou, Martin Patel and Ernst Worrell. Climate Policy: Bucket or Drainer? Energy Policy 18 34 pp.3656-3668 (2006). | To be taken into account |
| 17982 | 10 | | | | | The usage of ther terms "social acceptability" or "social acceptance" is inconsistent with agreements made in Wellington (p.36) and should be replaced, if appropriate, with the term "public perception" (see earlier comment). | Accepted - terms replaced where relevant |
| 4560 | 10 | | | | | This section is extremely generic, and does not address any issues related to industry. I think this could be better discussed elseshere in the AR5 report. | Reject - section has been revised in SOD |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 17984 | 10 | | | | | An introductory sentence along the example of Chapter 9 referring to the agreement reached in Wellington (p. 36) might be helpful for readers: "Barriers and opportunities are referred to as conditions that hinder or facilitate the implementation of the analyzed measures." | Accepted -- included in initial sentence in this section |
| 4561 | 10 | | | | | I do not understand the organisation of section 10.9. Why is it discussed by sub-sector and not by barrier? I think the latter would make much more sense. In he current format a lot of literature is missed and a lot of doubling of text will happen. | Accepted -- this section draws from literature that addresses barriers to mitigation at different steps in the industry supply chain and not general barriers which are covered in general |
| 2298 | 10 | | | | | Some redundancy with other areas - condense | Accepted -- redundancy reduced (e.g. between chapter 7 and 10 on the topic |
| 3031 | 10 | | | | | This section should be improved. There are several barriers to implement GHG mitigation measures in the service sector. For example, for implementing CHP plants in hospitals in Brazil, Szklo et al (2004) found that Brazilian hospitals face the following barriers: availability of funds for investment; concern over the functioning of new items of equipment in existing facilities; professional skills levels among the administrators; and focus solely on health care services to the detriment of technical and economic feasibility analyses for hospital related engineering problems. [Szklo et al (2004). Energy consumption indicators and CHP technical potential in the Brazilian hospital sector. Energy Conversion and Management, 45 (2004) 2075–2091] | Accepted -- barriers to mitigation of emissions from buildings is covered in Chapter 9. |
| 7559 | 10 | | | | | Glass melting technology innovation has to be mentioned: Page 34 of http://www.wbcsd.org/Pages/Adm/Download.aspx?ID=276&ObjectTypeId=7<br>For example, insert the following sentences.<br>The glass production industry is energy-intensive and consumes more than 70% of the total energy in the glass melting process. The new technology called 'in-flight melting' has the potential of achieving large energy savings in the glass industry, which contributes to meeting the global goal of GHG emission reductions. The traditional process of melting materials (such as silica sand and soda ash) is done with fuel oil to keep the large melting tank at a high temperatures for many hours, which is required to manufacture homogenous glass without bubbles. The new technology involves bringing granulated raw materials, made by spray dry methods, into a much higher temperature environment, produced with an oxygen combustion burner and/or plasma. The process changes the granulated materials to glass instantly.<br>Estimates suggest that the energy required for glass melting with this technology could be up to almost 50% of the average energy required for melting most kinds of glass in Japan (WBCSD 2010). | Noted - thanks very much for offering this, but under pressure of space, we have had to remove this section. |
| 2280 | 10 | | | | | Items 20 - 22 are not supported at the same level (references?) as others - sound like opinions - suggest eliminate | Taken into account - section on waste (10.14) and on longterm pathways have been significantly revised in the SOD. Hence corresponding messages in the |
| 12951 | 10 | | | | | Very limited talk of carbon pricing as a necessary policy for driving abatement, while comlpementary measures have a dedicated paragraph. Carbon pricing should be more present as it is indispensable to creating the economic conditions for many of the key abatement measures discussed here | Rejected: carbon pricing is included in the overarching economic instruments in the ES. Due to space constraints no comprehensive discussion possible in the ES. Moreover, a general discussion |
| 6720 | 10 | 0 | | | | There do not seem to be a common way to describe emissions. CO2, CO2eq, CO2eg subscripted, CO2 Equivalents, etc | Accepted - mostly CO2eq is used in SOD, unless data refers only to CO2. Will be checked further in the future as |
| 6721 | 10 | 0 | | | | Do not use words as Billion or Trillion though they have different meaning in different countries. http://en.wikipedia.org/wiki/Long_and_short_scales | Accepted - only used in a few instances now. Will be checked further as part of |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 6722 | 10 | 0 | | | | The authors use often very great numbers to state energy reductions, improvements or other changes. This many times put in relation with something else, however to many times the number is left for the reader to try imagine the amount. | Accepted - context for the numbers has been provided in some instances in SOD. Will be considered further in next |
| 6757 | 10 | 0 | | | | To conclude my review: I think you should focus of the sector specific analyses, and cross sector Analyses to present specific mitigation tools, their risks and potential. Section 10.4.1 and 10.4.2 could be migrated to avoid having much information on two places. 10.7 to 10.9 can also be migrated. to sector specific chapter expand the policy chapter and make it clear what tools will impact how. | a) given the mandate from the IPCC plenary the general scope of the sector chapters is fixed. b) overlap between 10.4.1 and 10.4.2 has been reduced in SOD. Cobenefits, barriers sections and costs to certain extent try to discuss considering these mitigation options. Also Figures 10.1 and equation 10.1 have been clearly restated. c) context between costs, barriers and |
| 15870 | 10 | 0 | | | | • Need more consistent treatment/structure of each sector by providing similar format and information: e.g., include CO2/ton emission factors for each technology<br>• Omission of fossil fuel extractive industries (oil, gas, coal). Please coordinate with Chap. 7 and 8 since there are many similarities between mining (Chap. 10) and upstream oil/gas/coal and with manufacturing (Chap. 10) and oil refining and gas processing (LNG,NGLs, etc)<br>• More use of tables/graphs to summarize text. E.g., could show CO2 marginal abatement curves ($/tCO2 vs. tCO2 mitigation potential)<br>• Could use more quantitative data, especially costs, also case studies based on real performance<br><br>• Might include a discussion on the effectiveness of international standards for industry e.g., ISO 50001 (energy management), 14040 (life cycle analysis)<br>• Check missing references – noted in text body but not in reference section (e.g., UNIDO)<br>• Might include more industry references to strengthen doc: e.g., associations (IPIECA, ASME, etc), journals, UNIDO | a) Accepted - presentation of numbers in tables and figures has been improved and harmonized where possible b) Noted - there is a clear agreement with chapter 7 in terms of consideration of the extractive industries. Energy chapter will discuss energy carrier extraction in their chapter. References between the chapters have been improved c) Accepted - cost and potentials section has been revised and overview tables has been included d) cost and potential section has been improved and specific examples given. e) Standards are now mentioned in policy section but due to space limitations no in-depth analysis has been made. f) Accepted - due to an editorial problem chapter 10 had the |
| 15884 | 10 | 0 | | | | Sections to shorten in Chap. 10:<br>• Special focus on tourism seemed a little out of place – it is one of smallest service sectors (p.9). Instead, choose a sector with greater global impact as a focus item (e.g., food?) and one which also impacts basic sustainability. Or eliminate the focus item completely<br>• 10.8.2 – CCS discussion is somewhat long and is already covered in Chap. 7. CCS for power and industry is similar<br>• More use of graphs or streamlined tables to eliminate text | a) cf. Response to comment 2279. b) Accepted - CCS discussion has been substantially shortended and focus is now only on industry specific aspects. c) Accepted - we have used tables where possible, and tried to improve presentation style |
| 15885 | 10 | 0 | | | | Ch. 10 needs more coverage on other efficiency technology options, both existing and new ones. For example, (p. 21, line 2) – there are more than just motors and furnaces—waste heat recovery, advanced cooling systems, pinch analysis, load tracking, variable speed/frequency drives, nanotechnology, etc). The Cement sector well presented and could be used as a template for the others. Each sector should include energy performance chart, best practices, current state, challenges and costs | a) Taken into account - text at start of section 10.4 revised to indicate three categories: steam systems, process heating systems (furnaces an boilers), motor systems (…), with examples from USDOE reports. b) Taken into account- |
| 15886 | 10 | 0 | | | | Need to keep the audience in mind. The industry chapter may attract attention from company CEOs, CTOs, and plant managers. Questions they might ask: What is in this for me? How can this report help me? | Accepted - we have improved the reader guidance by a more focused executive summary. ES tries to focus on answers to the key questions the chapter is |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 15887 | 10 | 0 | | | | • More specific case studies including actual data on CO2 saved, $ invested would be useful<br>o Only a few cases are included (p. 32- Taiwan/India , p.44 Philippines,…). Many other examples can be found in industry journals<br>o Try to cover data for both OECD and developing world – e.g., in some cases, only EU data are stated<br>o Careful to site actual data based on real performance, not "expected" performance touted before project is actually implemented since many times expectations are too optimistic and actual projects end up over budget and underperforming. | a) cf. Response to comment 15870. b) accepted - more case-studies can be found in SOD. c) accepted - despite the shortage of data for Non-OECD we have tried to present more information d) very good comment, we have tried to be more careful and explicit about this in SOD |
| 15890 | 10 | 0 | | | | Should include a discussion on water use in industry and associated energy (water-energy nexus). Also discuss the potential climate change impact on water availability for industry sector which uses a lot of water for power, cooling and processing. Might include the latter in a section on adaptation? | Noted - there are now at least two mentions of the water nexus, one in section 10.5 and one in a footnote in 10.6. While we consider the issue important, as stated in 10.6 the general impact issue (direct and indirect through resources) is dealt with in working group 2. The section is restricted to the potential impacts of climate change and |
| 15895 | 10 | 0 | | | | Lack of cost data in general in report. McKinsey is quoted several times (e.g., but I would add other sources for balance since McKinsey numbers are sometimes questionable. | Accepted. Additional information on Costs is has been provided in SOD. Mc Kinsey data has been used among other sources in section 10.7. Lack of access |
| 15902 | 10 | 0 | | | | Highlight what changed from AR4 at high level. More detailed lookback would be good | Accepted - introduction has been revised |
| 16949 | 10 | 0 | | | | I regret I have not had time to review the Sectoral chapters in depth. It may be interesting to clarify the extent to which industrial energy use is driven by rational "Domain 2" decisionmaking processes (the System 2 of the FOD Chapter 2), at least compared to decisionmaking in buildings and transport. This – within limits – is the broad suggestion laid out in the structure-setting Chapter 3 of Grubb, Hourcade and Neuhoff, Planetary Economics: the Three Domains of Sustainable Energy Development, Taylor & Francis forthcoming (Chapters 1 – 5 submitted, others in draft available on request).<br>This industry chapter might also find the data and analysis on distributional impacts of pricing in this book (Chapter 8) to be of particular interest.<br>Finally, an important source of analysis of industry internaitonal flows and policy options are the Carbon Trust reports, Tackling Carbon Leakage: specific approaches in a world of unequal carbon prices (2010); and Global Carbon Flows (2011) □ | Noted - factors affecting decision-making in the sector are partly considered in the barriers and sectoral policy section, but will be checked again and if necessary discussed more in detail. We acknowledge the importance of the other points in this comment - literature suggested to be studied further. |
| 8353 | 10 | 0 | | | | I suggest the summary of AR4 and what's new be added like Chapter. 9. | Accepted - introduction has been revised |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 11661 | 10 | 0 | | | | Tourism is focused as one of the most dynamic service sectors, but emissions from tourism overlaps with those from transport sector. The differentiation between emissions in tourism and those in transport (Chapter 8) is not straightforward. | Accepted and substantial changes incorporated. Decision to include tourism was made by the IPCC plenary at ther very beginning of AR 5 process. In light of this and other reviewer comment and comments by review editors a detailed discussion took place. It was agreed to prioritise the balance and logical flow in the chapter which is primarily on the industry sector. The discussion on tourism was repositioned as a demand-side driver for industrial products and product services and now appears in the SOD as Box 10.2. Moreover we have improved and intensified coordination with the transport and buildings chapter. In the SOD tourism is used as one of two illustrative examples to show how |
| 2277 | 10 | 0 | | | | The chapter needs to use common units and basis for comparing the different industries and mitigation opportunities. Tons CO2 total and/or tons CO2 per ton of material suggested (LCA type of approach using GHG from raw materials, energy and process). Otherwise the reader is left with the wrong impression. Fig 10.5 showing emission factors for non-Fe metals make it appear that non-Fe are responsible for less GHG than Ferrous, concrete, etc. This is because the figure ignores the tremendous amount of electrical energy required to produce Al, Mg, etc. GHG production for Al is higher than other materials - this does not indicate it. | a) Accepted - units used are consistent where possible.b) Noted - relevance of indirect emissions (e.g. due to electricity consumption in the production process) is highlighted in the chapter and in ES. The table on non-Fe metals has been |
| 2279 | 10 | 0 | | | 12 | Tourism is emphasized too much in the chapter versus other major industry sectors (extractive too little) | Accepted and substantial changes incorporated. Decision to include tourism was made by the IPCC plenary at ther very beginning of AR 5 process. In light of this and other reviewer comment and comments by review editors a detailed discussion took place. It was agreed to prioritise the balance and logical flow in the chapter which is primarily on the industry sector. The discussion on tourism was repositioned as a demand-side driver for industrial products and product services and now appears in the SOD as Box 10.2. Moreover we have improved and intensified coordination with the transport and buildings chapter. In the SOD tourism is used as one of two illustrative examples to show how |

|---|---|---|---|---|---|---|---|
| 5215 | 10 | 0 | | | | Regarding the UNWTO 2008 report has later been published in reviewed papers:<br>Dubois, G., Ceron, J. P., Peeters, P., & Gössling, S. (2011). The future tourism mobility of the world population: emission growth versus climate policy Transportation Research - A, 45, 1031-1042.<br>Gössling, S., Hall, C. M., Peeters, P., & Scott, D. (2010). The Future of Tourism: Can Tourism Growth and Climate Policy be Reconciled? A Climate Change Mitigation Perspective. Tourism Recreation Research, 35, 119-130.<br>Peeters, P., & Landré, M. (2012). The emerging global tourism geography – an environmental sustainability perspective. Sustainability, 4, 42-71.<br>Peeters, P. M., & Dubois, G. (2010). Tourism travel under climate change mitigation constraints. Journal of Transport Geography, 18, 447–457.<br>Scott, D., Peeters, P., & Gössling, S. (2010). Can tourism deliver its 'aspirational' greenhouse gas emission reduction targets? Journal of Sustainable Tourism, 18, 393 - 408. | Noted - cf. Response to 2279. References will be updated if still appropriate in the new approach to the tourism sector. |
| 18535 | 10 | 0 | | | | The terminology that is used to present and discuss the different categories of mitigation options is often mixed throughout the chapter, which can be confusing. For example, energy efficiency is also referenced as energy intensity, and reducing energy requirements. GHG intensity is also refereed to as reducing emissions and fuel-switching. It would be useful to pick one set of terms and apply them throughout the chapter. Introduce and explain the alternative terminology up-front, but stick with the one. | Accepted - consistency check will be done for the whole chapter (consistent use of important terms) |
| 18552 | 10 | 0 | | | | The way that CCS is discussed in Chapter 10 (especially in Sections 10.8 and 10.9) is very similar to the coverage in Chapter 7. There doesn't seem to be a clear differentiation in what is covered in which chapter. To save space it may be useful simply to refer to their broader discussions of CCS, and focus all Ch 10 discussions on industry related CCS and how that differs in each relevant sub-section. | Accepted - CCS-related text in chapter 10 has been shortened and revised, with stronger focus on industry-specific aspects and more cross-references to |
| 18562 | 10 | 0 | | | | Across the chapter, a more consistent treatment of the different industries would be useful. | Accepted - we have tried our best to do |
| 18563 | 10 | 0 | | | | The Chapter is in a good state for the FOD, and has strongly implemented the kaya identity throughout its structure, though there are some opportunities to make sure that the sections adhere more strictly to this master structure. | Accepted - we have tried our best to do this in the SOD |
| 18564 | 10 | 0 | | | | The sections from which a reader would pull the meat of the output of the chapter (e.g. 10.7 and 10.11) have not yet been well developed. With the structure of the chapter well in place, it would be useful to focus SOD preprations on those sections. | Accepted - SOD includes fully revised sections |
| 3015 | 10 | 0 | | | | I suggest use t instead of ton as the abbreviation of tonne in all manuscript. The SI unit symbol for the tonne is "t". | Accepted - mostly t is used in SOD. Will be checked further as part of final copy- |
| 3168 | 10 | 0 | | | | This chapter has a note on p.7 about double counting. I think this should be addressed earlier in WG3—maybe in chapter 1.<br><br>This chapter is about industry but it is surprisingly thin on two things that really matter in industry: a) costs; and b) industrial organization (that is, the structure and ownership of industry and how those factors affect the design of policy and industrial investment decisions). | a) Accepted - issue of double counting has been discussed and the note has been transferred to chapter 5. b) section on cost is significantly revised in SOD c) consequences of specific ownership structure in the industry sector is partly considered in the barriers and sectorial policy section, but will be checked again and if necessary discussed more in detail |
| 18770 | 10 | 0 | | | | Please consider discussing planned obsolesence in context of sustainability - possibly discuss this also in such a general manner that this section can be referenced e.g. from Ch.8 and 9. | Accepted - Issue off product lifetime is now discussed in more in depth in SOD and refelcted in framing identity and |
| 17482 | 10 | 0 | 0 | 0 | 0 | Many of the figures in this chapter reproduce very poorly in black & white. I suspect many, if not most, readers will read chapters in the IPCC report as PDF documents, i.e., without benefit of color display or reproduction. If that is true, the figures need to be systematically reviewed to ensure that they can be understood without color. | Accepted. We have tried our best to make the figures readable this time. In Final Draft figures will be further elaborated with the help of a professional |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 17483 | 10 | 0 | 0 | 0 | 0 | Many, many references are missing from reference throughout this chapter. This makes review difficult as the support for statements that reviewers may want to investigate cannot be assessed. | Accepted - due to an editorial problem chapter 10 had the reference list of a different chapter. This problem has now |
| 12340 | 10 | 1 | | 2 | | The heading should be renamed to for instance "Industry and services" to reflect the facto that service and tourism is included in the chapter. We think that reflects in a better way the content of the chapter | In the light of commenst from reviewers, services and tourism are dealt with very differently as compared FOD (cf. response to comment 2279), so we feel |
| 2284 | 10 | 10 | 14 | 10 | 20 | The wording and data for this paragraph need to be cleaned up and checked. Iron ore increased by 264% but steel only 153%? I found 1970 world production of 431 million tons (USGS database) and 1490 million in 2011 (WSA website) which is 246% increase in annual production for steel. Check data and rewrite to flow a better. | Accepted - Wording revised. Numbers revised and according to WSA and USGC are fine. |
| 4543 | 10 | 10 | 21 | 10 | 39 | The focus on copper and rare earth seems to be misplaced when you are concerned about the trends in industrial GHG emissions. These elements are important, but from a completely different perspective. | Mineral extraction is part of Chapter 10 so is mandatory to include it. Rare elements are mentioned because its increasing importance in energy. Mining is excluded from Table 1.2 to avoid |
| 15707 | 10 | 10 | 24 | 10 | 24 | The sentence is a little ackward in that South Africa produces about 75% of the worlds platinum as the top country, Chile produces about 30% of thw world's copper as the top county, but China only produces about 15% of the worlds gold as the top producer. Not a critical sentence but the distribution is much more important in this context than the largest producer for gold, silver, and copper. | Accepted - text revised |
| 2285 | 10 | 10 | 28 | 10 | 30 | Sentence does not make sense - "per capital production of what over what period?" Something missing in sentence structure. | Accepted – text revised |
| 8269 | 10 | 10 | 29 | | | China's per capita production increase (of what?) | Accepted - text revised |
| 15899 | 10 | 10 | 35 | | | add "energy storage" to list of technologies using rare minerals | Accepted - included |
| 8270 | 10 | 10 | 38 | | | "reveal increase reserves" - unclear | Accepted - text revised |
| 5746 | 10 | 10 | 4 | 10 | 5 | This is consistent with the (22+15)% found by the recent FAO report on Energy-Smart Food (http://www.fao.org/docrep/014/i2454e/i2454e00.pdf) | Noted - thanks for the link, this valuable feedback will be used in completing the work of publishing this diagram. However, the position within the WG3 report will most likely be changed and |
| 16138 | 10 | 10 | 40 | 11 | 17 | Paragraph difficult to read. Maybe a graph would help here. | Accepted - text revised |
| 5250 | 10 | 10 | 40 | 11 | 17 | There is no reflection here of 'embedded emissions'. So China only exported 5.3% of the rolled steel it produced - for what purposes was it used? What proportion of China's production of this and other products were used in manufatured goods for export? What was the scale of embedded emissions in those products imported by major industrialised countries. This is intellectually bogus analysis. | Noted - GHG emissions embodied in trade are discussed in Chapter 14, and a cross-reference to this chapter has been made in the section |
| 15708 | 10 | 10 | 42 | 11 | 17 | The production changes for steel, concrete, and potentially other goods is impacted by global trade. The text tends to imply that national consumption and production are directly linked and not impacted by global trade. I do not think this was the intention of the authors, so this needs to be clarified. Likewise, the implication to CO2 emisions from global transport of commodities is an imporatnt issue. | Noted - Most of China's production is for own consumption. Emissions related to trade are discussed n Chapter 14, , and a cross-reference to this chapter has |
| 12954 | 10 | 10 | 43 | 10 | 45 | Economic downturn deepened in 2009 not 2010. 2010 was a recovery year from the trough in 2009. | Accepted - text revised |
| 2286 | 10 | 11 | 1 | 11 | 17 | This section is one of the most important sections in this chapter. However, it does not flow well and needs to develop the theme better - currently it reads like a review of statistics and is not clear. | Accepted - text revised |
| 15903 | 10 | 11 | 18 | 11 | 28 | Interesting discussion on impact of trade, emissions offshoring/structural changes, leakages, BUT need to note that lowering footprint for one nation could increase that of another due to leakage, emissions offshoring | Noted - GHG emissions embodied in trade are discussed in Chapter 14, and a cross-reference to this chapter has been |

|---|---|---|---|---|---|---|---|
| 16139 | 10 | 11 | 36 | 12 | 2 | On tourism, the split in several parts (economic situation, emissions, policy) along the chapter make reading difficult. At least one should catch the share of transport or consumption in emissions, from the outset and not wait for the next development. | Accepted and substantial changes incorporated. Decision to include tourism was made by the IPCC plenary at ther very beginning of AR 5 process. In light of this and other reviewer comment and comments by review editors a detailed discussion took place. It was agreed to prioritise the balance and logical flow in the chapter which is primarily on the industry sector. The discussion on tourism was repositioned as a demand-side driver for industrial products and product services and now appears in the SOD as Box 10.2. Moreover we have improved and intensified coordination with the transport and buildings chapter. In the SOD tourism is used as one of two illustrative examples to show how |
| 15709 | 10 | 11 | 36 | 12 | 2 | The components of tourism that belong in Chapter 10 and other chapters needs to be clarified. The produciotn of goods that support tourism seem to fit well within Chapter 10 but emissions from the services of tourism see to fit better in other chapters. | cf. Response to comment 2279 |
| 7096 | 10 | 11 | 46 | 11 | 46 | Reference UNWTO and UNEP 2008 should be UNWTO, UNEP and WMO 2008 | Noted, thanks - but it has been deleted |
| 7097 | 10 | 11 | 47 | 12 | 2 | the WTTC might not be an appropriate source for economic estimates, as it is unclear what tourism as a sector is meant to comprise- often, this includes all sorts of associated industries and services. "word" is apparently meant to be "world". | Noted - see revised text on tourism in box 10.2 of SOD. UNWTO estimates that in 2012 of the contribution of tourism to world GDP is around 5% and |
| 17488 | 10 | 11 | footnote | 11 | footnote | Why is footnote 1 needed? | Accepted - footnote deleted |
| 12955 | 10 | 11 | 4 | 11 | 7 | The measures of tjhe share of production of these key commodities coming from developing countries is a key fact and should be in the executive summary in one form or another. | Taken into account - however due to space restrictions this was not included |
| 5216 | 10 | 12 | 2 | 12 | 2 | Be very careful with 'indirect' economic impacts: these are vulnerable to extensive double counting (toirism claims the whole aircraft manufactoring industry and the latter claim tourism as 'indirect' economy), ignore that, in case other sectors were growing at the expense of tourism, there would also be indirect activities, so the indirect impact is only relevant in comparison with alterantive economies or spendings. So, please keep these data to direct economic ones only. Eventually add input-output analysis to get a more comprehensive idea of tourism in the economy. analysis like | Taken into consideration: discussion about tourism is more foccused and repositioned (tourism will serve as one of two illustrative example to explain interaction between service/product demand and industry activities). cf. |
| 15282 | 10 | 12 | 2 | 12 | 2 | "word" to be "world" | Editorial - copyedit to be completed prior |
| 11046 | 10 | 13 | | 13 | | Unit is needed | This comment has been addressed to Ch.10 by error and is meant as a |
| 15881 | 10 | 13 | 1 | | | Add energy intensity in J/tonne (or J per unit activity) sinc ethis is more indicative of energy efficiency than kg/capita | Accepted in part - The section is on activity trends not energy or emissions, for energy indicators see section 10.3 |
| 6723 | 10 | 13 | 2 | 13 | 2 | The references to the Table were not found in the reference list. I could therefore not check the numbers. For example US steel kg/cap has a 90% decrease between 2005 and 2011. | Accepted - due to an editorial problem chapter 10 had the reference list of a different chapter. This problem has now |
| 10134 | 10 | 14 | 26 | | | "final energy use" is wrong in this context. It is "final fossil fuel use" | Rejected - This is final energy use as defined in footnote 3 of FOD (footnote 4 of the SOD). This is not just "final fossil |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 10135 | 10 | 14 | 27 | | 29 | This sentence should be deleted as it delivers no relevant information. As is stated correctly, in the chemical industry most of the carbon contained in the fossil fuel used as raw material is transferred into chemical products. Only few processes exist, in which CO2 is produced as a by-product. Because the chemical industry is growing, the CO2 emissions from these processes are also growing. Alternatively it could be helpfull to add the following sentence: "Fossil fuels used as raw materials in the chemical industry cause emissions at the end of their life-span in the disposal phase. These emissions are accounted for in the waste disposal industry's emissions." | Accepted - sentence included in SOD |
| 15900 | 10 | 14 | 37 | | | footnote 3: how are electricity and heat flows allocated? | Question unclear - footnote 3 of the FOD (now footnote 4 in SOD) has a long |
| 17490 | 10 | 14 | 7 | 14 | 8 | Indicate the period of time that is encompassed by this statement. | Accepted - reference deleted as non |
| 18518 | 10 | 14 | 2 | | | This section includes nothing on the emissions of extractive industries, but covers only the energy consumption. Are there extractive industries that have more emissions than others? How do they compare? | Noted - see note under Table 10.3 in SOD: "Energy use for mining and quarrying is not included in the final and primary energy values; energy-related CO2 emissions from mining and quarrying, which are estimated to be less that 3% of total industry emissions, are included due to data limitations" (IEA detailed CO2 data for 2010 are not |
| 11131 | 10 | 14 | 31 | 14 | 37 | Line 32 implies that the levels of HFC-23 per tonne of HCFC-22 manufacture have doubled. This is not the case. It is the total quantity emitted that has doubled. | Accepted - text revised |
| 4792 | 10 | 14 | 37 | 14 | 38 | (Footnote 3), please change the sentence to "In order to calculate primary energy for non-fossil fuel (nuclear, hydro and other renewables)," as hydropower is a renewable energy source | Accepted - text revised |
| 15710 | 10 | 15 | 1 | 15 | 2 | The sentence addressing the sources of N2O needs to be clarified. Presumable, the sentence reference to the source of industrial emissions of N2O. Nitric acid and adipic acid manufacturing only make up about 6-7 percent of all anthropogenic N2O emissions. | Accepted - text revised |
| 17492 | 10 | 15 | 6 | 15 | 6 | What does "industry and non-energy industy" mean? | Accepted - revised to "energy and non- |
| 12956 | 10 | 15 | | | | Agree with proposition of making the table a stronger visual impact as the information is very important to communicate clearly but is very detailed as is. | Noted - will be considered in final draft when the help of a professional graphic |

|---|---|---|---|---|---|---|---|
| 11132 | 10 | 16 | | 16 | | Table 10.3: Emissions of non-CO2 GHGs (EPA 2011) Emissions (MtCO2e)<br>Source 1990 2005 2010<br>HFC-23 from HCFC-22 production 91 177 309<br>Data from UNFCCC (CRF emissions from Annex A) 88 37 20<br>Data for Global emissions from Miller & Kuijpers (2011) and<br>Miller et al. (2010) 96 142 117<br>ODS Substitutes 0 73 93<br>Data from UNFCCC (CRF emissions from Annex A) 3 184 237<br><br>The above shows the first two rows of Table 10.3 (in bold), taken from the reference EPA (2011). In fact, this reference does not exist in the draft and I presume that it is actually:<br><br>Alsalam J., and S. Ragnauth. (2011). Draft Global Antropogenic Non-CO2 Greenhouse Gas Emissions: 23 1990-2030. US EPA, Washington. Available at: http://www.epa.gov/climatechange/economics.<br><br>I've compared the EPA numbers with the literature sources:<br><br>UNFCCC data, unfortunately only for Annex A because the main emitters (India and China) do not report, and<br><br>Ben Miller's papers on HFC-23 emissions:<br><br>Miller, B. R., Rigby, M., Kuijpers, L. J. M., Krummel, P. B., Steele, L. P., Leist, M., Fraser, P. J., McCulloch, A., Harth, C., Salameh, P., Muehle, J., Weiss, R. F., Prinn, R. G., Wang, R. H. J., O'Doherty, S., Greally, B. R., and Simmonds, P. G.: HFC-23 (CHF3) emission trend response to HCFC-22 (CHClF2) production and recent HFC-23 emission abatement measures, Atmos. Chem. Phys., 10, 7875-7890, doi:10.5194/acp-10-7875-2010, 2010.<br><br>Miller B. R. and Kuijpers L. J. M., Projecting future HFC-23 emissions, Atmos. Chem. Phys. Discuss., 11, 23081–23102, doi:10.5194/acpd-11-23081-2011, 2011<br><br>It is clear that the EPA data are completely at odds with Miller's numbers and this means that the EPA data are wrong. The emissions in the Miller papers are consistent with measured atmospheric concentrations; effectively they have been verified against measurements.<br><br>I also had a look at the numbers in the table for ODS substitutes. The last two rows of the table above show the direct comparison between the EPA data and the values reported by countries to UNFCCC. Again there are huge differences but, for the ODS substitutes, they are in the opposite direction - the EPA data are far too small. Verification of the UNFCCC data for the most abundant HFC (134a) against its atmospheric concentrations, as published by AGAGE showed that the UNFCCC data are closer to reality than the low EPA values | Noted - due to an editorial problem chapter 10 had the reference list of a different chapter. This problem has now been resolved. The data corresponded to the EPA 2011 draft report, which in the SOD has been updated to EPA 2012. Two sources are used for Non CO2 emissions in the SOD (EDGAR and US EPA). There are currently discussions underway on the discrepancies between the two sources. This comment will be considered in the discussion. |
| 6724 | 10 | 16 | 1 | 16 | 1 | Should the reference be (Alsalam J., and S. Ragnauth., 2011)? However in that document I cant find those numbers. Maybe another source? | Noted - due to an editorial problem chapter 10 had the reference list of a different chapter. This problem has now been resolved. The numbers corresponded to the EPA 2011 draft |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 2287 | 10 | 16 | 3 | | | For iron and steel and cement industry, much of the CO2 emission arise from the chemical reactions not fossil fuel combustion. Sentence should be "CO2 emissions occur due to chemical reactions and fossil fuel combustion." CaCO3 = CaO + CO2 - calcining major source of CO2 for cement and for iron and steel, Fe2O3 + 2C + 1/2O2 = 2Fe + 2CO2 - major source of CO2 | Accepted - sentence changed to: Most of these manufacturing CO2 emissions arise due tochemical reactions and fossil fuel combustion largely used to provide the intense heat that is often required to bring about the physical and chemical |
| 7719 | 10 | 16 | 1 | | | The emissions from ODS substitutes should be updated by the 2012 TEAP Progress report or related Task Force Report to Decision XXIII/9 to make the present situation clearer. | Noted. Two sources are used for Non CO2 emissions in the SOD (EDGAR and US EPA). There are currently discussions underway on the |
| 11133 | 10 | 17 | | 17 | | As previous comments | cf. Response to comment 11132 |
| 18519 | 10 | 17 | | | | Please clarify which industries are included in 'other'. | Noted - the figure has been removed |
| 18520 | 10 | 17 | | | | Two comments: 1) Please clarify the abbreviations of the world regions to make the figure stand-alone; 2) As waste is covered in a separate, independent section to the chapter, it seems strange that waste emissions are included here. It may be more consistent to decouple these here to keep the discussion within the boundaries of this chapter section. | 1) Accepted - in Table 10.3 of the SOD the acronyms have been briefly spelt out and a note has been included in the caption: "For definitions of regions see Annex II (Metrics and Methodology)" 2) Figure 10.2 and Table 10.2 of SOD |
| 3014 | 10 | 17 | 11 | | 12 | The discussion about the relationship between trade and GHG emissions lacks important scientific contributions, for USA, Brazil and China. Please see the following papers LIU, H., XI, Y., LI, X., 2010, “Energy embodied in the international trade of China: An energy input-output analysis”, Energy Policy, v. 38, pp. 3957-3964. MACHADO, G., SCHAEFFER, R. E WORRELL, E., 2001, “Energy and carbon embodied in the international trade of Brazil: an input-output approach”, Ecological Economics, v. 39, pp. 409-424. WEBER, C. L., PETERS, P. P., 2009, “Climate change and international trade: Policy considerations in the US”, Energy Policy, v. 37, pp. 432-440. WTO, 2009, Trade and Climate Change: A report by the United Nations Environment Programme and the World Trade Organization. | Accepted - this paragraph has been significantly reduced in the SOD, referring readers to Chapter 14 where this issue is fully covered. |
| 6725 | 10 | 17 | 2 | 17 | 2 | The reference is not correct or found. | Accepted - due to an editorial problem chapter 10 had the reference list of a different chapter. This problem has now |
| 6726 | 10 | 17 | 3 | 17 | 4 | The F-gases use, is there possible a double counting or is it excluded in for example "Chemicals and petrochemicals" please clarify the note. | Noted - the figure has been removed |
| 12344 | 10 | 17 | 6 | | | Is the pie chart to the right releated to the figure to the left, or are they independent? Further explanation of the figure would ease the reading. | Noted - the figure has been removed |
| 15905 | 10 | 17 | 6 | | | Not clear why there are 2 pie wedges for F-gases | Noted - the figure has been removed |
| 6727 | 10 | 17 | 7 | | | Reference problem, see 6 | Accepted - due to an editorial problem chapter 10 had the reference list of a different chapter. This problem has now |
| 6728 | 10 | 17 | 8 | 18 | 16 | This part of trade could probable both use a table and an own sub-section to help reader to find how this impacts everything | Accepted - this paragraph has been significantly reduced in the SOD, referring readers to Chapter 14 where |
| 16141 | 10 | 17 | 8 | 18 | 13 | Important paragraph, maybe there should be a reference to international policy -or absence of- described in other chapters? | Accepted - this paragraph has been significantly reduced in the SOD, referring readers to Chapter 14 where |
| 15712 | 10 | 17 | 8 | 17 | 10 | The discussion of this issue needs to be better coordinated with Chapter 8 (Transport). | Accepted - this paragraph has been significantly reduced in the SOD, referring readers to Chapter 14 where |

|---|---|---|---|---|---|---|---|
| 12957 | 10 | 17 | | | | Graph legend needed. Who is REF? Who is MAF? | Accepted - in Table 10.3 of the SOD the acronyms have been briefly spelt out and a note has been included in the caption: "For definitions of regions see |
| 17496 | 10 | 18 | 1 | 18 | 2 | The sentence reads "In large economies of Western Europe net 1 imported emissions account for 20-50%,…" 20-50% of what? | Accepted - this paragraph has been significantly reduced in the SOD, referring readers to Chapter 14 where |
| 8271 | 10 | 18 | 12 | | | "CO2 emissions to grow in comparison" - missing "are expected" to grow | Editorial - copyedit to be completed prior |
| 17497 | 10 | 18 | 15 | 18 | 16 | "With regard to GHG emissions, service sector is less diverse, as it comprises only energy-related emissions" Are repair shops included in the category of service sector? If so, aren't there releases of refrigerants in this sector? I suggest having this read "as it generally comprises only ..." | Accepted - but coverage of services sector has been significantly reduced in SOD, cf. Response to comment 2279 |
| 5217 | 10 | 18 | 16 | 18 | 17 | I am unsure if the enerdata data given here include transportation related to the servioces sectorm, i.e. including all ourist's transport, but looking at the figures, it does not. Either include (would be my prefenrence) or make a clear note in this. | Note - the data from enerdata do not include within services the emissions related to transport. This section has been deleted as coverage of services |
| 6730 | 10 | 18 | 17 | 18 | 18 | What about Aircraft and combustion engines for transports? | cf. Comment 5217 |
| 15907 | 10 | 18 | 35 | 18 | 41 | service sector may lower emissions, but manufacturing related GHGs are then trasnfered to another country--> leakage | Noted - dealt with in same page (18), line 42 onwards |
| 8272 | 10 | 18 | 44 | | | missing "to" - "leads TO total energy use reduction" | Editorial - copyedit to be completed prior |
| 8273 | 10 | 18 | 45 | | | "as" is not needed | Editorial - copyedit to be completed prior |
| 15906 | 10 | 18 | | | | shorten this section | Accepted - cf. Response to comment |
| 8276 | 10 | 19 | | | | Table 10.4 does not reflect the text below: need to create a sub category - transportation | Accepted - but due to new approach (cf response 2279) table no longer appears |
| 18521 | 10 | 19 | | | | When discussing tourism emissions, it would be very useful to refer back to the discussion in Box 1 on double-counting emissions so that readers understand that emissions quantified here are also primarily accounted for in other chapters (Chapters 8 and 9). | Noted - Tourism is a human activity, a use of leisure time which, according to its different forms (touring, visiting friends and relatives…) more or less calls upon merchant services (catering, tour organisation etc). It has specific drivers and dynamics which cannot be caught by sectoral approaches (e.g. transport, building), an issue which is of some importance owing to its contribution to emissions. This justifies the bottom-up approach. It is not surprising that the question of the coherence between the bottom-up approach and the historically dominating top-down approach is posed. This is also relevant for services (e.g. education, health services etc). services (e.g. tourism) can be seen as end users and can be connected to the sectors that feed them through a Stankey diagram,. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 7102 | 10 | 19 | 1 | 19 | 7 | Best estimate share of tourism CO2 emissions is correct, suggest that section on share of tourism in radiative forcing (Scott et al. Reference) is moved up to follow directly after estimate on CO2. It is not necessarily correct that the share of tourism in national emissions is higher in affluent countries (see e.g. Australia; Dwyer et al. 2010, Journal of Sustainable Tourism), while in particular small island nations can have particularly high tourism emissions, though they may rank low in terms of GDP per capita. Note as well that all of the quoted studies on national emissions have different system boundaries. | Points taken into account. See response to comment 2279 on new approach to tourism in SOD. |
| 2288 | 10 | 19 | 14 | 19 | 16 | The reference is one of the only references to using a life cycle perspective. The importance of this to reducing GHGs should be emphasized. | Noted in general for the chapter which has attempted to give this perspective |
| 6729 | 10 | 19 | 19 | | | Shouldn't it be possible to update the table to today's value. Ask same organisation to redo analyse? | Noted - updated sources used. Table no longer appears in SOD. |
| 7104 | 10 | 19 | 19 | | | Table should be moved up, the sentence "the origins of emissions…" should be re-written (sounds odd) and integrated in first section. The reference to table 10.4 should be UNWTO, UNEP and WMO 2008. | Accepted - but due to new approach (cf response 2279) table no longer appears |
| 7105 | 10 | 19 | 24 | 19 | 31 | not sure this is relevant? | Accepted - revised to "981MT from transport" - but due to new approach (cf response 2279) table and text no longer |
| 8277 | 10 | 19 | 24 | | | Total of 981Mt (table 10.4 shows 1302MT) or need to clarify "world total of TRANSPORTATION emissions from tourism" | Accepted - but due to new approach (cf response 2279) table and text no longer |
| 15908 | 10 | 19 | 25 | | | "hundred"???? | Accepted - revised to "same day visitors 133MT" - but due to new approach (cf response 2279) table and text no longer |
| 8278 | 10 | 19 | 25 | | | Overnight stays 844Mt (table 10.4 shows 274Mt from accomodation) | Rejected - 844 Mt sums transport, accommodation and activities related to overnight stays. Due to new approach |
| 8279 | 10 | 19 | 31 | | | global figure of 981Mt - need to show in the table that 981 is the sum of air transport, car and other transport | Accepted - but due to new approach (cf response 2279) table and text no longer |
| 17498 | 10 | 19 | 6 | 19 | 6 | Aviation's role in tourism should have been introduced earlier, rather than as an aside in this quantitative statement. | Rejected - The importance of aviation is made as clear as possible though it is not stated in the first four lines, see table and text below. See response to |
| 8274 | 10 | 19 | 6 | | | from 5.2% in which year? | Accepted- changed "from" to "between", the figures state a margin of error. See response to comment 2279 on new |
| 8275 | 10 | 19 | 6 | | | 5.4% and 8.3% in which years? | cf.response to 8274 |
| 5218 | 10 | 19 | 8 | 19 | 10 | Cruise tourism is in the UNWTO report not included in 'other tourism' but in accommodations. This because cruises tend not to bring tourists somewhere, but are the destination itself, though a mobile one. Flights to and from ports are included in (air) transport. | Accepted - deleted "and included in other transport". See response to comment 2279 on new approach to |
| 5219 | 10 | 19 | 8 | 19 | 10 | Another issue: recommend strongly to include cruises not in a description of total emissions, but in an assessment of individual per tourist trip and per tourist night emissions for different forms of tourism to show the very large range and the high evels for most cruises and also with an eye on the large opportunities this diversit gives. In effect a minority of trips causes the majority of emissions and thus policies might be best directed at this minority (also because these minority trips trend to grow very fast at this moment). | Noted - it would be quite a good idea if we had space to devote to a more detailed analysis of cruise tourism. The unequal repartition of emissions is dealt with in the first paragraph next page |
| 7103 | 10 | 19 | 9 | 19 | 9 | "and included in "other transport"" - difficult to understand, remove, or rewrite to read "Cruise travel represents about 1.5% of global emissions of CO2 (e.g. Gössling 2012, Carbon Management, Routledge); it is the most energy intense form of tourism if calculated on a per tourist basis. Cruise travel has grown at an average annual rate... | Accepted - removed |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 12958 | 10 | 19 | 2 | 19 | 4 | figures missing for France, Switzerland; | Rejected - the French and Swiss sources make the same case as the others, yet the figures they give (e.g. emissions from transport only) are not comparable to the other studies and so |
| 12959 | 10 | 19 | 5 | 19 | 7 | There seems to be an inconsistency between the claim that GHG emissions associated with tourism represent 12.5% of CO2eq and the Sankey diagram in figure 10.2. The latter implies that Tourism and leisure together accou nt for around 5% of global GHGs in CO2eq in 2008. IF this is not a discrepancy it should be explained why not as its not clear. | Noted - regarding tourism the two sources are rather coherent, it is quite good news to see different approaches meet. TheUNWTO data include overnight stays (strictly tourism) and same day visits (i.e. part of leisure). They do not include all leisure near the home. Yet they point that transport is the greater part of emissions and that the weight of activities is much lower. Thus |
| 3651 | 10 | 2 | 1 | 2 | 1 | If the service sector is included in the analysis, please consider to add it to the title of the chapter. | cf. response to comment 12340 |
| 7106 | 10 | 20 | 1 | 20 | 3 | these are references to national studies, an overview of studies indicating unequal distribution in per capita emissions is provided in Gössling et al. 2009. It is also unclear what the references refer to? | Rejected - Gossling et al 2009 is quoted in the paragraph. It also seems important to refer back to national studies since they not all refered to in |
| 16143 | 10 | 20 | 14 | 20 | 15 | This line is controversial : there are several radical technologies being explored such as innovative cement processes or changes in the steelmaking. Although they are not yet in industrial scale, they suggest that paths are not necessarily incremental in large energy intensive industries. | Rejected - but if there is space we could add comments to illustrate the lack of evidence such claims. |
| 4545 | 10 | 20 | 14 | 20 | 25 | This is not a Kaya-identity. The Kaya-identity differentates between economic growth, economic structure and intensity changes. The formula 1 does not do this, as strucutre of demand is lacking. | Taken into account in revisions and identity shifted forwards in the chapter |
| 18522 | 10 | 20 | 20 | | 25 | It may be more useful to place this equation right up front next to Figure 10.1 to clarify in detail how the two fit together. The description here doesn't make it crystal clear. It might be useful to e.g. include the green circled numbers from Figure 10.1 in this equation as well to better clarify exactly which components represent energy efficiency, materials use efficiency, reduction of demand, etc.. | Accepted - Taken into account in revisions and identity shifted forwards in the chapter to be near to the structuring figure 10.1 |
| 3019 | 10 | 20 | 20 | | | Please fix the word off-shire. I think you intended to write offshore. | Editorial - copyedit to be completed prior |
| 15909 | 10 | 20 | 37 | | | offshore not offshire | Editorial - copyedit to be completed prior |
| 8280 | 10 | 20 | 37 | | | off-shire should be off-shore | Editorial - copyedit to be completed prior |
| 10414 | 10 | 20 | 37 | | | "off-shore" is got wrong here as "off-shire" | Editorial - copyedit to be completed prior |
| 16142 | 10 | 20 | 8 | 20 | 11 | Excellent paragraph that sums the problem | Noted, thanks. |
| 7112 | 10 | 20 | 9 | | | Bows et al. 2009: does not focus on tourism? | Looking at the title: "Air transport, climate change and tourism." it seeems |
| 6731 | 10 | 20 | | | | I would like a better structure in this part that would be the same for all sub-sections. What is the status, what has been done and the results followed with what can be done with risk and potential. | Taken into account, cf. Response to comment 18534 |
| 18534 | 10 | 20 | | | | The overall structure of the section is very useful (using 10.4.1 to explain the over-arching options and 104.2 how they apply to different industries). It is, however, inconsistently applied in 10.4.2, with some sections (e.g. steel and cement) following very closely, and others (e.g. food and textiles) following only to a very limited extent. It would be useful to have a consistent application throughout that section. Where that is not possible, please explain why, e.g. is there no option for material substitution in that industry? | Taken into account - it has been used as consistently as possible, but for several sectors, no published evidence related to some of the options was found. In revising the report, we have tried to |
| 18526 | 10 | 20 | | | | One option to shorten 10.4.1 (and thereby the chapter), would be to cut industry-specific examples to the relevant sections of 10.4.2. | Accepted - 10.4.1 has been shortened to summarise the five approaches, with all sector specific examples inserted into |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 8501 | 10 | 20 | 12 | 24 | 30 | The section 10.4.1 can be simplified and make it as general statement since the specific elaboration has been detailised in section 10.4.2 according to sectors. Therefore a few pages can be extracted in order to achieve target number of pages for this chapter. Repeation of statements in section 10.4.1 and 10.4.2 can be misleading and inaccurate in technicalities. It also good to combined section 10.4.1 and 10.4.2 with introduction of table when explainingtypes of mitigation according to sector specific. | Accepted - 10.4.1 has been shortened to summarise the five approaches, with all sector specific examples inserted into the relevant sections of 10.4.2 |
| 12124 | 10 | 20 | 27 | 20 | 29 | Sector Wide Mitigation Opportunities is missing many strategies - 1) waste heat loss minimisation and waste heat recovery Reference for this - US DOE (2008) Waste Heat Recovery: Technology and Opportunities in U.S. Industry. US DOE at http://www1.eere.energy.gov/manufacturing/intensiveprocesses/pdfs/waste_heat_recovery.pdf + US DOE (2004) Waste Heat Reduction and Recovery for Improving Furnace Efficiency Productivity and Emissions Performance. A Best Practices Process Heating Technical Brief. US DOE. http://www1.eere.energy.gov/manufacturing/tech_deployment/pdfs/35876.pdf - 2) Combined Heat and Power - Co/Tri Generation - Ref Oland, C. (2004) Guide to Combined Heat and Power. Prepared for the U.S. Department of Energy. Industrial Technologies Program. Prepared by Oak Ridge National Laboratory. At http://www1.eere.energy.gov/manufacturing/tech_deployment/pdfs/guide_chp_boiler.pdf | Accepted - References added at the start of section 10.4 (U.S. DOE, 2008; U.S. DOE, 2004) and within the costs and potentials section 10.7 (Oland, 2004) |
| 12125 | 10 | 20 | 27 | 20 | 29 | Sector wide Mitigation Opportunities - missing many strategies - 3) improving the operational energy efficiency of manufactured products, appliances, IT vehicles, industrial and commercial cooking equipment. Whilst energy efficiency of product manufacturing processes is important, it is important to note that that life cycle analysis shows that for most “energy using” manufactured products (vehicles, computers, electric motors, appliances, engines, toner cartridges and buildings) over 70% of the total life cycle energy use occurs over the 5-30 plus years of operation<br><br>For example - Product, % of lifecycle energy usage from operation , reference.<br>Cars, SUVs, pickups, buses - 65-74% (Chester, M.V. and Horvath, A. (2009) Environmental assessment of passenger transportation should include infrastructure and supply chains. Environmental Research Letters, vol. 4, no. 2, pp. 1-8)<br>US Family Sedan 85% (Sullivan, J. L., et al., 1998, Life cycle inventory of a generic U.S. family sedan – Overview of results USCAR AMP Project, proceedings of Total Life Cycle Conference Land, Sea and Air Mobility, SAE International P-339, pp.114)<br>Passenger transportation (private and public): 63-70% 63-70% (Chester, M.V., Horvath, A. and Madanat, S. (2010) Comparison of life-cycle energy and emissions footprints of passenger transportation in metropolitan regions. Atmospheric Environment, vol. 44, no. 8, pp. 1071-1079.))<br>Aircraft 69-79% (Chester, M.V., Horvath, A. and Madanat, S. (2010) Comparison of life-cycle energy and emissions footprints of passenger transportation in metropolitan regions. Atmospheric Environment, vol. 44, no. 8, pp. 1071-1079.))<br>Residential Buildings 80-90% (Ramesh, T., Prakash, R. and Shukla, K.K. (2010) Life cycle energy analysis of buildings: an overview. Energy and Buildings, vol. 42, no. 10, pp. 1592-1600)<br><br>Lighting – All Forms 98%<br>Office Buildings 86%<br>ICT network and mobile phones (e.g., 2G and 3G, not office network): 84%<br>79 -84% | Noted - but the absolutely valid point about use/embodied energy is dealt with by the overall structure of the WG3 report. The use of buildings and appliances is dealt with in the section on buildings and the use of vehicles is dealt with in the section on transport. This chapter covers only the industrial emissions related to making buildings, vehicles, equipment and other goods (i.e the other ~30% not listed by the reviewer). |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 12126 | 10 | 20 | 27 | 20 | 29 | Sector wide Mitigation Opportunities is missing many strategies - Reducing GHG through core industrial/manufacturing process innovation. I can send refs and text to support this strategy if interested. | Noted – but this chapter can not attempt to review every technology which is currently under development, and given the space limitations of the |
| 12127 | 10 | 20 | 27 | 20 | 29 | Sector wide Mitigation Opportunities is missing many strategies - Renewable Energy is missing. Renewable Energy is relevant for all these sectors including mining. Many mining sites are in remote areas off the grid and highly suitable to renewable energy. | Noted - section 10.4 does mention this briefly, but the main discussion on renewable energy in WG3 is in Chapter |
| 6732 | 10 | 21 | 1 | 21 | 9 | I am missing out risks and costs for the improvements. | Noted - this is discussed in sections |
| 16146 | 10 | 21 | 10 | 21 | 24 | This paragraph is too prudent and contradicts other parts of the chapter. Line 22 the "asymptote" of efficiency does not mean the potential is not there, especially in an industry with a limited number of players. For example, the Wuppertal Institut has shown that furnaces in the German Steel Industry nearly did not move in efficiency for 20 years, although technology did not stay idle... | Taken into account - cf. Response to comment 4546 |
| 17501 | 10 | 21 | 10 | 21 | 10 | Spell out acronyms at first use in chapter. What is EOR? | Editorial - copyedit to be completed prior |
| 8281 | 10 | 21 | 10 | | | What does it mean "within a factor of two of the absolute theoretical limit defined by Gibbs" | Accepted - text revised, theoretical limits now only discussed in general |
| 4546 | 10 | 21 | 10 | 21 | 24 | This section mixes up best practice, best available technology and technical limits, and makes for a confused story. The argument also builds on only 3 references. The argument should first state what savings are between current average practice and best practices (and BAT). Next to this it can then look at future technologies, beyond BAT. The thermodynamic limits are still far away fro many processes. The last sentence of this paragraph is incorrect, given all the mateial described above and withut definition of the word "future". Saygin et al. (2011) look at current best available technologies, but note that savings are possible in areas not included in BAT (e.g. process integration, CHP, recycling). | Taken into account: this paragraph has been rewritten in response, and more references added. |
| 16145 | 10 | 21 | 11 | 21 | 12 | Word missing (if?) | Editorial - copyedit to be completed prior |
| 17502 | 10 | 21 | 12 | 21 | 12 | Another reference that would be appropriate here: Brent, G. F., D. J. Allen, B. R. Eichler, J. G. Petrie, J. P. Mann, and B. S. Haynes. 2012. Mineral Carbonation as the Core of an Industrial Symbiosis for Energy-Intensive Minerals Conversion. Journal of Industrial Ecology 16(1): 94-104. | Accepted but due to space restrictions the statement was deleted |
| 6733 | 10 | 21 | 13 | 21 | 20 | EJ and PJ are to big numbers to grab. Use relative values. 54 PJ lacks a comparable number. | Accepted - context for the numbers has been provided in some instances in SOD. Will be considered further in next |
| 17503 | 10 | 21 | 13 | 21 | 31 | To what does "its" refer? | Editorial - copyedit to be completed prior |
| 8282 | 10 | 21 | 13 | | | annual GLOBAL energy savings? | Accepted but due to space restrictions the statement was deleted - section 10.7 now includes a reference to mitigation |
| 8283 | 10 | 21 | 15 | | | 19 to 32% - why a range? | Accepted but due to space restrictions the statement was deleted - most mitigation potential data can now be |
| 15910 | 10 | 21 | 2 | | | Add "boilers" after "furnaces. There are more technologies to consider—waste heat recovery, advanced cooling systems, pinch analysis, load tracking, variable speed/frequency drives, nanotechnology, etc) | Noted - cf. Response to comment 15885 |
| 17500 | 10 | 21 | 21 | 21 | 21 | A new paragraph should start with the sentence "Similar limits…" or the sentences should be edited to provide a segue. | Taken into account |
| 16147 | 10 | 21 | 22 | 21 | 24 | Radical technology, e.g. direct reduction of iron oxyde for steel, or radical cements do exist, even if they are still to implement. Thus this sentence may be misleading. Maybe add "in the short term" | Noted - some mentions have been adde, e.g new cement technologies. However chapter is concerned with general trends and possibilities; it does not address specific technologies which are currently |
| 8284 | 10 | 21 | 23 | | | "is the limit to likely future .." should be "is likely the limit to future…" | Reject |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 15911 | 10 | 21 | 26 | | | coal and oil for industry mostly used in developing nations, not OECD. OECD uses mainly nat gas | Noted - but this pattern reflects the decision by developed countries to reduce their production of basic materials (such as steel) in favour of lower-energy downstream manufacturing - such as car making. So, it isn't clear |
| 6735 | 10 | 21 | 29 | 21 | 30 | What is the potential with three to four times more biofuel, how much could that decrease total emissions from energy in the industry. | Noted - section 10.4 does mention this briefly, but the main discussion on renewable energy in WG3 is in Chapter |
| 6734 | 10 | 21 | 33 | 21 | 39 | Try to find numbers to show the potential otherwise remove the part with "if power is decarbonised…" | Noted - see response 12345 |
| 12345 | 10 | 21 | 33 | 21 | 36 | Wider use of heat pumps can be implemended independetly of decarbonized power generation, because the heat pumps have efficiency rates of producing heat >1. Please reflect this fact. | Reject - the Unido report cited by the reviewer makes two arguements which suggest that decarbonisation of the electricty grid is required to any significant savings from heat pumps. Firstly, page 37 clearly points out that the effcieincy of electricity generation must me considered when comparing heat pump technologues to other options, such as direct combustion fo the fuel. "So, for example, if the electricity comes from fossil fuel generation with an efficiency of 40%, the coefficient of performance of the heat pump needs to be higher than 2.5 if the pump is to save primary energy and be considered as providing renewable heat." (i.e. a COP >2.5 for the heat pump is required for the heat pump to start saving CO2). Secondly, page 39 explains the efficiency of heat pumps fall quickly when producing high temperature heat (governed by Carnots Law),making heat pump technology more suited for low temperature heat in |
| 15912 | 10 | 21 | 33 | 21 | 39 | issues for using renewable sinclude intermittency andarea footprint which are limitations for indsutry | Noted - but the main discussion on renewable energy in WG3 is in Chapter |
| 9535 | 10 | 21 | 33 | 21 | 36 | Good comment | Noted |
| 10014 | 10 | 21 | 33 | 21 | 36 | This part should be kept in SOD because "heat pump technology" has huge potential to reduce GHG emission from industrial sectors, as described in (IEA/OECD, 2010, page65-83) and (UNIDO, page38, Fig14). These literatures are listed in the No47 line of this table. | See response to comment 12345 |
| 9541 | 10 | 21 | 36 | | | Please, add the following; the analysis has identified the potential for heat pumps to meet 4.87EJ/yr of industry's process heat demands in 2050.(renewable energy in industrial applications, UNIDO) | See response to comment 12345 |
| 16148 | 10 | 21 | 38 | | | Maybe precise "large scale" solar systems in use in industries. | Noted - but the main discussion on renewable energy in WG3 is in Chapter |
| 16144 | 10 | 21 | 4 | | | The list does not include explicitly the efficiency of the motor itself. Maybe add "in addition to improvements to the motors themselves." | Taken into account - changed to "motor systems" which includes motors |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 16149 | 10 | 21 | 44 | | | The desctruction of HFC23 as a CDM benefit is controversial, this should show in the sentence, for example with "the controversial destruction of HFC-23 is the major source…" | Noted. This is now mentioned only in section 10.11. The statement reflects a fact: HFC23 destruction is a major source of CDM credits. The controversy is not related to this fact, but has been discussed by the chapter team who will |
| 7510 | 10 | 21 | 25 | 22 | 26 | It should be explained that CCS requires huge energy for capture and strage of CO2. As far as carbon free energy is not available, additional CO2 emission is inevitable. High costs of CCS is stated at line 25 of page 22. And it should be added that for industry, the issue is "Who will pay for the cost of CCS?" and how the cost should be passed on to the consumer. | Noted - but most of the CCS text in chapter 10 has been removed and cross-reference is made to chapter 7 on energy which covers the issue in more |
| 11134 | 10 | 21 | 41 | 21 | 41 | mistyping. Should say "hydrochlorofluorocarbons" | Editorial - copyedit to be completed prior |
| 15913 | 10 | 22 | 13 | 22 | 26 | CCS for indsutry assume sthat plants will be around for long term - may not be true for many industries and might preclude CCS from these sectors | Noted and disucssed in section 10.9 on barriers |
| 3020 | 10 | 22 | 17 | | 18 | I suggest including ethanol and sugar production as one of the major sources of cheap and pure CO2 that can be easily captured and, depending on the location of the industrial facility, used as a refrigerant fluid or as an input to food and beverage industries. CO2 in ethanol distilleries can also in the future be an input for producing succinic acid, which is a valuable bioplatform to produce different chemical products. | Taken into consideration, if we find literature than it couod be included in section 10.5 cross industry cooperation |
| 2289 | 10 | 22 | 19 | 22 | 20 | Check data. The offgas from iron and steel is typically much lower in CO2 content than from power plants. EAF especially much lower (use baghouses with air cooling reducing to very low CO2 levels) versus typical ESP for powerplants where CO2 is much higher. | Accepted - comparison with power plants ommitted |
| 12627 | 10 | 22 | 24 | 22 | 26 | This statement is factually incorrect. There are very well known and accepted assessment techniques for geological storage potential, CCS on a $/tonne of co2 basis is cost competitive with many renewables and other technologies, most CCS projects globally have not experienced public engagement issues beyond what is common for large industrial projects, there is 5 large-scale proof of concept projects each storing in the order of 1 million tonnes of CO2 per year. | Noted - see section 10.9.2 which now summarises barriers on CCS for industry. The statement that the costs are uncertain is factually correct, because there are so few installations operating to date. The reviewers comment that there are "5 large-scale |
| 12670 | 10 | 22 | 24 | 22 | 26 | This statement is factually incorrect. There are very well known and accepted assessment techniques for geological storage potential, CCS on a $/tonne of co2 basis is cost competitive with many renewables and other technologies, most CCS projects globally have not experienced public engagement issues beyond what is common for large industrial projects, there is 5 large-scale proof of concept projects each storing in the order of 1 million tonnes of CO2 per year. | Duplicate of comment 12627 |
| 8909 | 10 | 22 | 26 | | | The reference for "high costs" of CCS should be deleted. High costs relative to what? Offshore wind turbines are an extremely high cost way of mitigating CO2, as are many other technologies. The reason that the IEA blue map scenario contains a large proportion of CCS is that overall it is an extremely cost-effective method of CO2 abatement, particularly when issues of grid stability and balancing are taken into account. From the IEA CCS roadmap "Carbon capture and storage (CCS) is an important part of the lowest-cost greenhouse gas (GHG) mitigation portfolio. IEA analysis suggests that without CCS, overall costs to reduce emissions to 2005 levels by 2050 increase by 70%."http://www.iea.org/papers/2009/CCS_Roadmap.pdf | Taken into account - text revised to: "their comparitively high costs", based on the IEA's BLUE map marginal abatement curve (Figure 2.34 and 2.35, pg109-110, IEA (2009b). Energy Technology Perspectives 2010. Scenarios and Strategies to 2050. International Energy Agency, Paris.) which shows 37% of the abatement potential in industry coming from CCS, |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 11999 | 10 | 22 | 26 | | | It is wrong that there is no large-scale proof of concept for the CCS: Look at the Sleipner project in the Northern Sea where Statoil has been injecting 1 million of CO2 per year cince 1990. It works very well and CCS has suffered from way too much scaring and generalization from generalists. The CO2 contained in the combined fossil fuel reserves known today is over 2600 Gt. CCS is feasible and defendable provided the necessary Quality assurance is applied throughout the whole process. We have overcome bigger challenges and should definitely use CCS much more in the future. We cannot afford not to use it and there is nothing speaking against using it if done professionally. | Taken into consideration - there are some large scale storage projects (Sleipner, In Dsalah, Weyburn), but not large scale project connected with industry processes |
| 9914 | 10 | 22 | 27 | | | The standard ISO 14051 "Material Flow Cost Accounting" released by the end of 2011 should be referred to as a guidance document to assist decision makers in companies in reducting both their material and their energy use. | Rejected - not related to the context mentioned |
| 10136 | 10 | 22 | 4 | | 8 | To clarify the statement the following reformulation is recommeded: "... was too small, to become a significant means for mitigating climate change. Due to the large energy amount that is necessary to transform the low-energy-content CO2 molecule into other chemical products, the overall CO2 balance for reactions using CO2 as raw material depends on the carbon-factor of the energy used. A recent analysis....". The sentence in lines 6 to 8 should be deleted as it creates a wrong impression. CO2 as raw material for urea production is not a pilot or demonstration project, but a long-established process. Pilot projects on CO2 as building blocks for polymers do exist because they make commercial sense for reasons very specific to each project. The carbon emission avoidance of these projects depends on the primary energy source used. | Noted - but most of the CCS text in chapter 10 has been removed and cross-reference is made to chapter 7 on energy which covers the issue in more detail |
| 6736 | 10 | 23 | 11 | 23 | 12 | The chapter could have a section for re-use. It has a lot of potential if products were made of more standardized parts designed for disassembly. | Rejected - reuse is discussed in section 10.4.1.3 |
| 5457 | 10 | 23 | 16 | 23 | 17 | Kiln drying process of wood products uses more energy than sawing process etc., but it could not be called "energy intensive", comparing metal material processing energy. | Taken into account. The statement has been changed to "but is in effect still energy intensive due to kiln drying and the need for greater volumes of wood to |
| 6737 | 10 | 23 | 24 | 23 | 24 | This could be avoided with smarter design for manufacturing. | Accepted - the statement now reads "This could be reduced by process |
| 15914 | 10 | 23 | 24 | | | add after "process innovations" , "and better product energy management" | Taken into account - covered in section 10.4.2.1 - heat and energy recovery in the iron and steel sector. The authors do not feel that better product energy management would contribute to an |

| 17506 | 10 | 23 | 28 | 23 | 28 | While cement cannot be recycled as such, cement in concrete is recycled when concrete debris is downcycled into civil engineering applications. | Taken into account - text revised to "There is no recycling possible for cement although concrete can be |
| 10138 | 10 | 23 | 28 | | 29 | Delete "plastics recycling is greatly inhibited by the wide variety of incompatible compositions" and exchange with: "for plastics recycling different possibilities are in practice depending on the cleanliness and conformity of the plastics waste". See comment reffering to page 67 lines 16 to 23 for more details. | Taken into account. Text will be modified to convey right message. there are clear limits to future possible recycling of plastics due to the high variety of plastics in use, regardless of the cleanliness of plastics waste. The reality is that plastics are useful precisely because they can be tailored easily to |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 12009 | 10 | 23 | 28 | 23 | 29 | The statement is too simple and misleading. A very important reason why there exist variety of plastics is to serve best to the needs. For example, wrapping and containers require shielding, damper, protection and other performance and specific needs widely differ by applications. The best suit plastics much contribute to resource and energy saving. Product specific recycling systems have been developed to enhance recycling. See more info on the following webs.<br>http://www.plasticseurope.co.uk/<br>http://www.jpif.gr.jp/7teigen/teigen.htm | Noted - but the reviewer's comment does not contradict what is written |
| 7094 | 10 | 23 | 29 | 23 | 30 | Recycling may also reduce GHGs by reducing methane emissions from landfills, but the size of this avoided emission depends on the amounts of paper that would have been landfilled if not recycled. For instance, see FAO. (2010). Impact of the global forest industry on atmospheric greenhouse gases: FAO Forestry Paper 159. Rome: United Nations Food and Agriculture Organization (FAO). | Noted- it is clear that paper recycling could also reduce GHGs if paper waste is diverted from landfill, but this would not necessarily be the case if paper was incinerated and used as an energy source instead of landfilled. The statement in page 23-line 29 "...it does not always reduce emissions..." acknowledges this fact, but it also refers to the fact that virgin paper production is commonly fueled with biomass, whereas recycling is not, which means that in |
| 2290 | 10 | 23 | 4 | 23 | 24 | lighter weight advanced high strength steels reduce the amount of steel required to make products and hence GHGs. The last sentence ignores many of the advances made in the metals industry in near net shape products resulting in very high yields (90+%) - thin slab casters, direct strip production, beam blanks production, etc. | Taken into account - the important role of yield improvements through technologies such as these are already covered in this section. |
| 17505 | 10 | 23 | 7 | 23 | 7 | Improvement of manufacturing yields is not a form of material substitution. | Rejected - the sub-heading for this section is not just material substitution. |
| 10137 | 10 | 23 | 7 | | 8 | Delete the sentence "For plastics…." and substitute it with the following more differentiated paragraph: "For plastics, a substitution of oil as feedstock by renewable ressource has been discussed as GHG mitigation option. LCA studies show that other environmental parameters like eutrophication and stratospheric ozone are often influenced negatively and additional land use impacts, such as the potential loss of biodiversity, soil carbon depletion, soil erosion, deforestation, as well as greenhouse gas emissions from indirect land use change are often not quantified. Additionally, the studies show a large variability depending on the process analysed. This underlines the conclusion that feedstock change for plastics has to be analyzed based on various criteria and individually for each process over the complete life-cycle in order to assess the sustainability of this GHG mitigation potential." (Source: A Review of the Environmental Impacts of Biobased Materials, Martin Weiss et al., Journal of Industrial Ecology, Special Issue: Meta-Analysis of Life Cycle Assessments, Volume 16, Issue Supplement s1, pages S169–S181, April 2012.) For more details on the negative GHG emission effect of land use change for the plantation of bio-raw materials refer to the following source: Quantifying global greenhouse gas emissions from land-use change for crop production, HELEN C FLYNN et al., Global Change Biology (2012). | Taken into account: there isn't space to delve into the LCA study debate, but we have modified the statement to acknowledge that although feedstock substitution is technically feasible, it would require huge amounts of land, which has implications for food production, and CO2 emissions from changing land use, etc. |
| 4548 | 10 | 23 | 8 | | | Vegetable oil??? You must be kidding..... | Noted - but this is an issue of language. "Vegetable oil" and "crop-derived renewable substitute for fossil oil" have |

|---|---|---|---|---|---|---|---|
| 6606 | 10 | 23 | 26 | 23 | 27 | Delete this sentence.<br><br>Cooperation between steel production of electric ark furnace (EAF) and blast furnace (BF) can establish the circulation system and iron and steel contributes for society as recycling oriented material.<br>However, some people say “changing production of BF into EAF can achieve GHG reduction.”<br><br>The idea that promoting electric arc furnace instead of blast furnace is more environmental friendly is totally incorrect since it does not consider that production from iron ore by BF is and will be required for satisfaction of world steel deand for a long time and scrap was originally made by BF which has emitted GHG in the past. That means this idea handles only a portion of a huge circulating system.<br><br>As you know, from a longer-term perspective, steel production is expected to exceeding 2 billion tons in 2050 in analysis of IEA and RITE.<br><br>This simplistic interpretation which has high risk of misleading shall not be included IPCC report.<br><br>See Steel's contribution to a low carbon future by worldsteel.<br>The simplistic thinking can be removed by this position paper.<br>http://www.worldsteel.org/publications/bookshop?bookID=26c4d914-f159-4468-8933-94404015861b | Taken into account - it is not the intention of this section to suggest that production of steel via the EAF route should be promoted over the BF-BOF route, due to the constraint of scrap availability. However, all available scrap should be recycled to reduce overall steel sector emissions i.e. less primary production is required to replace lost scrap. The text has been revised to clarify the issue: Recycling of available scrap is already widely applied for metals as a means to use less energy, and is an additional GHG mitigation option if more scrap can be collected in future. " |
| 7511 | 10 | 23 | 25 | 24 | 8 | There is diffeence in recycling situation betwen steel and alminum. Separate explanation is required. Post consumer scrap of steel is over 50% of recycled scrap in case of steel with around 85 % end-of life recycling rate of post consumer scrap. Despite high-grade steel like steel sheeet for automobile requires virgin iron from iron ore, obsolete scrap is successsfully used for production of steel for various usage as same sa the virgin material. The steel scrap is successfully recycled. | Taken into account - more detail on recycling will be provided in section 10.14 on waste |
| 8003 | 10 | 23 | 25 | 24 | 8 | It is not appropriate to discuss both steel and aluminum in a common manner. Steel's case is described in the following site: http://www.worldsteel.org/publications/fact-sheets.html | Rejected - This chapter is concerned with general trends and possibilities and as such, there are common lessons to |
| 5019 | 10 | 23 | 25 | 24 | 8 | The global rate of recycling of steel is 83% and some specific steel use sector shows much higher recycle rate. Reality and future of the recycling of steel is described in deteil in the following site of worldsteel association: http://www.worldsteel.org/publications/fact-sheets.html | Taken into account - covered in the section on waste. |
| 7095 | 10 | 24 | 13 | 24 | 15 | The completely "paperless" offices may not be realistic, but it is wrong to downplay the reduction in demand for printing and writing papers attributable to electronic communications devices.<br>See, for instance, http://www.risiinfo.com/blogs/North-American-copy-paper-trends-at-home-vs-the-office-u2013-less-paper-but-far-from-paperless.html?source=rss | Noted - although paper production and consumption might be declining in North America, this is not the case for global production and consumption. Data from FAO (http://www.fao.org/forestry/46203/en/) for writing and printing paper clearly show that although production fell during the 2008 financial crisis, production levels have recovered now to the same |
| 16150 | 10 | 24 | 18 | | | "sustainable consumption" is a key issue and rightly mentioned. But section 10.11 is still in progress and not up to that ambitious -and new in AR5- direction for policy. | Noted - actually the report could have benefited from a whole chapter on demand and sustainable consumption - but the structure was determined at |

| 17508 | 10 | 24 | 28 | 24 | 29 | There is an emerging literature on "degrowth." See http://degrowth.org/publications | Noted - but we have limited space to |
| 16151 | 10 | 24 | 29 | | | Excellent use of (Jackson 2011), but the term "last resort" is wrong here. If policy of decreased usage can be developed, it is by an optimising the distribution channels (e.g. replacing a product by a service, organizing the share or productions, or by complex patterns of change in consumption. A "last resort" suggests that only a crisis of large scale will bring this evolution, when it is only one possibility. | Accepted - see SOD box 10.2 for more on service demand reduction |
| 2291 | 10 | 24 | 3 | 24 | 8 | Recycling is more prevalent than indicated - especially in the steel industry. Most recycling of steel is aftermarket - not scrap generated in production. In the US and other developed countries - the majority of the feedstock is recycled materials. The quality of liquid steel from recycled material in the steel industry is no different than virgin material due to refining techniques. Agreed, there are differences in the aluminum and other metals industries - less recycling because of problems separating the metals (steel is magnetic and easy to separate) and liquid metal in aluminum is lower quality. | Rejected - not supported by the peer-reviewed published literature (Cullen et al., 2012) - this shows that post-consumer scrap is a smaller scrap input than scrap generated in production. While the US has a high proportion of EAF steel production and the majority of the input is recycled material, the global |
| 12128 | 10 | 24 | 33 | 25 | 10 | Steel - As the Australian Prime Minister's Taskforce on Energy Efficiency clearly states<br>"R&D from the Australian steel industry and CSIRO has the potential to reduce emissions by 50% in existing BOF plants. Since 2006, the Australian steel industry (BlueScope Steel and OneSteel) and CSIRO (Minerals Down Under Flagship) have been collaborating under the Australian CO2 Breakthrough Program. They have invested around $7 million to develop breakthrough technologies for reductions in net emissions from the industry. This R&D program covers two focus areas — biomass and dry granulation of slags —which, if successful and implemented, could more than halve the greenhouse gas emissions from the industry. Furthermore, the technologies under development could be in widespread implementation in three to seven years' time, once the R&D is completed." Government report is at http://www.climatechange.gov.au/~/media/submissions/pm-taskforce/report-prime-minister-task-group-energy-efficiency.pdf □ | Noted - the abatement options suggested in this report (biomass, waste heat recovery, by-product utilisation etc.) are already covered by this section (energy efficiency, emissions efficiency, fuel switching etc.), however the timescales suggested in the report are much shorter than those anticipated in the peer-reviewed literature. |
| 16152 | 10 | 24 | 42 | 25 | 16 | The ambition of ULCOS was described in many publications in the trade journals. IPCC does not have to snub the program because it does not fit in the upscale journals. | Noted - peer-reviewed literature on ULCOS will be considered for inclusion |
| 7526 | 10 | 24 | 46 | 24 | 48 | The diffusion of existing energy efficient technologies is important no-regret option as a first step. More detail description is beneficial for world-wide readers and policy makers. Policy makers are interested in current policies rather than future possibility.<br><br>IEA ETPs indicate energy/CO2 saving potentials. In addition, Oda et al., (2012) indicates specific energy consumption of BF-BOF route among countries. These specific materials can lead more comprehensive and objective IPCC Report. | Taken into account - this chapter is concerned with general trends and possibilities so more detailed descriptions of existing energy efficiency options are not included. The text has been revised to include the reference on the different specific energy intensities of regional BF-BOF production: (page 24 line 40) "...furnaces before refining. The specific energy intensity of steel production varies by technology and region (Oda et al., 2012)" Reference: |
| 17509 | 10 | 24 | 47 | 24 | 47 | Explain/define "specific energy" | Accepted - text added "specific energy consumption (GJ/tonne product)" |
| 6738 | 10 | 24 | 5 | 24 | 5 | Add a reference to the 20 %. | Accepted - Referenced added - paper is currently under review - with the original source of this in Aluminium for future generations/2008 update; International Aluminium Association: London, 2008; |
| 8819 | 10 | 24 | 9 | 24 | 29 | Good to see these options at least considered. | Noted - thanks |

|---|---|---|---|---|---|---|---|
| 12346 | 10 | 24 | 30 | | | This is a very important and relevant section, and efforts should be made to impove it even more. Every sector has a description of its mitigation possibilites. The mitigation options are divided into groups like energy efficiency, emissions efficiency and fuel switching etc. Whitin the main groups of mitigation options more numbers on the magnitude of the emission reduction potentials, would be useful. More figures to illustrate would also improve the presentation. There could also be discussion of the mitigation groups compared to each other. For instance, within the iron and steel sector; what are the most important mitigation options of material efficiency and energy efficieny? Where are the potentials? CCS could also be added as a group of mitigation options, like for iron and steel and cement. | Taken into account. CCS is alread discuss ed. Section 10.7 aims to define costs and potentials -but it is so far relatively difficult to define potentials for material efficiency, as the option has to date had so little attention. |
| 17510 | 10 | 25 | 11 | 25 | 11 | What is the date by which the 50% reductions are to occur? | Accepted - it should say "emissions |
| 3023 | 10 | 25 | 20 | | | The study of Henriques et al. (2011) and Gouvello (2010), both focused on the Brazilian case, stressed the huge potential for curbing GHG emissions in steel production by replacing coal and charcoal derived from deforestation with charcoal from planted forestry. I suggest including this option, which can be an opportunity for emerging countries. The references are: DE GOUVELLO, C., 2010, Brazil Low-carbon Country Case Study. World Bank, Sustainable Development Department of the Latin America and Caribbean Region. HENRIQUES JR., M.F., DANTAS, F., SCHAEFER, R., 2010, “Potential for reduction of CO2 emissions and a low-carbon scenario for the Brazilian industrial sector”, Energy Policy, v. 38, pp. 1946–1961. | Accepted - texted revised "notably in Brazil (Taibi et al, n.d., De Gouvello, 2010, Henriques et al., 2010) References: DE GOUVELLO, C., 2010, Brazil Low-carbon Country Case Study. World Bank, Sustainable Development Department of the Latin America and Caribbean Region. HENRIQUES JR., M.F., DANTAS, F., SCHAEFER, R., 2010, “Potential for reduction of CO2 |
| 12347 | 10 | 25 | 24 | 25 | 25 | Hydrogen can be produced by emission-free sources today. If emission-free renewables are used to produce electricity, hydrogen can be produced emission-free from that power. | Taken into account - text revised to indicate that a renewbale energy soruce for hydrogen production is not currently available or economic at the scales required. New text: "Hydrogen fuel might reduce emissions if a cost |
| 6739 | 10 | 25 | 26 | 25 | 29 | I do not feel this paragraphs trustfully. Leave out until it is a better proven technology. | Rejected - the technology is at the early stages of development, but this is clearly |
| 4550 | 10 | 25 | 30 | | | While I am extremely happy to see that the report pays tribute to material efficiency as a mitigation opportunity currently not fully addressed in analyses, the authors should be careful with statements as "large potentials", especially after first "downsizing" the opportunities for energy efficiency improvements... | Accpepted - changed to "significant potential for emissions reductions " |
| 2293 | 10 | 25 | 37 | 25 | 38 | Check context of Cooper reference. Reuse of 30% of all steel is questionable. Auto 100% recycled currently - could not be reused. White goods - 90% recycled currently - reuse. Buildings, bridges, etc. - high of reuse possible. Did reference talk about structural shape reuse? If so should spelled out. | Noted - Cooper et al. estimate a figure of 30% reuse of all steel products. This estimate is based on different strategies of reuse, not necessarily reuse in the same application. For example, automotive body sheet could be used to |
| 6597 | 10 | 25 | 14 | 25 | 15 | Energy saving technologies such as coke dry quenching have positive economical impacts besides energy saving, i.e. water-saving, less demand for fuel and others. It should be noted that CCS has no enough economical incentives to diffuse widely in steel industry unlike other energy saving technologies with positive economical impacts. | Taken into account - text added: "…emissions reduction with additional benefits of reduced water and fuel demand" |
| 6596 | 10 | 25 | 25 | 25 | 26 | Add "as COURSE 50" in the end or rewrite as follows: Hydrogen reduction is being investigated in the US 26 (Pinegar et al. 2011) and Japan as COURSE 50 (Matsumiya 2011). For reference: http://www.jisf.or.jp/course50/index_en.html | Accepted - text added: "and Japan as COURSE50" |
| 8005 | 10 | 25 | 25 | 25 | 26 | Hydrogen reduction is being investigated in the US and also in Japan in the national project named "COURSE50"(Matsuyama 2011). Details are reported in the following url: http://www.jisf.or.jp/course50/index_en.html | Accepted - text added: "and Japan as COURSE50" |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 11663 | 10 | 25 | 30 | 25 | 38 | As some studies have already considered the material efficiency improvement in BAU scenario, implementing additional material efficiency improvement will lead to double counting in the potential emission reductions. For example, according to the ETP by IEA (2012), steel and cement production will be decoupled from population rise and economic growth, which implies an inclusion of material efficiency in BAU scenario. | Noted - but we have not tried to make numerical predictions of the combined effects of the different strategies, so hope that such double counting will not |
| 7513 | 10 | 25 | 30 | 25 | 34 | This paragraph should be revised. It is correct that material efficiency offers the potential for emissions. However, since material efficiency is one biggest component of production cost, not only steel producers but desighners of cars and other products made of steel have competed each other to reduce material loss. This sentences are mis-leading and not worthy for IPCC report. | Taken into account - we have added the sentence "However, a significant challenge to the adoption of material efficiency in the use of steel (and other basic materials) is that bulk materials are relatively cheap in comparison to labour, and this difference is amplified by tax policy, so economic logic currently drives a preference for material |
| 7514 | 10 | 25 | 34 | 25 | 38 | It is questionable. | Noted - but the text claims a potential |
| 6595 | 10 | 25 | 39 | 25 | 46 | Delete all sentences regarding "reduced product and service demand" in terms of steel experts' view and business impact.<br><br>Indeed, one of the key contribution from the steel industry is to work closely with its customers in optimising the design and use of steel in steel-using products and to consider steel life cycle.<br>However, discussion about reduction of steel production and demand only for GHG reduction is too simplistic thinking and has enormous damage for steel business.<br><br>This simplistic interpretation which has high risk of misleading shall not be included IPCC report.<br><br>See Steel's contribution to a low carbon future by worldsteel.<br>The simplistic thinking can be removed by this position paper.<br>http://www.worldsteel.org/publications/bookshop?bookID=26c4d914-f159-4468-8933-94404015861b | See response to comment 7513 |
| 7515 | 10 | 25 | 39 | 25 | 41 | 30% reduction is queswtionable. All design is performed to reduce material weight. Car weight reduction by high strength steel application has not only reduced steel demand but also improved fuel efficiency by reducing the car weight and reduced consequetial CO2 emission. | Noted - however Carruth et al. 2011 performed a case study on a car bodies and found a weight reduction potential of 17.5-25%, which was in-line with major car manufacturer targets. Evidence on construction in the UK suggests the figure for commercial buildings will be much higher. The average figure of 30% arises from the application of general weight-saving principles. Unfortunately, to date despite the increased use of high |
| 7512 | 10 | 25 | 9 | 25 | 9 | Delete "in short term" from this sentence. Coke dry quenching has a great effort on emission reduction not only in a short period, but also in a long-term. | Taken into account - text revised: "short-term" removed |
| 6741 | 10 | 26 | 2 | 26 | 4 | Use relative values and compare to total industry emissions. | Accepted. Changed sentence to: CO2 emissions from cement production in 2006 totalled 1.9 Gt CO2: 1.1 Gt CO2 from process emissions (calcination) and 0.8 Gt CO2 from fuel emissions (IEA 2009b), and a small contribution from grinding and transport (Bosoaga et al., |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 7494 | 10 | 26 | 2 | 26 | 4 | “CO2 emissions from cement production in 2006 totaled 1.9 Gt CO2: 1.1 Gt CO2 from process emissions (calcination) and 0.8 Gt CO2 from fuel emissions (IEA 2009b), and a small contribution from grinding and transport”. When cement or concrete sets some CO2 is reabsorbed, especially on the skin of the cement. Also, in some areas, charcoal is used for cement manufacture and firewood used for lime burning. In several developing countries, burnt bricks are used in place of concrete and mortar is used as a binder (lime plus aggregate). Brick kilns/stacks are generally fired with wood. | Comment noted, however Collins (2010) reports that carbonation (absorbtion of carbon into cement) is "almost negligible" compared with production emissions. Need peer-reviewed literature citations to include comments regarding charcoal and burnt bricks. [Ref: Collins, F; "Inclusion of carbonation during the life cycle of built and recycled concrete: |
| 18527 | 10 | 26 | 5 | 26 | 22 | Is there any option to improve the energy efficiency in the cement industry further? Or have we already approached the theoretical limits? | See 12129 |
| 10015 | 10 | 26 | 5 | 26 | 6 | In the footnote No.7, the losses associated with conversion of fuels into electricity are 67%. But this "67%" should be revised with recent data. The average 2001-2005 efficiencies of all fossil fired electricity production in OECD countries are 39%, as described in (Taylor, 2008, page17, Figure6).<br><br><Reference><br>[1] Taylor, P., O. Lavagne d’Ortigue, N. Trudeau, & M. Francoeur (2008). Energy Efficiency Indicators for Public Electricity Production from Fossil Fuels, IEA Information Paper. | Accepted - the loss percentage figure from the footnote has been deleted |
| 9376 | 10 | 26 | footnote7 | | | Replace 67% with the latest figure. | see 10015 |
| 12011 | 10 | 26 | | | | Japan is also a major country to use municipal wastes for cement production.<br>Http://www.jcassoc.or.jp/cement/2eng/eh3.html | Taken into account - while this is may be true, it is not supported by a peer-reviewed source. Text revised to "…countries (for example The |
| 7527 | 10 | 26 | 1 | | | The draft about “Energy efficiency” and “Emissions efficiency and fuel switching” is really excellent.<br><br>For further grade up, trade-off between alternative fuels and energy efficiency is highly suggestive. The use of waste plastics requires additional electricity consumption for chlorine (Cl) bypass and removal system (Oda et al., 2012). Japan Cement Association and Dr. Izumi (yoshito-izumi@jcassoc.or.jp) have an actual data as for the trade-offs. | Taken into account - text revised to " Even though processing alternative fuels requires additional electricity consumption (Oda et al., 2012), using alternative fuels can still reduce cement sector emissions by 0.16 Gt CO2e per year by 2030 (Vattenfall, 2007). |
| 12129 | 10 | 26 | 1 | 27 | 33 | Cement - completely ignores low carbon cement technologies - eg: The company Zeobond, in Australia, has pioneered the commercialisation of geopolymer cement technologies which achieve up to 80% reductions in the energy intensity and GHG emissions of portand cement, and can be used for many major purposes for which Portland cement is currently used. Extensive Peer reviewed literature on the geopolymer cements being manufactured and sold by Zeobond Pty Ltd in Australia - based on 20 years of research at the University of Melbourne are available at http://www.chemeng.unimelb.edu.au/geopolymer/publications.html | Taken into account. Added "There are also a number of emerging technologies or measures which are still under development or recently commercialised that focus on improving energy efficiency and reducing the emissions from cement and concrete production (Hasanbeigi et al., 2012). However, there are regulatory, supply chain, product |
| 9302 | 10 | 26 | 26 | 27 | 7 | Toward a sustainable society, the cement industry contributes to recycle many of resources to establish a recycling based society. However, it should be recognized that the recycling processes in the cement plant require further additional energy for a primarily treatment including drying and cutting.<br>(http://www.jcassoc.or.jp/cement/2eng/eh1.html ) | See 7527 |

|---|---|---|---|---|---|---|---|
| 12348 | 10 | 26 | 1 | | | The calcination is adressed in the introduction as contributing 1.1 Gt CO2 from cement production globally. However, emissions from calcination is not really adressed in the mitgation options discussed, apart from measures in the material efficiency part and the reduce product and service demand. Since emissions from calcination is the major source of emissions from the cement industry, we would appreciate if measures to reduce these emissions was furter investigated. EG. is it possible to use CCS? | Taken into account - CCS for cement kilns is covered in lines 11-14 on page 27 |
| 16153 | 10 | 27 | 15 | 27 | 25 | This paragraph should mention the reuse of parts (cars) or bottles (glass) as possible gains in other industries. | Taken into account - reuse of steel is covered in section 10.4.2.1. Glass falls into section 10.4.2.8 but has not been |
| 8287 | 10 | 27 | 23 | 28 | 7 | In Canada waste tires have been used as an alternative fuel in the cement industry.<br>Reference: http://cieedac.sfu.ca/media/publications/Cement_report_2011__2010_data__Final.pdf<br>Energy Use and Related Data: Canadian Cement Manufacturing Industry 1990 to 2010<br>John Nyboer, Michelle Bennett<br>prepared for Cement Association of Canada | Noted:- The list is just illustrative and doesn't include many countries with lower alternative fuel use ratios. |
| 4552 | 10 | 27 | 26 | 27 | 33 | Blending is not equal to reduced product and service demand. I would discuss blending above, similarly as recycling within an industry would be discussed. | Accepted - text moved to previous paragraph, which now reads: "...concretes (Muller and Harnish, 2008). Demand for clinker can be reduced by reducing the clinker-to-cement ratio. Portland cement is comprised of 95% clinker and 5% gypsum. Cement can be produced with lower ratios of clinker use additives such as blast furnace slag from steel mills, fly ash from power plants, limestone, and natural or artificial pozzolans. The weighted average clinker-to-cement ratio for the companies participating in the WBCSD GNR |
| 4551 | 10 | 27 | 4 | 27 | 5 | The comment on one company in India has no meaning without further understanding of the context of this plant. Propose to delete this sentence. | Accepted - sentence removed |
| 3024 | 10 | 27 | 7 | | | I suggest considering the fact that in some countries the use of residual fuel oil and petcoke by cement facilities is increasing. The oversupply of high-sulphur petcoke in the Atlantic Basin, due to recent investments in delayed coking units in petroleum refineries, explains this fact. Hence, although the "cement industry could use up to 70% alternative fuels", the availability of low-cost residual fuels can undermine this opportunity. | Taken into account: The phrase that this comment refers to ("cement industry could use up to 70% alternative fuels") has been deleted. Would need peer reviewed literature to include this |
| 9303 | 10 | 27 | 7 | 27 | 7 | This is completely mistakes. "Cement Technology Roadmap" studied by IEA shows "alternative fuel costs are likely to increase with high CO2 costs". Therefore, it dose not say "the cement industry could use up to 70% alternative fuels by 2050" but "it will be economically viable for the cement industry to use alternative fuels until 2030, when prices will reach about 30% of conventional fuel costs, increasing to 70% by 2050. So, please align this principle with the sentence.<br>I would suggest to rewrite to "the cement industry in developed regions could use up to 60% alternative fuels by 2050 and in developing regions to 35%. | See response to comment 7527 |
| 9304 | 10 | 27 | 8 | 27 | 10 | Good figure. This shows accurate regional estimation on energy efficiency (GJ per ton of clinker) as well as utilization of alternative fuels. | Noted |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 10148 | 10 | 28 | | | | Insert a paragraph on "emissions per unit energy" and add here: "Increasing the share of power from combined heat and power plants in the chemcial and petrochemical sector from currently 10 to 25% in most countries to 100% would result in energy savings up to 2 EJ for the activity level in 2006." (Source: IEA as quoted in comment 8)." | Accepted. Added "A theoretical estimate suggest that increasing the share of power from combined heat and power plants in the chemical and petrochemical sector from current levels |
| 10139 | 10 | 28 | 11 | | 13 | Delete sentence and substitute it with the more specific sentence: "The global GHG emissions attributable to the chemical industry have been estimated to be about 1.81 GtCO2 e (CO2, N2O, F-gases, CH4). (Source: http://www.wri.org/publication/world-greenhouse-gas-emissions-in-2005: World Greenhouse Gas Emissions in 2005 is a comprehensive view of global, anthropogenic greenhouse gas (GHG) emissions. The chart in this working paper is an updated version of the original chart, which appeared in Navigating the Numbers: Greenhouse Gas Data and International Climate Policy (WRI, 2005).) About 80% of the direct greenhouse gas emissions of the chemical industry are caused by the following products/processes: Nitric acid, cracker products, ammonia, adipic acid, hydrogen/syngas (including methanol), soda ash, aromatics, carbon black, with the first three products/procees being responsible for more than 50%. (Source: Methodology for the free allocation of emissions allowanced n the EU ETS post 2012 - sector report for the chemical industry, Ecofys (Study leader), Nov. 2009, EU Study contract: 07.0307/2008/515770/ETU/C2). It has been estimated that the worldwide energy saving potential related to the chemical and petrochemical sector in 2006 was about 35% as compared to reported final energy use in energy statistics. The saving potential stems from implementation of Best practice technology (1,8 EJ/yr primary energy savings), increased use of CHP (2 EJ/yr), process integration (0.9 EJ/yr), processing of post-consumer waste from products originating from the chemical and petrochemical sector (recycling and energy recovery, 2.4 EJ/yr). Additional potential for GHG emission reduction stems from fuel switch from coal to natural gas in China and India." (Source: Chemical and petrochemical sector - Potential of best practice technology and other measures for improving energy effiency, IEA information patepr, Saygin et al., 2009) | Noted - although the suggested replacement simply seems to be a restatement of what is already in the text - albeit with the addition of a few other chemicals. |
| 10140 | 10 | 28 | 15 | | | Insert: "Additionally the synthesis of chlorine in the chlor-alkali electrolysis is responsible for about 40% of the electricity demand of the chemical industry, which causes indirect emissions for electricity production." (Source: Arn Mike et al., Estimating the carbon footprint of the worldwide chemical industry, Menlo Park, California: SRI Consulting, 2007). Delete the last sentence in line 15, as this does not refer to the emissions caused by the manufacturing of chemicals. It would belong to section 10.5., but then a general discussion of the value chain emissions of the chemical industry in general should be included there instead of just picking out one example. | Accepted |
| 10141 | 10 | 28 | 16 | 29 | 2 | The whole following paragraphs should be structured based on "GHG efficiency and energy efficiency of processes", "emissions per unit energy" and "Efficiency in use" according to the scheme on page 20. Within the first part on "GHG efficiency of processes" the options should be analysed according to their share of GHG emissions in the chemical industry (see comment above). Accordingly opportunities to reduce N2O emissions from nitric acid and adipic acid production would be discussed first (lines 28-32 and 41-47). Ethylene/Cracker products would be discussed second (lines 18-24) and ammonia/fertilizer production third (lines 24-28 and 39-41 and 47 ff.) See following comments for details. In general the references given in these paragraphs could not be found in the references section on page 70 ff. | Noted. Due to an editorial problem chapter 10 had the reference list of a different chapter. This problem has now been resolved |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 10628 | 10 | 28 | 16 | 28 | 19 | The sentences; "The majority of energy use in the production of ethylene is in the steam cracking process, which produces ethylene from a variety of hydrocarbon feedstocks. Steam cracking processes were responsible for emissions of around 180MtCO2/year (Ren et al. 2006), and consumed about 65% of the total energy used in ethylene production." should be repalced with the following sentences;<br>"Steam cracking for the production of light olefins, such as ethylene and propylene, is the most energy consuming process in the chemical industry, which is responsible for emissions of around 180Mt CO2/year, and the pyrolysis section of steam cracking consumes about 65% of the total process energy (Ren et al. 2006)."<br>The steam cracking consists of three sections; pyrolysis section (thermal cracking of hydrocabons such as naphtha), fractionation and Compression section and separation section (recovery of light olefins such as ethylene and propylene). It should be clarified that pyrolysis section is the most energy consuming section in the course of steam cracking. | Accepted - but with the absolute number removed as it had no date |
| 17512 | 10 | 28 | 18 | 28 | 19 | To what period do these figures apply? | Absolute emissions number now removed - see response to comment |
| 10143 | 10 | 28 | 18 | | | To which year does the figure refer? | See above |
| 10144 | 10 | 28 | 22 | | 24 | Unclear what is meant with this statement. Concerning the use of biomass see comment no. 6 above. Potentially the study by Ren and Patel from 2009 did not include the quite recent findings on the influence of indirect land use change, yet. Unfortunately this cannot be checked as the reference cannot be found on page 70 ff. | Noted - see below, and also: due to an editorial problem chapter 10 had the reference list of a different chapter. This problem has now been resolved |
| 10629 | 10 | 28 | 23 | 28 | 24 | The sentence; "avoided CO2 emissions are due to “electricity co-generation” should be replaced with the following sentence;<br>"fossil energy use could be avoided because biomass energy is used to produce electricity (electricity co-generation), resulting in reduction of CO2 emission."<br>Because, "the electricity co-generation" is not self-explanatory. | Accepted. Changed to "Switching to a biomass-based route as an alternative to steam cracking could reduce total CO2 emissions per ton of output (Ren and Patel 2009) but with significantly higher |
| 10145 | 10 | 28 | 26 | | 28 | 43% energy savings in ammonia production are mentioned as being possible in these lines, whereas in line 39 to 41 it is stated that technological innovation within the current process of ammonia production is limited. | Changed to "with further savings possible by applying best available |
| 10142 | 10 | 28 | 31 | | 32 | The comment also refers to lines 41 to 47. Sentence should be changed to "The N2O decomposition technology allows reduction of emissions between 85% and 98% depending on the exact plant setup." The following sentence should be added: "While implementation of this technology has been largely completed in regions incentivicing carbon emission reduction like e.g. the EU through the ETS or China through CDM, the implementation of this technology still offers large mitigation potential in other regions like the former soviet union and the US." (Source: Industrial N2O Projects Under the CDM: The Case of Nitric Acid Production, Anja Kollmuss, Michael Lazarus, November 2010, Stockholm Environment Institute<br>Working Paper WP-US-1007). | Accepted. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 10147 | 10 | 28 | 33 | | 36 | Efficiency in Use: Delete the end of the first sentence "to the use of plastics as a means of demand reduction" and substitute by "to chemicals". Delete the sentence on recycling. Instead insert: "In the chemical production itself the integration of plants producing excess heat with plants requiring heat in a large plant verbund has shown to be able to reduce energy demand and GHG emissions considerably. Efforts to reduce the material input per product depend on chemical companies changing from material providers to solution providers, which is a trend observed in the industry. Chemical companies e.g. develop advanced fertilizers containing N2O-inhibiting components and train farmers on the efficient use of them. This results both in reduced...." (Source: BASF report 2011 reviewed by auditors, page 98 states: The Verbund system is an important component of our energy efficiency concept. Waste heat from one plant's production processes is used as energy in other plants. In this way, BASF saves more than 18 million MWh each year, which corresponds to savings of 3.7 million metric tons worth of carbon emissions annually. Furthermore, the by-products of one plant can be used as feedstock elsewhere, thus helping us to use raw materials more efficiently.) | Noted - this form of energy exchange between industries is discussed in section 10.5 |
| 10630 | 10 | 28 | 34 | 28 | 36 | The sentence; "To produce a high value recycled material with favourable properties, a pure waste stream is required, as impurities in inputs to the recycling process greatly degrade the properties of the recycled material." should be deleted, because a pure waste stream is not always the solution for recycling of plastics, ie, in Asian countries including Japan, a mixture of polyethylene and polypropylene is used for recycling. | Taken into account. Added " Although some plastics can be produced from mixed waste streams, these generally have a lower value than virgin material." |
| 10146 | 10 | 28 | 47 | 29 | 2 | Does this paragraph refer to fuel switch? This most important option to reduce GHG emissions in the chemical industry is missing so far. The beginning should therefore read: "Fuel switch from coal to natural gas has a large impact on the emissions from chemical plants in general. E.g. the fuel switch in ammonia production plants can lead to the following significant GHG emission savings; for example….GHG emission savings….". | Accepted - the section restructured to give fuel-switching more priority earlier on. |
| 16154 | 10 | 28 | 8 | | | Reduced demand or "Sobrieté" is described by authors such as Salomon et al. 2003 "A newagatt scenario for 2005-2050" ECEEE Stockholm. The European ECEEE has devoted important energy in its recent referenced publications (ECEE summer studies) to publish peer-reviewed studies on policy regarding patterns of consumption. Maybe it deserves to be quoted here. | Noted - while the suggested reference is interesting, it is not directly relevant to this chapter as it focuses on energy use in other sectors rather than in industry. |
| 7720 | 10 | 28 | 30 | 28 | 32 | The data on emissions N2O from industries are too old and outdated. Update should be necessary. | Accepted - has been updated |
| 18528 | 10 | 28 | 9 | | | This section contains good information, but the topics are often intermixed - i.e. it would be clearer for the reader if the section were to adhere to the exact categorization of the other sections (e.g. material efficiency, emissions efficiency and fuel switching, etc.) with clear deliniations of text accordingly. | Noted - the section has been restructured |
| 15917 | 10 | 29 | 11 | | | might use pulp and paper figure for world, not just EU | Noted - We are currently unaware of any published global figures for this. In any case, the example is useful to point out that there are limits to energy efficiency even in the most developed nations |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 7495 | 10 | 29 | 31 | 30 | 4 | “Black Liquor Gasification which uses the by-product of the chemical pulping process has the potential to replace the commonly used Tomlinson recovery boiler as an alternative technology to increase safety, flexibility and energy efficiency of pulp and paper mills (Naqvi et al. 2010). With commercial maturity expected in 10-15 years (Eriksson and Harvey 2004), Black Liquor Gasification can be utilized as a waste-to-energy method with the potential to achieve higher overall energy efficiency (38% for electricity generation) than the conventional recovery boiler (9-14% efficiency) while generating an energy-rich syngas from the liquor (Naqvi et al. 2010). The syngas can also be utilized as a feedstock for chemical production or to produce dimethyl ether, which can be used as a diesel substitute in road transport (Pettersson and Harvey 2012; Takeishi 2010)”. I think in Canada, methanol is made from black liquor. | Accepted - Yes, methanol can be produced from black liquor. This has been added to the text. |
| 18530 | 10 | 29 | 4 | 29 | 19 | This is a useful example from Europe, but what about the rest of the world? They won't have the same efficiencies. How do they compare to this European example? | Noted - We are unaware of any published global figures for this. In any case, the example is useful to point out that there are limits to energy efficiency even in the most developed nations |
| 18531 | 10 | 29 | 20 | 30 | 4 | It seems that much of this discussion would actually belong under the category 'energy efficiency'. | Taken into account - The section has been re-structured to be consistent with |
| 18529 | 10 | 29 | 3 | | | This section misses an introduction to the pulp and paper industry that the preceding sections have, clarifying e.g. % of emissions, some basics of the process, etc. This would be useful, and would also then allow a clear deliniation of the beginning of the energy efficiency discussion. | Accepted - A short introduction has been added to the section. |
| 17514 | 10 | 30 | 18 | 30 | 19 | The substitution of electronic media for paper media produces mixed environmental outcomes. Contrary to the statement here, there is substantial research on this. See, e.g., Gard, D. L. and G. A. Keoleian. 2002. Digital versus print: Energy performance in the selection and use of scholarly journals. Journal of Industrial Ecology 6(2): 115-132; Reichart, I. and R. Hischier. 2002. The environmental impact of getting the news: A comparison of on-line, television, and newspaper information delivery. Journal of Industrial Ecology 6(3-4): 185-200. | Taken into account - the text has been modified to reflect the fact that there has been some research done in the area. |
| 6744 | 10 | 30 | 2 | 30 | 4 | State the potential with the proposed action. | Noted - No quantifiable potential is provided in the reviewed references. |
| 17515 | 10 | 30 | 21 | 30 | 21 | Isn't there a more recent reference than 2003? The metals industry has been changing rapidly. I tried checking the citation indices, but could not locate the reference by Sjardin. | Noted - We are continuing to try and find more recent data, however this is currenty the most comprehensive list of consistent sytem boundary emission factors found. Moreover: due to an editorial problem chapter 10 had the |
| 6745 | 10 | 30 | 22 | 30 | 23 | Use relative values and compare to total industry emissions. | Taken into account: Aluminium production (by mass) is now contrasted |

| 8288 | 10 | 32 | 23 | | | Figure 10.9 does not provide much of an insight, could be removed to save the space, with text below slightly modified | Accepted |
| 16156 | 10 | 32 | 30 | | | The figure in absolute terms is not very meaningful. Maybe a percentage would be more helpful | Sentence changed to: Hong et al. (2010) reports energy savings of CO2 emissions reductions of about 1% the Taiwan's textile industry following the adoption of energy-saving measures in 303 firms (which was less than 10% of |
| 8289 | 10 | 32 | 30 | | | 140 kt/CO2 - what is that unit? | Noted - but no longer relevant as the number has been replaced by a %, as |
| 16157 | 10 | 33 | 15 | 33 | 17 | Essential line in favour of recycling (link with paragraph on waste?) | Noted - thank you. |
| 15879 | 10 | 33 | 4 | | | Mining sector section could be expanded (e.g., use of solar thermal energy in Chilean copper mines, also in heavy oil (e.g., see Chevron's solar to steam facility in their Coalinga oil operations in California) . Other mitigation options not discussed include switching to cleaner fuels for mining trucks, electrification of mines, etc | Noted - however mining is not a priority sector, because its total energy use is relatively low. Potentially we could expand figure 10.2 to demonstrate this. |
| 11135 | 10 | 34 | | 34 | | Word "strong" is not an appropriate definition | Accepted - changed to "GHGs with high GWP". But table 10.6 has been |
| 11136 | 10 | 34 | | 34 | | Under "Chemicals" should include HFC-23 in section on non-energy emissions | Accepted - But table 10.6 has been |
| 17521 | 10 | 34 | | 34 | | Column 1: Explain "Pure 'Kaya'"; What does the heading "Industry Kaya" mean? Columns 2-4: Activity is not a good label for these 3 columns -- many of the entries are not activities. Column 3, Chemicals row: "more intense use" is NOT equivalent to more efficient use. Increased intensity means more materials per dollar output. | Accepted - But table 10.6 has been removed from SOD |
| 10149 | 10 | 34 | | | | First row "sector-wide", columnc "material input/output": Put biomass-based feedstock as last option in brackets and add "sustainable". Row "Chemicals": Column "products/services": add as first issue "cooperation with costumers to develop complete solutions", column "material input/product": delete bio-based materials and add as first issue "development of improved materials", column "energy/material": delete current entry and substitute by "increase energy efficiency of processes (steam cracking, ammonia, chlorine production etc.), integration of several chemical plants in a verbund site", column "emisisons/energy": delete and write instead "CHP, renewable power, fuel switch from coal to gas/waste". | Accepted - But table 10.6 has been removed from SOD |
| 18533 | 10 | 34 | | | | This table is very useful! The order is the only puzzling bit - i.e. why does it vary with the order of options presented in 10.4.1? I.e. why wouldn't energy intensity appear in the left-most column? | Accepted - But table 10.6 has been removed from SOD |

Cost and performance of fossil fuel power plants with CO2 capture and storage. Energy Policy 35, 4444–4454.<br>[5] Zobacka, M.D. & S.M. Gorelick (2012). Earthquake triggering and large-scale geologic storage of carbon dioxide. Available at: http://www.pnas.org/content/early/2012/06/13/1202473109.abstract | See response to comment 12345 |
| 12351 | 10 | 34 | 2 | | | The cells "GHG intensity","emissions/energy" regarding Non-ferrous metals is empty. PFC-reduction from aluminiumproduction is an important option here, since PFCs from aluminium production can be reduced substantially by process control. Fuel-switching is also important for non-ferrous metals. Fuel-switching can lead to reductions from aluminium production by substituting fossile fuel used for casting. Fuel-switching is also relevant for other non-ferrous metals like silicomanganese, silicon and ferromanganese. | See response to comment 12349. Table 10.6 has been removed. |
| 15896 | 10 | 34 | 2 | | | Simplify table 10.6. Some repetition between sectors | Noted - but table 10.6 has been |
| 9305 | 10 | 34 | 2 | 34 | | Reader may confuse cement with concrete. Cement-row in this table shows that a Production/service-column is "concrete" performance but other columns are "cement" characteristics such as Energy intensity and GHG intensity. Therefore, in order to align with column of other sectors in the Table, I would strongly suggest to leave "blank" in the cell instead of concrete characteristics. | Taken into account - new text added to 10.4.2.2 to clarify this "Concrete is formed by mixing specific proportions of cement, water, sand and aggregates. Almost all cement is used in this form to construct buildings and infrastructure (van Oss & Padovani, 2002)" [Ref: Oss HG, Padovani AC. "Cement Manufacture and the Environment: Part |
| 7110 | 10 | 35 | 17 | | | There is a whole book dedicated to mitigation in tourism: Gössling, S. 2010, Carbon Management in Tourism, Routledge. | Taken into account |
| 17522 | 10 | 35 | 21 | 35 | 22 | Define/explain acronyms - WTTC, ETC, UNWTD. | Accepted - acronyms now defined |
| 7111 | 10 | 35 | 22 | | | if this is a quote, " are missing plus page number in reference (Scott et al. 2010) | Accepted |
| 16158 | 10 | 35 | 25 | 35 | 26 | Sentence is not clear. Does the target put a burden on other sectors? Or the opposite? | Noted - the idea is that "the current emission targets" proposed by the stakeholders (stated above) would |
| 5220 | 10 | 35 | 26 | 35 | 26 | As Scott et al. 2010 show, by 2050, the burden cannot be taken up by other sectors because it exceeds the target emission level avoidingdanerous climate change. It seems important to mention this at this place. Also, this is the place to put emphasis on the fact that by reducing demand in some small subsectors of tourism (long haul, cruises) effective emission reduction may be reached with a minimum of damage to then sector. and may be refer to Peeters, P. M., & Dubois, G. (2010). Tourism travel under climate change mitigation constraints. Journal of Transport Geography, 18, 447–457. | Accetped - text modified “some research and found using the current target would put in additional unstirred unsustainable burden on other sectors of the economy, why some authors also point that by reducing demand in some small subsectors of tourism (long haul, cruises) effective emission reduction |

| 8290 | 10 | 36 | 13 | | | Reference Ghosh and Roy 2011 is not listed in the References section. There are other references missing (e.g. Geng et al) | Accepted - due to an editorial problem chapter 10 had the reference list of a different chapter. This problem has now |
| 17528 | 10 | 36 | 25 | 36 | 29 | Indicate the period of time that is encompassed by this statement. | Accepted - text revised. The Chinese case is from 2002 to 2005, while the |
| 5021 | 10 | 36 | 30 | 36 | 36 | It is widely recognised that the by-product slags from brast furnace for steelmaking replaces cement klinker, which need to use massive energy to produce, thus replacing klinker by BF slags can reduce CO2 emission in a massive scale. | Noted - We have very limited space to introduce every details in our draft and here the cement case is just one example. We believe that one sentence for one example is enough here. See |
| 15920 | 10 | 36 | 31 | 36 | 50 | burning of municipal waste can have air pollution impacts if not controlled | Noted - waste and waste handling are dealt with in section 10.13 |
| 16159 | 10 | 36 | 44 | 36 | 48 | Very long sentence, could be split for clarity | Editorial - copyedit to be completed prior |
| 15919 | 10 | 36 | 9 | 36 | 11 | there are SME clusters in US too: IT in California, biotech in Boston, energy in Houston, etc | Noted: Due to space limits, we have shortened our introduction on SMEs, but with a strong focus on industrial |
| 8004 | 10 | 36 | 30 | 36 | 36 | It is widely recognised and reported quantitatively that cement clinker can be replaced by the blast furnce slags and it makes eliminating CO2 emissions from CaCO3 cracking and saving energy for cement kiln. | Noted - We have very limited space to introduce every details in our draft and here the cement case is just one example. We believe that one sentence for one example is enough here. See |
| 17529 | 10 | 37 | 1 | 37 | 7 | Better wording: "The reuse of materials recovered from urban infrastructure…" While term "urban mining" is unfortunately used inconsistently, the appropriate usage refers to recovering materials from in-use stocks (either actively used stocks or dormant stocks). That is, it does not refer to recycling of discards. See Klinglmair, M. and J. Fellner. 2010. Urban mining in times of raw material shortage: Exemplified by copper management in Austria during World War I. Journal of Industrial Ecology 14(4): 666-679. The wording in this paragraph should be more precise if the intention is to describe urban mining rather than just recycling. | Accepted |
| 10151 | 10 | 37 | 21 | | 23 | Change sentence to: "These materials cause GHG emissions at the time of manufacturing, but the avoidance of emissions in the use phase is larger by factors between 1:2 (polymers for packaging) and 1:230 (materials for thermal insulation of buildings)." | Rejected - no reference provided |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 10152 | 10 | 37 | 23 | | 28 | Delete these sentences and write instead: " To unlock the full innovation potential for GHG emission mitigation and in order to avoid counterproductive actions, full value chain analyses are required on product as well as on corporate level. Standards and best practices for this are evolving." (Source: The Greenhouse Gas Protocol, http://www.ghgprotocol.org/) | Accepted - text revised partly based on suggestion |
| 16160 | 10 | 37 | 29 | 37 | 38 | Suggestion : note that recent building standards such as in France or Switzerland do take into accounr the embodied emissions, called here "grey energy". | Accepted - but due to space limitations only a limited number of examples kept |
| 17530 | 10 | 37 | 47 | 37 | 48 | it is not true that "the quality of many metals is maintained SOLELY through addition of pure primary materials" Effective sorting plays an important role as well. The sentence should be reworded. | Accepted and will add this point (in Final Draft) |
| 3865 | 10 | 37 | 7 | 37 | 8 | Do we really need large scale bioenergy production to significantly mitigate climate change. See Pacca and Moreira, 2011 - Pacca, S. and J. R. Moreira, 2011. A Biorefinery for Mobility? Environ Sci Technol. 2011 Nov 15;45(22):9498-505. | Noted - while we consider bioenergy important, it is discussed in Chapter 7 (Energy). |
| 10018 | 10 | 37 | 8 | 37 | 15 | This paragraph should be deleted totally or explain that CCS is costly and has technical uncertainty, even if CO2 sources and sinks were clustered. CCS has problems such as high cost, difficulties in site selection, and difficulties in public acceptance, as shown in (Finkenrath, 2011, page39) and (Zobacka, 2012, Abstract). These literatures are listed in the No47 line of this table. | Accepted - CCS discussion has been significantly reduced throughout the chapter and is now concentrated in chapter 7 (Energy) |
| 5020 | 10 | 37 | 16 | 37 | 38 | One example of the necessity for coss sectoral implications is shown by WorldAutoSteel project. Fuel efficiency policy of automobiles usually only focus on tail-pipe emissions. In this study (by University of California Davis), total lifecycle emission from automobiles can be saved more by using advanced high-strength steel and innovative desigin/forming technologies, even though tail-pipe emission shows slightly higer emission as compared with other materials such as Aluminium. Social level mitigation can only be achieved such a cross-sectroal lufe-cycle analysis. See following: http://www.worldautosteel.org/life-cycle-thinking/greenhouse-gas-materials-comparison-model/ | Accepted |
| 10153 | 10 | 38 | 11 | | | Substitue "cement" by "materials" as a large variety of materials (including speciality chemicals) is used for building embankments | Accepted |
| 8291 | 10 | 38 | 15 | 38 | 19 | Repeating sentences | Editorial - copyedit to be completed prior |
| 10205 | 10 | 38 | 15 | 38 | 19 | These two sentences can be combined | Editorial - copyedit to be completed prior |
| 5697 | 10 | 38 | 20 | 38 | 27 | An example of temperature increase feedback on tourism adaptation should be mentioned here. I suggest: "An increase in summer tourism activities is already observed in alpine areas during hot temperature episodes (Serquet and Rebetez, 2011) whereas winter activities may disappear due to more frequent rain instead of snow (Serquet et al., 2011)." Serquet G, Rebetez M 2011. Relationship between tourism demand in the Swiss Alps and hot summer air temperatures associated with climate change. Clim. Change 108 (1-2): 291-300. Serquet G, Marty C, Dulex JP, Rebetez M, 2011. Seasonal trends and temperature dependance of the snowfall/precipiation day ratio in Switzerland. Geophys. Res. Lett. 38, L07703, doi:10.1029/2011GL046976 | Rejected - the section deals with the potential impacts of climate change and adaptation measures on mitigation options for the sector, not with the impact of climate change on adaptation. The remark may be relevant to tourism discussion in WG2 |
| 7098 | 10 | 38 | 23 | 38 | 23 | References missing in reference list - I am however doubtful they adequatly confirm the point made about desalination. "induces growing demand" - of what? | Accepted - due to an editorial problem chapter 10 had the reference list of a different chapter. This problem has now been resolved. That segment of text no |
| 7099 | 10 | 38 | 24 | 38 | 26 | Another example is… - unsubstantiated, not sure "pilgrimage" makes sense in this sentence? Handmer et al. 2012 - not in references. A comprehensive volume on tourism and climate change interactions is Scott, D., Hall, C.M. and Gössling, S. 2012. Tourism and Climate Change, Routledge. | Accepted |
| 17531 | 10 | 38 | 24 | 38 | 25 | Is snowmaking really used to maintain pilgrimages? | Accepted |
| 10206 | 10 | 38 | 25 | 38 | 27 | Unclear and not specific enough | Accepted |

|---|---|---|---|---|---|---|---|
| 9536 | 10 | 38 | 46 | | | Please, clarify here as probability of an 80% chance is different from that 26-78% (mean 54%) in Chapter 1. (AR5 FOD, p.22 L13) | Accepted - text has been revised thoroughly in SOD and will be further |
| 6750 | 10 | 38 | 7 | 38 | 13 | This part is very speculative and lacks trust. Rewrite, add source or leave out. | Noted - we have made it clearer in the SOD that there is no literature to back |
| 18536 | 10 | 38 | | | | This is admittedly a very difficult section, but seems to be in a much more preliminary state than the preceeding sections. It would need more effort to assure<br>1) a clear step-wise development from the AR4 (clarifying differences in approach and methodology where relevant, and also what has changed since the AR4) and<br>2) adherence to agreements in Wellington (e.g. discussion of historical cost trends, and presentation of figures in terms of $/GJ or $/CO2-eq where possible). | Accepted - text has been revised thoroughly in SOD and will be further improved in Final Draft |
| 18537 | 10 | 38 | | | | Please note that all costs should be presented in terms of 2010US$, as agreed for use across the AR5. | Accepted |
| 13062 | 10 | 38 | 28 | 40 | 10 | On the Costs & Potentials issues it is difficult for the reader to access the bigger picture of the cost & potential information. Each sector has its own approach to costs and potentials, which is appropriate as each sector has its own unique qualities and considerations. Nonetheless, the information that will be most relevant to take-away for policy-makers is overarching cost information that brings these different pieces together. To help policy-makers access this information, it should be important to highlighting market realization, but also the policy aspects of cost (by policy it is meant institutional frameworks and/or market frameworks and/or capacity building arrangements, etc...). In both developing and developed countries policy can have a strong impact on cost. Simply looking across the costs & potentials sections of the sector chapters, the reader could miss this message, although the information on policies and measures is there in the chapter. Therefore it could be important to make sure that these informations are put in perspective appropriately. | Accepted - text has been revised thoroughly in SOD and will be further improved in Final Draft |
| 17533 | 10 | 39 | 10 | 39 | 10 | What former IEA report? Provide a reference. | Accepted - energy Technology Transitions for Industry IEA 2009. |
| 10154 | 10 | 39 | 15 | | 16 | Unclear what is meant. It is assumed that the sentence refers to the source quoted on page 86, line 21/22, and in this soucre table 1.4. on page 34 is summarized. A clearer statement would be: "Two sectors (Iron and steel and Chemical and petrochemical) contribute more than 80% to the total industry CO2 emissions reductions potential by 2020 of 969 MtCO2." | Accepted - text has been revised thoroughly in SOD and will be further improved in Final Draft |
| 16161 | 10 | 39 | 18 | | | Missing word in the sentence | Editorial - copyedit to be completed prior |
| 8293 | 10 | 39 | 18 | | | China and ??? | Editorial - copyedit to be completed prior |
| 3027 | 10 | 39 | 18 | | | A word is missing in the sentence after “and”: “Akashi, Hanaoka et al. 2011 also indicate that the largest potential for CO2 emissions savings for some energy intensive industries comes from China and.” | Editorial - copyedit to be completed prior to publication |
| 15921 | 10 | 39 | 19 | | | "$100/tCO2" --> need a reference for this | Accepted - text has been revised thoroughly in SOD and will be further |
| 15922 | 10 | 39 | 22 | 39 | 24 | unlikely that 60% can be achieved at negative cost because it would have been done. Should use more than McKinsey for cost refrences since McKinsey generally presents a very optimistic viewpoint. | Accepted - references other than McKinsey have been used in SOD |
| 17534 | 10 | 39 | 22 | 39 | 22 | What is a MAC study? | Accepted - acronym now defined |
| 10155 | 10 | 39 | 22 | | | The quoted reference cannot be found on page 70 ff. Assuming that the Mc Kinsey "Pathways to a low carbon economy" is referred to, the sentence should be clarified as follows: "MAC sudies show that the highest potential within the industrial sector excluding power is in....." | Accepted - due to an editorial problem chapter 10 had the reference list of a different chapter. This problem has now |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 10632 | 10 | 39 | 22 | 39 | 24 | The sentences; "MAC studies also show the highest potential is in chemicals, followed by iron and steel and cement: 2, 1.5 and 0.9 GtCO2/year respectively. 60% of this potential can be achieved at negative costs or at a cost less than 20 euro/tCO2 (McKinsey Company 2009)." should be replaced with the following sentences; "MAC studies also show the highest potential is in iron and steel, followed by chemicals and cement: 2.4, 1.9 and 1.0 GtCO2/year respectively. 75% of this potential can be achieved at negative costs or at a cost less than 20 euro/tCO2 (McKinsey Company 2010)." Revised report is published by McKinsey in 2010 as follows; (See pages 8 and 9 of the revised report) http://solutions.mckinsey.com/climatedesk/default/en-us/Files/wp211154643/ImpactOfTheFinancialCrisisOnCarbonEconomics_GHGcostcurveV2.1.pdf | Accepted - text has been changed. Section has been revised thoroughly in SOD and will be further improved in Final Draft |
| 15268 | 10 | 39 | 31 | 39 | 35 | The importance in the mitigation evaluation for each sector of whole value chain like LCA( Ref: A. Gunasekaran, A. Spalanzan, Int. J. Production Economics 140, 35-47(2012)) will be very important and should be noted here. | Taken into account in "gaps in knowledge" section (10.12) |
| 17535 | 10 | 39 | 32 | 39 | 33 | What is non renewable biomass? | Accepted - Non renewable biomass refered to wood and biomass from |
| 17536 | 10 | 39 | 43 | 39 | 44 | See also Masanet, E. 2010. Energy benefits of electronic controls at small and medium sized U.S. manufacturers. Journal of Industrial Ecology 14(5): 696-702. | Accepted, reference has been used. |
| 16162 | 10 | 39 | 48 | | | This paragraph should mention the horizon of saving, and clarify if the goals. | Accepted - text has been changed. Section has been revised thoroughly in SOD and will be further improved in |
| 4558 | 10 | 39 | 48 | | | The statement that future "enhancement of potentials in the same direction may be expensive" is not based on references | Accepted - Section has been revised thoroughly in SOD and will be further |
| 16163 | 10 | 40 | 5 | 40 | 7 | In the case of cement, radical technology such as Novacement, is a possibility with a bigger jump in efficiency without CCS. | Accepted - alternatives to cement now mentioned in several instances in the |
| 16164 | 10 | 41 | | 42 | | Table 10.7 is not very clear, it does not help assessing the different scales of potential both in share and in absolute. | Accepted - Section has been revised thoroughly in SOD and will be further |
| 6607 | 10 | 41 | | 41 | | Delete "Increased recycling and use of scrap" from Steel. Increased recycling and use of scrap are not refferred in original reference (ETP2012). | Accepted - Section has been revised thoroughly in SOD and will be further |
| 10019 | 10 | 41 | | 42 | | "Heat pump" should be included in each industrial sector. There are many cases where heat pump technology is applied in industrial sectors, as described in (IEA/OECD, 2010, page65-83) and (UNIDO, page38, Fig14). In addition, the column of "CO2 intensity" should explain that CCS has problems such as high cost, difficulties in site selection, and difficulties in public acceptance, as shown in (Finkenrath, 2011, page7), (Rubin, 2007, page4447, Table3), and (Zobacka, 2012, Abstract). These literatures are listed in the No47 line of this table. | A) accepted - heat pumps now mentioned. B) CCS-related text has been shortened in chapter 10 and discussion is now concentrated in chapter 7 (Energy) |
| 15897 | 10 | 41 | 1 | | | streamline table 10.7. might include challenges. Also, add mitigation costs ($/tonne CO2) | Accepted - Section has been revised thoroughly in SOD and will be further |
| 18538 | 10 | 41 | 1 | | | A lot of the information here is the same as presented in Table 10.6. It may be useful to focus mitigation options in Table 10.6 (cutting them from this table), and focus this table on costs and potentials as was done in the AR4 (table 7.8 page 474-475). | Taken into account - Table 10.6 no longer appears in SOD |
| 18539 | 10 | 41 | 1 | | | A reader would expect indicators for chemicals, pulp&paper, and aluminum as is done for cement and steel. | Accepted - included in SOD |
| 11004 | 10 | 41 | | | | Heat pumps should be also added as one of the measures to reduce energy and CO2. | Accepted - heat pumps mentioned in |
| 10156 | 10 | 42 | | | | N2O abatement opportunities (large and cheap!!) are missing. Or the headline of the table has to be changed to "CO2 mitigation options: costs and potentials". The problem with bio-based raw materials has been discussed in the above comments. | Accepted - non-CO2 gases now considered in costs and potentials section of SOD |
| 18555 | 10 | 42 | | | | It's very useful that the structure reflects the mitigation options presented earlier in the chapter. Despite this similar structure, the last point (non-CO2 GHG) doesn't appear in that master structure, so the reader is left wondering why it then appears here. | Accepted -- sentence added to explain contribution of Non-CO2 emissions to process emissions at start on subsection |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 18556 | 10 | 42 | | | | The barriers introduced early in the section (technological, institutional, legal, cultural and financial) are useful, but aren't implemented clearly in the subsequent sub-sections, especially in 10.9.1.4, 10.9.1.5 and 10.9.2. | Accepted -- barrier categories are explicitly assigned to identified barriers in table 10.9 |
| 16165 | 10 | 43 | | | | Is behaviour change so risky if price signals and regulations are in place? See for example the average ration of fish or meat in the plates of Europeans, in marked decrease in ten years. | Noted |
| 7516 | 10 | 43 | | 43 | | Degree of Risk of CCS is very high mainly because of public acceptance and how to pass it's high cost to the customer. | Noted - CCS discussion has been significantly reduced throughout the chapter and is now concentrated in |
| 18553 | 10 | 43 | | | | This section failed to adhere to the agreement in Wellington to structure the discussion along the four categories 1) socio-economic effects; 2) environmental and health effects; 3) technological risks; and 4) public perception. The current structure should be amended accordingly. This would also help to better align the sub-sections with what is presented in Table 10.8. | Accepted - structure amended in agreement with Vigo Accord |
| 15888 | 10 | 43 | 1 | | | Co-benefits discussion would benefit from more quantitative examples | Accepted - section has been revised |
| 12013 | 10 | 43 | 1 | | | It should be clearly stated that uncertainty of future, which derives from future market structures, demand and government regulations to name a few, makes any options risky. Even energy efficiency measures are not well explored due to uncertainties. | Taken into account |
| 12035 | 10 | 44 | 13 | | | "On the other hand…." is not a relevant statement to follow the spill-over issues. At least, "public" needs to be clearly defined. The spill-over effects can be easily underestimated as various factors influences investment decisions. Quantatively, it is necessary to analyze changes embedded CO2 associated with export/import of goods. As sated earlier in the chapter, the shift from industrialised to developing countires is quite significant. As the competition becomes more global and the economic situation uncertain in the future long term investment decisions have become more difficult, failing to explore large amount of efficiency improvement potentials. | Noted - trade-related issues are discussed in chapter 14 |
| 17539 | 10 | 44 | 15 | 44 | 22 | Claims on such a controversial topic should be very carefully supported with multiple references! | Taken into account |
| 10020 | 10 | 44 | 15 | 44 | 19 | This part should be deleted totally or revised to explain that CO2 leakage caused by the implementation of the ETS happened actually through transfer of industry from one country to others. Market mechanisms at least under Kyoto-like international scheme, where the condition of all countries' meaningful participation is not met, does not work well. This information is described in (Rosendahl, 2011, abstract), (Aichele, 2012, page336), and (Peters, 2011, page1).<br><br><Reference><br>[1] Rosendahl, K.E. & J. Strand (2011). Carbon Leakage from the Clean Development Mechanism. Energy Journal, Volume 32, Number 4.<br>[2] Aichele, R. & G. Felbermayr (2012). Kyoto and the carbon footprint of nations. Journal of Environmental Economics and Management, Volume 63, Issue 3, pp. 336-354.<br>[3] Peters, G.P., J.C. Minx, C.L. Weber, & O. Edenhofer (2011). Growth in emission transfers via international trade from 1990 to 2008. Proceedings of the National Academy of Sciences. DOI: 10.1073/pnas.1006388108. | Noted - ETS discussed in chapter 15 |
| 17540 | 10 | 44 | 23 | 44 | 31 | This paragraph needs a segue (from the previous paragraph) and also needs context. Does it belong in this section? | Accepted |
| 18554 | 10 | 44 | 23 | 44 | 31 | Note in Wellington it was agreed to avoid the term trade-off - this paragraph has made trade-off a focus. | Taken into account |
| 15923 | 10 | 44 | 27 | | | Chemical indsutry is also emerging at large user of biomass for biochem since much more value added and higher returns on products | Noted |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 5221 | 10 | 44 | 27 | 44 | 28 | One important blockage in the scientific discussion of tourism's reduction of emissions (by reducing long haul trips) is the assumed adverse impact of this on the economies of the least developed countries. From a paper under review we wrote, it may be learned that this effect is limited to a special kind of LDC's: small, remote islands. In general other LDC's economies do suffer from increased distances travelled - or may gain from a reduction - in tourism because they will loos part of their neighbour country tourism, without an increase of long haul to fully compensate for this. Overall it appears that the impact is neutral to both LDC's and nonLDC in terms of total trips and for scenarios where travel distances are limited to up to only 1500 km one-way (theoreticlly of course). Menion of the conflict development of poor countries and long haul tourism can be found in: Gössling, S., Peeters, P., & Scott, D. (2008). Consequences of climate policy for international tourist arrivals in developing countries. Third World Quarterly, 29, 873-901.<br>Peeters, P. (2009). Pro-poor tourism, climate change and sustainable development. Tourism Recreation Research, 34, 203-205. | Noted. Due to re-organisation of SOD text the text on tourism in this section has been deleted (cf. Response to comment 2279) |
| 3028 | 10 | 44 | 27 | | | Please note that chemicals from biorefineries not mandatorily compete with fuels, heat and power produced in those industrial facilities. Chemicals and biopolymers can improve the profitability of biorefineries and, hence, increase the competitiveness of fuels produced in it. Interestingly, this is the case for sugar cane distilleries, which produce sugar, ethanol (fuel and solvent) and heat and power from biomass. The co-production of various energy and non-energy goods increases the profitability of the facility. This is scope economy is found in mulit-products plants, such as petroleum refineries (the classical example). Therefore, I don´t think that biorefineries are good examples of potential competition between biomass applications, as stressed in the report. | Noted |
| 16166 | 10 | 44 | 28 | | | The conflict beween development and mitigation should be described. | Rejected - it is not for industry chapter to describe it in full, see framing chapters |
| 15924 | 10 | 44 | 28 | 44 | 31 | tradeoffs btw GHG mitigation/energy effiicency and production, environment, safety, relaibility are very common and generally GHGs come last… | Noted |
| 15462 | 10 | 44 | 33 | 45 | 6 | One signficant technical risk that has not bee n widely addressed is security concerning technologies related to the smart grid. In spite of their potential to great enhance transmission and distribution efficiency, so-called smart technologies are vulnerable due to their large reliance on software controls, that are prone to cyber hacking. These need to be addressed so that residents will be assured to their security but also their privacy. See ref: http://ieeexplore.ieee.org/xpl/login.jsp?tp=&arnumber=5452993&url=http%3A%2F%2Fieeexplore.ieee.org%2Fxpls%2Fabs_all.jsp%3Farnumber%3D5452993 | Rejected - not relevant to industry chapter, see Energy chapter for this. |
| 12629 | 10 | 44 | 45 | 44 | 47 | CCS is commercially available today in certain circumstances in industrial applications - see the Sleipner and Snohvit projects and Weyburn Project. CCS may not necessarily have any greater risks and uncertainties than other technologies. | Noted - CCS discussion has been significantly reduced throughout the chapter and is now concentrated in |
| 12672 | 10 | 44 | 45 | 44 | 47 | CCS is commercially available today in certain circumstances in industrial applications - see the Sleipner and Snohvit projects and Weyburn Project. CCS may not necessarily have any greater risks and uncertainties than other technologies. | Noted - CCS discussion has been significantly reduced throughout the chapter and is now concentrated in |
| 16167 | 10 | 44 | 45 | 45 | 6 | This paragraph with a sober assessment of CCS is on point. But does it not contradict the more lenient parts on CCS in chapter 7? | Noted - CCS discussion has been significantly reduced throughout the chapter and is now concentrated in |
| 12352 | 10 | 44 | 45 | 44 | 46 | All of the (individual) components of integrated CCS Systems exist and are in use today in different sectors. The risk is probably not a technological risk, but an economic risk. The current knowledge of CCS and the challenges related to it, is thoroughly described in the Energy Chapter (chapter 7, page 31, line 5 to 7) and should be the basis also for the description in the Industry chapter (as it provides a more updated view). | Noted - CCS discussion has been significantly reduced throughout the chapter and is now concentrated in chapter 7 (Energy) |
| 11783 | 10 | 44 | 45 | 45 | 6 | These are reasonable. | Noted |
| 6763 | 10 | 44 | 45 | | 6 | Good description. It's very important. | Noted |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 10667 | 10 | 44 | 45 | 45 | 6 | Support this statement. | Noted |
| 6608 | 10 | 44 | 46 | 44 | 47 | Important- Should not be deleted. | Noted |
| 12353 | 10 | 44 | 49 | 45 | 1 | A lot of work on storage capacity in the North Sea has been undertaken (Norway/UK) since 2007. Please include some of these later studies. E.g. CO2 Storage Atlas. www.npd.no (2012) | Noted - CCS discussion has been significantly reduced throughout the chapter and is now concentrated in |
| 17538 | 10 | 44 | 7 | 44 | 7 | "despite being the most costly option" for what? GHG mitigation? | Accepted - sentence has been clarified |
| 17980 | 10 | 44 | 8 | 44 | 22 | Since spill-over effects might play a less important role in this section than agreed in Wellington, this paragraph might be shortened. If it was to be kept, additional literature would have to be added to substantiate the claims made. | noted |
| 6752 | 10 | 45 | 1 | 45 | 6 | Last part in this section is too speculative without references. | Noted - CCS discussion has been significantly reduced throughout the chapter and is now concentrated in |
| 17542 | 10 | 45 | 19 | 45 | 21 | Why does regional variation lead to public acceptance?? | Accepted - sentence deleted |
| 12354 | 10 | 45 | 2 | 45 | 5 | The description of geology (challenges) comes out too negative. This is a matter of carefully selection of suitable storage sites. It may not be problems with regard to occuping underground space if depleted gas reservoars are used for storage, or if storage sites are offshore. | Noted - CCS discussion has been significantly reduced throughout the chapter and is now concentrated in |
| 6753 | 10 | 45 | 22 | 45 | 35 | This has been discussed. Keep discussion of CCS on one place in one section to avoid writing the same information multiple times. | Accepted - CCS discussion has been significantly reduced throughout the chapter and is now concentrated in |
| 16168 | 10 | 45 | 22 | 45 | 35 | Very insteresting part. | Noted |
| 9284 | 10 | 45 | 22 | 45 | 24 | The following statement seems subjective and unsubstantiated: "Industrial CCS does not provide environmental co-benefits, moreover for many people the technology is connected with safety risks. Given the halting of several research projects for CCS due to local opposition, public concerns for safety are often seen as a future barrier to this technology."<br><br>Industrial CCS can permanently prevent anthropogenically produced CO2 from being released to atmosphere which in itself bestows multiple environmental co-benefits (in regards to climate change, bio-diversity, more sustainable production processes). The statement should either more accurately reference what aspect of CCS public opinion seems to be uncertain or it should be deleted. For example, it is mostly the storage aspect (not the capture or transport) and is dependant on the specifics of each storage location (both in terms of national regulations, geological site characterisation and proximity to urban centres). For instance, in the Netherlands it refers to on-shore storage (not off-shore storage). And in many other parts of the world, regulations in place that ensure compliance with a high level of environmental integrity and occupational heath and safety outcomes.<br><br>Indeed, the recent acceptance of CCS as an eligible project activity in the United Nations Framework Convention on Climate Change's (UNFCCC) Clean Development Mechanism (CDM) demonstrates that CCS related abatement is easily institutionalised and rewarded within market mechanisms, and is also consistent with the notion of sustainable and equitable development in developing countries. | Accepted - CCS discussion has been significantly reduced throughout the chapter and is now concentrated in chapter 7 (Energy) |
| 15925 | 10 | 45 | 22 | 45 | 35 | CCS is well covered in Chap. 7 - might coordinate to avoid duplication since CCS for powergen is similar to CCS for indsutry | Accepted - CCS discussion has been significantly reduced throughout the chapter and is now concentrated in |
| 17543 | 10 | 45 | 30 | 45 | 35 | These two sentences appear to be contradictory. The first sentence refers to less favorable public acceptance with increased information provision. The second sentence states "In line with this…" and points to value of public engagement. Clarifcation is needed. | Accepted - CCS discussion has been significantly reduced throughout the chapter and is now concentrated in |
| 17544 | 10 | 45 | 36 | 45 | 39 | 150 conflicts over what period? | Noted - will be checked |

|---|---|---|---|---|---|---|---|
| 17541 | 10 | 45 | 8 | 45 | 8 | In what way are the impacts asymmetric? | Accepted - text revised |
| 17983 | 10 | 45 | 22 | 45 | 35 | Please provide a cross-reference to and liaise with Chapter 7 to bring the different discussions of CCS impacts across chapters (5, 6, 7, and 11) together. | Accepted - CCS discussion has been significantly reduced throughout the chapter and is now concentrated in |
| 16169 | 10 | 45 | | | | Many parts in this section are repeating the previous ones. Maybe the plan of the chapter could be modified to give the same information without coming back to the same topics, and thus saving pages. | Accepted -- redundancy reduced |
| 17545 | 10 | 46 | 14 | 46 | 19 | These statements are familiar platitudes and could be cut for length. | Accepted -- deleted |
| 8294 | 10 | 46 | 35 | 46 | 36 | Rohdin compiled barriers reported access to capital - needs to be reworded - unclear | Accepted -- reworded |
| 9537 | 10 | 46 | 39 | 47 | 8 | Please, move to other related chapter as this is general idea of CHP, rather than a specific industry sector. (CHP – whether applied in industry, in buildings or integrated with DHC networks – offers policy makers a very significant opportunity to achieve a number of energy and environmental goal s at relatively low cost compared to alternatives. (Cogeneration and district energy, 2009, IEA, p31) | Noted -- this section only deals with barriers to industrial use of CHP |
| 10021 | 10 | 46 | 39 | 46 | 42 | This part should be deleted or revised to explain that the energy efficiency of cogeneration depends on heat demand and that its efficiency would be low if heat is not utilized effectively. This claim is shown in (Pedro, 2012, page82). In addition, this part should also explain the huge potential of "heat pump technology", as described in (IEA, 2011, page16) and (IEA/OECD, 2010, page65-83).<br><br><Reference><br>[1] Pedro J. Mago, Amanda D. Smith (2012). Evaluation of the potential emissions reductions from the use of CHP systems in different commercial buildings,<br>Building and Environment 53, 74-82<br>[2] IEA (2011). Technology Roadmap: Energy-efficient Buildings: Heating and Cooling Equipment. Available at: http://www.iea.org/papers/2011/buildings_roadmap.pdf<br>[3] IEA/OECD Heat Pump Centre (2010). Special Task: Case Studies. Available at: http://www.heatpumpcentre.org/en/projects/specialtasks/casestudies/Documents/Case%20Studies%20report.pdf | Rejected -- CHP in industry raises specific barriers not generally common to other energy efficiency options; this section is not on technology options and other heat pump comments are considered replies associated with 10.4; literature given focuses mainly on CHP in buildings not industry |
| 17985 | 10 | 46 | 25 | 46 | 26 | Please use the term "barriers" but not "issues". The meaning of these terms differ in the AR4 Glossary and this difference might be kept in the AR5 Glossary. | Accepted -- barriers replace issues |
| 3029 | 10 | 47 | 1 | | | I am not very comfortable with the idea of considering the Clean Air Act (or other command and control policies for local pollutants) as a barrier to industrial CHP. Local pollutants regulation is a requirement of societies and should not be removed as a barrier to mitigate GHG emissions. | Accepted -- reference to the CAA removed |
| 10022 | 10 | 47 | 19 | 47 | 21 | This part should be deleted totally. Carbon pricing and international emission trading do not always result in reducing CO2 emission. In addition, CO2 leakage caused by the implementation of the ETS happened actually through transfer of industry from one country to others. Market mechanisms at least under Kyoto-like international scheme, where the condition of all countries' meaningful participation is not met, does not work well, as shown in (Rosendahl, 2011, abstract), (Aichele, 2012, page336), and (Peters, 2011, page1). These literatures are listed in the No50 line of this table.<br>Even if there are not carbon pricing and international emission trading, CCS has problems such as high cost, difficulties in site selection, and difficulties in public acceptance, as shown in (Finkenrath, 2011, page39) and (Zobacka, 2012, Abstract). These literatures are listed in the No47 line of this table. | Accepted -- chapter 7 referred to on barriers to power decarbonisation |
| 9542 | 10 | 47 | 21 | | | Please, provide information of reference, IEA 2009c. | Accepted - due to an editorial problem chapter 10 had the reference list of a different chapter. This problem has now |
| 12355 | 10 | 47 | 25 | 47 | 25 | Regulatory and permitting uncertainties should not be regarded as a barrier. IEA 2007 is an old reference. EU Directive 2009/31/EC has now been implemented in most EU countries and can be applied world wide. | Accepted -- deleted and Ch7 referred to |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 9538 | 10 | 47 | 3 | 47 | 8 | Please, reconisder here as CHP is one of mature technologies without a cost gap. (ETP 2010, IEA, p50) | Rejected -- CHP is not economic in all cases due to market barriers |
| 12036 | 10 | 47 | 32 | | | 3R is important means in general to save resources and reduce CO2 emissions. However, specific cases need to be assessed with LCA standpoints to prove if they are indeed contributing to CO2 emission reductions as compared to alternatives. Duarable materials may be recycled less frequent than short life products but may have more environmetal advantage as they require less energy and resources from LCA aspects. It must be noted that downgrade of quality frequently happens in recycling. Even for aluminum cans, roughly 30 percents cannot be returned for use to cans but to be sent to dicast or other applications. | Accepted -- aluminum recycling example removed |
| 6754 | 10 | 47 | 36 | 47 | 37 | "reduce, re-use, recycle" concept should be included early in the chapter. This is important concepts. | Accepted -- topic covered in 10.4. |
| 17546 | 10 | 47 | 42 | 47 | 45 | But Allwood and Cullen debunk this oft-stated optimistic claim. See p. 21, Allwood, J. M., J. M. Cullen, and M. A. Carruth. 2012. Sustainable materials with both eyes open. England: UIT Cambridge Ltd. | Accepted -- sentence deleted |
| 12014 | 10 | 47 | 42 | 47 | 45 | This kind of statement often misleads readers to believe recycling can be done endlessly. Actually, in almost all cases, downgrade of quality is inevibable even in aluminium products. It is true that some 95% of aluminium products are recycled, however, due to the quality downgrade only 65% of aluminium cans can be recycled to cans. It is important to recognize that longer use, or reuse is usually more energy and resource efficient than recyling.<br>http://www.alumi-can.or.jp/data_0101.html | Accepted -- sentence deleted |
| 8295 | 10 | 47 | 22 | 47 | 31 | paragraph on CCS seems to be a repeatition of what has been already said about CCS in sections 10.8.2 and 10.8.3 | Accepted -- redundancy reduced |
| 17986 | 10 | 47 | 22 | 47 | 23 | Please provide a cross-reference to and liaise with Chapter 7 to bring the different discussions of CCS impacts across chapters (5, 6, 7, and 11) together. | Accepted -- redundancy reduced and Ch7 referred to |
| 16171 | 10 | 48 | 16 | 48 | 19 | This sentence gives no clear direction, it is "either" "or", maybe to be removed. | Accepted -- sentence simplified |
| 7107 | 10 | 48 | 34 | | | Sentence does not make sense - "first", delete? See also how sentence follows up | Accepted -- section deleted |
| 7108 | 10 | 48 | 38 | | | I cannot see that Gössling et al. (2009) makes the claim that tourists are attracted by the behaviour of a minority of hypermobile tourists. The text outlines, though, that an increasing number of people move towards highly mobile lifestyles. | Accepted -- section deleted |
| 17547 | 10 | 48 | 38 | 48 | 39 | Not clear what "are ATTRACTED by the behaviour of a minority of hypermobile tourists" means. | Accepted -- section deleted |
| 7109 | 10 | 48 | 43 | 48 | 45 | "Should large-scale mitigation emerge…" how does this sentence refer to the previous one, and what is meant by large-scale mitigation? "Serious" (in political or scientific terms) mitigation, with concomitent consequences for transport? Or technology-based mitigation - which is not what I can read out of Becken (2005), or see substantiated by this reference? | Accepted -- section deleted |
| 5222 | 10 | 48 | 45 | 48 | 45 | There is a contradiction here with statements in chapter 8, page 8, line 16-20, and also logically; developing countries have to develop their infrastructure anyway and 'only' have to dedicate their investment to more sustainable mopdes like rail. So the funds are there and i do not see the limitation due to funds (invest less in road and more in rail). opportunities are therefore much better for developing countries that do not suffer from very high sunck cost in current infrastructure. To some extend countries like India still depend mainly on more sustainable transport, but need to invest in improving this and less in new unsustainable transport infrastructures like arorports. | Accepted -- section deleted |
| 16170 | 10 | 48 | | | | Key section to be retained, even in case of limited space. | Accepted -- section retained |
| 17987 | 10 | 48 | 4 | 48 | 19 | Although this subscribes to some substantial critique of current business models and the way of life of many people, it is presented in a rather factual language and does not provide many references to substantiate the claims made. Please reword and/or provide more references. | Accepted -- value judgements removed |
| 7721 | 10 | 48 | 20 | 48 | 30 | The description in this section is too old and not worth reading in 2014. The update could be done by asking TEAP experts based uopn the 2010 TEAP Assessment Report as well as the 2011 and 2012 TEAP Progress Report to the Montreal Protocol. | Accepted -- TEAP 2010 reference added (as UNEP, 2010) for HCFC replacement |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 11137 | 10 | 48 | 21 | 48 | 30 | Consumption control of HFC use should be added (see USA/Canada/Mexico proposals/papers published under Montreal Protocol | Noted -- comment suggest a policy recommendation |
| 11138 | 10 | 49 | | | | Control of HFCs should be added to non-CO2 GHGs; Physical box | Accepted: control of HFCs is added |
| 9539 | 10 | 49 | | | | Please, check categories on the table as Cogeneration and CCS seem to be strange relative to other elements. Check also whether emissions efficiency is similar to emissions reduction. | Accepted -- cogen included in efficiency column and CCS included in emission |
| 17548 | 10 | 49 | | | | In the column "Non-CO2 GHGs", lower cost technology for PFC emission reduction is listed as a barrier. Shouldn't this be the lack of lower cost technology? Also this point is repeated in the last row. | Accepted -- suggested text added |
| 10023 | 10 | 49 | | | | According to the structure of the main text, "Cogeneration" should be mentioned in "Energy Efficiency". And "CO2 capture, utilization and storage" should be mentioned in "Emission Efficiency". "Heat Pump" should be considered in the same categorization as cogeneration with information of its huge potential, as described in (IEA, 2011, page16) and (IEA/OECD, 2010, page65-83). These literatures are listed in the No51 line of this table. | Accepted -- cogen included in efficiency column and CCS included in emission eff column |
| 15898 | 10 | 49 | 1 | | | simplify table 10.9 | Accepted -- table columns reduced to |
| 18525 | 10 | 5 | | | | It is surprising that there is so little on costs and potentials in the Executive Summary. One would expect the results of that section to be one of the major outputs of the chapter. | Accepted - the text on costs and potentials in the ES have been extended |
| 6719 | 10 | 5 | 2 | 7 | 7 | In order to make it fast and easy for the reader place cross-references for the statements. | Rejected - in ES usually no cross- |
| 2259 | 10 | 5 | 2 | 5 | 4 | There is no evidence that emissions of greenhouse gases hav any harmful effect on the climate. .This information is thus not a cause for concern so the whole Chapter is unnecessary. It is also surprising that while the supposed, unproven theory relies on changes in the atmospheric concentioin of greenhouse gases. you seem here to be exclusively concerned with emissions. which are not necessarily related to concentrations | Not specifically relevant for the industry chapter, general concern for the report |
| 15875 | 10 | 5 | 23 | 5 | 27 | Rather than saying that best practices are within 25-30% of technical limit (efficient Pareto frontier), you should look at gap between actual energy use and best practice. This is more usefulness to industry and policy makers in order to make real near-term gains. Also regional variations (OECD vs. developing nations, where developing nations = over 75% of industrial production, p.11) need to be considered. | Accepted - this is now explicitly mentioned in point 3 of the Executive Summary and acrosss the sections (e.g. 10.4, 10.7). Moreover the differences |
| 4539 | 10 | 5 | 23 | 5 | 27 | The claim of 25-30% and the appraching of technical limits is based on a few sectors. It cannot be generalized to all industry, not even energy-intensive industries. This is an example of a blanket statement, that in the body of the chapter is only backed up with a few selective references. | Accepted, cf. Comment 15875 |
| 12341 | 10 | 5 | 28 | 5 | 34 | In the last sentence, options beyond energy efficiency is mentioned. CCS should be added to the last sentence (line 33 and 34) to reflect the huge potential of CCS in line with the other options mentioned. | Rejected - CCS still included under point 9 "Long-term step-change options". CCS is nevertheless considered within the group of "emissions efficiency" |
| 12006 | 10 | 5 | 28 | 5 | 34 | Contribution of industry sector as providers of goods to be used in other sectors to save or generate energy should be mentioned. Many of the materials for the purpose tend to be energy intensive, e.g. carbon fibers, and silicon. | Accepted: this important aspect is now reflected in point 8 of the ES |
| 10796 | 10 | 5 | 3 | 5 | 9 | Are these numbers right? 0.83 in year 1990 grew to 11.00 in 2009? | Accepted - typo |
| 15876 | 10 | 5 | 35 | 5 | 41 | Material efficiency / demand – the chapter discussed the final end state for emerging nations (will China = Japan or US?) and the willingness and practicality of nations to choose end states based on emissions footprint (eating meat, car size, etc). There are several references in text to car sharing, lower meat consumptions, etc. Rather than sending a message of top down regulation of behaviour, perhaps the chapter should discuss Environmental valuation, namely including the cost of externalities (e.g., cost of emissions, waste, water use, climate change adaptation, etc) in product prices. Then, choices would be governed by simple supply-demand curves (e.g., see Worley-Parsons EcoNomics model, by Paul Hardisty, as a practical example of this) | Noted - the chapter tries to outline the full range of options (please see revised 10.1 text, equation and figure ); regulation of consumption patterns as an policy instrument is not mentioned in the chapter. We acknowledge importance of internalisation of environmental costs but this is covered in framing and policy chapters of the report |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 7525 | 10 | 5 | 35 | 5 | 34 | "Material Efficiency" is a current continuing advance rather than "an additional promising and largely unexplored option". The use of high-tensile steel for car is a good example.<br><br>In the context, business as usual scenarios (BAUs) of material demand include a certain "Material Efficiency" progress. Future material service and "Material Efficiency" are uncertain; however, additional "Material Efficiency" is less controllable.<br><br>As a result, “Low agreement” is appropriate. | a) Accepted - wording changed. b) Noted. see revised Executive Summary for the considerations on BAU and model projections regarding material efficiency: "The models running future long-term scenarios also envisage rising production rate of materials (...). But material flows and opportunities for material efficiency to mitigate emissions |
| 2278 | 10 | 5 | 35 | 5 | 41 | Wording could be interpreted differently. Although the idea of using materials longer, sharing products, etc. "using less new material" could also mean using lighter weight new materials such as increased use of advanced high strength steels to replace standard steels resulting in lighter weight products - primarily automotive industry to increase gas mileage. This is also important because making new materials from stronger materials makes them smaller - using less materials (less GHGs). Assuming new materials have similar embodied GHG | Accepted - the various dimensions of material efficiency are explained in the introduction to section 10.4 (space constraints do not allow detailed explanation in executive summary) |
| 10199 | 10 | 5 | 35 | 5 | 41 | Especially l. 37-39: what about reduced consumption? This would results in reduced energy and material use, reduced energy emissions, reduced waste disposal and increased health | Accepted - SOD very clearly mentions this in ES (point 7), introduction and |
| 17173 | 10 | 5 | 41 | 5 | 42 | The text says, ‘While spatial planning can influence energy use and emissions, there are limited quantitative assessments of the emissions savings through spatial planning strategies’. Due to the very different urban contexts (city size, geographical setting, affluence level, dominant culture, social cohesion/segregation etc.), it should not at all be an aim to develop general figures for savings potentials. Rather, examples form different cities could be mentioned, leaving it up to the users of the information to assess whether the context of the example is sufficiently similar to the planning context at hand. (See Næss, 2004 and Næss & Strand, 2012 for more elaborate discussion.) | This comment has been addressed to Ch.10 by error and is meant as a comment to Ch.12. Please see Comment ID 19006 for the answer by the Ch.12 author team |
| 6751 | 10 | 5 | 42 | 5 | 42 | This is the first time CCS is declared but not out written. The abbreviation is written out in page 44 row 45 | Accepted - copyedit to be completed |
| 16135 | 10 | 5 | 42 | 5 | 44 | There are several radical process options in the pipeline, such as the innovative cement processes at the pilot stage. These options do have difficulties in implementation to replace the existing stock of plants. But in this major case, there is no CCS involved. The point 8 should be broadened in this respect. | Accepted - text revised (see point 9 of ES) |
| 12342 | 10 | 5 | 42 | 5 | 44 | All of the (individual) components of integrated CCS Systems exist and are in use today in different sectors. The risk is probably not a technological risk, but an economic risk. The current knowledge of CCS and the challenges related to it, is thoroughly described in the Energy Chapter (chapter 7, page 31, line 5 to 7) and should be the basis also for the description in the Industry chapter (as it provides a more updated view). | Accepted - CCS-related text in chapter 10 has been shortened and revised, with stronger focus on industry-specific aspects and more cross-references to |
| 12007 | 10 | 5 | 45 | 6 | 2 | Emissions from Chemical sectors are expected to increase to supply goods for energy saving and renewables energy generations, which much more than offsets the increased emissions in the chemical sectors. ICCA report, July 2009 | Accepted - important aspect which is included in the ES (point 8) and in section 10.5 |
| 8439 | 10 | 5 | 8 | 5 | 8 | the 1990 data is clearly wrong (see Figure 5.2.3) | Accepted - typo |
| 14409 | 10 | 5 | 8 | | | Is “0.83” a typo? Looks far too small. | Accepted - typo |
| 15874 | 10 | 5 | 8 | | | 0.83GtCO2 should probably read 8.3Gt? or 7.9Gt (table 10.2). Make sure data in ES are consistent with rest of text! | Accepted - typo |
| 10132 | 10 | 5 | 8 | | | 0.83 GtCO2 energy-related emissions in 1990 for manufacturing must be a typo. On page 14, line 21 the primary enery use in the manufacturing industry is described as 129 EJ in 1990, which does not fit with the aforementioned CO2 emissions for 1990. A second figure showing the development in process emissions from chemical reactions should be shown as well. | Accepted - typo |
| 12005 | 10 | 5 | 8 | 5 | 8 | Is 0.83Gt CO2 in 1990 correct? | Accepted - typo |
| 11128 | 10 | 5 | 7 | 5 | 7 | Electricity is also produced on site through CHP | Rejected - this is considered as part of |
| 12947 | 10 | 5 | 29 | 5 | 30 | Expected increase in emissions not given a date (should be 2050 I think) | Accepted - dates for all projections now |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 12948 | 10 | 5 | 43 | 5 | 44 | Other reason for slowness of CCS development: lack of sufficiently high CO2 price/lack of economic model to support it commercially. | Noted - but CCS-related text in chapter 10 has been shortened and revised, with stronger focus on industry-specific |
| 17549 | 10 | 50 | | | | Remove original caption. Very hard to read in black & white. | Noted - but figure no longer appears in |
| 4284 | 10 | 50 | | | | Chapter 10.10.1 One general comment. I am fully missing energy audit as a policy. Normally, energy audits are the first step in succesful adoption of energy management practices and are the most common means of promoting energy efficiency in industrial SMEs and non-energy efficient companies but ar ealso mandatory components in e.g. LTAs or VAs. Please note that the succes of the Learning networks you refer to is 1) energy audits and two 2) the actual network where industry respondents meet and discuss their improvements and ideas for future such. | Accepted |
| 4285 | 10 | 50 | | | | Chapter 10.10.1 I am also missing the fact that energy management may not only be regarded to include technical measures. This comment holds for the whole chapter. Please see Thollander and Palm (2012) (Improving Energy Efficiency in Industrial Energy Systems - An Interdisciplinary Perspective on Barriers, Energy Audits, Energy Management, Policies, and Programs, Chapter 8 (and chapter 6), ISBN 978-1-4471-4161-7) where it is shown in Figure 4, chapter 8, that energy management could contribute to significantly higher energy efficiency potentials. Please also see Backlund, S., Thollander P, Palm, J., Ottosson, M., 2012. Extending the energy efficiency gap. Accepted for publication in Energy Policy holding the same line of arguments. | Accepted - we didn't get the book till just after submission but will consider it for final draft |
| 15891 | 10 | 50 | 13 | | | can't read this fig. | Noted - but figure no longer appears in |
| 17550 | 10 | 50 | 14 | 50 | 15 | Add "in IEA +5" to caption | Noted - but figure no longer appears in |
| 15926 | 10 | 50 | 19 | 50 | 28 | Might state which policies work best and describe how they work (what kind of incentives?) | Rejected - the factors that work best are described, for space reasons the specific instruments cannot be described in detail. The coment is not specific about |
| 4282 | 10 | 50 | 19 | | | Please note that Voluntary agreements (VA) may also be referred to as LTA (Long-term agreements). I suggest a footnote here clarifying this. Your ref to Rezessy and Bertoldi 2011 refers to LTAs. Please also include ref to the Swedish Scheme (Stenqvist and Nilsson, 2011 from the Journal Energy Efficiency). | a) Rejected - term is widely understandable. B) accepted |
| 18557 | 10 | 50 | | | | Please make sure that any policy category that is introduced matches the framework presented in Chapter 3. | Accepted - the framework agreed in cross-cut discussions was used |
| 18558 | 10 | 50 | | | | A reader sorely misses a synthesis of the subsections on policy, clearly answering the question: "which policies are the most important for each mitigation option in industry?". The answer to this question would eventually be brought into the Technical Summary and SPM. | Taken into account - statement with caveats and syntesis now included at the end of the section. |
| 15889 | 10 | 50 | 1 | | | Sectorial policies section could be shortened and could highlight/focus on examples of which policies are more successful | Taken into account when revising the section |
| 7116 | 10 | 51 | 24 | | | ".. Institutions like OECD and UNEP consequently are calling" - why is there no reference to OECD and UNEP here, rather than to Dubois? Wrong references? Check even subsequent section, where the same references appear to have been used. | Accepted - there was a problem with the references in the last paragraphs of section 10.10. References now correct |
| 10024 | 10 | 51 | 3 | 51 | 4 | This part should be deleted completely. Cap & trade schemes have not been effective to reduce GHG emissions and enhance energy efficiency in energy-intensive industry. CO2 leakage caused by the implementation of the ETS happened actually through transfer of industry from one country to others. Market mechanisms at least under Kyoto-like international scheme, where the condition of all countries' meaningful participation is not met, does not work well, as shown in (Rosendahl, 2011, abstract), (Aichele, 2012, page336), and (Peters, 2011, page1). These literatures are listed in the No50 line of this table. | Accepted - EU ETS discussed in Chapter 15 |
| 17551 | 10 | 51 | 33 | 51 | | Paragraph is in past tense. Are the programs over? | Rejected - past tense only used to say that a review has been made |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 4564 | 10 | 51 | 33 | 51 | 39 | I do not think energy management standards are mandatory in many of the countries quoted; certainly not in The Netherlands. | Accepted - text revised |
| 4283 | 10 | 51 | 35 | | | Same here, the Swedish program is missing, e.g Nilsson and Stenqvist, 2011 (in Energy Efficiency) | Taken into account |
| 10283 | 10 | 51 | 9 | 51 | 17 | The main reason that the carbon leakage did not observed in EU ETS is low carbon prices in the market due to economic crisis etc. It cannot be insisted that ETS scheme or ETS with free allowances have small impacts on carbon leakages. The draft descriptions will mislead readers, and should be revised. | Accepted - text revised |
| 11139 | 10 | 51 | 9 | 51 | 17 | This is clearly an over-simplication of the carbon leakage scenario in EU. Studies by both Climate Strategies and The Carbon Trust demonstrate that there are sector specific impacts. | Accepted - text revised |
| 4563 | 10 | 51 | 9 | 51 | 17 | The discussion on ETS is extremely selective and provides really wrong insights A wide body of literature is available around the EU-ETS, which is not used. Generally, the conclusion is that ETS had had little to no effect until now due to over-allocation in Period I and the crisis in Period II. The current section seems to suggest the opposite.... | Accepted - text revised |
| 9306 | 10 | 51 | 5 | 51 | 8 | Basically, EU-EST is only "regional" policy. Therefore, this paragraph should be moved to right place in 13.6.1.1 on page 32. Furthermore, since there is no reference of (Jochem and Gruber 2007) in Reference between page 70 and 106, I would suggest to delete it. | Rejected: the sectorial policy section has to rely on specific examples for sector specifc policies, but should also build the bridge to the more overarching policy instumenst discussed in chapter 13-15. The EU ETS is a very good bridge building example which high relevance particularly for the industry sector in the EU. Moreover: due to an editorial |
| 9307 | 10 | 51 | 9 | 51 | 17 | This is wrong analysis. Small effect of ETS on carbon leakage results mainly from shrinkage of European market due to Lehman shock or European finance crisis. It cannot be said that the scheme of ETS itself has no impact on carbon leakages even if free allowances are implemented.<br>Furthermore, it is seen that most of such studies based on ER20-30/tCO2 suggest small impact on carbon leakage under free allocation. Therefore, it should be stated that the current carbon price in the EU-ETS is lower than its prerequisite of ER20-30/tCO2.<br>In addition, since there are no references of (Reinaud 2008) and (Clo 2010) in Reference between page 70 and 106, I would suggest to delete both references. | Accepted. Moreover: due to an editorial problem chapter 10 had the reference list of a different chapter. This problem has now been resolved |
| 12632 | 10 | 52 | 21 | 52 | 23 | CCS legal and regulatory frameworks have been put in place in Australia and many parts of Europe and USA. I therefore do not feel signling out regulatory uncerntainy as an issue solely for CCS is appropraite. Please see the IEA CCS Model Regulatory Framework and IEA CCS Legal and Regulatory Review for references. CCS is also now included in the CDM as of COP 17 in Durban. | Accepted (moreover CCS-related text in the industry chapter has been shortened to avoid overlaps with chapter 7) |
| 12675 | 10 | 52 | 21 | 52 | 23 | CCS legal and regulatory frameworks have been put in place in Australia and many parts of Europe and USA. I therefore do not feel signling out regulatory uncerntainy as an issue solely for CCS is appropraite. Please see the IEA CCS Model Regulatory Framework and IEA CCS Legal and Regulatory Review for references. CCS is also now included in the CDM as of COP 17 in Durban. | comment is in duplicate, see reply in 12632 |
| 10025 | 10 | 52 | 4 | 52 | 8 | This part should be deleted completely because it is not necessary to adopt cap & trade scheme for non-CO2 GHG, considering successful example of capturing SF6 in Japanese power industry. Such Japanese examples is shown in (Nishimura, 2008, abstract).<br><br><Reference><br>[1] Nishimura et al ( 2008 ) . Mitigation of Non-CO2 Greenhouse Gases ( Y07012 ) . Available at: http://criepi.denken.or.jp/jp/kenkikaku/report/detail/Y07012.html | Taken into account as an example, but case reviewer gives is for power industry which is not within our scope. Text does not say that inclusion in the cap & trade system is a must, but more an option. |
| 7100 | 10 | 53 | 17 | 53 | 21 | References (Anderson and Newell 2004, etc.) - these appear to be misplaced, as the text refers to OECD and UNEP (2011), which is the review of tourism-related climate change policies. The sentence "Policies may vary…" does not make sense? | Editorial - copyedit to be completed prior to publication |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 8296 | 10 | 53 | 20 | | | … according TO the forms .. | Editorial - copyedit to be completed prior |

| 8300 | 10 | 54 | 15 | | | changing prices haVE on ?both? Energy service demand | Editorial - copyedit to be completed prior |
| 5223 | 10 | 54 | 18 | 54 | 21 | It is true that global scenarios are currently not available for tourism in the context of climate change mitigation (there are some for adaptation, e.g. Ciscar, J.-C., Iglesias, A., Feyen, L., Szabo, L. s., Van Regemorter, D., Amelung, B., Nicholls, R., Watkiss, P., Christensen, O. B., Dankers, R., Garrote, L., Goodess, C. M., Hunt, A., Moreno, A., Richards, J., & Soria, A. (2011). Physical and economic consequences of climate change in Europe. Proceedings of the National Academy of Sciences, 108, 2678-2683).<br>However, for a PhD thesis I am now almost finished with a global tourism emission model that allows for doing scenarios up to 2100. Included are policy imputs for cost, infrastructure investments, transport system quality and technological development. having fully reviewed paper out on scenario runs is envisaged next year. Happy to help to this respect. Still, the UNWTO presented BAU scenario sets the scen for measures as does the Peeters et al., 2010 reference used earlier in this chapter. | Noted - section has changed significantly in SOD, tourism now framed differently in the chapter (see comment 2279. Will check if results of Phd thesis can be used if the results of the phd have been published before FD submission |
| 8299 | 10 | 54 | 4 | 54 | 7 | Consider revising the wording, unclear. | Editorial - copyedit to be completed prior |
| 17553 | 10 | 55 | | | | Table is too faint to read and review. | Accepted - section has changed significantly in SOD and new figures are |
| 12015 | 10 | 55 | | | | Not readable and I can not understand what these graphs mean. | Accepted - section has changed significantly in SOD and new figures are |
| 8301 | 10 | 56 | 27 | | | the 2DS scenario IS exploring | Editorial - copyedit to be completed prior |
| 6927 | 10 | 56 | 44 | 56 | 46 | The statement "describing a pathway which tries to limit the rise in global average temperature to 4°C by 2050." is completely wrong; according to IEA ETP (http://www.iea.org/etp/explore/) it should rather be something along the lines of: limit the LONG-TERM RISE in global average temperature to 4°C which requires significant ADDITIONAL CUTS IN EMISSIONS in the period after 2050additional cuts in emissions in the period after 2050. The 4DS scenario is described as follows on the IEA ETP website: "The 4°C Scenario (4DS) takes into account recent pledges made by countries to limit emissions and step up efforts to improve energy efficiency. It serves as the primary benchmark in ETP 2012 when comparisons are made between scenarios. Projecting a long-term temperature rise of 4°C, the 4DS is already an ambitious scenario that requires significant changes in policy and technologies. Moreover, capping the temperature increase at 4°C requires significant additional cuts in emissions in the period after 2050." Please make sure to cross-check the accuracy of other scenario descriptions in your Chapter with the original source(s). | Accepted - text has been revised |
| 16172 | 10 | 57 | | | | Tables 10.11, 10.12, 10.13 give a misleading idea that "all scenarios are alike". This choice remove part of the point of the last sections in the chapter, i.e. there is room for manoeuver in more systemic or radical changes. For example, invididual energies remain nearly the same. Historically, though, entire branches have switched fuels or adopted technologies in rather short periods, phasing in or out fuels, for example the sugar industries. If the benefits of recycling is rewarded, even paper or glass may change fast. In all, the scenarios illustrate that the "absence" of radical technology implementation will limit the change in energy consumption patterns of industries. It is not helpful. | Noted - section has changed significantly in SOD and new figures are used |
| 8302 | 10 | 57 | | | | Additional Investment needs are zero for the 4DS scenario? | Rejected - comment unclear, no discussion about investment at this |
| 15892 | 10 | 57 | 1 | | | add production values for each industry sector (e.g., tonnes/yr), and their intensity (e.g., J/tonne) forecasts | Noted - section has changed significantly in SOD and new figures are |

| 7114 | 10 | 58 | 39 | | | how can emissions from air transport and accommodation triple at 130% projected growth, please clarify. | Accepted - text has been revised |
| 6755 | 10 | 58 | 7 | 58 | 27 | State the risks with the different solution, especially has the CCS technology been criticised earlier in the report, e.g. page 45, however here it is put forward as high potential solution. No doubt about that, however it feels strange for the reader. | Taken into account - overlaps with chapter 7 (Energy) on the topic of CCS have been removed from the text where |
| 7517 | 10 | 58 | 13 | 58 | 14 | 80% with CCS is overstated. For example, IEA(ETO2012) predict one third of CO2 emission even in 2deg.C senario, even in 2050. | Accepted - text has been revised |
| 16173 | 10 | 59 | | | | This figure is excellent because it includes both projections and potentials. | Noted, thanks. |
| 17554 | 10 | 59 | | | | X-axis labels have misspellings. | Editorial - copyedit to be completed prior |
| 7101 | 10 | 59 | 2 | | | Reference is UNWTO, UNWTO and WMO (2008), see also line 8, same page, as well as throughout text | Accepted |
| 17555 | 10 | 59 | 25 | 59 | 25 | 38% seems very high, but the references can't be checked because they aren't in the reference list. Also 38% in what year? | Taken into account. Due to an editorial problem chapter 10 had the reference list of a different chapter. This problem |
| 8304 | 10 | 59 | 4 | 59 | 6 | move "CO2 emissions" to after "reduction", i.e. reduction in CO2 emissions | Editorial - copyedit to be completed prior |
| 18559 | 10 | 59 | | | | A lot of the information presented here may be better placed in 10.8. A more thorough, focused discussion of the differences between the IAM community results and BU studies on industry will need to be developed and expanded in this section. | Accepted - section has been revised |
| 7518 | 10 | 59 | 24 | 60 | 2 | It is not clear what is the difinition of "Green job" of sttel industry. New technology is able to be developed to reduce CO2 emission to produce steel by exinting "large global stel producers". Since breakthrough technology development requires huge financial resorces and long research and development activity at which no return can be expected for rather long period. Only challenging large company can bear such development work. | Accepted: text has been revised, thisstatement no longer appears in the revised discussion of employment impacts (end of section 10.10.2) |
| 7115 | 10 | 6 | 12 | | | Please add: "…significant mitigation measures for the tourism sector can only be achieved through changes in demand and lifestyle". | Noted - see point 7 of new ES. Nature of discussion on tourism has changed, cf. |
| 15760 | 10 | 6 | 13 | | 16 | Seems like this would require incredible coordination across many different industries and individual companies. Might be possible were govts have a strong hand in industrial development; much more difficult in places like the U.S. | Accepted - complexities of industrial cooperation should be better acknowledged in barriers section 10.9, |
| 4791 | 10 | 6 | 17 | 6 | 19 | It could be different for other sectors. For instance regarding energy, hydropower plant with reservoirs, in addition to generate power, will also provide other benefits suhc as water storage and for instance flood control, navigation, irrigation, etc. | The example does not concern industry, comment is mostly relevant for chapter 7 |
| 8818 | 10 | 6 | 24 | 6 | 26 | It would be more specific to say that the short term payback promoted by speculative capital make mitigation with substantial but longer term paybacks make financing mitigation investment difficult to obtain in the absence of legislative requirements. | Accepted - text revised (see point 17 of ES) |
| 15878 | 10 | 6 | 24 | 6 | 30 | Additional Barriers to add:<br>o Volatile energy prices (high prices favour efficiency, low ones do not)<br>o Infrastructure Lockin (long life of facilities (30-50 years) limits new builds, tradeoffs between brownfield retrofits vs. green-field new builds)<br>o Economics (NPV, hurdle rates, use of high discount rate vs . lower “social” discount rates, how to value long term opex savings)<br>o capital allocation – tradeoffs between more production (making money), efficiency (saving money), and reliability and safety issues | Taken into account - some of these barriers could be mentioned in section 10.9, although in most cases they are dealt with in the general framing and policy chapters of the report (including the Finance chapter). The paragraph in the ES is only a list of selected examples. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 11045 | 10 | 6 | 25 | 6 | 26 | Not only new and additional approach and review the existing finance mechanism is needed as well. Please see Aaron Atteridge, Clarisse Kehler Siebert, Richard J. T. Klein (2009)Bilateral Finance Institutions and Climate Change - Stockholm Environment Institute, Working Paper - 2009 Environment Institute, Working Paper - 2009 ... | Taken into account - however due to space restriction a more in-depth discussion can be found in the finance chapter of the AR5 |
| 12343 | 10 | 6 | 27 | 6 | 28 | (Lack of) public acceptance regarding CCS can be managed by information and should not be regarded as a real obstacle. Consider to delete. | Accepted - removed from point 17 of revised ES |
| 15877 | 10 | 6 | 3 | 6 | 5 | Should include oil & gas upstream and refining, coal mining in this category since these industries have adopted many best practices and improved energy efficiency substantially. Chap. 7 only addresses these industries very superficially. | Rejected - those industries are dealt with in the energy chapter (chapter 7) |
| 12008 | 10 | 6 | 35 | 6 | 35 | What "complemenary policies" mean here to address what issues? The term should be clearly defined. | Accepted - sentence removed |
| 16136 | 10 | 6 | 37 | 6 | 42 | This finding that most scenarios involve an increase of energy demand from industry should be precised "in emerging countries" because it is misleading for developed country decision makers. In industrialised countries, demand is stable or decreasing. | Taken into account - longterm pathway discussion in the ES and main text (section 10.10) have been significantly |
| 15880 | 10 | 6 | 37 | 6 | 42 | Energy intensity (J/GDP) is not truly representative of sector energy performance or efficiency. You should use J/unit output instead (e.g., J/tonne product, J/barrel, etc). The cement section addresses this well, but others sections do not. Also need to mention/discuss structural (e.g., light vs heavy industry) vs. technical (really efficiency gains) components of J/GDP metric.<br>Note that electrification might result in less CO2 for an industry but might also be less efficient if you include the losses and emissions in the power plant | Taken into account - longterm pathway discussion in the ES and main text (section 10.10) have been significantly revised in light of results from modelling exercise. |
| 17484 | 10 | 6 | 43 | 6 | 43 | Awkward wording: "Technology oriented scenarios show possible future pathways describing that CO2 emissions" | Editorial - copyedit to be completed prior to publication |
| 6604 | 10 | 6 | 44 | 6 | 46 | Delete the sentence. It might be misunderstood that IPCC encourages a specific scenario i.e. 2DS. | Taken into account - longterm pathway discussion in the ES and main text (section 10.10) have been significantly |
| 15761 | 10 | 6 | 45 | | 46 | What is the likelihood/feasibility of achieving a 20% reduction? | Taken into account - longterm pathway discussion in the ES and main text (section 10.10) have been significantly |
| 16898 | 10 | 6 | 7 | | 12 | Suggest deleting this -- people find great utility from tourism as indicated by their willingness to pay a fairly high amount to engage in it. Air travel is a fairly small wedge of total emissions. The value of a market based system is not only that it tends to reduce the lowest costs reductions first, it also delays or gives time to find out other ways to reduce emissions for activities we value the most. Perhaps another way to think of it is that emissions from some activities are highly valued -- travel being one of those. Not all sectors should reduce at the same rate or hit the same targets -- the menu laid out in this paper seems to suggest they should. This goes against the meaning of market based policies discussed in other parts of the report. | Noted - but scope of discussion on tourism has changed in SOD, cf. Response to comment 2279. |
| 11129 | 10 | 6 | 24 | 6 | 30 | Commercially availability of alternatives is still a barrier to HFC replacement | Accepted - this barrier is explicitly discussed in section 10.9.5. However the paragraph in the ES is only a list of |
| 12949 | 10 | 6 | 2 | 6 | 2 | Not relevant and not necessarily true. Are Solar PV likely to be significant as a share of global industry emissions? Are solar PV production going to lead to an net increase in global emissions? Probably not. Not even necessarily in industry if they contribute to electrification of manufacturing. | Taken into account - Text has been revised to avoid a misunderstanding. However PV production is a source for non-CO2 emissions, maybe not the most important one, but as we try to address typical mitigation options and |

| 5224 | 10 | 62 | 31 | 62 | 31 | Suggest to add the radiative forcing share here as well (between 5 and 12%, though numbers vary a bit depending on the source you choose). | Rejected: comment not clear (context to discussion at this place is missing) |
| 12017 | 10 | 62 | 42 | 62 | 44 | It should be mentioned that the goods which contribute GHG emissions reductions at end use tend to use energy intensive materials such as carbon fires and silicon. Better quality products for longer use may need more energy to produce as compared with regular quality products. These imply that emissions at production may increase. Such an implication should be stated. | Taken into account in revision of chapter |
| 8502 | 10 | 62 | 32 | 62 | 36 | Option for mitigation of GHG emission from industry can consider action of raw materials subsitution e,g from PVC plastic packaging to biomass plastic packaging which emit less CO2 in process and during end of cycle. | Taken into account in revision of chapter |
| 17560 | 10 | 63 | | | | This figure should show disposal for (pre-consumer) industrial wastes along with post-consumer wastes. | Taken into account - but EDGAR database only contains data for post- |
| 17561 | 10 | 63 | 18 | 63 | 18 | "Waste to wealth" (using a variety of labels) is hardly a new concept!! Henry Ford was prominent proponent. Authors in Victorian England were passionate about it. See Desrochers, P. 2000. Market processes and the closing of "industrial loops": A historical reappraisal. Journal of Industrial Ecology 4(1): 29-43. | Taken into account - text revised. |
| 18560 | 10 | 63 | | | | This section is recognizably at an early stage. It may nonetheless be worthwhile to consider restructuring it according to the AR4 model (with indirect and direct mitigation strategies). The sections on Waste from chapters 5 (5.7.5) and 12 (12.4.3.11) could be integrated directly into this text. | Taken into acount. It is not possible to restructure the chapter to be similar to AR4 as space given to this section is limited compared to AR4. However, coordination has been done with other |
| 18561 | 10 | 63 | | | | To save space Figures 10.13 and 10.14 could either be deleted or merged. | Accepted - figures have been merged |
| 8354 | 10 | 63 | 3 | 69 | 26 | Chapter 10 is about industry sector. Therefore it would be better than waste sector is moved to separate chaper like AR4 WG III or chapter 11 (AFOLU) in AR 5. | Rejected - It was decided to include the waste sector as a subsection to the industry at a late stage after the approval |
| 9076 | 10 | 63 | 3 | 69 | 26 | 10.14 Waste- suggest to be treated as a separate chapter | Rejected - It was decided to include the waste sector as a subsection to the industry at a late stage after the approval |
| 17563 | 10 | 64 | | | | Some discussion of the impact of waste prevention on GHG emissions should be included. U.S. Environmental Protection Agency and Office of Solid Waste and Emergency Response. 2009. Opportunities to Reduce Greenhouse Gas Emissions through Materials and Land Management Practices: U.S. Environmental Protection Agency.<br>The statement about informal recovery is confusing. What about the involvement of the informal sector?<br>Incineration: Co-combustion of what? | Taken into account - included under waste minimization |
| 17562 | 10 | 64 | 5 | 64 | 6 | This sort of statement should be supported with a reference. | Taken into account - text revised |
| 8503 | 10 | 64 | 11 | 65 | | For waste handling activity, it good to mention types of storage container and GHG emission amount whenever it being disposed or incinerated. Especially during incineration, plastic container emit many types of GHG emission as well as other gases. As compare if the storage container made from the paper. This issue normally happen in incineration of Medical waste from hospital | Rejected - reference to emissions from waste handling in the table covers only the handling and transportation and not incineration. This table no longer |
| 8504 | 10 | 64 | 11 | 65 | | GHG emission form incineration process can be mitigated through segregating of waste material at source which in some part of the world the municipal waste is wet and it requires more fuel for complete combustion. | Taken into account - included under alternative waste treatment techniques. |
| 17564 | 10 | 65 | | | | What region is represented in this figure? | Accepted - clarified that these are world |
| 10797 | 10 | 66 | 17 | | | Composting: please refer to the book "Guia para Elaboracao de Projetos MDL a partir de compostagem". Nogueira da Silva et al. Fundacao Banco do Brasil, 2010. Portuguese. Downloadable from www.fbb.org.br. The book is a guide on how villages and poor communities can reuse/recycle organic wastes from residences and hotels. | Taken into account. Discussion of composting added in the revised text. |

|---|---|---|---|---|---|---|---|
| 15705 | 10 | 7 | 38 | 7 | 42 | Although this AR5 apporach is more holistic, which is good, this framework inherently has double counting from other sectors such as transport. This was state in the TSU notes but this is a critical issues that will likely not be resolve with just a note or table. | Accepted - issue of double counting has been discussed among report authors as it is important for the whole report. The |
| 10157 | 10 | 70 | | | | Many of the references provided in the text could not be found in the reference section. | Accepted - due to an editorial problem chapter 10 had the reference list of a different chapter. This problem has now |
| 9408 | 10 | 70 | 106 | | | Some journal informations were missing in reference even if these papers were reviewed in the text. Thus, reviewers cannot check whether contents were appropriately quated. For example, related to my paper, the following information was missing in reference.<br>Akashi, O., Hanaoka, T., Matsuoka, Y., Kainuma, M. (2011) A projection for global CO2 emissions from the industrial sector through 2030 based on activity level and technology changes. Energy, 36(4):1855-1867, DOI: 10.1016/j.energy.2010.08.016 | Accepted - due to an editorial problem chapter 10 had the reference list of a different chapter. This problem has now been resolved |
| 12952 | 10 | 8 | | | | Step 6 (using waste to substitute for resources from extractive industries) missing from model design | Accepted - figure 10.1 has been modified |
| 18515 | 10 | 8 | | | | The sixth point (by using waste to substitute resources) doesn't appear in the figure marked as a green number as the other options do. It is also not incorporated into the structure of Section 10.4. If it should be considered as a major option, may be useful to amend the figure and the structure of 10.4 accordingly. | Accepted - figure 10.1 has been modified, waste aspect is discussed in detail in a specific section 10.14 |
| 17486 | 10 | 8 | 18 | 8 | 19 | Awkward wording: "Box 1 shows a Sankey diagram clearly delineating different sources of<br>19 anthropogenic emissions aims to resolve this confusion." Perhaps some words are missing. | Editorial - copyedit to be completed prior to publication |
| 8267 | 10 | 8 | 18 | | | Sentence: "Box 1 shows a Sankey diagram …." unclear | Editorial - copyedit to be completed prior |
| 10203 | 10 | 8 | 21 | 10 | 11 | Box 1.1 and Fig. 10.2 could preferentially be moved to a more general chapter since it is relevant for all sectors | Accepted - issue of double counting has been discussed among report authors as it is important for the whole report. The |
| 8268 | 10 | 8 | 24 | | | Sentence "Using a Sankey diagram provides …" unclear | Editorial - copyedit to be completed prior |
| 15901 | 10 | 8 | 9 | | | Clarify fig. 10.1 (not clear what bottom flow box is for, also wrong chap. #'s in upper right corner) | Bottom box highlights trade-related issues. Presentation has been improved |
| 15706 | 10 | 8 | 22 | 8 | 25 | Figure 10.2 is helpful presentation of the issues associated with attribution of emissions to sectors but it is not clear that groupings in figure 10.2 parallel the chapter of the AR5 WGII report. This figure would be much more useful at addressing double counting if the categories of the figure paralleled the chapters of the report. As an example, trasnport of food and people for leisure seems to be part of transport but these are not included in transport in Figure 10.2. | Accepted - issue of double counting has been discussed among report authors as it is important for the whole report. The topic has been transferred to chapter 5 |
| 18516 | 10 | 8 | | | | I would like to echo the sentiment from Washington that this text (including figure) would be useful in an early chapter, e.g. Chapter 5. On the Sankey Diagram, it would be very useful to try and include some kind of deliniation of what is covered in which chapters -> this would also help to guide the reader through the AR5. | Accepted - issue of double counting has been discussed among report authors as it is important for the whole report. The |
| 11153 | 10 | 887 | 26 | | 27 | The statement that communication and information channels play a major role for an evaluation of the technology by the public is unlikely to come from Pietzner et al, 2011. I suggest the author checks this reference. | Accepted |
| 11154 | 10 | 887 | 27 | | 28 | The statement that there's no particular evidence on what the acceptance would be for the case of industrial applications of CCS is false. See comment 3 including a reference to an ancillary document including references on public acceptance of CCS related to real cases. | Accepted - CCS discussion has been significantly reduced throughout the chapter and is now concentrated in |
| 11155 | 10 | 887 | 30 | | 33 | The reference to de Best-Waldhober et al 2009 is incorrect in relation to the survey results from six European countries. The research in de Best-Waldhober et al. 2009 concerned a comparison of six technologies, not countries. Possibly there's confusion with another report that did compare six countries: Desbarats, J.,Upham, P., Riesch, H., Reiner, D., Brunsting, S., de Best-Waldhober, M., Duetschke, E., Oltra, C., Sala, R., McLachlan, C. (2010). Review of the public participation practices for CCS and non-CCS projects in Europe. NearCO2 report. | Accepted - CCS discussion has been significantly reduced throughout the chapter and is now concentrated in chapter 7 (Energy) |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 11156 | 10 | 887 | 33 | | 35 | An example of initiatives aiming to engage the public in a dialogue about the potential use of the technology within the context of other alternatives is the Large Group Process method used by CSIRO: Ashworth, P., Carr-Cornish, S., Boughen, N., Thambimuthu, K. (2009). Engaging the public on Carbon Dioxide Capture and Storage: Does a large group process work? Energy Procedia, 1, pp. 4765-4773. | Accepted - CCS discussion has been significantly reduced throughout the chapter and is now concentrated in chapter 7 (Energy) |
| 11130 | 10 | 9 | | | | This figure may simplify for a superhuman, for me, it is impossible to understand | Noted - this valuable feedback will be used in completing the work of publishing this diagram. However, the position within the WG3 report will most |
| 8440 | 10 | 9 | | | | I suggest to invert this figure, putting consumer need on the left and then emission vector, transofmration device, land-use, source and GHGs at the right | Rejected: figure follows the logical flow from the provision of primary energy carriers to the coverage of service demand. In any case this feedback has been forwarded to the authors of the |
| 10133 | 10 | 9 | | | | This Sankey diagram misses the segmentation by industry, which is the governing segmentation in this chapter. The Sankey diagramm from the World ressources institute would be more helpfull. (http://www.wri.org/publication/world-greenhouse-gas-emissions-in-2005: World Greenhouse Gas Emissions in 2005 is a comprehensive view of global, anthropogenic greenhouse gas (GHG) emissions. The chart in this working paper is an updated version of the original chart, which appeared in Navigating the Numbers: Greenhouse Gas Data and International Climate Policy (WRI, 2005).) | Rejected: figure is displayed incorrect in the pdf, transport, building and industry are explicitely outlined in one of the columns and discussed in line 16-17. In any case, figure will be shifted to chapter 5 and modified |
| 12953 | 10 | 9 | | | | Unless its a problem with my printer, certain important words do not seem to appear in the diagram e.g. Transport, Buildings, Manufacturing | Noted - this valuable feedback will be used in completing the work of publishing this diagram. However, the position within the WG3 report will most |
| 15904 | 10 | 9 | 1 | | | Sankey chart (fig. 10.2) is a good idea but is slightly confusing. It does a good job in showing where how the GHG emissions are allocated but does not show what the sources of these emissions are. It might be more useful to add a “standard” Sankey chart showing energy sources to the left, conversion steps in the middle (e.g., boilers, generators, compressors), and a breakdown of useful energy and wasted energy flows on the right to show where opportunity lies for improved efficiency (by minimizing waste energy, wasted product,…). The end users should also be more aligned with the traditional industry sectors (iron, steel, cement, food processing, …) o The power of a Sankey is that is shows users which industries are the “heavy hitters” or contributors. So, food, construction, and heating are more important GHG emitters than lighting, communication, or tourism (another reason why I think it is not necessary to focus on this tourism) | Rejected: figure is displayed incorrect in the pdf, transport, building and industry are explicitely outlined in one of the columns and discussed in line 16-17. In any case, figure will be shifted to chapter 5 and modified |
| 7092 | 10 | 9 | 1 | 9 | 3 | The large net sink due to forest growth and expansion should be noted., e.g. see Pan, Y., Birdsey, R., Fang, J., Houghton, R., Kauppi, P., Kurz, W., et al. (2011). A Large and Persistent Carbon Sink in the World's Forests. Science Vol. 333 , 988-993. | Rejected: figure focuses on emission and not mitigation options, discussion about the mitigation potential of forest growth is covered in chapter 11. In any case this feedback has been forwarded |
| 4542 | 10 | 9 | 12 | | | Billion? Please replace this with SI units (not sure if this 10^9 or 10^12) | Accepted - potentially confusing terms such as billion used only in a few instances now. Will be checked further |

|---|---|---|---|---|---|---|---|
| 8860 | 10 | p31 | | p32 | | Section 10.4.2.6 Page 31-32. The existing content seems too US-centric and shall be revised to cover more regions (ideally from global perspective). For example, dairy processing is among the most energy and carbon-emission intensive within global food processing industry. Xu and Flapper (2009, 2010) performed extensive analysis on global and regional dairy processing sector, and estimated that GHG emissions associated with energy use in the global dairy processing sector is responsible for over 128 million metric tonnes of CO2 emissions annually. Xu et al. (2009, 2012) identified cheese sector among the most carbon and energy intensive dairy processing, and developed a tool and recommendations for promoting mitigating strategies in the energy dairy processing sector. Supporting references are:<br>Xu, T. and J. Flapper. 2010. Reduce Energy Use and Greenhouse Gas Emissions from Global Dairy Facilities. Energy Policy. Volume 39, Issue 1, January 2011, Pages 234-247. doi:10.1016/j.enpol.2010.09.037;<br>Xu, T. and J. Flapper. 2009. Energy Use and Implications for Efficiency Strategies in Global Fluid-Milk Processing Industry. Energy Policy, Volume 37, Issue 12, December 2009, Pages 5334-5341.<br>Xu, T., J. Flapper, and K. J. Kramer. 2009. Characterization of Energy Use and Performance of Global Cheese Processing. Energy - The International Journal, Volume 34, Issue 11, November 2009, Pages 1993-2000.<br>Xu, T., J. Flapper, J. Ke, K. Kramer, J. Sathaye. 2012. Development of a Computer-based Benchmarking and Analytical Tool: Benchmarking and Energy & Water Savings Tool in Dairy Plants (BEST-Dairy). California Energy Commission, CEC 500-06-058, Lawrence Berkeley National Laboratory Report, LBNL-5679E. | Accepted - sentence added "Dairy processing is among the most energy- and carbon-intensive activities within the global food production industry, with estimated annual emissions of over 128 MtCO2 (Xu and Flapper 2009; Xu and Flapper 2010). Within dairy processing, cheese production is the most energy intensive sector (Xu et al., 2009)" |
| 4983 | 11 | | | | | Lay out of chapter did not follow outline sugessted | Rejected, Lead author meeting |
| 13513 | 11 | | | | | Lay out of chapter did not follow outline sugessted | Rejected, Lead author meeting |
| 4996 | 11 | | | | | Consider to delete table ,since it is not adding much to subsection, and not providing complete summary to what is presented in subsection | Accepted, Text has been shortened, table has been deleted |
| 13526 | 11 | | | | | Consider to delete table ,since it is not adding much to subsection, and not providing complete summary to what is presented in subsection | Accepted, Text has been shortened, table has been deleted |
| 8838 | 11 | | | | | Further, after such explanation it would be interesting to have a discussion on how the resulting GHG impacts of these changes can be accounted for products (e.g. for bioenergy) | Rejected, Accounting rules are not in scope of AR5 |
| 8779 | 11 | | | | | For this first draft I have no comments. I will waiting for the next version. | Accepted, Thank you |
| 9100 | 11 | | | | | One individual part (section or sub section) of "Forestry" should be composed. It makes clear that what is the contribution of forestry and forest products to governments and any sectors. Also role of forestry is clearer. And what governments and/or any sectors should do on Forestry.<br>That way relation between “forestry” and “another chapters” would be more clearly and practically.<br>[e.g.] “7.4.3 Renewable energy, 7.5.4 Renewable Energy in chapter 7”, “10.4.1.3 Material substitution, material reuse and waste (material efficiency), which covers recycling materials in chapter 10 ”. “Urban forestry”, which is mainly explained in chapter 12 and told some other chapters, is obviously one of “forestry”. But it is not enough to be covered in “agriculture and forestry” combined word in sections (or sub sections). | Accepted, Addressed in SOD |
| 10237 | 11 | | | | | Need to be improved in terms of format | Accepted, Revised for SOD |
| 10236 | 11 | | | | | Need to improve nearly all figure in terms of format: x-axis legend below the figure (e.g. Fig 11.2, 11.3), need to homogenize (Fig 11.1 left anf right), digital separator is "." … | Accepted, Figures have been revised for SOD. Will be further improved with |
| 16617 | 11 | | | | | The 20% figure may have been correct for the 1990s but no longer is, given the increases in total emissions since then. If this is the basis for the high figure (34%) in the final sentence it cannot be justified -- at least if you use the verb "is" rather than "was"! Make sure that all figures described in the present tense refer at least to the 2000s, and if possible to the 2005-2010 period. | Accepted, Update for 2000s |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 16618 | 11 | | | | | Are the demand-side reduction potentials in agriculture included in the agriculture figure? If not, they should be given separately. Also, do not give the high figure for agriculture ("up to 4.30 Gt") without also giving the low one, as for the forest sector. and deleted the unquantified and citation-lacking assertion that "a large proportion" of the potential is from soil carbon sequestration. | Accepted, Add for SOD |
| 16619 | 11 | | | | | Here, the "large portion" of the AFOLU mitigation potential is said to be in soils AND vegetation, but again without quantification and without a citation. Drop this sentence. | Rejected, Quantify and add references instead |
| 16620 | 11 | | | | | The question should be phrased "What are the co-benefits…" rather than "Are there any co-benefits.." | Accepted, Changed fo SOD |
| 16537 | 11 | | | | | Since as mentioned in the text the "Asia" figures are due to combining opposite trends in tropical (S and SE Asia) vs temperate (E Asia), it is important to separate out the tropical parts of Asia. Otherwise one gets the impression that deforestation is low in SE Asia, whereas just the opposite is true. | Accepted, Revise |
| 16538 | 11 | | | | | Clarify in the table heading that these represent net change (gain minus loss). | Accepted, Revise |
| 16601 | 11 | | | | | This appears to be the same data as in Figure 11.12, just rearranged in a different way (OECD vs non-OECD; where do the "Economies in Transition" fit in?). Thus it has the same problems as Figure 11.12 and Table 11.9; I suggest it be deleted. | Accepted, Revised for SOD |
| 16615 | 11 | | | | | This table completely leaves out the Norwegian program, which is has the largest commitment of funds of any country and has already achieved the most reduction in emissions (mostly in Brazil). It's important to add it. | Accepted, Added for SOD |
| 16558 | 11 | | | | | I doubt whether such a large table, simply summarizing options but without quantification of their potential contributions, really adds much (or will be read). Suggest you delete it. | Rejected, It describes the practice and provides the reader with the key papers to read on each measure. Potentials are |
| 16563 | 11 | | | | | This table is quite confusing and should be deleted. Among its problems are: a) no indication of what the separate rows within cells represent -- different estimates? Different time periods? Something else? b) no indication of the units for the numbers in the table; c)Cells that correspond to partly overlapping areas (e.g. Canada and USA", "Canada", "USA", "Europe & Russia", "Europe", "Former Soviet Union (Russia),", etc.). Most fundamentally, it's not clear what's the point it's supposed to demonstrate. | Accepted, This table went very wrong in formatting - it will be replaced in SOD |
| 16570 | 11 | | | | | The "reduction of FSC losses" line has high uncertainty and isn't comparable in assumptions to the others; it also is based to some extent on unpublished data ("Extrapolation from…."; "(in prep.)" I suggest deleting that part, and making the rest (Stehfest et al. 2009 results) into a Figure, which would be easier to interpret. | Accepted, Text was strongly revised and new references inserted |
| 16586 | 11 | | | | | Delete -- same point as # 68. | Rejected, Improved but retained - saves |
| 16588 | 11 | | | | | This table could be shortened considerably by eliminating the "could" and "can" assertions, leaving only those for which there is empirical evidence. | Accepted, Shortened and Revised for SOD |
| 16596 | 11 | | | | | Since there has been a peer-reviewed publication (Kindermann et al.) comparing the potential of forest mitigation according to these three models, I don't understand why this table presents what are apparently new, unpublished figures from those authors, and doesn't cite that paper. This leaves the chapter open to some of the same criticisms as AR4. Also, some of the numbers in the table appear to be lacking their final digits (e.g. Total for $100 for reduced deforestation and for forest management). The term "forest management" needs clarification. Finally, a Figure would show this information more clearly than such a large table. But in that case, it would have to show something beyond what Fig. 11.10 shows. | Accepted, Revised for SOD |
| 16598 | 11 | | | | | Given the new countries joining the OECD (Mexico, Chile, etc.) it's no longer a useful shorthand for "rich countries". Furthermore, this table mostly emphasizes how uncertain the estimates are (20-fold range for the global total). I suggest it be deleted. | Accepted, Is it not good to show uncertainties? Was replaced for SOD anyway |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 16528 | 11 | | | | | This figure has several problems: i) using units of GtC/yr is inconsistent with other chapters of AR5 and with other figures and text within this chapter, and looks particularly strange for emissions of CH4 and N20; ii) in both 11.1a and 11.1b, the fourth column is for a time period that overlaps with earlier columns, but is not visually distinguished or separated from those columns, making it appear incorrectly that the fourth column is for a subsequent period; iii) the quite considerable amounts of emissions from "fires" are stacked on top of those from deforestation, giving the incorrect impression that these are non-overlapping categories, which they are not; iv) the relation between the two sides of the figure (11.1a vs. 11.1b) is quite unclear -- is it that a is gross while b is net? Or that b represents additional emissions not included in a? | Accepted, Revise for SOD |
| 16597 | 11 | | | | | The point labelled "Sohngen (Copenhagen Consensus)" seems to be from a study that is not listed in the Literature Cited. Is it a peer-reviewed publication? | Accepted, Zotero updated for SOD |
| 16599 | 11 | | | | | This figure is very hard to interpret, since several of the X-axis categories would seem to be overlapping. For example: is it true that cropland management does not include actions that might help restore cultivated organic soils, nor rice management, nor restoring degraded lands, nor agroforestry? Does the "livestock" total exclude all grazing land management, and does it include the demand-side activities discussed earlier, which seem to have large potential from the data presented there? Do "Setaside", "LUC" and agroforestry overlap at all with forestry activities? | Accepted, Yes- these are all mutually exclusive. Clarified in the legend or replaced with better figure for SOD |
| 16609 | 11 | | | | | This is the Wise et al. figure and suffers from the unrealistic aspects already mentioned. There is no reason to include its projections as opposed to any of the others. | Accepted, Place holder only - scenarios not projections |
| 16533 | 11 | | | | | This figure is very confusing. Visually, all the reader can distinguish is that each panel has several lines, often crossing and with quite different trends, and which turn out to represent quite different kinds of variables (land areas, livestock numbers, fertilizer). There is no way one can see which region is most important for which variable, nor how they might or might not be correlated with each other. Rather than having the separate panels be regions, I suggest reversing the panels-vs-lines relation, so that each panel represents a separate variable (e.g. a for arable land, b for pastures, c for forest land, d for cattle, etc.) This will allow you to stack, and separately color, the values for each region, so that the reader can see which are the largest ones and how the scales (e.g. for arable vs pasture vs forest land) compare. I would also suggest using a more neutral term that "reforming economies" for the EIT countries. | Accepted, Figure revised for SOD, including actual numbers. A regional breakdown has been agreed as cross-cutting issue for all chapters. |
| 16546 | 11 | | | | | As with Figure 11.1, the third set of columns appears visually to be simply a later period than the first two, whereas in fact it combines them. There needs to be a visual break of some kind between 2 and 3. Also, it needs to be explained how "land use change" relates to the other bars (is it the combination of all of them?) and whether the "deforestation" and "secondary vegetation" bars are tropical only (since boreal and temperate forests are shown separately). Finally, where in this figure would forest degradation show up? | Accepted, Revise figure for SOD |
| 16575 | 11 | | | | | This figure can also be deleted. It has no quantitative data, and it's not at all clear what the differences among its components (e.g. two kinds of arrows, 5 kinds of shapes, 5 colors) are supposed to represent. | Accepted, Figure has been revised for SOD |
| 16577 | 11 | | | | | The text (p. 34. lines 16-17) says that this figure demonstrates different synergies and trade-offs for demand vs supply side measures. However it's not indicated in the figure where the boundary between demand and supply sides is. Should indicate that on the figure, or delete it. | Accepted, Figure was completely redrawn |
| 16587 | 11 | | | | | Delete -- same point as # 68. | Accepted, Considering all comments on this graph, we have improved the design |
| 16591 | 11 | | | | | This figure doesn't make the point for which it is cited (number 73), and failing that, it's not clear what it contributes other than indicating the great uncertainty of model predictions. Unless you wish to assert that in the text, it can be deleted. | Accepted, Revise figure for SOD |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 5518 | 11 | | | | | General comments- It would be very helpful for the reader if the authors could somehow divide the discussion into forestry, wild lands, and agricultural lands. These different land uses are currently interspersed and it is difficult to follow. There seems like the discussion on forest lands often eclipses the discussion on agricultural lands, and particularly the challenges to food production. If these topics could be divided- following a similar outline for each, it would be a much more effective way to present information. Finally- I realize that there are sections to be written to integrate a greater discussion of sustainability- but these are critical and I would encourage the authors to follow through on this linkage. Finally, the chapter makes no mention of how AFOLU interacts with urban spaces. This seems like a small but significant factor that merits discussion. There is an increasing trend to integrate ecosystem processes into urban areas- including bioretention systems to capture rainwater, green roofs and urban agriculture. The potential impacts for this type of development should be mentioned | Partially Accepted, We wish to integrate across land uses more rather than less, but the issue of under-represented land uses is well made and will be addressed in the SOD |
| 5515 | 11 | | | | | Adding a column with target area for each program would be helpful | Accepted, Good idea - revised for the |
| 3762 | 11 | | | | | An entry on the co-benefit of mitigation from RED for biodiversity conservation is warranted | Accepted, Interactions between REDD+ and biodiversity were included |
| 3764 | 11 | | | | | This table ought to include UNREDD and the REDD+ Partnership | Accepted, UNREDD was included in the |
| 4275 | 11 | | | | | Overall Excellent. In several places discussing forest disturbances, leaves impression (without actually saying so) that insect and disease disturbances are insignificant compared to fire. Mantions invasive alien species only in passing on page 43 line 19, even though they are a possibly significant feedback. | Accepted, Thank you |
| 11975 | 11 | | | | | In general, this is an excellent chapter and a real "tour de force" of all the critical issues on AFOLU. Mostly, the specific comments are simply recogninisng taht there are biodiversity considerations, alongside emision considerations, of AFOLU mitigation options | Accepted, Thank you |
| 11977 | 11 | | | | | The explanatory notes need to state what is included here, especially whether it includes plantations. | Accepted, Add for SOD |
| 11986 | 11 | | | | | Explain "technical potential" in teh footnote | Rejected, It will be in the glossary |
| 18231 | 11 | | | 10 | | • Table 11.1 (Trends in extend of forest 1990-2010); page 10, indicates that South America and Africa are the regions with more loss of forests. This trend diminishes in both regions during 2005-2010. The arguments of the report refer particularly to the diminution of deforestation in Brazil. The source of the data is report FRA 2010, published by FAO. Probably, many countries have not been able to update data of deforestation and forest degradation, because limitations in taking a baseline in the field, which forces them to maintain the same deforestation rates. | Noted, This is a statement - not clear what action is required |
| 18232 | 11 | | | 16 | | • In table 11.2 (Summary of production-side mitigation options in the AFOLU sector); page 16, regarding mitigation options in the productive forest sector, are included: reducing emissions from deforestation and forest degradation (REDD), afforestation/reforestation, improvement of forest management, plantations, sustainable management of the native forest, agroforestry and bioenergy generation by forests and plantations. In brief, these are different mitigation measures that each country adopt or will adopt in accordance of their forest-environmental policies. In the context of the Convention on Climate Change, Venezuela does not adopt REDD mechanisms, however the country have been developing management actions for sustainability of forests which result in voluntary mitigations. | Noted, This is a statement - not clear what action is required |
| 18230 | 11 | | | 7 | | • In graph 11.1 (Global trends in CO2 eq emissions from AFOLU (a) and net C emissions from land use, 1 land use change and forestry activities (b), Gt C/yr.); page 7, it shows that the largest emission of CO2 to the air comes from deforestation and burning, which raised significantly after the 90`s. It is hard to extrapolate or infer the situation of Venezuela within these numbers, since they are adding trends. Similarly, it is observed regarding the raise of the C global, that there are slight fluctuations in more than a decade. | Noted, We do not say anything about Venezuela, nor is the figure intended for any one country to infer trends from it |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 2367 | 11 | | | | | The cost elements are not clear and not overly recent. Recommendation to contact some key countries in which ambitious REDD+ efforts are underway (Brazil, Guyana, Indonesia, PNG, DRC). It is highly unlikely that those programs are already featured in peer reviewed academic literature, but they are just now being implmented at scale for the first time. Thus, IPCC should attempt to get best available information to make this chapter as relevant as possible to the next politicians who want to implment REDD+ measures. (Consider text boxes with case examples) | Accepted, Policy section rewritten and REDD+ text improved |
| 15172 | 11 | | | | | not readable/comprehensible as is | Accepted, This table went very wrong in formatting - it will be replaced in SOD |
| 16223 | 11 | | | | | REDD+ Partnership is not in the table; it came out of Copenhagen--now has many countries and $billions in pledges | Accepted, REDD+ partnership was included in the table |
| 16220 | 11 | | | | | Note the BAU scenario against which these reductions should be compared (in GTCO2e/yr) | Accepted, Add for SOD |
| 16209 | 11 | | | | | Is this based on the remote sensing assessment from FAO FRA? Or just the self-reported country data? The former is at least using a uniform methodology; the latter suffers from multiple different approaches and accuracies. Also surprising not to use non-FAO derived estimates, at least to bound these estimates (e.g. Hansen et al PNAS 2009?) | Accepted, State source |
| 2570 | 11 | | | | | Refer to GEA Chapter (Knowledge Module) 20 on land use and water for bioenergy | Accepted, Table has been deleted. Its content has been used in section 11.7 using the corresponding references. Reference by the reviewer is not complete. The issues correlating land |
| 13339 | 11 | | | | | Not clear what the units are. | Accepted, Added for SOD (in MtCO2/yr) |
| 13311 | 11 | | | | | Text is deformed, reformat. | Accepted, Revise figure for SOD |
| 7082 | 11 | | | | | In the row "Natural assets", in the first column, need to change first sentence to include "planted and other forests." Also, in the discussion of plantations later in this same part of TAble 11.7, it should be noted that the potential for the types of adverse impacts suggested for plantations are highly site specific and can often be mitigated by a variety of means. | Accepted, Table has been deleted. Its content has been used in section 11.7 |
| 7083 | 11 | | | | | In the row "Economic factors", in the first column, add the fact that "Demand for forest products give economic incentives for keeping land in forest rather than converting to non-forest uses." | Accepted, Table has been deleted. Its content has been used in section 11.7 |
| 7062 | 11 | | | | | Somewhere in this section, it would be useful to observe that although increasing amounts of fertilizer are being used in forest management, the amounts are small compared to those used in agriculture . e.g. see USEPA (2012), INVENTORY OF U.S. GREENHOUSE GAS EMISSIONS AND SINKS: 1990 – 2010 - which observes that "Direct N2O emissions from fertilizer application to forest soils have increased by 455 percent since 1990, but still account for a relatively small portion of overall emissions." | Accepted, Section 11.2.3 has been largely revised for SOD, reduced in page number and information. |
| 4273 | 11 | | | | | At first of this chapter there is used C and CO2 for emission and sink, I think that should be good if only one (C or CO2) is used instead of both | Accepted, Revised for SOD - all should be converted to CO2-eq. |
| 2149 | 11 | | | | | better understanding of the rural livelihood effects of curent carbon finance institutions in case those become more and more frequent in agricultural contexts - in particular, how do MRV requirements from carbon finance interfere with optimal agricultural production planning and implementation, etc. | Rejected, Not sure where this is suggested to go |
| 2146 | 11 | | | | | as it is first discussed in the text, put "co-benefits" in the first column | Accepted, Revised for SOD |
| 2138 | 11 | | | | | section Bioenergy/Natural assets: add: "May lead to competition for biomass used for bioenergy production or used as organic fertilizer in crop production" | Accepted, Table has been deleted. Its content has been used in section 11.7 |
| 2139 | 11 | | | | | also point out that biomass residues can become scarce in a region if too many biomass projects are implemented, thus driving up prices for this biomass waste, that was basically without a price before. This can compromise economic viability of residues based bioenergy - as e.g. happening in the context of the CDM in India. | Accepted, Table has been deleted. Its content has been used in section 11.7 |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 2128 | 11 | | | | | drop the CO2e on the vertical axis to the left of figure 11.1.a - it's Gt C only, I guess. - Calrify the figures in general - are they consistent? - 111.1.b does not cover deforestation? - Why not combining the two figures into one only? | Accepted, But change to CO2 in the figure instead |
| 7496 | 11 | | | | | ALFOU. My comments have already been submitted. (uploaded document 254). | Noted, No action required |
| 10183 | 11 | | | | | 1. Points in this table are important and interesting and could be discussed in more depth in some cases, e.g. competition between global benefits and local negative effects. 2. On the horizontal level of the table, are points under the different categories (i.e. risks, uncertainties, co-benefits and spill-over, respectively) related or unrelated? 3. This table might become clearer if points are related to specific mitigation measures. | Accepted, Revised for SOD |
| 10185 | 11 | | | | | How can increasing desertification be an opportunity? | Accepted, Incorrect - revised for SOD |
| 10189 | 11 | | | | | For Amazon: the same text used for context as well as objectives and strategies | Accepted, Incorrect - revised for SOD |
| 10174 | 11 | | | | | not all symbols in the graph are represented in the legend | Accepted, Revise figure for SOD |
| 10176 | 11 | | | | | Values for total economic mitigation potential are not the same although deriving from the same publication, e.g. cropland management is higher than grazing in the figure but lower in the table for <100 USD/tCO2 eq. | Accepted, Table removed |
| 10187 | 11 | | | | | Text: 1. lines 11-17 repeats lines 6-11, 2. FFICT and UCT scenarios/pathways are not discussed or described in the main text | Accepted, Revise figure for SOD |
| 10171 | 11 | | | | | Figure legend explaining the colour scheme is lacking | Accepted, Revise figure for SOD |
| 11811 | 11 | | | | | An interesting reference for the bioenergy part of the table maybe: Schulze et al. GCB Bioenergy doi: 10.1111/j.1757-1707.2012.01169.x | Accepted, This is new since FOD - has been revised to include newer references |
| 7163 | 11 | | | | | Overall comments: | Noted, |
| 7164 | 11 | | | | | It is useful to have a discussion on the 'definition of forest' in the beginning of the chapter, unless this topic has been touched upon in other chapters. Internationally accepted definitions should be used to avoid misunderstanding, and mis-interpretation of this chapter and to encourage mitigation measures that in fact encourage the opposite: destruction of natural ecosystems and loss off biodiversity by developing (high-carbon) monoculture ecosystems. E.g. the Indonesian definition of forest is: an area ≥ 0.25 ha, crown cover ≥ 30%, tree height ≥ 5 m. This may include any type of tree. If for example in tropical regions a natural existing peat swamp forest is being converted into an acacia plantation (which following the Indonesian definition is considered as reforestation), from a national-definition-point-of-view nothing happens: forest remains forest. | Rejected, Refer to standard IPCC / UNFCCC definitions (national) |
| 7165 | 11 | | | | | Since anthropogenic GHG sources in the AFOLU sector include fluxes from management of land (crops, forests, grasslands, wetlands) and land use change, all main sources and/or sinks should be broadly discussed while looking at mitigation measures to reduce fluxes from these activities. Unfortunately, this is not the case. Illustration: the word peatland or wetland has been used < 20 times in this chapter, the word 'forest' has been used > 500 times. No Figs. on 'fire' as a source or 'drained peat' as a source (fire is partly shown in fig. 11.1, but the other figs. are on forest only), which both are major AFOLU emission sources. Throughout the document I have tried to give suggestions to also include wetlands/peatlands/fire part in the various sections | Rejected, The chapter is about mitigation, not emission sources (which are the focus of WGI) |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 7166 | 11 | | | | | No mitigation measures are given for reducing emissions from managed peat (in. table 11.2, only soil C restoration on peatlands and improved land management are mentioned), while it has been demonstrated that peat oxidation is a major and increasing GHG source: 'CO2 emissions from drained peatlands in the world have increased from 1.1 Gton CO2 yr-1 in 1990 to 1.3 Gton CO2 yr-1 in 2008 (Joosten et al., 2012, page 14). Because of more and more scarcity of mineral soil in e.g. SE Asia, pressure on peatlands for agricultural (booming oil palm business) development is increasing. Suggestion: include wetlands/peatlands and fires throughout the whole document (e.g. in tekst, tables and figures) and in the discussion since these are major (potential) GHG emission sources within AFOLU, which should be considered in mitigation policies (e.g conservation of peat and rewetting of peat (PRC projects), measures to avoid fires etc), but also optimizing management in drained peat for agriculture (optimizing drainage systems, high water table etc) and encouraging paludicultures as an alternative for crops that need deep drainage. REDD+ does not only include forest conservation, sustainable forest management and enhancement of carbon stocks in forest, it also takes into account conservation and rehabilitation of soil carbon stocks which more clearly should be addressed in this chapter | Accepted, Included |
| 7167 | 11 | | | | | · Discussion is missing on implementation of mitigation measures e.g. by global initiatives such as Roundtables. 1) how and where to implement 2) how to increase the platform or basis of the (right!) stakeholders that support measures 3) how to implement as effective as possible taking into account future development trends, future demand trends etc. E.g. for production of bioenergy there could be a discussion on | Accepted, Added to policy implementation section |
| 7168 | 11 | | | | | o Continued globalization of bioenergy production over the next 20 years, including concentration of bioenergy production into regions and farmers cooperatives, debates about 'free trade' and 'protectionism'. | Accepted, Added to policy implementation section |
| 7169 | 11 | | | | | o The globalization-related changes in power relations (un-balanced power) and the related risks of exclusion of participant(s) (groups) such as small farmers, local communities, and poor countries from the debates. Debates and discussions within the participant groups could then become decentralized; how te deal with that?. | Accepted, Added to policy implementation section |
| 7170 | 11 | | | | | o Different participant groups have different forms of engagement (pragmatic and functional, justifiable, familiar). Understanding between participants and interactions between them needs to be promoted. | Accepted, Added to policy implementation section |
| 7171 | 11 | | | | | o Because the focus is on GHG emission savings which is one of the main drivers behind the production of bioenergy, the risk of exclusion of social vulnerabilities should be considered in mitigation measures. | Accepted, Added to policy implementation section |
| 7172 | 11 | | | | | o The debate on the indirect impacts of large scale bioenrgy production related to food supplies, food prices, and food scarcity. | Accepted, Has already been done, but has also been improved for SOD in |
| 7173 | 11 | | | | | Good implementation procedures are the key to successful GHG emission reductions | Accepted, |
| 7174 | 11 | | | | | In this chapter it shall be more clearly highlighted that a very important mitigation measure to reduce GHG emissions and to produce sustainable products in the AFPLU sector is to define 'no-go-areas' for agricultural expansion and land use planning. Kaper et al., 2008 concluded that the most sustainable case for 'choice of agricultural land' considers not to use 1) forest land, 2) steep terrain, or 3) vulnerable peat soils if the crop needs drainage. Wicke et al (2008) and Germer and Sauerborn (2007) studied the sustainability of production of palm oil (as a bioenergy crop). They concluded in their studies that in order for products to be sustainably produced from palm oil and its derivates, only (non-peat) low-carbon degraded land should be used for palm oil production and plantation management should be improved. With growing demand for both food and fuel export, as well as for domestic biodiesel production, it is likely that significant further land use conversions to oil palm will occur (Koh and Wilcove 2007; Levanget al., 2008) and will put further pressure on peat swamp forests (Rijenders and Huijbregts, 2008; Fargioneet al., 2008). Land use planning and good governance is mentioned as a tool to sustainably produce biofuels, however, this is at the end of the document (page 70) under sectoral policies and should be mentioned earlier. | Rejected, Policy prescriptive - entirely inappropriate for IPCC |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 7175 | 11 | | | | | Throughout the document there is some repetition of topics. I think the chapter could be easily shortened by avoiding this repetition | Accepted, Addressed in SOD |
| 7193 | 11 | | | | | Full and effective participation, broad platform (means meaningful influence of all relevant rights holder and stakeholder groups who want to be involved throughout the process, and includes consultation and free, prior and informed consent). | Accepted, Added to policy implementation section |
| 7194 | 11 | | | | | Good governance (includes accessibility, people's participation, transparency, accountability etc). | Accepted, Added to policy |
| 7195 | 11 | | | | | Implementation is understood to include on-going planning/decision-making as well as the implementation of the activities. | Accepted, Added to policy implementation section |
| 7196 | 11 | | | | | In the section 'successful implementation' it would also be interesting to have a discussion on the current status of mitigation measures. Mitigation projects (e.g. REDD (+) projects etc) are running, but most of them are not very successful until now. What is the problem? What should be improved? Another brief discussion related to this could be on 'validation of carbon credits' which is extremely complicated (in terms of monitoring, reporting, verification of baselines, project scenario's leakage etc) at the moment for project proponents, again, it would be good to relocate some of the text of 11.10 to this section, e.g. lines 29 onward, page 69 . | Accepted, Added to policy implementation section |
| 7203 | 11 | | | | | Page 45. Section 11.5.3. Perhaps this is a good paragraph to clearly show the separation between 1) climate impacts 2) human induced impacts and 3) natural disturbances. Impacts that have to be addressed can by summarized in 1) Offsite impacts resulting in a change in GHG emissions 2) On-site changes in GHG emissions 3) ILUC impacts. | Accepted, Addressed in SOD |
| 7186 | 11 | | | | | Does re-vegetation belong in this category? So, revegetation with vegetation that does not fulfil the requirements of the 'forest-definition' | Accepted, Clarified for SOD |
| 7187 | 11 | | | | | Land-based agriculture. Missing mitigation measures: Peat soil conservation (not only restoration), peat soil rewetting (or is that meant with restoration of organic soils?), crops on peat that do not need drainage (paludicultures) | Accepted, Added to table |
| 7188 | 11 | | | | | o Bioenergy. No bioenergy products from high carbon land (such as palm oil on peat). | Rejected, Not clear what action is |
| 7189 | 11 | | | | | Mitigation measures to reduce fires missing? E.g. Zero-burning practices for land clearing, fire detection and control, and rewetting to avoid peat fires. Fires is one of the major sources, mitigation measures should be included. | Partially Accepted, Can Discuss further but can increase fuel load and lead to greater C loss-so not correct as a |
| 7199 | 11 | | | | | This table needs revisions. Below an example of how the second column of the table could be optimized (avoid the word potential in the table, this is already in the title, the following question has to be answered in the table 'what are the potential impacts of AFOLU mitigation measures". | Accepted, Table has been deleted. Its content has been used in section 11.7 |
| 7210 | 11 | | | | | Suggestion: insert Global land area of Wetlands and/or peatlands under 'crops' since this is a category in AFOLU | Accepted, Revised for SOD |
| 11159 | 11 | | | | | Unfortunately, initiatives from many smaller developing countries tend to be very small scale. The nature of the scale, coupled with the wide differences in socio-economic and cultural differences over thousands of tribes etc especially in Africa means that these case examples are not identifiable. Specific success stories - eg. policy changes and continuing streamlining of land policies among countries in Afica that enhance the role of AFOLU in CC mitigation; | Accepted, Revised for SOD |
| 10596 | 11 | | | | | There is a GAP in the whole chapter (and report) on FISHERIES and AQUACULTURE. For example Table 11.2 could have a Fish section covering mitigation options. Useful examples are included in: FAO, 2011. Energy-smart food for people and climate, UN Food and Agricultural Organisation, Rome. 65 pp. http://www.fao.org/docrep/014/i2454e/i2454e00.pdf<br>Also if need a CA on fish, are some good people at FAO who might assist - eg Frank Chopin or Cassandra DeYoung | Accepted, Fisheries and aquaculture added for SOD - new CA on this topic has joined the team |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 3961 | 11 | | | | | Indian Research papers published in literature may be cited for crop residues production as well as feed and fodder deficit data given in report of 12th Plan submitted to Govt. of India (2012-2017). This information may be included "Over the last two decades (1985-86 to 2005-06) availability of various types of feed has increased. Even though availability of feed resources vary from area to area, but during this period, the India as a whole recorded 52% (240.7 to 365.8 Mt), 76.0% (19.6 to 34.5 Mt) and 1.8% (124.3 to 126.6 Mt) increase in crop residues, concentrates and green forages respectively. In spite of this, there is a gap in the availability vs. requirement. As per estimates, the deficit of dry<br>fodder, concentrates and green fodder currently is 10, 33 and 35 percent<br>respectively, which by 2020 is likely to be 11%, 35% and 45%." | Rejected, Too country specific - we cannot cite every paper and report for every country - this is a synthesis |
| 15348 | 11 | | | | | Smithers, R.J.; Cowan C.; Harley, M.; Hopkins, J.J.; Pontier, H. and Watts, O. (2008) England Biodiversity Strategy: Climate Change Adaptation Principles. Conserving biodiversity in a changing climate. Defra, London. 16pp. | Rejected, Not sure what is suggested here. This is an adaptation report - not a mitigation paper |
| 16051 | 11 | | | | | In general , the chapter is OK structured and written, but has, in my opinion, some major drawbacks related to forestry which should be improved in the next version. These drawbacks are: 1. The estimates of forest mitigation potential should be much more geographical explicit and linked to types of forest ecosystem and baselines/additionality. For example, very few studies from Scandinavian boreal forests are referred to and used. Many of these studies are considerably more specific than the US/North America and global studies referred to in Ch. 11, both regarding forest manangement options included, simultanously including bioenergy and "normal" end-uses of forest fibre (e.g. competition to the existing forest industries and substitution impacts), and regarding analysing additionality. 2. Carbon leakage impacts should be more thoroughly discussed (for example that decreased harvest in country A will in most cases lead to increased harvest in other countries, thus reducing the direct carbon sequestration impacts in country A).Because of time limitation I have managed to comment just so generally . If references are needed to Scandinavian/European articles , just contact. | Accepted, Revised for SOD |
| 15228 | 11 | | | | | In general, I think the chapter is well-balanced among different approaches. It is an improvement from AR4 to combine forest and agriculture in mitigation efforts related to land use, they are indivisible in practice and it is good to see an integrated holistic approach to those. | Noted, Thank you |
| 14418 | 11 | | | | | Overall the chapter is a good summary of the complexity of managing agricultural and forest landscapes for C storage and GHG reduction in terms of ecological capacity, as well as social and economic constraints. | Noted, Thank you |
| 14419 | 11 | | | | | 11 Throughout chapter parentheses for citations are not consistently formatted. | Accepted, Zotero updated for SOD |
| 17999 | 11 | | | | | The definition of spill-overs used in this section seem to deviate substantially from the topics discussed elsewhere in the report (e.g. carbon leakage, technological spill-overs, etc.). See my comment on section 11.7.3. | Parially Accepted, Section has been reviewed. The reviewer should consider that spillovers from AFOLU differ from other sectors anyway. . However the text |
| 6780 | 11 | | | | | Suggest add "interaction of desertification and crabon ",controlling desertification of lands is important sustainable development,and it can increase the carbon sequestation in lands.Inorganic carbon is important in arid region,so add some content about land use change on inorganic carbon. | Accepted, Included as a potential co-benefit (section 11.7) |
| 18922 | 11 | | | | | Try to convert into figure (absolute and % values; time range normalization needed for that); consider adding historic values (see Section 11.2.2) to that. | Accepted, Converted to figure for SOD |
| 18931 | 11 | | | | | Some issues brought up in this table have been critically discussing with regard to sustainability (negative effects and emissions from production of fertilizers; improving crops and breeds might include GMOs that are by some critically discussed; water availability in cropland leading to increase of competition for water; long term effects of dietary additives such as antibiotics; ). Please consider discussing these issues here or in the sustainability section with reference to the table. | Parially Accepted, Added refs but these issues are mainly dealt with in trade-offs section |
| 18932 | 11 | | | | | Giving ranges once the data is available sounds very good. Please consider turning it into a figure - possible several figures, one for each of the 5 world regions + 1 global. | Accepted, This table went very wrong in formatting - it will be replaced in SOD |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 18914 | 11 | | | | | Four comments: (1) In a) I suggest to change the order within the bars, having deforestation at the top, as this is most volatile - this will help comparing changes in the other aspects much better. Also try to separate the last stack from the others (e.g. by a vertical dashed line) as this one does not follow the time sequence of the others. (2) This figure should in my view be ammended by historic data from Ch.5 (or that historic data should go into separate figures). (3) In the caption line 4 it says "1990-2007" with respect to a) but this range is only found in b). (4) In line 10 there is a citation software error. | Accepted, Revised for SOD |
| 18919 | 11 | | | | | As the increase is very different for poultry please consider adding that data, too, if available. In order to be able to better compare world regions, consider having the same y scales for all figures here. | Accepted, Text revised to include non-ruminants |
| 18926 | 11 | | | | | I like the figure but have a few comments: (1) Could you clarify whether the last range is the sum of the other two or whether this is based on other data? (2) There should be a legend explaining the single points (i.e. which shape which study). As the other legend uses squares try to have a different symbol than a square for the single points. (3) I suggest to align the single points with the bars of the same colour, as otherwise the viewer asks him/herself whether it has any meaning that they are set aside. (4) I think it would be very good to also give the total over the different aspects, if nothing speaks agains adding the Pan data and if this is available for the other studies. (5) As the numbers labeled can already be read from the y-axis, consider replacing those values by % values, which would be interesting to have as additional information in the figure. | Accepted, Changed for SOD |
| 9446 | 11 | | 32 | | 32 | A trend is a real, observed phenomenon. It is not driven by a projection unless that projection causes people to act differently than they otherwise would have. | Rejected, No page number - cannot act |
| 7055 | 11 | | | | | It appears that throughout this chapter the "net co2 fluxes from management of land (croplands, forests, grasslands, wetlands)" is collectively referred to as "land use" but this is not clear. For instance, in the next sentence, the categories suddenly switch to land use, land use change, and forestry. And then in the next sentence, the terminology seems to change again - this time to "land management and land use change". This shifting of terminology makes it almost impossible for the reader to know exactly what is included in the various parts of the discussion. At the beginning of this section (perhaps in 11.1) the text should clarify what is meant by the various terms and the terms should be used consistently throughout. | Accepted, This should be dealt with in the glossary - but we should also use consistent terminology in SOD |
| 3531 | 11 | | | | | It is appreciated that Agriculture and Forestry are treated in a single sector AFOLU. I suggest to avoid to personalize the text. | Rejected, Cannot see what personalize means here |
| 15205 | 11 | | | | | glad to see review of REDD | Noted, Thank you |
| 2147 | 11 | | | | | may further emphasize the role of co-benefits in policies - e.g. the EU nitrate directive may has been the most effectice mitigation instrument for agriculture in the EU - and a similar soil-directive, still under discussion, could similarly benefit mitigation via soil carbon sequestration - while both these directives have not been aimed at supporting CC mitigation. | Accepted, Comment on the impacts of Nitrate Directive on mitigation of N2O was included |
| 2148 | 11 | | | | | add: better understanding of the combined C- and N-cycles - e.g. the influence of SOC levels on N2O emissions and also the dependence of N2O emissions on fertilizer types (incl. Legumes). | Accepted, Was reflected in SOD |
| 7216 | 11 | | | | | Gaps in knowledge and data. Add a bullet: Better data on the extent and depth of peatlands on a global scale. | Accepted, Added for SOD |
| 4991 | 11 | | | | | Title suggested in ouline fits more with content of section rather than this title . Delete the words ( New developmen in ) | Accepted, Changed for SOD |
| 4992 | 11 | | | | | In subsection 11.2.1 something on consumption of woodfuels in developing counteries can be added to subsection | Accepted, Done |
| 13521 | 11 | | | | | Title suggested in ouline fits more with content of section rather than this title . Delete the words ( New developmen in ) | Accepted, Change for SOD (duplicate comment) |
| 13522 | 11 | | | | | In subsection 11.2.1 something on consumption of woodfuels in developing counteries can be added to subsection | Accepted, Done |
| 14428 | 11 | | | | | It would be easier for a reader to compare the relative significance of a particular land cover if all numbers were reported in Gt. | Accepted, Done |
| 18923 | 11 | | | | | Try to convert numbers in this and the following sections into figures. | Accepted, Change to consistent units for |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 16540 | 11 | | | | | This section is densely packed with numbers, which are not easily understood when they simply follow each other in text. It would be helpful to reduce the text and express some of the changes and comparisons among estimates in Figure or Table form. | Accepted, Section rewritten for SOD |
| 7184 | 11 | | | | | Trend of C fluxes in land use and land use change. An overview is missing on C fluxes (per climate zone) in the AFOLU sector. It would be good to have a table with the main sources and sinks, ordered on source or sink sizes. This illustrates the relative importance of certain measures in terms of carbon 'gains' and GHG emissions reductions | Accepted, Section rewritten for SOD |
| 18927 | 11 | | | | | This section has a lot of numbers in the text. These are very hard to digest and make it difficult to keep with the flow of the text. So, please consider moving numbers into a table or better a figure and focus the text on contextualizing and interpreting the data. | Accepted, Section rewritten for SOD |
| 16556 | 11 | | | | | Another section with many numbers presented in text -- reduce the text and give the information as a Table or Figure. | Accepted, Section rewritten for SOD |
| 3959 | 11 | | | | | Contribution of ruminants towards methane emissions is missing so it should be added in this chapter | Rejected, Incorrect - ruminant methane is discussed throughout |
| 15159 | 11 | | | | | possible to replace some wordy, data laden text with figures? | Accepted, A new table is added that will reduce the amount of text |
| 15160 | 11 | | | | | a very interesting section, and perhaps the heart of the chapter. But, it repeats on itself across all subsections, especially on the topics of bioenergy/biofuels, diets, and land tradeoffs. The message seems to come through that there is a need to be create multi-criteria land uses (without a myopic focus on mitigation). That's a good message, but could be much better organized and tightened throughout the entire section. | Accepted, Agreed - have made more central to the storyline on the chapter for SOD |
| 3960 | 11 | | | | | Mitigation technology options and practices being adopted in feeding strategies of ruminants are to be given in this sub-section | Accepted, New table has been constructed and updated with more |
| 8839 | 11 | | | | | Would biomass based materials (biomass-baded plastics, natural fibre for material reinforcement, fine chemicals from forest residues, …) deserve a place in this section as well? | Accepted, Added reference here |
| 15161 | 11 | | | | | section cn be reduced/ tightened | Accepted, Revised for SOD |
| 17353 | 11 | | | | | Changes is global diet. This study needs to be better explained. Does it mean that is possible to conceive a diet that would be "healthy" for all persons in the world and still be healthy? There is more than one assumption here involved, as culture etc are all mingled with food. This is a difficult proposition and deserves further elaboration. | Accepted, Revised, references added |
| 5750 | 11 | | | | | The reasons for food loss/waste could be added as per pag. 26 of the FAO Energy-smart food report (http://www.fao.org/docrep/014/i2454e/i2454e00.pdf) | Accepted, Revised, references added |
| 11814 | 11 | | | | | This whole section is very conceptional is data and/or examples could make it more tangible for the reader and its arguments more convincing | Accepted, Section edited. Published papers to support examples not readily |
| 12074 | 11 | | | | | Please add a discussion on the point that timing of mitigation benefits from actions (e.g. bioenergy, forest management, forest products use/storage) can vary and that timing of benefits needs to be considered in judging the effectiveness. Cherubini et al (2012) gives examples for how timing of benefits varies for forest management to produce wood for energy or wood for products that have different use lives. [Cherubini, F., Guest, G. and Stromman, A. (2012). Application of Probability Distributions to the Modeling of Biogenic CO2 Fluxes in Life cycle Assessment. Global Change Biology Bioenergy, 1 - 15.] | Accepted, Commentary on timing of mitigation benefits added to end of section. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 12079 | 11 | | | | | Given the importance of assessing the risk of alternate mitigation strategies I suggest there is a great opportunity for the authors to prepare a table for this section that has as its columns the risks to mitigation noted in this section (ie nonpermanence/ reverablity; saturation; human and natural impacts (threats?); displacement/leakage) and as its rows the alternate strategies identified in previous sections of this report. I think the magnitude of risk - OF NOT ATTAINING MITIGATION BENEFITS would differ greatly, for example, between afforestation, avoided deforestation and biomass use for enegy from roundwood in forests. I think riskiness issues and uncertainties in risk could be identified. This would provide a dimension of understanding risk that is not shown in many model estimates of mitigation benefit where there is assumed certainty (mostly) in carying out the mitigation activities at least for a given scenario. I'll forward a table where we attempted to do this for the U.S, for forest sector mitigation actions for the Forest Sector report of the forthcoming U.S. National Climate Change Assessment. | Accepted, This is an excellent suggestion, however a published study that provides a quantitative basis for this analysis is not available. The US National Climate Change Assessment update, noted in this comment, has not been published (12/2012) and is "scheduled to be completed in 2013" http://www.globalchange.gov/what-we-do/assessment. This chapter is also for AFOLU rather than forestry alone and similar assessment as suggested for |
| 4993 | 11 | | | | | Suggest to remove subjection 11.4.4 since most of information are tackled in 11.10 and in other section of chapter 11 | Rejected, Retain here as per IPCC outline |
| 13523 | 11 | | | | | Suggest to remove subjection 11.4.4 since most of information are tackled in 11.10 and in other section of chapter 11 | Rejected, Retain here as per IPCC outline (duplicate comment) |
| 16574 | 11 | | | | | This section is a good candidate for deletion so as to reduce the length of the chapter to the allotted amount. It is rather general, lacks quantitative data, and mostly just makes the point that the system is complex. That is well known! | Partially Accepted, Section was strongly revised and shortened |
| 7198 | 11 | | | | | o A lot of text. Text is very suitable for illustrating it in a figure. E.g. show in a figure what the effects are from mitigation measures (ARR, REDD, PRC) on food prices, production, competition for land etc. maybe a separate figure for production of bioenergy. | Rejected, Only 3 paragraphs - correct section? |
| 16585 | 11 | | | | | This is another section that can be deleted to save space. It is general and conceptual, lacking quantitative data and mostly just listing the many factors that are involved, without suggesting which ones are most important nor what should be done about them. | Accepted, Retained here as per IPCC outline but shortened |
| 17354 | 11 | | | | | Interesting table. Please consider adding gender issues in particular with relation to land ownership issues and ressource managment affecting transitions. | Rejected, Wrong table / section |
| 4994 | 11 | | | | | Suggest to remove whole section since most of information may be covered in adaptation report | Noted, Need to make links to adaptation |
| 13524 | 11 | | | | | Suggest to remove whole section since most of information may be covered in adaptation report | Noted, Need to make links to adaptation |
| 7201 | 11 | | | | | Another example of a land use – climate feedback: the drainage of peat for agriculture makes the soils susceptible to fire. The global warming (increase in number of dry (El Nino) years) causes the fire frequency to increase. The particle load in the atmosphere increases, which causes not only health problems (steep increase in respiratory illnesses in e.g. the tropics), but also a reduced penetration of sunlight and therefore a reduced photosynthesis of trees | Noted, Noted, but reference not available for SOD |
| 7202 | 11 | | | | | o compounding pressures. Also mention compounding pressures of grasslands, wetlands and croplands. | Noted, Section restructured and shortened due to page limitation |
| 2142 | 11 | | | | | some more details on these measures would be nice - or more explicit reference that the reader should consult these othe rdocuments for these practices. - may provide a table or so. | Accepted, Text modified |

|---|---|---|---|---|---|---|---|
| 2144 | 11 | | | | | may refer Smith, P. and Olesen, J.E. (2010) 'Synergies between mitigation of, and adaptation to, climate change in agriculture', Journal of Agricultural Science, 148, pp. 543–552; may also take up the more critical assessment of synergies in Rosenzweig, C. and Tubiello, F. (2007) 'Adaptation and mitigation strategies in agriculture: an analysis of potential synergies', Mitigation and Adaptation Strategies to Global Change, 12, pp. 855–873; may also add a sentence at the end of this section such as: "Systemic approaches to sustainable agriculture, such as organi cagriculture, have a good potential to realise these synergies, as many of the aforementioned practices are core-practices in these production systems, which are applid in optimal combinations (El-Hage Scialabba, N., Müller-Lindenlauf, M., 2010. Organic agriculture and climate change. Renewable Agriculture and Food Systems 25, 11; Muller, A., Osman-Elasha, B. and Andreasen, L., 2012, The potential of organic agriculture for contributing to climate change adaptation, in: Halberg, N. and Muller (Eds), Organic Agriculture for Sustainable Livelihoods, Earthscan Publishers)." | Accepted, Reference and text included |
| 4995 | 11 | | | | | Insubsection 11.7.1.2 consider to adress environmental & health cobenefits associated in using wasted polluted water from industry or water produced in oil exploration field for establishing of forest plantation | Accepted, Section redrafted considering the comment |
| 13525 | 11 | | | | | Insubsection 11.7.1.2 consider to adress environmental & health cobenefits associated in using wasted polluted water from industry or water produced in oil exploration field for establishing of forest plantation | Accepted, That is the same comment as in line145:,section redrafted considering |
| 17988 | 11 | | | | | Introductory sentences like the ones in Chapter 10 might be a good idea to prepare the reader for the following discussions: "Besides economic cost aspects, several other aspects have implications on the final deployment of mitigation technologies. Co-benefits, co-costs, risks and uncertainties associated with alternative mitigation technologies as well as public perception thereof can affect investment decisions of companies and priority setting of governments."<br>Additionally, the structure of the section is not consistent with the agreements made in Wellington (p. 36) whereby both co-benefits and co-costs should be discussed under the sub-section headings 'socio-economic effects' and 'environmental and health effects' instead of framing the co-cost discussion under the risk headline. This would imply that sections 11.7.2.1, 11.7.2.2 and the paragraph on ecosystem markets in 11.7.3 should be integrated with the corresponding sections in 11.7.1. There is no obvious reason why Chapter 11 would want to deviate from the agreements made in Wellington on the structure of the sections on co-benefits, risks on the one hand and barriers and opportunities on the other. | Accepted, The whole section has been restructured considering this and other comments |
| 10258 | 11 | | | | | Sections 11.7 and 11.8 either might be merged thus their covers similar aspect and there are several times duplication of the ideas presented (See Table 11.11 and 11.12) | Rejected, Stick to IPCC chapter headings |
| 2145 | 11 | | | | | I suggest to add some paragraph specifically on soil carbon sequestration and it's double role for mitigation and adaptation in agriculture, the latter via imporved water absorption and retention capacity, thus increasing resilience agains water scarcity and heavy rains (water logging, erosion), improved soil fertility, etc. | Accepted, Included in the table and some mention in the text |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 3761 | 11 | | | | | A great deal has been published on the potential co-benefits and risks of REDD+ on biodiversity, and in general this topic could be given more coverage in the report. For example: Forests provide habitat for over two-thirds of known terrestrial species (Raven, 1988). Thus a REDD+ mechanism that pays for climate mitigation is also expected to benefit forest-dependent biodiversity by conserving forest habitat that would otherwise have been cleared (Busch et al., 2011). However, a REDD+ mechanism whose incentives are focused solely on carbon storage risks undesirable consequences for biodiversity. Such a REDD+ mechanism could favor the conservation of higher-carbon forests over higher-biodiversity forests (Putz and Redford, 2009; Paoli et al, 2010; Siikamaki and Newbold, 2012) or could displace agricultural activity into low-carbon but biologically important landscapes (Miles and Kapos, 2008).<br>There is substantial interest in policies to increase the biodiversity benefits or ameliorate the biodiversity risks associated with REDD+. This includes more closely linking the objectives of the United Nations Framework Convention on Climate Change (UNFCCC) and the Convention on Biodiversity (CBD) (Secretariat of the CBD 2009), but extends more broadly as well. Harvey et al. (2009) distinguish pro-biodiversity policies between those that contribute to greater climate mitigation and those that present a tradeoff with weakened or delayed climate mitigation. Policies that promote both greater biodiversity conservation and greater carbon storage include increasing finance for REDD+ (Busch et al., 2011, Strassburg et al., 2012), strengthening institutions to handle large financial flows under REDD+ (Ring et al., 2010), minimizing leakage of deforestation to regions with high forest cover and low deforestation rates (da Fonseca et al., 2007; Busch et al., 2011), and ensuring that definitions of forest proclude incentives for the conversion of natural forest to low-carbon, low-biodiversity plantation crops (e.g. oil palm) (Sasaki and Putz, 2008). Policies that present tradeoffs between biodiversity conservation and carbon storage include geographically prioritizing the conservation of forests that are richest in biodiversity (Kapos et al., 2008; Venter et al., 2009; Strassburg et al., 2010; Larsen et al., 2011; Gardner et al., 2012), monitoring the impacts of REDD+ on biodiversity (Gardner et al., 2012), and enacting safeguards to prevent the afforestation of biologically significant grasslands (Stickler et al., 2009).<br>A commonly suggested policy to increase the biodiversity benefits of REDD+ is supplementing carbon payments with biodiversity payments (Venter et al., 2009; Strassburg et al., 2010; Dinerstein et al., 2010; Busch et al., 2011; Collins et al., 2011). Busch, J., Godoy, F., Turner, W., Harvey, C. (2011). “Biodiversity co-benefits of reducing emissions from deforestation under alternative reference levels and levels of finance.” Conservation Letters, 4:101-115.<br>Collins, M.B., Milner-Gulland, E.J., Macdonald, E.A., Macdonald, D.W. (2011). Pleiotropy and charisma determine winners and losers in the REDD+ game: all biodiversity is not equal. (2010). Opportunities for achieving biodiversity conservation through | Accepted, The argument has been included as a potential environmental effect. Some of the mentioned references were included. |
| 15201 | 11 | | | | | highly repetitive of 11.3 | Accepted, The whole section has been restructured considering this and other |
| 7205 | 11 | | | | | o Suggestion: change title in ‘positive environmental and health effects’ | Accepted, The whole section has been restructured considering this and other comments. In the new version, positive and negative potential impacts are |
| 7207 | 11 | | | | | Add: 1) Reduction of fire: decrease respiratory illnesses, increase plant growth. 2) Rewetting of peat: decreasing soil subsidence -> decreasing flooding risk -> decreasing salt water intrusion in coastal areas, decreasing DOC loads because of peat-erosion in rivers and streams -> decreasing negative impacts on fisheries | Accepted, Reduction of fire included in the table. Impacts on floods, fisheries and salt water intrusion should be discussed in 11.5 |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 17994 | 11 | | | | | This paragraph has only one reference which is clearly not enough to substantiate the many claims made here - which are partly redundant. The sentence on carbon credits should mention that this only applies if a hypothetical carbon market is introduced and also covers the agricultural sector. | Accepted, The whole section has been restructured considering this and other comments |
| 7206 | 11 | | | | | o Suggestion: change title in 'negative environmental and health effects'. | Accepted, The whole section has been restructured considering this and other comments. In the new version, positive and negative potential impacts are |
| 7208 | 11 | | | | | Another example of a negative effect: Rewetting of peat might cause high methane fluxes in the first years after rewetting | Accepted, Considered, but not included because it is discussed in section 11.2 |
| 15202 | 11 | | | | | this si the land/water section! | Noted, We thank you for the statement |
| 17996 | 11 | | | | | The paragraph is the only discussion of risks which is consistent with the agreements made in Wellington. Please consider a broader discussion of risks and uncertainties along the classification of risks and uncertainties provided in Section 6.7. Please liaise with the other sector chapter LAs to discuss the process by which a more consistent approach can be reached. | Accepted, The whole section has been restructured considering this and other comments. The term "uncertainties" was avoid to reduced potential confusion. However, issues that are not yet clear |
| 17997 | 11 | | | | | This paragraph on public perception should have its own third-level heading according to agreements made in Wellington rather than be framed under 'risks'. | Accepted, The whole section has been restructured considering this and other |
| 11177 | 11 | | | | | Concept of this section is not clear.This section can be deleted. | Accepted, The whole section has been restructured considering this and other |
| 17998 | 11 | | | | | The definition of spill-overs used in this section seem to deviate substantially from the topics discussed elsewhere in the report (e.g. carbon leakage, technological spill-overs, etc.). I would suggest to integrate the paragraph on ecosystem markets into 11.7.1.2 or into the policy section and to integrate the paragraphs on the scale of impacts into the introduction to the section 11.7. Additionally, please avoid the usage of the term trade-off which is inconsistent with agreements made in Wellington (p.35). | Parially Accepted, Text has been reviewed. The discussion on terms like risks or trade-offs for this section is still open. The nature of spill-overs in the AFOLU sector is different than in the |
| 17993 | 11 | | | | | This short paragraph on innovation could well be moved to the section on socio-economic effect | Accepted, The whole section has been restructured considering this and other |
| 13354 | 11 | | | | | This section requires revision for grammar, clarity of sentence structure and use of language before it can be judged for content. | Accepted, Section has been reviewed |
| 18000 | 11 | | | | | An introductory sentence along the example of Chapter 9 referring to the agreement reached in Wellington (p. 36) might be helpful for readers: "Barriers and opportunities are referred to as conditions that hinder or facilitate the implementation of the analyzed measures." | Accepted, Introductory sentences were added |
| 7209 | 11 | | | | | Technological barriers and opportunities. Rewetting as a mitigation option requires knowledge on building dams. Building dams in rural areas can be a challenge and there are many examples of the dis-functioning of such dams. Future developments should focus on opportunities, e.g designing simple but robust constructions that can be build by using local products (to avoid that transport emissions are relatively large compared to the emissions that can be avoided through rewetting). | Accepted, Caveat added |
| 18002 | 11 | | | | | The use of opportunities in this paragraph is inconsistent with the agreements made in Wellington (p. 36) by which they should be interpreted as favourable conditions to mitigation options. It would thus be interesting which opportunities exist that would foster or prevent the mentioned "future developments". | Parially Accepted, Consistency improved |
| 18003 | 11 | | | | | This sub-section on public perception should be integrated with the sub-section on public perception in 11.7. | Accepted, Moved to 11.7 |
| 18766 | 11 | | | | | Mitigation potential (global and regional) should be discussed in this section and not as stated there in the "Cost and Potentials" section. We should discuss this at SIE-3 and other relevant X-Cut sessions at LAM3. | Accepted, Potentials given here as well as in the costs and potentials section |
| 18767 | 11 | | | | | Please communicate to Ch.6 what data would be desirable for this section. | Rejected, Already done at LAM2 |
| 18768 | 11 | | | | | Please communicate to Ch.6 what data would be desirable for this section. | Rejected, Already done at LAM2 |
| 8831 | 11 | 0 | | | | Generally this is a very comprehensive chapter bringing together state-of-the-are information on all relevant aspects. | Noted, Thank you |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 16518 | 11 | 0 | | | | Congratulations to the AR5 team for the welcome decision to integrate the land use chapters into a single AFOLU chapter. This has made it possible to consider in detail the interactions among agriculture, forests, bioenergy and other land uses, which is a major advance over AR4. To the degree that I have critical comments relating to this decision, it is that in some of the sections of this chapter the integration has not be done as much as necessary, so that analyses remain "siloed" and thus incomplete or even misleading. | Accepted, Has been further integrated for SOD |
| 16519 | 11 | 0 | | | | Given the damaging criticisms of AR4 for a few citations of non-peer-reviewed literature, it is particularly important to avoid this error in AR5 chapters. There are a few cases in this chapter where this problem appear to be present; although this would be a minor point in reviewing most publications, here it is of key importance. Thus I would urge special attention to these cases, pointed out individually below. | Rejected, This comment seems to have been spliced so cannot act on it in isolation |
| 16520 | 11 | 0 | | | | The different sections vary in the units they use for emissions and sequestration, and in a few places do not make it clear what the units are at all. This variation causes needless confusion, and the units should be standardized both within this chapter and between it and the rest of AR5. The main options are tCO2eq and tC; in a few places PgC, which is the same as GtC, is used. Since the standard unit for emissions in other sectors (and thus in other chapters) is tCO2eq, I urge the authors to convert all emissions and sequestration figures to this unit. This will also avoid the strange feature of having non-CO2 gas emissions expressed in "tCeq", apparently calculated by multiplying quantities of CH4, N2O, etc. by their GWPs and then dividing by 3.67 to convert them into C units. | Accepted, Made all units consistent for SOD |
| 16521 | 11 | 0 | | | | It is anachronistic, and substantially reduces the policy value of this chapter, to continue the AR4 practice of expressing mitigation potentials in the format "X GtCO2e at a carbon price of $ Y". This had a justification at the time of AR4, when it was expected that international negotiations would lead to a global carbon market in which competition would equalize supply and demand at a single carbon price. But this expectation no longer corresponds to reality. We do not have a single carbon market or a single carbon price, and the result of the negotiations in Durban (with its decisions on what will be negotiated over the rest of the decade) make it clear that we will not have them in the foreseeable future. Rather, policies are being made in a bilateral and multilateral, pledge-and-review framework, in which the major payments being made for AFOLU emissions reductions and sequestration are being done through non-market mechanisms (e.g. the Brazil-Norway Amazon Fund arrangement) and with different carbon prices, or even no explicit carbon price, depending on the particular donor and recipient nations involved. In these circumstances, to continue presenting results in a framework that assumes a global carbon price is to put a great deal of effort into analyses which the policymakers will find outdated and mostly irrelevant. | Noted, We can only review what has published - so if the literature uses these metrics, we have to reflect them |
| 16522 | 11 | 0 | | | | As a followup to my previous comment (#4) I would point out that it is also anachronistic to present analyses only for carbon prices up to $ 100/tCO2eq. Policymakers are now considering options which effectively imply higher prices than that, though often expressed in different ways. | Noted, We can only review what has published - so if the literature uses these metrics, we have to reflect them |
| 15973 | 11 | 0 | | | | There is a lot of interesting information in the document, however it is sometimes not represented in a very clear and structured way, especially at the beginning of the chapter. Sometimes too much detail is given which makes the main message unclear, figures, bullet points, etc. could be used in many places to represent the main issues. Numbers throughout the text from different authors, makes text sometimes heavy, comparable figures/tables may increase readability. | Accepted, Revised for SOD |
| 15975 | 11 | 0 | | | | The overall structure of the document could be improved, sometimes, it seems there is no connection between various chapters & sub-chapters | Accepted, Revised for SOD |
| 12356 | 11 | 0 | | | | Chapter 11 shows the effect development of bioenergy can have on the carbon stock in soil and vegetation and that transformation of these carbon stocks can lead to emissions of CO2 to the atmosphere, higher than the amount of CO2 saved by the substitution of fossil fuel. The chapter also emphasize the effect on land use and competition with production of food and fiber and visualize the consequences for land use of different bioenergy scenarios, for instance in fig 11.14. These consequences can be dramatic. | Noted, Statement - not clear what action is required |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 12357 | 11 | 0 | | | | The chapter elaborates on the effect of different diet scenarios on the emissions of GHGs from the food chain. The difference between scenarios with high consumption of animal products and low animal product scenarios in 2050/2055 could be up to 10 Gt CO2-eq. This figure is significant higher than the effect of technical mitigation measures. Land-use related GHG-emissions and the effect on land use play an important role. The effect of different diets on land use is mentioned clearly in WGII chapter 19 with reference to the same publication as in WGIII chapter 11. One of the studies conclude that, to limit the GHG concentration to 450 ppm CO2-eq, a global adoption of the "healthy diet" would reduce global GHG abatement costs by about 50% compared to the reference case. | Noted, Statement - not clear what action is required |
| 12358 | 11 | 0 | | | | It would be very useful if the effects of different bioenergy scenarios on emissions and land use could be compared and collocated with the effects of different diet scenarios with comparable units, for example Gt CO2-eq and million km2 land or percentage of the global land area. Eventually could the effect of technical mitigation and reduction of food-supply chain losses and wastes also be included. | Accepted, Revised, included new Table in section 11.4.4 |
| 18239 | 11 | 0 | | | | Final comments: The document presents a series of numerical data that allow visualize trends, especially CO2 emissions to carbon sinks. However, the evaluation of IPCC shows that in section 11.11 (Gaps in knowledge and data); pages 71-72, the need of increase knowledge on other environmental variables, space information, dynamic of world ecosystems, forestry practices, among others, so can be obtained a current description of forest, based on a reliable and timely data. In this sense, it is recognized an information deficit, which should be solved to improve decision making process in management of forests and climate change. | Accepted, Have expanded on uncertainties |
| 14263 | 11 | 0 | | | | The chapter is coherent, well written covering almost all aspects pertaining to mitigation in Agriculture, Forestry and Land use Section | Noted, Thank you |
| 14264 | 11 | 0 | | | | Repitition of same things, at some places, has made the chapter lengthy. I think synthesis of these can make the chapter concise | Accepted, Edited for SOD |
| 14265 | 11 | 0 | | | | The main purpose of the revision of Assessments Reports, after every four years, under auspices of IPCC is to have a synthesis of the work done in that period. So fresh refercnes are required to be quoted. Whereas the present manuscript have many citations of the period prior to 2007. This requires serious attention of the CLAs, LAs and ERs. | Accepted, Updated all references for SOD |
| 15135 | 11 | 0 | | | | very interesting overall. Strong messages don't jump out at reader though. In places, there are surprisingly detailed descriptions of specific studies. This becomes a somewhat random aggregaton of detail rather than providing a synthesis. It would be helpful to take draft as is and pull out the the synthetic messages (thus chopping away unnecessary detail as well as helping to decrease the chapter's page length. Make sure it's not just a lit review (mentioning that someone worked on a particular topic), but that it presents a coherent story and contributes value-added (i.e. more than the sum of its parts). | Accepted, Used multi-functional land use as the central narrative for the SOD |
| 15136 | 11 | 0 | | | | delete "either/or" statements, i.e. any vague sentences that say trends or stocks go up or down or could increase or decrease, depending on site or how things are modeled. Doesn't contribute to the synthesis (just the page length). (and no need to say that "anything can be everything" | Accepted, Removed for SOD |
| 15137 | 11 | 0 | | | | Similarly, cut any calls for the need for more data or study; doesn't *inform* here. | Accepted, Removed for SOD |
| 15138 | 11 | 0 | | | | Chapter is heavily, but somewhat narrowly, referenced. There seems to be a high degree of self-citation and nepotism (i.e., referencing colleagues from research groups and partnerships). Be cautious with this: a global assessment must draw widely, and fairly, on the literature. Given past controversies and media flare-ups, it's wise to tread carefully and judiciously here. | Accepted, Checked for over self-citation in SOD |
| 15139 | 11 | 0 | | | | a formatting issue to be sure, but the citations are a mess- it would be easier to read and cut the length if all citations were consistent (i.e. use only surnames in in-text citations!). Is it not possible to issue all authors with the same referencing software and citation style guidance? | Accepted, Zotero updated for SOD |
| 15140 | 11 | 0 | | | | writing to ban from chapter: "being" is not a strong verb; "impacted" or "impacted upon" is weak (doesn't tell much) and some argue it's not a verb; "etc." tells nothing, so there's no point including… | Accepted, Removed for SOD |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 15001 | 11 | 0 | | | | This chapter should include some discussion of the role of indigenous peoples in protecting forest land. This has been particularly salient in Brazil, where indigenous reserves are in some cases among the best-protected land in the Amazon. In many countries, active engagement of indigenous populations can amd must play a critical role in any strategy to reduce emissions from forest destruction and degradation. This issue may merit a separate section within chapter 11. | Accepted, Included in chapter, but not as separate section |
| 15003 | 11 | 0 | | | | In chapter 11, or perhaps more appropriately in chapter 13, it would be very useful to have a text box that would describe the evolution of REDD+ as an international effort. It would include discussion of national actions, such as Brazil's reduction in deforestation and establishment of the Amazon Fund; of the role that donor countries such as Norway are playing in stimulating interest and investment; the role of the Forest Carbon Partnership Facility at the World Bank; evolution of REDD+ as an area of agreement in the UNFCCC negotiations; interest among subnational governments as manifested through the GCF, involving governors from the U.S., Brazil, Indonesia, Mexico and other countries; and perhaps also the role that NGOs have played through supporting REDD+ projects (e.g., Noel Kempff Mercado in Bolivia), and the interest in REDD+ that was manifested in U.S. climate legislation with extensive REDD+ financing provisions in 2009. | Accepted, A figure with the evolution of REDD+ was included, as well as some information on national programs and bilateral cooperation for the REDD+ |
| 7666 | 11 | 0 | | | | Chapter 11 does not reflect that since AR4 the literature has fundamentally changed how we consider bioenergy as a mitigation option. Especially the papers by Searchinger et al. (2008) and Fargione et al. (2008), both in Science 319, have been followed by a vast literature. This literature is in contrast to the very optimistic view on bioenergy as an important mitigation option provided by earlier IPCC reports, not least the SRES report. I had expected that this chapter provides a critical review of the previously far too optimistic IPCC assessments as far as bioenergy concerns. | Rejected, The text reflects this later literature very well, and is not overly optimistic for bioenergy. See new concensus bioenergy annex. |
| 14775 | 11 | 0 | | | | The chapter focuses on global discussion on emission budgets and mitigation potential. However in AFOLU sectors mitigation actions need to take place at the local scale, predominantly by small-holders. I'd recommend the author team writes more about the issues at the local scale. There are a number of specific challenges at the small scale: measurement of carbon storage and mitigation potential, uncertainties associated with bottom-up estimates, access to mitigation finance schemes by farmers, lack of capacities, identification of efffective mitigation options, etc. | Accepted, Issues regarding local character of AFOLU measures are included |
| 8216 | 11 | 0 | | | | QUOTATION OF REFERENCES AND AUTHORS IN THE TEXT ARE VERY INCONSITENT SOME AUTHORS HAVE THEIR INITIALS INCLUDED IN THE TEXT OTHERS DO NOT HAVE INITIALS. SOME AUTHORS ARE QUOTED BY THEIR FIRST NAMES IN THE TEXT WHILE IN THE LIST OF REFERENCES | Accepted, Zotero updated for SOD |
| 2321 | 11 | 0 | | | | The National Comunications on Climate Change from Parties to UNFCCC could be useful for this kind of report as they provided informations and data related to mitigation of GHG emissions in each country. But on the whole, no reference is made to such documents | Rejected, Peer-reviewed analysis preferred |
| 12037 | 11 | 0 | | | | Chapter seems to be conclusive, good incorporation of current land-use patterns, good discussion of competition between food and feed production and bioenergy | Noted, Thank you |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 13303 | 11 | 0 | | | | The chapter was effective in summarizing the current knowledge of emission potential mitigation for the AFOLU sector based on large scale modelling studies published in the scientific literature. The chapter requires a more general introduction to AFOLU presenting in a brief and precise manner the interactions between sources of GHGs from AFOLU; how mitigation of one source or gas may compliment or contradict other mitigation of other sources or gases. My main, more specific criticism, lies in a generally poor treatment of the role of the nitrogen cycle in the text and analysis. Reactive nitrogen in the biosphere has increased proportionately to CO2 in the atmosphere over the past 100 years, with the increase in agricultural intensification (Galloway, J.N., Aber, J.D., Erisman, J.W., Seitzinger, S.P., Howarth, R.W., Cowling, E.B., Cosby, B.J., 2003. The nitrogen cascade. BioScience 53, 341-356). I find that N2O emissions are treated in a very peripheral manner throughout the text. Within the agricultural sector, there are important tradeoffs between CH4 and N2O and mitigation strategies for one may result in increases in the other gas. Likewise the interactions between soil carbon and nitrogen cannot be ignored and some acknowledgement of interactions must be clear within the discussion. Specific examples and suggestions are given in my comments throughout the text. The chapter drowns in technical jargon from a variety of different fields and is often quite difficult to follow. Particularly the last few sections. Finally, as the authors are no doubt aware, there are problems throughout the text with citation and brackets around citations All citations require verification. | Accepted, add new reference and expand N2O sections where appropriate |
| 7528 | 11 | 0 | | | | This executive summary indicates that messages from this chapter are not matured, not balanced and not comprehensive. Important messages form AR4 are forgotten. Huge revision is required respecting AR4. | Noted, Comment not specific enough to allow action - what huge revisions since |
| 7529 | 11 | 0 | | | | This chapter deals with AFOLU, but large parts of discussion look at agriculture sector and bioenergy. The most important issue in AFOLU is land use change / deforestation, so these related issues should be most highlighted in this chapter. Because the main draiver of deforestation is agriculture. However, discussion in forestry sector including deforestation is shrunk and does not have progress comparing with AR4. CLAs and LAs should consider priority of mitigation options in AFOLU. | Rejected, We consider the mitigation in the different parts of the AFOLU sector to be balanced |
| 7551 | 11 | 0 | | | | Where is discussion on Research and Development and Technology transfer? This discussion is important for R&D and mitigation options in developing countries especially for REDD+. | Rejected, Already dealt with in section 11.11 |
| 9077 | 11 | 0 | | | | I roughly understood the reasons of the integrated assessment of AFOLU in the AR5. But topic in Forestry sector were scale-down from AR4, and were biased toward "bioenergy" issue. | Accepted, Bioenergy text was shortened and revised |
| 13956 | 11 | 0 | | | | the chapter as a whole is lacking context of responsibility for emissions, therefore responsibility for mitigation. This is necessary for equity reasons, and should be connected to the discussion in chapter 5. it is also necessary because it is not appropriate to weigh costs and benefits, and the distribution of those costs and benefits, without also an assessment of who is undertaking action and who might be benefiting from that action. if the benefits of carbon sequestration are principally as an offset for developed country emissions, but the sequestration is undertaken in developing countries, this is absolute essential to include in the calculus of cost-benefit analysis. | Rejected, Whilst equity issues are discussed, responsibility for emissions is a policy issue and policy prescriptive text must be avoided. That discussion does not belong in Ch11 |
| 13989 | 11 | 0 | | | | several other references to include with regard to mitigation potential (or lack thereof) of conservation tillage. J.M. Baker, et al. 2007. Tillage and carbon sequestration -- what do we really know? Agriculture, ecosystems and environment 118: 1-5; A. Meyer-Aurich et al. 2006. Cost efficient rotation and tillage options to sequester carbon and mitigate GHG emissions from agriculture in Eastern Canada. Agriculture, ecosystems and environment 117: 119-127 | Rejected, Focus on post-2007 literature |
| 13990 | 11 | 0 | | | | other miscellaneous references. D.S. Powlson, et al. 2011. Soil carbon sequestration to mitigate climate change: a critical rexamination to identify the true and the false. European journal of soil science 62:42-55; J.D. Unruh. 2008. Carbon sequestration in Africa: the land tenure problem. Global environmental change 18: 700-707. | Partially Accepted, Added these references for SOD if appropriate |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 12924 | 11 | 0 | | | | Only for the structure of the chapter… When there are sub-section in each section, breaf introduction should be included before the sub-sections. For example, Line34-38 in section 11.3 and Line13-27 in section 11.3.2. | Accepted, Added few sentences at the beginning |
| 5455 | 11 | 0 | | | | Only forest with sustainable harvesting can remove CO2 from the atmosphere continuously. Natural forests without harvesting can not act as such CO2 pump. To increase wood products stock in human society and to substitute wood for energy intensive materials and fossil fuels can reduce CO2 in the atmosphere. The importance of sustainable foresty and wood utilization is described little in this chapter. | Accepted, Wood utilization has been discussed more in SOD |
| 11182 | 11 | 0 | | | | It is not appropriate to devide all the mitigation options into production side and demand side. This approach can only focus on the industrial aspect of AFOLU sector such as agriculture and timber production. However, mitigation options related to land-use sector especially forest-related options are not limited in these industrial activities. | Rejected, The division of options into demand and production side measures does not only focus on industrial aspects of the AFOLU sector |
| 11057 | 11 | 0 | | | | Overall, my major comment is that the issue of technological barriars to mitigation practices in the agricultural sector is not emphasized nearly enough. It is so often assumed by those not so familiar with the primary literature that practices such as reduced tillage for increasing soil carbon storage or improved nitrogen fertilizer management for reducing N2O emissions are highly proven and reliable strategies across systems and locations. Unfortuntately, at this point in time, this is not the case, and much more work is needed to better define what the most effective practices are for particular locations, and to quantify their effectiveness. In this regard, I have provided a few examples, and some references in along with my comments below (including some in press articles that were sent via email to comments@ipcc-wg3.de). | Accepted, Barriers have been emphasized more |
| 2607 | 11 | 0 | | | | This chapter has a lot of good information but is poorly organized and has poor transition between paragraphs and even between sentences. It does not have a balance in the materials that are presented and the summary has not balanced by much of the material that was introduced before the policy sector. Combining forests and agriculture also contributes to this imbalance since each is discussed in a section but frequently the information is really mostly applicable to agriculture. By combining them, it ends up suggesting that forests should mitigate impacts that are really from agriculture. In the front part of the chapter, there are many sentences that are too long so the take home messages are lost. | Accepted, Thorough edit has been done for SOD |
| 18983 | 11 | 0 | | | | General Comment: The chapter is substantiated and does a good synthesis. There are nonetheless a few points of critique by the TSU that we would like to share. We are submitting these comments so that they may guide the author team in their work on the chapter. The core comments are labelled "Main Comment". | Noted, |
| 18984 | 11 | 0 | | | | Main comments: Storyline. When reading the chapter no storyline emerges and key messages do not stick out. The FAQs, particularly FAQ 11.1, 11.2 and 11.3, though, address the core questions the chapter should answer. The structure and content of the chapter should be improved in such a manner that it becomes clear which sections contribute to which key messages. | Accepted, Coherent narrative developed for SOD - new introduction and executive summary outlines this narrative |
| 18985 | 11 | 0 | | | | Main comments: Data and accessibility. The chapter covers a lot of data, which is good but which also constraints the flow of the text significantly. Please move more numbers into tables and figures and restrict the text to providing the context and interpretation. | Accepted, Streamlined the text |
| 18986 | 11 | 0 | | | | Main comments: Potentials. The chapter is very detailed on the bio-physical potential. It would be good to extend on the economic potential if possible as this is the one that the policy makers are particularly interested in. We are aware that there is a great range between existing studies, that the ranges are great for different soils and Tiers assumed – please try nonetheless to provide more insights into the economic potential taking into account existing uncertainties. | Partially Accepted, We can only review the literature that exists - and almost all of this is of the kind that provides potential as Gt Co2-eq. at a given C price |
| 18987 | 11 | 0 | | | | Main comments: Redundancies. There are redundancies in Sections 11.3 (options), 11.4 (system perspective) and 11.6 (cost & potentials) concerning mitigation options and their associated potentials. Consider to have a central table that can be referenced throughout. | Accepted, Redundancies removed and whole chapter shorter by 20% |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 18988 | 11 | 0 | | | | Main comments: Co-benefits, risks and SD. For all sectoral chapters there must be more clarity about how and where risks, co-benefits and sustainable development is covered in the section “Costs and potentials” (11.6) and what in Section “Sectoral implications of transformation pathways and sustainable development” (11.9). The upcoming meetings (SIE-3, LAM3) should work on this. | Accepted, Has been better developed for SOD |
| 18989 | 11 | 0 | | | | Main comments: Scenario linkage. With the lack of data from the scenario database this section needs attention. Please start collecting, reviewing and where possible synthesizing bottom-up data as soon as possible to have an appropriate counterpart for the scenario data. | Accepted, No data was delivered from Ch6, so we could not include in the FOD. |
| 18990 | 11 | 0 | | | | Main comments: Policies. In the policy section it would be good to focus on policy experience rather than listing plans whose implementation is unclear. | Accepted, Restructured around assessment of existing that has been implemented rather than policies not yet |
| 18991 | 11 | 0 | | | | In contrast to AR4 there have been discussions and a consensus not to provide global mitigation potentials from the sectoral chapters, as these numbers do not take interdependencies into account. In the upcoming process there needs to be discussion among the sectoral chapters how to deal with AR4 numbers. At this stage it seems reasonable not to cite the AR4 mitigation potentials as we will not provide any updates to these numbers in AR5. | Partially Accepted, Accepted - have only provided updates - but we feel that global mitigation potentials should still be given |
| 18992 | 11 | 0 | | | | Please improve the coverage of regulatory uncertainty concerning aforestation. | Rejected, Why? No rationale given |
| 5081 | 11 | 0 | 0 | 0 | 0 | in your list of mitigation strategies I would use yield enhancing and input reducing technical change | Partially Accepted, Have included, but some technologies do both |
| 7394 | 11 | 0 | 0 | 0 | 0 | This chapter should include a section (and a statement in the executive summary) that considers and discusses the role of GHG metrics (GWPs etc) for AFOLU. As a sector whose main emissions are non-CO2 gases, but much of its perceived mitigation potential is CO2, the choice of metric is of major importance. I would expect a section that (a) recognises this, (b) exemplifies it by showing how the significance of agriculture compared to other sectors changes under different metrics, (c) identifies the areas within AFOLU where abatement options and LCA results might be affected by different metrics (in particular where e.g. reductions of CH4 come at the price of increasing N2O), and (d) considers the role of metrics in AFOLU abatement trajectories, including their impact on regional mitigation potential in the context of international trade (see Reisinger et al, 2012, accepted for Climatic Change), and also recognises the interaction between metrics and RD&D cycles. This could link with Section 3.10.3 but build on it by demonstrating the particular importance of GHG metrics for the AFOLU sector. More literature coming out over next few months on metrics for agriculture and policy options for implementing new metrics. | Accepted, Linked to section 3.10.3 |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 10131 | 11 | 0 | 0 | 100 | 100 | A general commnet: I am quite a bit concerned about the framing of mitigation in agriculture in this chapter, this can have serious unintended political consecuenses. It is important not to mix issues.I think you are mixing reduction of net emissions and how this could be funded and this leads to the unrational discussions that developing countries should not mitigate and agriculture should not be part of the convention. My frame would go like this; 1.Separate mitigation as a biophysical phenomenon of the politica decisions on financing. 2. Agriculture on existing land areas, separate mineral soils and organic soils.3. Existing agriculture on mineral soils, mitigation is a co-benefit for adoption climate smart practices increasing productivity, organic matter in oils, biomass including trees, reducing waste by more effeicient use of nutriensts and water, improving animal healt and nutrition, improving resilience etc. the real extra cost is MRV cots as and when the emission reducitons are reported.This should be funded by increased and climate smart normal agricultural investments by farmers, governments, private sector, ODA etc. 4. Agriculture on drained peatlands is unsustainable, the peatlands should be rewetted, here climate money is needed for rehabilitation, finding alternative livelhoods, PES etc. 5. AGriculture as a driver of landuse change, this is the difficult part and intimately related to REDD+, which will not succeed if a holistic landscape land use planning approach is not taken including development of agriculutre on existing areas on forest fringes and protection agreements to forests. This is the small holder piece. Then we have large scale commercial farming (soya in Brazil, oilpalms in Indonesia and elsewhere etc.), this is partly a policy driven (biofuel policies), ppartly demand driven (increasing demand of meat the main driver, ) and here the demand side has to be managed. | Partially Accepted, Items 1, 2, 3 and 4 already done. Discussion of leakage in REDD+ programs and land planning policies were included in section 11.10 |
| 14734 | 11 | 0 | 1 | | | use the chronological order to cite the authors: (Wise et al., 2009; Plevin et al., 2010; Searchinger, 2010; Havlik et al., 2011; Popp et al., 2012). This happens in several places of the text. | Accepted, Zotero updated for SOD |
| 10235 | 11 | 1 | | 103 | | General comments on chapter 11: Overall Chapter 11 covers well most of the AFOLU sector, but the writing can be greatly improved (many repetitions between sections, sections to review and / or complete).<br>The references are incomplete, and are often the same references that recur in the text, it should also include more existing reviews on the various points discussed in this chapter. Many sections still need to be updated.<br>See specific comments below for more details | Accepted, Thoroughly edited and updated for SOD |
| 14549 | 11 | 1 | | | | General comment: this chapter pulls a great deal of very useful information in one place. I think it is a move forward to have all AFOLU together and the authros have done a great job in complining much information. It still neds more synthesis in pulling the different information together but this is a great start | Noted, Thank you |
| 14550 | 11 | 1 | | | | General comment: I would like to see a discussion of land availability before numbers are given for potenial mitigation. Also where numbers are given for potential mitigation I would like to see wherever possible the amount of land impled to be used for this mitigation, particualrly for afforestation, reforestation bioenergy. This would help to judge trade off of different otpions and conflicts with other land use (e.g. food). Having land availablility first would help tp put the numbers we see in context. It would also aid in seeing where the land could be sued for either forest mitigation (aff/ref) or bioenergy, but not both, to avoid double counting | Partially Accepted, The land availability is completely linked to the mitigation potential and the land use, so these issues have to be treated holistically |
| 5533 | 11 | 1 | 1 | 73 | 29 | The general comments are now at the end. | Noted, Not a specific comment |
| 5662 | 11 | 1 | 1 | 73 | 29 | General comments on Chapter 11 AFOLU | Noted, Not a specific comment |
| 5663 | 11 | 1 | 1 | 73 | 29 | I have read and re-read this paper, some statements and figures are questionable and in my opinion it misses a fundamental option when considering mitigation alternatives to help reduce increases in GHGs over time. | Noted, Not enough information in this comment to take action |
| 5664 | 11 | 1 | 1 | 73 | 29 | The paper assumes that the use of wood products is a major cause deforestation. It never considers the annual growth of trees compared to annual demand for wood or its sustainability. It assumes that cutting trees is deforestation, yet cutting cereals is not de-farming! In most cases both are harvesting. | Rejected, We are dealing with economic, not total biophysical potentials. Biophysical potentials of not |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 5665 | 11 | 1 | 1 | 73 | 29 | I estimate that the growing stock of trees on all land formations is of the order of 544 Gt wood containing 272 Gt C. The annual growth from accessible trees is of the order of 18.4 Gt wood (9.2 Gt carbon) and the annual demand for wood products is an estimated 3.5 Gt wood (1.8 Gt C) or 19% of sustainable supply, (Openshaw, K. Supply of woody biomass, especially in the tropics: is demand outstripping sustainable supply? International Forestry Review. Vol. 13(4) 2011. ISSN 1465 5489.) I attach a copy for your information. Note the (low heat) energy value of dry wood = 18.7 GJ/tonne. | Rejected, We are dealing with economic, not total biophysical potentials. Biophysical potentials of not the focus of modern assessments |
| 5666 | 11 | 1 | 1 | 73 | 29 | Much more wood could be used, especially substituting it for fossil fuels and sawnwood/panel products for steel and concrete, without making inroads into the woody growing stock. The paper is silent on this. It assumes that energy crops will have to be grown to meet increased demands for renewable fuels and planting trees in all formations will sequester more atmospheric carbon and could supply more wood products. | Rejected, We are dealing with economic, not total biophysical potentials. Biophysical potentials of not the focus of modern assessments |
| 5667 | 11 | 1 | 1 | 73 | 29 | Each year, plants capture about 100 billion t of atmospheric carbon (NPP) of which about half is by land plants and each year the same quantity is returned to the atmosphere through respiration in plants and animals, rotting, wildfires etc. Only a small fraction of this carbon is used by humans for food and fuel etc. With improved management much more could be used. By way of contrast, the current use of fossil fuels produces about 8 billion t of carbon (IEA). If you don't use the annual growth of biomass (an estimated NPP of 53 Gt C for land plants – see my article), you lose most if not all of it. | Rejected, We are dealing with economic, not total biophysical potentials. Biophysical potentials of not the focus of modern assessments |
| 5668 | 11 | 1 | 1 | 73 | 29 | The paper talks about using switchgrass (Panicum sp.) and silvergrass (Miscanthus sp.) to produce bioenergy (ethanol). It may be cheaper and more practical to use these grasses and crop and wood waste to produce methanol etc. by the dry distillation of such biomass, or use it directly. I don't know if the 'energy' chapter discusses this? | Rejected, We are dealing with economic, not total biophysical potentials. Biophysical potentials of not the focus of modern assessments |
| 5669 | 11 | 1 | 1 | 73 | 29 | Figure 11.3 (page 12) gives global trends for three time periods. On the emissions side deforestation is separated from land use changes. This is very misleading. I suspect that some of this could be harvesting and thus is 'temporary deforestation'? What happens to these 'deforested' areas? Do they remain in a bare state or are they reclaimed to trees through natural regeneration or replanting? Nature abhors a vacuum and some plants will occupy these lands. I suspect most of it is 'land use change'! | Rejected, We are dealing with economic, not total biophysical potentials. Biophysical potentials of not the focus of modern assessments |
| 5670 | 11 | 1 | 1 | 73 | 29 | The principal causes of deforestation are clearing woody areas for farmland by the subsistence sector because of population increase and expanding cash crops to meet the increasing demand for food and energy. In order to reduce deforestation, agricultural productivity has at least to keep pace with population increase. But this is difficult for the subsistence sector, which has little means to improve its productivity. And by 2050 the population in developing countries is likely to increase by 2 billion of which up to half could be in rural areas. Such programs as REDD+ may be ineffective in slowing down deforestation, especially if subsistence agricultural productivity does not improve. The paper is quiet on ways to make this happen. | Rejected, We are dealing with economic, not total biophysical potentials. Biophysical potentials of not the focus of modern assessments |
| 5671 | 11 | 1 | 1 | 73 | 29 | Simple inputs could help improve productivity. For example, intercropping with marigolds (Tagets sp) in the field or home garden can reduce nematodes in the soil. Adding wood ash, lime, compost and mulch can improve soil fertility and friability. Planting brassicas (cabbage) with (nitrogen fixing) black beans can reduce the incidence of black bean aphids. Again planting napier grass (Pennisetum purpureum) around the rim of the field and then rows of molasses grass (Melinis minutiflora) between rows of maize, reduces the number of stem borers in the maize and increases the number of parasitic wasps that prey on the stem borers. Such a system may increase the maize yield by up to 30% and the two grasses provide nutritious animal feed. Similarly, a South American legume called Desmodium uncinatum (silverleaf) inhibits witchweed or striga (Striga asiatica), a major weed in some countries, when intercropped with the above grasses and maize and may more than double the yield of maize. Again, no-till farming helps maintain soil fertility and friability. These are all 'low-cost' options. | Rejected, This is an eclectic collection of marginal individual practices - does not fit here |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 5672 | 11 | 1 | 1 | 73 | 29 | Agroforestry systems can be a substitute for shifting cultivation and provide nitrogen inputs to at least maintain fertility. Abandoned agricultural and marginal lands can be reclaimed by 'biomass crops' rather than clearing forests for palm oil, soy bean and pastoral agriculture. Land invaded by Imperata cylindrica grass, an aggressive weed species growing in many developing countries, can be reclaimed by planting nitrogen-fixing trees such as Gliricidia sepium and Leucaena leucocephala. Similar dry areas can be reclaimed with Prosopis sp. Much of this work could be undertaken by the subsistence sector, thus helping with poverty alleviation. | Rejected, Thanks - but agroforestry is already included. Perhaps missed by the reviewer. |
| 5673 | 11 | 1 | 1 | 73 | 29 | A constraint is lack of adequate education. The above mentioned initiatives could greatly offset lack of education, but governments could help by introducing practical subjects in the school syllabus and run adult education classes. These could demonstrate simple and cheap agricultural techniques coupled with demonstration plots. | Partially Accepted, Included in the barrier section |
| 5674 | 11 | 1 | 1 | 73 | 29 | The paper talks about land use, but what is lacking is a table giving broad land use classes for the world. Section 11.2.1. First and foremost a table of land use should be given and inventories of the biomass growing on the land areas should be determined, particularly in areas of actual or potential use. | Accepted, Have given land area tables for the SOD (from central data spine) |
| 5675 | 11 | 1 | 1 | 73 | 29 | The following is an estimate of land use (Table 1). | Partially Accepted, Other estimates available (in core data spine) but this |
| 5676 | 11 | 1 | 1 | 73 | 29 | Table 1. Land use for the world 2006: units million hectares and 109 dry tonnes of woody biomass2.<br>World Forest Woodland Arable Grassland1 Desert Built up Arctic<br>14894 4021 1224 1638 4170 1787 298 1788 area<br>100 27 8 11 28 12 2 12 %<br>543.80 450.71 9.28 79.71 0 4.10 0 Growing stock<br>18.35 12.44 0.36 5.33 0 0.22 0 Annual yield<br>Note. 1 Grasslands include wetlands. 2. This is above ground biomass; total biomass is 20-33% more.<br>Annual yield is accessible yield. Total yield is 21.58 x 109 t. Carbon content is 50% of dry wood weight.<br>Source. FAO 2009 (State of the world's forests adjusted) and search of the WWW. Openshaw, K. 2011. □ | Partially Accepted, Other estimates available (in core data spine) but this was considered for the SOD |
| 5677 | 11 | 1 | 1 | 73 | 29 | Another table that should be in the text is an estimate of organic soil carbon in section 11.5.3 (page 45). The following is my estimate based on Chapter 2 –Land use and soil carbon in different agro-ecological zones by D. J. Greenland (1995). | Rejected, Very old reference - more up to date references available |
| 5678 | 11 | 1 | 1 | 73 | 29 | Table 2. Estimate of soil carbon by land use types: units million hectares and 109 t carbon<br>Land type Area Soil carbon Land type Area Soil carbon<br>Forest/woodland 5213 600-900 Desert 1787 85-130<br>Arable 1638 165-250 Built up 298 30-50<br>Grassland 2870 115-170 Sub-total 13106 1380-2100<br>wetland 875 35-50 Arctic 1788 190-280<br>Peat 425 350-550 Total 14894 1570-2380<br>Source. | 5679 | 11 | 1 | 1 | 73 | 29 | With similar soil and rainfall types, there is more organic soil carbon under forests than under wood lands and grasslands, which have more than under arable agriculture. | Noted, Statement - not a comment |
| 5680 | 11 | 1 | 1 | 73 | 29 | Some of the units are not consistent. Weight is usually in metric tonnes of carbon or carbon dioxide equivalent, but some it is given in short tons. GC or GCO2 is the common weight but sometimes Pg is used. Sometimes CO2 is given as CO2. Likewise N2O is given as N2O etc. | Accepted, Harmonized units for the SOD |
| 5681 | 11 | 1 | 1 | 73 | 29 | The text needs a good edit as there are grammatical and spelling errors and too many brackets in parts. | Accepted, Thoroughly edited for the SOD |
| 5682 | 11 | 1 | 1 | 73 | 29 | In my opinion, there are too many references, some have up to twelve (P 44). These should be reduced. | Accepted, Selected only key references |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 5798 | 11 | 1 | 1 | 103 | 20 | You could shorten the text considerably if you concentrated on messages and findings instead of listing study's results as it happens quite often throughout the text. This may be a choice of style, but if references are used as such and not chained following each other the text will be shorter without losing content. | Accepted, Thoroughly edited for SOD |
| 18287 | 11 | 1 | 4 | | | insert "and since it comprises a high diversity of management technologies and climate and location specific influences that interact with mitigation measures." | Rejected, Wrong page and line number - cannot locate |
| 5703 | 11 | 10 | | 11 | | After the sub-paragraph '11.2.2 Trends of C fluxes from land use and land use change', it will be useful to give a composite picture of C fluxes/emissions from Land Use, Land Use Change and Forestry (LULUCF) just after page 11. The treatise on AFOLU can be started thereafter, and it may also be indicated as to what additional land uses need to be added to LULUCF to make it more comprehensive in terms of reporting for all land uses coalescing in AFOLU. | Rejected, This is already done in figure 11.3 |
| 11113 | 11 | 10 | 1 | 10 | 2 | there is information that suggests that China's large-scale afforestation program is not a success, rather, on-the-ground surveys have shown that, over time, as many as 85 percent of the plantings fail. See at Earth Science Reviews, Excessive reliance on afforestation in China's arid and semi-arid regions: Lessons in ecological restoration - Review Article, Pages 240-245, Shixiong Cao, Li Chen, David Shankman, Chunmei Wang, Xiongbin Wang, Hong Zhang | Accepted, This is too country specific |
| 5701 | 11 | 10 | 10 | 10 | 14 | The text in these lines may be rephrased as "In addition, during the period from 2000 to 2010, ambitious tree planting programmes in countries such as China, India, The United States and Vietnam- combined with natural expansion of forests in some regions- have added about 7 Mha of new forests annually. However, due to deforestation in many other countries in Asia, Africa, and Central and South America, the net increase in forest area at the global level during the same period was reduced to 2.92 Mha y-1. | Accepted, Rephrased for SOD |
| 16210 | 11 | 10 | 13 | | | These numbers don't seem to match up right: 7 mha added ANNUALLY(?) in China, US etc vs. 8.3 M ha lost or 5.2 Mha lost in the tropics… is that number of added forest supposed to be over a longer time period? | Accepted, Checked numbers and revised for SOD |
| 10589 | 11 | 10 | 14 | | | Could add that in 2010 New Zealand, as part of its ETS, had 18.3Mt CO2 available from Kyoto plantation forests to offset other GHG emissions totalling 71.7 MtCO2eq/yr, 11.9 MtCO2eq higher than 1990 levels. Ref: MfE, 2012. New Zealand's greenhouse gas inventory 1990-2010 and net position, Environmental snapshot, April 2012. Ministry for Environment, http://www.mfe.govt.nz/publications/climate/greenhouse-gas-inventory-2012-snapshot/index.html | Noted, Too country specific - we cannot cite every paper and report for every country - this is a synthesis |
| 14592 | 11 | 10 | 15 | | | This section has several issues that I would be happy to help resolve in more detail. Ther is poor explanations or confusion here between co2 emissions from forest area change versus all land use change, between global and torpical only estimates, between gross and net emissions, and between fluxes due to human activity (LUC) versus fluxes due to indirect human induced change cliamte and CO2. The most up do date and comprehensive model results are not being used. I can provide input from Houghton et al 2012 and more recet data provided for WG1 and for the global Carbon project annual budget, I will just have to check with modelling groups. The section does not use the most appropriate references and mis uses others (e.g. le quere for fire. it totally lacks a proper discussion of the ucnertainties and recent estaitmes (SD across models alone is not th euncertainty). Pan et al is comapred to other refs that do not report on the same thing without explaining this. I list some additional line by line points below that are not dealt with in this general summing up | Accepted, Section redrafted for SOD - new synthetic studies available since the Fod |
| 15961 | 11 | 10 | 16 | 14 | 47 | Section provides a nice overview of sinks & emissions per landcover type, a figure visualization the differences in sink/emissions per landcover type could provide a nice visual overview of the relative contribution of each | Noted, No space |
| 7335 | 11 | 10 | 16 | 10 | 34 | Better clarification is needed on why there are such big discrepancies among the estimates of C flux from land use change, especially between Houghton 2010 and Piao 2009. The reader should be given some idea as to at least what sign is most realistic. And which study is cited for the numbers in lines 31-32? | Accepted, Section redrafted for SOD - new synthetic studies available since the Fod |
| 16541 | 11 | 10 | 19 | 10 | 23 | Is the considerably lower estimate from Piao et al. explicable by the different time period (i.e. by large emissions before 1901)? Or is there some other explanation for why it is so much lower? | Accepted, Section redrafted for SOD - new synthetic studies available since the |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 7058 | 11 | 10 | 19 | 10 | 23 | It is important to note that the Piao et. al. study from which these conclusions were drawn, observes that "...the effects of wood harvesting and forest regrowth are not included in our study, although they may play a significant role in shaping historic C fluxes...". The importance of such factors have been found to be very significant in more recent studies (e.g. Pan et. al.) and the text here should be modified to make clear that (a) the study in question did not examine wood harvesting and forest regrowth (as well as forest management and harvested wood products), and (b) these additional factors have been found to be very important to net carbon fluxes to the atmosphere attributable to forests. (See Pan, Y., Birdsey, R., Fang, J., Houghton, R., Kauppi, P., Kurz, W., et al. (2011). A Large and Persistent Carbon Sink in the World's Forests. Science Vol. 333 , 988-993.) | Accepted, Section redrafted for SOD - new synthetic studies available since the Fod |
| 11805 | 11 | 10 | 19 | 10 | 23 | It would be good to include here the mechanism, namely that the amount of C lost due to LUC is the same but that bthere is increased growth (hence uptake) on the remaining land | Accepted, Included |
| 2603 | 11 | 10 | 19 | 10 | 19 | "(RA Houghton, 2010)." should be "(Houghton, 2010)." | Accepted, Zotero updated for SOD |
| 5494 | 11 | 10 | 20 | 10 | 23 | How have inputs such as fertilization and irrigation contributed to NPP and does this have an impact on the overall balance on emissions? | Rejected, Not known - we can only review what is known and published - these references mainly deal with LUC and not managed land so no relevance |
| 12373 | 11 | 10 | 20 | 10 | 20 | The acronym NPP should be spelled out the first time it is mentioned. | Accepted, Revised for SOD |
| 16211 | 11 | 10 | 22 | | | total' C emissions--not clear if this is net or gros, especially given the numbers above--I think they mean 'net' here (not total) which to me implies gross. | Accepted, Specified net vs. gross throughout |
| 16542 | 11 | 10 | 24 | 10 | 36 | Successive sentence in this part give different impressions of when the increasing trend ended. The initial sentence ("All studies agree…") says it was till "the middle of the 20th century", and the sentence at the end of that paragraph ("Within variations between...") suggests no further increase from 1980 to 2000, but then the first sentence of the following paragraph ("A major contribution to the overall increasing trend...") indicates increase through the beginning of the 21st century. Rephrase to clarify (or simply show the trend in a Figure). | Accepted, Section redrafted for SOD - new synthetic studies available since the Fod |
| 5805 | 11 | 10 | 24 | 10 | 34 | This is confusing. Please re-order text so that periods are ordered along the time axis - "1990 - 2009 …" belongs at the end of the paragraph. | Accepted, Section redrafted for SOD - new synthetic studies available since the |
| 2604 | 11 | 10 | 28 | 10 | 28 | "(RA Houghton et al., 2012)." should be "(Houghton et al., 2012)." | Accepted, Zotero updated for SOD |
| 12371 | 11 | 10 | 30 | 10 | 32 | In line 30-31 the mean values of annual C-flux in the 1980s are estimated to 1.1 +/- 0.8 Gt C/yr and in the 1990s - 1.1+/-0.g Gt C/yr, while the Median values are estimated to resp 1.3 and 1.1 Gt C/yr. The negative value in the 1990 s for the mean value seems not consistant with the positive value for the median value for the same period. | Accepted, Section redrafted for SOD - new synthetic studies available since the Fod |
| 16212 | 11 | 10 | 32 | | | is that supposed to be 'negative' 1.1? Why the dash? It is not supposed to represent uptake in the 1990s, right? Remove the dash. | Accepted, Section redrafted for SOD - new synthetic studies available since the |
| 18925 | 11 | 10 | 34 | | | Correct reference to "Figure 11.1b" | Accepted, Revised for SOD |
| 9101 | 11 | 10 | 35 | 11 | 32 | See reference literature; Hashimoto S (2012) A New Estimation of Global Soil Greenhouse Gas Fluxes Using a Simple Data-Oriented Model. PLoS ONE 7(8): e41962. | Accepted, Included in SOD |
| 16213 | 11 | 10 | 35 | | | be careful: use 'net' c flux to atmosphere when you mean it; don't confuse with 'gross' flux. | Accepted, Specified net vs. gross |
| 7550 | 11 | 10 | 35 | 11 | 32 | Hashimoto estimated global emission of CO2, CH4 and N2O from soil of land uses including forests and farm lands. I recommend authors to refer the latest scientific paper. Hashimoto S (2012) A New Estimation of Global Soil Greenhouse Gas Fluxes Using a Simple Data-Oriented Model. PLoS ONE 7(8): e41962. doi:10.1371/journal.pone.0041962. | Accepted, Included in SOD |
| 16543 | 11 | 10 | 37 | 11 | 1 | The phrase "fire emissions from tropical deforestation" immediately raises the question of where these emissions are represented in Figure 11.1a -- in "fires" or in "deforestation"? If they are additional to, not part of "deforestation", it seems that deforestation should described as the "dominant source." If on the other hand these overlap, then it is incorrect to stack the boxes showing them in Figure 11.1a. | Accepted, Section redrafted for SOD - new synthetic studies available since the Fod |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 12372 | 11 | 10 | 4 | | | Please consider to replace the column "Country/area" with "Region". The word "total" after the name of each region could be deleted, as it is obvious information, and not consistantly used. The text in the section describes the forest cover in the period 2000-2010. It would be useful to find the same period in the table. | Accepted, Revised for SOD |
| 14413 | 11 | 10 | 4 | | | Can you add figures for the corresponding reductions in emissions from deforestation? | Accepted, Section redrafted for SOD - new synthetic studies available since the Fod. the table shows both areas with increase and decrease in forest area. its not simple to convert forest area change to emissions or uptake e.g. the emissions.r/regrowth are not all immediate and they will depend on the model of clearing or planting and the land transition types before/after forest area change, etc. Since latest houghton data is from FRA we could ask him to |
| 14424 | 11 | 10 | 4 | | | First column. Change 'Country' to 'Continent'. There are no data at the country scale. | Accepted, Revised for SOD |
| 11202 | 11 | 10 | 6 | 10 | 14 | Suffers from potential definition problems vis-a-vis 'forests' 'new forests' and the distinction between natural forest (ecosystems) and planted forests/plantations. This might be corrected with insertion of the 'planted' in between the words 'new forests' (at line12). | Accepted, Section redrafted for SOD - new synthetic studies available since the Fod |
| 11978 | 11 | 10 | 6 | | 14 | Needs some recongnition here that although new forests take up carbon, there's a time lag between C emissions from deforestation and C uptake. Soemthing like "However, this net approach may mask differences in the C content of newly regrowing forests, to that lost from deforestation of old growth forest". | Accepted, Added discussion of time issue in the redraft |
| 7549 | 11 | 10 | 6 | 10 | 14 | While planting programs increase forest area, natural/semi-natual forests are decreasing. They are not compatible often. Please don't look at only total forest area. | Accepted, Section redrafted for SOD - new synthetic studies available since the |
| 10102 | 11 | 10 | 6 | 10 | 8 | The important role of drained peatlands should be mentioned here as a significant source of emissions, conserving existing wetlands /mires is an importatn mitigation action likewise rewetting of drained peatlands. | Accepted, Added for SOD |
| 7183 | 11 | 10 | 7 | 10 | 8 | o ("known as REDD+"). See earlier comment. REDD+ programs include the following activities: 1) decreasing emissions from forest deforestation 2) decreasing emissions from forest and/or peatland degradation 3) preserving and accumulation of carbon stocks through a. forest conservation, b. sustainable forest management c. rehabilitation and restoration of damaged areas, 4) the creation of additional benefits such as a. improvement of local people's welfare b. improved preservation of biodiversity c. improved protection of other ecosystem services | Accepted, A better description of REDD+ was added |
| 16539 | 11 | 10 | 8 | 10 | 10 | This sentence is quite important; it definitely needs one or more separate citations. The reduction in deforestation in Brazil is coming to be well known, but not a corresponding change in Indonesia, so it is important to have a strong reference for that change. I would also suggest expanding, for 2-3 sentences more, on what were the "concerted efforts" that resulted in these successes. | Accepted, Section redrafted for SOD - new synthetic studies available since the Fod |
| 2602 | 11 | 10 | 8 | 10 | 8 | "(J.G. Canadell and M.R. Raupach, 2008)."should be "(Canadell and Raupach, 2008)." | Accepted, Zotero updated for SOD |
| 3538 | 11 | 10 | | | | What is the situation with regard to 'Settlement' which is another land use category of LULUCF in addition to forest, cropland, grassland, wetlands? | Accepted, Refer to C1h3 in SOD |
| 14776 | 11 | 10 | | | | Petrokofsky et al. (2012) is reviewing comparative advantages of different methods for assessing carbon stocks in AFOLU sectors, with particular attentions to uncertainties in estimates -> Environmental Evidence 2012, 1:6 doi:10.1186/2047-2382-1-6 ,http://www.environmentalevidencejournal.org/content/1/1/6/abstract , The large variabilities found among estimates of carbon fluxes are due part to differences in methodologies. This is especially true in estimates at smaller scales than continental. | Accepted, Added to uncertainty Discussion |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 6930 | 11 | 10 | 15 | | | Please coordinate and ensure consistency with WGI, Chapter 6 on the land C fluxes. Suggest to refer to WGI AR5 Chapter 6 here whenever appropriate. Many parts of this section stray into the WGI area of expertise and will overlap with the assessment provided by Chapter 6. This should be avoided to avoid duplication and/or inconsistencies. | Accepted, Working with WGI authors to ensure this (ongoing) |
| 10239 | 11 | 10 | 15 | 14 | 47 | Need to clarify since the beginning of theis section that there terrestrials ecosystems a global terrestrial sink, resulting from the photosynthesis/respiration-mineralization inbalance, and separate sources from LU and LUC. | Accepted, Clarified for SOD |
| 15477 | 11 | 1005 | 35 | 1006 | 5 | The authors lists a number of sweeping comments on the negative impacts of reforrestation/afforestation by just relying on two references. The impact on water use can be positive or negative depending on the location. Surface flow water runoff can be far higher in grassland systems than in forest systems. Sodium increase in soils from forests only occur in certain regions of the world. Although forests do decrease the pH, in many regions reforrestation returns soil conditions to the "natural" state before the soil was deforestated and soil conditions dramatically changed for agriculture. A far more balanced view is required here - and certainly shouldn't rely on just two references. | Rejected, Cannot locate comment = wrong page number |
| 7609 | 11 | 11 | 0 | | | The forest has large influence for the increase and decrease of GHG gas through deforestatin and reforesttion, forest growth, way of forest manegement. However, I feel to have few descriptions about the forest and fortry. I expect substantiality of the description about the forestry. | Accepted, Better description of forest practices provided in section 11.3 for SOD |
| 15959 | 11 | 11 | 1 | 11 | 31 | This paragraph is unclear, it appears that there is no change in the C fluxes since the 1980's up to now, this is also indicated by figure 11.3; the paragraph could be substantially shortened, also to increase readability | Accepted, Section redrafted for SOD - new synthetic studies available since the |
| 15956 | 11 | 11 | 1 | 11 | 66 | The C02 emissions in the tropics are well explained and quantified, however the net sinks in the temperate zones are described in a generic way, adding more quantitative information on this would help relative comparison | Accepted, Section redrafted for SOD - new synthetic studies available since the Fod |
| 18924 | 11 | 11 | 1 | | | "... of gross": Add "AFOLU" | Accepted, Specified net vs. gross |
| 3758 | 11 | 11 | 12 | 11 | 32 | Three relevant references on emissions from LULUCF are: 1) Baccini, A., S.J. Goetz, W.S. Walker, N.T. Laporte, M. Sun, D. Sulla-Menashe, J. Hackler, P.S.A. Beck, R. Dubayah, M.A. Friedl, S. Samanta, and R.A. Houghton. 2012. Estimated carbon dioxide emissions from tropical deforestation improved by carbon-density maps. Nature Climate Change 2:182-185. doi:10.1038/nclimate1354; 2) Houghton, R.A., G.R. van der Werf, R.S. DeFries, M.C. Hansen, J.I. House, C. Le Quéré, J. Pongratz, and N. Ramankutty. 2012. Chapter G2. Carbon emissions from land use and land-cover change. Biogeosciences Discussions 9:835-878. doi:10.5194/bgd-9-835-2012.; and 3) Nancy L. Harris1,*, Sandra Brown1, Stephen C. Hagen2, Sassan S. Saatchi3,4, Silvia Petrova1, William Salas2, Matthew C. Hansen5, Peter V. Potapov5, Alexander Lotsch6 Baseline Map of Carbon Emissions from Deforestation in Tropical Regions Science 22 June 2012:<br>Vol. 336 no. 6088 pp. 1573-1576 | Accepted, Section redrafted for SOD - new synthetic studies available since the Fod |
| 15958 | 11 | 11 | 12 | 11 | 15 | This seems to be twice the same information, though with different emission figures, confusing | Accepted, Section redrafted for SOD - new synthetic studies available since the |
| 12374 | 11 | 11 | 12 | 11 | 32 | Here are a lot of different figures that seem partly also to conflict. Please consider to put the most important figures in a matrix or table so it would be easier to compare and perceive the meaning. | Accepted, Section redrafted for SOD - new synthetic studies available since the |
| 14414 | 11 | 11 | 12 | | | Again, these numbers seem to say that deforestation (land use change) is far, far more important than “agriculture” (“land use”). | Accepted, Section redrafted for SOD - new synthetic studies available since the |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 5806 | 11 | 11 | 12 | 11 | 22 | Please rephrase this paragraph in a more concise way. Instead of using one sentence / study you could combine sentences. | Accepted, Section redrafted for SOD - new synthetic studies available since the |
| 11114 | 11 | 11 | 14 | 11 | 19 | the numbers provided, i.e. 1.5 (without confidence intarval) and 1.2±0.7 are NOT different from a statistical point of view, so it cannot be stated that "Global emissions from land use change estimated for 2008 by Le Quere et al. (2009) suggest a slightly lower value" | Accepted, Section redrafted for SOD - new synthetic studies available since the Fod |
| 16545 | 11 | 11 | 17 | 11 | 20 | Another important sentence that needs a supporting citation. | Accepted, Section redrafted for SOD - new synthetic studies available since the |
| 12375 | 11 | 11 | 2 | 11 | 3 | Please consider the language in the sentence, especially the word "rather" which seems to not be correct. | Accepted, Section redrafted for SOD - new synthetic studies available since the |
| 5702 | 11 | 11 | 2 | | | Please check the words 'southern Asia'. It seems, these need to be replaced with the words "South-Eastern Asia". | Accepted, Changed in SOD |
| 10103 | 11 | 11 | 2 | 11 | 2 | South East Asia large emissions due to draining conversion of peatlands to biofule plantations and agriculture, large fires have resulted in globally significan increased emissions | Accepted, Added for SOD |
| 11806 | 11 | 11 | 21 | 11 | 23 | Is there a reference for this statement or are you refering to the Zhao and Running paper? IN the latter case, why then the "Thus"? | Accepted, Change |
| 13309 | 11 | 11 | 22 | 11 | 24 | Suggest that clarify how Zhao and Running have made estimates of global NPP. | Accepted, Section redrafted for SOD - new synthetic studies available since the |
| 5538 | 11 | 11 | 22 | 11 | 23 | . "--- indicate the reduction in global NPP of 0.55 Gt C for the period 2000-2009". Land based NPP is of the order of 53 Gt C. So the above reduction is about 1%. | Accepted, Section redrafted for SOD - new synthetic studies available since the |
| 5539 | 11 | 11 | 26 | 11 | 26 | "--- up to 2100 --- fertilization might result in additional terrestrial uptake by global ecosystems in the range of 105-225 Gt C". This figure of an uptake of between 1.05 and 2.25 Gt C per year seems very optimistic. | Accepted, Section redrafted for SOD - new synthetic studies available since the |
| 14593 | 11 | 11 | 27 | 11 | 28 | what is the reference for this? | Accepted, Added for SOD |
| 10104 | 11 | 11 | 27 | 11 | 27 | Are you dealing with CH4 emissions from melting permafrost somewhere else? | Rejected, No - this is not an emission from managed land and cannot be |
| 14594 | 11 | 11 | 31 | 11 | 32 | this does not seem relevant | Accepted, Section redrafted for SOD - new synthetic studies available since the |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 14595 | 11 | 12 | | | | Need looking at carefully, not clear where all data comes from, lots of overlap (double counting), not comparable sources. Total LUC, Le quere et al result is houghton model, richeter and houghton is update, piao only on other estiamtes but lots out there, pan not LUC but forests only. USe Houghton et al 2012 synthesis or WG1 data (I can liaise). Pan paper itself in temepratue and boreal forests this is not LUC but all forest biomass change from inventories (ie LUC plus residual sink due to claitme and CO2). In tropics pan et al had totally different approach. confusing to show them together (it was in the Pan paper too). Pan and shevliakova mean different things by secondary vegetation. The real strength of Pan et al is that they pulled together an incredible data base of inventories to confirm a sink in extant forests that is likely due to climate and CO2. Other than that, the forest LUC in the tropics is just the same as houghton as it uses the bookeeping model and FAO data. | Accepted, Section redrafted for SOD - new synthetic studies available since the Fod |
| 7059 | 11 | 12 | | | | (1) The value for boreal forests is shown incorrectly. In the Pan et. al. paper it is 0.5 +/- , not 0.05 +/-.<br>(2) In addition, the value from Pan et. al. for the net global forest sink should be included.<br>(3) Finally,the legend does not accurately reflect the respective categories in the Pan et. al. paper. Each sink and source should be labeled as done in the Pan et. al. study to make clear, for instance, that the bars shown to the left for "land use change", "deforestation", and "secondary vegetation" all refer to tropical forests. | Accepted, Section redrafted for SOD - new synthetic studies available since the Fod |
| 5807 | 11 | 12 | | | | Please rework figure: Years should be given below all other graphic elements, legend should have white background to eliminate horizontal lines which disturb the text, boreal forests are given in the legend but not shown in the graph, numbers do not need to be shown (if you need them, put them in a table and delete the figure), and add space between the title of the vertical axis and numbers on the axis. | Accepted, Revised for SOD |
| 10590 | 11 | 12 | | | | This is a tricky figure to interpret. Do the bars for years 1990-2007 add anything? Suggest delete. If stay, then put a gap between first two bars as is done for 1990-1999 and 2000-2007 graphs. Boreal forests so small they are invisible so maybe better as a footnote in caption. What is a "tropical intact forest"? | Accepted, Revised for SOD |
| 11115 | 11 | 12 | | | | The figure is not clear as to what "land use change" means: does it include deforestation? what is secondary vegetation? Whereas land use change and deforestation are human activities, "secondary vegetation" does not mean anything without definition. Also, land use CHANGE data should be separated from carbon balance of existing forests (of any type) | Accepted, Revised for SOD |
| 2618 | 11 | 12 | | | | This figure was not clear because of the items that it included. Why was there a tropical intact forests group by itself? | Accepted, Revised for SOD |
| 8926 | 11 | 12 | | | | Although the presentation is common, it seems methodologically incorrect, to compare activities such as land use change and deforestation with vegetation forms. The activities result in change of land use and in turn leads to changes in average annual C fluxes | Accepted, Revised for SOD |
| 8927 | 11 | 12 | | | | given the massive deforestation of tropical and subtropical forests, the decreases in C fluxes appear very low, numbers verified? | Accepted, Section redrafted for SOD - new synthetic studies available since the |
| 14415 | 11 | 12 | 1 | | | Chart legend: what is the difference between deforestation and land use change? | Accepted, Section redrafted for SOD - new synthetic studies available since the |
| 15151 | 11 | 12 | 1 | 12 | 2 | graph is difficult to read and context of figure is confusing. One category is ""land use change", but other categories are also land-use change (like deforestation and secnfdary veg, perhaps). Note that the time periods metioned are not all decades (eg 2000-2007) | Accepted, Revised for SOD |
| 14425 | 11 | 12 | 1 | | | Number formatting is inconsistent between the figure and the text. The text uses the U.S. standard of a decimal mark as '.', the figure uses the European standard of the decimal mark as ','. | Accepted, Revised for SOD |
| 16214 | 11 | 12 | 11 | | | "total c flux" is it total? | Accepted, Specified net vs. gross |
| 5541 | 11 | 12 | 11 | 12 | 12 | How is the forest sink of 2.0 to 3.4 Gt C/yr estimated? Annual growth of woody biomass is of the order of 9 Gt C/yr. | Accepted, Section redrafted for SOD - new synthetic studies available since the |
| 9078 | 11 | 12 | 11 | 13 | 35 | It would be better to add a latest article relating to carbon emissions as follows: Harris, NL et al. (2012) Baseline map of carbon emmissions from deforestation in tropical regions. Science 336: 1573-1576. | Accepted, Section redrafted for SOD - new synthetic studies available since the |

|---|---|---|---|---|---|---|---|
| 11203 | 11 | 13 | | | | Suggest inserting the word 'unsustainable forms of' prior to 'shifting cultivation' at line 17. Science has shown that low intensity shifting cultivation can even act as a carbon sink in certain circumstances and net emissions may be neutralised over the medium and long term - sustainable systems of rotational farming also generate range of other benefits for soils and biodiversity. cf. Thilde Bech Bruun & Andreas de Neergaard & Deborah Lawrence & Alan D. Ziegler (2009) Environmental Consequences of the Demise in Swidden Cultivation in Southeast Asia: Carbon Storage and Soil Quality Hum Ecol (2009) 37:375388. See also Ziegler, A. D., Agus, F., Bruun, T. B., van Noordwijk, M., Lam, N. T., Lawrence, D., Rerkasem, K., and Padoch, C. (2009). Environmental consequences of the demise in swidden agriculture in Montane Mainland SE Asia: Hydrology and geomorphology Human Ecology (2009) 37 | Accepted, Revised for SOD |
| 15960 | 11 | 13 | | 13 | | figure is interesting but not clear, difference between sinks/sources is difficult to distinguish, increasing size of the figure, or indicating sinks with negativenumbers, could improve readability | Accepted, Revised for SOD |
| 15152 | 11 | 13 | | | | too small as is | Accepted, Revised for SOD |
| 14599 | 11 | 13 | | | | see earlier comments about pan et al data that should be explained better here than was in the original paper | Accepted, Revised for SOD |
| 7537 | 11 | 13 | | 13 | | Positive and negative bars are not distinguishable. | Accepted, Revised for SOD |
| 11807 | 11 | 13 | | | | Whether bars are negative (below x axis) or positive (above x axis) is as far as I understand not visible from this figure | Accepted, Revised for SOD |
| 5809 | 11 | 13 | | | | Please consider giving signs with the numbers. It is not easy to detect the X-axis in Asian Russia, Australia & New Zealand and Europe. | Accepted, Revised for SOD |
| 10594 | 11 | 13 | | | | Could be more logical to discuss stocks before sinks in this section | Accepted, Revised for SOD |
| 2619 | 11 | 13 | | | | This figure works well. | Noted, Thank you |
| 12871 | 11 | 13 | 1 | | | Fix the distortion in the map, which is currently compressed latitudinally. Preferably use an equal-area global map projection. | Accepted, Revised for SOD |
| 14426 | 11 | 13 | 1 | | | Since there isn't a common 'x-axis', describing a bar as above or below the axis is not sufficient. Because the bars are of different lengths it is possible to infer when a bar is meant to be positive or negative, but this is not sufficiently clear for a general audience. | Accepted, Revised for SOD |
| 14427 | 11 | 13 | 1 | | | Numerical values do not reflect the direction of the bars. The numbers on the figure currently only indicate magnitude of the flux, but not direction of the flux. Perhaps putting a '-' sign when appropriate would be sufficient to show when the bars indicate a net source or sink. | Accepted, Revised for SOD |
| 16215 | 11 | 13 | 10 | | | number here is 13 M ha converted; harmonize this with the earlier numbers on deforestation (5.2-8.3 M ha/yr), or recognize the difference. | Accepted, Revised for SOD |
| 16549 | 11 | 13 | 12 | 13 | 13 | Does this "20% of global emissions" figure refer to the 90s or the 2000s? Is this figure consistent with your other estimates? Seems too high, at least for the 2000s, particularly since it says GHG emissions, not CO2 emissions. | Accepted, Section redrafted for SOD - new synthetic studies available since the Fod |
| 14601 | 11 | 13 | 12 | | | according to houghton modelling results presented in Friedlingstein et al 2010 (global carbon project budget calcualtion) LUC total is about 12% of net emissions in the 2000s. This would be consistent with other data you present here e.g. le Quere (fireldingstein was the update o fle quere). stick to that data | Accepted, Section redrafted for SOD - new synthetic studies available since the Fod |
| 16550 | 11 | 13 | 13 | 13 | 15 | Is degradation 15-19% higher than deforestation, or does it add an additional 15-19% to the deforestation amount? If the first, it would be very large, and should show up as a large separate segment in Figures 11.1a and 11.3. | Accepted, Section redrafted for SOD - new synthetic studies available since the Fod |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 11979 | 11 | 13 | 13 | | 14 | Maybe add here that forest degradation leads to increased vulnerability to drought and fire in some forests, such as teh Amazon (Nepstad, D.C., Stickler, C.M.,Soares, B.& Merry, F. 2008. Interactions among Amazon land use, forests and climate: Prospects for a near-term forest tipping point. Philosophical Transactions of the Royal Society B 363:1737–1746.<br>Ray, D.; Nepstad, D. C. & Mourinho, P. 2005. Micrometeorological and canopy controls of fire susceptibility in mature and disturbed forests of an east-central Amazon landscape. Ecological Applications 15: 1664-1678.<br>Laurance, W.F. 2004. Forest-climate interactions in fragmented tropical landscapes. Philosphical Transactions of the Royal Society. 359: 345-352.) | Accepted, Dealt with in the section on susceptibility to future climate change (11.5) |
| 14602 | 11 | 13 | 13 | 13 | 18 | forest degradation should have its own paragraph. See also Imai et al 2009, archard et al., 2004 an d Putz et al 2012 synthsis in conservation letters http://onlinelibrary.wiley.com/doi/10.1111/j.1755-263X.2012.00242.x/abstract | Accepted, Added for SOD |
| 5542 | 11 | 13 | 13 | 13 | 14 | ”Additionally forest degradation, particularly selective logging is responsible for 15-19% higher C emissions than reported from deforestation alone. (Huang and G.P. Asner 2010)”. Much of this is harvesting and compared to annual growth should not be considered as C emissions. Also, if the logs are converted into sawnwood and panel products, they are still a store of C! | Accepted, Section redrafted for SOD - new synthetic studies available since the Fod |
| 2620 | 11 | 13 | 13 | | 18 | degradation is used frequently in this chapter but is a 'human value' laden word that is typically seen as negative. It needs to be clearer. Is it a loss of productive capacity? Is it a loss of nutrients like after fires? Forest degradation is written as the impacts of firests which is correct but then shifts to NTFP and shifting cultivation which does not fit into the same category. This mixes impacts that are major and others that do not fit into the same grouping. These have very different spatial and temporal scales. | Accepted, Glossary issue |
| 16551 | 11 | 13 | 15 | 13 | 17 | Why is shifting cultivation called degradation -- isn't it clearing of forests, but just on a smaller scale? If so it would seem to be deforestation. | Accepted, Section redrafted for SOD - new synthetic studies available since the |
| 5543 | 11 | 13 | 15 | 13 | 17 | “Forest degradation includes --- collection of firewood and NTFP, and production of charcoal ---“. This is harvesting not degradation. Much fuelwood collection is dead wood and charcoal production is usually managed on about a 15 year cycle unless areas are being cleared for agriculture. Collection of NTFP in most cases in managed sustainably! | Accepted, Agreed - clarified what is deforestation and what is harvest for SOD |
| 12386 | 11 | 13 | 18 | 13 | 25 | It is not clear if "wildfires" and its figure of 2.0 Gt C/yr for 1997-2001 is limited to forest fires, since this is under the heading "Forests". But it seems less consistent with line 24: "…global emissions from all types of fires in diffrenent ecosystems in 2010 were as high as 2,2 Gt C. Forest fores contributed with 0,3 Pg C (= 0,3 Gt C). This should be clarified. | Accepted, Agreed - clarified for SOD |
| 12383 | 11 | 13 | 2 | | | It is a bit confusing that tropical deforestation and regrowth is added in the same figure that shows the flux. May be it is a good idea streamlining fluxes in the world map figure, and add a separate figure or table separating the deforestation and regrowth in tropical areas. | Accepted, Revised for SOD |
| 12384 | 11 | 13 | 2 | 13 | 3 | The axis' in the figure should be more clear. It would be helpful if sinks were represented with not only negative bars, but also with negative values. | Accepted, Revised for SOD |
| 15153 | 11 | 13 | 22 | 13 | 22 | Delete "Data available …" sentence | Accepted, Deleted |
| 11293 | 11 | 13 | 22 | 13 | 35 | The mixture of raw numbers and proportions would be better shown through graphs that show both simultaneously (e.g. pie charts that visually demonstrate proportions while overlaying actual quantitative numbers). | Accepted, Revised for SOD |
| 11808 | 11 | 13 | 23 | 13 | 35 | You are not only refering to forest fires but this is in the forest section, maybe a special section on fires may help? Or move the estimates of fire emissions in specific sectors to their respective subsections. | Accepted, Agreed - clarified for SOD |
| 16216 | 11 | 13 | 24 | | 25 | use same units (have GT and Pg in same sentence). Not celar where the other 1.1 Gt are? You should 0.8, 0.3 out of 2.2---where are the rest?is 0.3 for forest firest NOT including forest fires that lead to conversion for agriculture? Or is 0.3 boreal? Not clear how this 2.2 has been parsed. | Accepted, Harmonized units for the SOD |
| 12387 | 11 | 13 | 25 | 13 | 27 | Is the figure 0,7Pg C for the increase in 2010 of emissions from fires from deforestation and degradation or is this the contribution from high emissions in S America and SE Asia? Please clarify. | Accepted, Clarified for SOD |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 5544 | 11 | 13 | 25 | 13 | 26 | Units –PgC not Gt? | Accepted, Harmonized units for the SOD |

| 15155 | 11 | 13 | 36 | 14 | 2 | is it worth being so non-committal? | Accepted, Revised for SOD |
| 14603 | 11 | 13 | 36 | 13 | 37 | is this really correct, what is meant by this number. My undesrtanting from memory of the shevliakova paper is they do LUC but do not really model croplands in terms of their emissions, it is merely conversion between forest PFT, and grassland PFT and possibly some very generic crop PFT, but not emissions for extant/permanent croplands. I suspsect this is the LUC emission from conversion of natural lands to croplands and if so is double counting with deforestation emissions, which is not a problem if it is clearly flagged. If it really is ongoing emissionf rom croplands after LUC is it is land use emissions not land use change emissions , then this number seems very high. Surely croplands are more or less in balance once established. | Accepted, Section redrafted for SOD - new synthetic studies available since the Fod |

| 10240 | 11 | 14 | 31 | 14 | 31 | an an subitem header as previously (line 3: grasslands, line 16 wetlands"), could be "other ecosystems". | Accepted, Revised for SOD |
| 5495 | 11 | 14 | 31 | 47 | | Agreed that it is important to include this- but not clear on lakes how human influence- apart from changes in climate can alter these to be sources or sinks- so not clear if it is appropriate here or in a separate section on unmanaged ecosystems | Accepted, Agreed - moved to a new section on unmanaged ecosystems and put lakes and permafrosts there (briefly |
| 14609 | 11 | 14 | 31 | 14 | 40 | delete frost sentence and give subheading of mangroves and put ins eparate paragraph from text below | Partially Accepted, Moved mangroves to |
| 11809 | 11 | 14 | 31 | 14 | 47 | Are lakes and mangrooves a part of wetlands? Or should this be a new sub-section? | Partially Accepted, Moved mangroves to |
| 18930 | 11 | 14 | 31 | | | Start this paragraph with "Others:" following the logic of previous paragraphs. | Accepted, Moved mangroves to forest |
| 16554 | 11 | 14 | 32 | 14 | 33 | Do these figures for mangroves overlap with those for forests? (Mangroves are forests after all; were they included in the previously given figures for forests?) | Accepted, Moved mangroves to forest section |
| 4276 | 11 | 14 | 40 | 14 | 44 | Refers to potential changes in fluxes from lakes without giving an indication of the magnitude of these fluxes, leaving the reader the impression the fluxes are large enough to matter but not knowing how big they are. Magnitude of flux is given later for saline lakes only. Possible reference (there are probably better and more recent ones, but it is a start): Campbell, I.D., Campbell, C., Vitt, D.H., Kelker, D., Laird, L.D., Trew, D., Kotak, B., LeClair, D., and Bayley, S. 2000. A first estimate of organix carbon storage in Holocene lake sediments in Alberta, Canada. Journal of Palaeolimnology 24: 395-400. This paper estimates that Alberta Lakes may represetn 1/1700 of total global lake sediment carbon, and that Alberta lakes sequester ~ 15 gCm-2yr-1, or .23 TgCyr-1 in total, which would make the global total (assuming the 1/1700 is accurate) 391 TgCyr-1 for global lakes. | Accepted, Agreed - moved to a new section on unmanaged ecosystems and put lakes and permafrosts there (briefly as unmanaged) |
| 14610 | 11 | 14 | 40 | 14 | 47 | New paragraph on disolved organic carbon in lakes and rivers. Presuming that is that the lake emissions being referred to are DOC, but may also be due to plant die back and exposed carbon rich soil? This is all about future, do we have anything on trends. Some disussion there may be a lot of DOC in river run off that is not accunted for in budgets, or is emitted elswehere from where the carbon is sequestered. I seem to rememebr a paper a long time ago by pacala that estiamted this in the USA, but I am sure there are more recent refs. | Accepted, Agreed - moved to a new section on unmanaged ecosystems and put lakes and permafrosts there (briefly as unmanaged) |
| 12391 | 11 | 14 | 43 | 14 | 44 | Could it be explained why a wet scenario will result in more C-emissions from lakes in N.USA than a dry scenario? | Accepted, Checked numbers and revised for SOD |
| 14605 | 11 | 14 | 6 | | | again I assume this is due to LUC and thus has some overlap witht eh forest number and the crop number, no problem there as long as it is clear. | Accepted, Checked numbers and revised for SOD |
| 5369 | 11 | 14 | 16 | 14 | 47 | Rooney et al (2012) describe another anthroprogenic impact on wetlands that I think is worth mentioning in this chapter as I dont see any other chapter taking this up. Rooney, R.C., S.E. Bayley, and D.W. Schindler, Oil sands mining and reclamation cause massive loss of peatland and stored carbon. Proceedings of the National Academy of Sciences, 2012. 10.1073/pnas.1117693108 | Accepted, Added reference for SOD |
| 11116 | 11 | 15 | | | | suggest to replace "measures" with "options" | Accepted, Revised for SOD |
| 14727 | 11 | 15 | 0 | | | CO2, CH4 and N2O instead of CO2, CH4 and N2O | Rejected, No difference in comment |
| 12392 | 11 | 15 | 1 | 15 | 15 | A lot of interesting information, but not easy accesible. A table with the different sources mentioned in the text, emissions in the same units, eventually also in percentages would improve the information value. | Accepted, Tabulated for SOD |
| 14612 | 11 | 15 | 1 | | | when you do have data…I would like to see some total numbers here not just %. Becomes confusing. First you have % global totals, then % agric emissions. But don't know what total emissiosn and total agric emissions are.. Have the numbers presented been checked for consistency with WG1? | Accepted, Tabulated for SOD |
| 11906 | 11 | 15 | 1 | 15 | 32 | Consider add a figure to show the trends of non-CO2 GHG and shorten the statements. | Partially Accepted, Tabulated for SOD |
| 10595 | 11 | 15 | 1 | | | What about a similar section for forests? Whole chapter needs to clearly dsitinguish between agriculture and forests throughout the text. When discussing both could use the term LULUCF. Also helps reader if keep to same order (eg forests discussed before agriculture) in each section. | Partially Accepted, But used AFOLU instead of LULUCF as LULUCF did not include agricultural emissions |
| 12393 | 11 | 15 | 10 | 15 | 12 | For better transparency; Indication of type of gas could be given inside the brackets for rice cultivation, biomass burning and manure management. | Accepted, Checked numbers and revised for SOD |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 7185 | 11 | 15 | 10 | 16 | 10 | If CH4 emissions from rice cultivation account for 11% of the agricultural non-co2 emissions and biomass burning CH4 for 12%, why is CH4 from biomass burning not given in fig. 11.1 | Accepted, Checked numbers and revised for SOD |
| 12394 | 11 | 15 | 15 | 15 | 29 | A lot of interesting information, but not easy accesible. A table with the different sources mentioned in the text, emissions in the same units, eventually also in percentages would improve the information value. | Accepted, Tabulated for SOD |
| 10106 | 11 | 15 | 15 | 15 | 17 | What about china, East Asia is missing, increased fertilizer use is a major source of N2O emissions from China | Accepted, Checked numbers and revised for SOD |
| 13316 | 11 | 15 | 18 | 15 | 20 | Expand discussion of N. N fertilizer requires significant contribution of energy to convert N2 to reactive N. Generally more reactive N in the biosphere. Link increase in crop residues to increased crop production. Give a more precise description of N cycle. | Accepted, Expanded text on N - under-represented |
| 16555 | 11 | 15 | 2 | 15 | 2 | Give a date to explain what you mean by "at present". | Accepted, Updated with 2010 values |
| 14611 | 11 | 15 | 2 | 3 | | again the question , is this CO2 emissiosn from LUC and from established corplands (LU) | Accepted, Checked numbers and |
| 11062 | 11 | 15 | 2 | 15 | 14 | Two comments in this paragraph: (1) The USEPA reference appears to be used in more than one instance to support statements regarding global emissions; this reference is a primary source for US emissions but not global emissions, thus it seems that there is an error here or that another source would be a better primary reference. (2) The units used here are CO2eq and thus it appears these units are inconsistent with those used earlier in the chapter, for example, Fig. 11.1 which uses C not CO2. Units should be clarified and consistent. | Partially Accepted, These are the USEPA global estimates - but should be augmented with other studies |
| 2622 | 11 | 15 | 2 | | 5 | Shouldn't deforestation and conversion to agriculture also show up here?? | Accepted, Checked numbers and |
| 14613 | 11 | 15 | 20 | | | wy are crop residues a N source in particualr, why is this in addition to crop production? | Accepted, Clarified for SOD |
| 13665 | 11 | 15 | 20 | 15 | 21 | Change (South Asia) to (South, southeast and east Asia) | Accepted, Revised for SOD |
| 13666 | 11 | 15 | 22 | | | Add the following reference because it updates the global estimation of CH4 emission from rice cultivation and showing the greatest contribution of south, southeast and east Asia: Yan, X., Akiyama, H., Yagi, K., and Akimoto, H.: Global estimations of the inventory and mitigation potential of methane emissions from rice cultivation conducted using the 2006 IPCC Guidelines. Glob. Biogeochem. Cycles, 23, GB2002, doi:10.1029/2008GB003299 (2009); a PDF file for the reference is attached. | Accepted, Added for SOD |
| 14614 | 11 | 15 | 24 | | | suggest instead ot "rpduction cycle" to say "trends in" | Accepted, Revised for SOD |
| 10107 | 11 | 15 | 24 | 15 | 15 | It would be usefull to mention trends in animal numbers development in different regions and relate the emissions to produced units (of protein) FAO Getrber et all 2012 LCA anaylis of milm and a new report just coming on meat | Accepted, Added reference for SOD - provided breakdown of numbers |
| 9326 | 11 | 15 | 26 | | | The increase of harvest rice' is not clear. | Accepted, Clarified for SOD |
| 5048 | 11 | 15 | 26 | 15 | 26 | what is harvest rice in "increase of harvest rice" is this harvested rice land? | Accepted, Clarified for SOD |
| 5049 | 11 | 15 | 29 | 15 | 29 | the numbers in this paragraph cast doubt on 76% estimate | Accepted, Check numbers and revise for |
| 9327 | 11 | 15 | 30 | 15 | 32 | Please see if the word 'from' in line 30 and 32 can be replaced with 'in'. | Accepted, Revise for SOD |
| 14617 | 11 | 15 | 33 | | | eems odd that in this section you give mitigation potential for AFOLU sections not icnluded in comparable AR4 chanpter in past, but you don't give the updated mitigation ptoential of things that were presented in AR4, even though there must be newer estaimtes. SOme people will jsut look to heare and will not want to look back to AR4 so at least summarise and update what was in AR4, rather than merely present totally new sectors. However I also appreciate this hcapter is already over page limit. Covnersely you could cut down what is presented on bioemergy, and more sumarise what wsa in SRREN. | Accepted, reduce bioenergy section - refer back to AR4 and show updates |
| 2606 | 11 | 15 | 33 | | | suggest to add the part to emphasize "the sensitivity and uncertainty of carbon budget" | Accepted, Do in climate susceptibility |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 10242 | 11 | 15 | 34 | 15 | 35 | It is written: “Greenhouse gases can be reduced by production-side mitigation measures (i.e. by reducing GHG emissions per unit of land or per unit of product)”. This kind of sentence is dangerous, thus it could be completely wrong when balance take into account the whole dimension of the land, and crosscutting issues. As it is stated in the item 11.1, the balance should consider feedbacks between mitigation options related to land surface. For instance, in Africa, most future policies will rely on increasing N-fertilizer level, and thus more N2O emission by unit of land, but this will avoid degradation of other lands, and at the end certainly less GHG emissions.<br>It should also be stated here that mitigation technology options and practices should be compared with baseline emissions, thus mitigation in the AFOLU sector are rarely absolute, but relative to other alternative which must comply with increasing food and biomass demand. | Partially Accepted, Clarify for SOD |
| 7539 | 11 | 15 | 34 | 15 | 38 | Chapter 9 in AR4 focused on both sides measures. | Accepted, Revise for SOD |
| 16557 | 11 | 15 | 35 | 15 | 36 | "by reducing demand" is a misleading way to describe demand-side options; the most feasible ones change the composition of demand towards foods that produce lower emissions, rather than reducing the amount of food people have to eat. | Accepted, Revise for SOD |
| 5550 | 11 | 15 | 36 | 15 | 36 | “Reducing the demand for --- fibre products”. I have argued that demand could be substantially increased to use much more of the annual growth of biomass including bioenergy and biochar. This would give employment opportunities, especially to the rural poor. | Rejected, Does not belong in this section |
| 5047 | 11 | 15 | 4 | 15 | 4 | I don’t think I believe "In total 76% of GHG emissions on croplands comes 4 from the application of fertilizers and 7.6% - from field operations (Ceschia et al., 2010)." as I think the emissions from tillage, uptake from no till, emissions from fossil fuel use, legumes, histosoils, rice etc are such that 76% is high | Accepted, Check numbers and revise for SOD |
| 10105 | 11 | 15 | 4 | 15 | 14 | I do not think it is good idea to lump CH4 and N2O this way, the different sources presented play different role in emissions of these two gasses | Accepted, Revise for SOD |
| 13664 | 11 | 15 | 4 | 15 | 5 | Is this estimation (76% from fertilisers and 7.6% from field operation) included CH4 emissions from rice cultivation? If not please recalculate. | Accepted, Check numbers and revise for SOD |
| 5812 | 11 | 15 | 40 | | | You mean chapters 8 and 9, not 7 and 8. | Accepted, Revise for SOD |
| 15158 | 11 | 15 | 41 | 15 | 43 | awkward to get through; fix phrasing | Accepted, Revise for SOD |
| 12395 | 11 | 15 | 44 | 15 | 44 | It says that measures described in detail in AR4 are not described further here. Have new information since AR4 changed any of the conclusions on measures? For instance, new information on pay-back time and the possible responses on the climate and the albedo? Due to the albeo, afforestation in boreal areas could have a negative climate effect. Please consider to include such information in the chapter. It would also be helpful with a sum-up of the information on measures in AR4. | Accepted, Refer back to AR4 and show updates |
| 13315 | 11 | 15 | 5 | 15 | 5 | Not clear what "field operations" is referring to, clarify in text. | Accepted, Clarified for SOD |
| 16218 | 11 | 15 | 6 | | | going back and forth here with CO2e and C; perhaps try to keep consistent | Accepted, Harmonized units for the SOD |
| 15157 | 11 | 15 | | | | weak section overall, repetiitve, and can be tightened | Accepted, Conducted a thorough edit for |
| 3539 | 11 | 15 | | | | When data is updated, please include figures to illustrate trends and changes. | Accepted, Revised for SOD |
| 15607 | 11 | 15 | 1 | 15 | 32 | Consider mentioning projected emissions from animal agriculture. Pelletier N. and P. Tyedmers (2010). Forecasting potential global environmental costs of livestock production 2000-2050. Proceedings of the National Academy of Sciences of the United States of America 107(43), 18371-74. Available at: http://www.pnas.org/content/early/2010/09/27/1004659107.full.pdf+html. | Accepted, Expanded and updated livestock sector for SOD |
| 13963 | 11 | 15 | 1 | | | Appropriate references for global data needed. The US GHG inventory is an inventory of US GHG emissions and should not be used as a reference for global emissions. All uses of the US GHG inventory in this section should be removed and appropriate data and data sources added. | Rejected, The USEPA also produces reports on global emissions - it is that one we use here - but have included |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 10241 | 11 | 15 | 1 | 15 | 32 | This section is by far too short and incomplete, thus AFOLU sector is responsible for the majority of N2O emissions and more than half of methane emissions. This section should highlights that there are still too many uncertainties both for source and sink.<br>Concerning sink, add regional estimates (e.g. Bernardier A.B. and Conant R.T. 2012. Global Change Biology (2012) 18, 928–935, doi: 10.1111/j.1365-2486.2011.02554.x).<br>Concerning sinks, see papers by Chapuis-Lardy et al. (Chapuis-Lardy L., Wrage N., Metay A., Chotte J.L, Bernoux M. 2007. Soils, a sink for N2O? A review. Global Change Biology. 13, 1-17. Doi: 10.1111/j.1365-2486.2006.01280.x).<br>Also it should be stated somewhere that human activities in AFOLU influence also indirect emissions (e.g. termites communities may change with LU and managements options). | Accepted, Expanded on the importance of the sector in emissions of N2O and CH4 |
| 7538 | 11 | 15 | | 31 | | Dividing mitigation options into production-side and demand-side is not good idea. Even AR4 deals with both side options in Chapter 9. All options are linked tightly each other. All options should be summerized in a table. Categorization by sectors and common options (i.e. Agricilture, Forestry, other land uses , land use change and bioenergy) is enough. | Rejected, Since demand side measures in agriculture were not considered at all in AR4, it is useful to consider here. We deal with the inter-relatedness of the |
| 3170 | 11 | 15 | 33 | | | Sections 11.2 and 11.3: streamline the tables and the prose; much of the prose in the main text repeats the tabular points. | Accepted, Revised for SOD |
| 5370 | 11 | 15 | 34 | 15 | 36 | Much later on in Chapter 11 considerable discussion is devoted to the Wise et al (2009) paper in Science that shows how intelligent climate policy can also mitigate land use emissions. I strongly encourage the authors of Chapter 11 to bring those ideas up to this point in the chapter or at least introduce those ideas up here. This framing of either production-side or demand-side is too simplistic and is not in keeping with the more nuanced set of options availiable to society that are covered in the Wise et al (2009) paper and which are described later in Chapter 11 itself. | Partially Accepted, It is a matter or where best to place this material |
| 3541 | 11 | 15 | | | | In the title 'Production-side mitigation measures', I have the impression that the term 'Production' is appropriate for sectors like industry. But for AFOLU, probably not. I would suggest that we say something like 'Source-side mitigation measures'. | Rejected, This terminology does not help - but we will seek alternatives, or define better |
| 3540 | 11 | 15 | 40 | | 45 | Please check the correct way to write references in IPCC documents. Replace 'i.e.' with 'for e.g.' on line 45. | Accepted, Zotero updated for SOD |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 9092 | 11 | 15 | 40 | 15 | 45 | I think measures already described in AR4 should be described again (or at least included in Table 11.2), if new estimates of carbon sequestration potential were published after AR4 because the number of such publication, especialy at country-scale, increased after AR4 publication. For example, please include the following paper, which estimated the soil C sequestration potential in Japanese cropland by high input carbon practices, in references of "Croplands-agronomy" in Table 11.2; 1); Yokozawa, M., Shirato, Y., Sakamoto, T., Yonemura, S., Nakai, M., Ohkura, T. (2010) Use of the RothC model to estimate carbon sequestration potential of organic matter application in Japanese arable soils. Soil Science and Plant Nutrition, 56, 168-176.<br>In addition, the following papers should be included, too; 1) Alvaro-Fuentes J;Paustian,K 2011: Potential soil carbon sequestration in a semiarid Mediterranean agroecosystem under climate change: Quantifying management and climate effects. Plant and Soil, 338, 261-272; 2) Prechtel A, von Lutzow M, Schneider BU, Bens O, Bannick CG, Kogel-Knabner I, Huttl RF 2009: Organic carbon in soils of Germany: Status quo and the need for new data to evaluate potentials and trends of soil carbon sequestration. JOURNAL OF PLANT NUTRITION AND SOIL SCIENCE-ZEITSCHRIFT FUR, 172, 601-614; 3) Girmay G, Singh BR, Mitiku H, Borresen T, Lal R 2008: Carbon stocks in Ethiopian soils in relation to land use and soil management. Land Degradation & Development, 19, 351-367; 4) Maquere V, Laclau JP, Bernoux M, Saint-Andre L, Goncalves JLM, Cerri CC, Piccolo MC, Ranger J 2008: Influence of land use (savanna, pasture, Eucalyptus plantations) on soil carbon and nitrogen stocks in Brazil. European Journal of Soil Science, 59, 863-877; 5) Katterer T, Andersson L, Andren O, Persson J 2008: Long-term impact of chronosequential land use change on soil carbon stocks on a Swedish farm. NUTRIENT CYCLING IN AGROECOSYSTEMS, 81, 145-155; 6) Schulp CJE, Veldkamp A 2008: Long-term landscape - land use interactions as explaining factor for soil<br>organic matter variability in Dutch agricultural landscapes. Geoderma, 146, 457-465; 7) VandenBygaart AJ, McConkey BG, Angers DA, Smith W, de Gooijer H, Bentham M, Martin T 2008: Soil carbon change factors for the Canadian agriculture national greenhouse gas inventory. Canadian Journal of Soil Science, 88, 671-680. | Partially Accepted, Agree to refer back to AR4 - but many of the references listed are far too specific - there are 10s or 1000s of references in this filed and be have to choose the most synthetic - we cannot cite all individual studies |
| 12926 | 11 | 15 | 1 | 15 | 32 | Since the mechanisms of N2O and CH4 production in each ecosystem, these GHG should be discussed in sepeartely. After the trend of contribution of these GHG emission is discussed, detail of these source or regional distribution of the source of each GHG should be discussed in different sub-sections like in "Trend of N2O emission" and "Trend of CH4 emission" sub-sections. | Accepted, Disaggregated |
| 11204 | 11 | 16 | | | | Table 11.2: In final cell on left hand column it would be useful to add specific reference to and "including through recognition of communal/customary tenure systems" after 'community forests'. In the right hand column it might be good to add the above references of Agrawal and others? | Accepted, Add for SOD |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 10243 | 11 | 16 | | 20 | | Most references are not listed, thus it is difficult to judge if there are all adequate! It should be given here priority to paper already synthetizing available information (review paper) for instance a search on the ISI web of Science with the key words “crop* carbon review” in the field “title” return only 4 papers. Citing review paper will permit to cite fewer references and allowing readers to summarized and synthetized information.<br>For the “Croplands – tillage/residues” (page 17) : Tillage effect have to be differentiated from the residues effect; As it is, it sums too different management options: tillage and residues, tillage without residues, no-tillage and no-residues, and no-tillage and residues<br>For “Biochar” (page 17): researches are still in the infancy, and first meta-analysis showed that biochars is not always synonymous of increasing biomass productivity (e.g. Jeffery et al. 2011. Agriculture, Ecosystems and Environment 144 (2011) 175–187, doi:10.1016/j.agee.2011.08.015)<br>Livestock – feeding (page 18): It should be underline that some dietary additive suggested here might be forbidden or limited in some countries (e.g. bST in Europe)<br>“Other mixed biomass production systems”: this heading is too vague, it would be better to consider on one hand something like integrated crop-livestock systems, and double-cropping systems. □ | Accepted, Replace many papers with reviews since 2007 in SOD |
| 10622 | 11 | 16 | | | | Please consider the paper Caparrós et al. (2011). This paper analyzes avoided degradation costs in Spain and in Tunisia. Caparrós, A., Ovando, P., Oviedo, and Campos, P., 2011. Accounting for carbon in avoided degradation and reforestation programmes in Mediterranean forests. Environment and Development Economics 16(4): 405-428.. This paper reviews different studies which estimate economic and physical potentials for bienergy and forestry options in Europe. | Rejected, Considered but too country specific |
| 9448 | 11 | 16 | | 20 | | Table 11.2 is helpful however it mixes one nascent set of mitigation options (REDD) with numerous technologies that on their own do not constitute mitigation options. Avoided deforestation is a potential outcome of set of incentives and rules that provide the mechanisms for mitigation. Other technologies in the list would require similar rules and incentives to be mitigation options. Biochar is not a mitigation option. A scheme to promote farmers to make and bury biochar is a mitigation option. | Partially accepted, A sentence was added in the opportunities column |
| 11980 | 11 | 16 | | | | "Forest management in plantations". Not clear why this is a mitigigation option | Rejected, Improved management in plantations can enhance C sinks |
| 2364 | 11 | 16 | | | | This table is very helpful and contains good information in a concise form. Consider to add "abatement cost" and "investment needs" (link appropriatelywith 11.10 and avoid duplication) | Rejected, Better to leave these until the later sections where these are dealt with |
| 6825 | 11 | 16 | | 19 | | The table starts with some activities and describes the impact eg avoided emissions or additional sequestration. These explanations are useful to explain the impact on the atmosphere - should be extended to all activities in the table, perhaps as a separate column? in some cases eg bioenergy, impacts may be in other sectors eg energy | Accepted, Harmonize the table entries across all practices for the SOD |
| 3542 | 11 | 16 | | | | Check again the way references are writen; for e.g. Gibbs, Brown et al. 2007; Saatchi, Harris et al. 2011; Lehtonen and A. 2005 are not common ways to present references. | Accepted, Zotero updated for SOD |
| 14618 | 11 | 16 | | | | row 2, afforestation, reforestation, needs more up to date refs. | Accepted, Replaced references with |
| 14619 | 11 | 16 | | | | row 4. forest management in plantations. Surely this is overlap with section above Also how will improving productivity of fruits, cofee, gum etc improve carbon balance | Rejected, Less emissions per unit product - but removed specification of |
| 14620 | 11 | 16 | | | | sustaitnable management in native forests, this is not so much management but conservation really it is REDD and more clear to state as such. | Rejected, Conservation includes management |
| 7611 | 11 | 16 | | 16 | | "Plantation" meams about 5 to 20 years rotation forestry in tropical regions. It is not include planted forest such as Europa and Japan. Replace "forest manegement. FAO classifies plantation of fruit and cocoa, coffee ,NTFP in agricultural land. Fruit and cocoa, coffee, NTFP will be delete from "Forest manegement in plantion" in plantations" with "forest mangegement in planted forest" option. | Accepted, Done |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 7612 | 11 | 16 | | 16 | | I think "Protection for wild fire" is very important for GHG gus reduction. Plese add "Protection for wild fire" or "Wild fire manegement" in option. | Rejected, Evidence is not clear - some studies this increases fuel load leading to larger fire events - have discussed, |
| 9328 | 11 | 16 | | | | Most of the reference listed pertain to pre-AR4 period, i.e. before 2007. It is suggested that references pertaining to 2007 and the later years only may be given. | Accepted, Replaced references with post-2007 reviews |
| 7336 | 11 | 16 | | | | citations all messed up | Accepted, Zotero updated for SOD |
| 5705 | 11 | 16 | | | | Table on Forestry Option needs to be reoriented in tune with the terminologies that are being used in the UNFCCC decisions and text on REDD-plus. At the top of the Table, under heading Option, 'Forestry' should be replaced by "Forestry (REDD-plus)". Next, elements below "Forestry (REDD-plus)" will need to be regrouped. For example, 'Afforestation/Reforestation' and 'Forest Management in Plantations' could be grouped together under the new sub-head "Enhancement of Forest Carbon Stocks", 'Improved Forest Management' could be put under "Sustainable Management of Forest", and similarly, 'Sustainable Management in Native Forest' could be put under "Conservation". The terms in bold font are coming from the UNFCCC decisions on REDD-plus. | Accepted, Revised for SOD |
| 7540 | 11 | 16 | | 16 | | REDD is the name of a policy in UNFCCC, and it is not appropriate as a name of a mitigation option. | Accepted, Revised for SOD |
| 7541 | 11 | 16 | | 16 | | Categorization of mitigation options is not reasonable and not comfortable. Respecting Subsection 9.4.2 in AR4, categorization and illustration should be revised. | Accepted, Revised for SOD |
| 7542 | 11 | 16 | | 16 | | Replace "forest manegement in plantations" with "forest management in planted forests" because plantation means short rotation forestry in toropical regions. Use generic words. Delete "in native forest" in "sustainable forest management in native forest". "Native" is not appropriate but generic SFM here. | Accepted, Revised for SOD |
| 5551 | 11 | 16 | | 16 | | REDD will not be successful in reducing deforestation, if agricultural productivity, especially for the subsistence sector does not increase in line with population increase and the increase demand for food and fibre products. REDD may be most successful in attacking forest degradation. Under Forestry options, which I would rename Tree planting and management options, I would have: Encouraged the planting/management of trees outside the forest, especially on farm in shelterbelts and along roads, rivers and railways (RRR), Use trees to improve fertility and soil friability. But above all need good inventory information on all land use types, especially in areas of high population densities. | Accepted, Discussed in the policy section (11.10) |
| 11810 | 11 | 16 | | | | IN the option "Forest management in plantations": Why are fruits and NTFPs named here? Are they a mitigation option? If yes, explain how. | Rejected, Less emissions per unit product - but remove specification of the |
| 10262 | 11 | 16 | | | | To improved Forest Management : Add fresh reference: Routa,J., Kellomäki, S. and Strandman, H. : Effects of Forest Management on Total Biomass Production and CO2 Emissions from use of Energy Biomass of Norway Spruce and Scots Pine. BioEnergy Research: Volume 5, Issue 3 (2012), Page 733-747. | Rejected, Considered but too country specific |
| 11117 | 11 | 16 | | | | This table is a simple list of possible options - a reference would be needed to later sections where quantitative assessments are provided. However, it would be nice to have an indication of the relative importance of the various options. Also, the references in this format are not informative at all, maybe some quantitative information from them would be interesting. | Accepted, Reference to later sections will be added for SOD |
| 11118 | 11 | 16 | | | | For reducing deforestation…, REDD (actually: REDD+) is only a program for developing countries, however, deforestation may also be a (considerable) problem for countries such as Australia (mentioned in the draft), Russia, Canada, Finland and others. Thus, additional forms of mitigation are required. | Accepted, Revised for SOD |
| 11119 | 11 | 16 | | | | For afforestation: the definition of afforestatin and reforestation may not be important here at all (most people know what these are), and providing any definition may result in a conflict with "official" definitions under the Kyoto Protocol - please check and modify | Accepted, Revised for SOD |
| 11120 | 11 | 16 | | | | "Sustainable management in native forests" - this is a rather odd term. "Improved forest management" should cover management in native forests, thus, preserving carbon in UNMANAGED forest should be mentioned here. | Accepted, Revised for SOD |
| 11160 | 11 | 16 | | | | Difference between the "Improved Forest Management" and the "Sustainable management in native forest" is not clear. These can be merged into "Sustainable forest management" | Accepted, Revised for SOD |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 11161 | 11 | 16 | | | | "Plantations" and "planted forest" should be discriminated. Orchards, cacao, coffee and rubber trees are not always defined as "forests". | Accepted, Revised for SOD |
| 11162 | 11 | 16 | | | | In the table, use of unclear terms should be avoided as possible. For example, "native forest" | Accepted, Revised for SOD |
| 11163 | 11 | 16 | | | | Forest fire control, water level control in the peat forest should be included as mitigation options. | Accepted, Revised for SOD |
| 2623 | 11 | 16 | | 20 | | What is 'forest degradation' - it needs to be defined. Does the Afforestation/Reforestation part need to include that it is afforestation only if it was not in forest conditions for 50 years? The Biochar is not something that is just found in agriculture but is also practiced in forests. The Grasslands - fire mgt includes fire prevention but this is part of the ecophysiology of grasses - they self generate fires. Fire prevention has to be cautiously implemented if the ecosystem needs it. The unhealthy forests in western US are due to fire prevention. There needs to be a definition for Degraded soils. The Bioenergy from dedicated crops are plants that have a significant potential to become invasive so this should be approached cautiously, i.e., probably not a good idea to plant outside of their normal range. | Accepted, Defined in glossary and clarified in the SOD; biochar in forestry is difficult economically and practically. The impacts on forests negative of wood used for production. But unlikley, as charcoal more valuable as a fuel |
| 12397 | 11 | 16 | 1 | 16 | 2 | Production of artificial meat is one way of reducing emissions from production of meat. Especially ruminant meat may show dramatic reduced GHG-emissions when artificially produced. Could also be assessed being a measure reducing the demand side (meat demand). | Accepted, Included mention in livestock demand-side Discussion |
| 12396 | 11 | 16 | 1 | 20 | 2 | Please consider to start the explanation box by giving a reference to which greenhouse gas the measure is relevant. | Partially Accepted, Changed table to include gas or reference to other section |
| 12872 | 11 | 16 | 1 | | | This table currently omits forest management actions that are adaptations to future climate change. Add a line "Column 1: Adaptation of forest management to climate change. Column 2: Prescribed burning, mechanical thinning, and retention of large trees; These adaptation measures also mitigate greenhouse gas emissions because long-term storage of carbon in large trees outweighs short-term emissions from prescribed burning; Fire management to control bark beetle outbreaks, projected to emit, in boreal forests in Canada, 8-67 Mt C y-1. Column 3: Stephens et al. 2009, Hurteau and Brooks 2011, Kurz et al. 2008. Stephens, S.L., J.J. Moghaddas, C. Edminster, C.E. Fiedler, S. Haase, M. Harrington, J.E. Keeley, E.E. Knapp, J.D. McIver, K. Metlen, C.N. Skinner, and A. Youngblood. 2009. Fire treatment effects on vegetation structure, fuels, and potential fire severity in western U.S. forests. Ecological Applications 19: 305-320. Hurteau, M.D. and M.L. Brooks. 2011. Short- and long-term effects of fire on carbon in US dry temperate forest systems. BioScience 61: 139-146. Kurz, W.A., G. Stinson, G.J. Rampley, C.C. Dymond, and E.T. Neilson. 2008. Risk of natural disturbances makes future contribution of Canada's forests to the global carbon cycle highly uncertain. Proceedings of the National Academy of Sciences of the USA 105: 1551-1555. | Accepted, Revised for SOD |
| 9079 | 11 | 16 | 1 | | | Some references in this table were not cited in the References section | Accepted, Zotero updated for SOD |
| 9080 | 11 | 16 | 1 | | | For description in "Sustainable management in native forest" , it would be better to add biodiversity issue. | Accepted, Revised for SOD |
| 14615 | 11 | 16 | 26 | | | suggest instead of "harvest rice" to say "rice production". | Accepted, Revised for SOD |
| 14616 | 11 | 16 | 26 | | | should you make the point here that carbon realeased as CH4 was taken up as CO2 so small net change in carbon, but methane greater raditive forcing effect in the short term. (in the longer term the CH4 turns back to CO2) | Accepted, Revised for SOD |
| 9130 | 11 | 16 | 28 | | | To avoid confusion, it is better use "plantation" and "planted forest" separately. Column 1 : change "Forest management in plantations" to "Forest management in planted forests and plantations", Column 2: "Planted forest are" to "Planted forests and plantations are", "timber, fruits" to "timber, or fruits". | Accepted, Revised for SOD |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 5496 | 11 | 17 | | | | Biochar in the agricultural recommendations- while this amendment has its devotees- research on behavior in soils is mixed with some studies showing N immobilization and yield decreases. Also it isn't clear in others if an observed response is the result of a pH increase or some other factor related to the char. I would suggest that char be replaced here with a more generic reference to residuals based soil amendments. There is a wealth of literature on benefits associated with organic amendments derived from residuals and this would have the added benefit of reduced landfill emissions for redirected organics. Using this term also would include biochar as a type of amendment and so would not upset any char devotees. | Accepted, Moved biochar to amendments section and treated as char. It is correct that biochar can deprive plants of N through ammonium sorption if added in large quantities without consideration for N supply from soil or other inputs. Positive effects on retention / supply to plants look to cancel out negative effects later, so small annual additions may be best; Biochar would have potential to impact crop yield in multiple ways, only one of which is pH - others are direct supply of mineral |
| 14621 | 11 | 17 | | | | row 6, not sure if you need LUC here | Accepted, Revise for SOD |
| 14622 | 11 | 17 | | | | row 7. biochar. Not sure this fits here quite as biochar probably produced from wood products, like timber in long lived prodcuts where you store it may not be so critical. I guess it may icnrease crop productivity, but this is a side issue to the carbon storage. | Partially Accepted, Moved biochar to amendments section and treated as char. It is correct that biochar can deprive plants of N through ammonium sorption if added in large quantities without consideration for N supply from soil or other inputs. Positive effects on retention / supply to plants look to cancel out negative effects later, so small annual additions may be best; Biochar would have potential to impact crop yield in multiple ways, only one of which is pH - others are direct supply of mineral nutrients, improved retention of |
| 11907 | 11 | 17 | | | | Add a new reference for nitrient management: Akiyama et al. (2010) Evaluation of effectiveness of enhanced-efficiency fertilizers as mitigation options for N2O and NO emissions from agricultural soils: meta-analysis. Global Change Biology, 16: 1837-1846. | Accepted, Add for SOD |
| 11908 | 11 | 17 | | | | Add a new reference for rice management: Ito et al. (2011) Mitigation of methane emissions from paddy fields by prolonging midseason drainage. Agriculture, Ecosystems and Environment, 141: 359-372. | Accepted, Add for SOD unless review / meta-analysis is available |
| 5706 | 11 | 17 | | | | Please add an additional row, and discuss enhancement of soil organic carbon separately for cropland management and grassland management. | Accepted, Revise for SOD |
| 13317 | 11 | 17 | | | | The real mitigation potential of biochar is not established. It could be removed from this table as its inclusion is premature. | Rejected, We are specifically asked to consider it in the chapter outline |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 5552 | 11 | 17 | | | | Land-based agriculture. Croplands-set-aside & LUC. I have never heard of 'holly forest'. What is it? It does not seem to be very common. It should be explained. Will it make significant in-roads? Biochar. This could be produced using crop residues (and tree waste), but at what cost? Who will pay for the spreading on fields? Surely soot serves the same purpose? This could be collected from chimneys? Under grassland could promote browse (and shade) trees. Under this heading could be a section on reclaiming land such as that invaded by 'weed' species, irrigated land that has become saline etc. | Partially Accepted, Moved biochar to amendments section and treated as char - and removed specific details such as holly forest. No one has made a global assessment of the potential for economic biochar deployment. Currently, lack of a price on carbon abatement (and/or a methodology for claiming a price at least for directly for sequestered carbon, however small) is a barrier. Refining predictability and certainty of crop impacts by matching biochar and soil, making biochar from wastes rather than virgin biomass, improving availability and cost of pyrolysis technologies, adopting sensible deployment strategies |
| 15608 | 11 | 17 | | | | For grasslands management option, consider citing: Thornton P.K. and M. Herrero (2010). Potential for reduced methane and carbon dioxide emissions from livestock and pasture management in the tropics. Proceedings of the National Academy of Sciences of the United States of America 107(46), 19667-72. | Accepted, Added for SOD |
| 10597 | 11 | 17 | | | | Why "Land-based" agriculture? I guess trying to distinguish from livestock - so better term is "Agronomy". | Rejected, Agronomy often only refers to cropland so land-based is better |
| 10598 | 11 | 17 | | | | Biochar rewording suggestion: Biochar is a soil amendment that sequesters C from source biomass and could possibly increases "crop" productivity in some soils. | Accepted, Moved biochar to amendments section and treated as char - Accepted wording change. Slight change to suggested wording to include |
| 10599 | 11 | 17 | | | | last line "mgt" in full | Accepted, Revised for SOD |
| 13964 | 11 | 17 | | | | under agronomy -- remove reference to agricultural biotechnology unless real data can be provided that unequivocally link a particular new variety to a measurable increase in soil carbon content. Include references (e.g., ongoing work by Six of UC Davis) regarding use of compost and manures in cropping systems and measured increases in soil carbon content. | Rejected, It has to be considered - even if it is just as a future possibility. We cannot pretend it doesn't exist |
| 13965 | 11 | 17 | | | | under nutrient management, remove reference to increased fertilizer input reducing land conversion pressures. This is a simplistic and highly contestable link. See for example several recent reviews of the science by doug boucher/union of concerned scientists. | Accepted, Remove for SOD or see comment on line 558 |
| 15230 | 11 | 17 | | | | Croplands - nutrient management. Missing remark about organic fertiliser inputs. Fertiliser input can minimised GHG emissions if they are from organic sources or from green manure, for example. Beneficial in economically poor regions and low yielding locations. Ref. "Increased carbon sequestration by a management practice may increase other GHG emissions and, as such, decrease or even negate the sequestered CO2 in the soil. The application of synthetic fertilizer, for example, was considered to result in net GHG emissions when considering emissions from fertilizer production and nitrous oxide emissions after application (Powlson et al., 2011)". From Bellarby et al. 2012. Bellarby, J., Tirado, R., Leip, A., Weiss, F., Lesschen, J. P. & Smith, P. 2012. Livestock greenhouse gas emissions and mitigation potential in Europe. Global Change Biology, in press. http://onlinelibrary.wiley.com/doi/10.1111/j.1365-2486.2012.02786.x/abstract | Accepted, Add for SOD |
| 15231 | 11 | 17 | | | | "Biochar favours C sequestration, but does not increase soil fertility." Galvez et al. 2012. Galvez, A., Sinicco, T., Cayuela, M. L., Mingorance, M. D., Fornasier, F. & Mondini, C. 2012. Short term effects of bioenergy by-products on soil C and N dynamics, nutrient availability and biochemical properties. Agriculture, Ecosystems & Environment, 160: 3-14. | Accepted, Have provided review that considers all studies rather than citing many studies. I would be cautious citing this work, it does not actually assess effects on plants, only (limited) |

|---|---|---|---|---|---|---|---|
| 14429 | 11 | 17 | | | | Typo. Row “Croplands – water management”. Correct ‘avaialability’ | Accepted, Revise for SOD |
| 11064 | 11 | 17 | | | | Column 2, Row 7: Summary information on biochar does not include potential impacts on N2O emissions although mentioned in text. | Accepted, Revise for SOD |
| 11063 | 11 | 17 | | | | Column 3, Row 2: none of the references for Croplands-nutrient management are included in Reference List. Perhaps more importantly, none of them is more recent than 2005. Several efforts have been made since then to integrate information regarding mitigation potential for cropland nutrient management, for example: Eagle et al., 2012. Greenhouse Gas Mitigation Potential of Agricultural Land Management in the United States: A Synthesis of the Literature. Nicholas Institute for Environmental Policy Solutions NI R 10-04, available at http://nicholasinstitute.duke.edu/ecosystem/land/TAGGDLitRev. Also see comment and references below for section 11.8.3 | Accepted, Update with post 2012 references |
| 12398 | 11 | 17 | 1 | 17 | 2 | Cropland - water management may also include drainage of too wet soil, to gain better harvests. | Accepted, Revise for SOD |
| 12399 | 11 | 17 | 1 | 17 | 2 | It could be mentioned that bio char does have a number of other advantageous properties in the soil environment. | Accepted, Revise for SOD |
| 11526 | 11 | 17 | 1 | 17 | 1 | you may also refer to Meyer-Aurich et al. 2012 in the second line of the table on page 17 (croplands-nutrient management) In Meyer-Aurich et al 2012 we elaborated on the issue "fertilizer input to increase yields causes GHG emissions but reduces land conversion pressures and increases residue for recirculation to soils (Meyer-Aurich, A., Olesen, J., Prochnow, A., Brunsch, R. (2012). Greenhouse gas mitigation with scarce land: The potential contribution of increased nitrogen input. Mitigation and Adaptation Strategies for Global Change:1-12. doi:10.1007/s11027-012-9399-x.) | Accepted, Remove for SOD or see comment on line 550 |
| 13667 | 11 | 17 | | | | Description column, line 4: Add 'use of nitrification inhibitors', because the effectiveness of this option has well demonstrated. | Accepted, Add to SOD |
| 13668 | 11 | 17 | | | | References: Add the following reference because it analyzed average mitigation potentials of nitrifivation inhibitors to reduce N2O from cloplands: Akiyama, H., Yan, X., and Yagi, K.: Evaluation of effectiveness of enhanced-efficiency fertilizers as mitigation options for N2O and NO emissions from agricultural soils: meta-analysis. Global Change Biol., 16, 1837–1846 (2010); a PDF file for the reference is attached. | Accepted, Add to SOD |
| 13669 | 11 | 17 | | | | Description column, line 4: Add 'organic matter management (composting and aerobic decomposition of rice starw and stubbles)', because these options are well known and their effectiveness has well demonstrated as shown in Yagi et al., 1997 (Yagi, K., Tsuruta, H. and Minami, K.: Possible options for mitigating methane emission from rice cultivation, Nutrient Cycling in Agroecosystems 49: 213–220, 1997); a PDF file for the reference is attached. | Accepted, Find a more up to date reference, but add to SOD |
| 13670 | 11 | 17 | | | | References: Add the following reference because it provides an avarage mitigation rate of improved mid-season drinage to reduce CH4 from Japanese rice fields by a nation-wide field campaign: Itoh, M., Sudo, S., Mori, S., Saito, H., Yoshida, T., Shiratori, Y., Suga, S., Yoshikawa, N., Suzue, Y., Mizukami, M., Mochida, T., and Yagi, K.: Mitigation of methane emissions from paddy fields by prolonging mid-season drainage. Agric. Ecosys. Environ., 141, 359– 372 (2011); a PDF file for the reference is attached. | Accepted, Add to SOD |
| 14623 | 11 | 18 | | | | row 4, bioenergy from forestry residues, column 2. The last logn sentence is a qulifying statement that is otut of line with the rest of the table which describes the category, but does not discuss its effects. This belongs in main text discussions | Accepted, Revise for SOD |
| 9329 | 11 | 18 | | | | Against 'Degraded soils - restoration', under column 'Description', the phrase 'soil fertility reduction', is suggested to be changed to 'soil fertility improvement'. | Accepted, Revise for SOD |
| 5707 | 11 | 18 | | | | In the row for ‘Degraded soils- restoration’ in the second column, replace words ‘soil fertility reduction’ with “soil fertility reduction or enhancement”. | Accepted, Revise for SOD |
| 13318 | 11 | 18 | | | | Under manure management, could refer to anaeorobic digestions. | Accepted, Revise for SOD |
| 13319 | 11 | 18 | | | | Under livestock should seperate genetic selection and manipulations of rumen microbial community. | Accepted, Revise for SOD |
| 5553 | 11 | 18 | | | | Livestock. Under this section or under bioenergy should mention small and large-scale methane production. | Accepted, Revise for SOD |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 11294 | 11 | 18 | | | | Under header 'Livestock', row 'Livestock-feeding', column 'Description', one should be cautious about referencing 'antibiotics' in this positive context; in the current political climate this could be distorted as an endorsement. | Accepted, Change wording for SOD |
| 15232 | 11 | 18 | | | | Manure management - What is missing In my opinion, also in AR4, is an analysis on how much GHG emissions could be saved in N fertilisers production, distribution, etc, if all manure would be managed and used efficiently for food production, i.e. substituting emissions from some % of synthetic N, even when emissions from manure remains similar. Globally, about 50% of manure is not returned to agriculture land, so if they were and synthetic N inputs adjusted accordingly, there will be some additional savings in GHG emissions. | Accepted, This has been addressed in Davidson, Ready et al. and Erisman et al., so we can perhaps find these numbers |
| 12844 | 11 | 18 | 0 | | | Please add a new block 4 after Livestock-Manure management, with the title: Crop-livestock integration. Coupling crop and livestock production offers possibilities for better utilisation of animal manure. In this way artificial fertiliser can be saved and subsequently emissions associated with fertiliser production are avoided. Reference: Oomen et al., 1998. Publication is attached | Partially Accepted, Covered generically under better use of livestock manures |
| 12402 | 11 | 18 | 1 | | | Combustion or catalysis of air from livestock rooms has been reported as a possible technique of reducing methane emissions from ruminants. Applying these techniques on large farms may be possible without too high costs. Please consider to include this in table 11.2, if relevant references are found in the literature. | Noted, Literature does not exist as far as I can ascertain - concentration too low for combustion from animal house. |
| 12403 | 11 | 18 | 1 | | | The table lists a number of mitigation options. in the 3.row, 2.colon the expression "soil fertility reduction" is used. Is this correct? | Accepted, Revise for SOD |
| 12400 | 11 | 18 | 1 | 18 | 2 | Organic soils - restoration. In some countries existing peatlands may have a demonstrable risk for changed land use. E.g. drainage of the water and use for crop production or grasslands will release CO2 to the atmosphere compared to if the areas had not been converted. This comparison with a "business-as-usual scenario" for peatlands is comparable to REDD concept on forest management. | Noted, Statement - not a comment |
| 12401 | 11 | 18 | 1 | 18 | 2 | Degraded soils; Reduced soil compaction is relevant in countries with a high degree of motorized agricultural machinery. Has relevant publications on this topic been investigated? | Accepted, Add for SOD |
| 7656 | 11 | 18 | 17 | 18 | 17 | I recommend to cite Shinkai et al. (2012) as a reference for mitigation options in "Livestock - feeding". They reported reduction of enteric methane emission from dairy cattle using cashew nut shell liquid (CNSL).<br><br>Shinkai et al. (2012) Mitigation of methane production from cattle by feeding cashew nut shell liquid. J. Dairy Sci. 95:5308-16 | Accepted, The section does not try to include every reference but focuses on comprehensive post 2007 reviews. These cover the use of oil by-products |
| 14267 | 11 | 18 | 26 | 19 | 44 | Repitions in Sec. 11.2.3 and 11.2.3.1 needs to be removed. | Accepted, Sections completely revised |
| 7657 | 11 | 18 | 35 | | | I recommend to cite Fukumoto et al. (2006) or (2012) as a reference for mitigation options in "Manure management". They reported reduction of N2O emissions from animal manure composting by promotion of nitratation.<br><br>Fukumoto et al. (2006) Reduction of nitrous oxide emission from pig manure composting by addition of nitrite-oxidizing bacteria. Environ. Sci. Technol. 40(21):6787-91.<br>Fukumoto (2012) Nitratation Promotion Process for Reducing Nitrogen Losses by N2O/NO Emissions in the Composting of Livestock Manure, Soil Health and Land Use Management, Dr. Maria C.<br>Hernandez Soriano (Ed.), ISBN: 978-953-307-614-0, InTech. | Accepted, The section does not try to include every reference but focuses on comprehensive post 2007 reviews. These cover reducing emissions from manure treatment. |
| 7655 | 11 | 18 | 40 | 18 | 40 | Ahh et al. (2011) is not listed in References. | Accepted, Zotero updated for SOD |

|---|---|---|---|---|---|---|---|
| 7658 | 11 | 19 or 20 | 18 or 18 | 19 or 20 | 22 or 22 | I recommend to cite Ogino et al. (2007) or (2012) as a reference for mitigation options in "Integration of biomass production with subsequent processing in food and bioenergy sectors" or "bioenergy (and biomaterials) from organic wastes". They reported GHG mitigation by producing animal feed from food residues/wastes.<br><br>Ogino et al. (2007) Environmental impact evaluation of feeds prepared from food residues using life cycle assessment. J. Environ Qual. 36(4):1061-8<br>Ogino et al. (2012) Life-cycle assessment of animal feeds prepared from liquid food residues: A case study of rice-washing water. J. Environ Qual. (in press) | Noted, References have been reviewed and included where possible |
| 15962 | 11 | 19 | | | | unutilzied forest growth is not very clear, not clear why the distinction is made with forest resideus , an example may clarify | Accepted, Text has been revised |
| 13320 | 11 | 19 | | | | Under, Other mixed biomass production systems: This discussion is not clear as to how it reduces carbon emissions. It is definitely agronomically a good idea, but the link between good environmental practice and mitigation of GHGs should be made much more clear | Accepted, Text has been revised |
| 13321 | 11 | 19 | | | | Under, Integration of biomass production with subsequent pocessing in food and bioenergy sectors: Same comment as above, this explanation is not clear as to how it mitigates GHGs. Reformulate explanation. | Accepted, Text has been revised |
| 13322 | 11 | 19 | | | | Space between words: category.Environment | Accepted, Text has been revised |
| 5554 | 11 | 19 | | | | Integrated systems. The principal wood products from agroforestry systems are fuelwood and poles. Timber is a minor product. There are also NTFP. Under this should also mention inter-cropping with species that inhibit pests as mentioned on page 1 – General comments. | Accepted, Text has been revised |
| 10600 | 11 | 19 | | | | Change "Bioenergy" to "Biomass for energy" and in sections below change "bioenergy" to biomass - which is the resource provided from agriculture that is converted to bioenergy. | Accepted, Text has been revised |
| 14674 | 11 | 19 | | | | In row 1 on this page, agroforestry can also be for biofuel feedstock biomass production. | Accepted, Text has been revised |
| 9131 | 11 | 19 | 35 | | | Column 1: change " Bioenergy from forest unutilized forest growth" to " Bioenergy from unutilized forest growth". | Accepted, Text has been revised |
| 5497 | 11 | 20 | | | | Bioenergy from crop residues- can be expanded to include residuals from food processing. Food processing residuals can be used either directly as soil amendments or as a source of energy through anaerobic digestion, co-digestion with manures has been shown to be more effective- with nutrients largely preserved | Accepted, Text has been revised |
| 3847 | 11 | 20 | | | | 2nd. Row, 2nd column. Why not include as conventional agriculture crops sugar cane, as an example from dedicated crops? This is a real example while some of the ones quoted are not yet in the market? | Accepted, Text has been revised |
| 5555 | 11 | 20 | | | | Under bioenergy, should emphasize much more use of annual growth for bioenegy, especially for direct use of wood for rural industries including charcoal production (and biochar) and electrical generation with conventional boilers (small-scale) or by gasification, for large-scale production. Need inventory data of waste products, especially animal waste for methane production and direct use for electrical generation where industrial production of meat is undertaken (pigs, poultry and cows etc.). | Accepted, End uses of bioenergy are treated in other chapters, but the text has been revised |
| 5556 | 11 | 20 | | | | Bioenergy from dedicated crops. Mention is made of oil from Jatropha sp. This can be grown in low-rainfall areas, but production is a function of water and nitrogen availability. It is good as a hedge plant in keeping animals in or out. Then the oil-bearing fruit could be used on a small-scale for heating. Large-scale Jatropha plantations have been relatively disappointing in India. Regarding switchgrass and Miscanthus sp. if grown for ethanol production the economics are not very favorable. It is not very cost effective to break down the cellulose into simple sugars (See Scientific American). It should be cheaper to use the grasses and other 'waste' biomass to produce methanol etc. by dry distillation, or used directly for energy. The methanol could be used directly as a fuel or as a building block for other organic compounds, including energy. | Rejected, Too detailed |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 15233 | 11 | 20 | | | | Bioenergy from crop residues - Crop residues are not considered wastes in many situations. For example, in econonmically poor rural regions, crop residues as wheat and rice straw are used for animal feed, construction, etc. In addtion, maintaining or increasing SOM need returning of crop residues to soils. Seems essential to add these concerns and further analyse (here or elsewhere) how much global agriculture residue is left for bioenergy generation once other uses are taken into account. This will avoid double counting and/or counter effective policies (e.g. increase soil erosion and SOM losses due to residues removal). | Accepted, Text has been revised |
| 14624 | 11 | 20 | 13 | 20 | 17 | language needs improving here | Rejected, Not clear which section this |
| 5548 | 11 | 20 | 13 | 20 | | . 500,000 km2 = 50 M ha. | Rejected, Wrong page and line number - |
| 7613 | 11 | 20 | 14 | 20 | 14 | "maximum sustainable technical potential" is incomprehensible term for citizen. This sentence would be improved. | Accepted, Clarified |
| 5557 | 11 | 20 | 14 | 20 | 15 | "--- maximum sustainable technical potential" for 1.8 GtCe/yr abatement from 2.27 Gt biomass C. Explain what is GtCe? The conversion from biomass C to Ce is 79% and is extremely high; normally a 50% conversion is the upper limit. Also, the sustainable potential, subtracting existing use of wood alone is over 7 Gt C (see my article), this does not take into account crop residues. | Accepted, Checked numbers and revised for SOD. If I understand the comment properly: only 50% of the carbon abatement is from bicohar C, 30% is from fossil fuel substitution in energy from pyrolysis, 20% from suppression / avoided N2O and CH4 emissions; not sure about ZGt. Woolf et |
| 12404 | 11 | 20 | 16 | 20 | 16 | Use Gt in stead of Pg since Gt already is used ; | Accepted, Revised for SOD |
| 5051 | 11 | 20 | 16 | 20 | 16 | I waw early drafts of "Woolf et al" on biochar and would have been very reluctant to use given assumptions about land coverage. Don't know if they fixed them, hope so. | Accepted, Checked numbers and revised for SOD |
| 5558 | 11 | 20 | 16 | 20 | 16 | 1.0 GtCe/yr from 1.01GtC. This is a 99% conversion. This is impossible. | Accepted, Checked numbers and revised for SOD. If I understand the comment properly: only 50% of the carbon abatement is from bicohar C, 30% is from fossil fuel substitution in energy from pyrolysis, 20% from suppression / avoided N2O and CH4 emissions; not sure about ZGt. Woolf et |
| 5559 | 11 | 20 | 16 | 20 | 16 | "--- and the accrual of 66-130 Pg (GtC) abatement over 100 years". This seems very high at 0.66 – 1.30 GtC per year. | Accepted, Checked numbers and revised for SOD |
| 10602 | 11 | 20 | 16 | | | use Gt not Pg - especially in same sentence! | Accepted, Corrected units for the SOD |
| 14625 | 11 | 20 | 17 | | | suggest replace "supports" with "indicates" | Accepted, Revised for SOD |
| 14626 | 11 | 20 | 19 | | | I am not sure what this means | Accepted, Clarified for SOD |
| 15234 | 11 | 20 | 19 | | | Assumed increases in productivity are very uncertain. See for example: "Biochar favours C sequestration, but does not increase soil fertility." Galvez et al. 2012. Galvez, A., Sinicco, T., Cayuela, M. L., Mingorance, M. D., Fornasier, F. & Mondini, C. 2012. Short term effects of bioenergy by-products on soil C and N dynamics, nutrient availability and biochemical properties. Agriculture, Ecosystems & Environment, 160: 3-14. | Accepted, Revised for SOD. I am cautious citing this work, it does not actually assess effects on plants, only (limited) 'indictators' of soil fertilty. Also, only one type / rate of biochar. I have |
| 10601 | 11 | 20 | 2 | | | Suggest just "Production mitigation measures not considered in AR4". But Bioenergy was included extensively in AR4 - though spread across several chapters. So why does it come under this sub-heading? So could have "11.3.1.1 Biochar" and put all Bioenergy section into the Biomass/bioenergy annex rather than here. | Accepted, Moved to bioenergy annex |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 5050 | 11 | 20 | 29 | 20 | 29 | biochar is not necessarily a stable C-rich co-product it is highly vcombustable after production, some percentage oxidizes on application. Also it comes in very different rates from fast and slow pyrolysis and also creates vastly different amount of C in char under fast and slow. we did an economic analysis considering c prices in McCarl, B.A., C. Peacocke, R. Chrisman, C.C. Kung, and R.D. Sands, "Economics of Biochar Production, Utilisation and GHG Offsets", Biochar for Environmental Management: Science and Technology, Chapter 19, Edited by Johannes Lehmann and Stephen Joseph, Earthscan Publications, UK, 341-358, 2009. and in Kung, C.C., and B.A. McCarl, "Economics of Taiwanese Biochar Production, Utilization and GHG Offsets: A Case Study on Taiwanese Rice Fields", 2011.<br>(that paper is under second review at an energy journal) | Accepted, Revised for SOD. I think this is captured in the box with the range in estimates of cabron stability in biochar (haf life ranging from 50-10,000 yr). |
| 15963 | 11 | 20 | 3 | 21 | 8 | Chapter on Biochar is not very clear, some sentences do not seem to be complete. | Accepted, Revised for SOD |
| 10244 | 11 | 20 | 4 | 21 | 8 | Biochar: as stated before, Biochar application is still controversial, potential risks (HAPs, hydrophobicity, …) have to be considered, even more that this is a nearly non-reversible option thus biochar is stable!<br>Biochar can also be made with animal wastes (manure but also bones when processing the animals) | Accepted, Revised for SOD. Hydrophobicity seems to be very short term and not likely to be a problem at real rates of application - however, contaminants worth a note. Now added to the box "Standards to ensure that |
| 16559 | 11 | 20 | 4 | 21 | 8 | Given the small amount of field data showing that biochar is an effective mitigation technique in practice, this section could be shortened very considerably. | Accepted, Shortened and revised for SOD. Actually the scale of the opportunity warrants maintaining share of document, but if the document is shrinking…. The stabilisation of carbon is the main element of the abatement from biochar and is both pretty certain |
| 5498 | 11 | 20 | 4 | 21 | 8 | The discussion on biochar makes it clear that research to date on this amendment has not provide clear answers on appropriate ways to use this amendment or on predictable results related to use of char. High variability in outcomes suggests that recommendations for use of this amendment are not appropriate. A recent review (Ippolito et al, 2012) noted a wide range in results for plant productivity with biochar with approximately 50% of studies reporting yield reduction. The authors suggested N immobilizationas the primary cause of reduced yield with immobilization observed for low temperature biochars. High temperature biochars, while they are less likely to result in nutrient deficiencies are sited here as high in potentially hazardous PAHs. Energy balance for biochar production is related to both feedstock characteristics and gassification conditions. Using nutrient rich, wet materials such as animal manures to produce biochar with no net or a negative energy balance as well as loss of a significant portion of N does not seem to be a viable or recommendable practice. As the primary end of these materials is on highly weathered tropical soils, and as characteristics of chars and associated outcomes are highly variable- it would seem that the end use market is not likely to enforce the strict production guidelines necessary to produce high quality amendments | Accepted, Revised for SOD. The Spokas review is now cited in Table 11.4 - in conjunction with Jeffery et al - is a better assessment than Ippolito, who focuses on soil N. Crop N supply would not be suppressed if bicohar was added each yr in small amounts (or beyond yr 1 after a large slug) - that is reported in the literature - Spokas says 50% studies are +yield, 30% no change and 20%- ... not good enough, but we're still learning about when / where / how much. |
| 6826 | 11 | 20 | 4 | 21 | 8 | Biochar section could be shortened - highly speculative and uncertain impacts. Reducing energy output of biomass to produce char means alternative (fossil?) energy supplies required. | Accepted, Shortened and revised for SOD, but not uncertainty alongside the |
| 3543 | 11 | 20 | | 21 | | Are there examples of implementation of biochar? Please provide. The problem I see here is the origin of the biomass used in the production of biochar; if the biomass is derived from forest, that is an issue. Please include some text on life cycle analysis to demonstrate that biochar is environmentally sound. | Accepted, Revised for SOD. More elaboration in box now on 'sustainable' restriction in the analysis of Woolf et al. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 13323 | 11 | 20 | | | | Biochar does deserve mention as a possible mitigation method currently being researched, but I feel an entire section over estimates its potential as a panacea for mitigation. | Partially Accepted, The estimate of potential is quite detailed, it is *potential*. I think we can be more cautious about what can actually happen - but that applies to all mitigation options e.g. diet change. Must admit I worry a |
| 14430 | 11 | 20 | 11 | 20 | 24 | This section emphasizes the large potential abatement from using biochar, but simultaneously emphasizes that the effects on N2O are not predictable. This section could be shortened and streamlined for clarity regarding the unknowns of biochar management. | Accepted, Revised for SOD. Sensitivity analysis is included in the box - the N2O / CH4 component is not critical. |
| 5371 | 11 | 20 | 4 | 21 | 8 | This seems to be an overly optimistic discussion of biochar. Do any of these studies look at the energy or life cycle impacts associated with mechanically encorporating the biochar into the soil? The biochar isn't just droped on the top of the soil is it? This section would benefit from a few sentences that shed light on the difference between "maximum sustainable technical potential" and what might happen in the messier real world. Also be careful of words like "sustainable" that might be described (or might not be described) in the paper being cited but are not described in Chapter 11. "Sustainable" has many different potential means and will be read by different readers in very different ways. | Accepted, Revised for SOD. Biochar has been incorproated into the soil as per / with other residues. It can also be surface applied to perrenial crops and probably stubble (not to bare soil). Intended not to involve any additional soil disturbance. Sustainable - fair point - |
| 10603 | 11 | 21 | 1 | | | Lehmann reference missing. Guess "y" in this section means "years". Put in full. | Accepted, Which Lehmann reference? Yr has been expanded to 'years' |
| 8835 | 11 | 21 | 10 | 21 | 17 | What about exhaustpipe emissions (GHG and non-GHG emissions)? | Rejected, Not a land use issue - belongs elsewhere in the volume |
| 12405 | 11 | 21 | 10 | 21 | 46 | It would be useful with consideration of pay-back times for different biomass-fractions and how/if the pay-back time will affect the climate. | Rejected, Too detailed for the chapter. The issue is mentioned however. |
| 10444 | 11 | 21 | 10 | 21 | 46 | This paragraph is too dense for 1st time read. Please rewrite | Accepted, Section was shortened |
| 5813 | 11 | 21 | 10 | 21 | 21 | In your list, you forgot to include replacement effects. Biomass used in bio-energy production could also be used in other products, notably if "biomass" is wood of any kind. The net effect is thus not only the balance between energy systems, but also between e. g. HWP CO2-replacement in both biomass utilization paths. So, if wood that could be used in e. g. building materials is used in bio-energy instead and the construction is built from concrete instead of wood the net effect is negative - you have higher emissions than you would have had without bioenergy use. | Noted, Trade-offs are discussed in section 11.4 and in the Bioenergy Annex |
| 7190 | 11 | 21 | 10 | | | Bioenergy. It is important to highlight the significance of considering the whole life-cycle of bioenergy production in the light of 'sustainability'. An example of a bioenergy that has been identified as low-carbon energy source, is that produced from palm oil. With advanced understanding it has turned out that when oil palms, are grown on peat they instead create a 'carbon debt' and increase overall global carbon emissions (e.g. Fargioneet al., 2008; Gibbs et al., 2008). There are some lines that touch on this topic (e.g. lines 29/30 page 22, lines 29-34 page 21), but this is not enough. Considering the total life cycle (production to end-of-life) includes: production, processing, transport, packaging, 'end-of-life'. Transport, processing and packaging is not mentioned in this chapter, shall this be discussed here (if food-demand is being discussed then its perhaps logical that also the other issues are being discussed)? Or elsewhere? Is this production-side or demand-side? Table 11.4 could be extended with mitigation measures in the total life-cycle of products from the AFOLU sector. | Noted, These issues will be discussed in the LCA/MCA annex |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 12076 | 11 | 21 | 10 | 21 | 21 | In this section please note that the mitigation benefit of bioenergy will critically depend on the varying timing of emissions and sequestration associated with use of various biomass sources. There are different pathways of causation for use of biomass for energy and each different causation pathway/ biomass source leads to a different sequence and timing of biomass emissions and C sequetrationon the land. For example one causation pathway is a policy supporting planting energy crops including trees (for energy) and then using it for energy. Sequestration occurs before emissions. A policy that supports use of logging residue causes logging residue to be used for energy rather than decay in the forest. In this case emissions occur before avoided emissions (which occur over time - and depend on avoided decay rate). I would argue that it is critical to understand these causation pathways and timing to understand the emission offset over time. Each pathway entails a different risk of attaining offsets. Please find a place to discuss how risk of attaining offset benefits can vary notably among the alternate causation pathways/ use cases. | Noted, Timing issues will be discussed in the Bioenergy Annex |
| 5499 | 11 | 21 | 11 | 21 | | Start this paragraph with the last two sentences- add a graphic to the paragraph to clarify what you are talking about showing the range of potential sources and sinks associated with biofuel production | Accepted, Text has been revised |
| 15163 | 11 | 21 | 11 | 21 | 18 | hard to follow | Accepted, Text has been revised |
| 5052 | 11 | 21 | 11 | 21 | 11 | the biofuel points seem to miss regrowth and carbon uptake, cargon replacement of long term sequestered carbon in replaced fossil fuels, emissions from inputs like N fertilizer to raise feedstocks. hauling related emissions. Indirect effects on livestock from higher prices of commodities | Rejected, This issue is discussed in the LCA Section Bioenergy Annex |
| 10604 | 11 | 21 | 11 | | | Production of biomass and use of bioenergy…….. | Accepted, Text has been revised |
| 2624 | 11 | 21 | 11 | 22 | 47 | These paragraphs jump from agriculture and then to forests which suggests that agricultural impacts are the same as forest impacts. They are different and their impacts are different. This could be confusing for the reader and will probably make them attribute ag impacts as really being forests. Combining forests and agriculture doesn't work well since they have different contexes and different mitigation efforts. THis can be confusing for the reader. This chapter should mention rural communities who use forests for energy. Most of the discussion appears to be relevant for commercial or industrialized operations. There are many other models of forest uses and management. | Accepted, Text has been revised |
| 12072 | 11 | 21 | 18 | 21 | 21 | In order to evaluate the net effect of shifting from fossil energy to bioenergy an evaluation is needed of the change in emissions associated with a set of processes within a system boundary over some time horizon. The comparison is between the operation of all the processes with the system boundary in one case versus all the processes in another case. It is not correct or at least misleading to suggest that the comparison is between two separate systems. Please consider an alternative such as - "The net effect of harnessing the climate change mitigation benefit of bioenergy use is determined by estimating the change in emissions and radiative forcing over a given time for biomass and fossil energy processes within a given system boundary." If you think you are replacing one system with another you can miss the need to include emissions for forest or ag land in the case where fossil fuels are used in the comparison of the with bioenergy case to the without bioenergy case. | Noted, This issue is discussed in the Bioenergy Annex |
| 15162 | 11 | 21 | 2 | 21 | 4 | delete sentence | Accepted, Text has been revised |
| 5560 | 11 | 21 | 2 | 21 | 2 | What is 'y'? | Accepted, Text has been revised |
| 5055 | 11 | 21 | 20 | 21 | 20 | int the statement about "between total climate forcing of the 19 bioenergy system" I would include and massociated market adjustments in iLUC and livestock herds | Accepted, Text has been revised |
| 7667 | 11 | 21 | 22 | 21 | 24 | This is a very misleading statement. Even if bioenergy systems replace coal they could cause higher CO2 emissions compared to coal use for centuries, see for example Searchinger et al. (2008) and Fargione et al. (2008) and Holtsmark, B. 2012 Harvesting in boreal forests and the biofuel carbon debt. Climatic Change 112: 415—428. | Accepted, Text has been revised |
| 14728 | 11 | 21 | 23 | | | " of reliable empirical data". Please explain to which data is this referred to. | Accepted, Text has been revised |
| 5053 | 11 | 21 | 25 | 21 | 25 | in the sentence "Alternative methods of quantification lead to variation in estimates of GHG 24 savings" neglects the substantial regional variation in yields plus big differences in hauling needs for low yielding items. | Accepted, Table with Regional Values has been added |

|---|---|---|---|---|---|---|---|
| 5054 | 11 | 21 | 25 | 21 | 25 | in the statement "However, GHG emissions from LUC of some bioenergy schemes" you are missing big references, searchenger et al and fairgone et al both in science 2007 plus a wide variety of estimates as summarized in recent nas report led by tyner | Accepted, Text has been revised |
| 11981 | 11 | 21 | 29 | | 31 | LUC bioenergy schemes may be large. Maybe add "and entail negative biodiversity impacts if natural ecosystems are converted to cropland" | Accepted, This issue is discussed in the Bioenergy Annex |
| 5500 | 11 | 21 | 35 | 46 | | Is there sufficient knowledge of albedo affects to put as much emphasis on it as you have here? | Noted, This issue is discussed in the |
| 15164 | 11 | 21 | 35 | 21 | 46 | paragraph can be tightened. Betts reference not in ref. list. Kirchbaum et al 2011 also not in ref. list. What's temporal difference in albedo effect? | Accepted, Text has been revised |
| 10605 | 11 | 21 | 35 | | | Albedo effects are not just from biomass plantations - could delete from here. (Need to check throughout this section on the use of "bioenergy" often used where "biomass" is the proper term - eg "forest bioenergy" and page 22 line 1 "Bioenergy feedstock supply....." | Accepted, This issue is discussed in the Bioenergy Annex |
| 16560 | 11 | 21 | 38 | 21 | 41 | It should be clarified that this sentence refers to temperate and particularly boreal regions, not the tropics. | Noted, This issue is discussed in the |
| 11982 | 11 | 21 | 38 | | 40 | ditto. Again maybe need to add that when forests are convented to croplands - biodiversity is negatively affected although albedo maybe increase. | Noted, This issue is discussed in the Bioenergy Annex |
| 6827 | 11 | 21 | 9 | | | The bioenergy section needs some rationalisation and context eg compare total supply estimates with total energy demands, and relate supply potential with different bioenergy types to reflect conversion efficiency and hence derive GHG mitigation potential eg 1 tonne 'raw' biomass contains X GJ (avoided coal), or Y GJ if refined as liquid biofuel (avoided petrol or diesel). For example, EU seems to favour bioethanol over biodiesel for lower total emissions? | Rejected, These issues are covered in other Chapters of the Report |
| 5561 | 11 | 21 | 9 | 21 | 46 | Bioenergy. If annual growth is used to manufacture bioenergy then there will be no net-CO2 emissions, because if it is not used it will be returned to the atmosphere. If there is a land use change, using the biomass, rather than burning it in situ, makes environmental sense. | Accepted, Text has been revised |
| 5562 | 11 | 21 | 9 | 21 | 46 | . Bioenergy. If annual growth is used to manufacture bioenergy then there will be no net-CO2 emissions, because if it is not used it will be returned to the atmosphere. If there is a land use change, using the biomass, rather than burning it in situ, makes environmental sense. | Noted, The section needs to be much shorter - how does it fit with other chapters and x-cut piece |
| 5563 | 11 | 21 | 9 | 21 | 46 | Paragraph from line 35. I had difficulty in following the logic. | Accepted, Text has been revised |
| 12073 | 11 | 21 | 9 | 22 | 47 | The climate mitigation benefits of current period use o f(e.g. change in radiative forcing) of using forest-based or ag-based biomass can differ widely over time yet there is no discussion in this section about this time dimension of mitigation benefits. To judge merit of actions we need to clarify the timing of benefits. I think such a discussion is needed here and in section 11.3.3 where mitigation effectiveness is discussed. Some examples - planting of trees that are later used for energy decreases raditive forcing prior to harvest and emission which would then increase radiative forcing. Use of logging residue for energy causes a change from a no use case where there is slow emission in the forest and slow build up of radiative forcing with a case where there is burning and immeadiate increase in radiative forcing. The benefit could be viewed is the difference in the two radiative forcing curves. Increase in use of roundwood for energy from an existing forest calls for estimate of the change in radiative forcing over time between a no use for energy case and a roundwood use for energy case. In this case the benefit of decreased radiative forcing may be many decades into the future. Cherbini et al. (2011) gives a simplified example of the timing in the change in radiative forcing for a case of roundwood use and forest regrowth. The main point is that time dimension of mitigation benefit (change in radiative forcing) matters. Where benefits are aquired over time the uncertainty of benefit can also be greater. [Cherubini, F., Peters, G., Berntsen, T., Stromman, A. and Hertwich, E. (2011). CO2 Emissions from Biomass Combustion for Bioenergy: Atmospheric Decay and Contribution to Global Warming. Global Change Biology Bioenergy, 413 - 426.] | Noted, This issue is discussed in the Bioenergy Annex |
| 11164 | 11 | 21 | 9 | 22 | 47 | Information regarding the life cycle assesment of bioenergy crops should be incorporated in this section | Accepted, This issue is discussed in the LCA Section Bioenergy Annex |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 3544 | 11 | 21 | | | | In the section on bioenergy, it will be very helpful to provide clear answers to the following questions: what is bioenergy? How bioenergy carries potential for climate change mitigation and give some examples of countries? What are the different options of bioenergy (i.e. sources of bioenergy)? What are the barriers for the adoption of bioenergy? For e.g. bioenergy should be implemented in a sustainable manner and should not compromise the food security which is a priority in developing countries. | Accepted, This issue is discussed in the Bioenergy Annex |
| 5372 | 11 | 21 | 2 | 21 | 8 | The Wise et al (2009) paper and its UTC scenario describes how "stabilized C can be monitized". Suggest referencing that paper here so readers understand that there has been some thinking about this issue and the benefits that would accrue under such a policy/scenario. | Accepted, Text has been revised |
| 5373 | 11 | 21 | 29 | 21 | 31 | The GHG emissions can be "more than a hundred times larger" than just burning fossil fuels. 100 times!! Wow that's a big number. Are these 100 times worse than fossil fuel bioenergy schemes realistic or are they implausibly bad ideas that would never be put into practice. If it is the later, then perhaps cite literature that surveys a more realistic set of bioenergy options. I have no doubt that some bioenergy options are potentially worse than burning natural gas in a highly efficient natural gas turbine to generate electricity but I am skeptical that most bioenergy options are 100 times worse than burning coal in an 50 year old power plant. | Noted, No action needed |
| 8836 | 11 | 21 | | | | Maybe the report could devote a section or box on the accounting discussion of these exhaustpipe emissions (see EEA opinion http://bit.ly/onyPg7) | Noted, These issues will be discussed in the LCA/MCA annex |
| 10245 | 11 | 21 | 9 | 27 | 11 | This section is too long and can be shortenned | Accepted, Text has been revised |
| 14432 | 11 | 22 | | | | This bioenergy text could be made more concise to reduce page length. | Accepted, Text has been revised |
| 11983 | 11 | 22 | 1 | | 1 | "Primary and secondary residues". I couldn't find where these were defined. Maybe add a definition? | Accepted, A definition will be included in |
| 10177 | 11 | 22 | 1 | 22 | 47 | The discussion on the trade-off between mitigation within the agroforestry sector, in the form of production of bioenergy, and biodiversity could be expanded, with for example reference to where in the world this trade-off potentially has the largest effects and where it has less effects. | Rejected, We have very strict space limitation |
| 14729 | 11 | 22 | 17 | | | “conversion”. Is it referred to feed conversion? | Accepted, Text has been revised |

| 5814 | 11 | 22 | 3 | | | What does "MSW" stand for? | Accepted, A definition will be included in |
| 14431 | 11 | 22 | 3 | | | MSW not previously described in the text. | Accepted, A definition will be included in |
| 3849 | 11 | 22 | 36 | 22 | 37 | "Including GHG emission or CO2 sequestration associated with LUC". Please, check this sentence since direct CO2 sequestration associated with LUC will be extremely difficult due the large areas involved, the loe gas flux per area, and economic barrier. | Rejected, This is routinely done with LCA |
| 2131 | 11 | 22 | 37 | 22 | 39 | add the reference Muller, A. (2009). Sustainable Agriculture and the Production of Biomass for Energy Use, Climatic Change 94(3-4): 319-331 to the reference list as it adds a further, often neglected trade-off, namely between biomass use for energy production and biomass use as a fertilizer. | Accepted, Text has been revised |
| 5058 | 11 | 22 | 42 | 22 | 42 | tradeoffs with adaptaion are also a big factor | Accepted, Text has been revised |
| 5567 | 11 | 22 | 43 | 22 | 47 | All the figures cited are less than the current annual growth of wood and much less if agricultural crop and animal residues are included. | Accepted, Text has been revised |
| 12406 | 11 | 22 | 44 | 22 | 44 | It would be interesting to know how much 100-300 EJ/yr bioenergy in 2050 is of the total demand for energy in 2050. | Accepted, Text has been revised |
| 16219 | 11 | 22 | 44 | | | put in context of global demand for EJ/yr. all these numbers mean what in the context of global demand? Give reader context | Rejected, Other chapters deal with total energy demand |
| 5056 | 11 | 22 | 6 | 22 | 6 | somewhere in the sentence "Biomass from cropping systems (annual and perennials) established on lands ranging from prime" I would have stuck the words "dedicated energy crops" | Accepted, Text has been revised |
| 15165 | 11 | 22 | 8 | 22 | 8 | Put (Table 11.3) at end of preceding sentence and delete "describes these resources". Suggest that this the way figures and tables are dealt with throughout (rather than writing sentences about what table and figures are showing) | Accepted, Text has been revised |
| 15166 | 11 | 22 | 9 | 22 | 23 | tighten paragraph | Accepted, Text has been revised |
| 15609 | 11 | 22 | 12 | 22 | 12 | Consider citing Stehfest et al (2009) after "…in diets…" Stehfest E., L. Bouwman, D.P. van Vuuren, M.G.J. den Elzen, B. Eickhout, and P. Kabat (2009). Climate benefits of changing diet. Climatic Change 95, 83-102. | Accepted, Text has been revised |
| 5374 | 11 | 22 | 9 | 22 | 23 | This is a very long paragraph that doesnt say anything concrete. | Accepted, Text has been revised |
| 13324 | 11 | 23 | 1 | 23 | 16 | Requires a discussion of undertainty around the impact of the removal of residue on soil carbon. Lack of extensive long-term studies. | Accepted, Text has been revised |
| 5815 | 11 | 23 | 13 | 23 | 16 | This is not completely true. If the wood is used for bioenergy the emission of the C stored in the wood is "immediately" and if the wood is left for decomposition the emissions are "gradually". However, you have to add the emissions of the fuels used (instead of the wood now left for decomposition) to generate energy to the balance. | Accepted, Text has been revised |
| 5060 | 11 | 23 | 16 | 23 | 16 | these are some implication fro increased fertilizer use plus there may be substantial storage losses (some of this is treated in Flugge, M., T. Buchholz, C. Canham, G. Marland, B.A. McCarl, S.M. Ogle, S. Prisley, and N. Sampson, "Accounting framework for GHG emissions from bioenergy and other biogenic sources", Draft report for EPA, 2011. | Accepted, Text has been revised |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 2132 | 11 | 23 | 16 | 23 | 16 | add the following sentence: "A particular trade-off may arise however from the potential to use the biomass as organic fertilizers in certain sustainable agricultural production systems that rely on nutrient recycling, such as organic agriculture. Widespread adoption of biomass residues use for energy production is likely incompatible with widespread adoption of organic and related production practices, where compost and mulching play an important role (Muller, A. (2009). Sustainable Agriculture and the Production of Biomass for Energy Use, Climatic Change 94(3-4): 319-331). This is of particular relevance as application of these organic fertilizers tends to increase soil carbon levels (Cross Ref within the chapter). " | Accepted, We have improved the discussion on potential trade-offs |
| 5568 | 11 | 23 | 17 | 23 | 21 | This gives estimates of potential in 2050 for biomass as follows: agricultural residues, 15-70 EJ/yr (800 – 3745 Mt wood equivalent [we]); dung, 5-50 EJ/yr (270-2675 Mt we); forest residues, 0-110 EJ/yr (0-5890 Mt we). This gives a total of 20- 230 EJ/yr (1070 – 12300 Mt we). This is much less than the accessible annual growth of wood, estimated to be 980 EJ/yr (18350 Mt we). NOTE sometimes per year is given as yr-1 other times as/yr. | Accepted, The statement is correct |
| 5061 | 11 | 23 | 19 | 23 | 19 | dung also involves methane | Accepted, Text has been revised |
| 12077 | 11 | 23 | 22 | 23 | 30 | By identifying forest biomass for energy from forest growth that is in excess of current use for paper and sawnwood it seems there is an unspecified assertion that policy should not consider cases where some current use of wood for paper and sawnwood could be diverted to use for energy. I think I would tend to agree with this point but I think you should make an explicit arguement that the reason for avoiding displacing current uses is that they will provide more mitigation benefit than use of wood for energy. It does not make sense (in this mitigation report) that you could argue that use of wood for energy should not displace use for paper and sawnwood simply because those markets have some priority. I think as a scientific issue I think there can be cases where uses of wood for paper could be worse than use for energy if the paper goes to lanfills and emits a notatble amount to methane. | Accepted, Text has been revised |
| 7668 | 11 | 23 | 23 | 23 | 42 | This text should take into account the findings in Holtsmark, B. 2012 Harvesting in boreal forests and the biofuel carbon debt. Climatic Change 112: 415—428. No other study to date has considered the long term consequenses of a permanent increase in harvesting forests. With regard to Cherubinie et al. (2011). The following forthcoming paper will here be very relevant and present another view: Holtsmark, B. 2012: The outcome is in the assumptions: analyzing the effects on atmospheric CO2 levels of increased use of bioenergy from forest biomass. GCB Bioenergy (in press) | Accepted, Text has been revised |
| 2625 | 11 | 23 | 23 | | 30 | Natural forests and plantations are not discussed as separate forest types. Much of the industrial forestry is occurring on plantations even though natural forest management is occurring in some tropical areas. The discussion appears to be focusing on conservation of natural forests even though much of forestry is plantations globally. | Rejected, There is no space to discuss separate forest types. Plantations are included in the discussion, and we have improved the text. |
| 5569 | 11 | 23 | 27 | 23 | 27 | The sentence should read --- present global roundwood production (not industrial roundwood production). Fuelwood, charcoal and building poles account for over half of current use. These are not considered to be industrial production. | Accepted, Text has been revised |
| 12407 | 11 | 23 | 29 | 23 | 29 | Related to bioenergi from forest biomass and timing of C flows, is it possible to say more about the optimal timing and how long the pay-back time could be without affecting the long-term stabilization of the temperature? | Rejected, There is no space for detailed discussion |
| 3851 | 11 | 23 | 29 | 23 | 29 | Timing of C flows is really significant for temperate climate countries. Tree growth in tropical countries occurs in 10 to 20 years. | Accepted, Text has been revised |
| 16562 | 11 | 23 | 3 | 23 | 4 | Doesn't the energy cost of transportation represent a major constraint at least for dung and straw? | Accepted, Text has been revised |
| 5502 | 11 | 23 | 30 | | | Are there estimates of the % of forest land that is currently managed for biomass production and harvest? | Accepted, FAO Statistics provide these |
| 8929 | 11 | 23 | 30 | | | it should be made clear that a larger forest output cuts disproportionately the potential for C sequestration | Accepted, Text has been revised |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 12078 | 11 | 23 | 31 | 23 | 42 | I think this paragraph should help the reader understand what kind of analysis framework is needed to assess the prospective mitigation benefit of forest biomass use. In my view it is critical to 1) carefully define the system boundaries that define what processes are inside the system (e.g. forest carbon change, energy emissions, fossil emissions, indirect land use change from market forces, change in wood products production/consumption ) 2) define the time horizon for the evaluation e.g. 20 yrs, 100 yrs, more years?, 3) specify the metrics that will be used to estimate mitigation benefit, eg, radiative forcing (GWP), global temperature potential (GTP), other. 4) Specify the CHANGE in the system that is being evaluated - this will identify the fluxes before any changes (over time) and the fluxes of the system AFTER changes. This report could do a service to clarify what is needed to clearly evaluate the impact of forest biomass mitigation actions/system changes. We need to recognize that some minimal consistency is needed in defining analysis frameworks in order to compare evaluations and understand how alternate frameworks can influence findings. | Accepted, Text has been revised |
| 2626 | 11 | 23 | 36 | | 42 | These are industrial forests since non-industrial forest owners cannot afford fertilizers. | Accepted, Text has been revised |
| 15168 | 11 | 23 | 40 | 23 | 42 | is this statement necessary? | Accepted, Text has been revised |
| 8930 | 11 | 23 | 40 | | | from a climate protection perspective the intensification of forest productivity will then be rational when the C stored in harvested wood is sequestrated for a longer period such as lumber or furniture. | Accepted, Text has been revised |
| 14774 | 11 | 23 | 41 | | | There is currently an systematic review of literature to compare different methods for quantifying carbon/biomass in forest and other terrestrial system components. -> Environmental Evidence 2012, 1:6 doi:10.1186/2047-2382-1-6 , http://www.environmentalevidencejournal.org/content/1/1/6/abstract | Accepted, Text has been revised |
| 11985 | 11 | 23 | 43 | | 48 | biodiversity considerations are important here - especially with the conversion of old growth forsets to planted production forests. Suggest add at end "In addition, conversion of old-growth forests to plantations generally entails negative impact biodiversity. | Rejected, Biodiversity issues will be discussed in Bioenergy Annex |
| 15169 | 11 | 23 | 43 | 23 | 48 | really? A bit controversial, but totally uncited… | Accepted, Text has been revised |
| 7063 | 11 | 23 | 43 | 23 | 48 | There is large body of literature documenting the carbon benefits of active forest management but these benefits are barely mentioned in this material. The value of active forest management in providing output while maintaining forest stocks needs much more attention herein. As a starting point, the Fourth Assessment Report should get far more credit. Importantly, it contained the following finding. "Each mitigation activity has a characteristic time sequence of actions, carbon benefits and costs. Relative to a baseline, the largest short-term gains are always achieved through mitigation activities aimed at emission avoidance (e.g. reduced deforestation or degradation, forest protection, and slash burning). But once an emission has been avoided, carbon stocks on that forest will merely be maintained or increased slightly. .... In the long term, sustainable forest management strategy aimed at maintaining or increasing forest carbon stocks, while producing an annual yield of timber, fibre, or energy from the forest, will generate the largest sustained mitigation benefit." (continued below) | Accepted, In the section regarding mitigation options, we have mentioned benefits from active forest management |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 7064 | 11 | 23 | 43 | 23 | 48 | (continued from above) The only thing that has changed significantly since the Fourth Assessment Report was written (including the conclusion dealing with the long-term benefits of a sustainable forest management strategy), is the growth in literature examining the emissions profile over time of various forest management and forest product scenarios (i.e. the "carbon debt" literature). This new work has been very valuable in clarifying the factors that determine how "long-term" the period is before the benefits of a "sustainable forest management strategy aimed at maintaining or increasing forest carbon stocks, while producing an annual yield of timber, fibre, or energy from the forest" become apparent. This work has not, however, provided a basis for retreating from the conclusion in the Fourth Assessment Report. By giving so little attention to the benefits of a sustainable forest management strategy aimed at maintaining or increasing forest carbon stocks, while producing an annual yield of timber, fibre, or energy from the forest, the draft Fifth Assessment Report risks giving the impression that these long-term benefits were discovered to be false. Nothing could be further from the truth. (continued below) | Accepted, In the section regarding mitigation options, we have mentioned benefits from active forest management |
| 7065 | 11 | 23 | 43 | 23 | 48 | (continued from above) Some newer references pointing to the value of working forests managed under sustainable forest management are shown below.<br>- "Fox, T. E. et. al. (2004). The Evolution of Pine Plantation Silviculture in the Southern United States. In H. M. Rauscher, & K. e. Johnsen, Southern forest science: past, present, and future: Gen. Tech. Rep. SRS-75 (p. 394). U.S. Department of Agriculture, Forest Service, Southern Research Station." - This reference shows the dramatic improvements in standing stock and productivity that have been made possible through investments in sustainable forest management. (continue below) | Accepted, Text has been revised |
| 7066 | 11 | 23 | 43 | 23 | 48 | (continued from above)- More reverences on the value of active forest management.<br>- Ince, P. (2010), Global Sustainable Timber Supply and Demand, Chapter 2 in Sustainable development in the forest products industry, Chapter 2. Porto, Portugal : Universidade Fernando Pessoa, 2010: p. 29-41. This reference examines the distribution of deforestation around the world and finds that "...In general, the data show that the global regions with the highest levels of industrial timber harvest and forest product output are also regions with the lowers rates of deforestation. Thus, a ... appropriate economic hypothesis is that global loss of forest cover and carbon emissions from deforestation are driven primarily by systematic conversion of economically marginal forest land to other land uses.... [This] hypothesis suggests that forest products and industrial roundwood demand provide revenue and policy incentives to support sustainable forest management, and in turn industrial timber revenues and economical forest management have helped avoid large-scale systematic deforestation in those regions with the highest levels of industrial timber harvest." (continue below) | Accepted, Text has been revised |
| 7067 | 11 | 23 | 43 | 23 | 48 | (continued from above) More references documenting the benefits of active forest management include:<br>-Gillespie, A; Gustavsson, L; Eriksson, E; Langvall, O; Olsson, M; Sathre, R; Stendahl, J; " Integrated carbon analysis of forest management practices and wood substitution"; Canadian Journal of Forest Research, Volume 37, Number 3, March 2007 , pp. 671-681(11)<br>-Albaugh, T.; E. MacLean, L. Amos-Binks, "A novel approach to optimize management strategies for carbon stored in both forests and products", in Forest Ecology and Management, Volume 256, Issue 4, August 2008<br>(continue below) | Accepted, Text has been revised |
| 7069 | 11 | 23 | 43 | 23 | 48 | (continued from above) Studies that fail to identify benefits related to active forest management often ignore substitution effects (as in J. Nunery and W. Keeton, "Forest carbon storage in the northeastern United States: net effects of harvesting frequency, post-harvest retention and wood products", Forest Ecology and Management, 2010) or consider only a limited time scale (for a discussion of the importance of time see R. Sathre and L. Gustavsson in "Time-dependent climate benefits of using forest residues to substitute fossil fuels".) In other cases, extreme circumstances are examined which are not representative of managed forests as as a whole.<br>(continue below) | Accepted, Text has been revised |
| 7070 | 11 | 23 | 43 | 23 | 48 | (continued from above) In cases where studies fail to find benefits from active forest management it is often because they fail to include some of the GHG benefits of the forest product value chain. The benefits of "cascading" in the forest products value chain, for instance, are often ignored - as in Seidl, R. et. al. "Assessing trade-offs between carbon sequestration and timber production within a framework of mult-purpose forestry in Austria" in Forest Ecology and Management 248 (2007)), where the work excludes secondary GHG benefits associated with the use of forest products in a cascading fashion where the fossil fuel displacement benefits are first indirect (e.g. via displacing more fossil fuel intensive construction materials) and then direct (via use of wood debris as biomass fuel to directly displace fossil fuel). The benefits of cascading in the forest product value chain are is examined in more detail in Dornburg, V. and A. Faaij, "COst and CO2-emissions reduction of biomass cascading: methodological aspects and case study of SRF poplar", in Climatic Change (2005) ,71: 373–408. | Accepted, Text has been revised |
| 5816 | 11 | 23 | 43 | 23 | 48 | This statement is correct, but changing the forest type can be a viable option IF the wood cut is put to good use, i.e. in products with high replacement effects. According to Sathre & O'Connor the mean replacement effect of wood used in products is 2.1, so if 50% of the wood cut in the forest enter the product chain in any way the emissions are balanced and C stock changes on the landscape level are cancelled. (Sathre, R. and J. O'Connor (2010). "Meta-analysis of greenhouse gas displacement factors of wood product substitution." Environmental Science & Policy 13(2): 104-114.) | Accepted, Text has been revised |
| 3852 | 11 | 23 | 45 | 23 | 45 | Timing of C flows is really significant for temperate climate countries. Tree growth in tropical countries occurs in 10 to 20 years. | Accepted, Text has been revised |
| 5570 | 11 | 23 | 45 | 23 | 48 | With improved management, will have production from thinnings. Also, short-rotation tree growth, especially outside the forest, may compensate for conversion of old-growth forests. | Accepted, Text has been revised |
| 5059 | 11 | 23 | 5 | 23 | 5 | there are methane implications and lost sequestration form diversion of wood wastes | Accepted, Text has been revised |
| 3850 | 11 | 23 | 7 | 23 | 7 | Replace "but methane emission from wood chip storage" by "but methane emission from long-term wood chip storage". Rationale - CDM methodologies discussing this issue consider that storage for less than one year implies on negligible emission. | Accepted, Text has been revised |
| 9484 | 11 | 23 | 7 | 23 | 8 | What is the case "methane emissions from wood chip storage is important"? Do you mean wooden waste in landfill? | Accepted, Text has been revised |
| 9485 | 11 | 23 | 8 | 23 | 8 | The quote Wiersaari (2005) and Cherubini and Ulgiati (2010) are missing in the reference list. | Accepted, References have been cross- |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 5501 | 11 | 23 | 9 | 23 | | Distance and conversion technology are also really important factors here. Location of residues in relation to converision sites, energy use sites can have a large impact on both the economic viability of conversion as well as emissions balances | Accepted, Text has been revised |
| 14675 | 11 | 23 | 16 | 23 | 16 | When soils become depleted of organic matter they are less able to buffer against variations in water and nutrient levels and yield less on average, so that the ability of the crops to take up carbon dioxide is diminshed. Climate change conditions can be expected to result in more frequent and more extreme droughts so that having soils high in organic matter becomes more and more important. | Accepted, Text has been revised |
| 4390 | 11 | 23 | 17 | 23 | 21 | translating EJ in CO2 eq emission would help interpret bioenery potential, this comment applies to other parts of the text where EJ unit is used | Rejected, Translation to CO2 emissions is done in other chapters. Here, we don´t know which is the system replaced |
| 15965 | 11 | 24 | | | | table is not clear, the different numbers in the same cell are not explained, it seems this table can be simplified considerably | Accepted, Table has been changed |
| 9330 | 11 | 24 | | | | The table is not easily understable. There are many values under different columns. Are these the values reported by different authors or for different sub-regions by the same authors? How are the global and total figures on page computed? | Accepted, Table has been changed |
| 5709 | 11 | 24 | | | | Can we define EJ (Exajoule) on this page, possibly in a footnote? Can some equivalence like 1EJ= energy produced by burning of …..million tonnes of dry biomass, or= energy produced by burning of ……million tonnes of oil, be also mentioned in the footnote? It will make the comprehension of the subject easier. | Accepted, EJ are defined in the Metrics Annex |
| 5572 | 11 | 24 | | | | This table makes little sense at present. For example the waste sub-totals add to 7 EJ, yet for global the total is give as 1-3 & 11 EJ. The dung subtotals add to 22 EJ, but the total figures are given as 9-25 & 39 EJ. The unutilized forest growth adds to 2.9 EJ, (155 Mt we), but the global figures are 64 to 74 EJ (3.42 to 3.96 Gt we). The former figure is much too low and at present the estimated annual growth minus present use is 14.82 Gt. I do not understand the other columns. | Accepted, Table has been changed |
| 10265 | 11 | 24 | | 26 | | Please compare the figures also with this working paper: Anttila, P., Karjalainen, T. and Asikainen, A. Global Potential of Modern Fuelwood. 2009. Working Papers of the Finnish Forest Research Institute 118<br>http://www.metla.fi/julkaisut/workingpapers/2009/mwp118.htm<br>ISBN 978-951-40-2160-2 (PDF)<br>ISSN 1795-150X | Accepted, Text has been revised |
| 10607 | 11 | 24 | | | | Define "Waste". Is it MSW for example? "Plantations" better as "Energy crops" perhaps. Whole tbale is confusing with lists of numbers in each box. If from different references, then need to assess and then use ranges. Why is there no regional data for Marginal/degraded lands- only a global total? Maybe not found in literature - if so needs a footnote to clarify. | Accepted, Table has been changed |
| 11121 | 11 | 24 | | 26 | | References will be needed for each number. | Accepted, Table has been changed |
| 14434 | 11 | 24 | | 26 | | This table needs better formatting and clarification. I do not understand the significance of the multiple ranges noted for each region in many columns. | Accepted, Table has been changed |
| 14435 | 11 | 24 | | 26 | | Reformatting table could reduce chapter length. | Accepted, Table has been changed |
| 2627 | 11 | 24 | | | | Unutilized forest growth does not exist. You have to be able to define what this is since most forests are used by someone. Should these be targeted for conversion to a higher energy source if forest dependent communities use them? | Accepted, Table has been changed |
| 5571 | 11 | 24 | 11 | 24 | 13 | For an annual production of 1000 EJ/yr from biomass crops (53.5 Gt we) would require a planting area of between 3.6 and 5.4 million ha, assuming an annual yield of 10 to 15 dry t of biomass with an annual precipitation of 1500mm to 2000mm. This is about 1% of the forest area and 3% of the arable area, so it is possible. For 300 EJ/yr (16.0 Gt we), the required plantation area will be between 1.1 and 1.6 million ha. | Noted, There are many trade offs that need to be examined in addition to the energy potential |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 3853 | 11 | 24 | 14 | 24 | 23 | The concept that large extension of land area is required for some biomass-based fuels to make real impact on global GHG mitigation has to be changed if new demand side technologies become available. An example is the extension of soils needed to power a hybrid plug-in fleet of cars, See Pacca and Moreira, 2011. - Pacca, S. and J. R. Moreira, 2011. A Biorefinery for Mobility? Environ Sci Technol. 2011 Nov 15;45(22):9498-505. | Accepted, Text has been revised |
| 15171 | 11 | 24 | 17 | 24 | 23 | delete | Accepted, Table has been changed |
| 12408 | 11 | 24 | 24 | | | This table seems hard to understand and needs editing and more explanation | Accepted, Table has been changed |
| 9081 | 11 | 24 | 24 | | | More than one data are shown in one column. What does it mean? Each data was refered from different source? | Accepted, Table has been changed |
| 15170 | 11 | 24 | 5 | 24 | 6 | nutrient limitation is also a factor here… | Accepted, Table has been changed |
| 11812 | 11 | 24 | 9 | 24 | 13 | It would be interesting to include here the reason for this diference (e.g. different assumptions about land availability) | Accepted, Table has been changed |
| 5375 | 11 | 24 | 14 | 24 | 16 | If the Ramankutty et al, 2002 reference is supposed to support the assertion that we don't have good data on the slopes of lands then I think the authors should look up some more recent literature. Most GIS systems have digital elevation models that have useful resolution and certainly better than what was the case in 2002. I'm not sure if we are going to have perfect knowledge about this for the globe but I dont see this as a major issue given today's tools and datasets. | Accepted, Text has been revised |
| 10623 | 11 | 25 | | | | Please consider the paper Ovando and Caparrós (2009). This paper reviews different studies which estimate economic and physical potentials for bioenergy and forestry options in Europe. Reference: Ovando, P. and Caparrós, A., 2009. Land Use and Carbon Mitigation in Europe: A Survey of the Potentials of Different Alternatives. Energy Policy 37(3): 992-1003. | Accepted, Text has been revised |
| 16564 | 11 | 26 | 10 | 26 | 12 | This is an important point but only makes the distinction between animal and plant products. There are also very large differences among the different animal products, with beef having much larger land requirements, and lower efficiency in terms of either calories or protein, than chicken or pork (see, e.g. the Wirsenius et al. 2010 paper cited here). These between-animal-differences should be mentioned also; in terms of potential changes in trends, they are considerable more acceptable to a broad public than vegetarianism, and thus an important policy option. | Rejected, Changes in diet are discussed in Section 11.4 |
| 15235 | 11 | 26 | 12 | 27 | 2 | It should mention that other analysis suggest available abandoned / degraded land does not amount to a very significant potential for bioenergy production and could impact food security and biodiversity conservation. Eg. Field, C. B., Campbell, J. E. & Lobell, D. B. 2008. Biomass energy: the scale of the potential resource. Trends in Ecology & Evolution, 23: 65-72. | Accepted, Text has been revised |
| 5573 | 11 | 26 | 14 | 26 | 16 | I would argue that the trade off may be much less serious if existing annual biomass growth is more fully used and if marginal land and land invaded by 'weed' species is converted to plantations. This latter should lead to a positive GHG capture. | Accepted, Text has been revised |
| 10108 | 11 | 26 | 7 | 27 | 16 | One importatn option are integrated food endrgysystems which optimise the use of resrources to produce both food and energy needed in househjolds and farm operations (FAO 2010 Making Integrated Food-Enery systems work for people and climate. Working paper 45.) | Accepted, Text has been revised |
| 3854 | 11 | 26 | 8 | 26 | 8 | When considering "efficiency in the use of biomass" consider results quoted in Pacca and Moreira, 2011 - Pacca, S. and J. R. Moreira, 2011. A Biorefinery for Mobility? Environ Sci Technol. 2011 Nov 15;45(22):9498-505. | Accepted, Text has been revised |
| 5376 | 11 | 26 | 2 | 26 | 5 | I read the footnote for this table as saying that there will always and everwhere be decreased econmies of scale for biomass production and therefore increased biomass production will lead to higher costs. I am not sure that is strictly true. Luckow et al 2010, Hamelink et al, 2005 and others have shown that there are potentially scales of economy that can arise from dedicated biomass production. | Accepted, Table has been changed |

|---|---|---|---|---|---|---|---|
| 3855 | 11 | 27 | 14 | 27 | 15 | Complete your information since there are plenty of literature explaining that hungry is mainly driven by difficulties in carrying out food distribution and poverty. Food supply is above consumption. This should be stated here and not further down in the text. | Accepted, Revised |
| 12843 | 11 | 27 | 15 | | | Please add here another argument. Globally the human diet is based on 33% animal-based protein and 67% plant-based protein. In Europe this is just opposite; 67% animal-based protein and 33% plant-based protein (Data from FAOSTAT). As animal-based protein has a higher environmental impact than plant-based protein, a shift in developed countries is desirable. | Partially Accepted, Revised |
| 15173 | 11 | 27 | 16 | 27 | 18 | delete | Accepted, Deleted |
| 10246 | 11 | 27 | 19 | 27 | 30 | A third option (or can be included under (2)) are dietary shifts towards more local, more seasonal and less processed food. See for instance Weber C.L.W & Matthews H.S. 2008. Food-miles and the relative climate impacts of food choices in the United States. Envion. Sci. Technol. 42, 3508-3513. | Partially Accepted, The quoted article argues that shifting diets is more important than food miles because for most food production accounts for a much larger fraction of GHG emissions than transport. Nevertheless, less |
| 12409 | 11 | 27 | 19 | 27 | 27 | The demand-side is extremely important when assessing possibilities for reducing GHG emissions. Hence, it is very satisfactory that this aspect now is included in the report. Both the focus on reducing losses and changes in diets are highly relevant, since the goal is to still be able to supply a growing population with healthy food. | Noted, Thank you |
| 6828 | 11 | 27 | 19 | | 25 | There could be a case for adding another here: local and seasonal food. Demonstrate why complete impact is not just an issue of distance (food miles). | Partially Accepted, See comment line 754 |
| 7614 | 11 | 27 | 21 | | | "FSC" is the name of internatinal forest certification organaization that very famous in forest and consevation sector. "food in the supply chain" will be just use without abbreviating as coufuse with "certified sustainble wood" in Table 11.4 | Accepted, Abbreviation removed |
| 9082 | 11 | 27 | 21 | 27 | 22 | In general, FSC stand for "Forest Stewardship Council" in forest sector. | Accepted, Abbreviation removed |
| 11165 | 11 | 27 | 21 | | | Food in the supply chain should not be abbreviated into "FSC" because this may be confused with "Forest Stewardship Council" . | Accepted, Abbreviation removed |
| 9449 | 11 | 27 | 23 | | 25 | Changed diet is not a mitigation option, but rather a potential outcome of mitigation options. More discussion of interventions to change diet would be helpful here. | Rejected, Changed diet is a mitigation option. The interventions suggested are |
| 11295 | 11 | 27 | 23 | 27 | 24 | It would be better if animal products were not so unilaterally dismissed and plant products not necessarily assumed to be less resource-intensive. Instead a brief discussion of the nuances would be in order (e.g. livestock v fish, or local fowl v air-freighted soya beans cultivated on recently deforested land). Species, locality and seasonality all matter a great deal when it comes to resource intensity. Insects in particular convert the calories they consume into consumable protein and fatty acids at very high efficiencies, largely because they are cold-blooded (see Durst, Patrick and Kenichi Shono 2010: 'Edible forest insects: exploring new horizons and traditional practices.' In P Durst, D Johnson, R Leslie and K Shono, eds, 'Edible forest insects: humans bite back. Bangkok: FAO Regional Office for Asia and the Pacific: 1-4). Moreover, the emissions that result from farm-to-table distances may outweigh food type; consuming seasonal food is therefore just as important a part of demand-side mitigation of emissions from AFOLU. | Accepted, Text has been revised and additional references included. |
| 13528 | 11 | 27 | 25 | 27 | 25+ | (3) Quality changes in nutrition and suitability (meaning: viable and healthy) of different kinds of diets, choosing between all different options (traditional, predominant, new and adaptable) the less resource intensive, to solutions involving both food supply chain (FSC) and food consumption chain (FCC). | Rejected, Statement - not a comment; not clear what changes should be made. Text describing losses and diet changes |
| 15174 | 11 | 27 | 27 | 27 | 27 | delete "Demand side options are summarised in" and append (Table 11.4) to previous sentence. | Accepted, Done, thanks |

| 13529 | 11 | 27 | 46 | 27 | 46+ | Indeed, the challenge to reduce food wastes is not just a matter of data gaps, but also focus to include the views of key players, the householders. | Accepted, Revised, sentence deleted. |
| 5749 | 11 | 27 | 6 | 27 | 9 | please add "...services, such as integrated food-energy systems,.." (reference: http://www.fao.org/docrep/013/i2044e/i2044e.pdf) | Accepted, Revised for SOD |
| 15966 | 11 | 27 | 7 | 22 | 11 | Sentence does not seem correct | Accepted, Revised for SOD |
| 13966 | 11 | 27 | | | | this section is an essential addition to the analysis. Some additional references include E.A. Davidson. 2012. Representative concentration pathways and mitigation scenarios for nitrous oxide. Environmental research letters doi: 10.1088/1748-9326/7/2/024005 and t. Garnett. 2011. Where are the best opportunities for reducing greenhouse gas emiaaions in the food system? Food Policy 36: S23-S32 | Accepted, Revised |
| 15002 | 11 | 27 | 12 | | | This section should also discuss demand-side efforts to reduce consumption of wood and wood products harvested through unsustainable logging of primary forests. Third-party certification mechanisms such as the Forest Stewardship Council certification can help to drive demand toward more sustainable - and lower carbon - sources of wood and wood products. Laws, such as the U.S. Lacey Act, can be used to block imports of wood harvested illegally from protected areas, including those with primary forests. | Accepted, It does - see section beginning on page 30, line 4. There are several comments regarding use of certificated wood. Certification is to some extent discussed in the policy |
| 4396 | 11 | 27 | 12 | 30 | 32 | contribution of sea derived food products is not covered | Accepted, Revised, see description of |
| 7615 | 11 | 28 | | | | It is important to do't use wood by illegal logging before to use certificated wood. It is better to add such description. | Accepted, Revised, cross-reference to policy section (11.10) added, see above line 775 |
| 7072 | 11 | 28 | | | | Regarding the row "Substitution of wood for carbon intensive products"; an important reference is missing. In 2010, FP Innovations reviewed 66 studies that speak to the substitution effect. It is a key reference in this area. See Sathre, R., & O'Connor, J. (2010). A synthesis of research on wood products and greenhouse gas impacts - 2nd Edition. Vancouver BC: FPInnovations. | Accepted, This is no peer-reviewed publication. While it provides a useful overview, it does not change the conclusions we have reached in the text, so it does not seem justified to include |
| 5574 | 11 | 28 | | | | ‘Change consumption of wood products’. Mitigation option. Buying wood products from ‘certified sustainable wood’. It can be argued that most wood products are sustainable, even though they may not be certified as such. This is because the rate of wood growth is an estimated 5 times more than wood demand! Also, according to FAO statistics only about 8% of industrial wood and zero percent of fuelwood is exported. Therefore, in practice, certification is only dealing with a small fraction of wood products. The other two mitigation options cannot be overemphasized. | Accepted, Revised, cross-reference to policy section (11.10) added, see above line 775 |

It might be regarded as a change in diet, even if the meat more or less are of the same quality compared to meat from animals. | Accepted, Did not find any studies confirming that meat analogue is equivalent in terms of GHG emissions to other plant-based food. Also, the comment is difficult to integrate in the |
| 15611 | 11 | 28 | 12 | 28 | 13 | Global studies cited in previous comment should be cited in Table 11.4 for "Change in diet" section. | Accepted, Not able to find out what the "studies mentioned in the previous |
| 16566 | 11 | 28 | 13 | 28 | 17 | Same point as number 47 -- only distinguishes animal vs plant sources. I don't object to giving data that support vegetarianism, but you need to discuss other diet change options -- some of which are more broadly acceptable at present -- as well. | Accepted, We are not supporting vegetarianism - just exploring the relative impacts of animal and plant based food |
| 5504 | 11 | 28 | 13 | | | Are there associated estimates of land base required for each diet described? | Accepted, Estimates of area savings |
| 12411 | 11 | 28 | 13 | 30 | 3 | This part deals with the effect of diets/diet changes on emissions from the whole food chain. The referred studies seem to indicate mitigation potentials of up to 8-10 Gt CO2-ekvivalents in 2050/2055, a very significant amount. It would be a great advantage if the assumptions could be clearified more; whether and how the effect of land use, land use change and deforestation is taken into consideration seem to differ between the referred studies. It would be useful to clearify this and if posible display the results in a comparable way e.g. an extension of table 11.5. The different diets seem also to result in quite different needs for land area. Given the limitations of arable land and the increasing competition between needs for food/feed, C-sequestration, bioenergy and ecosystem conservation, it would be useful to elaborate this more. Such information could also be taken into the context of 11.9 "Sectoral implications of transformation pathways and sustainable development", especially the land use implications. This issue is also mentioned clearly in WGII chapter 19, p.16, line 7-11 with reference to the same report (Stehfest et al.2009) ; "Dietary changes could reduce the land requirements of food cropping embodied in these tradeoffs. Specifically, a transition to a vegetarian diet would free up 2700 Mha of pasture and 100 Mha of cropland, 75% of which could be used for biofuel cropping (Stehfest et al 2009), whilst the remainder could revert to natural vegetation becoming a carbon sink (see 19.3.2.1)." This text implies that 27 million km2, 70 % of the global agricultural area is used for animal products. | Accepted, Revised. |
| 5062 | 11 | 28 | 13 | 28 | 13 | there is a ppaer coming out in climatic change about a healthy nowegian diet where fish are substituted so substitution can also be in animal protein categories | Accepted, Not able to find the paper, not clear what should be changed |

|---|---|---|---|---|---|---|---|
| 11297 | 11 | 28 | 13 | 28 | 15 | Re: comment #6 above the 'exception' here is duly noted, but in much of the developed world non-seasonal, non-local food is not actually exceptional at all. | Accepted, Noted and revised. |
| 11167 | 11 | 28 | 13 | 30 | 3 | Change of diet is very important option, but to avoid misleading, considerations for cultural aspect of variety of food must be reffered. | Accepted, Revised. These aspects are outside the scope of this part and need |
| 16567 | 11 | 28 | 17 | 28 | 22 | This comparison actually makes my point (numbers 47 and 49) about the importance of comparing different kinds of animal-based diets, not just animal vs. plant. Going from the beef-based option to the pork-based one reduces emissions by 3.4 kgCO2eq; going from the pork-based meal to the soy-based one saves another 0.9 kgCO2eq. In other words, changing the kind of animal protein reduces emissions by 79% as much as going from animal to plant entirely. For a review of 16 such studies, see: DeVries, M., and I.J.M. deBoer. 2010. Comparing environmental impacts for livestock products: A review of life cycle assessments. Livestock Science 128(1–3):1–11 | Accepted, Revised; also discussed in other parts of this subsection. |
| 9450 | 11 | 28 | 17 | | 23 | Care should be taken to distinguish between average GHG intensity of food and marginal effects of diet switching. A large literature on this theme exists in LCA including the literature comparing attributional and consequential LCA. This turns out to be a particularly vexing problem for AFOLU. See for example, Lemoine, D., Plevin, R., Cohn, A., Jones, A., Brandt, A., Vergara, S., et al. (2010). The Climate Impacts of Bioenergy Systems Depend on Market and Regulatory Policy Contexts. Environmental Science & Technology, 44(19), 7347-7350.<br><br>Thomassen, M., Dalgaard, R., Heijungs, R., & de Boer, I. (2008). Attributional and consequential LCA of milk production. The International Journal of Life Cycle Assessment, 13(4), 339-349. | Accepted, Revised, reference by Thomassen et al. Added; the other was not related to food. |
| 13530 | 11 | 28 | 22 | 28 | 22+ | It was argued that these are nutritionally comparable meals, but nutrition is not only a matter of calories and proteins. We all are concerned with the world hunger, but it can't mean open the door to the soy business, with all its risks, even from the point of view of GHG emissions. Real problems are complex, and they haven't magic solutions. | Rejected, We are exploring biophysical effects of assumed behavioral changes here, not recommending actions. |
| 15179 | 11 | 28 | 23 | 29 | 1 | what does this mean? Unclear as written | Accepted, Revised |
| 9331 | 11 | 28 | 29 | | | The phrase 'and a quarter respectively half of the wasted food --' is not clear. | Accepted, Revised |
| 5503 | 11 | 28 | 6 | | | Wasted food is a current priority for US EPA and they are likely to have data that would be useful. Jean Schwab-schwab.jean@epa.gov is a contact for this information | Accepted, Jean has been contacted |
| 15178 | 11 | 28 | 8 | 28 | 11 | doesn't make sense | Accepted, Revised |

| 15236 | 11 | 29 | 4 | | | Suggest adding a recent quantified account of consumer-demand mitigation in Europe: For example, a recent analysis of the potential mitigation from various reductions in animal protein consumption including land use change emissions, calculated savings between 2 and 30% of total European emissions from livestock. From Bellarby et al. 2012. Bellarby, J., Tirado, R., Leip, A., Weiss, F., Lesschen, J. P. & Smith, P. 2012. Livestock greenhouse gas emissions and mitigation potential in Europe. Global Change Biology, in press. http://onlinelibrary.wiley.com/doi/10.1111/j.1365-2486.2012.02786.x/abstract | Accepted, Revised, references added. |
| 16569 | 11 | 29 | 6 | 29 | 19 | A quite useful paragraph; it could be improved (and shortened somewhat) by putting the numbers into a Figure. | Accepted, Text was thoroughly revised and shortened, no space for additional |
| 15181 | 11 | 29 | 6 | 29 | 19 | rather detailed for synthesis; tighten paragraph (next paragraph too) | Accepted, Revised. |
| 5818 | 11 | 29 | 6 | 29 | 35 | Please avoid phrasing text like "X wrote …, Y wrote ...". Give the statement and a citation. This way, you save space and the text will be easier to read. | Accepted, Revised. Note, however, that this is less useful when one particular study is discussed in more detail. In that case, this would only result in awkward |
| 13531 | 11 | 29 | 7 | 29 | 35 | However, research must be directed to a joint balanced solution of rich and poor diets, and the GHG emissions, avoiding the temptations to adopt any kind of global or unique answer for these regionally differenced issues. | Rejected, Proposing research strategies is beyond the scope of this section |
| 15968 | 11 | 30 | | | | Table adds little more info, text is already explanatory, could be removed. | Accepted, Table deleted |
| 5819 | 11 | 30 | | | | Table can be deleted, information is already given in the text (page 29). | Accepted, Table deleted |
| 12412 | 11 | 30 | 1 | | | The table should be extended with the information on p 29 line 6-19. An advantage would be to introduce a column for the emissions in 2050 or 2055 for different diet scenarios, if posible including also the CO2-emissions from landuse/landuse change. | Partially Accepted, Table deleted |
| 5063 | 11 | 30 | 1 | 30 | 1 | I think all this discussion about changing diet shopuld be tempered with a little discussion of how hard this is to get done. In the us there is a lot of talk about obesity and unhealthy food but it has proved very hard to change | Accepted, Revised. Implementation issues discussed elsewhere |
| 9486 | 11 | 30 | 10 | 30 | 10 | The reference quote as Christian Lauk et al. (2012) is Lauk Christian ("Laul Christian"in the reference list)? | Accepted, Zotero updated for SOD |
| 12413 | 11 | 30 | 13 | 30 | 20 | Could you please clarify if the buildings energy-demand over the lifetime are included in the analysis of the net CO2 emissions over a 100 year lifetime? | Accepted, Revised |
| 15182 | 11 | 30 | 16 | 30 | 18 | repetitive | Accepted, Deleted |
| 16571 | 11 | 30 | 21 | 30 | 22 | I assume that the "construction of one million flats per year" is using wood, correct? Clarify this. | Accepted, Revised |
| 5505 | 11 | 30 | 21 | 30 | 32 | Are wood structures suitable as multi family dwellings? Energy use in multifamily dwellings is a fraction of that in single occupancy homes- this should be considered in this discussion. One estimate of energy use and LCA costs of home construction is available at:State of Oregon Department of Environmental Quality. A life cycle approach to prioritizing methods of preventing waste from residential construction sector in the state of Oregon: Phase 2 report, version 1.4. Document 10-LQ-022; http://www.deq.state.or.us/lq/pubs/docs/sw/ResidentialBldgLCA.pdf. | Accepted, Revised |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 7074 | 11 | 30 | 21 | 30 | 32 | This section should also refer to the important meta analysis by Sathre and Oconner - Sathre, R., & O'Connor, J. (2010). A synthesis of research on wood products and greenhouse gas impacts - 2nd Edition. Vancouver BC: FPInnovations. | Accepted, Revised, peer-reviewed paper cited |
| 7076 | 11 | 30 | 21 | 30 | 32 | This section leaves the impression that there is no overarching conclusion to be drawn from these studies. This is incorrect. As a whole, these studies indicate that using wood from sustainably managed forests to displace more GHG-intensive non-wood materials will always yield mitigation benefits, although the timing of benefits will vary depending on the specific situation. It is important that this section include this overall conclusion and that it be reflected in the executive summary of the report as it was in the Fourth Assessment Report (Fourth Assessment Report, WGIII, Chapter 9, Executive Summary). Even the Nassen study reflects the benefits of active forest management and the resulting low GHG-intensity products, althought the results of this study are misrepresented in the current draft (the subject of the next comment). | Accepted, Revised. Note that Sathre and O'Connor (2010) and Werner et al. (2010) also identify cases in which emissions of wood use are higher. Although this is the exception rather than the rule, balanced treatment requires that this is mentioned. |
| 5577 | 11 | 30 | 21 | 30 | 32 | I think that the argument that GHG saving with wood products in place of steel and concrete may be small or zero is false. Wood from existing forest areas (especially under improved management) and areas of abandoned land under tree crops, will not only increase the sequestration of C, but also provides sustainable (and increased) sources of wood. The use of energy for steel and concrete production for building and furniture etc. is much more than for a similar building made of wood products. | Accepted, Revised, but note the caveats in row 825 |
| 11124 | 11 | 30 | 21 | 30 | 32 | When "wood" is discussed, it is often forgotten that wood comes out of forest, and every single harvest reduces or destroys many other goods and services of forests. If this is also considered, then the wood - non-wood equation must be re-evaluated. | Accepted, Revised |
| 5820 | 11 | 30 | 26 | 30 | 32 | The study of Nässén et al. has weaknesses in the C cycle assessment (e.g., using wood for bio-energy only when it could be used in products requires CCS or it would increase emissions compared to fossil fuels, see Schulze, E. D. et al.: Large-scale bioenergy from additional harvest of forest biomass ... , doi:10.1111/j.1757-1707.2012.01169.x, for an - unfortunately also incomplete - overview and general problem discription). The "question whether promotion of wood ... " is also misleading as the situation where both options were equal is based on future options not available for quite some years to come. The weighing today is clear. So please be aware what messages you want to send. | Accepted, Revised |
| 5456 | 11 | 30 | 26 | 30 | 32 | The quotation of (Naessen et al., 2012) is irrelevant and gives wrong message. Their report is based on uncertain assumptions like CCS technologies, carbonation of concrete, and future carbon price. Considering middle term period until 2050, wood construction can reduce more CO2 than concrete construction. Promotion of wood construction is best mitigation measures in the construction sector. | Accepted, Revised, but note the caveats in row 825 |
| 10247 | 11 | 30 | 3 | 30 | 3 | instead of "multiplication with 3.66667" it is better to use "44/12" which is more explicit | Accepted, Revised |
| 3856 | 11 | 30 | 3 | 30 | 3 | Do we really need all these decimal figures? | Accepted, Revised |
| 15969 | 11 | 30 | 31 | 30 | 31 | CCS - not explained | Accepted, This part was deleted |
| 7077 | 11 | 30 | 31 | 30 | 32 | The results of the Nassen et al 2012 study are misrepresented and the study is flawed. First, Nassen et. al. focused on a question that had not been examined previously, i.e. the effect of hypothetical future energy systems on the relative benefits of wood and concrete building systems. The future energy systems included CCS applied to both power production and industrial emissios, including emissions during calcination in the concrete manufacturing process. The study first points out that "Summing up the results from previous studies in this field we find it fairly well-established that, given the current energy system, increasing the share of buildings with wood frames would reduce overall GHG emissions, and a few studies also point out that this could be a cost-effective strategy." Then in the conclusions, the authors state that "Our analysis confirms the results from previous studies that for current conditions wood framed buildings will emit less CO2 during their life cycle than concrete buildings. Built on these earlier results arguments have been put forward that using wood frames in buildings should be stimulated. Still, in an elaborative scenario where CCS technologies are made available in the energy system,...(continued below) | Accepted, Revised |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 7078 | 11 | 30 | 31 | 30 | 32 | (continued from above)...the better carbon balance for wood frames is dependent on that CCS would also be used for the incineration of the relatively small and scattered streams of wood waste at the end-of-life of the building. Moreover, the carbon balances are sensitive to assumptions on the alternative use of the forest land in the concrete case, for which the land requirements for materials production are smaller than in the wood case." The findings in Nassen et. al., however, appear to have been affected by the study's having ignored the removal of CO2 from the atmoshpere accomplished in the initial growing of wood for construction. (See Table 2 in the study to see the carbon flows considered in the study) Instead, only regrowth is considered. Had carbon uptake by initial forests and the subsequent transfer of this carbon into wood-based construction materials been included for the wood-based system, in accordance with normal LCA practice, the wood-based systems would have shown benefits in both the current and future energy systems. (continued below) | Accepted, Revised |
| 7079 | 11 | 30 | 31 | 30 | 32 | (continued from above) This is because, had proper boundaries been used, it would have revealed that CCS applied to biogenic CO2 has a much larger benefit in reducing atmospheric GHGs (due to its removing carbon that was previsoulsy actively cycling in the atmosphere, so CCS results in a net negative flux of carbon to the atmosphere) compared to the removal of fossil fuel CO2 (which merely removes carbon that was added by fossil fuel burning, resulting in a net zero flux of carbon to the atmosphere). By excluding the initial uptake of carbon from the atmosphere, this difference is missed. We suggest, therefore, that due to limitations of the study, and the fact that its summary of previsou studies merely confirms other references used, this study be removed from the list of those used in the Fifth Assessment Report. | Accepted, Revised |
| 5710 | 11 | 30 | 4 | 30 | 32 | Research to make life of wood products longer is a workable proposition. Proper application of research has the potential of increasing the life of long-lived wood products like, door- window frames, lumber in house construction, and furniture, which will increase carbon sequestered in wood products. Flagging this kind of research here will be relevant. | Accepted, Revised |
| 5575 | 11 | 30 | 4 | 30 | 4 | Demand-side options related to wood and forestry. Should define 'socioeconomic'. I assume it mainly means the stock of carbon in long-lived wood products? | Accepted, Revised |
| 11813 | 11 | 30 | 4 | 30 | 32 | Here you only focus on construction wood.What about wood used for pulp and paper or furniture? | Accepted, The aggregate numbers from Lauk et al. (2012) and Pan et al. (2011) include all uses of forest biomass. No peer-reviewed studies were found on |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 12075 | 11 | 30 | 4 | 30 | 32 | It seems that section 11.3 divides, as almost unrelated ,many forest related mitigation actions - increased use of biomass for bioenergy, improved natural forest management (more growth), improved plantation management, forest conservation ("production" measures); decreasing wood consumption, increasing wood consumption to subtitute for other products, and increased storage of carbon in wood products. ("demand side measures). It seems we need a concept for how policies could encouage or support these measures in a coordinated way to get the greatest mitigation offset. It seems a way to do is ito have a discussion about how to use wood (or not use wood and let it accumulate in forests) that is parallel to the discussion about how to changing food diets (pg 28 line 13 to pg 30 line 3). The parallel idea is that we should look to modify our wood product use diet - bioenergy, wood for paper, wood for construction products - in a way that gets the most OVERALL mitigation - over time - from the combination of carbon increase in forests, biomass for energy, (offset of fossil emissions), wood product carbon storage, wood product production for construction products (offset of emissions from displaced construction products). The main point is that for given forest circumstances (forest age, growth, regrowth, current uses for wood ) and current wood use/ wood use opportunities we need to identify what are the most effective combination of CHANGES in uses (or no use or decreased use) to mitigate emissions over time. Second we need to identify the coordinated policies that will support this integrated outcome - not just separate policies for forest management, bioenergy, and wood products use in construction that would likely not recognize the best mix of uses (no use). If this document does not recognize that there is a NEED to analyze our wood use DIET and determine the most effective diet then the question about the policy needed to attain the best diet will likely not be discussed elsewhere (in this document or by policy makers) . Cherubini et al (2012) gives a simplified set of examples comparing the radiative forcing reduction benefit associated with alternate use of roundwood for energy, and various products. Sathre and O'Connor (2010) review of estimated carbon offsets if wood is substituted for nonwood products in a range of cases. Ximenes et al (2012) give a good pair of real world examples comparing no harvest to harvest and use of wood for products and energy. I am not aware of a study that does a good job of comparing no harvest to several levels/uses for harvest for a range of conditions. There are many studies that include payments to add carbon to forests (and sometimes products) but these do not consider a policy that would pay builders to substitute wood for other materials as a way to get substitution benefits. Refs cited --- [Cherubini, F., Guest, G. and Stromman, A. (2012). Application of Probability Distributions to the Modeling of Biogenic CO2 Fluxes in Life cycle Assessment. Global Change Biology Bioenergy, 1 - 15.] [Ximenes et al. 2012. Greenhouse gas balance of native forests in New South Wales, Australia. Forests 2012 (3)653-683. ] [Sathre, R. and J. O'Connor. 2010. | 5576 | 11 | 30 | 8 | 30 | 10 | "--- increase from 17 MtC/yr in 1900 to a maximum of 188 MtC/yr in 2007". This is nearly a 3 fold per-capita increase, which seems high. Whereas --- to 50-80 MtC/yr (line 10) seems more reasonable. | Accepted, Revised |
| 9452 | 11 | 31 | 1 | | 1 | This section would benefit from a sub-section on the extent to which mitigation effectiveness depends on adoption choices by land users and, relatedly, the design of instruments to induce adoption. | Rejected, Dealt with later in the chapter |
| 5070 | 11 | 31 | 1 | 31 | 1 | in this section you could also mention additionality which is a problem with redd and afforestation and a number of other ag items. The real question is how much of this mitigation activity happened anyhow | Partially accept, Additional paragraph added to end of section introducing additionality; this is described elsewhere |
| 16573 | 11 | 31 | 10 | 31 | 11 | "easy to track visually" is a dubious assertion -- one certainly can't see the below-ground effects, and even if one can see changes if one is present when plowing happens, it is much more difficult to track (let alone quantify) the effects over a large scale by remote sensing. | Accepted, Have reworded and caveated this statement: viz;. "Some activities that reverse carbon sequestration are relatively easy to track visually, such as deforestation and some changes in land-use such as the removal of residues from a ploughed field. Obviously, such an approach cannot assess all carbon pools (e.g. below ground). These techniques, which rely on remote |
| 5578 | 11 | 31 | 10 | 31 | 12 | "Most activities that reverse carbon sequestration are relatively easy to track visually. A ploughed field with residues removed, the removal of trees etc". I would argue that this is not a reversal of C sequestration. Crop residues if not used will rot and/or be eaten by insects etc. and be returned to the atmosphere. If they are used for energy, the may substitute fossil fuels. What could be lost is some minerals (fertility) soil friability etc. The harvesting of wood from a sustainable supply will not affect C loss. Rather it should have a positive effect on C accumulation in wood products or the substitution of wood energy for fossil fuels. | Accepted, Added reference to remote sensing of forests for REDD (Gibbs et al. 2007) |
| 14629 | 11 | 31 | 12 | | | surely it is as much carbon as is usually lost due to LUC or fire in a certain ecosystem type | Accepted, Agreed, however this will depend very much on the carbon stores and nature of disturbance. Not necessarily equivalent. Text added "There are relatively few data on how much carbon is lost when reversals occur and estimates will depend on a range of factors such as the carbon storage within the system and the nature of the disturbance. A first order estimate |
| 13969 | 11 | 31 | 13 | 31 | 15 | this sentence requires a separate paragraph. Permanent removals should be described in the first paragraph of this section, then followed by a discussion of those types of mitigation for which non-permanence is an issue. | Accepted, Agreed and changed |
| 15183 | 11 | 31 | 15 | 31 | 17 | contradictory | Rejected, The statement is not contradictory. Frost damage affects the annual increment but doesn't reverse the |

|---|---|---|---|---|---|---|---|
| 5064 | 11 | 31 | 24 | 31 | 24 | Kim, M-K., B.A. McCarl, and B.C. Murray, "Permanence Discounting for Land-Based Carbon Sequestration", Ecological Economics, vol. 64, issue 4, 763-769, 2008. do some work on permanance and show contract terms and unequal sequestration rates plus saturation and possible maintainence costs lead to value of sequestation being as low as 1/3 of a perfect detruction of methane on a co2eq basis | Accepted, Text inserted to cover this: " estimated the impact of differences in permanence on the value of carbon offsets using examples from cropland |
| 14633 | 11 | 31 | 25 | 26 | | change order of sentence and give example what you mean (e.g. afforestation) and (e.g. fossil fuel substitution with bioenergy). Culd be owrth noting at end of this paragraph that peatlands sinks may not saturate, but C uptake very slow. | Accepted, Agreed. |
| 5711 | 11 | 31 | 25 | 31 | 30 | Can some idea/figures about saturation limit of carbon in different types of soils, say in %, or t ha-1, be given? This could give an idea about the capability of a particular soil to assimilate carbon in future. | Rejected, No - too much detail and too variable |
| 5065 | 11 | 31 | 25 | 31 | 25 | post and six have a climatic change article on saturation in 2007. also there is an uncertainty question here as to what is the rate and Kim, M-K., and B.A. McCarl, "Uncertainty Discounting for Land-Based Carbon Sequestration", Journal of Agricultural and Applied Economics, 41, 1(April 2009), 1-11, 2009. deal with it theoretically and empirically | Accepted, Agreed and two papers cited. |
| 5579 | 11 | 31 | 25 | 31 | 30 | Saturation. I agree that there are saturation points for carbon stored in biomass and soils. However, in most systems, the C content is well below the saturation point. Also, even if the saturation point can be achieved, the removal of annual growth provides carbon that can be used in wood products for building etc. and as a sustainable energy source to substitute for fossil fuels. | Rejected, No support for the statement that "in most systems, the C content is well below the saturation point" |
| 5821 | 11 | 31 | 25 | 31 | 30 | It is currently debated whether the equilibrium hypothesis is correct or not. Studies from old-growth forests for example show that they can continue to sequester C in soil and dead organic matter even if net living biomass increment is near zero (see, for example, Luyssaert, S., E. D. Schulze, A. Borner, A. Knohl, D. Hessenmoller, B. E. Law, P. Ciais and J. Grace (2008). "Old-growth forests as global carbon sinks." Nature 455(7210): 213-215). The debate is ongoing, but I suggest to keep the paragraph in subjunctive as far as an equilibrium is concerned. | Accepted, Agreed and added |
| 9132 | 11 | 31 | 29 | | | "Smith, 2005" is not cited. | Accepted, Fixed |
| 16572 | 11 | 31 | 3 | 31 | 4 | The assertion that "soil and vegetation carbon sequestration forms a large proportion of the mitigation potential in the AFOLU sector" is surprising -- particularly since the previous section has just shown the large mitigation potential of demand-side changes. Is it still "a large proportion" if these demand-side options are included? What is that proportion? At minimum, this assertion needs to be quantified and supported by citations. | Accepted, Changed to significant component. This is value is covered in earlier sections. |
| 13325 | 11 | 31 | 3 | 31 | 3 | a large, not a lage | Accepted, Agreed. |
| 14634 | 11 | 31 | 31 | | | This paragraphs confuses natural drivers with indirect human drivers. Ie . A direct human driver is an intentional activity that affects C balance such as LUC. A Natural driver of GHG flux would be cliamte variability, fires, wind throw disease. If a natural driver is changing, e.g. due to human induced claimte change or pollution , then this would be an indirect humn induced change. So see line 25, future changes in clumate are not natural changes, they are indirect human induced drivers of hange in flux. | Accepted, Changed |
| 9133 | 11 | 31 | 32 | | | "Smith, 2005" is not cited. | Accepted, Changed |
| 15184 | 11 | 31 | 35 | 31 | 36 | delete sentence | Accepted, Retained. Linking sentence in |
| 9134 | 11 | 31 | 36 | | | insert "changes" after "indirect human-induced". | Accepted, Changed |
| 15970 | 11 | 31 | 40 | 31 | 40 | Displacement/leakage - it seems this is key to many sink/emission statements, this could be elaborated more, one can assume that previous text takes this into account, and many studies would build on this. Leakage/displacement seems to be one of the more important factors to take into account, as a basis for all other mitigation effectiveness studies, this could be discussed first | Accepted, Rearranged |
| 5066 | 11 | 31 | 40 | 31 | 40 | the statement "If reducing emissions in one place leads to increased emissions elsewhere, 40 the emissions no net resuction in emissions occurs" is rather rediculous as it assumes a one to one corespondance. A more realistic view is in Murray, B.C., B.A. McCarl, and H-C. Lee, "Estimating Leakage From Forest Carbon Sequestration Programs", Land Economics, 80(1), 109-124, 2004. where the percentage offset is computed | Accepted, Done |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 7191 | 11 | 31 | 40 | | | o Leakage. Now only displacement leakage is mentioned. Also ecological leakage should be discussed when it comes to rewetting of peat soils as a mitigation measure. If in the area where the rewetting activity takes place is not hydrologically 'intact', then ecological leakage shall be considered (expressed in amounts of carbon). | Noted. Text augmented. |
| 10248 | 11 | 31 | 41 | 31 | 41 | rewrite | Accepted. Text revised. |
| 14635 | 11 | 31 | 41 | | | delete "the emissions | Accepted. Text revised. |
| 14636 | 11 | 31 | 41 | | | the net reduction might not be zero, it might be lower than one is aiming for, or it might even be negative (ie reduction elsewhere is greater than gain by activity) this would be perverse mitigation. I would suggest to say, net reduction in emissions would be lwoer than that of the planned activity alone | Noted. Text revised. |
| 11065 | 11 | 31 | 41 | 31 | 41 | typo needs correction in following wording "…the emissions no net resuction in emissions occurs…." | Accepted. Text revised. |
| 9453 | 11 | 31 | 44 | | 45 | Trade statistics are not necessarily a proxy for emissions displacement. | Rejected. The text does not assume this for all trade statistics. |
| 14637 | 11 | 31 | 46 | | | ther are many publciations not on this patter of which Serchinger is at one extreme. In fact the jury is still very much out on quantifying iLUC. Needs some more thoughtful and in depth discussion as this is a critical point for this chapter. | Accepted. Text augmented. |
| 5506 | 11 | 31 | 6 | 33 | 3 | Excellent clear discussion | Noted. |
| 6829 | 11 | 31 | 6 | | 24 | There is some confusion cause by apparent interchangeability between 'sink' and 'stock' - the former is a process and the latter is a reservoir - and the addition of 'storage', which could be sink or stock. Avoided emissions are accounting issues not sinks and hence have different impacts on the atmosphere. Avoided emissions cannot be re-emitted (reversed) becasue there is nothing to reverse! | Accepted. We've added sentences explaining 'sink' and 'stock'. Use of the term 'storage' will be checked. |
| 14627 | 11 | 31 | 6 | | | this section needs some work, it is disjointed and a little confusing | Noted, section revised. |
| 14628 | 11 | 31 | 8 | | | other types of what? | Accepted. Other types of carbon sinks. |
| 13968 | 11 | 31 | 8 | 31 | 10 | this phrase confuses real mitigation, where gases are prevented from entering the atmosphere or are removed from the atmosphere, with market fixes. Buffer pools and insurance have nothing to do with mitigation. You can't take out insurance on reversals as a means to keep CO2 out of the atmosphere. with regard to the global GHG concentration increases, buffer pools are irrelevant. this sentence should be struck. | Accepted. Text revised. |
| 4392 | 11 | 31 | | 31 | | I find this section very small in regard to its importance, although some aspects of non-permanance appear in other sections. E.g. tree die back, pests, increased drought | Noted. Section has been augmented within limits of page allocation. |
| 13967 | 11 | 31 | | | | Essential section, but the findings are not adequately incorporated into the analysis of technical and economic potential. If there are serious uncertainties with regard to both amount of carbon sequestered and permanence of carbon sequestered (particularly as temperatures increase), there is little likelihood that this carbon can be commodified in a market. Other references to be added include R.P. Philipps et al. 2012. Roots and fungi accelerate carbon and nitrogen cycling in forests exposed to elevated CO2. ecology letters doi: 10.1111/j.1461-0248.2012.01827.x; F.M. Hopkins et al. 2012. Warming accelerates decomposition of decades-old carbon in forest soils. PNAS doi:10.1073/pnas.1120603109; A. Knohl and E. Veldcamp. 2011. Indirect feedbacks to rising CO2, Nature 475: 177-178;K.J. vanGroenigen et al. 2011. Increased soil emissions of potent greenhouse gases under increased atmospheric CO2. Nature 475: 214-216. | Noted. Section (now 11.3.2) has been revised and two of the three references added. |
| 14436 | 11 | 31 | | | | Relatively little discussion space is allotted to the important topic of mitigation effectiveness, relative to the page-length of the black carbon and biofuels section. Given the interest in policies that offer land managers payments for C sequestration, it is important for readers to understand the risk regarding C sequestration permanence. | Noted. Section has been augmented within limits of page allocation. |
| 11206 | 11 | 32 | | | | The treatment here on 'competition for land' is overly truncated and could be expanded upon and this feeds back to my earlier comments about the need for specific actions to control unregulated land grabbing and strengthen communal tenure rights for customary land owners. At line 32: Why call these benefits 'cultural services'? | Accepted, Competition for land is discussed in an entire subsection (was 11.4.2); text regarding cultural services revised |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 16221 | 11 | 32 | | | | figure is missing conservation as one of the competing uses of land (it has biofuels and food/fiber); it leaves out water/biodiversity | Accepted, Figure was deleted for reasons of scarce space, and following the suggestion by another reviewer. |
| 15971 | 11 | 32 | 1 | 41 | 43 | Chapter is well written and clear, useful information is presented in a format which gives a nice overview. Displacement could be discussed more | Partially Accepted, Revised, but leakage is discussed elsewhere in more detail, |
| 5067 | 11 | 32 | 1 | 32 | 29 | I find this section redundant to coverage above and would delete it or move a little of it to earlier section on land use | Rejected, Most reviewers wish to see the section expanded |
| 3858 | 11 | 32 | 11 | 32 | 18 | It will be useful to provide figures at this point. What about quoting increase in agricultural area in the last 50 years, compared with population growth and society revenue (Global National Income)? I am surprised with the many references provided supporting the view of food versus fuel competition when agricultural land expansion has been many times lower than population and wealth growth. Be fairer by adding literature sources with different view. | Accepted, Two sentences with numbers and citations added |
| 11298 | 11 | 32 | 14 | 32 | 16 | Interesting indeed, but the 'points in space in time when this currently trajectories [sic] may be more easily influenced' already seem quite clear: cities. In particular, the fastest-growing cities in the developing world that are looking to expand and upgrade their infrastructure will have massive implications for resource use and efficiency; if their growth trajectories are directed appropriately they can have a great and positive impact on sustainability. However, neither the term 'cities' nor 'urban' appears even once in this entire chapter. | Accepted, Revised, text and references added |
| 13326 | 11 | 32 | 16 | 32 | 16 | Global resource, not .in global | Accepted, Revised |
| 3859 | 11 | 32 | 16 | 32 | 17 | Check wording | Accepted, Revised |
| 5822 | 11 | 32 | 20 | | | The information shown in this figure is already given in the text, so the figure can be deleted. Its presentation does not result in more information or better understanding. | Accepted, Figure deleted. |
| 11205 | 11 | 32 | 3 | 32 | 18 | The use of the term 'wild' here is inappropriate and outdated. Most scientific studies demonstrate that almost every corner of terrestrial ecosystems are used and occupied by peoples, the point is that in 'remote' areas the usage tends to be very low intensity and infrequent, yet nonetheless this land is under use, it just tends to be 'invisible' to western planners and decision-makers. This is especially case for indigenous gatherer hunter groups and shifting cultivators who combine hunting and gathering land use in very distant forest areas with swidden farming in forests closer to home. In some cases areas of 'remote' land are specifically set aside as no-go areas by indigenous peoples for spiritual *and* ecological reasons e.g. game breeding areas, water sources BUT they form part of an integrated customary system of land use and management. See, for example: Jane M. Read, Jose. V. Fragoso, Kirsten M. Silvius, Jeffrey Luzar, Han Overman, Anthony Cummings, Sean T. Giery, L. Flamarion de Oliveira (2010), Space, Place, and Hunting Patterns among Indigenous Peoples of the Guyanese Rupununi Region Journal of Latin American Geography Volume 9, Number 3, 2010 pp. 213-243. | Accepted, Revised, reference added. |
| 11987 | 11 | 32 | 30 | | 30 | Need to add here that ecosystem services are underpinned by biodiversity, e.g. "ecosystem services, which are underpinned by biodiversity". | Partially Accepted, Agreed, but the text was considerably shortened so the proposed formulation did no longer fit in. |
| 15185 | 11 | 32 | 33 | 32 | 33 | cite MEA. | Accepted, Done |
| 11299 | 11 | 32 | 34 | 32 | 38 | Agriculture (and indeed forestry) are increasingly important for urban livelihoods and employment too, though urban and peri-urban agriculture is never mentioned in this chapter. Urban and peri-urban agriculture can also help alleviate competition for scarce land resources by working within dense urban areas (and the innovative land use changes like green roofs, walls and redeveloped brownfields it often involves) and allowing larger green areas to remain intact. | Accepted, Urban and settlements are now better covered |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 5580 | 11 | 32 | 7 | 32 | 9 | "Approximate ¼ of --- NPP is appropriated by humans either forgone due to land-use related loss in NPP or harvested for human purposes". (H. Haberl et. Al 2007). The NPP for terrestrial plants is an estimated 53 GtC. One quarter of this is therefore 13 GtC. The annual gross rate of deforestation, according to FAO is 15.2 million ha/yr. The annual loss in NPP from this area is between 75 MtC and 115 MtC. However, according to FAO, there has been an annual planting of an estimated 8.8 million ha. This should sequester between 44 MtC and 66 MtC, thus the net NPP loss will be between 31 MtC and 49 MtC. The annual use of wood products is an estimated 1765 MtC, (but if this is not used it will decay etc. and finish up as atmospheric CO2 and the annual NPP for wood is over 9 GtC). Food consumption for 7 billion people at 2750 kcal day (page 8, line 24), consumption is about 790 MtC. Allowing for waste, residues and losses via animal consumption, the annual consumption of NPP may be of the order of 1.6 GtC. (However, some NPP, e.g. grass would rot if not eaten). Thus gross the 'socioeconomic' loss of NPP is an estimated 3.5GtC/yr. This is less than 7% of NPP not 25%! Also fish from the sea etc. should be excluded from terrestrial food consumption. Thus Haberl estimates are much too high. | Partially Accepted, Numbers were cross-checked but matched the numbers reported in the peer-reviewed literature; additional reference added. Note that, as explained in detail in the paper by Haberl et al., 2007, this hinges on the definition of HANPP applied; the formulations used here are based on definitions widely used in the scientific literature, see e.g. the special issue edited by Erb et al. (2009) in Ecological Economics, 69(2), 250-334; in particular the editorial gives an in-depth discussion of definitional issues related to HANPP. |
| 15612 | 11 | 32 | 25 | 32 | 29 | Feedbacks should also include animal welfare. People around the world care about the welfare of animals raised for food. World Society for the Protection of Animals (2007). WSPA International Farm Animal Survey (China & Brazil), Dec. 14; Zogby International (2003). Nationwide views on the treatment of farm animals. Poll for the Animal Welfare Trust; Lusk J.L., F. B. Norwood, and R.W. Prickett (2007). Consumer preferences for farm animal welfare: results of a nationwide telephone survey. European Commission, Scientific Veterinary Committee, Animal Welfare Section. 1995. Report on the welfare of calves. Adopted November 9. Available at: http://ec.europa.eu/food/fs/sc/oldcomm4/out35_en.pdf. | Partially Accepted, Revised - introduced a sentence in the subsection on demand-side measures. It fitted better than here due to length concerns. |
| 15186 | 11 | 33 | 11 | 33 | 13 | delete sentence | Accepted, Deleted |
| 15187 | 11 | 33 | 11 | 33 | 24 | is it trade offs that you want to minimize or negative effects? (tradeoffs can work, yes?) | Accepted, Revised |
| 5823 | 11 | 33 | 18 | 33 | 19 | "Leakage must be avoided" is only correct if the term "leakage" in used in the sense that emissions occur elsewhere and are therefore not considered in the assessment. This must be avoided. If emissions are assessed without regard to the location or timing of emission, than "leakage" is no problem. | Accepted, Revised |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 5581 | 11 | 33 | 20 | 33 | 22 | Exploiting fully the NPP of the land should positively affect the livelihoods of the poor, especially if the are given control of say natural forests, paid for protecting them and provided with simple management techniques and opened up new markets for the products. | Rejected, Policy prescriptive and not sufficiently supported by peer-reviewed literature |
| 13327 | 11 | 33 | 21 | 33 | 21 | I believe it should say livlihoods of populations, not only poor populations. How do you define poor? | Accepted, Revised |
| 8931 | 11 | 33 | 21 | | | "poor" seems inappropriate better "rural population" | Accepted, Revised |
| 5072 | 11 | 33 | 29 | 33 | 29 | I have seen discussion of "Competition for land and water" before in this chapter | Accepted, Revised |
| 11207 | 11 | 33 | 30 | 33 | 46 | The section at 11.4.2 on 'competition for land and water' might be an ideal place to insert stronger and more robust text and references on the need to control unjust land acquisition and take measures to ensure forest tenure reforms to recognise the collective property rights of indigenous peoples and forest dependent communities. | Accepted, Noted - but not in a policy prescriptive way |
| 16576 | 11 | 33 | 30 | 33 | 38 | This section is important. However its first paragraph is fairly general and reads more like an introduction to the whole chapter than to this section specifically. Some of the sentences could be moved to the start of the chapter. | Accepted, Revised |
| 5582 | 11 | 33 | 35 | 33 | 37 | “Competition for --- resources is expected to intensify”. This could be mitigated by increasing agricultural productivity, increasing the use of NPP, changing the diet and tempering population increase etc. | Rejected, Policy prescriptive |
| 5507 | 11 | 33 | 39 | | | Is there a potential to include in this list multi purpose use of lands? So for example earlier on in the chapter combination forest and production agriculture were mentioned- integrating coffee growing into forest lands is one case, another way to describe this would be to maximize ecological functions of land. This seems to be an important consideration- not clear where it would best fit into the discussion- just got up to pg 37 ln 43- thank you | Accepted, Revised, sentence and references included. |
| 5071 | 11 | 33 | 39 | 33 | 39 | the section about "Mitigation activities in the AFOLU sector can reduce climate forcing in different ways" has appeared twice before and does not fit under land and water | Accepted, Deleted |
| 7197 | 11 | 33 | 39 | | | Mitigation activities. Missing: reducing fire frequency, reducing peat oxidation. Maybe it’s also good to think a bit further: choice of land for agricultural expansion (e.g. no-go-areas. Avoiding high carbon, high biodiversity land). | Partially Accepted, Agreed, but this part was deleted due to required shortening, so the proposed text cannot be added |
| 5069 | 11 | 33 | 4 | 33 | 28 | I again think this was covered before and would eliminate some and rearrange | Accepted, Revised |
| 5068 | 11 | 33 | 4 | 33 | 4 | adaptaion also comoets plus future demands need to be considered | Rejected, Do not understand the |
| 7192 | 11 | 33 | 4 | | | o Successful implementation. This section illustrates the constraints and difficulties, and it describes ‘what is needed’, however, its very abstract and at the end I still do not know what the ‘key’ is to successful implementation. You could think of describe more concrete ‘what is known already’, including references, and takes parts from section 11.10. E.g important points regarding successful implementation: | Accepted, Revised |
| 13328 | 11 | 33 | 43 | 33 | 46 | This bullet could be taken to suggest that fertilization could lead to a net sequestration of carbon (removal of N,P deficiencies). This is not a statement that has a high degree of certainty and may in fact be false considering the energy required to produce fertilizer as well as N2O emissions. | Accepted, Revised (this part was deleted due to shortening) |
| 2133 | 11 | 33 | 44 | 33 | 44 | write "…to reduced till cropping" as it is not yet clear that no-till cropping, measured over the whole soil horizon does increase soil carbon (e.g. Ogle, S.M., A. Swan, and K. Paustian. 2012. No-till management impacts on crop productivity,carbon input and soil carbon sequestration. Agriculture, Ecosystems and Environment 149: 37-49 | Accepted, Revised (this part was deleted due to shortening) |
| 5583 | 11 | 33 | 46 | 33 | 46 | Reducing deforestation is tied mainly to population increase and the increased demand for food and energy (increase in wealth), not from the use of forest product. | Accepted, Revised (this part was deleted due to shortening) |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |

| 5074 | 11 | 35 | 1 | 35 | 38 | lots of redundancy to above and another opportunity to shorten | Accepted, Revised |
| 2628 | 11 | 35 | 1 |  | 5 | The diet discussions have been interesting to read even though it doesn't show up again when much of the information is summarized. My only point on this is that it is an individual decision and behavioral change which will be more difficult to achieve so the benefits are less achievable. Other practices are government and organization controlled so there is an institutional change in behavior that is possible, i.e., more likely a broad impact and behavioral change. Is it worth including some discussion on this point? | Accepted, Yes - added for the SOD |
| 2135 | 11 | 35 | 14 | 35 | 14 | may also add the following reference that directly addressess this trade-off: Muller, A. (2009). Sustainable Agriculture and the Production of Biomass for Energy Use, Climatic Change 94(3-4): 319-331 | Accepted, Reference added |
| 16578 | 11 | 35 | 15 | 35 | 22 | This paragraph assumes that land sparing will result from yield increases, but a later section (p. 69 lines 1-12) indicates, and cites evidence, to show that this assumption is questionable. The chapter needs to be consistent on this controversial question; the treatment on p. 69 is better since it takes into account at least some of the literature that questions land sparing (see also papers by Angelsen, Minang, Perfecto and Vandermeer). | Accepted, Revised |
| 15237 | 11 | 35 | 15 |  |  | "land sparing" might also have rebound effects at the farm level. As yields increase, economic benefit per piece of land increase, and there is higher pressure to expand farmlands. Ref: Matson, P. A. & Vitousek, P. M. 2006. Agricultural Intensification: Will Land Spared from Farming be Land Spared for Nature? Conservation Biology, 20: 709-710. | Accepted, Revised, reference added. |
| 15190 | 11 | 35 | 2 | 35 | 3 | repeats earlier sections | Accepted, Deleted here, integrated in demand-side section (11.4.3.) |
| 14437 | 11 | 35 | 20 | 35 | 22 | This is an important point, that observation suggests that yield improvements have not lead to land-sparing, rather to increase in consumption. As currently written this sentence does not integrate well into the other points made in this paragraph. | Accepted, Revised, reference added. |
| 11988 | 11 | 35 | 21 |  | 21 | "rebound effects" need to expand what these might be, e.g. increased deforestation for crop land. | Accepted, Revised, reference added. |
| 7080 | 11 | 35 | 23 | 35 | 32 | The benefits of higher forest productivity in increasing the potential for the land should also be mentioned. A good reference is Fox, T. E. (2004). The Evolution of Pine Plantation Silviculture in the Southern United States. In H. M. Rauscher, & K. e. Johnsen, Southern forest science: past, present, and future: Gen. Tech. Rep. SRS-75 (p. 394). U.S. Department of Agriculture, Forest Service, Southern Research Station. | Rejected, Not peer reviewed and pre-2007 |

|---|---|---|---|---|---|---|---|
| 3861 | 11 | 35 | 23 | 35 | 32 | The amount of land required for biofuel production can be very modest as shown in Pacca and Moreira, 2011. Thus, it may be useful to reconsider the view that large scale biofuels production is a serious competitor for land use - Pacca, S. and J. R. Moreira, 2011. A Biorefinery for Mobility? Environ Sci Technol. 2011 Nov 15;45(22):9498-505. | Accepted, Revised; mostly moved to bioenergy annex |
| 5589 | 11 | 35 | 33 | 35 | 35 | If much more use is made of existing NPP, then the competing uses of biomass may be greatly reduced, especially if marginal land and waste land is taken into more productive use. | Partially Accepted, Use of marginal land for bioenergy has now been moved to |
| 13532 | 11 | 35 | 34 | 35 | 34 | ...may also (or may not) | Accepted, Revised |
| 9454 | 11 | 35 | 36 | | 38 | True, but how? This chapter would benefit from discussion specific to AFOLU of how mitigation strategies can be implemented. | Partially Accepted, These issues are discussed in section 11.7 and 11.10 |
| 13533 | 11 | 35 | 38 | 35 | 38 | (OPRE, MEM-ADC, 2001; EEP, MST-MEM, 1994) | Rejected, Not clear what is meant by |
| 15191 | 11 | 35 | 40 | 25 | 48 | could cut whole paragraph (it's already been covered | Accepted, Whole paragraph has been |
| 3862 | 11 | 35 | 40 | 35 | 42 | This is a point where the conclusion from Pacca and Moreira, 2011 can be commented. - Pacca, S. and J. R. Moreira, 2011. A Biorefinery for Mobility? Environ Sci Technol. 2011 Nov 15;45(22):9498-505. | Accepted, Whole paragraph has been excluded. But paper is now cited in the |
| 5591 | 11 | 35 | 40 | 35 | 48 | . In my opinion, the upper limit for bioenergy crops of 9900 Mha is unrealistic. Much increased bioenergy could come from a much better use of existing NPP. | Rejected, Which would not then increase the area |
| 10610 | 11 | 35 | 40 | | | Update from 2004 | Accepted, Update to 2010: HH: I only found numbers for 2007. I hope others |
| 12415 | 11 | 35 | 41 | 35 | 43 | The sentence states "In 2050, energy crops might occupy 1.3-9.9 Mkm2(9-65 % of current cropland which amounts to 15.2million km2) if ambitious bioenenergy strategies are pursued." 9-65 % is a very wide interval. Could it be explained which different assumptions are covered by "ambitious bioenergy strategies"?. To move from the existing 1 % (2004) to 65 % of crop area to bioenergy in 2050 is quite more ambitious than to 9%. | Accepted, Whole paragraph has been excluded; issues are now discussed (in revised form) in the bioenergy annex |
| 10611 | 11 | 35 | 41 | | | IEA, 2006 not listed in refs | Accepted, Zotero updated for SOD |
| 5590 | 11 | 35 | 42 | 35 | 42 | 15.2 mio km2 should read 15.2 M km2 (1520 M ha.) | Accepted, Whole paragraph has been |
| 14732 | 11 | 35 | 43 | | | (Coelho et al., 2012), (H. Haberl et al., 2010)…should be changed to (Haberl et al., 2010; Coelho et al., 2012). | Accepted, Zotero updated for SOD |
| 16579 | 11 | 35 | 45 | 35 | 45 | Here, and in several other places, the phrase "avoided deforestation" is used as if it were comparable to afforestation, bioenergy or other new activities that reduce available land. It is not; deforestation is the land use change, and "avoided deforestation" is no change. Including it with these other activities effectively makes deforestation the default assumption; I doubt if the authors of the chapter wish to introduce such a bias in favor of one kind of land use change, but against others. (You certainly wouldn't refer to "avoided conversion of cattle pastures", for example!) | Accepted, Terminology has been improved. |
| 14733 | 11 | 35 | 46 | | | the same as above in chronological order, (Wackernagel et al., 1999; Murtaugh and Schlax, 2009 and Dietrich, et al., 2011). | Accepted, Zotero updated for SOD |
| 11168 | 11 | 35 | 6 | | | In this secton, it is enphasized that options in the AFOLU sector often cause competition or trade-off. However, it is mainly happen in the energy crops and not common in forestry sector. | Rejected, This is in the AFOLU sector |
| 5587 | 11 | 35 | 8 | 35 | 8 | Again I stress that the fist bullet should be: | Rejected, Not a comment |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 5588 | 11 | 35 | 8 | 35 | 8 | · Much more use of the existing NPP, especially from wood. | Noted, Increased use of wood is discussed in the demand-side section (11.4.3). The literature very clearly shows that increasing wood use does not always reduce GHG emissions (Werner et al., 2010, Environmental Science & Policy 13, 72–85). Increasing wood harvest in forests results in a C debt because trees are felled that would otherwise store C and would also continue to grow. Simple (e.g. various papers by Holtsmark and Cherubini) as well as complex models (e.g. Boettcher et al. 2012, GCB Bioenergy, vol 4(6), 773-783) show that this results in complex changes in flows and stocks of C in forests as well as socioeconomic |
| 8837 | 11 | 35 | | | | I would appreciate a more elaborated explanation on iLUC, on the mechanism, the available estimation methods (models) and their assumptions. How is the displacement factor estimated and which land use type is targeted in this displacement and in which geographical region. | Accepted, No space to give detailed explanation in ILUC and LUC treatment in the models. Methodology can be |
| 14438 | 11 | 35 | | 37 | | This section repeats land-pressure issues discussed earlier (11.3.2, 11.4.2) such as water scarcity and the impact of a changing diet. There may be opportunities for reducing text length by editing these sections. | Accepted, Revised. |
| 3863 | 11 | 36 | 10 | 36 | 11 | First generation energy crops can build up carbon stocks while delivering bioenergy, as is the case of sugar cane in Brazil (EPA, 2010). Combining with CCS, the result is negative emission (see Pacca and Moreira, 2009). EPA, 2010 - EPA (Environmental Protection Agency). Renewable Fuel Standard Program (RFS2), Regulatory Impact Analysis. Assessment and Standards Division, Office of Transportation and Air Quality. EPA-420-R-10-006, February (2010). Pacca, S. and J. R. Moreira, 2009. Historical carbon budget of the brazilian ethanol program, Energy Policy, 2009, vol. 37, issue 11, pages 4863-4873 | Accepted, Changed from 2nd generation to perennial crops (now includes sugarcane). |
| 2629 | 11 | 36 | 11 | | | Lands that used to be for food crops and no longer are used for this purpose are typically less productive. Therefore growing energy crops will need considerable amount of fossil inputs as fertilizers, pesticides, etc. | Rejected, The logic is flawed. Some crops grow well on less fertile land. |
| 10109 | 11 | 36 | 16 | 36 | 17 | The price calculations I assume do not take into account the potential to reduce demans throug less waste and less meat (esp beef) dicussed above in theis chapter. | Noted, Correct - they do not |
| 3864 | 11 | 36 | 18 | 36 | 20 | Why not quote EPA, 2010 presents a much smaller figure? Why not quote Chapter 2 - Biomass from Special Report on Renewables that concludes that iLUC effects evaluation are decreasing as most fresh literature calculates with improving resolution soil uses? EPA, 2010. EPA (Environmental Protection Agency). Renewable Fuel Standard Program (RFS2), Regulatory Impact Analysis. Assessment and Standards Division, Office of Transportation and Air Quality. EPA-420-R-10-006, February (2010). | Accepted, Strongly revised and moved to bioenergy annex |
| 5593 | 11 | 36 | 23 | 36 | 24 | What is meant by 100g CO2 eq/MJ? 100 g CO2 contains 27 g C, which has an energy value of about 1 MJ. Why would LUC emissions increase under such crops? In fact the opposite may occur. | Accepted, This paragraph has been excluded due to length restrictions |
| 2630 | 11 | 36 | 24 | | 30 | Not all bioenergy production needs to deforest. This only happens when converting forests to ag production, e.g., palm oil. | Accepted, Revised. |
| 7081 | 11 | 36 | 27 | 36 | 30 | It is more than just the avoidance of deforestation - it is also, as clearly noted in the Fourth Assessment Report, the need for sustainable forest management to maintain or increase carbon stocks while producing a continued output of product. (Forth Assessment Report, WGIII, Ch. 9, Executive summary) | Accepted, This paragraph has been excluded due to length restrictions |
| 5594 | 11 | 36 | 28 | 36 | 29 | As stated above, the avoidance of deforestation could occur through a more fully use of NPP, increasing agricultural productivity, changing diet and tempering population increase. | Accepted, This paragraph has been excluded due to length restrictions |
| 16580 | 11 | 36 | 31 | 36 | 31 | Another place where "avoided deforestation" is combined with land use changing activities, making deforestation the default. | Accepted, Terminology has been improved. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 5078 | 11 | 36 | 31 | 36 | 31 | the statement "However, restrictions of agricultural expansion resulting from avoided deforestation, expansion of 31 energy crop areas, afforestation and reforestation are expected to increase food and feed prices and 32 costs of agricultural production. Integrated assessments of land use based mitigation options 33 indicate that conserving natural" could be stronger. see the discussion in Abbott, Philip; Hurt, Christopher; and Tyner, Wallace E. What's Driving Food Prices? Farm Foundation Issue Report, July 2008. www.farmfoundation.org. there is a 2012 update | Noted, This paragraph has been excluded due to length restrictions |
| 5595 | 11 | 36 | 31 | 36 | 41 | This paragraph states that one outcome of LUC may be an increase in food prices. But this will most likely change food eating habits to more grain eating rather than meat consumption. This is what you have previously argued, so should it not be encouraged? | Rejected, This paragraph has been excluded due to length restrictions |
| 16581 | 11 | 36 | 34 | 36 | 36 | The Wise et al. paper on which these comparisons are based assumes a world-wide carbon tax on fossil fuels. This unlikely assumption is critical to its prediction of increased food prices. Thus I suggest you drop this first sentence. | Accepted, This paragraph has been excluded due to length restrictions |
| 15192 | 11 | 36 | 4 | 36 | 30 | repetitive of bioenergy ection | Accepted, This paragraph has been excluded due to length restrictions |
| 5592 | 11 | 36 | 4 | 36 | 30 | This whole paragraph assumes that the will be no increased use of NPP and that energy crops will be grown on converted forests and woodlands. This is highly unlikely. Even when natural forests are converted to eucalyptus plantations, the annual growth of eucalyptus is at least 50% more and with the use of the wood for charcoal production, which is then used for steel manufacture in place of fossil fuels gives a positive GHG balance after about 15 years and thereafter. | Accepted, This paragraph has been excluded due to length restrictions |
| 13534 | 11 | 36 | 41 | 36 | 41+ | Indeed, it's more relevant and useful develop trade agreements and finance controls that could reduce or avoid the artificial rise of food prices, which have doubled and tripled, well before the end of the century. | Accepted, Revised by including text on trade as an adaptation option.. |
| 16582 | 11 | 36 | 42 | 36 | 45 | This sentence understates the point. Forest conservation will tend to incentivize increase yields, by reducing the supply of cheap land for agricultural expansion. Limiting expansion on the extensive frontier will lead to more expansion on the intensive frontier. Thus forest conservation is not simply something that can be compensated by increased yields, but also will tend to stimulate them. | Accepted, This paragraph has been excluded due to length restrictions |
| 5079 | 11 | 36 | 42 | 36 | 42 | the study by Mosnier, A., P. Havlk, H. Valin, J.S. Baker, B.C. Murray, S.J. Feng, M. Obersteiner, B.A. McCarl, S.K. Rose, and U.A. Schneider, "Alternative U.S. Biofuel Mandates and Global GHG emissions: The Role of Land Use Change, Crop Management and Yield Growth", Energy Economics, second review, 2012. looks at global issues with bioenergy and yield growth | Noted, This paragraph has been excluded. Publication could also not be found. |
| 2631 | 11 | 36 | 47 | | 49 | The list includes most of the factors that one would assume is soil degradation. Remove soil degradation from the list but introduce it. | Rejected, Unclear comment of the reviewer. |
| 10110 | 11 | 36 | 48 | 36 | 48 | This argumentation forgets that it means also increased income for farmers, we are taking about agricultural investments not costs, the investments can have high/or acceptable returns, often there is a time lag before the increased productivity will be realised, but since we are at the same time talking about economic development and poverty reduction, the investments are bot economically, socially and environmentally justified. Further it is assumed that it is not possible to increase productivety or intensify without negative environmental impacts, we have a lot of evidence of farming practices and especially systems where productivity (per land area) can be increased sustainably. the issue is very much about research politics and what kind of technical solutions are promoted. | Noted, This paragraph has been excluded due to length restrictions |
| 11816 | 11 | 36 | 5 | | | LUC is here introduced the first time as an abbreviation but has been used already earlier in the document. | Accepted, Revised |
| 5379 | 11 | 36 | 11 | 36 | 16 | Suggest adding a citation to Rooney et al (2012) as this speaks directly to the point being made in this passage Rooney, R.C., S.E. Bayley, and D.W. Schindler, Oil sands mining and reclamation cause massive loss of peatland and stored carbon. |---|---|---|---|---|---|---|---|
| 2136 | 11 | 37 | 6 | 37 | 6 | Add the waste-aspect as a third point to land use and yields, e.g. by adding the following "Hereby, the 30-40% of global food wastage (*add a cross reference*) should not be neglected, as reducing this wastage would also lower pressure to increase yields and further intensify production in the context of fewer land availability for crop production." | Partially Accepted, This paragraph had to be excluded due to length restrictions. |
| 15193 | 11 | 37 | 7 | 37 | 26 | THIS is the land/water tension | Accepted, Revised; most material was moved to the Bioenergy Annex |
| 3867 | 11 | 37 | 7 | 37 | 14 | It is worthwhile noting that sugar cane in Brazil usually doesn't require artificial irrigation. How much land will be used in order to achieve 70% increase in water price in Latin America? | Partially Accepted, This paragraph had to be excluded due to length restrictions (parts of the material are now in the |
| 3866 | 11 | 37 | 7 | 37 | 8 | Why not comment AR4, Chapter 2 - Bioenergy main conclusion here. Bioenergy production can be performed in the right and in the wrong way. When using the right way there are significant benefits. | Partially Accepted, This paragraph had to be excluded due to length restrictions (parts of the material are now in the |
| 14677 | 11 | 37 | 21 | 37 | 22 | C4 plants generally have a higher water use efficiency than C3 plants. If a C4 plant replaces C3 plants transpiration may go down. | Partially Accepted, This paragraph had to be excluded due to length restrictions (parts of the material are now in the |
| 5380 | 11 | 37 | 27 | 37 | 34 | What is said here is certainly true. However this seems a little too black and white. If we do not reduce GHG emissions that will certainly have a negative impact on biodiversity. Biodiversity and GHG mitigation will have to be balanced. The text here reads as if it is obvious that protection of biodiversity is the more worthy goal. The point that climate change is bad for biodiversity is made a few pages down in Chapter 11. Perhaps a pointer could be provided here to this later text so the reader understands the authors of chapter 11 see this as a nuanced balancing of goals. | Accepted, Revised; mostly moved to bioenergy annex |
| 11209 | 11 | 38 | | | | Table 11.6: The section on "Institutional arrangements" should make mention of free, prior and informed consent (FPIC) and could make specific reference to legal recognition of communal tenure regimes of indigenous peoples. | Partially Accepted, The content of this table has been moved. Consideration to FCIP as one option has been included. Land tenure and use rights for |
| 15972 | 11 | 38 | | | | good figure, readability should be improved and discussed. | Accepted, Design improved |
| 5827 | 11 | 38 | | | | Where do you subsume e. g. trade relations and the question of production for subsistence economy or cash crops? | Accepted, Trade and subsistence economy (also informal sector) included |
| 5829 | 11 | 38 | | | | Conditions can also be prohibitive, not only enabling. The figure could also be deleted because it offers no additional information then contained in the text. | Rejected, There are other comments highlighting the usefulness of the graphic. The term "enabling conditions" is well known as such. Of course in absence of such conditions the planning, |
| 11169 | 11 | 38 | | | | The intention of this figure is not clear. This figure must be improved. | Partially Accepted, We got positive and negative comments about this graph. |
| 5597 | 11 | 38 | 12 | 38 | 13 | I entirely agree with Herold (2009) | Noted, |
| 5828 | 11 | 38 | 12 | 38 | 13 | This example is not clear. Besides, deforestation monitoring does not require national or even local capacities: it can be done by remote sensing. | Rejected, Detailed monitoring can not be done only with remote sensing, as the quality and readability of the imagines is not always as high as required. This is especially the case in tropical countries. Additionally, local capacities are also needed for using remote sensing in developing countries. Herold et al 2009 |

|---|---|---|---|---|---|---|---|
| 5598 | 11 | 38 | 15 | 38 | 15 | "--- for example promoting agroforestry plantations". I would use the word systems rather than plantations. In Asia they have the taungya system to grow teak with farmers growing crops for 2 to 3 years, while weeding under the trees and in East Africa they have the shamba system with a similar outcome, but most agro-forestry systems are based on short-rotation trees scattered in the fields or in lines, mainly to improve the soil fertility or to enhance soil fertility while providing brows. Some 'trees' may be on a 1-year rotation, but generally 3-5 years. The trees are not replanted as they coppice. | Accepted, Term improved in the SOD |
| 10168 | 11 | 38 | 15 | 38 | 16 | I lack a specific explanation on how agroforestry improves food security | Accepted, Many agroforestry systems mix wood species with crops and/or with trees producing food. These systems sequester C from the atmosphere and also produce food. A good example are the agroforestry gardens used by farmers in Africa, Asia and Latin America. References are cited in the text. Further references can be found under the publications of ICRAF, including its annual report 2007 - 2008 or Pye-Smith C. 2008. Farming Trees |
| 14439 | 11 | 38 | 17 | 38 | 20 | Text can more strongly state that development must consider the benefits of mitigation strategies with respect to food security. Focusing on mitigation at the expense of creating viable cropping systems which promote local access to nutritious food should not be a possible outcome. We should not endanger nutrition in developing countries to offset the high energy use of developed countries. | Accepted, We agree with the comment. It has been noted repeatedly in the chapter. |
| 11302 | 11 | 38 | 21 | | | This figure may not be necessary. The graphic effects obscure the message which the text alone may explain better anyhow. | Partially Accepted, We got positive and negative comments about this graph. |
| 5083 | 11 | 38 | 3 | 38 | 3 | the statement "as well as in chapter 4 of the AR5" is odd. Ar5 is not out yet what are you referring to? | Rejected, It is a cross reference within |
| 7616 | 11 | 38 | 5 | 38 | 5 | "sustanable future" is incomprehensible term for citizen. This trem would be improved. | Partially Accepted, Sentence improved |
| 15616 | 11 | 38 | 8 | 38 | 10 | The social and human framework in Table 11.6 should include animal welfare. See, e.g. studies including animal welfare in sustainability analyses: Stern S., U. Sonesson, S. Gunnarsson, I. Öborn, K.-I. Kumm, and T. Nybrant (2005). Sustainable development of food production: a case study on scenarios for pig production. Ambio 34(4), 402-407. Mollenhorst H., P.B.M. Berentsen, and I.J.M. De Boer (2006). On-farm quantification of sustainability indicators: an application to egg production systems. British Poultry Science 47(4), 405-417. Additionally, people around the world care about the welfare of animals raised for food. World Society for the Protection of Animals (2007). WSPA International Farm Animal Survey (China & Brazil), Dec. 14; Zogby International (2003). Nationwide views on the treatment of farm animals. Poll for the Animal Welfare Trust; Lusk J.L., F. B. Norwood, and R.W. Prickett (2007). Consumer preferences for farm animal welfare: results of a nationwide telephone survey. Available at http://asp.okstate.edu/baileynorwood/AW2/InitialReporttoAFB.pdf; and Penn, Schoen & Berland Associates (2005). Poll for the Humane Society of the United States, Washington, DC. (Illustrating consumer concern for farm animal welfare in the United States of America.) | Noted, Thanks for the references. Animal welfare can be included in social issues. Why? Because the definition of animal welfare is based on cultural values |
| 10251 | 11 | 38 | 1 | 41 | 49 | This section can be improved with recent papesr that showed/illustrated possibilities of synergy between development and mitigation in AFOLU (e.g. Branca et al. 2013. (available on line) Capturing synergies between rural development and agricultural mitigation in Brazil. Land Use Policy, 30,1 507-518. Also International agencies involved in development activities in the AFOLU sector (FAO, World Bank, GEF, IFAD,...) started to incorporate the "mitigation" (and also "adaptation") aspect, by developing indicators or tools to maximise synergies (see for instance the UNEP Year Book, 2012; The GEF Carbon Benefits project; the Ex-ante carbon balance Tool developed by FAO: http://www.fao.org/tc/exact). | Accepted, Thanks for the references. Were considered when drafting the SOD |

|---|---|---|---|---|---|---|---|
| 7617 | 11 | 39 | | | | Replace "Sustainable manegement of plantations" with "Sustainable manegement of planted forest" as "Plantation" meams short rotation forestry. | Accepted, Term changed |
| 5599 | 11 | 39 | | | | P39 Table 11.7 Natural assets - Forestry. The statement GHG emissions from forests for rural energy (firewood) are highly relevant in developing countries is wrong. Firewood and wood for charcoal accounts for an estimated 2036 MT dry wood out of a total wood consumption of 2422 Mt dry wood. The annual growth of accessible wood is an estimated 10328 Mt dry wood, (K, Openshaw 2011 –ref above). When burnt, the wood gives off CO2 and some products of incomplete combustion, but if not burnt it will rot giving of CO2 etc. or be eaten by termites etc, which also give off CO2 and CH4 etc. – the carbon cycle. You use it or you lose it! | Partially Accepted, GHG emissions from forest for rural energy are relevant not only because of the carbon balance but because of its importance for the livelihood. Mitigation activities related to firewood will therefore have an impact not only on GHG balance but also on the whole livelihood |
| 5600 | 11 | 39 | | | | Natural assets – Bioenergy. Under natural assets, the stated points are mainly negative. First and foremost the use of NPP should be emphasized. While monoculture has its negative aspects, the most successful natural forests are mainly monoculture –northern temperate forests. The statement about potential increases in GHG emissions should be qualified. Again under livestock, silvopatoral activities have a positive impact when replacing degraded grasslands | Accepted, The whole table has been moved to 11.7 and redrafted |
| 13970 | 11 | 39 | | | | under livestock and manure, a differentiated treatment of manure issues in different management systems is required. The GHG contributions of intensive feedlot manure lagoons are different than the contributions of manure from dispersed pastoralism. | Accepted, The whole table has been moved to 11.7 and redrafted |
| 13971 | 11 | 39 | | | | under cropland management, the claim that increasing productivity has an impact on areas required for food security cannot be made uncritically. Food security is complex, and the effects of increased productivity on who eats is not straightforward, let alone, as mentioned earlier, the impacts that may or may not have on other land uses. | Accepted, The whole table has been moved to 11.7 and redrafted. We agree with the reviewer on the challenges for attributing co-benefits and risks, |
| 13972 | 11 | 39 | | | | under cropland managements, add the word negative in the sentence on large scale monocultures | Accepted, The whole table has been moved to 11.7 and redrafted |
| 13973 | 11 | 39 | | | | under livestock and manure, add the word positive in the sentence on silvopastoral activities | Accepted, The whole table has been moved to 11.7 and redrafted |
| 14440 | 11 | 39 | | 40 | | Tabulating concepts is a very helpful format for concisely presenting the complex interactions discussed. The table should be reviewed for formatting and can be made more concise to improve readability. | Accepted, The whole table has been moved to 11.7 and redrafted |
| 12416 | 11 | 39 | 1 | | | Comment on column on forestry and/or bioenergy, and the row on natural assets: Cutting of boreal forest (and other slow growing forests) may give higher short term emissions of GHG compared to not cutting. The time lag lasts for several decades before the released amount of CO2 is on the same level as if the forest continued growing. Repeated cutting magnifies this time lag. This aspect is important for policy makers to be aware of. | Rejected, Time frame in the context of AFOLU mitigation options is discussed in p. 41 line 25 ff |
| 9455 | 11 | 39 | 1 | | 1 | This table is valuable, but seems mischaracterized. It should be labeled "Factors Affecting Mitigation Activities and Mitigation Outcomes." | Accepted, The whole table has been moved to 11.7 and redrafted |
| 11303 | 11 | 39 | 1 | | | There is too much text in this table for it to be useful as a graphic. It would be much easier to read as listed bullets. | Accepted, The whole table has been moved to 11.7 and redrafted |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 15617 | 11 | 39 | 1 | 40 | 2 | Table 11.7 should build on the AR4 WGIII Chapter 8, Table 8.8, which at least included qualitative analysis of the effects (+, -, or ?), and explanation in the notes. Table 11.7 here should be made more clear for whether impacts are positive, negative, or unknown. Additionally, the section on "Livestock and manure" (for the "Social and human Framework" and "Natural Assets") should include animal welfare to the extent that AFOLU mitigation options may include intensification that leads to more intensive confinement or other welfare-depriving practices. The breadth of scientific evidence demonstrating that intensively confined animals are frustrated, distressed, and suffering under modern production schemes is extensive, conclusively substantiating that battery cages for egg-laying hens and crates for pregnant sows and calves are simply not appropriate environments. Duncan I.J.H. (1970). Frustration in the fowl. In: Freeman B.M. and Gordon R.F. (eds.), Aspects of Poultry Behaviour (Edinburgh, Scotland: British Poultry Science Ltd., pp. 15-31). Špinka M. (2006). How important is natural behaviour in animal farming systems. Applied Animal Behaviour Science 100(1-2),117-28. Baxter M. (1994). The welfare problems of laying hens in battery cages. The Veterinary Record 134(24), 614-9. Dawkins M.S. (1990). From an animal's point of view: motivation, fitness, and animal welfare. Behavioral and Brain Sciences 13, 1-61. Vestergaard K. (1984). An evaluation of ethological criteria and methods in the assessment of well-being in sows. Annales de Recherches Vétérinaires (Annals of Veterinary Research) 15(2), 227-36. Broom D.M., Mendl M.T., and Zanella A.J. (1995). A comparison of the welfare of sows in different housing conditions. Animal Science 61, 369-85. European Commission, Scientific Veterinary Committee, Animal Welfare Section. 1995. Report on the welfare of calves. Adopted November 9. Available at: http://ec.europa.eu/food/fs/sc/oldcomm4/out35_en.pdf. Additionally, the Table 11.7 section on "Economic Factors" under "Livestock and manure" could include negative impacts on small-holders, to the extent that AFOLU mitigation options indicate industrial farm animal production (IFAP) practices. Mirle C. (2012). The industrialization of animal agriculture: implications for small farmers, rural communities, the environment, and animals in the developing world. The 10th European International Farming Systems Association Symposium in Aarhus, Denmark, July 1-4. Workshop 1.3: Understanding agricultural structural changes and their impacts, to support inclusive policy dialogue and formulation. Available at: http://www.ifsa2012.dk/downloads/WS1_3/ChetanaMirle.pdf. | Accepted, We checked the references. Many of them are either too old for this assessment report (which focuses in new scientific outputs after the AR4) or non-scientific literature. We then looked for recent references that consider the issues highlighted by the reviewer. |
| 7337 | 11 | 39 | | | | under box Natural Assets/Forestry: 'Vulnerability of forest ecosystem to climate change needs to be better understood." Of course it needs to be better understood (doesn't everything in this report?), but we do know quite a bit about this, and as expected, there is a wide variation on vulnerability, depending on species and location. My group has been working on this topic for 17 years, so I include a couple of citations. I would rather see you put something like "Certain forest ecosystems are highly vulnerable to climate change, others not so much". Citations: 1) Iverson L., Matthews S., Prasad A., Peters M. and Yohe G. 2012. Development of risk matrices for evaluating climatic change responses of forested habitats. Climatic Change 114: 231-243. 2) Iverson L.R., Prasad A.M., Matthews S.N. and Peters M. 2008. Estimating potential habitat for 134 eastern US tree species under six climate scenarios. Forest Ecology and Management 254: 390-406. 3) Swanston C., Janowiak M., Iverson L., Parker L., Mladenoff D., Brandt L., Butler P., St. Pierre M., Prasad A.M., Matthews S., Peters M. and Higgins D. 2011. Ecosystem vulnerability assessment and synthesis: a report from the Climate Change Response Framework Project in northern Wisconsin. U.S. Department of Agriculture, Forest Service, Northern Research Station, Newtown Square, PA. p. 142. | Accepted, The whole table has been moved to 11.7 and redrafted. Further, the discussion on vulnerability and adaptation is located in section 11.5. References checked. Some were too local, we were looking for meta-analysis for validating results |
| 15974 | 11 | 4 | 1 | 5 | 26 | The executive summary can be improved to better summarize the remainder of the chapter | Accepted, Revised for SOD |
| 14551 | 11 | 4 | 1 | 5 | 26 | Exec summary general comment: obviously it is hard to write this until all the numbers are in. I would like to see sub headings for difference AFOLU sectiors (e.g. REDD, Aff/ref, agric, livestock,bioenergy. Numbers in each sector. | Accepted, Revised for SOD |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 2591 | 11 | 4 | 1 | 5 | 26 | The text focuses a lot on the multi-functionality and underestimate the role of the creation of intergrated agricultural activities, which gives priority to food and fibre production. But, at the same time, it does exploit the opportunities to produce bioenergy. There a lot to do in terms of R&D to find adequate solutions in terms of finding species and varieties that adapt to arid zone. | Rejected, Statement - not a comment |
| 9183 | 11 | 4 | 1 | 5 | 26 | You can cut emissions drastically by shrinking agriculture and changing food consumption pattern from meat to vegitable - isn't it an issue in this chapter? | Noted, Sure - all of 11.4 deals with this |
| 14410 | 11 | 4 | 10 | | | Inconsistent. 1.1-1.3 GtC per year is far less than 1/3 of emissions. (Total emissions of CO2 in 2007 were 8 GtC.) Please clarify whether the absolute figure or the 1/3 share is correct. | Accepted, Checked numbers and revised for SOD |
| 14554 | 11 | 4 | 10 | | | this is not the range of ucnertainty, see comments on that section later | Accepted, Gave uncertainty range where |
| 14420 | 11 | 4 | 10 | | | What does 11.2 refer to? A section? Table? | Accepted, Revised for SOD |
| 16523 | 11 | 4 | 11 | 4 | 13 | The recent reductions in estimates of emissions from deforestation, as well as increases in fossil fuel emissions, make the "about one-third" estimate out of date. And in fact it is misleading to use the words "is responsible for" to describe calculations based on estimates for the 1980s and 1990s. For a report coming out in 2013, those decades clearly should be described with "was", not "is". I urge you to calculate the proportion based on the most recent estimates, for the decades of the 2000s, and for all GHGs (not just CO2) in both numerator and denominator, so as to give a reasonable estimate of the role of AFOLU in the overall climate change problem. | Accepted, Updated for 2010 |
| 12359 | 11 | 4 | 11 | 4 | 12 | Please consider to include "fire" in this sentence, since it is one of the main contributors from AFOLU according to Figure 11.1 a) | Accepted, Revised for SOD |
| 6820 | 11 | 4 | 11 | | | It would be helpful to recognise that in terms of the atmosphere forestry is a sink or reservoir and agriculture is a source, with the conversion of forest to agriculture (accounted as) a source. Deforestation causes a rapid carbon stock loss, but the emission (UNFCCC source) may occur at another time/place due to processes such as combustion (eg bioenergy) and decay (eg landfill of wood products).<br>The key point to make is what is the optimal outcome for land use in relation to GHG, before other factors are taken into account. for example this would include high on-site stocks of carbon, regenerative site management (mantaining/enhancing soil carbon, fertility etc), low external inputs (fertilisers, pesticides etc), low fossil fuel energy inputs, and sustainable harvest levels. the quantified GHG impacts are highly dependent on the accounting system adopted ie boundaries (as shown for forestry in AR4) and baselines. | Accepted, Revised for SOD |
| 12866 | 11 | 4 | 11 | 4 | 11 | Change this to read "for one-fourth of anthorpogenic greenhouse pas emissions" because WGIII, Chapter 5, page 4 says 23%. | Partially Accepted, Updated for 2010 |
| 11290 | 11 | 4 | 11 | 4 | 13 | An important point -- and excellent justification for the integrated nature of this chapter -- which is clearly explained in Muller 2010 (Muller, Adrian, Julia Jawtusch and Andreas Gattinger 2011: 'Mitigating Greenhouse Gases in Agriculture'. Stuttgart: Diakonisches Werk der EKD. Original source Bellarby, J et al 2008: 'Cool Farming: Climate impacts of agriculture and mitigation potential'. Amsterdam: Greenpeace International.). The authors may wish to reference these articles in this chapter. | Accepted, Added reference to Bellarby et al. and Mueller et al. |
| 5026 | 11 | 4 | 12 | 4 | 12 | is rice "soil and nutrient" I might stick in the word rice | Accepted, Revised for SOD |
| 16524 | 11 | 4 | 13 | 4 | 13 | The phrase "biomass burning….also" implies that emissions from fires are separable from, and additional to, emissions from deforestation and forest degradation. If the authors have in fact separated out a biomass burning component of emissions it should be explained further on in the chapter; if not, this phrase should be deleted. | Accepted, Revised by Jo House |
| 14555 | 11 | 4 | 13 | 4 | 14 | biomass burning often little net emission as carbon taken up during growth (apart from land clearing fires and peatland fires).land clearing firest in forets already covered by deforestation. Need to be careful about different types of fire in the main text, see comments there. But if you are going to have smaller additional contributions then there are others. E.g could add in land use change other than deforestation here such as expansion of agricultural land into grasslands and peatlands... | Accepted, Revised by Jo House |
| 10578 | 11 | 4 | 13 | | | Add …agricultural "residue" burning | Accepted, Revised for SOD |

|---|---|---|---|---|---|---|---|
| 13950 | 11 | 4 | 13 | | | While I recognize that production of fertilizers is accounted for in another IPCC category, the emissions from production are inextricably linked to their use in agriculture and should be mentioned/referenced here. | Accepted, Revised for SOD |
| 14421 | 11 | 4 | 15 | | | What does 11.3 refer to? A section? Table? | Accepted, Revised for SOD |
| 14556 | 11 | 4 | 16 | 4 | 19 | I find the separation by demand and supply side measures a bit odd and prefer just to see sectorial. E.g. some of reducing losses of waste in food seems to be production rather than demand. It is not clear where bioenergy and Aff/ref fit as they are produced in response to a demand for mitigation. REDD is reducing demand and relocationg production. i would prefer just to see by option without this separation. howevr ican see a lot of work has gone into this thinking so also happy to live with it as long as it is better explained , eg, mention here that REDD aff/def and nioenergy are considered as production side options. | Partially Accepted, Terminonology changed (supply side and demand side) but discussed together |
| 7531 | 11 | 4 | 16 | 4 | 17 | Dividing mitigation options into production-side and demand-side is not good idea. Even AR4 deals with both side options in Chapter 9. All options are linked tightly each other. All options should be summerized in a table. Categorization by sectors and common options (i.e. Agricilture, Forestry, other land uses , land use change and bioenergy) is enough. | Rejected, See other comments giving the opposite view. In AR4 the agriculture chapter did not consider demand side options at all, so this is a |
| 9438 | 11 | 4 | 17 | | 17 | Normalizng across land units presumes that land units are fungible. They are not fungible economically or biophysically. Land area is poor normalization technique for AFOLU interventions. | Rejected, I don't think it assumes fungibility |
| 5534 | 11 | 4 | 18 | 4 | 18 | As stated above, wood consumption could be increased considerably without affecting the growing stock of wood. | Rejected, Do not know of evidence to support the reviewers statement |
| 13951 | 11 | 4 | 18 | | | changes in diet, including with regard to consumption of animal products -- should be specifically mentioned here. | Accepted, Revised for SOD |
| 6821 | 11 | 4 | 19 | | | Displacement of fossil fuels with bioenergy is important under the current accounting system, but this does not reflect the atmospheric impact. Burning carbohydrate emits more C per unit of energy than burning hydrocarbon. | Rejected, Bioenergy can substitute for fossil fuel, thereby reducing emissions in the energy sector |
| 7532 | 11 | 4 | 19 | 4 | 19 | Replace "displacement " with "substitution" which is used in AR4. | Accepted, Reworded throughout |
| 7533 | 11 | 4 | 19 | 4 | 19 | Not only bioenergy. " ... the substitution of fossil fuels through bioenergy and use of wood products .." is better. | Accepted, Revised for SOD |
| 7052 | 11 | 4 | 19 | 4 | 19 | The mitigation benefits of forest-based products go far beyond "bioenergy" and include the indirect displacement of fossil fuels via production and use of biomass based products that can substitute for more GHG-instnsive products", especially when done in a "cascading" framework, as described in Dornburg, V. and A. Faaij, "COst and CO2-emissions reduction of biomass cascading: methodological aspects and case study of SRF poplar", in Climatic Change (2005) ,71: 373–408. | Accepted, Revised for SOD |
| 5390 | 11 | 4 | 2 | 5 | 26 | The Executive Summary need to be shorten to one page or less | Rejected, This is not the guidance we |
| 6819 | 11 | 4 | 2 | | 8 | The unique feature of AFOLU related to GHG is its ability to perform as a sink, source or reservoir. Furthermore it has perhaps the greatest potential for both mitigation and adaptation impacts. | Accepted, Revised for SOD |
| 2260 | 11 | 4 | 2 | 93 | 26 | This entire Chapetr fails to understand that the entire agricultural and forestry industry has as its prime objective the removal of carbon dioxide from the atmosphere. Any increase in either agriculture or forestry should therefore have the benefit of mitigation credits. At present, only forestry is considered to qualify for such benefits. This is completely unfair to the agricultural industry which finds itself penalised for its relatively minor emissions of methane, whch have no effect on the climate, since the atmospheric concentrations are not rising, but gets no credit for its much greater contribution to sequestering carbon dioxide. | Rejected, The statement is untrue. Many activities in the AFOLU sector emit more GHG to the atmosphere than is gained in C sinks. The statement about CH4 having no climate impact is also incorrect. An ill informed comment. |
| 7530 | 11 | 4 | 2 | 4 | 3 | The first sentence "since it has a central role in providing food security, water and livelihoods, and supporting sustainable development" is not appropriate as the first message for AFORU. It is good only for Agriculture. AFOLU is unique because it contributes mitigation by both emission reduction and removal from the sight of climate change mitigations. And it should be stressed that land use change / deforestation is one of key issues at the beginning. | Accepted, Revised for SOD |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 11111 | 11 | 4 | 2 | | | "Agriculture" has several definitions. Of all definitions, one is related to the LULUCF context where agriculture is limited to animals, and specific aspects of land use, whereas LULUCF includes the rest. In this respect, I suggest that the definition of AFOLU is repeated here (or there is a link to the IPCC 2006 Guidelines). This is important to link all emission and removal data to the correct definition of agriculture. See e.g. Figure 1.3 (Chapter 1) where "Animal husbandry" and "Agriculture" are treated separately - what is then "Agriculture"? | Accepted, Figure 1 in Chapter 1 needs to be revised. Agriculture includes animal husbandry, if the latter means raising livestock for food |
| 2608 | 11 | 4 | 2 | 5 | 26 | The Executive summary does not reflect the key points made in the chapter. The distinction between forest and agriculture land use, especially as related to bioenergy, needs to be clarified. The inclusion of fertilizers is not applied to forests except on industrial lands and that is a small percent of our forests. | Partially Accepted, Revised for SOD |
| 5027 | 11 | 4 | 20 | 4 | 20 | you say "changes in diet can have a significant impact" but getting that implemented may be very hard and I would qualify that some | Accepted, Qualified the statement to recognize it is hard |
| 14557 | 11 | 4 | 21 | 4 | 22 | sentence doesn't tell us much unless more information given. Also this is just true for the different options regardless of semand or suplly side. "May" is a weak term, trade offs are inevitable, synergies exist and will be ciritcal to exploit | Accepted, Revised for SOD |
| 13952 | 11 | 4 | 23 | | | "the nature of the sector" is too vague to be useful in an executive summary | Accepted, Revised for SOD |
| 5704 | 11 | 4 | 25 | | | Replace 'sounding' with word "surrounding". | Accepted, Revised for SOD |
| 15142 | 11 | 4 | 26 | 4 | 26 | replace "between" with 'among" | Accepted, Revised for SOD |
| 5028 | 11 | 4 | 26 | 4 | 26 | limited available resources are also an item forcing tradeoffs (investment capital, land, wate, human capitalr) | Accepted, Revised for SOD |
| 14558 | 11 | 4 | 28 | 4 | 30 | does this sentence need a confidence qualification. | Accepted, Yes |
| 14266 | 11 | 4 | 3 | 4 | 4 | Reption of Reference "Godfray et. al 2010" may be corrected | Accepted, Deleted |
| 15141 | 11 | 4 | 3 | 4 | 4 | duplicated reference | Accepted, Deleted |
| 14552 | 11 | 4 | 3 | 4 | 4 | I don't think you make the right case for it being a unique case, after all energy has a central role in providing energy security. It is rather that use of land for cliamte mitigation comeptes with other uses or priorities of land such as food production and natural capital | Accepted, Reworded |
| 5024 | 11 | 4 | 3 | 4 | 3 | agriculture is also taking on an increasing role in energy | Accepted, Revised for SOD |
| 5025 | 11 | 4 | 3 | 4 | 3 | you might isert fiber or building materials or forest products to encompass forest | Accepted, Revised for SOD |
| 5023 | 11 | 4 | 3 | 4 | 4 | agriculture has a central role in providing … water? Really? Words must be missing | Accepted, Revised for SOD |
| 11974 | 11 | 4 | 30 | | 31 | "Sustainable management of agriculture, forests...". Excellent statement. Completely agree. | Noted, Thank you |
| 11801 | 11 | 4 | 30 | 4 | 31 | This sentence as formulated here is so general and unspecific that it does not convey much information. | Accepted, Removed in edit |
| 13953 | 11 | 4 | 30 | 4 | 31 | I would add here the need for increased research and diffusion of research. | Rejected, Do scientists not always say |
| 7053 | 11 | 4 | 31 | 4 | 31 | To accurately reflect the literature and give adequate attention to the critical role of sustainable forest management, the following conclusion (originally in the fourth assessment report) should be repeated here. i.e. "In the long term, sustainable forest management strategy aimed at maintaining or increasing forest carbon stocks, while producing an annual yield of timber, fibre, or energy from the forest, will generate the largest sustained mitigation benefit". (Fourth Assessment Report, WGIII, Chapter 9, Executive Summary) This finding remains true in spite of the recent fondness for focusing on "carbon debt". The carbon debt research does not contradict the important finding in the Fourth Assessment Report. Instead, it highlights the fact that various systems where forest carbon stocks are reduced to produce biomass require differing times to reach the point where the long-term benefits of using the biomass are realized. The fact remains, however, that "In the long term, sustainable forest management strategy aimed at maintaining or increasing forest carbon stocks, while producing an annual yield of timber, fibre, or energy from the forest, will generate the largest sustained mitigation benefit". | Accepted, Has been reflected here - with similar wording |
| 9439 | 11 | 4 | 32 | | 32 | Will the terms top-down and bottom up be defined elsewhere in WG3? If not, I think that they should be defined here | Accepted, Replaced with more explicitly descriptive terms |
| 13954 | 11 | 4 | 35 | 4 | 36 | moreover an overriding concern for food security will require careful evaluation of mitigation options in context-specific manner | Accepted, Revised for SOD |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 5698 | 11 | 4 | 36 | 4 | 40 | Cost of mitigation per tCO2eq is mentioned for agriculture sector. However, for forestry mitigation potential, the same is not mentioned. It will be advisable to add this figure. | Accepted, Revised for SOD |
| 15955 | 11 | 4 | 37 | 4 | 37 | A range should be given for agriculture, with a lower limit, as is done for forestry | Accepted, Revised for SOD |
| 15143 | 11 | 4 | 37 | 4 | 39 | with falling carbon price, should take care in what kind of estimates and price are highlighted | Noted, Revisit what basis on which to quote economic potentials |
| 11058 | 11 | 4 | 37 | 4 | 39 | Should CO2 eq. also be used in the numerator of the unit as well as the denominator? | Rejected, No - the form of the carbon |
| 5535 | 11 | 4 | 38 | 4 | 39 | There is a surplus of annual growth of an estimated 9 Gt C or 34 Gt CO2 equivalent. This is not taken into account when considering forest mitigation options (1.3 to 4.2 GtCO2/yr). Thus, the potential for 'forest' mitigation is much larger. | Rejected, Please provide a reference for this. What does surplus annual growth mean? |
| 9324 | 11 | 4 | 4 | | | Please delete '(Godfray et al., 2010)'; it appears twice. | Accepted, Deleted |
| 8597 | 11 | 4 | 4 | 4 | 4 | There is only one work of Godfray et al. (2010) in the References section. Thus, it should be cited once in this line. | Accepted, Deleted |
| 11059 | 11 | 4 | 40 | 4 | 44 | Mitigation potential for the agricultural sector will vary at much smaller scales than considered in these sentences - see comment below regarding Section 11.8.3. | Rejected, Cannot see what the reviewer is referring to |
| 14559 | 11 | 4 | 41 | 4 | 42 | suggest delete as unecesary: "for instance, between….rdeveloping regions" | Accepted, Deleted |
| 5029 | 11 | 4 | 42 | 4 | 42 | sentence "In developing countries, agriculture is often central to the livelihoods of many social groups and a significant share of the GDP." is fairly irrelevant and could be dropped | Rejected, Retained, but qualified as suggested in comment on row 1109 |
| 14560 | 11 | 4 | 43 | 4 | 44 | true but link to rest of text e.g by saying at end "COMPARED TO DEVELOPED REGIONS" | Accepted, Revised for SOD |
| 14561 | 11 | 4 | 45 | | | "..is difficult TO ESTIAMTE..."" | Rejected, Removed as below comment |
| 11060 | 11 | 4 | 45 | 4 | 45 | Awkward wording, suggest edit "…difficult to estimate accurately.." | Accepted, Revised for SOD |
| 13955 | 11 | 4 | 48 | | | and the overriding food security priorities/demands at national and subnational levels | Accepted, Revised for SOD |
| 12361 | 11 | 4 | 49 | 4 | 49 | Please consider to add "soils" so the sentence states; "climate change impacts on carbon stocks in forests, soils and future land use…..". Significant C-stocks are found in peat lands and other soils and these are also vulnerable to climate change. | Accepted, Revised for SOD |
| 14562 | 11 | 4 | 49 | | | suggest: "…cliamte change impacts on LAND COVER, carbon stocks in PLANT BIOMASS AND SOILS, and future HUMAN land use.." because climate change could lead to e.g. forest dieback or expansion, as well as loss of soil carbon, etc in natural vegetation as well as deliberate activity changing land use in the future | Rejected, Adopted wording suggested in comment on row 1113 |
| 14553 | 11 | 4 | 7 | | | suggest add: as well as the OTHER COMPETING ecosystem services | Rejected, They do not all compete |
| 12360 | 11 | 4 | 9 | 4 | 10 | Please consider to rephrase, as this sentence is difficult to understand | Accepted, Revised for SOD |
| 9437 | 11 | 4 | 9 | | 9 | Why report global C and not GWP? | Accepted, I think you mean total GHG impact (not the same as GWP) - but we |
| 13304 | 11 | 4 | 9 | 10 | 4 | The link between the introductory sentence is not clear. This paragraph could be reorganised. Is the objective of the paragraphs is to clearly state that there is a great deal of uncertainty in AFOLU estimate methodology? If not it should be clearly stated. | Accepted, Revised for SOD |
| 7051 | 11 | 4 | 9 | 4 | 10 | Cited range does not include atmospheric removals of carbon attributible to forest growth and expansion as documented by Pan, Y., Birdsey, R., Fang, J., Houghton, R., Kauppi, P., Kurz, W., et al. (2011). A Large and Persistent Carbon Sink in the World's Forests. Science Vol. 333 , 988-993. While part of this removal of carbon from the atmosphere may be due to anthropogenic nitrogen fertilization and elevated termperature, Pan et. al. indicate that much of it is clearly attributable to expansion of forestland, regrowth of forest land, and forest management. It is simply wrong to ignore this important flux. | Accepted, Revised for SOD |

European Commission, Scientific Veterinary Committee, Animal Welfare Section. 1995. Report on the welfare of calves. Adopted November 9. Available at: http://ec.europa.eu/food/fs/sc/oldcomm4/out35_en.pdf. | Rejected, This is dealt with later - does not belong here in such detail |
| 14671 | 11 | 4 | 4 | 4 | 4 | Unless this is done elsewhere in the document it might be useful to indicate what exactly is meant by sustainable development. This is a word that has been appropriated by many over the last few decades and its meaning has been stretched in a wide range of directions. | Rejected, Hopefully done in another chapter - should not be defined here |
| 11210 | 11 | 40 | | | | Table 11.7: Again -- would be useful to include explicit language here on the need to take measures to recognise and secure the land rights of indigenous peoples in left hand column on 'forestry' | Accepted, explicit language to land rights of indigenous peoples can be |
| 11211 | 11 | 40 | | | | Table 11.7: On left column at 'state of infrastructure...'; there is indirect mention of prior agreement: why not insert FPIC here? | Rejected, Because it doesn't belong to infrastructure, but to institutional |
| 11212 | 11 | 40 | | | | Table 11.7: On left column at 'Institutional arrangements' - you could insert here the word 'and recognition' after 'clarification' | Accepted, The whole table has been moved to 11.7 and redrafted |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 3868 | 11 | 40 | | | | 1st. Row, 3rd. Column. Are you sure that bioenergy production in countries with insufficient political stability can reduce or prevent investment? Look the example of oil and NG investments in some very political unstable countries. | Rejected, 1st Row 3rd column in page 40 discusses availability of infrastructure in cropland management. |
| 5601 | 11 | 40 | | | | Under Forestry –economic factors. I would add --- or with better land management and fuller use of NPP. | Partially Accepted, The whole table has been moved to 11.7 and redrafted |
| 11817 | 11 | 40 | | | | The references should be linked to the content of the table, otherwise they are not so useful | Accepted, The whole table has been moved to 11.7 and redrafted |
| 5830 | 11 | 40 | | | | Notes: There is only one note, so "-s" and "a)" can be deleted. The last sentence is highly speculative and should be deleted. One could also assume that these options are supposedly little researched. | Partially Accepted, The whole table has been moved to 11.7 and redrafted |
| 13974 | 11 | 40 | | | | under the caption. Many developing countries have little to no mitigation burden to bear. Their per capita emissions are below 1 ton and many LDCs have a per capita emission below .1 ton. Equity and responsibility issues also have a very significant bearing on the adoption of agricultural mitigation strategies in countries where actually they might need to increase emissions from agriculture for food production and food security reasons. following on the comment earlier on about who bears the cost of migitation, vs. who is responsible for emissions and thereby derives most of the benefits, excessive costs for assuming someone else's mitigaiton burden might actually go a long way to explaining why there is little experience with agricultural mitigation in developing countries. the lens of the carbon market is really not appropriate for these countries. see for example P. Tschakert. 2004. Carbon for farmers: assessing the potential for soil carbon sequestration in the old peanut basin of senegal. climatic change 67: 273-290. | Rejected, The chapter discusses the opportunities of AFOLU mitigation options, but not the responsibility issue. This is mainly discussed within the UNFCCC, which is a more proper place for this discussion |
| 13975 | 11 | 40 | | | | some differentiated analysis of where responsibilities and mitigtion potential lie, particularly with regard to ch4 and n2o is absolutely essential, as is a breakout of per capita emissions among countries. | Rejected, ibid |
| 11785 | 11 | 40 | | | | Deleate or transfer to WG2 to save the voulme.Climate change impact should be described in WG2. | Accepted, The whole table has been moved to 11.7 and redrafted |
| 5602 | 11 | 41 | 1 | 41 | 39 | This page needs a good edit. | Accepted, Section re -drafted |
| 11304 | 11 | 41 | 13 | 41 | 16 | As both a social and scalar phenomenon, 'city' is missing from the social scale-line. As it is, the sudden jump from 'village' to 'province' makes little sense, and in any case agriculture most likely originated as a result of cities (see Soja, Edward 2000: 'Postmetropolis: Critical Studies of Cities and Regions'. Oxford: Blackwell: 20-27.) | Partially Accepted, City was included in tthe SOD. |
| 14441 | 11 | 41 | 16 | 41 | 17 | Unclear sentence. The topic of this paragraph - mitigation scenarios having potentially negative impacts on regional socio-ecological systems is an important point to emphasize. | Accepted, The whole table has been moved to 11.7 and redrafted |
| 5603 | 11 | 41 | 18 | 41 | 21 | Bio-fuel plantations can also have positive impacts for villagers. The could provide work, sell fuelwood, charcoal and poles etc. | Accepted, Section re -drafted |
| 13331 | 11 | 41 | 27 | 41 | 29 | This sentence is not clear. | Accepted, Section re -drafted |
| 5604 | 11 | 41 | 31 | 41 | 31 | Population growth is a key input and should be mentioned sooner. | Accepted, Section re -drafted |
| 17146 | 11 | 41 | 32 | | | Suggest a more indepth inclusion of Indigenous Peoples and Sustainable Development specifically as it relates to behaviour | Rejected, "indigenous peoples" is indicated in the text as the first example. Indigenous peoples are not the only social group potentially affected; colonos (settlers) or farmers need also to be considered. The awareness of different social groups is key for getting the potential of AFOLU realized as well as |
| 3869 | 11 | 41 | 40 | 41 | 41 | Sustainable management of bioenergy crops is also possible (see AR4, Chapter 2 - Bioenergy),. You should add this to make the text a little less biased against bioenergy. | Accepted, Section re -drafted |
| 5605 | 11 | 41 | 40 | 41 | 49 | . I am in full agreement with this paragraph, as I am with the first paragraph on page 42. | Noted, thanks |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 11170 | 11 | 41 | 40 | | | The description "Sustainable management of agriculture, forests, and other land uses –either natural or man-made, such as plantations- is essential to achieving sustainable development." is not clear. Any land management, including agriculture, forestry and other land uses are human-induced activities even if there are some difference of intensity. This sentence should be changed into "Sustainable land management is essential to achieving sustainable development." | Accepted, Section re -drafted |
| 13976 | 11 | 41 | 42 | | | a blanket statement that synergies need to be maximized, including maximization of the mitigation efect, cannot be made. It depends on what country you are in and what your food security demands/needs are. | Partially Accepted, Section re -drafted |
| 3870 | 11 | 41 | 43 | 41 | 44 | Should read "Adequately implemented forestry and agriculture, including bioenergy, mitigation options provide". | Partially Accepted, Section re -drafted |
| 7200 | 11 | 41 | 43 | 41 | 43 | What is adequately implemented? Ideas? Systems? Global? National? See earlier comments. | Partially Accepted, This paragraph has |
| 13977 | 11 | 41 | 43 | 41 | 47 | it is inappropriate to use the 2007 forestry chapter and its conclusions and then conclude that they are also appropriate for the agriculture sector, particularly a claim that mitigation options are an effective means to reduce poverty. There is no empirical evidence for this claim and it should be eliminated. | Accepted, Some of the management options included for AFOLU measures in agriculture have been used in developing countries (although without being used as mitigation options). This experience |
| 2137 | 11 | 41 | 47 | 41 | 47 | may add a reference to the potential of "systemic" approaches to agricultural production, e.g. between "...(Nabuurs et al., 2007)." and "Additional costs…": e.g. the following. "Thereby, it should be accounted for the potential of systemic approaches to agricultural prouction, such as pursued in agro-ecology or organic agriculture (e.g. (El-Hage Scialabba, N., Müller-Lindenlauf, M., 2010. Organic agriculture and climate change. Renewable Agriculture and Food Systems 25, 11.))." | Accepted, Reference assessed |
| 14735 | 11 | 41 | 47 | | | The phase: “Additional costs and human…” is confusing, needs rewriting. | Accepted, Section re -drafted |
| 11818 | 11 | 41 | 9 | 41 | 49 | this text part could be shortened | Partially Accepted, Section re -drafted |
| 5606 | 11 | 42 | 12 | 42 | 12 | What is meant by natural resource space? | Accepted, Text modified |
| 12873 | 11 | 42 | 19 | 42 | 19 | It would be good here to add a key example of the connection between adaptation and mitigation with forest management and forest carbon: "Field trials in western U.S. forests indicate that prescribed burning, mechanical thinning, and retention of large trees can help forest ecosystems adapt to climate change (Stephens et al. 2009) and mitigate greenhouse gas emissions because long-term storage of carbon in large trees outweighs short-term emissions from prescribed burning (Hurteau and Brooks 2011)." Stephens, S.L., J.J. Moghaddas, C. Edminster, C.E. Fiedler, S. Haase, M. Harrington, J.E. Keeley, E.E. Knapp, J.D. McIver, K. Metlen, C.N. Skinner, and A. Youngblood. 2009. Fire treatment effects on vegetation structure, fuels, and potential fire severity in western U.S. forests. Ecological Applications 19: 305-320. Hurteau, M.D. and M.L. Brooks. 2011. Short- and long-term effects of fire on carbon in US dry temperate forest systems. BioScience 61: 139-146. | Accepted, Text Modified |
| 11819 | 11 | 42 | 21 | 42 | 48 | This text part could be cross-referenced to WG2 and then shortened | Accepted, Section restructured, referring |
| 2632 | 11 | 42 | 21 | | 38 | It would be worth clarifying the material a bit. There is a CO2 fertilizer effect if the plant is able to adjust its water use efficiency and nutrient use efficiency. It is unable to adjust its physiological activities, there will be no fertilizer effect. Part of the CO2 fertilizer effect is the increased efficiency of water uptake which could be valuable if the environment becomes more dry. | Accepted, Section restructured, referring to WGII |
| 10113 | 11 | 42 | 24 | 42 | 24 | Scale works also the other way, integrated food-energy systems at farm/communitylevel can mitigate while brininging substantial development benefits (energyavailability, cost savings, additional income source,energy for agricultural production i.e. irrigation pumps, reduced forest degradation etc.) | Accepted, Section restructured, referring to WGII |
| 7338 | 11 | 42 | 25 | 42 | 34 | need citations for the CO2 fertilization effect, and the report that carbon storage would decline with warming. Also the Wamelink study needs more info, including the modeled time frame. And the Metsaranta study -4.5 to +4.5! - needs some indicator as to what key variables matter the most and what business as usual might look like. | Accepted, Section restructured and shortened due to page limitation |
| 5084 | 11 | 42 | 25 | 42 | 25 | I believe brent sohngen has some results that are very different from the those inculded in this paragraph. | Accepted, Section restructured |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 5085 | 11 | 42 | 25 | 42 | 25 | you might also talk about the face experiements as they seem to show that forest growth may be somewhat lower than what people project. | Accepted, Section restructured |
| 5086 | 11 | 42 | 25 | 42 | 25 | this first section is somewhat unbalanced. One should also discuss croplands and grasslands. | Accepted, Section restructured |
| 15194 | 11 | 42 | 3 | 42 | 19 | doesn't add much | Accepted, Section restructured and shortened due to page limitation |
| 4277 | 11 | 42 | 30 | 42 | 32 | As worded leaves impression Metsaranta et al worked on European Forest; their work was in British Columbia. Also, listing of growth rates, decay rates, and area burned by wildfire leaves out insect and disease disturbances which are a very large component of forst disturbance in British Columbia and boreal forests more generally. | Accepted, Text modified |
| 5831 | 11 | 42 | 30 | 42 | 38 | Please rephrase this paragraph. Do not put the weight on persons but on the findings. It is also not very polite to refer to G.B. Bonan as "it" as your wording in lines 34 - 36 does. | Accepted, Text modified |
| 13978 | 11 | 42 | 30 | 42 | 36 | how does this data then translate into carbon storage in fields, and what is the relation between increase in T and altered precipitation regimes and carbon storage in fields? | Rejected, These are trees- they are not grown in fields. Misplaced comment? |
| 12417 | 11 | 42 | 34 | 42 | 38 | The lines state that "... carbon cycle feedbacks are projected to increase atmospheric CO2 at the end of the 21. century by 4-44 % equivalent to 20-224 ppm". Could it be clearified, compared to which model scenario this increase will take place? And whether the big interval is caused by uncertainty or by different emission scenarios. | Accepted, Text modified |
| 13332 | 11 | 42 | 36 | | | Remove extra "to" | Accepted, Text modified |
| 7339 | 11 | 42 | 41 | 42 | 43 | Reader needs to know how deforestation in mid-high latitudes may cool the Earth, and by altering what biophysical processes. This is potentially a really important statement in that, if true and taken at face value, why would I not want to go out and harvest the entire boreal forest??? | Accepted, Text based on reference |
| 2633 | 11 | 42 | 41 | | 46 | Shift to deciduous will be more challenging. Deciduous species need higher nutrient contents and even growing season rainfall. If these do not exist, they will not begin to dominate. Most coniferous sites are nutrient poor and have low rainfall during the summer growing season. | Rejected, Projections are for an increase |
| 5832 | 11 | 42 | 43 | 42 | 48 | Please rephrase in a more concise way. I suggest: "Several studies show that there will be an expansion of deciduous woodlands (Edwards et al., 2005; Peros et al., 2008). This can have a positive feedback on regional climate change by creating a positive feedback through albedo and transpiration, and produce a strong warming if they act in combination with sea-ice processes (Swann et al., 2010)." | Noted, Text based on references and is already concise |
| 12418 | 11 | 42 | 47 | 42 | 48 | It would have been useful if it could be clearified whether the combination of positive feedback through albedo and transpiration and sea-ice processes will produce a "strong warming" proportional with the sum of these phenomena or if these will reinforce each other even more and in that case why. | Partially Accepted, We only cover the albedo here |
| 2140 | 11 | 42 | 6 | 42 | 6 | add reference to Smith P., D. Martino, Z. Cai, D. Gwary, H. Janzen, P. Kumar, B. McCarl, S. Ogle, F. O'Mara, C. Rice, and others (2008). Greenhouse gas mitigation in agriculture. Philosophical Transactions of the Royal Society B: Biological Sciences 363, 789–813. Available at: http://rstb.royalsocietypublishing.org/content/363/1492/789.short. | Accepted, Text deleted |
| 2141 | 11 | 42 | 9 | 42 | 9 | Locatelli et al: add further references emphasizing the potential of systemic approaches, e.g. El-Hage Scialabba, N., Müller-Lindenlauf, M., 2010. Organic agriculture and climate change. Renewable Agriculture and Food Systems 25, 11 or Muller, A., Olesen, J., Smith, L., Davis, J., Dytrtova, K., Gattinger, A., Lampkin, N. and Niggli, U., 2012, Reducing Global Warming: The Potential of Organic Agriculture, Scandinavian Working Papers in Economics 526 / FiBL Working Paper or Muller, A. and Aubert, C., forthcoming, The potential of organic agriculture to mitigate the impact of agriculture on global warming - a review, in: Penvern, S., Bellon, S. and Savini, I. (eds), Organic Farming, prototype for sustainable agricultures? Springer | Accepted, Issue adequately addressed |
| 11125 | 11 | 42 | | | | If mitigation=emission reduction + sink increase + feedbacks, it would be nice to develop one table where all effects could be combined, at least by AFOLU categories, to highlight the complexity of the entire system and the limits of our knowledge. | Noted, I think this would require multiple scenarios - will do in systemic perspectives chapter |
| 8011 | 11 | 42 | 20 | | | Some descriptions are required for climate feed-backs of not only forests but also agricultural land and other land use. | Accepted, Referred to WGI and a generic sentence added from WGI |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 6931 | 11 | 42 | 20 | | | Please coordinate and ensure consistency with WGI, Chapter 6 on the land use change - climate feedbacks. Suggest to refer to WGI AR5 Chapter 6 here whenever appropriate. Many parts of this section stray into the WGI area of expertise and will overlap with the assessment provided by Chapter 6. This should be avoided to avoid duplication and/or inconsistencies. | Accepted, Consistency with WGI ensured |
| 12874 | 11 | 43 | 10 | 43 | 10 | Because biome shifts comprise a major climate change impact that also alters greenhouse gas emissions and removals, add here: "Field measurements from boreal, temperate, and tropical ecosystems around the world have detected numerous latitudinal and elevational biome shifts (Gonzalez et al. 2010) that alter ecosystem function and greenhouse gas emissions and removals." Gonzalez, P., R.P. Neilson, J.M. Lenihan, and R.J. Drapek. 2010. Global patterns in the vulnerability of ecosystems to vegetation shifts due to climate change. Global Ecology and Biogeography 19: 755-768. | Accepted, Section restructured and shortened |
| 7340 | 11 | 43 | 12 | | | it seems 'fires in tropical forest ecosystems' should be 'fires in all forest ecosystems'. Why restrict to tropical? | Accepted, Section restructured and |
| 5607 | 11 | 43 | 13 | 43 | 13 | Give examples of invasive species. | Accepted, Section restructured and |

|---|---|---|---|---|---|---|---|
| 10633 | 11 | 44 | 1 | 44 | 10 | As for implication of climate change on forest carbon sink, climate influences on GHG fluxes in forest soils. The following sentence would be appropriate in this section.<br><br>Hashimoto et. al. (2011) showed climate-driven changes in soil GHG fluxes (CO2 emission, CH4 uptake, and N2O emission) in Japanese forests from 1980 to 2009, which were estimated using a regional soil GHG model that is data-oriented. It revealed that the soil GHG fluxes in Japanese forests have been increasing over the past 30 years.<br><br>Shoji Hashimoto, Tomoaki Morishita, Tadashi Sakata and Shigehiro Ishizuka<br>Increasing trends of soil greenhouse gas fluxes in Japanese forests from 1980 to 2009<br>Scientific Report 2011; 1: 116. Published online 2011 October 13. doi: 10.1038/srep00116 | Accepted, New sentence added quoting Sitch et al, 2008 and Bowman et al., 2009 which covers forest biomass and soil carbon |
| 6933 | 11 | 44 | 1 | | | Please coordinate and ensure consistency with WGI, Chapter 6 on climate change and forest carbon. Suggest to refer to WGI AR5 Chapter 6 here whenever appropriate. Please avoid duplication of assessment. | Accepted, Cross reference to WGI, Ch6 is provided |
| 4274 | 11 | 44 | 37 | | 40 | Because some models showed different trends (Fig. 11.8,) should be good to know some of the key assumptions of Heimann and Reichstein, 2008 to allow better undertansding of those modeled results | Accepted, Figure 8 deleted |
| 6935 | 11 | 44 | 39 | 44 | 40 | Better: Components of "the terrestrial carbon cycle become a substantial source of atmospheric CO2 [...]". | Accepted, Text modified and shortened |
| 6934 | 11 | 44 | 4 | 44 | 9 | Suggest to refer here to the WGI and WGII AR5 reports in relation to climate change and forest carbon. Make sure this assessment is consistent with the other two AR5 WG reports. | Accepted, Cross reference better to WGI, Ch6 provided in the paragraph |
| 12927 | 11 | 44 | 1 | 46 | 11 | Section 5.2 and 5.3 should be combined. Pragraph in Line37-40 in Page may good for the introduction in this section. Implication of climate change on forest C sinks and soil C in three land use should be discussed in different sub-sections, I think. | Rejected, Section 11.5.3 retained to provide focus for peatlands, grasslands and rangelands |
| 7618 | 11 | 45 | | | | Need explanatory notes in this figure. | Accepted, Figure deleted |
| 5833 | 11 | 45 | | | | The figure has no legend. Besides, it has little informational value beyond the text and can be deleted. If you want to retain it please add information to the text: under what circumstances can the terrestrial C cycle become a source? | Accepted, Figure deleted |
| 11171 | 11 | 45 | | | | A legend or some explanations for the lines are needed to understand the figure. | Accepted, Figure deleted |
| 14442 | 11 | 45 | 1 | | | Is there a legend? | Accepted, Figure deleted |
| 9085 | 11 | 45 | 18 | 45 | 29 | Besides CO2, CH4 and N2O are also important GHG and are emitted from peatland, easpecially after disturbances. | Accepted, Text added |
| 15197 | 11 | 45 | 24 | 45 | 25 | delete sentence | Accepted, Text modified |
| 12420 | 11 | 45 | 30 | 46 | 2 | Could an estimate for the carbon stock in the soil of Grasslands, Pastures and Rangelands be given as it is done for forest soils and peatlands? | Noted, Carbon stock values provided for peatlands due to the magnitude involved. Due to lack of space, C-stock |
| 12875 | 11 | 45 | 30 | 45 | 31 | The 2006 IPCC National Greenhouse Gas Inventory Guidelines have superceded the older good practice guidance. So, say instead "...used in the IPCC National Greenhouse Gas Inventory Guidelines (IPCC 2006)..." Intergovernmental Panel on Climate Change. 2006. Agriculture, Forestry, and Other Land Use. National Greenhouse Gas Inventory Guidelines. Institute for Global Environmental Strategies, Hayama, Japan.) | Accepted, Text deleted |
| 12419 | 11 | 45 | 4 | 45 | 5 | In connection to chapter 11.5.3, it would be useful to include a table which illustrate the total estimated content of carbon in different types of soil, adding up to 100%. | Rejected, No - too detailed |
| 5611 | 11 | 45 | 4 | 45 | 4 | 11.5.3 Soil carbon. Insert soil carbon estimates by land use types as given in general comments on page 2 above. This could be in place of or addition to Figure 11.8. | Rejected, What would the purpose be? |
| 16222 | 11 | 45 | 8 | | 18 | Inconsistency here: FAO has 363 GT C for forest soil carbon; then below, for peatlands only, estimate is 350-550 GTC (the entire amount) and they say: 'this is 20-25% of the soils stocks globablly'--they must mean non-forest as well? And nevermind that it seems to represent 100% of the above referenced soil carbon? | Rejected, Not all forests are on peatlands- no inconsistency here |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 5612 | 11 | 45 | 8 | 45 | 8 | The figure of 363 GtC for forests seems low. | Accepted, Values deleted since available in FAO reports and WGI and lack of |
| 4393 | 11 | 45 | | 45 | | indication of emission scenarios used would be useful | Rejected, Where? |
| 10612 | 11 | 45 | | | | Could merge with section 11.2 and delete from here - much overlap | Accepted, Substantial text deleted from |
| 12189 | 11 | 45 | 18 | 45 | 19 | Firstly the estimated carbon in peatlands seems too high and if it consists 20-25% carbon of the world's soil organic carbon, the estimated value of the world's soil carbon should be mentioned. | Rejected, No - this is consistent with global soil C estimates |
| 4279 | 11 | 45 | 4 | | | There is good literature on peatland carbon (CO2 and CH4) emissions, but this section does not seem to clearly summarize it. Peatlands are extremely sensitive to climate, and store vast amounts of carbon (see Yu, Z, Vitt, D.H., Campbell, I.D>, & Apps, M.J. 2003. Understanding Holocene peat accumulation pattern of continental fens in western Canada. Can. J. Bot. 81: 267-282; Yu, Z., Campbell, I.D., Campbell, C., Vitt, D.H., Bond, G.C. and Apps, M.J. 2003. Carbon sequestration in western Canadian peat highly sensitive to Holocene wet-dry climate cycles at millenial timescales. The Holocene 13: 801-808)- that point is made - but there is a need to further discuss CH4 and CO2 separately, along with net carbon fluxes. | Accepted, Text modified and shortened and since WGI covers these issues, not addressed here |
| 6936 | 11 | 45 | 4 | | | Please coordinate and ensure consistency with WGI, Chapter 6 on climate change and soil carbon. Suggest to refer to WGI AR5 Chapter 6 here whenever appropriate. Please avoid duplication of assessment. | Accepted, Cross reference to WGI, Ch6 provided |
| 10172 | 11 | 45 | 6 | 45 | 29 | Structure could be improved for increased understanding, e.g. 1. peatlands globally, 2. regionally, i.e. permafrost | Accepted, Section modified; due to limited space available, detailed |
| 12188 | 11 | 45 | 8 | 45 | 8 | As per FRA 2010 of FAO the Carbon in soil is 292 billion tonnes or 44 % of the total carbon in the forest ecosystem then where from 363 Gt C has come? | Accepted, Text modified |
| 18233 | 11 | 46 | | 46 | | • In section 11.5.4 (Potential adaptation measures to minimize the impact of climate change on 12 carbon stocks in forests); page 46. This section shows in a positive way and in perspective, the need to assume different adaptation strategies related with forests; aspects considered relevant in the forest policy of the country, by the fact that adaptation measures will allow to take the future risks of the climate change, risks that would produce a number of environmental, economic, and human costs, among others. In Venezuela are initiating the application of adaptation measures by implementing a new model for forests management. | Rejected, Interesting - but this is a statement, not a comment. What can we do with it? |
| 6777 | 11 | 46 | | 47 | | add the "potential adaptation measures to minimize the impact of climate change on carbon stocks in grasslands or other lands ",because climate change will influence the carbon stocks or non-CO2 emission,some potential adaptation measures will minimize the impact of climate change on carbon stocks or non-CO2 emission in grasslands or other lands type. | Accepted, Section includes forest and agriculture land only. Grassland and other land categories not included due to lack of references. Have been explored |
| 8603 | 11 | 46 | 1 | 46 | 11 | Please, consider contributions on tropical savannas such as Grace, J., San José, J., Meir, P., Miranda, H. & Montes, R. 2006. Productivity and carbon fluxes of tropical savannas. J. Biogeogr. 33:387-400 and San José, J. & Montes, R. 2007. Resource apportionment and net primary production outcome across the Orinoco savanna-woodland continuum. Acta Oecol. 32:243-253. | Rejected, Ideally, we should use post-2007 reviews and meta-analyse and not older single studies |
| 12421 | 11 | 46 | 12 | 46 | 43 | The measures in this paragraph seem not to comprise forest soils, even though forest soils represent huge stocks of C as mentioned on p 45 line 8. Does that mean that such measures don't exist? | Accepted, Forest soils not included due to lack of references. If found, will be |
| 16592 | 11 | 46 | 26 | 46 | 34 | These are important points. I suggest that they be made into a Box to highlight them. | These are important points. I suggest that they be made into a Box to highlight |
| 15198 | 11 | 46 | 3 | 46 | 11 | section is supposedly about SOC, but all effects on grassland mentioned here | Accepted, Section title modified; Mitigation aspects of peatland SOC |
| 5091 | 11 | 46 | 3 | 46 | 3 | the statement "The potential impacts of climate change on pastures would be declines in pasture/grass productivity, 3 reduced forage quality, livestock heat stress, greater problems with some pests and weeds, more 4 frequent droughts and intense rainfall events, and greater risks of soil erosion (Hennessy et al. 5 2007). " is a lttle too harsh as i think there are grasslands in northern areas that will have increased productivity. | Accepted, Text modified and sentence deleted |
| 5092 | 11 | 46 | 3 | 46 | 3 | also again you are doing things that overlap with wgii | Accepted, Text modified and sentence |

| 13336 | 11 | 47 | 17 | 47 | 17 | Why are reduce fertilizer and increase crop diversification included as one soil management practice. | Accepted, Text modified |
| 13337 | 11 | 47 | 17 | 47 | 21 | There should be a qualifying statement that these practices should be undertaken in such a way as to not affect crop yields. | Accepted, Text modified |
| 11824 | 11 | 47 | 2 | 47 | 3 | the mitigation potential of a land use systems itself…' is more clear | Accepted, Text deleted to avoid generic |
| 5834 | 11 | 47 | 2 | 47 | 16 | Please make sure you do not consider C stocks only. SFM with high annual increment, high annual harvest and a high share of timber flow to HWP with a high replacement factor (substitution factor) can contribute much better to mitigation than forest reserves or simply raising C stocks. | Noted, Text provides only illustrative examples; all potential examples cannot be covered due to page limitation. |
| 13979 | 11 | 47 | 2 | | | add the phrase "may at times be" prior to the word "complementary." these measures may not necessarily be undertaken by the same person at the same time. | Accepted, Sentence deleted |
| 5093 | 11 | 47 | 3 | 47 | 3 | this was all said earlier in the document | Accepted, Text deleted |
| 13338 | 11 | 47 | 31 | 47 | 35 | Sentence is confusing, rephrase. | Accepted, Revised for SOD |
| 13981 | 11 | 47 | 31 | 47 | 34 | this section must include discussion of the fact that there is no functioning carbon market for AFOLU and that the current CDM market is crashing. To discuss market potential in the absence of a functioning market is highly misleading. | Noted, The section deals with economic potentials and not market potentials. The market potentials are mentioned as a concept and only to distinguish these |
| 13980 | 11 | 47 | 35 | 47 | 36 | does technical mitigation potential completely incorporate the biogeophysical uncertainties about carbon sequestration potentials under changing climates? | Accepted, No - it is the unconstrained maximum - see figure 11.9 |
| 5615 | 11 | 47 | 38 | 47 | 38 | Mt of GHG mitigation --- MtC or MtCO2? | Accepted, CO2-eq. |
| 5094 | 11 | 47 | 41 | 47 | 41 | I think the section puts all the gaps at the foot of barriers but I think incentives are a huge part as are resource competiton. mccarl and schneider shows big gaps depending on resources and altered shares depending on prices McCarl, B.A., and U.A. Schneider, "Greenhouse Gas Mitigation in US Agriculture and Forestry", Science, Volume 294 (21 Dec), 2481-2482, 2001. | Accepted, Revised in SOD (can be more specific pending the outcome of the costs and potentials cross-cut) |
| 5095 | 11 | 47 | 41 | 47 | 41 | not sure what leakage means in the sentence "Providing consolidated estimates of economic potentials for GHG mitigation within the AFOLU sector 19 as a whole is further complicated because of potential 'leakages' stemming from competing 20 demands on land for various agricultural and forestry activities as well as for the provision of many 21 ecosystem services" but i think it is being used wrong | Accepted, Revised in SOD (can be more specific pending the outcome of the costs and potentials cross-cut) |
| 11825 | 11 | 47 | | | | there are no trade-offs mentionned here, such as decreasing rotation length to adapt to pest and storm risks in forestry | Accepted, Added for SOD if appropriate |
| 13063 | 11 | 47 | 22 | 54 | 6 | On the Costs & Potentials issues it is difficult for the reader to access the bigger picture of the cost & potential information. Each sector has its own approach to costs and potentials, which is appropriate as each sector has its own unique qualities and considerations. Nonetheless, the information that will be most relevant to take-away for policy-makers is overarching cost information that brings these different pieces together. To help policy-makers access this information, it should be important to highlighting market realization, but also the policy aspects of cost (by policy it is meant institutional frameworks and/or market frameworks and/or capacity building arrangements, etc...). In both developing and developed countries policy can have a strong impact on cost. Simply looking across the costs & potentials sections of the sector chapters, the reader could miss this message, although the information on policies and measures is there in the chapter. Therefore it could be important to make sure that these informations are put in perspective appropriately. | Accepted, (Peter, my understanding is that these issues will be picked up in the synthesis report) |
| 10254 | 11 | 47 | 23 | 54 | 6 | I am not an econimist, but I think this section need to include somewhere the economic dimension of the REDD debate. | Accepted, Addressed in SOD |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 5509 | 11 | 47 | 16 | 11 | 47 | Use of organic soil amendments as a source of fertility as well as soil conditioners should be mentioned here. Depending on how one considers carbon storage accouting- multiple studies have shown persistant soil carbon increases following the use of organic soil amendments. These amendments also increase soil nitrogen reserves, decrease bulk density and improve soil water holding capacity, and can increase NPP- all important factors for mitigation and resiliance See Khaleel, R.; Reddy, K. R.; Overcash., M. R. Changes in soil physical properties due to organic waste applications: A review. J. Environ. Qual. 1981, 10, 133–141., Albaladejo, J.; Lobez, J.; Boix-Fayos, C.; Barbera, G. G.; Martinez-Mena, M. Long-term effect of a single application of organic refuse on carbon sequestration and soil physical properties. J. Environ. Qual. 2008, 37, 2093–2099. Spargo, J. T.; Alley, M. M.; Follett, R. F.; Wallace, J. V. Soil carbon sequestration with continuous no-till management of grain cropping systems in the Virginia coastal plain. Soil Tillage Res. 2008,100, 133–140. Tian, G.; Granato, T. C.; Cox, A. E.; Pietz, R. I.; Carlson, C. R., Jr.; Abedin, Z. Soil carbon sequestration resulting from long-term application of biosolids for land reclamation. J. Environ. Qual. 2009,38:61-74, Life Cycle Inventory and Life Cycle Assessment for Windrow Composting Systems; Recycled Organics Unit, The Univ. of New South Wales: Sydney, Australia, 2006; www.recycledorganics.com/publications/ reports/lca/lca.htm., Brown, S., K. Kurtz, A. Bary, and C. Cogger. 2011. Long-term effects of organic amendments on soil carbon storage and physical properties. Environ. Sci. & Tech. dx.doi.org/10.1021/es2010418 | Accepted, Added in revision |
| 10624 | 11 | 48 | | | | Please consider Lubowski et al. (2006) and in general the papers that use econometric estimations of reveled preferences of the landowner to estimate reforestation economic potentials and costs. Reference: Lubowski, R.N., A.J. Plantinga, and R.N. Stavins (2006), 'Land-use change and carbon sinks: econometric estimation of the carbon sequestration supply function', Journal of Environmental Economics and Management 51: 135–152. | Rejected, Prefer more up to date literature (post-2007) |
| 5616 | 11 | 48 | 15 | 48 | 15 | Change acreage to hectarage or area? | Accepted, In SOD used 'area' |
| 5617 | 11 | 48 | 19 | 48 | 19 | The word sectoral is used here and subsequently. I think the correct word is sector. | Accepted, Revised in SOD: sector- |
| 9456 | 11 | 48 | 21 | | 21 | Is a mitigation "response" the same as a mitigation "option?' | Accepted, Clarified in SOD (can be more specific pending the outcome of |
| 16594 | 11 | 48 | 32 | 49 | 13 | This point seems too subtle (and only conceptual) to be appropriate in this chapter. | Accepted, Revised to contextualize the 'sectoral implications of transformation |
| 15976 | 11 | 48 | 34 | 48 | 34 | the concept of carbon prices could be briefly explained or refered to | Accepted, Carbon prices explained |
| 10173 | 11 | 48 | 3 | 49 | 32 | Especially p. 48, l. 32 - p. 49, l. 13 : could be illustrated with theoretical graphs for easier understanding | Accepted, Revised to contextualize the 'sectoral implications of transformation |
| 18235 | 11 | 49 | | | | "…deforestation is the most important source of greenhouse gas emissions, with a net loss of forest area estimated in 5.2 million hectares each year, between 2000 and 2010 (FAO 2012)" From this sentence is relevant for countries reaffirm the common but differentiated responsibilities, and deepen binding measures of countries, annex 1; preserved forests will be insufficient as carbon sinks to mitigate the capture of CO2 gases. On the other hand, countries with large forest areas and those adopting REDD measures, will have to account effectiveness of the sink in a carbon markets context. | Rejected, This is a statement - not a comment |
| 18234 | 11 | 49 | | 53 | | • In section 11.6.2 (Forestry), pages 49-53, comment extensively on the economic potential of carbon mitigation, mainly by the forest sector, including reducing deforestation, forestation and agroforestry, which differ largely by activity and by regions, therefore, said options are assessed. At short-term, is expected that economic potentials for carbon mitigation by reduction of deforestation, be higher than economic potentials for forestation (forests management: forestry, forests management, others). This is probably since deforestation is the greatest source of greenhouse gas emissions. | Rejected, This is a statement - not a comment |
| 9457 | 11 | 49 | 1 | | 13 | Important point, but should be re-written for clarity. | Accepted, Revised to contextualize the 'sectoral implications of transformation |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 16595 | 11 | 49 | 22 | 49 | 22 | It's quite strange to be citing a 2013 reference, and it's not clear from the literature cited whether it even has been submitted. Given the danger of criticism for citing unpublished work, this should be dropped. | Accepted, it will be in press before SOD |
| 13340 | 11 | 49 | 25 | 51 | 5 | Confusing and repetitive, rephrase. | Accepted, Revised in SOD (can be more specific pending the outcome of the |
| 5618 | 11 | 49 | 37 | 49 | 37 | Reduced deforestation depends on increased agricultural productivity (and tempering population increase) not on cutting down on wood consumption. This could be increased substantially up to the point of NPP of wood! | Rejected, Point made many times elsewhere - does not fit here |
| 7204 | 11 | 49 | 38 | | 39 | That is because deforestation is the single most important source for GHG emission….'. Within the 'forestry' yes, within AFOLU no. Over a 100 years time period, conserving or restoring a peat will produce >50% more carbon credits than the conservation or restoration of a forest on the same area of land. Suggestion: show somewhere in the document a figure on economic potentials of all mitigation measures within AFOLU: 'Forest', 'Croplands', 'grasslands' and 'wetlands'. Fig. 11.12 illustrates this partly, but it's all about management (excludes avoided degradation of forest and peat) and excludes forest. | Accepted, Revised in SOD (can be more specific pending the outcome of the costs and potentials cross-cut) |
| 12423 | 11 | 49 | 40 | 49 | 43 | Could you please clarify if the emissions from biomass-burning are included in the estimated mitigation potential? | Accepted, Clarified in SOD |
| 5619 | 11 | 49 | 40 | 49 | 40 | . Biomass from trees not forestry can contribute up to 340 EJ from NPP alone of which up to 300 EJ are potentially available for energy. The figure of 12-74 EJ is much too low. The current IEA consumption figure for biomass energy is 74 EJ/yr. Likewise the mitigation potential of 0.4 to 4.4 GtCO2/yr (0.11 to 1.2 Gt C) is much too low for power plants. There can be many more wood-fired 'local' plants with conventional boilers and larger wood gasified plants. | Rejected, These numbers seem very optimistic |
| 7669 | 11 | 49 | 41 | 49 | 43 | The above mentioned literature shows that you cannot talk about annual mitigation potentials of bioenergy from forests as a fixed number. Generally increased harvest will lead to increased accumulation of co2 in the atmosphere for a long period (from decades to centuries) before one could hope for a mitigation. | Rejected, Surely not - if that wood is used to substitute fossil fuels, less fossil C will end up in the atmosphere and forest regrowth will take up the C |
| 3760 | 11 | 49 | 44 | 51 | 17 | Three relevant references on economic potential for carbon mitigation from forestry are: 1) Coren, Streck, Myers-Madeira. Estimating supply of RED credits 2011-2035. Climate Policy doi:10.3763/cpoi.2010.0181; 2) Busch, J., Lubowski, R., Godoy, F., Steininger, M., Yusuf, A., Austin, K., Hewson, J., Juhn, D., Farid, M., Boltz, F. (2012). "Structuring economic incentives to reduce emissions from deforestation within Indonesia." Proceedings of the National Academy of Sciences of the United States of America 109(4):1062-1067.; and 3) Merger, Held, Tennigkeit, Blomley. A bottom-up approach to estimating cost elements of REDD+ pilot projects in Tanzania, Carbon Balance and Management 2012, 7:9 doi:10.1186/1750-0680-7-9 | Accepted, Added these references in SOD |
| 12424 | 11 | 49 | 47 | 49 | 47 | Does economically viable mitigation potential mean that effects on biodiversity is not included? If no, what would the mitigation potential be if biodiversity constraints were taken into account? | Rejected, No - and don't know the answer. We can only review what is |
| 12422 | 11 | 49 | 34 | | | This section could be improved to make it more undestandable.Texts should be placed more in connection with the figure they explain. Table 11.9 is hard to understand. Why is the difference between global integrated assesment models and Global forest sector models so much - 700 respectively 13 755 Mt CO2. | Accepted, Revised in SOD (can be more specific pending the outcome of the costs and potentials cross-cut) |
| 13957 | 11 | 5 | | | | some reference to competition of residues for bioenergy with residues needed for fertility (composts) and sequestration. This is a major potential conflict that must be put in the foreground | Accepted, Agreed - has been noted |
| 14563 | 11 | 5 | 1 | | | should this be ADAPTIVE CAPACITY | Accepted, Revised for SOD |
| 2609 | 11 | 5 | 11 | 5 | 12 | bioenergy expansion 'of agricultural plantations into forests' can ….TOO MANY THOUGHTS ARE INCLUDED IN THIS PARAGRAPH WITHOUT HAVING A TRANSITION BETWEEN SENTENCES - MAKES IT DIFFICULT TO FOLLOW | Accepted, Revised for SOD |
| 14565 | 11 | 5 | 13 | 5 | 14 | "will likely increase" increase from what? I would say its more than likely. Use of land for bioenergy and sequestration does comepte with other land uses. Of course the parger the scale the greater the competition. (this is aprtly also covered in paragraph above. Could say this stronger and earlier. | Accepted, Revised for SOD |
| 7535 | 11 | 5 | 13 | 5 | 18 | Forest management and sustainable forest management is important options in this discussion. | Accepted, Revised for SOD |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 2610 | 11 | 5 | 13 | 5 | 18 | Is the large scale bioenergy from agriculture or is this referring to forests since afforestation and reforestation is mentioned in the same sentence? The comment on harvesting residues does not factor in that most residues have someone that is already using it, e.g., mill owners or small industries colocated with a facility. Therefore residues are a competitive resource. Linking food security with forest energy becomes confusing. Bioenergy from forests or plantations is minor compared to land conversion to agricultural or oil crops. | Accepted, Both |
| 12363 | 11 | 5 | 17 | 5 | 18 | "Multifunctional systems" is at term which is very general an may not be too meaningful for the reader. May be the authors could give a short definition of what is meant by a "multifunctional system" in the body of the text? | Accepted, There is one in the glossary, but we have now explained it on first use |
| 5033 | 11 | 5 | 17 | 5 | 17 | "consider competition for land" I might add and water | Accepted, Revised for SOD |
| 8920 | 11 | 5 | 17 | 5 | 18 | multifunctional system in practice are not yet developed to the point that they could substantially contribute to a considerable decrease of the food-energy competition; a more cautious formulation is recommended | Accepted, Revised for SOD |
| 2126 | 11 | 5 | 18 | 5 | 18 | harnessing agricultural residues for bioenergy may also cause conflicts, due to the utilization of this biomass as fertilizer in a range of sustainable agricultural production systems (e.g. organic; cf. e.g. Muller, A. (2009). Sustainable Agriculture and the Production of Biomass for Energy Use, Climatic Change 94(3-4): 319-331). Another issue is the role of organic fertilizers for soil carbon sequestration which may conflict with using this biomass for energy use. | Accepted, Revised for SOD |
| 2611 | 11 | 5 | 19 | | 23 | Comment - forest conservation is not the only issue that needs to be addressed since half of the world is still dependent on forests for food (wildlife), energy and water. They don't use the forest materials efficiently and mainly burn woodfuel. They also do not convert forests to energy crops. | Accepted, Revised for SOD |
| 2612 | 11 | 5 | 2 | | | Comment - how is this a social benefit if the lands are conserved and forest dependent communities are not provided any alternatives? | Accepted, Revised for SOD |
| 14566 | 11 | 5 | 20 | 5 | 23 | REDD should have its own paragraph. The sentence above is general to all mitigation and not specific to REDD | Accepted, Revised for SOD |
| 5034 | 11 | 5 | 20 | 5 | 20 | the redd statement is a little strong. How we implement this is a major issue. You can spend a lot of money on redd projects that would never have been defforested (additionality isse) plus you can just move development elsewhere (leakage problem) | Accepted, Revised for SOD |
| 13958 | 11 | 5 | 20 | 5 | 22 | the evidence base for a revenue stream forthcoming for substantial numbers of REDD projects is severely lacking. A much more critical, nuanced, and contingent analysis of mitigtion financing options in the AFOLU sector is required given the serious lack of potential currently for finance, from markets or otherwise. | Accepted, Revised for SOD |
| 5699 | 11 | 5 | 21 | | | Words 'REDD mechanisms' may be replaced by "comprehensive REDD mechanism known as REDD-plus mechanism". | Accepted, Revised for SOD |
| 7536 | 11 | 5 | 21 | 5 | 22 | "One of the most striking aspect of policies for the AFOLU sector is the implementation of REDD mechanisms and its variations that can represent a very cost-effective option for mitigation" is based on the Stern report. However, we realize tha REDD requires large costs of system development and transaction throgh experiments of negotiation and development for REDD. | Accepted, Some limitations for REDD+ implementation and related programs were included in section 11.10 |
| 10580 | 11 | 5 | 21 | | | Put REDD in full first time used. Also could explain it in a footnote and also for REDD+ (first quoted on page 10) | Accepted, Revised for SOD |
| 11061 | 11 | 5 | 21 | 5 | 21 | Does the acronym "REDD" need to be defined ahead of this? | Accepted, Revised for SOD |
| 8921 | 11 | 5 | 21 | | | the term REDD should be explained | Accepted, The term was explained - |
| 15144 | 11 | 5 | 24 | 5 | 25 | vagues sentence; reader may not be familiar with transformation pathways at this point | Accepted, These have been defined in |
| 5035 | 11 | 5 | 24 | 5 | 24 | when you say "AFOLU forms a critical component of transformation pathways," I am unsure what you are talking about. I would also think you might say currently implementable and also mention the concept of limikted capacity plus bridge to the future | Accepted, These have been defined in Ch6 |
| 9441 | 11 | 5 | 28 | | 40 | Indeed progress. Although I suspect that the present format limits discussion of the land-energy nexus and the synergies and tradeoffs between urban and rural regions | Noted, Statement - not a comment |
| 5036 | 11 | 5 | 31 | 5 | 31 | I might fence off "other land use" from urban use by inserting the word rural | Accepted, Revised for SOD |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 5037 | 11 | 5 | 35 | 5 | 35 | I think bioenergy will still be probalematic and you should acknowledge it is split to another chapter (I assume). That did not work so well in ar4 and probably will plague ar5 | Accepted, Now in ioenergy annex |
| 2127 | 11 | 5 | 37 | 5 | 37 | add the following between "...Meyfroidt, 2011)" and "and water…": ", biomass (Muller, A. (2009). Sustainable Agriculture and the Production of Biomass for Energy Use, Climatic Change 94(3-4): 319-331)" | Accepted, Revised for SOD |
| 12364 | 11 | 5 | 38 | 5 | 40 | It is important to remember that even though the new IPCC guidelines on national GHG inventories merge the sectors agriculture and LULUCF (AFOLU), it is decided under the UNFCCC that the sectors will continue to be reported as two separate sectors. Please consider to include this information in a sentence. | Rejected, Is that relevant for mitigation - surely an accounting issue |
| 7610 | 11 | 5 | 4 | 5 | 6 | Bioenrgy expansion is not main driver for land use change. Land use chenge would not occur under sustainable use of timber for bioenergy. Need more anlysis of another cause such as agriculture and expansion urban area. | Accepted, Revised for SOD |
| 7534 | 11 | 5 | 4 | 5 | 6 | Bioenergy is not a main driver for land use change. Before this paragraph, discussion on emission from land use change is required. | Accepted, Revised for SOD |
| 5030 | 11 | 5 | 4 | 5 | 4 | when you say "Land use and land use change associated with bioenergy expansion" I would also add affrestation, adaptation, grassland conversion | Accepted, Revised for SOD |
| 12365 | 11 | 5 | 41 | 5 | 42 | Since it is rather obvious that climate mitigation is not the primary use of land, the senescence could be simplified by stating; "In this chapter we consider the conflicting uses of land for food and fiber provision, for energy production and for conservation of biodiversity and ecosystem services and natural resources" | Accepted, Revised for SOD |
| 13959 | 11 | 5 | 42 | | | livelihoods are essential to add to any list that addresses uses of land. Lands provide livelihoods to billions, not merely food and fiber. Food security encompasses more than just the production of food. The rural nature of billions requires attention to food production as one element of livelihood strategies for this immense proportion of the global population. | Accepted, Revised for SOD |
| 13960 | 11 | 5 | 45 | 5 | 46 | explicitly include livestock/meat as element considered in the demand-side measures | Accepted, Revised for SOD |
| 9440 | 11 | 5 | 7 | | 7 | Here, I assume that availability means something like cost-competitive. The reserve of productive land remains effectively ample, the problem is often cost-competiitiveness. | Accepted, Revised for SOD |
| 14564 | 11 | 5 | 7 | | | DUE TO limited availability of productive land, INCREASING demand for both food and bioenegy may induce…... | Accepted, Revised for SOD |
| 5031 | 11 | 5 | 7 | 5 | 7 | I would add fiber and fodder to "due to growing food and bioenergy" | Accepted, Revised for SOD |
| 12362 | 11 | 5 | 8 | 5 | 8 | End of sentence could be simplified since the main consequence of extended use of fertilizer is higher N2O-emissions. Suggested rewriting: "...which imply more energy use for irrigation and higher N2O emissions from the increased use of fertilizer." | Accepted, Revised for SOD |
| 5032 | 11 | 5 | 9 | 5 | 9 | add land degredation? | Accepted, Revised for SOD |
| 10579 | 11 | 5 | 9 | | | "energy use" is for more than just irrigation | Accepted, Revised for SOD |
| 18022 | 11 | 5 | 13 | 5 | 14 | The term "will likely" is too strong. It attributes causality to the impacts of bioenergy and afforestation and reforestation on competition for land and other natural resources, on an ex-ante basis. Naturally, there are also ways of doing that in manners that avoid or minimize such competition. Thus, the suggestio is to use "may" instead of "will likely". The suggestion is also consistent with the term "may" already used in Section 11.4.3, page 35, lines 43 to 44. | Accepted, Revised for SOD |
| 11902 | 11 | 5 | 27 | 6 | 26 | Consider add a figure or table to summarize the changes in treatment "AFOLU" from IPCC SAR to AR4, and what are new in AR5. | Accepted, section revised - new figure added |
| 8314 | 11 | 5 | 28 | 5 | 40 | Also rural societies affect simultaneously land use of agriculture and forest. This point is enhanced as a reason to discuss agriculture and forest sectors together. | Accepted, Revised for SOD |
| 3532 | 11 | 5 | 41 | | 43 | It is hard to understand this sentence, please reformulate and make it clearer. | Accepted, Revised for SOD |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 18236 | 11 | 50 | | | | Page 50: table 11.8 (Potential of mitigation measures of global forestry activities. Global model results indicate annual amount sequestered or emissions avoided, above business as usual, in 2030 for carbon prices 100 US$/Tco2 and less), shows mitigation potentialities economically viable, by key region and mitigation options, calculated using global models which indicate annual amount of CO2 sequestered or avoided emissions by 2030, with carbon prices between 1 and 20 $, 20 – 50 $ and 100 $. In this case is evident that potential mitigation measures by forest activities, globally, are more obvious for Central and South America, followed by Asia countries and USA. Based on these prices, strategies will be focused to reduce deforestation, aforestation (the establishment of forests where there never has been forests) and forest management, being more striking, commercially at a price of 100 $, highlighting that no option represent negatives results, namely, loss. However, they recommend the elimination of uncertainty in the models showed because the lack of baselines does not allow definitive estimates of forest´s mitigation potential. Thus, is expected that combined effects of deforestation and degradation reduction, implementation of forest management, agroforestry and bioenergy will increase from now to 2030 and beyond, depending always of carbon sequestering prices. | Accepted, The issue has been recognized as part of the assessment. |
| 8217 | 11 | 50 | | | | VALUES UNDER FOREST MANAGEMENT COLUMN 3, 12, AND 30 ARE NOT CLEAR, ALSO UNDER REDUCED DEFORESTATION COLUMN 21 AND 30 THE VALUES ARE NOT CLEAR | Accepted, Reduced deforestation and forest management are |
| 5713 | 11 | 50 | | 52 | | The global forestry mitigation potential up to 2030 based on 3 different cost classes should also add one or two paragraphs on various possibilities and conditionalities that would be essential for mobilizing resources for the purpose. For example, enhanced mitigation commitments by developed nations could be the main trigger for the purpose. Similarly, a minimum support price may be helpful in ensuring realization of mitigation potential in forestry sector across the world. | Noted, (Peter, my understanding is that issues like this will be picked up in the synthesis report and/or in section 11.9 on transformation pathways) |
| 5620 | 11 | 50 | | | | . I had difficulty in following this table. I think there should be another column for each region giving the fraction for class 50-100. Thus the USA afforestation activity, the three columns should read 0.3; 0.3; 0.4. The cost columns should values to the nearest 1000. E.g. for forest management in the USA, the value should by 1,590 not 1,59. | Accepted, Table has been reformatted |
| 5835 | 11 | 50 | | | | The description needs some re-phrasing and re-working. It does not become clear what is meant by "Two right columns …". If you want to show fractions, why are values given in total units and not per cent? Please amend "1)" and "2)" accordingly. The potential is not equal over C costs up to a certain point - the 100 US$ - so your description under "3)" is wrong. Do you mean "maximum potential under C costs up to 100 US$"? If you want to have one column with a max. / total potential and two columns with fractions of this total that could be realized at the cost ranges specified in the column header it would be better - in my opinion - to place the "total" column at the left, not the right. Reading direction in English texts is left to right, so you have the important value (total) first and the fractions following. Pay attention to cell formats, too: is "USA / FM / 100" 1,590 or 1.59? You can also save space by using REDD as abbreviation instead of "reduced deforstation". | Accepted, Table has been reformatted |
| 11172 | 11 | 50 | | | | Definition of the activities such as afforestation, Reduced deforestation and forest management are not clear. Some explanations are needed to avoid missleading. | Accepted, Defined the terms in SOD |
| 12425 | 11 | 50 | 1 | 50 | | There seem to be some errors with the use of "," and "." in the numbers. | Accepted, Errors corrected in SOD |
| 9086 | 11 | 50 | 1 | | | Some typo errors ocurred in the Table. | Accepted, Errors corrected in SOD |
| 14443 | 11 | 50 | 1 | | | Check numbers. Decimal value appears to follow U.S. convention. Check value for USA (forest management), Total (deforestation, forest management). | Accepted, Errors corrected in SOD |
| 5621 | 11 | 50 | 10 | 50 | 10 | Removal of annual growth could be at a negative cost. I don't think this table takes into consideration using the NPP of trees. | Rejected, Correct - it does not |
| 4394 | 11 | 50 | | 50 | | units of sequestered C ? | Rejected, Stated in footnote 3 |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 10625 | 11 | 51 | | | | Please consider Strengers et al. (2008) for the costs of carbon plantations. Reference: Strengers, B.J., van Minnen, J.G., Eickhout, B., 2008. The role of carbon plantations in mitigating climate change: potentials and costs. Climatic Change 88, 343–366. | Accepted, Reference considered |
| 10626 | 11 | 51 | | | | Please consider Tavoni et al. (2008) for the costs of forests alternatives. Tavoni, M., Sohngen, B., Bosetti, V., 2007. Forestry and the carbon market response to stabilize climate. Energy Policy 35 (11), 5346–5353. | Accepted, Reference considered |
| 5622 | 11 | 51 | | | | Global forestry mitigation potential in 2030. The diamond spots on the graph are not explained. Again, I don't think this figure takes into consideration NPP of trees. | Accepted, Figure reformatted/revised in SOD |
| 5836 | 11 | 51 | | | | Please amend legend: the panel shows also diamonds in at least two colours, but no source is given for this. And please check author names (Sohngen / Songhen). | Accepted, Figure reformatted/revised in SOD |
| 14737 | 11 | 51 | 13 | | | …" One important reason that bottom-up…" This phrase is confusing needs to be clearer than it is now. | Accepted, Revised for SOD |
| 5623 | 11 | 51 | 21 | 51 | 22 | "Forestry mitigation options --- to contribute between 1.27 and 4.23 GtCO2/yr for economical viable abatement in 2030". This is extremely low. The current un-used accessible NPP from trees is an estimated 14.82 Gt wood, equivalent to an abatement potential of over 27 GtCO2/yr. This is more than 6 times the 4.32 GtCO2 figure and this is without other abatement measures considered in the text. The same applies to Figure 11.11 on page 52. | Noted, We are dealing with economic, not total biophysical potentials. Biophysical potentials of not the focus of modern assessments |
| 12426 | 11 | 51 | 3 | 51 | 5 | Could you please clarify if the albedo is included in the calculations, e.g. for afforestation? | Accepted, Clarified; no, not included |
| 18237 | 11 | 52 | | | | Page 52: Graph 11.11 (Annual economic mitigation potential in the forestry sector by world region and cost class in 2030), highlights the annual economic mitigation potential in the forest sector by region and cost by 2030. Again are Central and South America which have more mitigation potential for the forest sector, with similar values for sequestration to both lower costs of 20 $ and prices between 20 $ and 100 $, emphasizing that in a PNUMA report, it is suggested that forestry offers a mitigation potential of 1,3-4.2 Gt 1 CO2 / per year and stabilization of climate in 2ºC. These aspects are very important for Venezuela because of the potential represented by its forests and areas under management, estimated in 16.231.389 hectares (162.313,89 Km2). | Noted, Statement - not a comment |
| 5624 | 11 | 52 | | | | The regional bottom up maximum estimate of 4230 MtCO2 is very low and even the global forest sector models of 13,775 MtCO2 is low compared to the NPP from trees of OVER 33,600 MtCO2. Excluding current use of woody biomass, the net NPP is over 27,000 MtCO2. At present about 55% of woody NPP is in the tropics and according to Melillo et all (1993) 66% of NPP is in the tropic (see my article). Thus, the potential for expanding wood consumption, including energy is much greater than stated and much could be achieved quickly with the help of rural people and with proper incentives for them. | Noted, We are dealing with economic, not total biophysical potentials. Biophysical potentials of not the focus of modern assessments |
| 5625 | 11 | 52 | | | | This is extremely low. The current un-used accessible NPP from trees is an estimated 14.82 Gt wood, equivalent to an abatement potential of over 27 GtCO2/yr. This is more than 6 times the 4.32 GtCO2 figure and this is without other abatement measures considered in the text. | Noted, We are dealing with economic, not total biophysical potentials. Biophysical potentials of not the focus of |
| 5837 | 11 | 52 | | | | Please clarify text: You do not need to state "excluding bio-energy" two times. Concerning footnote "a": is it related to the column "regional, bottom-up, mean" only? However, if bio-energy is excluded in general, it does not have to be given here again. Numbers can be compared more easily if they are set right-bound. | Accepted, The table (should be referred to as Table 11.9) was reformatted and double statement removed in SOD. |
| 5838 | 11 | 52 | | | | Please either expand figure or table. Both show parts of the same information, so please delete one and show the information in one place. | Accepted, The table and the figure were reformatted in SOD |
| 13342 | 11 | 52 | 10 | | | occuring | Rejected, Do not understand the |

|---|---|---|---|---|---|---|---|
| 9458 | 11 | 52 | 15 | | 16 | Where would avoiding emissions from U.S. biofuels production go on this chart? North America or scattered everywhere where LUC is avoided? If the Searchinger et al. (2008) paradigm is to be adopted, it is inconsistent with this sort of framework. | Accepted, Explicitly recognized in SOD that net emissions outcome or emission abatement potentials from LUC is not considered in this section?????? (Peter, you are better placed to judge but my understanding is that this issue relates to an LCA but will be addressed somewhat in Chs. 7 and 8 on 'energy systems' and 'transport', respectively. These chapters, through the measurement of leveled costs of energy generation and leveled cost of conserved energy, will look into what feedstocks be used in bio-energy production as well as what fuels be |
| 13341 | 11 | 52 | 5 | | | Economic_mitigation | Rejected, Do not understand the |
| 18238 | 11 | 53 | | | | "… A recent PNUMA report suggests that forestry can offer a mitigation potential of 1,3-4.2 Gt 1 CO2 / per year in the achievement of stabilization of climate at +2ºC". This is a reckless asseveration: confer forests the responsibility of stabilize the temperature increase of global climate; there should be a balance with the diminution of GHGs by the developed countries / Annex 1. On the other hand, an increase of +2ºC is worrying for the life on the planet; this trend implies the design of simulation climate models immediately. In the best-case scenario, sure there will be adverse consequences for humanity and the environment, in particular in those areas identified as of high climate vulnerability. Finally, we encourage the IPCC to review this figure and the party countries to boost a mass dissemination of environmental education for all the population to promote environmental awareness globally. | Rejected, The purpose of IPCC AR5 is not to review non-peer-reviewed reports for governments, but to assess the best available science and provide a synthesis of it |
| 2365 | 11 | 53 | | | | As this is not in cost curve format, be explicit if there is doublecounting between the measures | Accepted, Further assessed and caveats used as and when applicable. |
| 13343 | 11 | 53 | | | | Why use up to. What was the number that the scenario was tested at. Use this number. | Rejected, It was "up to" - these were the thresholds used in the FASOM model |
| 5626 | 11 | 53 | 1 | 53 | 2 | Again the UNEP figure seems very low for the mitigation potential. | Rejected, Looks very reasonable to me - and consistent with many other studies |
| 12429 | 11 | 53 | 10 | | | Manure management has been shown to represent a relatively low reduction potential compared to other measures. It should be indicated in the legend that this does not include the substitution effect for biogas in other sectors used in district heating or as fuel for buses and trucks. | Accepted, Explicitly mentioned in SOD that only CH4 emission reduction potential considered here |
| 11069 | 11 | 53 | 13 | 53 | 13 | Is more than one figure being referred to here as suggested because I can see only one that applies. | Accepted, Changed 'figures' to |
| 11070 | 11 | 53 | 13 | 53 | 17 | Fig. 11.12 does not break down mitigation potential by category (e.g. carbon sequestration) as indicated buy the text, or should a different figure or table be referred to here? | Accepted, Better explained the mitigation options/categories in SOD |
| 13344 | 11 | 53 | 14 | | | CO2e | Rejected, Do not understand the |
| 9335 | 11 | 53 | 15 | | | The word 'is' is suggested to be deleted. | Accepted, Revised in SOD |
| 13345 | 11 | 53 | 15 | | | which may (remove is) | Accepted, Revised in SOD |
| 16600 | 11 | 53 | 18 | 53 | 25 | McKinsey et al. 2009 - is another apparently non-peer-reviewed publication; furthermore, it is a company that gets some of its income from studies of climate change mitigation, and its data is proprietary. Unless you can cite a journal article giving these results, don't court danger by including this paragraph. | Noted, Included for SOD as publically available |
| 5628 | 11 | 53 | 21 | 53 | 21 | What is MACC? Spell out. | Noted, spelt out in its first use. |
| 18288 | 11 | 53 | 24 | | | "a mitigation potential of 1.1-4.3 Gt CO2 / yr" should it be CO2-equ.? | Accepted, Corrected |
| 18289 | 11 | 53 | 24 | | | It would be helpful to have the mitigation potential also expressed as % of total agricultural CO2-equ. Emissions; so far, total emissions are only given as Gt C (not Co2-eq.) | Rejected, Not a good idea, as there are C sinks which act very differently from |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 13983 | 11 | 53 | 24 | | | isn't this just circularly referential? Isn't UNEP just using IPCC AR4 data? | Accepted, I don't think so - I reviewed the UNEP report - needs to be checked |
| 5627 | 11 | 53 | 3 | 53 | 3 | 11.6.3 Agriculture. Nitrogen-fixing trees (and shelterbelts) could play an important role in all the potential mitigation measures for agriculture. So the potential may be much greater than indicated. | Rejected, This will be tiny in the global picture |
| 12427 | 11 | 53 | 4 | 53 | 12 | Summarizing the ecomic potential for each practice(measure) for resp 20, 50 and 100 USD in figure 11.12 results in resp about 1 000, 2 400 and 3 300 Mt CO2-eq/yr. These are lower than the figures in the text line 6 resp 1 600, 2 700 and 4 300 Mt CO2-eq/yr. Is there an explanation for the differences? | Rejected, No - the numbers in the figure add up exactly to the numbers in the text. Must be reading the axis incorrectly. |
| 13982 | 11 | 53 | 5 | 53 | 7 | the question of demand must be integrated into this economic analysis. As carbon prices increase, the proported potentials increase significantly. But multiply here -- 4.3 billion tonnes at $100/ tonne is almost a half a trillion dollars. Do you really propose that at some point there will be half a trillion dollars available just for soil carbon sequestration? are you serious? and how are the significant caveats of pp. 31 and 35 factored into this "economic" potential? | Rejected, Very complex -and we can only review work that has already been done. Nobody is proposing how much money will or will not be available- simply estimating the potential that would be realized if these carbon prices |
| 11067 | 11 | 53 | 5 | 53 | 5 | It is not accurate to state that Fig. 11.12 presents "various …..stabilization scenario pathways", it only presents one as indicated in the figure caption. | Accepted, Revised in SOD |
| 11068 | 11 | 53 | 7 | 53 | 8 | The final sentence of this paragraph appears redundant to what was stated in the first sentence, as both sentences are referring to the same figure. | Accepted, Revised in SOD |
| 12428 | 11 | 53 | 8 | 53 | 12 | For clarification a short description of the difference between "Restore cultivated organic soils" vs. "Cropland/Grazing land management" should be given. Does restoring of cultivated soil mean that the soil is converted to natural soil or is it soil that is e.g. drained to produce more crop? | Rejected, The difference is between peatlands (organic soils) and non-peatlands (mineral soils) |
| 15618 | 11 | 53 | 3 | | | This section on economic mitigation potentials in agriculture does not mention any analysis of demand-side measures. I don't know whether such analysis exists to parallel the other IPCC analysis, but Wirsenius S. and others (2010), seems worth discussing as a start. Wirsenius S., F. Hedenhaus, and K. Mohlin (2011). Greenhouse gas taxes on animal food products: rationale, tax scheme and climate mitigation effects. Climatic Change 108(1-2), 159-84. | Accepted, Very few studies - these are all discussed in the systemic perspective section |
| 13346 | 11 | 54 | | | | Be more specific for what the actual actions are that are mitigating GHGs under the heading "Option" | Rejected, The individual measures are presented in table 11.2 in section 11.3 |
| 5629 | 11 | 54 | | | | Trees could play an important role in all the options and thus increase the CO2 equivalent for the different prices of CO2. For the subsistence sector, cheap inputs could increase fertility. They include wood ash (high in K), manure (N), compost (N P K), Lime (CaCO3: this increases the pH and facilitated the release of P), soot (C), bone meal (Ca,) dried blood (N) and no-till etc. | Rejected, This was not in the published studies |
| 5839 | 11 | 54 | | | | Please explain what is given in brackets: min - max., standard deviation, …? | Accepted, Explained in SOD: Standard |
| 13984 | 11 | 54 | | | | are the assumptions underlying these numbers still valid? I would suggest a reassessment -- that's the point of having an assessment called AR5 -- it should evaluate and update AR4, not merely copy the data. | Partially Accepted, Agreed - we have included all new studies in figures 11.10 |
| 12431 | 11 | 54 | 1 | | | The figure needs some more explanation, eg the big differences in mitigation potential in this figure, compared with table 11.10. | Accepted, Revised in SOD |
| 13985 | 11 | 54 | 1 | | | where is the analysis of other financing mechanisms? In the absence of a global carbon price, significant issues of non-permanence and a functioning market, it clearly begs the question of how to mobilize resources for mitigation in agriculture that are not linked to "the carbon market." | Noted, The issue has been dealt with elsewhere in the report. (Peter, I suspect Ch 16 will deal with this issue.) |
| 11071 | 11 | 54 | 4 | | | A recent analysis (In press) by Delgrosso and Cavigelli entitled "Climate stabilization wedges revisited: can agricultural production and greenhouse gas reduction goals be accomplished?" (Frontiers in Ecology and the Environment, In press) could be included in this summary and/or elsewhere in the chapter or the analysis. They conclude that "agriculture could provide wedges of 1350 to 3900 Tg C under realization of technological and human behavior mitigation potentials". I have sent the article via email to comments@ipcc-wg3.de. | Accepted, Included in SOD |
| 12430 | 11 | 54 | 5 | | | This table should be placed together with the text at page 53 line 26 to p 54 line1. | Accepted, Revised in SOD |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 11072 | 11 | 54 | 5 | | | What is the value of republishing the information that was already included in Fig. 8.9 of AR4? Did you consider an updated analysis that incorporates the previous as well as more recent information instead of presenting them separately? | Accepted, Agreed - we have included all new studies in figures 11.10 and 11.13 |
| 14268 | 11 | 55 | | 58 | | sections 11.7.1, 11.7.2 & 11.7.3 are unnecessarily prolonged. These can be minimized to have the desired number of pages allocated for this chapter | Accepted, Section re -drafted |
| 5714 | 11 | 55 | 10 | 55 | 17 | In respect of forests, co-benefits or incentivization of ecosystem services other than carbon is being discussed globally. What is the possibility of financing these services alongwith financing of mitigation in the forestry sector? One or two paragraphs on this aspect will also be useful. For example, even mentioning that mixing up of the forestry mitigation and other forest ecosystem services in terms of financing may not be a feasible approach for the present, or that more research would be required to go into the determination of modalities for valuation of other ecosystem services before considering their financing, would be a useful suggestion. | Partially Accepted, We checked references on success/failure of A/R CDM and the voluntary carbon markets in promoting mitigation and other ecosystem services. |
| 11175 | 11 | 55 | 10 | 61 | | I co-benefits, Risks and uncertainties, Barriers and opportunitiesの 3 つに区分して記述している。他の章との横並びなのかもしれないが、記述の多くが重複しており、冗長な印象。11.7.3 spilloversはコンセプトが不明。不要では？ | Rejected, Sorry, we could not read the comment. |
| 11176 | 11 | 55 | 10 | 61 | | From 11.7.1 Co-benefits to 11.8 Barriers and opportunities, there are some dupricates of discriptions in these sections. The concept of these setions must be distinguished clearly. | Accepted, Section re -drafted |
| 11178 | 11 | 55 | 10 | 61 | | The impact of international market prices for crops and timbers should be mentioned as risks or barriers of mitigation options. | Accepted, Considered for the SOD in 11.7 (could also have been in 11.8) |
| 11305 | 11 | 55 | 12 | 55 | 15 | Urban and peri-urban agriculture is a perfect example of AFOLU's land management co-benefit potential, especially on vulnerable sites like steep hillsides and/or floodplains where permanent human settlement is ill-advised. UPAF in this areas may also turn geographic liabilities into livelihoods and increase food security close to where it is needed most acutely. | Partially Accepted, Considered to include positive examples --> checked references |
| 11173 | 11 | 55 | 12 | 55 | 15 | In addition to these example of co-benefits, prevention of landslides and coastal erosion must be included. | Partially Accepted, Included partially in co-benefits and also in 11.5 |
| 5630 | 11 | 55 | 13 | 55 | 14 | I think the sentence should read --- rising salination, lowering ground water levels --- | Accepted, Improved |
| 10116 | 11 | 55 | 19 | 55 | 19 | There are may other important activities with socioeconomic cobenefits like improved livestock healf and improved feedproduciton/regeneration of degraded pastures will increase the income, also improve the nutrition of the household and create a capital assest which improfvew livelihoodsecurity. Another excample is integrated food-energysystems discussed earlier. Agrocofersty will create an income source, improve nutrition etc. | Section has been reviewed including more co-benefits and potential adverse effects from livestock |
| 5631 | 11 | 55 | 20 | 55 | 48 | Change timber production to wood production. | Rejected, Both terms are widely |
| 2634 | 11 | 55 | 21 | | | Mostly not ag to forests but forests to ag. | Partially Accepted, Sentence improved |
| 13347 | 11 | 55 | 25 | | | Are the authors promoting the commercialization of water. | Noted, No, we are only mentioning |
| 16602 | 11 | 55 | 38 | 55 | 38 | The phrase "land tenure" is better than "property rights" here -- more inclusive of traditional tenure systems. | Partially Accepted, Tenure rights included (both elements are important, tenure is often not enough, property |

| 5096 | 11 | 55 | 46 | 55 | 46 | consideration of cobenefits is somewhat more complex than stated for example under a hypthetical cap and trade elbakdize and mccarl compare co benfits from sequestration with those from reducing power plant emissions and show that the cobenefits offset and reccomend ignoring them since you have to not do selective evaluation but look at tfor all strategies, this is also coverd in the nas report on limiting emissions Fri, R., M. Brown, D. Arent, A. Carlson, M. Carter, L. Clarke, F. de la Chesnaye, G. Eads, G. Giuliano, A. Hoffman, R.O. Keohane, L. Lutzenhiser, B.A. McCarl, M.C. McFarland, M.D. Nichols, E.S. Rubin, T. Tietenberg, J. Trainham, L. Geller, A. Crane, T. Menzies, and S. Freeland, "America's Climate Choices Limiting the Magnitude of Future Climate Change", National Academy Report, The National Academies Press, Washington, D. C, 2010. Elbakidze, L., and B.A. McCarl, "Sequestration Offsets versus Direct Emission Reductions: Consideration of Environmental Co-effects", Ecological Economics, Volume 60, 564-571, 2007. | Partially Accepted, References checked. We agree that attribution of co-benefits and negative effects is difficult and therefore we discuss "potential" effects in the AR5. |
| 13348 | 11 | 55 | 47 | | | net (not nett) | Accepted, Done |
| 11174 | 11 | 55 | 49 | | | Something is missing after the last sentence. Period or additional explanations. | Accepted, Section re -drafted |
| 13350 | 11 | 55 | | | | This section should have a discussion that reduction of emissions from agriculture reduces inefficiencies and improves agricultural profitability. | Partially Accepted, Although the point is interesting, it can not be generalized as for all GHG emissions in the agricultural |
| 15619 | 11 | 55 | 18 | | | The socio-economic co-benefits does not mention those from demand-side consumption measures, which can improve animal welfare. E.g., industrial systems now produce approximately two-thirds of the world's poultry meat and eggs, and more than half of all pork. Food and Agriculture Organization of the United Nations (2009). The state of food and agriculture: livestock in the balance (Rome, Italy: FAO, p. 27). Available at: http://www.fao.org/docrep/012/i0680e/i0680e.pdf. The breadth of scientific evidence demonstrating that intensively confined animals are frustrated, distressed, and suffering under modern production schemes is extensive, conclusively substantiating that battery cages for egg-laying hens and crates for pregnant sows and calves are simply not appropriate environments. Duncan I.J.H. (1970). Frustration in the fowl. In: Freeman B.M. and Gordon R.F. (eds.), Aspects of Poultry Behaviour (Edinburgh, Scotland: British Poultry Science Ltd., pp. 15-31). Špinka M. (2006). How important is natural behaviour in animal farming systems. Applied Animal Behaviour Science 100(1-2),117-28. Baxter M. (1994). The welfare problems of laying hens in battery cages. The Veterinary Record 134(24), 614-9. Dawkins M.S. (1990). From an animal's point of view: motivation, fitness, and animal welfare. Behavioral and Brain Sciences 13, 1-61. Vestergaard K. (1984). An evaluation of ethological criteria and methods in the assessment of well-being in sows. Annales de Recherches Vétérinaires (Annals of Veterinary Research) 15(2), 227-36. Broom D.M., Mendl M.T., and Zanella A.J. (1995). A comparison of the welfare of sows in different housing conditions. Animal Science 61, 369-85. European Commission, Scientific Veterinary Committee, Animal Welfare Section. 1995. Report on the welfare of calves. Adopted November 9. Available at: http://ec.europa.eu/food/fs/sc/oldcomm4/out35_en.pdf. | Accepted, Animal welfare has been included at the social side. Why? Because the understanding of welfare is based on cultural values. References were checked. Special consideration was given to scientific papers |
| 17989 | 11 | 55 | 21 | 55 | 37 | From where does this "increase in the overall capital" come from? In what way would that be a co-benefit, given that the capital would not be available elsewhere in the economy? While the mentioned payment schemes might obviously lead to additional income for land-holders, these seem to be policy instruments to realize mitigation options rather than mitigation options themselves and should be discussed in the policy section. | Rejected, Make your analysis. If you Considered K a finite element or not. Furthermore there are sectors in the economy that are over-capitalized causing a stagnation. This is more a |
| 17990 | 11 | 55 | 24 | 55 | 27 | While increased (or decreased) downstream water availability might well be a co-benefit (or co-cost) of mitigation options such as revegetation or reforestation, why would additional timber be a co-benefit when it should clearly be part of the economic asssessment of the mitigation option? | Rejected, It is a co-benefit of the mitigation. That means that besides the mitigation benefit you get other benefits. Further, getting additional wood doesn't necessary have a direct economic benefit as it can be used by the producer (e.g. firewood, building) When this |

|---|---|---|---|---|---|---|---|
| 17991 | 11 | 55 | 42 | 55 | 22 | Since these improvements on institutional agreements are hard to quantify, I would frame these as opportunities rather than co-benefits and thus move the discussion to section 11.8.1. | Rejected, Co-benefits are not only quantifiable things. The existing institutional framework can be an opportunity or a barrier . But changes in the institutional framework can be also a consequence of an AFOLU measure |
| 10117 | 11 | 56 | 1 | 56 | 1 | Healt would fit better to socioeconomic benefits, nutrition benefits must be better articulated | Accepted, Done |
| 16603 | 11 | 56 | 15 | 56 | 22 | This paragraph, as with that mentioned in my point 61, is contradicted in the discussion of land sparing on p 69, lines 1-12. The land sparing issue should be discussed in one place so that you have a consistent set of opinions on it. P. 69 is better at including the evidence on both sides, although as mentioned earlier it leaves out several important works. | Accepted, re-drafted |
| 9459 | 11 | 56 | 15 | | 22 | Key point, but poorly articulated and misplaced. | Accepted, re-drafted |
| 13986 | 11 | 56 | 15 | 56 | 22 | this assertion needs to be significantly qualified to reflect the substantial disagreement in the scientific community about these conclusions. | Accepted, re-drafted |
| 12432 | 11 | 56 | 2 | 56 | 2 | Reduced deforestation will have at least the same benefits as reforestation. Please consider to add "reduced forestation" before reforestation. | Rejected, Environmental and health effects from reducing deforestation and reforestation are not necessarily the same. Impacts on watersheds is a good |
| 15200 | 11 | 56 | 2 | 56 | 14 | what's the point here? | Noted, |
| 3871 | 11 | 56 | 20 | 56 | 22 | Bioenergy crops are being exploited with high yields since this is a compulsory market for them in some countries (e.g. USA, Brazil, EU). Thus, the statement for Austria does apply for bienergy crops. This isn't mentioned in Section XY where mainly negative impacts of bioenergy are presented. Please, be fairer in your evaluation. See Pacca and Moreira, 2009. - Pacca, S. and J. R. Moreira, 2009. Historical carbon budget of the brazilian ethanol program, Energy Policy, 2009, vol. 37, issue 11, pages 4863-4873 | Partially Accepted, Reference checked. The discussion on bioenergy co-benefits and potential negative effects has been moved to the annex on biodiversity, where a more balanced view has been |
| 3872 | 11 | 56 | 28 | 56 | 31 | This point must be made clearer. Several papers complain that bioenergy crops require too much water. The amount of water required includes rainfall. Here you claim that surface cover can increase water availability. Please, explain the contradiction pointed out. | Partially Accepted, The impacts discussed here are the impacts from activities aimed at restoring watersheds (i.e. watershed restoration), which is rarely done through bio-fuel plantations. What is often done is a combination of biofuel crops and other (trees and crop) species. Biofuels monocultures on the other side can require much water, but there won't be any reason for making |
| 2635 | 11 | 56 | 33 | | 37 | There are many examples of agricultural yields increasing but as many examples for the need for a new green revolution since yields are down. | Noted, |
| 12433 | 11 | 56 | 38 | 56 | 38 | Please consider to add a few words so the sentence read; "Measures to reduce GHG-emissions from agriculture and forestry may also improve air, soil and water quality" | Accepted, Good suggestion! It increases readability. The whole section has been |
| 10118 | 11 | 56 | 42 | 56 | 42 | This section is vague, mainly refers to other sections, maybe should focus on innovative new technologies , including breeding, pest management, wasteproductuse, …or then skipped if no more content developed | Partially Accepted, Section has been re-drafted |
| 5097 | 11 | 56 | 43 | 56 | 43 | this section does not fit well under its subheading | Accepted, Section reviewed for the SOD |
| 13351 | 11 | 56 | 44 | | | agricultural, not agricclutual | Accepted, checked |
| 10179 | 11 | 56 | 7 | 56 | 14 | In some cases it is unclear whether the studies referred to are theoretical or empirical | Accepted, Section redrafted considering |

| 14680 | 11 | 56 | 2 | 56 | 3 | Persistant reductions in light levels will tend to reduce the productivity of crop and forest systems. | Accepted, Considered for the SOD, however, few clear references |
| 4266 | 11 | 56 | 40 | 56 | 41 | This section omits important health co-benefits from reduction of ischaemic heart disease as a result of reduction in animal source saturated fat consumption and reduction in large bowle cancer from reduced red and processed meat consumption. There are also benefits from increased fruit and vegetable consumption. Friel S, Dangour AD, Garnett T, Lock K, Chalabi Z, Roberts I, Butler A, Butler CD, Waage J, McMichael AJ, Haines A. Public health benefits of strategies to reduce greenhouse-gas emissions: food and agriculture. Lancet 2009; 374:2016-25 | Partially Accepted, Section re-drafted considering impacts on human health |
| 15620 | 11 | 56 | 40 | 56 | 41 | There are numerous additional studies discussing environmental and health benefits of reduced consumption. I suggest citing and/or discussing some of those briefly here. Mekonnen M.M. and A.Y. Hoekstra (2012). A global assessment of the water footprint of farm animal products. Ecosystems 15, 401-15. Available at: http://doc.utwente.nl/80897/1/Mekonnen-Hoekstra-2012-WaterFootprintFarmAnimalProducts.pdf. Eshel G. and P. Martin (2009). Geophysics and nutritional science: toward a novel, unified paradigm. The American Journal of Clinical Nutrition 89(suppl), 1710S-16S. McMichael A.J., J.W. Powles, C.D. Butler, and R. Uauy (2007). Food, livestock production, energy, climate change, and health. The Lancet 370, 1253-63. Marlow H.J., W.K. Hayes, S. Soret, R.L. Carter, E.R. Schwab, and J. Sabaté (2009). Diet and the environment: does what you eat matter? The American Journal of Clinical Nutrition 89(suppl), 1699S-703S. Donner S.D. (2007). Surf or turf: a shift from feed to food cultivation could reduce nutrient flux to the Gulf of Mexico. Global Environmental Change 17, 105-13. | Partially Accepted, References were checked. The relationship between diet and gHG emissions is addressed in sections 11.4 and 11.7 as well as dietary change |
| 10255 | 11 | 56 | 1 | 56 | 41 | This section is too weak and must be refocused on the human health aspect! There is really much to be considered:<br>- avoided burning of residues that have positive impact in reducing respiratory problems (e.g. Cançado ED, Saldiva PHN, Pereira LAA, Lara LBLS, Artaxo P, Martinelli LA, Arbex MA, Zanobetti, Braga ALF (2006) The impact of sugar cane–burning emissions on the respiratory system of children and the elderly. Env. Health Persp. 114: 725-729.);<br>- Debate on some substancies proned to reduce methane emission by liter of milk produced such as the Bovine somatotrophine;<br>- The no-tillage and muching option that is also synonymous of a shift in herbicide consumption;<br>- The bioenergy debate arround Jatropha and the presence of tumor promoters and phytotoxin (curcin) in its seed oil (e.g. Horiuchi T, H Fujiki, M Hirota, M Suttajit, M Suganuma, A Yoshioka, V Wongchai, E Hecker, T Sugimura. (Mar 1987) resence of tumor promoters in the seed oil of Jatropha curcas L. from Thailand. Japanese Journal of Cancer Research, 78(3):223-236;<br>- The possible presence of polycyclic aromatic hydrocarbons (PAHs) is Biochars (e;g. Hilber et al. 2012. Quantitative Determination of PAHs in Biochar: A Prerequisite To Ensure Its Quality and Safe Application, J. Agric. Food Chem., 2012, 60 (12), pp 3042–3050 | Partially Accepted, Section re-drafted considering impacts on human health |
| 10256 | 11 | 56 | 42 | 57 | 2 | This section is too short in its present form to be informative. | Accepted, Length of the sections is given. We have redrafted the section and hope that even if short it will be |
| 15621 | 11 | 56 | 42 | 57 | 2 | One additional technological consideration may be cultured meat production. Tuomisto H.L. and M.J.T. de Mattos (2010). Life cycle assessment of cultured meat production. 7th International Conference on Life Cycle Assessment in the Agri-Food Sector in Bari, Italy, September 22-24. Available at: http://oxford.academia.edu/HannaTuomisto/Papers/358909/Life_cycle_assessment_of_cultured_meat_production. | Accepted, Livestock sections improved throughout |
| 17992 | 11 | 56 | 2 | 56 | 6 | The climate benefits are no additional benefits to mitigation and should not be discussed under the framework of co-benefits. | Accepted, done |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 10627 | 11 | 57 | | | 8 | Please consider the Caparrós et al. (2010). This paper analyzes reforestations in Spain including, in addition to commercial values, social preferences. The paper also studies the impact of different carbon accounting methods on the speciees selected. Reference: Caparrós, A, Cerdá, E., Ovando, P. and Campos, P , 2010. Carbon Sequestration with reforestations and biodiversity-scenic values. Environmental and Resource Economics 45: 49-72. | Accepted, References checked |
| 10120 | 11 | 57 | 10 | 57 | 1 | The argumentation here assumes that mitigaiton is connected to carbon markets, but mitigation and possible financing mechanisms are two different things. Reduction of net emissions is mitigaiton. How this is achieved is another issue, carbon markets is one options, not very probably in my view in small holder/pastoralist context in developing countires (major land users). Since agricultural investments (including farmers as the maininvestors) are about 1500 billion/year. directing thesefor climate smart agricultural investments (with mitigation as a co-benefit0 will I think be the major means of financing for mitigaiton in agriculture. Some kind of mitigation top up (to cover MRV if countries want to demonstrate downward deviation from ther baseline in their national reporting), investment suport for specially atractive mitigation practices with long lead limes ets. seem much more realistic alternative for agriculture that carbon markets. Through NAMAs Annex 1 countries could also offset theri emissions if they cannot do it in theri own agsectro (countries like New Zealand). LUC is another issue and has to be linked to red where a landscape approach looking at all ecosystem services is needed | Rejected, Without proper financing measures it is unlikely to get the AFOLU potential used. This is special critical in developing countries. The carbon markets (including all, Kyoto, the voluntary markets and the semi-regulated markets) are a main instrument promoting AFOLU activities. Carbon markets and agriculture are not necessarily two different things. Here it seems to be a confusion by the reviewer. The VCS for example includes methods for agriculture in its voluntary scheme |
| 11213 | 11 | 57 | 11 | 57 | 25 | Section 11.7.2.1 on socioeconomic risks and uncertainties could expand the analysis of risks of mitigation measures on indigenous peoples and local communities to include low carbon developments like dams and carbon sequestration (tree plantations) that risks marginalising community land and resource rights and causing environmental damage etc | Partially Accepted, The risk mentioned here is not only for indigenous peoples but for many rural communities. The issue has been included in the SOD |
| 5098 | 11 | 57 | 11 | 57 | 11 | I would not call the following risks they are tradeoffs "Some mitigation measures may result in a decrease in the amount of land available for food 11 production (e.g. reforestation of farmland to sequester carbon or produce bioenergy), decrease 12 yields (e.g. competition between trees and crops, reduced yields with reduced fertilizer inputs), or 13 directly compete for food materials as a bioenergy feedstock (e.g. conversion of sugar or maize to 14 ethanol)." | Rejected, It is a trade-off in the sense of land availability . However it is a high risk from the livelihood perspective |
| 3873 | 11 | 57 | 11 | 57 | 11 | Here it is stated that multiuse of land decreases yield and has negative impacts on GHG mitigation. Early in this paper multiuse of land is recommended as a mitigation source. How can we live with such contradiction? | Rejected, It is written that "some mitigation measures MAY result..." We didn't mention any specific and we didn't |
| 5099 | 11 | 57 | 15 | 57 | 15 | what is the risk in "Mitigation projects may have rules that require the mitigation activity to be in place for 70-16 100 years; this can reduce future flexibility in land-use." this is a barrier | Rejected, Defining use for such a long period can be an important risk for livelihoods in developing countries as these are locking any future use that |
| 5510 | 11 | 57 | 16 | 57 | 17 | The reviewer strongly agrees with the issue of the required 70-100 year time frame as counterproductive to many mitigation strategies. Commercial tree plantations for example can have a 40 year rotation period- and not qualify as mitigation- however these types of plantations provide sustainable forests, multiple benefits as well as carbon storage. The required time frame also puts constraints on crediting for soil carbon and an emphasis on increasing inert C in soil systems, again counterproductive. As the potential benefits of rapid action within this sector are large and cost productive- this is a key hurdle to be overcome | Noted, Thanks. This comment is completely opposed to the previous comment. |
| 5840 | 11 | 57 | 17 | 57 | 18 | Not clear: why should land holders want to repurchase C credits? The projects are tailored to generate credits. Buying credits can only be necessary if the project failed the expectations? | Partially Accepted, That can make sense e.g. in developed countries through JI projects. Consider rewording |
| 16604 | 11 | 57 | 18 | 57 | 19 | This assumes both a broad carbon market including land use credits, and landholders who participate in it actively. Neither is the case currently and as mentioned in my point 4, the trends are no longer moving in that direction. Delete. | Rejected, It only assumes that this is possible. If the possibility exists then land-holders need to consider this |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 12436 | 11 | 57 | 18 | 57 | 20 | Please consider to explain the meaning of "beyond 2015". The meaning of this sentence is hard to understand. | Partially Accepted, Page is incorrect. The sentence is in page 58. It is expected that a new agreement under the UNFCCC will be achieved at the latest by 2015. This is one of the outcomes of the last COP in Durban. However, as there is not yet clarity about the architecture of such an agreement |
| 5100 | 11 | 57 | 25 | 57 | 25 | personally I think there there are risks that you omit likel that with distribution of future carbon prices, amount of sequestration, monitoring reliability or emissions reduction, disturbances like fires, future value of resource and opportunity costs. Also indirect land use is a risk as we dont often know what it is | Partially Accepted, Issues were considered and some included in the SOD |
| 5101 | 11 | 57 | 25 | 57 | 25 | I don't find "The impacts of greenhouse gas mitigation in the AFOLU sector on other climate drivers (such as 27 albedo and water balance) are discussed in detail in section 11.5 so are not discussed further here." to be a risk it is a known consequence and a tradeoff | Accepted, Discuss with Ravi and Frank |
| 12437 | 11 | 57 | 26 | 57 | 26 | Please specify which section "The section on systemic perspectives" refers to. | Accepted, Redrafted |
| 3874 | 11 | 57 | 29 | 57 | 32 | Here you are presenting negative aspects of land use intensification. Earlier in this paper, high yields were described as a good approach to reduce GHG emissions. I understand that what is important is the amount of fertilizers used in relation to the volume of useful crop harvested. | Partially Accepted, High yields are not considered as negative impacts in the SOD |
| 11214 | 11 | 57 | 3 | 57 | 8 | As well as the observation in the text that mitigation might have positive impacts on tenure, land use rights and governance, there is an equal risks that these measures might have negative impacts if human rights standards, FPIC and rule of law are not adhered to... | Noted, We agree, and this has been mentioned in other subsections of the chapter (e.g. 11.4.4) |
| 5632 | 11 | 57 | 3 | 57 | 8 | Fully agree with this paragraph. Line 7 change greated to greeted. | Accepted, Thanks. Term corrected. |
| 10119 | 11 | 57 | 3 | 57 | 3 | This is weak, much more needs to be said about mitigation, since it is a very contentuos issue. Mitigation in agriculture in existing land area can be framed as a co-benefit of adoting climate smart practies i.e. increasing productivity sustainably on existing land area, building the resilience and adopting long term adaptation strategis, and then having mitigaiton as a co-benefit. The contentuous issue is really land use change and the role of agriculture and bioenergy there, this has been well discussed earlier, probably taking a lnad scape approach securing multiple objectives trhoug inclusive participatory processes is the way forward here. | Partially Accepted, Page 57 line 3 deals with public perception. We have considered "smart agriculture" in the SOD: However the term is not really defined, neither there is a definitive agreement on it. Thus we include the positive impacts only. |
| 5103 | 11 | 57 | 31 | 57 | 31 | there may be risks in environmental quality from increased n use and runoff, pesticides can also be a problem | Accepted, Discussed in the SOD in environmental co-benefits and risks |
| 5104 | 11 | 57 | 31 | 57 | 31 | there is a major risk of practice reversal particularly if programs are voluntary | Rejected, The comment is highly speculative. There is not much to prove |
| 5105 | 11 | 57 | 31 | 57 | 31 | there is also a major risk of non performance. I have been working with steve rose and he has estimates from a trader on delivery risk due to international contraacts, political instability, individual performance ets that shows some high riskes (20-50% non performance) | Accepted, Discussed in section 11.5 |
| 5106 | 11 | 57 | 31 | 57 | 31 | wher you say (R.B. Jackson et al., 2005) documented several effects of afforestation/ 35 reforestation on the environment" I think this is wrong (I am a coauthor) they really looked at water not the total environment, you should use the word water in the sentence | Accepted, Redrafted |
| 5102 | 11 | 57 | 32 | 57 | 32 | leakage is a known concept in mitigation and I would avoid use of the word | Accepted, Redrafted |
| 3875 | 11 | 57 | 35 | 57 | 48 | Here the statement is against land cover increase. Just a few paragraphs before land cover was presented as a potential benefit for water. We need a final conclusion on that. | Accepted, Redrafted |
| 12435 | 11 | 57 | 39 | 57 | 40 | Do plantations have increased nutrient demand compared with cropland, as stated in the sentence ? | Accepted, Redrafted |
| 12434 | 11 | 57 | 4 | 57 | 4 | Please consider to add "can" before have, to make the statement more nuanced and more consistant with p.57 line 11-14. | Accepted, Redrafted |
| 13353 | 11 | 57 | 40 | | | Space between words: increase_nutrient: changes soil chemistry (s on change) | Accepted, Redrafted |
| 5633 | 11 | 57 | 43 | 57 | 48 | Some litter decomposition can raise the pH, especially from broadleaf trees. Agroforestry crops --- have been used. Used for what? VOC emitted --- by most of the species commonly used. What common species? | Accepted, Redrafted |

|---|---|---|---|---|---|---|---|
| 10192 | 11 | 57 | 48 | 58 | 3 | What about reduced land run-off of precipitation due to increased uptake by biomass and soil after reforestation/afforestation, as well as dew harvesting by the forest? See e.g. Meuser (1990) Agricultural and forest meteorology, 50: 125-138; del Campo et al. (2006) Forest Ecology and Management, 235: 107-115 | Accepted, One of the references is too old, the other one is only 2006. We searched for more recent references on |
| 13352 | 11 | 57 | 7 | | | greeted not greated | Accepted, Redrafted |
| 10257 | 11 | 57 | 3 | 57 | 8 | There will be difference between countries (developping, developped,…), and also rather similar to section 11.8.4. | Accepted, We tried to include the regional differences in the SOD |
| 5381 | 11 | 57 | 4 | 57 | 5 | The first sentence of this paragraph is really a sweeping statement. What evidence has been offered that mitigating terrestrial carbon emissions are going to throw farmers off their land. How do we know that this is the cause and not other drivers, e.g., there have been a number of reports of China and oil-rich states buying up large tracts of land in Africa to grow food which is then imported into the country that bought the land. Certainly that is displacing small farmers. How do we know that mitigation will be negative. What evidence has been presented in Chapter 11 for such a sweeping statement? See for example Collier, P. and S. Dercon, AFRICAN AGRICULTURE IN 50 YEARS: SMALLHOLDERS IN A RAPIDLY CHANGING WORLD?, in Expert Meeting on How to Feed the World in 2050, Food and Agriculture Organization of the United Nations, Economic and Social Development Department, FAO, Editor 2009, Food and Agriculture Organization of the United Nations: Rome, Italy.http://www.fao.org/docrep/012/ak542e/ak542e00.htm ftp://ftp.fao.org/docrep/fao/012/ak542e/ak542e18.pdf | Partially Accepted, Section has been re-drafted. New references are included, more were checked |
| 14445 | 11 | 57 | | | | This is a very important risk with mitigation strategies. Good to see it receives attention in this chapter. Does this topic receive more attention in other chapters? | Noted, Thanks |
| 15622 | 11 | 57 | 10 | 57 | 25 | To the extent that mitigation measures encourage industrial farm animal production practices, there are numerous socio-economic risks for consideration, including to small farmers and animal welfare. Mirle C. (2012). The industrialization of animal agriculture: implications for small farmers, rural communities, the environment, and animals in the developing world. The 10th European International Farming Systems Association Symposium in Aarhus, Denmark, July 1-4. Workshop 1.3: Understanding agricultural structural changes and their impacts, to support inclusive policy dialogue and formulation. Available at: http://www.ifsa2012.dk/downloads/WS1_3/ChetanaMirle.pdf. | Partially Accepted, Livestock sections improved throughout |
| 17995 | 11 | 57 | 27 | 57 | 34 | The negative impact of mitigation options in terms of other climate drivers are no additional costs to mitigation and should not be discussed under the framework of co-costs. | Partially Accepted, Added to table |
| 15623 | 11 | 57 | 33 | 57 | 34 | Agricultural intensification in animal agriculture could also lead to increased grey water footprints. Mekonnen M.M. and A.Y. Hoekstra (2012). A global assessment of the water footprint of farm animal products. Ecosystems 15, 401-15. Available at: http://doc.utwente.nl/80897/1/Mekonnen-Hoekstra-2012-WaterFootprintFarmAnimalProducts.pdf. | Accepted, Unfortunately it is not a scientific reference. However we considered the issue. |
| 10180 | 11 | 58 | 12 | 58 | 13 | Expand on this topic: i.e. which technologies and which areas, and what are the reasons for banning? | Accepted, technology sub-section |
| 5107 | 11 | 58 | 13 | 58 | 13 | we are facing a tech risk in united states. Namely cellulosic ethanol is not advancing at the assumed rate | Noted, Statement - not a comment |
| 5108 | 11 | 58 | 13 | 58 | 13 | there is also a tech risk in ag technological progress namely if the technology advances at a rate slower that population growth we have a real problem with production diverting mitigation. This is covered in Mosnier, A., P. Havlk, H. Valin, J.S. Baker, B.C. Murray, S.J. Feng, M. Obersteiner, B.A. McCarl, S.K. Rose, and U.A. Schneider, "Alternative U.S. Biofuel Mandates and Global GHG emissions: The Role of Land Use Change, Crop Management and Yield Growth", Energy Economics, second review, 2012 | Accepted, We checked more scientific references on the topic and by the authors. Although, before having this as an important risk, other technological challenges were included in the SOD. For other sectors this might be more important than for AFOLU, where the major challenge is probably not an |
| 5635 | 11 | 58 | 14 | 58 | 24 | The general public perception is that the cutting of trees is deforestation, when in most cases it is harvesting. An effort to correct this should be vigorously pursued! | Rejected, The statement that "the general perception is" something is vague. The text clarifies in some places |
| 10178 | 11 | 58 | 14 | 58 | 24 | Based on the scientific knowledge of today, what measures would be most effective at the global scale and at the regional scale, respectively? | Partially Accepted, This is a valuation. What is most effective depends on the |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 11306 | 11 | 58 | 20 | 58 | 22 | Re: the use of the term 'perceived' in this context, is this to say that there is no evidence of the risks in biotechnology or animal feed additives? Again, in the current political climate this could be misconstrued by corporate interests as a dismissal of any risks. Would it be better to change to 'real or perceived health and/or environmental risks'? | Rejected, The text refers to the effects caused by the uncertainties regarding international agreement(s) within the UNFCCC. |
| 16606 | 11 | 58 | 22 | 58 | 24 | This final sentence is needlessly provocative, implying that the scientists know better than the public. Delete. | Accepted, deleted |
| 10181 | 11 | 58 | 23 | 58 | 24 | Therefore the need to be specific in this report | Accepted, redrafted |
| 5842 | 11 | 58 | 24 | 58 | 46 | Please give an explanation what you mean by "spill-over" in this here context, e.g. in the glossary, because this is synonymous with side-effects and can thus mean anything from "co-benefit" to "risk of desaster". I do not see any reason to mention scale effects and environmental markets so broadly here, this is redundant. The text could be shortened to "they exist". As everything written here is already mentioned elsewhere in the text the text of the section could be deleted and only the table be retained. | Accepted, We considered spill overs as co-benefits that go beyond the original system of the AFOLU measure. There is still discussion going on how exactly to deal with spillovers in the AR5. |
| 11826 | 11 | 58 | 26 | | | insert the section number so that it is clear which section is meant | Accepted, Redrafted |
| 5636 | 11 | 58 | 37 | 58 | 37 | Change timber yield to wood yield. | Rejected, Timber is a widely accepted |
| 5109 | 11 | 58 | 53 | 58 | 53 | I would think mention of indirect land use and leakage might appear in "Where this displaces other 42 commodities, there are likely to be impacts on markets." | Noted, There is a cross-cutting group on leakages. In the drafting group, we agreed that we don't include international leakages at the moment. The issue is mainly argumentative, and |
| 5634 | 11 | 58 | 6 | 58 | 13 | Technological considerations. Technical consideration are: whether to end the rotation at the point when mean annual increment (MAI) is maximum, that is when current annual increment (CAI) dissects the MAI curve from above; to fell when economic returns are maximum (usually before maximum MAI); or to let the crop grow to maturity. In the latter case the C sequestration will be maximum, but in the two former cases, the thinning and felling yields will give the greatest returns. For a mixed-aged plantation the C stock and thinnigs/felling, will be greater than the C stock in the mature trees. | Accepted, Technological issues were re-drafted for the SOD |
| 5841 | 11 | 58 | 6 | 58 | 13 | Mitigation projects without consideration of the potential use of biomass grown on the land or other management issues are wasted. Please bear in mind that sequestration means "removal from the atmosphere", not "fixing C in this place and leaving it here". | Rejected, Use of biomass as well as waste management and various management issues (options) are |
| 10121 | 11 | 58 | 6 | 58 | 6 | Needs strengthening, again not much content | Accepted, Redrafted |
| 16605 | 11 | 58 | 7 | 58 | 8 | Again, it is asserted that "a large proportion" of the AFOLU sector is in soil and vegetation sequestration, without an estimate of what that proportion is nor a citation. Both are needed. | Partially Accepted, Link to the corresponding section in the chapter |
| 10182 | 11 | 58 | 4 | 58 | 5 | Reforestation/afforestation on previous agrocultural land, such as grazing areas, may reduce biodiversity since species specific to these agrocultural habitats will disappear while forest species may be limited in their dispersal or have problems establishing populations due to habitat specifics. See e.g. Cocca et al. (2012) Land Use Policy, 29: 878-886; Bruun et al. (2010) PRESLIA, 82: 345-346; Brunet et al. (2012) Scandinavian Journal of Forest Research, 27: 245-254; Amici et al. (2012) Ecological Complexity, 9: 55-62; Stenert et al. (2012) Marine and Freshwater Research, 63: 283-292; Otero et al. (2011) Land Use Policy, 28: 207-218; | Partially Accepted, References checked. Impacts on biodiversity are included. |
| 4267 | 11 | 59 | | | | There is no mention of any health co-benefits in this table | Partially Accepted, Health co-benefits and risks included in the SOD |
| 3876 | 11 | 59 | | | | Row Technological risks, 4th. Column. Promotion of innovation is a positive input of bioenergy as stated here and in the IPCC-SRREN. At Section XY only negative aspects of bioenergy are mentioned and even this one positive aspect is absent there. Make Section XY fairer. | Partially Accepted, Technological issues redrafted |
| 5843 | 11 | 59 | | | | Do you want to give the sources with the table, or why do you show numbers in brackets? | Rejected, Brackets were used during drafting and for guidance among the writing team. The numbers in brackets should have been deleted. However, we |

|---|---|---|---|---|---|---|---|
| 11073 | 11 | 59 | | | | what do the numbers in parentheses refer to within Table 11.11 and some other tables? | Rejected, Brackets were used during drafting and for guidance among the writing team. The numbers in brackets should have been deleted. However, we |
| 2636 | 11 | 59 | | | | This table is mostly agriculture and should state that. It has been difficult throughout the chapter to balance the agricultural information with forests data. Since they are really different - one perennial and the other annual - they are difficult to summarize together. | Partially Accepted, Ensure balance between the sectors |
| 10445 | 11 | 59 | 0 | 59 | 0 | Potential negatice impact of ill defined land tenure rights in the poor communities is multifold. The poorly defined property rights will result in biased compensation for the most vulnerable | Accepted, Land tenure is discussed in 11.7 and 11.7 and included also in |
| 5110 | 11 | 59 | 1 | 59 | 1 | there are a numner of risks in here not in the text might point to this in text on risk. | Accepted, redrafted |
| 5111 | 11 | 59 | 1 | 59 | 1 | also what do the numbers in parentheses mean? | Rejected, Brackets were used during drafting and for guidance among the writing team. The numbers in brackets should have been deleted. However, we |
| 15624 | 11 | 59 | 1 | 59 | 1 | The summary Table 11.11 should include risks to small farmers and animal welfare under "Socio-economic effects." Mirle C. (2012). The industrialization of animal agriculture: implications for small farmers, rural communities, the environment, and animals in the developing world. The 10th European International Farming Systems Association Symposium in Aarhus, Denmark, July 1-4. Workshop 1.3: Understanding agricultural structural changes and their impacts, to support inclusive policy dialogue and formulation. Available at: http://www.ifsa2012.dk/downloads/WS1_3/ChetanaMirle.pdf. | Noted, Unfortunately it is not a scientific reference. However, we considered the issue. |
| 11201 | 11 | 6 | 1 | 6 | 10 | This section treats land management by 'sector' without recognising land management functions and customary land tenure systems of indigenous peoples and local communities (these are not 'sectors'). There is a need to insert text here on "communal tenure regimes" and/or traditional and/or customary land owners and managers. | Accepted, Added later in the chapter |
| 3533 | 11 | 6 | 1 | | | What are these issues common to all land uses? Please give some examples. | Accepted, e.g. all have soils and vegetation GHG fluxes; has been |
| 2614 | 11 | 6 | 11 | | 16 | This is one sentence - too long and too many ideas embedded in it. | Accepted, Edited for SOD |
| 18912 | 11 | 6 | 13 | 6 | 14 | consider replacing "scenarios also being considered by IPCC WG I and WG II (i.e. the RCPs)" with "same assumptions (i.e. the Representative Concentration Pathways [RCPs]) that many scenarios that are assessed in the three IPCC Working Groups are based on." Reasoning: RCPs are not scenarios but part of the framework scenarios are based on and they are also used in WG III. In case you are also making use of SSP (Shared Socio-economic Pathways) then also reference these (https://www.isp.ucar.edu/sites/default/files/Scenario_FrameworkPaper_15aug11_0.pdf) | Accepted, Edited for SOD |
| 14569 | 11 | 6 | 17 | 6 | 19 | I would liketo see a slightly improved definition of what is meant by "bottom up " and top down". often bottom up studies are not necessarily small scale, they could be large scale but based in just one sector. May be something like…scale up from site to regional scale sector or resource specific studies" (ie start with land availability and regional tree productivity, or corp productivity. The top down studies: the riginal RCPs actually started with different bottom up policy driven assessments eg. agressive mitigation in lots of sectors including AFOLU in the 4 IAMs that originally developed the mitigation pathways. I think one of the differences here is bottom up studies often dont consider cross sectoral competiation for demand. Whereas the IAM studies are looking at demand on land use in an integrated way. | Accepted, Replaced terms with more descriptive ones |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 15145 | 11 | 6 | 18 | 6 | 18 | replace "the" with "then" | Accepted, Edited for SOD |
| 18913 | 11 | 6 | 19 | | | consider adding a reference to the discussion about bottom-up and top-down to this section as background information | Accepted, Replaced terms with more descriptive ones |
| 15954 | 11 | 6 | 20 | 6 | 23 | The sentence provides three different figures for agriculture, from the text it is not directly clear to what these 3 ranges refer to. In the introductory section a range is given. | Accepted, Revised for SOD |
| 5536 | 11 | 6 | 21 | 6 | 21 | There is a surplus of annual growth of an estimated 9 Gt C or 34 Gt CO2 equivalent. This is not taken into account when considering forest mitigation options (1.3 to 4.2 GtCO2/yr). Thus, the potential for 'forest' mitigation is much larger. | Discuss further at LAM3, We are not condsidering total biophysical potentials here so total extractable NPP is not |
| 14570 | 11 | 6 | 22 | | | rangeD | Accepted, Edited for SOD |
| 10583 | 11 | 6 | 23 | | | Is this range quoted at $100/tCO2eq? | Accepted, Clairfied for SOD |
| 16526 | 11 | 6 | 24 | 6 | 25 | As discussed above (points 4 and 5) the expression of mitigation potentials in terms of responses to a global carbon price reduces their utility considerably, even if they are "refined estimates" as described here. I understand the advantage of modelling and estimating them this way in terms of analytic simplicity (using marginal abatement curves), but that doesn't justify using an anachronistic approach that doesn't correspond to the world of the second decade of the 21st century. | Noted, We can only report what is in the literature so have to report potentials at the costs calculated |
| 10584 | 11 | 6 | 24 | | | Add "(LULUCF) | Accepted, Edited for SOD |
| 4989 | 11 | 6 | 28 | 6 | 29 | Sentence: The section describes …… in drivers. No need for this sentence | Accepted, Deleted |
| 13519 | 11 | 6 | 28 | 6 | 29 | Sentence: The section describes …… in drivers. No need for this sentence | Accepted, Deleted (duplicate comment) |
| 15146 | 11 | 6 | 28 | 6 | 28 | insert "them" after "compares" | Accepted, Edited for SOD |
| 14571 | 11 | 6 | 28 | 29 | | could delete first sentence as title says it. | Accepted, Edited for SOD |
| 5800 | 11 | 6 | 28 | 6 | 37 | Combine lines 28 - 29 and 34 - 37. This paragraph could thus be reduced to half ist length. | Accepted, Edited for SOD |
| 16527 | 11 | 6 | 32 | 6 | 32 | Clarify here and in Figure 11.1 whether these figures are for gross or net emissions. | Accepted, Clarified gross and net |
| 9442 | 11 | 6 | 4 | | 6 | The distinctions presented here are too broad and do not contribute much to the piece. | Rejected, Improve distinction instead |
| 14567 | 11 | 6 | 4 | 6 | 8 | these two sentances could be combined | Accepted, Edited for SOD |
| 5038 | 11 | 6 | 4 | 6 | 4 | where you say "The land managers are also very different" I might add "and time frames of concern" after managers | Accepted, Edited for SOD |
| 8832 | 11 | 6 | 5 | 6 | 5 | Can the land use 'agriculture' be considered short term? The rotation are of shorter term than in forestry, but generally the land occupation in an agricultural practice (even fallow) can be long term | Accepted, Edited for SOD |
| 10581 | 11 | 6 | 5 | | | ….short-term "returns" by farmers whereas forests are managed for longer-term returns. | Accepted, Edited for SOD |
| 10095 | 11 | 6 | 5 | 6 | 5 | apart from farmers and foresters large land areas, grasslands, are managed by pastoralists who have a long term view | Accepted, Edited for SOD |
| 2613 | 11 | 6 | 5 | 6 | 7 | Why highlight the difference between farmers and forest managers? Farmers being small private landholders doesn't work for the industrialized world. | Accepted, Edited for SOD |
| 10238 | 11 | 6 | 6 | 6 | 7 | " the different land managers have perceptions of themselves as one otr the other of these"…I do not understand | Accepted, Edited for SOD |
| 16525 | 11 | 6 | 7 | 6 | 8 | Delete "small" from the phrase "small private landholders". Many of the most important landholders for AFOLU (e.g. deforestation in Latin America due to soy and beef expansions) are very large, owning thousands or even tens of thousands of hectares. | Accepted, Edited for SOD |
| 7054 | 11 | 6 | 7 | 6 | 8 | The statement "agriculture tends to be managed by small private landowners; forestry by Government and corporate entities" is an over-generalization and not true for many parts of the world. | Accepted, Edited for SOD |
| 5799 | 11 | 6 | 7 | 6 | 8 | Concerning forestry, please be careful with your interpretation of FAO FRA page 121. ff. The world's regions differ in the share of ownership types (what can have significant impacts on mitigation policy implementation), and ownership and management must not necessarily be in the same hand. | Accepted, Edited for SOD |
| 10096 | 11 | 6 | 7 | 6 | 7 | there are wast land areas with communal tenure systems, notable partures and grasslands, where one can also trough introduction of trees "cross over"sectors | Accepted, Edited for SOD |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 8922 | 11 | 6 | 7 | 6 | 8 | On a global perspective White and Martin estimates that 77% of the global forest estate are administered by governments, 4 % belong to communities and indigenous groups, 19% are private ownership based on traditional or entitled rights; in some important forest countries up to 80% of the state own forest are managed by private firms under long-term lease/concessions [White, Andy; Martin, Alejandra 2002: Who owns the World's forests, Center for Environmental Law, Washington, DC ] | Accepted, Added reference and details later in the chapter |
| 14568 | 11 | 6 | 8 | | | suggest to delete "also" | Accepted, Edited for SOD |
| 11802 | 11 | 6 | 8 | | | What about private and community forest owners/managers? | Accepted, Edited for SOD |
| 10582 | 11 | 6 | 8 | | | Forests owned mainly by private landowners in NZ and Sweden I think - not always corporates/governments. | Accepted, Edited for SOD |
| 13305 | 11 | 6 | 11 | 6 | 19 | Long confusing sentence, rephrase for clarity | Accepted, Edited for SOD |
| 3534 | 11 | 6 | 1 | | 10 | Agriculture' and 'Forestry' are different sectors, but in order to better deal with common issues between both sectors (for e.g. forest converted to agricultural land, afforestation, reforestation, mitigation options), it is good practice to treate them in a single sector. Therefore, saying that there are significant differences between the sectors (policies, governed by different ministries, etc) is a fact, is abvious, it cannot be otherwise. I would suggest to reformulate the paragraph and include some ideas like "since both sectors are governed by different policies, ministries, etc., there is a need, when it comes to mitigation, to consider agriculture and forestry as a single sector to avoid to dissipate and jeopardize mitigation efforts" | Rejected, Acknowledging that there are differences is important |
| 6928 | 11 | 6 | 11 | 6 | 16 | Please provide a more specific reference to WGI/WGII AR5. | Accepted, Added for SOD |
| 5366 | 11 | 6 | 3 | 6 | 4 | It seems needlessly perjorative and factually incorrect to assert that farmers manage their lands focused only on the "short term." I don't see how that can possibly be true for all farmers across the world. If there is an important point that needs to be made here, it needs to be restated. Otherwise delete. | Accepted, Edited for SOD |
| 3169 | 11 | 6 | 27 | | | Much of section 11.2 is also covered in WG1. Sections 11.2 and 11.3: streamline the tables and the prose; much of the prose in the main text repeats the tabular points. | Accepted, Section was largely revised for SOD, and became shorter. Some |
| 3536 | 11 | 6 | 28 | | 37 | I would suggest to reformulate the first sentence as follows: "This section describes new trends in GHG emissions and major drivers since the publication of the AR4". Please indicate also in the paragraph, as sources of GHG emissions, non-CO2 emissions (CO, NOx) from, for e.g., biomass burning (forest fires, savannah burning, etc.). Saying that "Global trends in total emissions from AFOLU activities between 1971 and 2010 and contributions of single sources are shown in figure 11.1a" is in contradiction with what is shown in Figure 11.1a, please harmonize. | Accepted, Edited for SOD |
| 7056 | 11 | 6 | 32 | 7 | 19 | This part of the intro to 11.2, including figures 11.1a and b, should be removed because this formulation of the information is unnecessary, easily misinterpreted and far less transparent than the more detailed discussion of the issue that follows.<br>It would also help to reduce the length of this section - a stated goal of the review. | Accepted, Agreed - edit |
| 6929 | 11 | 6 | 34 | 6 | 34 | Relevant for WGI AR5, encourage to ensure consistency between WGI (Chapter 6 for sure) and WGIII on the issue of land use, land use change. | Accepted, Has been cross-referenced to WGI |
| 14672 | 11 | 6 | 6 | 6 | 6 | If it is true, as some paper suggest, that the Hadley pressure cells have broadened, moving to higher latitudes north and south. As things become drier, particularly in the high latitude subtropics, there will be more fires. | Accepted, Figure has been removed; fire dealt with later |

| 11827 | 11 | 60 | 1 | | | Wouln't be "Barriers and oportunities to AFOLU mitigation" or so be a more complete title for this section? | Rejected, Titles are given |
| 5114 | 11 | 60 | 11 | 60 | 11 | why single out unfccc as a source of incentives many others could do so | Accepted, Good point. Voluntary markets are included in the text |
| 5115 | 11 | 60 | 13 | 60 | 13 | what about education level and acess to information | Accepted, Good point. Skill and |
| 2637 | 11 | 60 | 19 | | 21 | There are many other uses of forests that do not always require deforestation. | Noted, We fully agree |
| 5113 | 11 | 60 | 22 | 60 | 22 | land ownership and property rights is also an issue | Partially Accepted, Land tenure has been already addressed in other sections. We didn't want to put the same issues in all sections. On the other |
| 2638 | 11 | 60 | 22 | | 33 | This is a difficult case to make since the countries with clear land tenure (most of Europe, USA) are also the countries conserving their forests and not using forests as working forests. While countries with low land tenure are the suppliers of forest products to the countries with clear land tenure. So this is not very simple. | Rejected, These are not the only countries conserving forest. There are interesting experiences in developing countries (e.g. Brazil, Costa Rica, Bhutan). The issue is certainly not |
| 10122 | 11 | 60 | 3 | 60 | 3 | See my previous comment in agriculture in existing areas mitigation is a cobenefit, it does not make sense to discuss mitigaiton actions separately. LUC and REDD is another issue. I think this framing is WRONG and leads precisely the type of misconceptions about ag mitigation maintained by many developing countries and NGOs. I urge you to think carefully about the framing of mitigation in agriculture.Also looking further the text, mitigaitoon has to be framed in development context, so the question of people being too poor to mitigate is again to me a comletely false framing. | Rejected, I don't see how this comment is linked to the text in page 60, line 3. Further co-benefits are discussed in section 11.7 |
| 5637 | 11 | 60 | 30 | 60 | 30 | --- improve C storage and use, is usually a better financial option, especially for local people. | Partially Accepted, Considered while |
| 15203 | 11 | 60 | 31 | 60 | 33 | delete sentence | Accepted, Changed |
| 6781 | 11 | 60 | 34 | 61 | 3 | add " some mitigation technologies may bring negtive effects for conservation biodiversity,some may benefit for conservation biodiversity". | Accepted, Checked for references and considered when drafting the SOD |
| 16607 | 11 | 60 | 35 | 60 | 35 | Citation needed for these estimates (nearly 1/3 to 1/2). | Accepted, Included references |
| 15204 | 11 | 60 | 35 | 60 | 35 | differs from earlier statistics quoted. Should be consistent. | Accepted, Harmonised for SOD |
| 5638 | 11 | 60 | 35 | 60 | 35 | This statement is wrong. The NPP for land plants is an estimated 53 GtC. One third of this is 17.5 GtC and one half is 26 GtC. Also page 32, line 6 gives a figure of 25% - 13 GtC! In the text on page 6 above, I have calculated that the maximum loss of NPP from land use change, use of wood products and food production is of the order of 3.5 GtC/yr or 7% of NPP. Also, the only real loss of NPP is through 'deforestation' which is a net NPP of 31-49 MtC/yr: this is less than 0.1%. The use of wood products and food does not cause a loss of NPP, for if annual NPP is not used it reverts back to the atmosphere, mainly in the form of CO2. Lines 35-42 need rewriting. | Rejected, The estimates of maximum theoretical potential for biomass growth and exploitation are noted, but we do not consider maximum theoretical potential for any technology in WGIII AR5 - instead we consider the economic potential, as constrained by economics, and note that the market potential is |
| 14446 | 11 | 60 | 37 | 60 | 38 | This is a very important risk with mitigation strategies. Good to see it receives attention in this chapter. Does this topic receive more attention in other chapters? | Noted, Thanks |
| 3877 | 11 | 60 | 45 | 60 | 47 | The examples provided are due to climate change and not due to AFOLU mitigation options. Please, reconsider your statement. | Rejected, We are discussing barriers. Specific soil conditions and water availability as well as natural variability and resilience to the specific systems will determine the size of the potential by |
| 13987 | 11 | 60 | 1 | | | the state of the carbon market should be evaluated in this section. Also to be included in this section should be the question of who is responsible for emissions vs. where the mitigation potential lies. The overarching principle of common but differentiated responsibilities that underpins global political agreement on mitigation action is essential to understand why action may or may not be taken. | Accepted, We consider constraints of financing mechanisms (including market mechanisms). |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 18001 | 11 | 60 | 18 | | | There should be a cross-reference to Chapter 4 that are supposed to provide the framework for all SD discussions in the WGIII AR5. | Accepted, Checked cross-references |
| 14681 | 11 | 60 | 35 | 60 | 35 | I think 25 to 40% was stated above in the text. | Partially Accepted, Checked in the text |
| 15625 | 11 | 60 | 37 | 60 | 37 | The animal agriculture sector alone is likely to add significant pressure to several sustainability thresholds, including reactive nitrogen mobilization and biomass appropriation. Pelletier N. and P. Tyedmers (2010). Forecasting potential global environmental costs of livestock production 2000-2050. Proceedings of the National Academy of Sciences of the United States of America 107(43), 18371-74. Available at: http://www.pnas.org/content/early/2010/09/27/1004659107.full.pdf+html. | Partially Accepted, The reference of Pelletier and Tyedmers is more relevant for 11.7. The issue of land limitations/land as finite element is included in 11.8 |
| 5511 | 11 | 61 | | | | This table is not essential | Accepted, Table deleted |
| 11828 | 11 | 61 | | | | It is unclear why "available land" is an opportunity (or how this is meant) | Accepted, Text improved |
| 5844 | 11 | 61 | | | | Opportunities: What opportunities come from "increasing desertification"? | Accepted, Text improved |
| 2640 | 11 | 61 | | | | Same comment on land tenure and whether it will help or create opportunities. Governments mostly own the forests and generate much of their economic return from this so they will not release rights easily to communities living in or around the forests. | Partially Accepted, Clear land tenure can create opportunities for AFOLU mitigation options. This has been |
| 4990 | 11 | 61 | 11 | 61 | 11 | Sentence: These issues are discussed in full in section 11.7. Delete this sentence or correct | Accepted, Text improved |

| 5117 | 11 | 61 | 13 | 61 | 13 | in the U.S. unwillingness to accept that climate change is occuring and we need to do something about it is a major barrier | Rejected, Political issue. |
| 5639 | 11 | 61 | 20 | 61 | 29 | I am in full agreement with this paragraph. | Noted, Thanks |
| 9460 | 11 | 61 | 23 | | 23 | optimization of what? | Partially Accepted, Text improved |
| 10184 | 11 | 61 | 26 | 61 | 29 | Do you have references on this statemenet, i.e. has this been shown empirically? | Accepted, Text improved and more |
| 12877 | 11 | 61 | 32 | | | Add to the technological line - Barrier: Accurate forest carbon monitoring for REDD; Opportunities: Standard scientific methods from IPCC National Greenhouse Gas Inventory Guidelines, remote sensing data, Monte Carlo quantification of uncertainty | Accepted, Lack of monitoring capacity can become a major barrier for REDD+ (Herlod, 2009) |
| 5116 | 11 | 61 | 5 | 61 | 5 | this is rather an overstatement. There is often a need to improve existing items to say in front of pests and other suceptabilities. I would think r and d investment rates might be a barrier plus a need to continue to invest to adpat existing mitigation to the effects of climate change | Partially Accepted, Scale of funding resources included in the SOD |
| 11307 | 11 | 61 | 5 | 61 | 11 | Again, this suggests (to the present reader anyhow) that amongst the barriers to dietary additives and crop trait manipulation, their risks are not valid. It would be more credible if the possible risks of additives and manipulation were considered fairly. | Rejected, What is meant by fairly? |
| 2639 | 11 | 61 | | | | All of the technology discussion is for agriculture and forests are really not included in any of the technology discussions. | Accepted, Updated text in the SOD |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 12876 | 11 | 61 | 4 | 61 | 11 | This section omits the major issue of forest monitoring for REDD. Add something like "Although monitoring forest carbon in forests with high spatial variation of tree density and species composition poses a technical barrier for the implementation of REDD (Baker et al. 2010), the IPCC National Greenhouse Gas Inventory Guidelines (Aalde et al. 2006) provide one opportunity because they offer standard scientific methods that countries already use to report AFOLU emissions and removals under the UNFCCC. Also, field research in high-biomass forests (Gonzalez et al. 2010) show that remote sensing data and Monte Carlo quantification of uncertainty offer a technical opportunity for implementing REDD." Aalde, H., P. Gonzalez, M. Gytarsky, T. Krug, W.A. Kurz, S. Ogle, J. Raison, D. Schoene, N.H. Ravindranath, N.G. Elhassan, L.S. Heath, N. Higuchi, S. Kainja, M. Matsumoto, M.J.S. Sánchez, and Z. Somogyi. 2006. Forest Land. In Intergovernmental Panel on Climate Change. National Greenhouse Gas Inventory Guidelines. Institute for Global Environmental Strategies, Hayama, Japan. Baker, D.J., G. Richards, A. Grainger, P. Gonzalez, S. Brown, R. DeFries, A. Held, J. Kellndorfer, P. Ndunda, D. Ojima, P.E. Skrovseth, C. Souza, and F. Stolle. 2010. Achieving forest carbon information with higher certainty: A five-part plan. Environmental Science and Policy 13: 249-260. Gonzalez, P., G.P. Asner, J.J. Battles, M.A. Lefsky, K.M. Waring, and M. Palace. 2010. Forest carbon densities and uncertainties from Lidar, QuickBird, and field measurements in California. Remote Sensing of Environment 114: 1561–1575. | Accepted, Barriers and opportunities regarding MRV included in the SOD. |
| 15626 | 11 | 61 | 4 | 61 | 11 | Perhaps worth mentioning cultured meat production in section on technological barriers and opportunities. Tuomisto H.L. and M.J.T. de Mattos (2010). Life cycle assessment of cultured meat production. 7th International Conference on Life Cycle Assessment in the Agri-Food Sector in Bari, Italy, September 22-24. Available at: http://oxford.academia.edu/HannaTuomisto/Papers/358909/Life_cycle_assessment_of_cultured_meat_production. | Partially Accepted, The issue has been considered. We searched for scientific references. |
| 11074 | 11 | 61 | 4 | | | The section on "Technological barriars.." could be expanded considerably. In particular, mitigation potential in the agricultural sector can be highly site-specific even within specific regions or cropping systems. For example, within different areas of the midwest US the potential for no-till agriculture to generate soil carbon storage is limited due to climatic and soil factors. See Chatterjee and Lal, 2009. Soil and Tillage Research 104(2):270-277 and Venterea et al. 2006. Soil Sci. Soc. Am. J. 70: 1752-1762. The same issues apply with regard to N2O emission reduction potential: For example, some studies have found that controlled-release or stabilized nitrogen fertilizers reduced N2O emissions by up to 70% compared with conventional fertilizers in irrigated systems in a semi-arid climate (e.g., Shoji et al. 2001. Commun Soil Sci Plant Anal 32:1051-1070; Halvorson et al. 2011. J Environ Qual 40:1775-86), while studies in more humid, rain-fed locations found no significant benefit (e.g., Venterea et al. 2011. J Environ Qual 40: 1521–31; Sistani et al. 2011. J Environ Qual 40:1797-1805). A recent (in press) article (sent via email to comments@ipcc-wg3.de) addresses this issue with regard to N2O in some detail: Venterea et al. Technical challenges and opportunities for mitigating nitrous oxide emissions from fertilized cropping systems. Frontiers in Ecology and the Environment. | Accepted, Barriers and opportunities related to the natural assets (soil, water, etc) were included as environmental barriers. References were checked, some included. |
| 15627 | 11 | 61 | 5 | 61 | 6 | It is not necessarily the case that there are no technological barriers for already-applied mitigation technologies. Lokey E. (2009) shows the significant challenges of biodigester operation. Lokey E. (2009). The status and future of methane destruction projects in Mexico. Renewable Energy 34, 556-69. | Partially Accepted, The section on technological barriers and opportunities has been updated for the SOD. |
| 4395 | 11 | 61 | | 61 | | not sure how to interpret “available land” as an opportunity for environment and health effects | Accepted, Text has been improved to be |

|---|---|---|---|---|---|---|---|
| 5641 | 11 | 62 | 13 | 62 | 13 | Bioenergy --- reaching as high as 100EJ by 2030. This is = to 5.35 Gt wood equivalent, - 2.66 GtC, or 5% of NPP. | Rejected, The estimates of maximum theoretical potential for biomass growth and exploitation are noted, but we do not consider maximum theoretical potential for any technology in WGIII AR5 - instead we consider the economic potential, as constrained by economics, and note that the market potential is likely to be still lower due to the many |
| 12439 | 11 | 62 | 14 | 62 | 15 | Does the sentence mean that bioenergy will require the use of 15-16 % up to 50 % of all land on earth? Please consider to clarify. | Accepted, Clarify that these are IAM scenario outputs - not projections of |
| 14738 | 11 | 62 | 18 | | | Line 18-20: “An exception is (Steven K. Rose et al., 2012) who reported agriculture, forest carbon, and bioenergy abatement levels for various climate stabilization policies´. This is not clear. In any case the reference citation should be: An exception is Rose et al. (2012) who reported… | Accepted, Zotero updated for SOD |
| 5845 | 11 | 62 | 18 | 62 | 23 | What has been assessed as "forest carbon" in this study? A considerable share of forest carbon (all which is included in aboveground biomass) can also be used in bio-energy generation and HWP. If the study did not include substitution effects and HWP under "forest biomass" please either delete the lines or use terminology that indicates that not forestry but C stock increases in the forest only were part of the study. | Accepted, Clarify with Steve Rose and amend for SOD |
| 12440 | 11 | 62 | 20 | 62 | 22 | Do all the percentages in this entence relate to the all-over global abatement of the emissions of GHGs? | Accepted, add word "global" |
| 10186 | 11 | 62 | 20 | 62 | 23 | Using past tense when discussing scenarios for the future is not intuitive | Accepted, Change wording |
| 13988 | 11 | 62 | 20 | 62 | 22 | no agricultural carbon is included? This should be pointed out. | Accepted, Not included in the model - |
| 11786 | 11 | 62 | 24 | 63 | 17 | All sentences including figure 11.14 should be deleted to avoid misunderstand of readers that carbon tax is the best way to achieve the 450ppm target. There is a possibility in (B) scinario to bring higer elecricity fee to pepole instead of the significant incresing of food praice, because (B) would be thought to need more ristrict measuers like introducing CCS, too much other renewable energies compared with (C). | Accepted, This figure will be replaced for the SOD |
| 5642 | 11 | 62 | 24 | 62 | 32 | Bioenergy ‘leakages’. Biomass can be used directly as a feedstock for charcoal production and electricity generation. This paragraph assumes that wood waste and switch grass etc. will be converted to ethanol. It may be more cost effective and more environmentally sustainable to dry distill the ‘non-oil’ plant biomass, rather than trying to break down the cellulose to simple sugars and then distill the mash into ethanol. | Rejected, it does not assume this - checked with Chapter 6 |
| 5744 | 11 | 62 | 31 | 62 | 32 | This aspect is investigated in more detail in "Biofuels and the underlying causes of high food prices" (GBEP/FAO) (http://www.globalbioenergy.org/fileadmin/user_upload/gbep/docs/BIOENERGY_INFO/0810_Flammini_-_Biofuels_and_the_underlying_causes_of_high_food_prices_GBEP-FAO.pdf) | Rejected, Statement - not a comment. Select peer reviewed literature in preference |
| 16608 | 11 | 62 | 4 | 62 | 15 | As mentioned previously, the Wise et al results assume a global carbon tax on all fossil fuels -- this explains why they give such divergent estimates from other studies (e.g. 50% of land in bioenergy), and should be mentioned. | Accepted, This figure will be replaced for the SOD |
| 5640 | 11 | 62 | 4 | 62 | 36 | This hardly takes into consideration, the existing use of NPP. | Rejected, The estimates of maximum theoretical potential for biomass growth and exploitation are noted, but we do not consider maximum theoretical potential for any technology in WGIII AR5 - instead we consider the economic potential, as constrained by economics, and note that the market potential is likely to be still lower due to the many |
| 12438 | 11 | 62 | 9 | 62 | 12 | Does this sentence mean that the global landscape will contribute to reduction of global CO2-emissions in 2030 with 0-3 Gt CO2/yr, possibly up to 10 Gt CO2/yr? Please consider to clearify. | Accepted, Yes - clarify |
| 13355 | 11 | 62 | 9 | 62 | 12 | Sentence is confusing, rephrase. | Accepted, Edit for SOD |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |

| 15628 | 11 | 62 | 1 | | | Note relevance of discussion of Davidson E.A. (2012) to this section. Davidson E.A. (2012). Representative concentration pathways and mitigation scenarios for nitrous oxide. Environmental Research Letters 7, 024005. Available at: http://iopscience.iop.org/1748-9326/7/2/024005/pdf/1748-9326_7_2_024005.pdf. | Accepted, Add new reference |
| 7543 | 11 | 62 | | 62 | | Extreame senarios may give misleadings. Discussion on Land use should be focused on deforestation, not bioenergy crops. More fisible senarios and discussion are required. | Accepted, This figure will be replaced for the SOD |
| 5512 | 11 | 63 | | | | The caption here should be edited to make the point more succinctly- it might be easier to do this by eliminated (B) and just noting that no significant changes in land distribution would be seen with limits on fossil fuel, …. Main point of this is that a focus on bioenergy would eat up land area | Accepted, This figure will be replaced for the SOD |
| 7343 | 11 | 63 | | | | Figure legend has a lot of redundancy - reword. | Accepted, This figure will be replaced for |
| 18655 | 11 | 63 | | | | (Interesting figure on page 63 comparing global land use under different scenarios. Source: M. Wise et al., 2009 Implications of limiting CO2 concentrations for land use and energy, Science 324, 1183 -1186) | Rejected, Statement - not a comment. |
| 5643 | 11 | 63 | | | | I don't think this takes into consideration the use of NPP. | Rejected, The estimates of maximum theoretical potential for biomass growth and exploitation are noted, but we do not consider maximum theoretical potential for any technology in WGIII AR5 - instead we consider the economic potential, as constrained by economics, and note that the market potential is likely to be still lower due to the many |
| 11308 | 11 | 63 | 1 | | | Excellent graphics that manage to layer several dimensions of quantitative data in a spatial format. This chapter would benefit from more figures like these. | Accepted, This figure is pasted in from a paper. It will be replaced, but we will endeavour to provide useful figures for |
| 12441 | 11 | 63 | 10 | 63 | 11 | Please consider to add "energy" and "for bioenergy" so the sentence states: "As a result, the relative increase in land required for biomass and other energy crops exceeds the relative increase in demand for bioenergy." This will make it easier to understand. | Accepted, Edit for SOD |
| 5846 | 11 | 63 | 11 | 63 | 16 | The text "Illustrative figure … impact on all land use," is redundant.Please delete and include statement concerning unmanaged forests and pastures in the text above. The information given about the scenarios is not sufficient, too. For example, what does UCT stand for? Besides, given the wide array of drivers, I would certainly question any scenario that leads to an increase in UNmanaged lands, be it pasture or forests, in the future. This would violate any findings from land-use history (except: if "unmanaged lands" includes "devastated, deforested and degraded beyond usability") . | Accepted, This figure will be replaced for the SOD |
| 8013 | 11 | 63 | 2 | | | The illustrated result, energy crops will cover about 30 % of the global land area in 2050 and about 50% in 2100, seems to be unrealistically large. Does this have a consistency with the biomass supply potential from cropping systems described in Page 24 and Table 11.3 ? | Accepted, This figure will be replaced for the SOD |
| 11829 | 11 | 63 | 3 | | | has this abbreviation (UCT) been introduced? | Accepted, This figure will be replaced for |
| 5644 | 11 | 63 | 5 | 63 | 5 | What is FFICT? | Accepted, This figure will be replaced for |
| 11830 | 11 | 63 | 5 | | | has this abbreviation (UCT) been introduced? | Accepted, This figure will be replaced for |
| 5645 | 11 | 64 | 1 | 64 | 11 | I assume SD is sustainable development, but what is SOD? | Noted, Second Order Draft |
| 10190 | 11 | 64 | 12 | 64 | 18 | Consequences for biodiverstiy migth merit its own section, and should at least explicitly be added somewhere | Partially Accepted, Add more information - but not in this section |
| 5119 | 11 | 64 | 16 | 64 | 16 | when you say "The rapid increase of biofuels production worldwide" and say subsidies I am not totally in agreement. The big driver has been energy prices, mandates and in place technologies (due to earlier subsidies) | Accepted, Discuss and add reference to support (not incorrect page number - should be page 70) |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 2641 | 11 | 64 | 20 | | 29 | This is an interesting policy discussion. The first paragraph is not supported or reinforced by the earlier discussions. This note about Europe would be good to briefly explain since it will have policy implications beyond European borders. | Accepted, Expanded |
| 10188 | 11 | 64 | 25 | 64 | 29 | more of this, and for all regions! | Accepted, Expanded |
| 5646 | 11 | 64 | 27 | 64 | 29 | Only carbon sequestration is mentioned, not sequestration and use. | Rejected, The estimates of maximum theoretical potential for biomass growth and exploitation are noted, but we do not consider maximum theoretical potential for any technology in WGIII AR5 - instead we consider the economic potential, as constrained by economics, and note that the market potential is likely to be still lower due to the many |
| 12442 | 11 | 64 | 28 | 64 | 28 | It makes sense that afforestation and bioenergy can compete with other land use, but please consider to explain how "crop land management" could compete with "other land use". | Accepted, Expanded |
| 12443 | 11 | 64 | 30 | 64 | 30 | Maybe the meaning is better expressed by"Nationa and international agricultural, forest and climate policies have the potential ……" | Accepted, Edited for SOD |
| 5118 | 11 | 64 | 37 | 64 | 37 | this is more on potential than policy | Accepted, Edited for SOD |
| 5647 | 11 | 64 | 37 | 64 | 38 | Rather than Forests provide --- I would say Trees on all land-use types provide. They also provide goods and services to about half the world's population, (>3 billion people), not half a billion users. | Accepted, Trees can occur on land that is not forestry - good point |
| 7211 | 11 | 64 | 37 | | 42 | About carbon sequestration 1) forest C stocks can be increased by increasing biomass on existing forest acreage 2) forest C stocks can be increased by expanding forest land; missing: 3) protection of existing natural forests (not perse by improved management, but by saving it from being converted). | Accepted, Edited for SOD |
| 5648 | 11 | 64 | 39 | 64 | 39 | Change 'forest acreage' to 'forest area'. | Accepted, Edited for SOD |
| 10123 | 11 | 64 | 39 | 64 | 40 | Forest degradation due to charcoal produciton is a major issue which whoudl be mentioned here | Accepted, Edited for SOD |
| 12444 | 11 | 64 | 41 | 64 | 44 | Please consider to specify "alternative sinks" and explain whether "forests can continue to act as sinks…" comprises only tropical forest, but also temperate and boreal forests. | Accepted, Has been clarified for SOD |
| 16610 | 11 | 64 | 45 | 64 | 46 | The Brazilian reduction in emissions from deforestation has been large and rapid, and deserves to be explained in more detail. I'd suggest several sentences or a Box. Also, the peer-reviewed studies relevant to it (e.g. Cederberg, Macedo, Rudorff) should be cited rather than the PRODES web site. | Accepted, Edited for SOD |
| 10259 | 11 | 64 | | 71 | | need to be update with recent debate on green economy, Rio+20 outcomes, Green climate funds,…<br>Policies have also started to adress the intersectorial aspect (Agriculture versus Forest, as annonced at the beggining of chaper 11!) and exemple should be given. perhaps in this sence, a focus should be dedicated to ex-ante tools available for policy makers, and tools beeing developed to implement policies (e.g. Climagri in France to help territories and cities over 50000 inhabitnats to comply with the law (see Climate-Energy Territorial Plan). | Accepted, Edited for SOD |
| 7544 | 11 | 64 | | 66 | | This subsection includes many kind of options and it is difficult to undersand. It is devided into sub-subsections. | Accepted, Edited for SOD |

European Commission, Scientific Veterinary Committee, Animal Welfare Section. 1995. Report on the welfare of calves. Adopted November 9. Available at: http://ec.europa.eu/food/fs/sc/oldcomm4/out35_en.pdf. | Accepted, Added more detail on livestock here |
| 16611 | 11 | 65 | 1 | 65 | 1 | "The mechanism" presumably refers to REDD+ but this should be said explicitly (the previous sentence had it in the plural). | Accepted, Edited for SOD |
| 7212 | 11 | 65 | 1 | | 7 | o Somewhere here I would add some text on PRC projects (peatland rewetting and conservation) as a new activity, at least in the voluntary market (e.g. Winrock, VCS). This could be a very promising and cost effective tool for emission reduction. | Accepted, Added for SOD |
| 11179 | 11 | 65 | 1 | 65 | 3 | Explanations for REDD-plus is not consistent with the international agreement. Detailed modarity for establishment of national reference level(s) have not yet agreed. | Accepted, Harmonized and revised throughout the chapter |
| 2642 | 11 | 65 | 1 | | 15 | Comment - the policy discussions is not balanced with the earlier materials, e.g., changing diet etc. They need to be better blended together so there is a consistent voice for the chapter. Most of the policies appear to be for forests while the drivers of increased emissions appears to be agriculture - especially during the last decade. | Accepted, Strengthened agricultural policy parts for SOD |
| 10124 | 11 | 65 | 10 | 65 | 10 | Does this really address agriculture as a driver of deforestation , the prices of agricultural products are increasing, the demand for more food feed and fibre is growing, , is this taken into account in the calculations. | Accepted, Edited for SOD |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 13699 | 11 | 65 | 13 | 65 | 13 | Add after "...Kyoto Protocol": "Therefore, in the political discussion regarding the integration of REDD+ into the market mechanisms under international climate policy, there has been a marked reluctance due to the fear that emission credits from REDD+ might crowd out credits from other project types (Michaelowa and Dutschke 2009). " Reference: Michaelowa, A.; Dutschke, M. (2009): Will credits from avoided deforestation jeopardize the balance of the carbon market?, in: Palmer, C.; Engel, S. (eds.): Avoided deforestation. Prospects for mitigating climate change, Routledge, Abingdon, p. 130-148 | Accepted, Harmonized throughout the chapter |
| 5514 | 11 | 65 | 16 | 66 | 35 | This discussion on nuts and bolts of implementation is too detailed for this type of section. A box with a portion of this information would be more helpful- integrating some of this into an additional column for Table 11.13 is another option | Accepted, Summarized, edited, and shortened for SOD |
| 14447 | 11 | 65 | 16 | 65 | 49 | Good to see these social concerns outlined in this chapter. | Noted, Thank you |
| 16612 | 11 | 65 | 18 | 65 | 20 | The 86% figure may have gone down in recent years; check FRA 2010 instead of 2005. | Accepted, Checked numbers and edited |
| 5847 | 11 | 65 | 20 | 65 | 22 | Please add a reference - why do you put the emphasis on temperate forests when most of the LUC and Deforestation-related emissions come from tropical forests? | Accepted, Edited and added reference |
| 9182 | 11 | 65 | 20 | 65 | 36 | It has been reported for long that there are large potential at low costs - but nothing happened in last decades. There mush have been lack of human capacity , coordination and so forth - that has to be assessed. I guess the situation is similar to so-called "energy efficiency gap". | Noted, Statement - not a comment |
| 12445 | 11 | 65 | 27 | 65 | 35 | These lines seem hard to understand and also contain som contradictions, please consider to rephrase. | Accepted, Edited for SOD |
| 7545 | 11 | 65 | 3 | 65 | 5 | "The REDD-plus approach would finance not only forest conservation, but also sustainable forest management and nhancement of carbon stocks restoration / afforestation / reforestation)" is not correct. It should be revised into "The REDD-plus approach would finance not only deforestation and forest degradation, but also forest conservation, sustainable forest management and enhancement of carbon stocks". In the decision, restoration / afforestation / reforestation are not described. | Accepted, Harmonized and revised throughout the chapter |
| 5649 | 11 | 65 | 3 | 65 | 3 | The REDD+ approach must be tied to increasing agricultural productivity, especially in the subsistence sector. | Accepted, Harmonized and revised |
| 17147 | 11 | 65 | 33 | | | Important to mention more clearly the impact of REDD on Idnigenous Peoples as cited in the literature. See fo rInstance: Anderson, N (2009) REDDy or not? The Effects on Idngienous Peoples in Brazil of a global mechanism for Reducing Emissions from Deforestation and Degradation. In Journal of Sustainable Development 2 (3). Also see Ghasoul, J., Butler, R., Mateo-Vega, J, Pin Koh, L. (2010) REDD: A reckoning of environment and development implications. In Trends in Ecology and Evolution 25 (7) 396-402. |---|---|---|---|---|---|---|---|
| 5651 | 11 | 65 | 46 | 65 | 47 | For proper MRV, good inventories and maps are needed. Remote sensing can help with mapping and changes of land use over time. | Accepted, Comment on MRV technologies and costs was included in |
| 5513 | 11 | 65 | 8 | 65 | 15 | It would be helpful to have a map where the most significant mitigation options for a region along with associated cost and sequestration potential are identified. This comment goes back to the mention of costs of mitigation options in Europe on pg 64 ln25 | Accepted, Regional breakdown now given - but will be improved for FD |
| 7546 | 11 | 65 | 8 | 65 | 9 | I cannot agreed with "REDD can be very cost effective" that is a message from the Stern report. It was a kind of economics analysis. Now we realize that REDD requires large costs of system development and transaction throgh experiments of negotiation and development for REDD. | Accepted, Harmonized and revised throughout the chapter |
| 5650 | 11 | 65 | 8 | 65 | 8 | REDD+ will only be accepted fully if the local participants agree to it and get properly rewarded. At present, some of REDD+ money goes to Outside contractors and to governments, with little left for local people. | Accepted, Harmonized and revised throughout the chapter |
| 9181 | 11 | 65 | 8 | 65 | 15 | But these low cost options are limited. Compensation for oppportunity costs will get more expensive soon. | Noted, Discussion included in broad |
| 16613 | 11 | 66 | 1 | 66 | 18 | This paragraph explains the Bali Action plan and the NAMAs discussion in the following years, but not the REDD+ discussion. It, and its decisions (particularly those in Cancun and Durban) are more relevant to REDD+ in the next few years than the NAMAs questions, which are much broader in terms of sectors covered. | Accepted, Text was revised |
| 10125 | 11 | 66 | 12 | 66 | 14 | at the moment there are 18 agricultural Namas and 29 forestry submitted, the text covers only forestry, text needed on agriculture | Accepted, Strengthened agricultural policy parts for SOD. Comment on |
| 16614 | 11 | 66 | 19 | 66 | 35 | This paragraph discusses the carbon market relating to REDD+, which is mostly voluntary and very small, but leaves out the non-market approaches. These, particularly the Norway-Brazil arrangement related to the Amazon Fund, have been much larger both in monetary terms and in terms of the emissions reductions already accomplished (several hundred million tons). They deserve at least as much space. This could usefully be put in a Box. | Accepted, Box was included |
| 10126 | 11 | 66 | 19 | 66 | 35 | Note that NAMAs can be financined form any sources, probably agricultural NAMAs where mitigaiton is a co-benefit would be most sensibly financed by normal agricultural investments which are geared to support climate smart production systems. The economuc incentive for farmers comes from increased productivity and reduced risk, the extra cost for mitigation is really MRV if countries want to include the mitigaiton impacts in tehri national reporting | Accepted, Comment on MRV technologies and costs was included in section 11.10 |
| 7548 | 11 | 67 | | 68 | | This table is not enough for REDD+. REDD+ partnership, UN-REDD, Norway-Indonesia REDD+ Partnership and Indonesia-Australia Forest Carbon Partnership should be listed in this table. | Accepted, Information was included |
| 5652 | 11 | 67 | | | | There is no programme for mapping and inventory. This is essential to monitor land use changes and to assess biomass stock and yield on all land use types. Without such information many initiatives may be misguided. | Accepted, Added to data gaps |
| 16616 | 11 | 69 | 1 | 69 | 12 | This is the land sparing paragraph that should be combined with the earlier ones and expanded to include other relevant references (e.g. Angelsen, Minang, Perfecto and Vandermeer). It should be placed early in the chapter rather than left to this final section. | Accepted, This has been put in earlier section where this is first discussed |
| 10127 | 11 | 69 | 1 | 69 | 12 | Reducing global cultivated area seems highly unlikely given the increasing demand from population and income growt. Keeping the present area only is ambitious enough goal (but might be realistic though) and would meand much improved productivity from areas with productivity gap, much more use of sustainable farming practices reducing N2O emissions and manuremanagement to reduce CH$ emissions and produce eousehold and farm energy and reduction of waste from all food systems. | Noted, Statement - not a comment |
| 11831 | 11 | 69 | 10 | 69 | 12 | Is there a reference for this statement? | Accepted, Added reference |
| 5516 | 11 | 69 | 13 | | 21 | Very important point | Noted, Thank you |
| 13991 | 11 | 69 | 15 | | | salient? Needs a citation. I would not agree with this claim. | Noted, Revised for SOD |
| 5653 | 11 | 69 | 17 | 69 | 17 | What is PES? | Accepted, Spelled out on first use |
| 10191 | 11 | 69 | 17 | 69 | 17 | What PES stands for is not given in the text, a list of acronyms and abbreviations would be useful | Accepted, Spelled out on first use |
| 15206 | 11 | 69 | 18 | 69 | 21 | hard to read; tighten | Accepted , Revised for SOD |
| 10128 | 11 | 69 | 22 | 69 | 22 | This depends on commodity price developments and the amount of investments to improved prodcutivity in agriculture | Accepted , Revised for SOD |

Soares-Filho, F.D. Merry, D.C. Nepstad, H. Rodrigues, and O.T. Almeida (2012). Persistance of cattle ranching in the Brazilian Amazon: a spatial analysis of the rationale for beef production. Land Use Policy 29, 558-68. | Accepted , Revised for SOD |
| 14682 | 11 | 69 | 1 | 69 | 3 | Food prices are rising making land sparing unlikely. | Accepted , Revised for SOD |
| 6822 | 11 | 7 | | | | Very helpful graphic - perhaps CO2e more useful scale than C? | Accepted , Harmonize units throughout - |
| 14572 | 11 | 7 | | | | I have a major problem with this figure regarding the LUC and deforestation data. LUC is mostly driven be deforestation yet we see in panel b LUC results show a decline in emission since the 1980s and in panel a deforestation emissions increase substantially abetween the 1980s and later decades. You cannot compare ramankutty and Piao with Pan like this, it is mixing apples and oranges. Among other things, Pan treats temeprate and tropical forests differently, their temeprate forest numbers are (LUC + sinks due to claimte and CO2) from inventory data, their tropical data separates these out using a model . Also it means in panel a you are only dealing woth conversions to and from forests, and not other land use conversion (e.g. pastures and crolands into grasslands.) I would show CO2 from LUC (including deforesation ) in panel a. There are also some refs where you could split def only in the tropics e.g. those you give an others. I would give these nummbers int eh text and total LUC here. I can help you with this | Accepted, figure to be redrawn using WGI model data on LUC emissions |
| 14573 | 11 | 7 | | | | re. fires. In panel a. Can you be clear what type fo fires, and whether these are gross or net emissions ie. . The GFEd database includes emissions from deforestation fires which would double count with deforestation emissions. It includes natural fires in forests and grasslands which have annual gross emissions but small net emissions due to regrwoth of vegetation. peatland fires will have large net emissions which are not otherwise cvered under deforestation or LUC. | Accepted, New databases considerd |
| 14574 | 11 | 7 | | | | panel b: the SD between the model results hown does nto represent the uncertainty. This is also not the full range of reults. For WG1 we asked modelling groups to do runs up to and including 2009 to get decadal averages that are comparable acorss decades going up to the 2000s. It would be good to use these numbers for consistency. Ican check with hte WG1 LAs and the model contributers that they ae happy for this to be done. Alternatively, use the synthesis results in Houghton 2012, on which I am co-authro, againa and can help with numbers. | Accepted, figure to be redrawn using WGI model data |
| 11903 | 11 | 7 | | | | The data sourses are confused. Please check. | Accepted, agree, figure to be redrawn |
| 11803 | 11 | 7 | | | | Please Explain why the standard deviation of the periods 1980-1989 and 1990-1999 are so large while for the later periods they are comparably small | Accepted, they are smaller in the later period as fewer models covered this period, however this figure will be redrawn to be consistent with new runs |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 7176 | 11 | 7 | | 7 | | Page 7, figure 11.1. It would be good to include all main sources that fall under AFOLU: CO2 and CH4 from fires, N2O from agricultural soils, CH4 and N2O from manure, CH4 from rice cultivation, CH4 from enteric fermentation, CO2 from deforestation, CO2 from drained peat soils | Accepted, Now done |
| 7177 | 11 | 7 | | 7 | | Page 7, figure 11.1. Drained peat soils are large sources of CO2 and have a high potential for conservation and restoration (they store more than twice the carbon in all terrestrial biomass). In this fig. drainage of peat would be together with fires and deforestation one of the major sources. | Accepted, agree, but not likely to get numbers on this for different decades, could say something about it in text |
| 7178 | 11 | 7 | | 7 | | Page 7, figure 11.1. Are the fire numbers averaged over dry AND wet years? Or are numbers taken from el nino years in which fire existed more frequently? The figure suggests that this is the case. | Accepted, I imagine they are averaged over the decade, may need to check |
| 7179 | 11 | 7 | | 7 | | Page 7, figure 11.1. Are global numbers used, of is the figure for certain sources biased towards a certain climatic region (e.g. tropics, or temperate zones)? E.g. Ramankutty reports on tropical forests, Pan et al on temperate forests etc | Accepted, suggesting re-draw figure should take care of this, just use global modelled net CO2 from LULUCF |
| 10585 | 11 | 7 | | | | Can't see how range bars are so small in 2000-2009 and 1990-2007 if there is high uncertainty in first 20 years. Footnote a) could maybe be shortened - just be listing references. | Accepted, see above, fewer models, but will redraw using WGI data |
| 10097 | 11 | 7 | | | | The emmissions from agricultural soils do not include CO2 emissions from organic soils, drained peatlands, which are in agricultural use and this is an important source of emissions in some areas. Also degraded pastures on organic soils are an important source of emissions of CO2. I also wonder are the cumulative CO2 emissions from drained organic soils under forestry (which continue until all the peat has oxidized) represented here | Accepted, agre peatlands underrepresented, probably not enough data on previous decased to include in figure but shoudlspecifically mention in text. |
| 8598 | 11 | 7 | | | | In this figure, it is important to discriminate fires associated to deforestation processes and other LUC from those that occur in natural fire-adapted systems (ie. Tropical savannas) | Accepted, agree need more clarity, |
| 8923 | 11 | 7 | | | | it seems unlikely that the values have remained the same for enteric fermentation from 1980 to 2010 , despite a significant increase in animal production | Accepted, Check numbers and revise accordingly |
| 12366 | 11 | 7 | 1 | | | Comment to Figure 11.1 b); For enhanced transparency the "net C emissions per year" should be converted to CO2-equivalents to make the figure direct comparable to Figure 11.1 a). If the conversion factor is given this can be done even if the referred publications gives the emissions in Gt C/year. | Accepted, suggesting merging these two figures anyway and only showing net LULUCF modelled emissions from |
| 12367 | 11 | 7 | 1 | | | Two questions arises from the stacked bars of figure 11.1 a); 1) Does the CO2 emissions from deforestation include emissions also from forest soils? 2)Is carbon loss from agriculture soils and human activity on peatlands neglected in the figure? If these sources are not included it should be indicated clearly in the caption. | Accepted, yes the numbers include forest sils, no they do not typically include peatland emissions, will add comemnt to text/caption |
| 14411 | 11 | 7 | 1 | | | Figure 11.1 seems to say that by far, deforestation and fires are the main source of AFOLU emissions (about 3/4ths). But neither one is really “agriculture.” (Could usefully clarify whether fires refers to forest fires caused by campers – presumably forest fires caused by lightening are not anthropogenic – or fires set in agricultural practices to clear fields.) Looks like there is far more scope for emissions reduction through ending deforestation than, for example, through reducing animal share of diet or changing crop practices. Maybe there was a good reason why agriculture was separated from deforestation in earlier IPCC reports. Surely the main message remains the importance of curbing deforestation, and the opportunity presented by afforestation. | Accepted, Agree. Actally much deforestation is by fire and for agriculture. Need to clarify the fire part here. |
| 12867 | 11 | 7 | 1 | 7 | 19 | For carbon emissions from land use change, the 95% confidence interval is the standard measure of uncertainty (see Intergovernmental Panel on Climate Change. 2006. National Greenhouse Gas Inventory Guidelines. Institute for Global Environmental Strategies, Hayama, Japan.) So, convert the uncertainty in these graphs to 95% CI. That would also allow for comparison with other published forest emissions results. | Accepted, I assume these graphs are showing 1 SD which = 68%, so would need to go to 2 SD. But anyway should merge these graphs and not show LUC |
| 14718 | 11 | 7 | 1 | | | Global trends in CO2….change to CO2 | Accepted, OK |
| 13961 | 11 | 7 | 1 | | | it's not at all clear how b relates to a, given values for co2 emissions included in a and changes in units co2eq vs c. | Accepted, agree, will merge using WG1 data |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 13527 | 11 | 7 | 15 | 7 | 15 | It seems obvious that the main efforts are directed to progressively solve the complex interplay of factors linking the farm and agroforestry with LUC, deforestation and fires, while advancing to detect reliable correlations of these processes with GHG emissions, because with current methods such as remote sensing, can measure the magnitude of deforestation in a much more easy, coherent and reliable manner than the measurement of the produced emissions. Until then, me must use the available data, even if they are not very consistent, because they respond broadly to the relationship between GHG emissions, its causes, and proportions. Deforestation and fires (A) are largely the main contributors to CO2 emissions, and clearly much more than agricultural soils, manure management, rice cultivation and enteric fermentation, ie, essential activities for food production (B); namely, A/B= 40/11 (1980-1989), 53/13 (1990-1999), 46/14 (2000/2009), 49/13 (1990-2010). It also appears that CO2 emissions from fires fell from 27 (1980-1989) to 23.33 in average (23+18+20/3=41/3=20,33) in the last 30 years. Fires are sometimes related to deforestation, and both have to do with the uncontrolled “expansion of the agricultural frontier”, but we must recognize that while its management is a complex multifactorial process, a progressive decrease of its magnitude could markedly reduce CO2 emissions, without conflicting with food production on well-organized bases and social science and technology methodologies. A different problem is posed by the N2O and CH4 emissions, but that is a fertile field for practical scientific and technological progress in the understanding of natural phenomena. | Rejected, Statement - not a comment |
| 2595 | 11 | 7 | 16 | 7 | 16 | "RA Houghton, 2003, 2010" should be "Houghton, 2003, 2010;" | Accepted, agree |
| 2596 | 11 | 7 | 16 | 7 | 17 | "S. Piao et al., 2009;" should be "Piao et al., 2009;" | Accepted, agree |
| 2597 | 11 | 7 | 19 | 7 | 19 | "(RA Houghton et al., 2012)." should be "(Houghton et al., 2012)." | Accepted, agree |
| 10166 | 11 | 7 | 20 | 8 | 6 | This text appear a bit unstructured, a suggestion for improvement is 1. change in land use: i) global pattern, ii) regional scale, 2. change in productivity and its reasons, 3. change in livestock | Accepted, Agree |
| 16529 | 11 | 7 | 21 | 7 | 28 | The relation between the pasture numbers in the first sentence ("In 2009 total agricultural land…) and the 4th ("In accordance to the wider definition…") is not clear. Is "about 25% of the global land surface" calculated using the figure of 3356 Mha, or some other number? If so, what is this other number? | Accepted, Numbers were checked and text revised largely for the SOD. |
| 14575 | 11 | 7 | 21 | 7 | 22 | the share has remained stable but what has the land area done? | Accepted, Numbers were checked and text revised largely for the SOD. |
| 2615 | 11 | 7 | 21 | | | Immediate question came up how agricultural land has changed from 2009 to an earlier date. Saw that it was covered in the next paragraph. Would be good to present how the amount of ag land has changed in first paragraph. This would make sense then to discuss the components of the ag land. | Accepted, Numbers were checked and text revised largely for the SOD. |
| 12868 | 11 | 7 | 23 | 7 | 24 | Say instead "Agricultural lands, including croplands and rangelands, occupy 40–50% of the ice-free land surface of the Earth (Bartholomé and Belward 2005, Ellis et al. 2010)." Bartholomé, E. and A.S. Belward. 2005. GLC2000: A new approach to global land cover mapping from Earth observation data. International Journal of Remote Sensing 26: 1959-1977. Ellis, E.C., K.K. Goldewijk, S. Siebert, D. Lightman, and N. Ramankutty. 2010. Anthropogenic transformation of the biomes, 1700 to 2000. Global Ecology and Biogeography 19: 589-606. | Accepted, Text revised largely for the SOD, included post 2007 references |
| 3537 | 11 | 7 | 23 | | 24 | Please include a reference to this statement. | Accepted, Text revised largely for the SOD, included post 2007 references |
| 14576 | 11 | 7 | 23 | 7 | 24 | better as introductory sentence to paragraph?? | Accepted, Text revised for SOD |
| 11904 | 11 | 7 | 23 | | | (see AR4): please indicate the section or page of AR4. | Accepted, Text revised for SOD |
| 11112 | 11 | 7 | 23 | | | "croplands and pastures are one of the largest terrestrial biomes on the planet" - this statement is not precise, and may lead to incorrect concepts. Regarding what are they "one of the largest" biomes? Area? That is OK, but when we are talking about emission, removals and mitigation, and the share of natural and human-induced processes, then a more detailed and precise picture is necessary. | Accepted, Text revised largely for the SOD, included post 2007 references |
| 11905 | 11 | 7 | 25 | 7 | 33 | This section is about "prodution and consumption trends", not about the area of pasture or grazing land. Consider to delete or move to a suitable place (The definition of grassland also mentioned in page 45, line 30). | Accepted, Numbers were checked and text revised largely for the SOD. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 14577 | 11 | 7 | 26 | 7 | 28 | so agric is 15% of the 40% mentioned above?are these numbers from same data source?. Bit confusing | Accepted, Numbers were checked and text revised largely for the SOD. |
| 12869 | 11 | 7 | 27 | 7 | 27 | The 2006 IPCC National Greenhouse Gas Inventory Guidelines have superceded the older good practice guidance. So, say instead "...used in the IPCC National Greenhouse Gas Inventory Guidelines (IPCC 2006)..." Intergovernmental Panel on Climate Change. 2006. Agriculture, Forestry, and Other Land Use. National Greenhouse Gas Inventory Guidelines. Institute for Global Environmental Strategies, Hayama, Japan.) | Accepted, Text revised for SOD, reduced in pages |
| 5801 | 11 | 7 | 3 | 7 | 19 | The text is too long. Please consider just giving the sources and a statement about differences in regional coverage and other sources of incomparability. | Accepted, Figure replaced / removed for SOD |
| 5042 | 11 | 7 | 31 | 7 | 31 | this is the last time I will say this but when you say "Overgrazing 31 often happens on drylands as a result of pressure from food demand" I would have said food, fiber and energy demand | Accepted, text largely revised for SOD |
| 14578 | 11 | 7 | 33 | | | add comma after "poor regions,…." | Accepted, text largely revised for SOD |
| 4565 | 11 | 7 | 34 | 7 | 35 | The statement " The amount of arable and pasture land per-capita has increased in deveoping countries by 5% and 10% respectively between 20002 and 1970s, despite a continued decreasing trend in developed countries (FAOSTAT, 2011)" is not clear and it is somehow confusing. Probably more clarity is needed. | Accepted, Numbers were checked and text revised for SOD |
| 12368 | 11 | 7 | 34 | 7 | 35 | substitute "despite" with "opposite to" to make the sentence logical | Accepted, text largely revised for SOD |
| 15148 | 11 | 7 | 34 | 8 | 6 | do stats in this paragraph line up (or contradict?) | Accepted, Numbers were checked and |
| 14579 | 11 | 7 | 34 | 7 | 36 | sentence could be worded better and sswap 200s and 1970s. Would be good to know absolute numbers in terms of land area as well as % increase per capita as gives sense of what is to do with pper capita increase and hwat to do with population. But also note that a lot of the land for agriculture in developing countries isfor the export market to develpoped countries, so increase in per captial land does not imply people have more food. may be owrth making this point | Accepted, Numbers were checked and text revised for SOD |
| 5040 | 11 | 7 | 34 | 7 | 34 | I don't look at the data but I really doubt that the statement :The amount of arable and pasture land per-capita has increased in developing countries by 5% and 34 10% respectively between 2000s and 1970s" as population has grown. The only explanation I could think of is this is due to deforestation or poor wording where arable should be replaced with cropland and the word used should be inserted. i dont think the stock of potential arable and pasture land can change other than through deforestation. simpley put land is generally not being created. | Accepted, Numbers were checked and text revised for SOD |
| 2129 | 11 | 7 | 34 | 7 | 42 | is this consistent? - land area increase and decrease in the lines 34 resp. 42? - It should be made clearer which type of land use changed by which amount over which period. | Accepted, Numbers were checked and text revised for SOD |
| 2616 | 11 | 7 | 34 | | 35 | respectively between 2000s and 1970s is confusing. Is this a decadal comparison or from 1970 to 2000? | Accepted, Numbers were checked and |
| 18915 | 11 | 7 | 34 | 7 | 35 | 5%, 10%, 2000s, 1970s: There is one range but two values, order of the years should be switched. Please correct/clarify. | Accepted, Numbers were checked and text revised for SOD |
| 16530 | 11 | 7 | 35 | 7 | 35 | 2000s and 1970s are reversed. | Accepted, Numbers were checked and |
| 15147 | 11 | 7 | 35 | 7 | 35 | switch order of 1970s and 2000s | Accepted, Numbers were checked and |
| 7333 | 11 | 7 | 35 | 7 | 35 | 2000s and 1970s --- should be 1970s to 2000s | Accepted, Numbers were checked and |
| 5041 | 11 | 7 | 36 | 7 | 36 | when you say "Changing land-use practices have enabled world grain harvests to double" I would add technological progress and maybe crop management as ferilizer and varietal improvement have been important as have changes in crop mix | Accepted, text revised for SOD |
| 10586 | 11 | 7 | 39 | | | Is the 311 Mha increase as a result of deforestation? Could clarify | Rejected, A better question is "did deforestation result from the land clearance for agriculture?" - the answer would depend on where the expansion |
| 14719 | 11 | 7 | 4 | | | (Y. Pan et al., 2011) should be changed to (Pan et al., 2011) | Accepted, Zotero updated for SOD |
| 2594 | 11 | 7 | 4 | 7 | 5 | Y. Pan et al., 2011 should be Pan et al., 2011 | Accepted, Zotero updated for SOD |
| 9443 | 11 | 7 | 40 | | 40 | WG3 refers to developed, OECD, and Annex One countries. The latter two categories are much more meaningful than "developed." | Accepted, Regions harmonised |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 18916 | 11 | 7 | 41 | | | 7%, 75Mha: It is unclear whether this is about developed countries only. If so, it would be good to give the developing country values that partially make up for the developed country trend. For consistency please have a "-" before numbers throughout the chapter and make sure that this is the case for % values AND absolute values. It should e.g. be "-3.1% or -31.6 Mha)" etc. | Accepted, Numbers have been checked and text revised accordingly |
| 5039 | 11 | 7 | 5 | 7 | 5 | you refer to pan with "1990-2010" in one place and "1990-2007" which is it? | Accepted, Check numbers and revise |
| 14720 | 11 | 7 | 7 | | | (GR van der Werf et al., 2010) change to (van der Werf et al., 2010) | Accepted, Zotero to be updated for SOD |
| 8315 | 11 | 7 | 6 | 7 | 6 | Authors should note that the amount of carbon emission is varied according to a land use type. | Accepted, Revise for SOD |
| 3535 | 11 | 7 | | | | It is very hard to understand that Figure 11.1 (a) include all land use categories (LUC) in AFOLU. For e.g. does 'fires ($CO_2$)' covers all LUC (forest, cropland, grassaland, etc.)? Also, it is not clear whether this figure 11.1 (a) include emissions from all carbon pools (living biomass, dead organic matter, soils), please clarify. Please indicate what are the LULUCF activities indicated for Figure 11.1(b). How settlement as LULUCF category is treated? Are all C pools included in Figure 11.1(b)? Please include as much information as possible to demonstrate the completeness of your assessment (i.e. justify that the entire AFOLU sector is covered in the assessment), otherwise indicate what is missing in the current literature. This is very important for future scientific and IPCC work. Also, please increase consistency between both figures 11.1(a) and 11.1(b): 11.1(a) shows data for 1980-2010 while 11.1(b) shows data for 1980-2007. Explain clearly what is AFOLU and LULUCF in this chapter (indicate the different categories). | Accepted, Figure to be replaced / removed for SOD |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 7057 | 11 | 7 | 16 | 7 | 19 | We fear that the primary source for Figure 11.2 (Houghton et. al. 2012) does not accuractely reflect recent information. In particular, Houghton 2012 asserts that the forest sink is due to fertilizatoin and climate effects whereas the information in Pan et al 2011 clearly shows that forest regrowth, expansion and management are key contributors to growing forest stocks and the global forest sink. (See Pan, Y., Birdsey, R., Fang, J., Houghton, R., Kauppi, P., Kurz, W., et al. (2011). A Large and Persistent Carbon Sink in the World's Forests. Science Vol. 333 , 988-993.)<br>Net emissions due to land use, land use change and forestry are best calculated from Pan et al. This publication, by leading international authorities and built on actual national inventory data, shows different picture than implied by Figure 11.1b, and explains the unexplained sink described in AR4 | Accepted, Comment actually refers to Figure 11.1. Figure to be replaced / removed. The commentator is confused between land use change net emissions due to direct activity of land use and land cover change, and the response of ecosystems to the indirect effects of environmental change in the two different papers. this is not surprising as the current chapter text and indeed the Pan et al. paper are not clear on this. Human activity on the land (land use land-use change and forestry LULUCF) is a net source of CO2 emissions, primarily due to tropical deforestation. The Pan paper uses the Houghton model to calculate the NET LULUCF flux in the tropics, but also splits the model results up into the GROSS flux from forests loss, and the GROSS sink from regrowing vegetation (e.g. much of the tropics undergoes shifting cultivation as well as net forest area loss). Then the other thing the Pan paper does is collate inventory data in tropics to show that extant forests not undergoing human management are currently net sinks for carbon, this is due to indirect effects of environmental change (CO2 fertilization, climate). This is consistent with Houghton 2012. In fact Houghton was an author on both papers. Houghton |
| 12183 | 11 | 7 | 3 | 7 | 7 | First sentence of the paragraph lines 3/4/5 are not clear. In one source it is mentioned as 1990-2007 where as in the next line as 1990-2010. Why the data of 1980s ( perhaps 1980-1989) is not comparable with 1990-2010.<br>FAO is the best source of data on deforestation but that has not mentioned here.<br>Similarly the sentence starting C emissions from fires from 1980-1989 and ---for 1980 only is not clear.<br>It is also not clear how the data of CO2 emissions has been harmonized and presented in the figure 11.1. | Accepted, Revise for SOD |
| 5493 | 11 | 7 | | | | Section 11.2.1- would it be possible to include some information on trends re import and export of primary production in this section? | Noted, Could not find space |
| 11291 | 11 | 7 | 20 | | | Quantitative data in this section would be much more comprehensible if shown graphically (i.e. on a map or chart). | Accepted, Tabulated or inserted figures |
| 12925 | 11 | 7 | 20 | 10 | 14 | Topics in this section should be discussed following three categories of "Cropland", "Grassland", "Wetland". Trend of C flux was discussed in such categories in 11.2.2, so readers can easily compare the discussion in Production and Consumption trend with in the trend of C flux. | Accepted, Revised for SOD |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 10129 | 11 | 70 | 13 | 70 | 13 | A discussion on mitigaiton in livestock produciton is completely missing and it is the biggest emitter, animal healt and feeding practices (more production of protein per animal, sick animals hyngry animals do not produce but they do emit), how the feed is produced (deforestation consequences, but could also be a carbon sink) , manuremanagement and produciton of biogass (FAO has done a lot of work on this). | Accepted, Livestock sections have been strengthened |
| 10130 | 11 | 70 | 13 | 70 | 13 | Also energy in agricultural context is much larger issue that only biofuel production , energy is needed in the households (forest degradation) and in farming (irrigation pumps, machinery, transport, processing) this can be produced as apart of farming system with clear mitigaiton benefits but maybe this is addressed in the energychapter | Noted, Energy chapter issue |
| 2643 | 11 | 70 | 14 | | 28 | The discussion seems to suggest that only agricultural crops can be used to produce biofuels. This is not correct and forest materials are also used to produce liquid fuels. | Accepted, Clarified for SOD |
| 5517 | 11 | 70 | 21 | | | Biofuels are mentioned frequently in this chapter but I have not seen any type of assessment of relative benefits:costs of different types of biofuel or detailed discussion on the relative energy to costs for different types of biofuels. Tools for appropriate assessment of different biofuels would also be helpful. | Rejected, This occurs in the energy chapter and the bioenergy cross cut chapter |
| 7214 | 11 | 70 | 21 | | | ' coherent biofuel policies need to be promoted'. This only counts if the existing biofuel policies are sound, reliable, and promote the production of 'true' sustainable biofuel. And this is not the case yet. Discussion needed on e.g. Roundtables such as RSPO, RSS, RSB. RSPO for example does not even have GHG criteria yet in their policy. This needs to be discussed | Accepted, Revised for SOD |
| 12448 | 11 | 70 | 32 | 70 | 32 | Is the emission reduction of 104 Mt CO2-eq per year or accumulated over ten years? Please consider to clarify. | Accepted, Checked numbers and revised accordingly |
| 10613 | 11 | 70 | 38 | | | Australia didn't have the "world's first" scheme. NZ emissions trading scheme started in 2008 and the forestry sector was included from 1 January with forest C credits being traded since then. http://www.mfe.govt.nz/publications/climate/emissions-factsheets/factsheet-17.html | Accepted, Removed claim that Australia was the first - unimportant and should not single out countries except as |
| 12449 | 11 | 70 | 41 | 70 | 44 | Line 42 "reducing fertilizer use" indicates that N2O emissions are included in the scheme. The expression "Carbon Farming Initiative in line 43/44 and "Australia's carbon emissions" however suggests that only C-related emissions are included. Please clearify. | Accepted, Revised for SOD |
| 12450 | 11 | 70 | 44 | 70 | 44 | Clearify if the figure 460 million tonnes is C, or CO2-eq and if it is per year. | Accepted, Checked numbers and |
| 5654 | 11 | 70 | 44 | 70 | 44 | "--- cut Australia's carbon emission by 460 million tonnes by 2050". Units tC or tCO2 equivalent? | Accepted, Checked numbers and |
| 5849 | 11 | 70 | 45 | 70 | 46 | Please give the complete name of the certification initiative: "Forest Stewartship Council". | Accepted, Revised for SOD |
| 15207 | 11 | 70 | 6 | 70 | 7 | extensive citation for simple sentence | Accepted, Revised for SOD |
| 14448 | 11 | 70 | | | | Good summary of research areas that should be supported. I recommend leaving this section intact. | Accepted, Retained this section, but added to it and developed it further |
| 17148 | 11 | 71 | 10 | | | A Case Study on the important role that traditional/indigenous agriculture makes in climate change mitigation might be a valuable includsion in this chapter. | Noted, Very limited space |
| 5850 | 11 | 71 | 10 | 72 | 5 | There are two topics missing from your list (at least): 1.) Better understanding of the indirect effects of land-use, especially of the use of biomass grown on the land in HWP and / or bio-energy, with an emphasis on cascading use and recycling. 2.) Better understanding of the optimization of biomass production in agriculture or forestry with regard to the climate change impacts and trade-offs (in both cases: positive and negative). Linking 1.) and 2.) is a matter of course. | Accepted, Added to gaps list |
| 6782 | 11 | 71 | 10 | 72 | 5 | date about the effects of Nitrogen deposition or other air pollution on the carbon stocks or non-CO2 emission.soil inorganic carbon changing following land use change.the trade-off about adaptation and mitigation in AFOLU sector. | Accepted, Added to gaps list |
| 5655 | 11 | 71 | 11 | 71 | 42 | First and foremost: | Noted, Not a full comment |
| 5656 | 11 | 71 | 11 | 71 | 42 | An inventory of biomass, especially trees on all land use types. Where important, inventories of residues both plants and animals. Data required on stock and annual growth. | Accepted, Added to gaps list |
| 5657 | 11 | 71 | 11 | 71 | 42 | Good land use maps and monitoring for land use changes over time. | Accepted, Added to gaps list |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 5658 | 11 | 71 | 11 | 71 | 42 | Regarding point 10. Better data on forest degradation. This sentence assumes that selective logging, collection of fuelwood/poles and NTFP, charcoal production etc. is a principal cause of forest degradation. In most cases the removal of these products is harvesting. Dead wood is the first choice of fuelwood collectors. They are doing a service in decreasing the risk of forest fires. Also trees outside the forest (TOF) are a significant source of fuelwood and poles. Such trees have been neglected in this First Order Draft. TOF could supply much of the firewood (and poles) in developing countries. | Accepted, Added to gaps list |
| 5659 | 11 | 71 | 11 | 71 | 42 | Point 11. What are DGVMs? | Accepted, Spelled out DGVMs |
| 5660 | 11 | 71 | 11 | 71 | 42 | Point 14. The dry distillation of biomass for liquids energy should not be neglected. | Accepted, Added to gaps list |
| 4352 | 11 | 71 | 11 | 72 | 5 | Indication of these gaps are useful to understand uncertainty of future projection in AFOLU and study targets. I can add some, e.g. migration and survival of native forest species, responces of vegetation and soil for extreme climates, linkage after several potions in AFOLU | Accepted, Considered and added those considered important |
| 18290 | 11 | 71 | 13 | | | "A global, high resolution data base of typical land management practices": the same applies for typical animal housing systems and manure management practices, please add this as a gapof knowledge | Accepted, Added to gaps list |
| 18291 | 11 | 71 | 16 | 71 | 18 | the same applies for livestock management practices,please add this as a gap of knwoledge | Accepted, Added to gaps list |
| 11075 | 11 | 71 | 16 | 71 | 18 | Suggest changing this item to "Better data on how agricultural management practices including crop rotations, variety selection, fertilization practices (amount, type and timing) and tillage practices affect GHG gas emissions including N2O and CH4 emissions and soil C storage, and how these effects vary at different locations across the globe." | Accepted, Revised for SOD |
| 18292 | 11 | 71 | 18 | | | Please add the following gap of knowledge:"better data on emission level and mitigation options of new technologies e.g. in animal housing, manure management, feeding practices, etc." as we also need data on the newly developed technologies | Accepted, Added to gaps list |
| 2644 | 11 | 71 | 19 | | 21 | Studies need productivity (NPP) data and not just C stocks to calculate C sequestration potentials. | Accepted, Added to gaps list |
| 13671 | 11 | 71 | 19 | 71 | 21 | This data and knowledge gap should be saparated as follows:<br>- More accurate data on C stocks in biomass for grasslands, croplands and wetlands, and C stocks in pools of dead organic matter for different types of ecosystems around the world, including forests<br>- More accurate long-term monitoring data on C stocks in soils for different types of ecosystems and different management around the world, including forests | Accepted, Considered and reorganized |
| 2645 | 11 | 71 | 26 | | 28 | Most of the burning of forests and fires in Indonesia is for planting palm oil plantations and not shifting agriculture | Partially Accepted, Expanded bullet point |
| 2646 | 11 | 71 | 29 | | 30 | There is a need for a better word than degradation. Degradation can be a heavily human laden word or value. A change may be negative for humans because it decreases the delivery of an ecosystem service but the ecosystem itself may be shifting within its range of change without it being negative. | Accepted, Defined degradation |
| 7215 | 11 | 71 | 3 | | | the length and complexity of the biofuel supply chains make the sustainability issue very challenging'. That is true, however, it is of major importance to study the total chains, since otherwise very wrong, highly impacting decisions on e.g. biofuel policies could be made, because simply the knowledge is not there. E.g. the promotion of palm oil produced on any kind of land (including peatland) as a biofuel. While afterwards it turns out that biofuels that contain palm oil produced on peat has very negative impacts in terms of GHG emissions compared to fossil fuels | Accepted, Nuance Discussion and refer back to bioenergy section |
| 2647 | 11 | 71 | 31 | | 33 | Llarge global data bases already exist (FAO) so one would question the need for more data collection. It would be better to mine the large existing data bases instead of just collecting more data. | Accepted, Reworded bullet point |
| 2648 | 11 | 71 | 38 | | 39 | This needs to include soils | Accepted, Reworded bullet point |
| 2649 | 11 | 71 | 41 | | 42 | Bioenergy is not one type of energy but a broad group of different types of energy - gas, liquids, etc. | Accepted, Nuanced discussion and referred back to bioenergy section |
| 10260 | 11 | 71 | | 72 | | A major gap to be added: an effective initiative is necessary to build an on-line dedicated tier2 database for the AFOLU activities | Accepted, Added to gaps list |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 13356 | 11 | 71 | | | | There is a poor understanding of the relationship between animal nutrition and enteric fermentation. Current global manure management estimates are extremely crude and poor. There is a poor understanding of the impact of draining of wet areas (potholes) on carbon balance on agricultural soils. There is a poor understanding of forested wetlands/peatlands and the impacts of forestry on forested wetlands/peatlands. In general the gaps in knowledge here are focussed mainly on land use and are just touch on knowledge gaps in AFOLU. | Accepted, Added to gaps list |
| 11181 | 11 | 71 | | | | Knowledge of practical technology for sustainable forest management in diversed natural and social conditions are important to reducing emissions from deforestation and forest degradations in developing countries in the long term. But it is still insufficient. | Accepted, Added to gaps list |
| 4280 | 11 | 71 | 10 | | | Fire is identified as a data gap; fire statistics are probably better and more readily avaialble thatn insect and disease data, which may be as important or even more important, but is not identified as a data gap. A gap in the data gaps list :) | Accepted, Added to gaps list |
| 11180 | 11 | 71 | 19 | | | More accurate data on C stocks in forest biomass are also needed especially for the natural forest in developing countries. Correcting forest biomass data is more difficult than in the cropland/grassland and diversity is much larger. | Accepted, Added to gaps list |
| 15208 | 11 | 72 | | | | it's not just ag and l-u change. It's all kinds of land uses and land-use change | Accepted, Edit for SOD |
| 13992 | 11 | 72 | | | | add in change in diets. Mention the problems with 4.3 Gt estimate. | Accepted, Edit for SOD |
| 13993 | 11 | 72 | | | | some barriers such as non-permanence cnanot be resolved. | Rejected, Statement - not a comment |
| 13994 | 11 | 72 | | | | increased incorporation of manures and composts will increase soil fertility, soil health, water infiltration and water holding capacity, etc. | Rejected, Statement - not a comment |
| 2650 | 11 | 72 | 1 | | 2 | We need productivity of the total ecosystems (above and belowground) to better understand the carbon budget | Rejected, Statement - not a comment |
| 18293 | 11 | 72 | 17 | 72 | 28 | The question on "main mitigation options" is not being answered | Accepted, state explicitly |
| 9461 | 11 | 72 | 17 | | 28 | This chapter does plenty to demonstrate the mitigation potential of mitigation options, but does little to nothing to demonstrate that these are actionable strategies. | Accepted, Write more in policy section to suggest what is already happening |
| 18294 | 11 | 72 | 30 | | | I suggest to add a question liek "How can consumers influence GHG mitigation by their choice of diet and agricultural products?" | Partially Accepted, Will add something on diets under mitigation options - see |
| 5851 | 11 | 72 | 38 | 73 | 4 | What you refer to here is the direct mitigation potential through C sequestration and storage in situ or by e. g. avoided degradation / deforestation. You neglect indirect effects of biomass use, what can lead to erroneous conclusions. | Rejected, Accounted for in the energy chapter |
| 5661 | 11 | 72 | 9 | 72 | 16 | Annual flux from land use and land-use changes account for 12-20% --- 1.1 +/- 0.9 GtC. This is a very large figure for +/-! | Noted, Yes - it is a very complex system and the uncertainty is large |
| 15631 | 11 | 72 | 3 | 72 | 4 | In terms of knowledge and data gaps, the effects of mitigation options on the social and economic conditions of poor people are not the only gaps to be considered. More should be done to improved knowledge and data on a wide range of social and economic impacts, as well as non-climate environmental impacts. This includes, for example, animal welfare, which to my knowledge has been rarely considered in this context. | Rejected, Animal welfare considered already in earlier comments; will be included in the main chapter |
| 5382 | 11 | 72 | 8 | 73 | 9 | This reviewer feels that there really needs to be a bullet here in the FAQs that says doing noting about climate change represents a real and already present danger for AFLOU and therefore the baseline needs to be framed in terms of deviating from this bad outcome trajectory and not on restoring the earth to some idyllic natural state. | Accepted, Revise for SOD |
| 7084 | 11 | 73 | | | | The answer to the FAQ needs to be expanded to included the mitigation benefits associated with forest products. In this context, it should be noted here that in the fourth assessment report, it was found (and is still true) that as regards mitigation benefits of forests, the maximum long-term benefits are attained via sustainable forest management to maintain or increase forest carbon stocks while producing a continuing output of forest-based products. (Fourth Assessment Report, WGIII, Chapter 9, Executive Summary) | Accepted, Revise for SOD |
| 10193 | 11 | 73 | 10 | 73 | 12 | However, reforestation of burnt areas will lead to CO2 sequestration again, which is not the case if the area originally was left deforested | Noted, Statement - not a comment |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 11833 | 11 | 73 | 17 | | | FAQ 11.6: Shouldn't there be a a FAQ about trade-offs as well? | Rejected, We are working to the IPCC |
| 2150 | 11 | 73 | 18 | 73 | 26 | add the role of improved soil quality, fertility etc. from increased soil organic carbon levels (water retention, absorption, etc.) - given the big mitigation potential of SOC sequestration, co-benefits thereof have to be communicated clearly as well. | Accepted, Revise for SOD |
| 10194 | 11 | 73 | 20 | 73 | 20 | For clarity change to "reforestation, afforestation and reduced deforestation" since it is a reduction in the last but an increase in the first two that results in mitigation. Alternatively write out "increased" before reforestation and afforestation. | Accepted, Revise for SOD |
| 13537 | 11 | 73 | 28 | 73 | 28 | explained, integrated, or used for feedback for profound changes in concept, approach and scope? | Rejected, We are working to the IPCC |
| 11832 | 11 | 73 | 6 | 73 | 8 | In which sense does the feedback from thawing permafrost to the climate relate to AFOLU? Just by ist overall effect on warming? | Noted, Yes - via feedback to increase future warming |
| 6940 | 11 | 73 | 27 | 73 | 28 | Models to do what? We suggest to revise the title to be more explicit in order to better capture the content. | Accepted, To estimate mitigation potential in the AFOLU sector - clarify |
| 6939 | 11 | 73 | 5 | | | We are concerned about the current focus of the FAQ. Most of this FAQ deals with physical science and climate change feedbacks. We suggest to either delete the FAQ or to move the focus on the emissions side to avoid unnecessary overlap and duplication with the WGI AR5 assessment, Chapter 6 WGI AR5. | Accepted, This FAQ removed |
| 16621 | 11 | 74 | | 103 | | I have emphasized the importance for the credibility of the chapter, given possible attacks as with AR4, of avoiding citations to reports that are not either peer-reviewed or citations of official government or intergovernmental publications. The following are those which may fall into this category. (I hope not, but it's important to check!): Berndes Goran 2012, Calder 2005, CATF 2009, CBD and Giz 2011 Chan et al 2010, Eliasch 2008, Herold 2009, Jackson 2009, Joosten 2010, Mayrand and Paquin 2004, McKinsey and Company 2009, Peters-Stanley et al 2011, Shiraishi et al. 2006, Strassburg et al. 2007 (I believe this is the "white-paper" equivalent of Strassburg et al. 2009), WBGU 2009, and WBGU 2011. | Accepted, Okay - thanks - we havel taken advice |
| 7670 | 11 | 74 | 29 | 74 | 36 | The two papers by P. Asante et al mentioned here contain both a fundamental error. This will be shown in the following paper, which conclude very differently with regard to the importance of dead organic matter: Holtsmark, B., M. Hoel, K. Holtsmark (2012) Optimal harvest age considering multiple carbon pools - a comment. Journal of Forest Economics (in press) | Accepted, Removed reference, or have shown the counter-case |
| 15209 | 11 | 76 | 1 | 76 | 5 | repeated reference | Accepted, Zotero updated for SOD |
| 16531 | 11 | 8 | 10 | 8 | 10 | ".. Expected to double" with respect to its value in what year? | Accepted, Text largely revised for SOD, included reference years |
| 10587 | 11 | 8 | 10 | | | FAO projection of 70% more food will be needed by 2050 than 2005/2007 production could be quoted: FAO 2009, How to feed the world in 2050, Food and Agriculture Organization of the United Nations, Rome. 35 pages. www.fao.org/fileadmin/templates/wsfs/docs/expert_paper/How_to_Feed_the_World_in_2050.pdf | Accepted, Text revised for SOD |
| 11976 | 11 | 8 | 11 | | 11 | "M head" maybe better as million head first time as people may get confused | Accepted, Agreed - revised |
| 18917 | 11 | 8 | 11 | 8 | 12 | For better readability change the million values to billion. | Rejected, Billion means different amounts in different parts of the world |
| 5802 | 11 | 8 | 15 | 8 | 22 | Please explain "EIT" and bear in mind that cattle, buffalo, sheep and goats are all ruminants, too. So you could simply delete the term from line 20. | Accepted, The guidance at LAM3 on regional breakdown is agreed, and those have been used for SOD. Regions are |
| 9444 | 11 | 8 | 21 | | 21 | The term drivers is pervasive in the scientific literature, but its meaning varies widely. Here, it should be defined or excised | Accepted, Text largely revised for SOD. Term 'drivers' used in accordance to |
| 14583 | 11 | 8 | 22 | | | would be good to make the point somewhere in this para or the one below that amount of land and agric cops needed to sustain livestock production, ie. not just a matter of increasing pasture land, but of feed production. | Accepted, Text largely revised for SOD |
| 4566 | 11 | 8 | 24 | 8 | 26 | The use of the term developing regions is not very common and may be difficult to understand. I suggest that the term developing countries in Asia be used instead. | Accepted, The guidance at LAM3 on regional breakdown is agreed, and those have been used for SOD. Regions are |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 18918 | 11 | 8 | 24 | | | "for the world": add a time span | Accepted, Text revised for SOD |
| 13307 | 11 | 8 | 25 | 8 | 25 | remove "for" before "Asia" | Accepted, Revised for SOD |
| 10100 | 11 | 8 | 25 | 8 | 25 | The per capita food availability in Africa has to my knowledge decreased | Accepted, Numbers have been checked, text revised for SOD |
| 9445 | 11 | 8 | 26 | | 28 | Since when has the share of livestock products in developed nations begun to decline? The 1970's also? | Accepted, Text largely revised for SOD, included reference years |
| 2130 | 11 | 8 | 26 | 8 | 26 | may write "almost doubled" instead of "up 92%" - to avoid that an inattentive reader may think that meat constitutes for 92% of the diet. | Accepted, Text largely revised for SOD, included actual numbers |
| 13306 | 11 | 8 | 3 | 8 | 6 | With the increase in N fertilizer, there has been an increase in the amount of reactive N in the biosphere, and as a consequence a corresponding increase in N2O and see Galloway et al. The N cascade ( | Partially Accepted, This is dealt with later in the chapter dealing with changes |
| 10098 | 11 | 8 | 3 | 8 | 4 | There has been a significan increase in fossile fuel use due to mechanisation, production of fertilizers, the irrigation pumps use significant amount of fuels and also emit harmful substancies (I try to dig a reference if I have time) | Partially Accepted, This is accounted for in the energy sector |
| 6823 | 11 | 8 | 34 | | 36 | Is increasing use of artifical fertilisers possible in these developing countries given rising oil prices and land degradation etc? FAO (Save and Grow, 2011) promotes "sustainable crop production intensification (SCPI), which produces more from the same area of land while conserving resources, reducing negative impacts on the environment and enhancing natural capital and the flow of ecosystem services." | Accepted, Text largely revised and shortened for SOD |
| 9325 | 11 | 8 | 34 | 8 | 36 | The likelihood that increased crop and livestock production will be met through expanded use of synthetic fertilizer does not seem to be a good proposition. The synthetic fertilizers, which were the moving force behind the green revolution of 1960s and 70s, are blamed for atmospheric pollution, i.e. nitrate contamination of groundwater through leaching from agricultural fields and emission of nitrous oxide ( a greenhouse gas) through the process of denitrification. This is supported by a statement on page 15, line 11 of this Chapter (Chapter 11) that 'In total, 76% of greenhouse gas emissions on croplands come from the application of fertilizer'. | Rejected, Of course - we are not advocating it - we are reporting the trends |
| 5700 | 11 | 8 | 34 | 8 | 36 | Please add that enhanced use of chemical fertilizers and expanded livestock production will, however, increase GHG emissions. | Accepted, We have added that - but we are not advocating it - we are reporting |
| 8924 | 11 | 8 | 34 | 8 | 36 | "and by the substantial conversions from forest to arable / grazing land" | Rejected, Provide reference |
| 10101 | 11 | 8 | 35 | 8 | 35 | Expanded livestock production capacity? Improved, increased? | Accepted, Changed to "increased" |
| 14584 | 11 | 8 | 36 | | | see point above, again it would be useful in the context of this para to have data on crop yeild/ha in the past, currently and potential for increase. | Accepted, Text revised for SOD |
| 10099 | 11 | 8 | 4 | 8 | 5 | There has been a very significant intensification in China, which at the moment uses most N fertilizers per ha but also South Korea, Vietnam, Indonesia | Accepted, Regional breakdown removed |
| 15229 | 11 | 8 | 4 | | 6 | Missing parallel comparison to food yields. 700% increase in chemical fertilizer use and 70% increase in irrigation (ok). But this resulted in non-proportional increases in food production. For example, grain yields increase by 1.5-fold from 1961 to 2006 (FAO stats). Suggest adding this comparison inputs vs. yields increases (to highlight innefficiencies and impacts of GR technologies). | Accepted, Have shown yields per capita increasing, and yield per unit input going down |
| 14721 | 11 | 8 | 5 | | | (J. A. Foley et al., 2005), needs to be changed to (Floey et al., 2005). In this matter several authors throughout the text are cited in different ways. In my opinion this should be standardized. | Accepted, Zotero to be updated for SOD |
| 14722 | 11 | 8 | 5 | | | …" agricultural intensification has mainly occurred in the Southern Asia (e.g. Bangladesh and Sri Lanka) (Royal Society, 2009)." Agricultural intensification in the Savanas areas of Brazil (Central part of the country) has also been intensified since the 70's. Significant areas were de forested and soybeans crop and grazing lands were planted. | Accepted, Removed regional statements |
| 2598 | 11 | 8 | 5 | 8 | 5 | "(J. A. Foley et al., 2005);" should be "(Foley et al., 2005);" | Accepted, Zotero to be updated for SOD |
| 14580 | 11 | 8 | 6 | | | it would also be good to have information on yield/ha in different regions over time to see past icnrease and potential for further yield icnreases. | Accepted, Have shown yields per capita increasing, and yield per unit input going |
| 14581 | 11 | 8 | 6 | | | delete : in THE Southern Asia | Accepted, Removed regional statements |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 16532 | 11 | 8 | 7 | 8 | 22 | This paragraph does not mention pigs, whose numbers have changed rapidly in recent years, particularly in China. There should be a sentence or two mentioning their trend. | Accepted, Non-ruminants and poultry have also been considered. Text largely |
| 2592 | 11 | 8 | 7 | 8 | 9 | It would be more opportune to state where the increase happens: in Europe, milk productions exceds the demand. | Rejected, These are global trends - not the place for regional details |
| 5043 | 11 | 8 | 7 | 8 | 7 | I note this paragraph does not have hogs or aquaculture and that might be a good addition | Accepted, Non-ruminants and poultry have also been considered. Text largely |
| 2617 | 11 | 8 | 7 | | 22 | The organization of information delivery is hard to follow, the word sequence difficult to follow and one sentence is 5 lines long. | Accepted, Text revised for SOD |
| 2599 | 11 | 8 | 7 | 8 | 7 | "the last 50 years" would be given by specific time, for example, during 1961- 2011 | Accepted, Time periods are more |
| 2323 | 11 | 8 | 8 | | 17 | This paragraph could be deleted as other report will deal with impact and adaptation to Climate Change. | Rejected, Trends data needed - not dealt with elsewhere - not about adaptation - |
| 14582 | 11 | 8 | 9 | | | would be good to make the point htat this is linked to both increasing population,a nd increasing meat onsumption per capita in developing nations. There is mor eon this in the next para though so may not be necessary | Rejected, Dealt with in next paragraph |
| 2322 | 11 | 8 | 9 | | 10 | Please, provide references. | Rejected, Each statement is fully |
| 15604 | 11 | 8 | 10 | 8 | 12 | Why exclude poultry (including egg-laying hens) from these production numbers, especially given the shift to monogastric production. Food and Agriculture Organization of the United Nations (2009). The state of food and agriculture: livestock in the balance (Rome, Italy: FAO, p. 13). Available at: http://www.fao.org/docrep/012/i0680e/i0680e.pdf. | Accepted, Non-ruminants and poultry have also been considered. Text largely revised for SOD |
| 15606 | 11 | 8 | 21 | 8 | 22 | Consider mentioning the importance of emissions trends based on economic sectors, specifically animal agriculture; and adding figures on this such as those in Unger N. et al (2010) and Pelletier and Tyedmers (2010). Unger N., T.C. Bond, J.S. Wang, D.M. Koch, S. Menon, D.T. Shindell, and S. Bauer (2010). Attribution of climate forcing to economic sectors. Proceedings of the National Academy of Sciences of the United States of America 107(8), 3382-87. Steinfeld H., P. Gerber, T. Wassenaar, V. Castel, M. Rosales, and C. de Haan (2006). Livestock's long shadow: environmental issues and options. Food and Agriculture Organization of the United Nations. Available at: ftp://ftp.fao.org/docrep/fao/010/a0701e/a0701e.pdf. Pelletier N. and P. Tyedmers (2010). Forecasting potential global environmental costs of livestock production 2000-2050. Proceedings of the National Academy of Sciences of the United States of America 107(43), 18371-74. Available at: http://www.pnas.org/content/early/2010/09/27/1004659107.full.pdf+html. | Accepted, Emissions have been presented by subsectors; section largely revised for SOD |
| 5367 | 11 | 8 | 23 | 8 | 25 | This point about food avialiabilty per capita increasing even in the face of growing world population seems to be a profoundly important point that should perhaps be mentioned in the executive summary and the FAQs at the end of the chapter. This finding seems to have important ramifications for going forward in terms of addressing climate change as well as feeding the world. | Accepted, Have shown yields per capita increasing, and yield per unit input going down |
| 12184 | 11 | 8 | 25 | 8 | 26 | The share of animal product in the diet ? Perhaps it should be per capita consumption to make it more clear | Accepted, Changed wording |
| 15605 | 11 | 8 | 7 | 8 | 22 | Consider more clearly highlighting the animal agriculture sector. Steinfeld H., P. Gerber, T. Wassenaar, V. Castel, M. Rosales, and C. de Haan (2006). Livestock's long shadow: environmental issues and options. Food and Agriculture Organization of the United Nations. Available at: ftp://ftp.fao.org/docrep/fao/010/a0701e/a0701e.pdf. Pelletier N. and P. Tyedmers (2010). Forecasting potential global environmental costs of livestock production 2000-2050. Proceedings of the National Academy of Sciences of the United States of America 107(43), 18371-74. Available at: http://www.pnas.org/content/early/2010/09/27/1004659107.full.pdf+html. Also consider highlighting the amount of crop production going to animal feed. Over 97% of global soymeal production is fed to animals used in agriculture, and during the last four decades of the 20th century, over 60% of the corn and barley crop were also fed to these animals. Steinfeld H., P. Gerber, T. Wassenaar, V. Castel, M. Rosales, and C. de Haan (2006). Livestock's long shadow: environmental issues and options. Food and Agriculture Organization of the United Nations, pp. 38-39, 43. Available at: ftp://ftp.fao.org/docrep/fao/010/a0701e/a0701e.pdf. | Accepted, Non-ruminants and poultry have also been considered. Text largely revised for SOD |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 14673 | 11 | 8 | 7 | 8 | 9 | It seems very likely that as feed prices rise, due to climate change related reductions in yield and increasing population pressure on food of all sorts, meat prices will rise resulting in decreased per capita, and possibly absolute, meat consumption. | Rejected, Possibly but we have no reference to base this on |
| 13538 | 11 | 80 | 9 | 80 | 9+ | OPRE - Operational Plan for Renewable Energy, New Energy Division, Ministry of Energy and Mines-MEM & Andean Development Corporation-ADC, Caracas, 1998-2001. | Accepted, Zotero updated for SOD |
| 15210 | 11 | 81 | 27 | 81 | 38 | foley reference in here 3 times; twice as 2009 and once as 2005. | Accepted, Zotero updated for SOD |
| 8599 | 11 | 81 | 27 | 38 | | Check if Foley et al (2009a), Foley et al (2009b) and Foley et al (2005) are not the same | Accepted, Zotero updated for SOD |
| 13539 | 11 | 83 | 31 | 83 | 31+ | González, F.G., Energy and mechanization in agriculture, Central University of Venezuela, Caracas, 1995 (404 pp.). | Accepted, Zotero updated for SOD |
| 13540 | 11 | 86 | 43 | 86 | 43+ | Huici C., J., Integrated Rural Development Project, Community Huanacu, Energy & Development, PROPER-GTZ, N°9, 1996. | Accepted, Zotero updated for SOD |
| 13541 | 11 | 88 | 29 | 88 | 29+ | Kumar, A., Optimizing Small Water Resources of India, Energy & Development, PROPER-GTZ, N°9, 1996. | Accepted, Zotero updated for SOD |
| 8316 | 11 | 9 | | 9 | | Absolute figures are more important than percentages to estimate GHG emission through land use fluctuation. | Accepted, Checked numbers and |
| 14585 | 11 | 9 | | | | I have a slight preference for absolute numbers rather than % change. I understand this allows you to plot all on one figure but I think it is interesting to see relatively how much land is in crops and forests etc. Anyway, I see the rational of doing it both ways. | Accepted, Checked numbers and revised for SOD |
| 7334 | 11 | 9 | | | | It ssems the countries should be better identified on this figure, especially OECD90 and EIT countries. At least give a clue on how to find out what countries are included. Also, I don't like how figure #1 is compressed to make room for the legend. They should all be on the same x scale, and note should be made that the Y axis are different. | Rejected, Regional breakdown is required - but not individual countries |
| 5537 | 11 | 9 | | | | The combined increase in agriculture and pasture should equal the decrease in forest area. It does not seem to be the case! | Rejected, Not true - these can come from natural grasslands |
| 5803 | 11 | 9 | | | | Please rework this figure. The years should be given below all curves to facilitate reading, panels should be of equal size, and it would benefit readers if regions were indicated in the panels, not in the text. The legend can be drawn across both columns of panels what might also allow for a larger size of the font used. | Accepted, Reformatted for SOD |
| 7181 | 11 | 9 | | | | For SE Asia recent numbers of deforestation have been published by Miettinen et al., 2011: 46% of the forest cover is lost between 2000 and 2012 (see also table below). It is interesting to see how the total net gain of forest in total Asia is more than 2.2 M ha yr-1 in the period 2000-2012. Are these numbers in table 11.1 reliable? Please check. | Accepted, Deleted table and used figure |
| 7182 | 11 | 9 | | 9 | | In the study by Miettinen et al (2011), deforestation rates in insular Southeast Asia were determined by comparing satellite imagery between 2000 and 2010 using a spatial resolution of 250 m and land cover maps with regional methodologies and classification schemes. They calculate a net deforestation rate for Indonesia and Malaysia of 1110 ha-1 yr-1. | Accepted, Deleted table and used figure |
| 13663 | 11 | 9 | | | | It is strange that the data for N fertilizer and forest land are shown to start from 2001 and 1990, respectively. They should be started from 1971 so that the trends can be compare to other data. | Rejected, Data not available for different regions |
| 11292 | 11 | 9 | 1 | | | The significance of the data in these six graphs would be much clearer if the scales of their y-axes were standardized. | Accepted, Reformatted for SOD |
| 14422 | 11 | 9 | 1 | | | Formatting of graphs is not uniform. When y-axis has negative values, the x-axis labels are embedded in the graph. Could streamline by using a master x-axis label on the lower graphs (5&6). | Accepted, Reformatted for SOD |
| 14423 | 11 | 9 | 1 | | | The graphs are not aligned evenly. Make all graphs the same size, place the legend outside the graph frame. | Accepted, Reformatted for SOD |
| 16535 | 11 | 9 | 10 | 9 | 12 | These two sentences are misleading, since the changes in wheat production and in rice and soy yields are not due solely to climate change (and in fact probably reflect relative demand and prices more than climate change.) Delete them. | Accepted, Removed, work of WGII |
| 14587 | 11 | 9 | 10 | | | Is it just warming (ie heat stress) or also reduced ppt (drought). May be better to be specific (ie rising heat stress) or to say "due to climate change" | Accepted, Removed, work of WGII |
| 2600 | 11 | 9 | 11 | 9 | 11 | "D.B. Lobell,2011" should be "Lobell, 2011" | Accepted, Zotero to be updated for SOD |
| 18920 | 11 | 9 | 11 | | | "respectively": add time frame (range) here during which the increase in yield has taken place | Accepted, Text revised for SOD |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 14588 | 11 | 9 | 12 | | | add some text at beginning of sentence to clarify but also to make it make sense e.g. "MODELLED ESTIMATES OF future changes…." and to clarify, is this in the US? | Accepted, Removed, work of WGII |
| 14589 | 11 | 9 | 13 | 9 | 14 | I would prefer to see the range after the best estiamte in a racket, use "to, be careful of commas versus decimal points, and put the crop type with the number rather than list them all and say respectively as this way it is easier to follow e.g.wheat +1.6% (-4.1 to +6.7); maize -14.1% (-28.0 to +4.3).....etc | Accepted, Removed, work of WGII |
| 18921 | 11 | 9 | 13 | | | "A1B scenario": Please add reference to the SRES | Accepted, Removed, work of WGII |
| 2601 | 11 | 9 | 14 | 9 | 14 | "Tebaldi and D.B. Lobell, 2008" should be "Tebaldi and Lobell, 2008" | Accepted, Zotero to be updated for SOD |
| 14590 | 11 | 9 | 15 | | | surely everywhere not just temerate regions, especially since the next number is a global one. | Accepted, Removed, work of WGII |
| 13962 | 11 | 9 | 15 | 9 | 17 | adaptation is much more complex than just adapting planting dates and cultivar choices, even in rather well understood temperate growing systems, as the drought in the US this summer has demonstrated all too well. See for example recent editorial by lobell at http://globalfoodforthought.typepad.com/global-food-for-thought/2012/09/commentary-series-climate-change-adaptation-lessons-from-2012.html and writings by jarvis of CIAT/CCAFS. | Accepted, Text revised for SOD |
| 16536 | 11 | 9 | 18 | 10 | 3 | In giving data on area losses it is important to point out that, due to differences in carbon density (dry forests and savannas vs. wet forests) the resulting emissions are much larger in relative terms in Latin America and tropical Asia than in Africa. Otherwise the reader may get the impression that Africa is responsible for a substantial proportion of climate change, which it is not. | Accepted, Agree could give density data or even CO2 emissions, could ask houghton to separate out numbers?? FAO should have forest biomass |
| 12369 | 11 | 9 | 18 | 10 | 14 | The section only describes the trends in forest cover. Production and consumption is more than forest cover. We miss a description on trends in forest management (harvest/ standing biomass). | Accepted, agree, could do this, FAO should have numbers - Francesco?? |
| 12370 | 11 | 9 | 18 | 9 | 19 | Would it be possible to specify if the net loss of forests is in a specific year or average over the period? | Accepted, agree should do this, probably average over period |
| 6824 | 11 | 9 | 18 | | 22 | It will be good to note the primary causes/drivers of deforestation as well as the exacerbating factors. | Accepted, OK , again FAO -Francesco |
| 14591 | 11 | 9 | 18 | | | I would prefer to start by giving global numbers then breaking down regionally. But I think there also needs to be some explanation where the data comes from ie. FAO FRA reporting happens every 5 years, relies on country reporting, many uncertainties (grainger paper),. Increasing use of setellite data is improving estiamtes, FAO now including this.Has led to substantial reduction of FAOs past estimates of deforestation rates between FAO FRA 2010 and FAO FRA 2005. Satellite data now increasing being used. Also note that FAO FRA 2010 found a decline in deforestation brates between 200 and 2005, but FAO/JRC report based entirely on satellite data found an increase. In addition to satellite area change data (Hansen et al) there are now satellite estimates of biomass (e.g. Baccini et al, harris et al). | Accepted, agree jo/Francesco rto rework this section |
| 11804 | 11 | 9 | 18 | 10 | 3 | This subsection needs a reference, probably the numbers come from the FRA, which is cited later but it should be cited here as well | Accepted, agree |
| 7180 | 11 | 9 | 18 | 9 | 24 | For deforestation rates it might be useful to give references. Are these numbers based on peer reviewed literature? Are they from national ministries? | Accepted, agree |
| 10588 | 11 | 9 | 18 | 9 | 24 | This para just repeats info in Table 11.1 so delete. | Accepted, agree this section should talk more about drivers of the data se see on |
| 8833 | 11 | 9 | 21 | 9 | 21 | Are (all) forests lost due to fire, lost as land with forest as land use? | Accepted, most forest loss is due to land clearing firs for agriculture. Need ref on |
| 17149 | 11 | 9 | 21 | | | A possible case study to include on the role of IK and Fire Management/Abatement is the case of WALFA in Australia. See Russell-Smith, J., Whithead, P., Cooke, P., (2009) Culture, Ecology and Economy of Fire Managemnet in North Australian Savannas: Rekindling the Wurrk Tradition | Rejected, Seems a bit specific. Do we have a general reference on cause for fire loss on Australia? |
| 5044 | 11 | 9 | 23 | 9 | 23 | today north america is losing a lot of forest to disturbances like fires and pine bark beetles | Rejected, Statement - not a comment |

| 15473 | 11 | 955 | 1 | | | Some grammar issues plus removing internal notes from text description of figure | Accepted, Revise for SOD |
| 15474 | 11 | 957 | 1 | | | Different scales on each figure disorts the % changes between graphs. Suggest selecting one or two y axis values and use for all figures. For graph 1, there is no need to show the entire -ve y-axis for just sheep and goats. The trend is evident. Use a break in the y-axis make this half of the graph smaller. | Accepted, Reformatted for SOD |
| 7654 | 11 | 96 | 35 | 96 | 44 | Searchinger et al. (2008) is listed twice in References. | Accepted, Zotero updated for SOD |
| 15475 | 11 | 990 | 20 | | | The section is essentially correct about the CO2 "fertilisation" effect, however I believe it is worth an expansion (say several more sentences and refs) since there is some confusion on interpreting the results of enhanced CO2 experiments - and contridictions in the literature. How this effect is used in CC modelling can have a large impact on the results - as highlighted with Mensaranta et al. A sentence should be added to reinforce this point. I also believe that any discussion about this subject is not complete unless the seminal paper Karnosky (2003) is not mention. It goes through all the factors that can/might mitigate photosynthesis upregulation - and its conclusions are still relevant. Ref: Karnosky, D.F. (2003). Impacts of elevated atmospheric CO2 on forest trees and forest ecosystems: knowledge gaps. Environment International 29, 161-169 | Rejected, Cannot locate the comment - wrong page number. Paper too old anyway (prefer post 2007 papers) |
| 15476 | 11 | 999 | 18 | 1000 | 4 | I would recommend adding the impact of the Finanical Crisis on carbon prices. The collapse of the value of carbon prices have made mitigation with carbon trading for existing or new forests uneconomic. A perfect example is New Zealand's Emission's Trading Scheme (currently <NZ$5 / tonne CO2). With current very low carbon prices that are unlikely to improve anytime soon, Figure 11.11 is misleading (that shows mitigation potential of carbon prices of less than <US$20/ tonne CO2) | Rejected, Not in this chapter |

|---|---|---|---|---|---|---|---|
| 17302 | 12 | | | | | Urban issues/local governments: | Noted: This area is rewritten in report |
| 2511 | 12 | | | | | Important and useful table - but where have the 12 drivers come from? There is also much more than can be added to it to make it more comprehensive - it mixes up supply (e.g. infrastructure and energy mix) and demand (e.g. transport) - and it does not really focus on carbon reduction | Accepted: The table is revised as 12.9 in SOD |
| 2521 | 12 | | | | | This is very helpful - there could be more discussion of it through talking about such issues as the energy mix, shorter trips, use of public transport, walk and cycle, through using waste for energy, through carbon sinks, through insulation and design standards, and thorugh buildings design and materials etc. | Noted: The table in deleted in rewriting of this section and therefore the comment is no more relevant. |
| 2534 | 12 | | | | | This is very helpful and could perhaps be used to structure this Section | Noted: The table in deleted in rewriting of this section and therefore the |
| 2539 | 12 | | | | | This table is again helpful and could be made more central to the Chapter's main messages | Noted: The table in deleted in rewriting of this section and therefore the |
| 5532 | 12 | | | | | General comments- well written, clear chapter. It would help to provide more discussion on urban areas with existing infrastructure and urban areas without infrastructure. It would also be good to mention standards for energy efficient construction including the LEED certification program | Noted: Added discussion of importance of infrastructure. LEED is more appropriate in buildings chapter. |
| 5522 | 12 | | | | | This reviewer would suggest that there are more opportunities for mitigation in columns 5 and 6 in this table than the authors have identified. For Agriculture and Forestry- urban agriculture is a rapidly growing phenomena, with agriculture in a farm belt outside of urban areas(peri- urban agriculture) in developing countries also seen as a way to utilize an available labor force, reduce waste associated with food spoilage, and provide an economical land application site for urban generated organic residuals. For residuals management- use of reclaimed water or grey water offers potential benefits not included in the table, energy from controlled anaerobic digestion at centralized wastewater treatment plants for organics diverted from landfills are other benefits not currently listed | Noted: but the table has its own limits on how much it can represent only very important ones are shown. However, we will review this table in next round. |
| 5530 | 12 | | | | | Waste and water infrastructure row- mitigation measures should include landfill diversion, energy recovery in dedicated digesters, composting or direct land application of organics, green infrastructure for stormwater diversion, grey water systems- also consider the full implications of organics diversion with energy recover, land application with use within the urban landscape- nutrient credits, potential soil carbon credits and reduced energy costs for water treatment and landfilling | Noted: The table in deleted in rewriting of this section and therefore the comment is no more relevant. |
| 5529 | 12 | | | | | The Chicago table includes quantity of CO2 associated with each practice- this is very helpful. Including this information for the other two cities would be helpful. It would also be helpful to provide population of each city in the table captions | Noted: We presume reviewer is mentioning Table 12.6. The table is deleted in rewriting of this section. |
| 11041 | 12 | | | | | Against 'Subdivision regulations', the Potential relevance statement is 'Amount of open space required by subdivisions could be important for retaining green carbon sinks in suburbanizing areas'. However, this quantum of green carbon sinks is so negligible in most cities as to render the goal of retaining green sinks virtually meaningless. Against Limitations of Tool… it is suggested that the following words be added: 'However, size of green carbon sink likely very small.' | Noted: The table in deleted in rewriting of this section and therefore the comment is no more relevant. |
| 16659 | 12 | | | | | Table 12.1. This table is problematic because most of the "mitigation opportunities" are spatial features of urban form or structure, with no necessary connection to policy. It would be much better to have that column filled with policies. But that would also require a better treatment and understanding of existing policies and practices in different parts of the world, as noted above. | Noted: but the table has its own limits on how much it can represent only very important ones are shown. However, we will review this table in next round. |
| 16663 | 12 | | | | | Table 12.2: This is a very US-centric list of planning tools. | Noted: The table in deleted in rewriting of this section and therefore the |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 18381 | 12 | | | | | It would be desirable to add the following works of bibliography in the chapter listed:<br>Cap 12.<br>-Olcina, J., 2010: Spatial planning processes, territorial planning law and flood risk in the region of Valencia (Spain), in Risks Challenging. Publics, scientists and governments. [Menoni, S. ed. ] Taylor and Francis Group, 191-204.<br>-Olcina, J., Hernández, M., Rico, A.M., Martínez, E., 2010: Increased risk of flooding on the coast of Alicante (Region of Valencia, Spain), Natural Hazards, 10, nº 11, 2229-2234.<br>-Olcina, J., 2008: Droughts and their economic and territorial effects on the Iberian peninsula, Environmental Economics [Burny, Ph.; Petrescu, D. C. (editors)], Les Presses Agronomiques de Gembloux, ASBL, 173-192.<br>-Sauri, D. Serra, A. Olcina, J., Vera, J.F., 2011: Climate change and Europe's regions: Key findings. Case study Spanish Mediterranean coast. ESPON Climate. Climate Change and Territorial Effects on Regions and Local Economies / Stefan Greiving (Coordinator) / ESPON (European Observation Network for Territorial Development and Cohesion), 30-39.<br>-Rico, A.M., Olcina, J. and Sauri,D. 2009: Tourist land use patterns and water demand: Evidence from the Western Mediterranean, Land Use Policy, 26, nº 2, 493-501. ANNEX I-GLOSARY<br>-Olcina, J., 2007:<br>Research into climate risk in Spain: challenges for the future, in Spanish Climatology. Past, present and future [Cuadrat, J.M. and Martín Vide, J. (coords.)], Prensas Universitarias de Zaragoza, 421-449. | Noted but less relevant |
| 18382 | 12 | | | | | There is a limited treatment of increased exposure and vulnerability to climate hazards occurred in some areas of the western Mediterranean, in relation to the massive increase in residential building and infrastructure. This has provoked increasing risk territories. For example in areas of the Spanish Mediterranean coast is more likely in 2012 than it had in the late 1989 and 1990. And this has been caused by a massive occupation of land dedicated to housing and infrastructure (soil sealing). An analysis of this can be seen in Olcina (2010) and Olcina, Hernandez, Rico and Martinez (2010). | Rejected: WGII will cover that |
| 18383 | 12 | | | | | There are details to be made in the treatment of the concept of risk from the geographical point of view. The natural –climate- risk must be understood as an expression of territorial actions carried out by humans in the territory who have not taken into account the natural functioning of the environment where they occur. So if the man does not respect the dynamics of the physical land, infrastructure, economic activities, housing to develop man are deemed to be vulnerable to the development of a climatic event of extraordinary range (Olcina, 2007). | Rejected: Out of scope |
| 2552 | 12 | | | | | Table is too generic, implying that the references are generic too. Says everything and nothing at the same time. More accurate references should be provided after each statement. | Noted: The table in deleted in rewriting of this section and therefore the |
| 2551 | 12 | | | | | This figure has been extensively reproduced. Are there empirical evidences to support it, e.g. air pollution studies? These should be quoted, otherwise the chapter looks like an average textbook | Taken into account: Figure removed in section rewriting |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 17187 | 12 | | | | | Similarly, a number of studies have found that employees at suburban workplaces tend to commute by car much more frequently than employees at inner-city workplaces. Cities where lower proportions of car commuters and higher shares of employees traveling by public transit, bicycle or by foot have been found at inner-city than at suburban jobsites include the San Fransisco Bay area (Cervero & Landis, 1992); London and other large British cities (Dasgupta, 1994); the Dutch Randstadt area (Schwanen et al., 2001); Atlanta and Boston (Yang, 2005); and Paris (Aguilera et al., 2009), Oslo (Næss & Sandberg, 1996), Trondheim (Strømmen, 2001) and Copenhagen (Hartoft-Nielsen, 2001b; Næss, 2007). Several studies also show that job decentralization from inner to outer parts of cities and metropolitan areas usually does not contribute to reducing average commuting distances (Næss & Sandberg, 1996; Hartoft-Nielsen, 2001b; Næss, 2007; Strømmen, 2001; Cervero & Landis, 1992; Yang, 2005; Aguilera et al., 2009). Admittedly, according to some studies employment decentralization has reduced commuting times (Gordon et al., 1991; Cervero & Landis, 1992; Giuliano & Small, 1993). This has, however, mostly to do with the generally higher shares of fast modes of travel and higher driving speeds in the suburbs than in the inner city. | Accepted: We recognize that location aspect is important .. we have address location aspects from urban form, spatial planning and land value capture viewpoints here. Given there are separate chapters in WGIII on buildings and transportation, we have limited our discussions here. |
| 17188 | 12 | | | | | It is an serious shortcoming of the existing text that the influence of the location of dwellings and workplaces relative to the city center is not mentioned. This must be corrected. | Accepted: Some discussions on location aspects are added in 12.6.4. Discussed |
| 3655 | 12 | | | | | What does the line express specifically? | Noted: The fitted curve, that shows relationship of x and y axis parameters |
| 15459 | 12 | | | | | The following work may be referred to: Bulkeley, H. and Betsill, M., 2003, Cities and Climate Change: Urban Sustainability and Global Environmental Governance. London, UK: Routledge. The influential work of Roger Keil on Networked Disease may also be incorporated in this chapter. Census reports in countries with large urban populations in India and other parts of Asia, show that small towns are growing rapidly and contribute both to emissions, as well as to other forms of pollution, with scarcely any thought for mitigation strategies. A small section on metropolitan cities vis a vis rapid urban growth in hitherto rural hinterlands may be useful. The smaller towns pose many new challenges which are not captured by a 'metrocentric' understanding of urbanization and human settlements. | Noted: the publication is referred.12.2 discussed cities by population size |
| 15505 | 12 | | | | | (Whole Chapter) Almost everything is covered. May be reinforcing link with on going global initiative could be interesting (such as the Green economy, Sustainable cities numerous on-going initiatives, Resource efficient cities). The lock in effect (as well as for the buildings sector) needs also to be underlined. Failure to reduce Cities footprint would consume time and money for predictable poor results. The point now is to transform constraints into opportunities. | Accepted: The related aspect has been discussed in several sections in the revised report. |
| 18852 | 12 | | | | | Detail in what regard the figures would be different (see last sentence). | Accepted: Text is rewritten. We will look at it further in next round to make sure that we provide a balanced picture. This |
| 18824 | 12 | | | | | Clarify where the categories in this table are coming from. Has this come out of your synthesis or are these categories suggested in Blanco (2011)? | Noted: The table in deleted in rewriting of this section and therefore the |
| 18825 | 12 | | | | | Row "Urban Growth Boundaries": Please have a look for further examples, as this is just one from one US state. The Flächennutzungspläne (land development plans) in Germany are another example being practices since decades. | Noted: The table in deleted in rewriting of this section and therefore the comment is no more relevant. |
| 18826 | 12 | | | | | If also the last 2 columns are based on the publications cited in column 2 then make this clear by e.g. having the references in an extra column at the very end (or to save space have footnotes in such a column and the references below the table). | Noted: The table in deleted in rewriting of this section and therefore the comment is no more relevant. |
| 18841 | 12 | | | | | Make this more concise, e.g. by having a bulleted list of the type of plans and have city names and references just as running text in brackets within the respective bullet points. Delete the names of the plans as they can be found via the references and do not add any relevant information. | Noted: The table in deleted in rewriting of this section and therefore the comment is no more relevant. |
| 18842 | 12 | | | | | Synthesize with other information in the chapter. | Noted: The table in deleted in rewriting of this section and therefore the |

| 18843 | 12 | | | | | Synthesize with other information in the chapter. | Noted: The table in deleted in rewriting of this section and therefore the |
| 18844 | 12 | | | | | Synthesize with other information in the chapter. | Noted: The table in deleted in rewriting of this section and therefore the |
| 18845 | 12 | | | | | Also this table, though covering more information, should be synthesized with other information in the chapter. | Noted: The table in deleted in rewriting of this section and therefore the |
| 18796 | 12 | | | | | If possible mark the (estimated) share of urban for each of the sectors. Make clear that the right is enlargement of the indursty slice on the left (if I am not mistaken). See examples for that in IPCC SRREN Chapter 1 Figure 1.10. (As the graphic designer can do this in the end, for now it is sufficient for you to just somehow indicate the relationship.) | Noted: The figure is deleted. |
| 18809 | 12 | | | | | Does data exists to produce another FIGURE that compares ranges of construction emissions (e.g. of buildings or transport infrastructure) with operataions' emissions? | Noted: The figure is deleted. The section is rewritten |
| 18838 | 12 | | | | | The figure should be removed as it is giving absolute numbers for the mitigation potential of a random number of cities and no information can be drawn from it. The 36% discussed in the text are meaningful. Maybe giving percentages in the figure could be a solution. | Taken into account: Removed |
| 18849 | 12 | | | | | The figure is unclear. The arrows in the lower part I do not understand and they should be labelled. The top part should be explained and the border conditions should be specified (the figure is btw not referenced in the text), e.g. that this while hte green path is about aggregated effects the red part is about marginal effects. Though there should be more figures in this chapter I suggest to delete this one and rather explain what you want to convey in the text as the figure seems to be too reductionist (at least as it is now). | Taken into account: Figure removed in section rewriting |
| 18801 | 12 | | | | | Given the logic "small country" -> "can produce less"/"more secialized" -> "imports more" the figures confirm the common sense. Are they relevant for anything that you want to say here? If this should stay, please also have the figure with linear scale as this will improve accessibility to a wider audience. | Accepted. Removed figure. |
| 17286 | 12 | | 14 | | 16 | here it's better specify what kind of difficulties you find ,as for example life cycle analysis applications | Taken into account: The text is deleted |
| 17287 | 12 | | 41 | | 42 | it's occur some citations of accreditated studies and assessments already done. | Taken into account: The text is deleted |
| 5995 | 12 | | | | | There is no common framework or concept visible for the whole chapter. Definitions and terms are used in a variety of different meanings, often definitions are missing. There is few reference to theoretical frameworks in this chapter, and those reference that are made are inconsistent. Overall, this leads to a missing logical structure of the whole chapter. | Taken into account: The chapter has neen reframed and re-written as SOD as much as possible. Changing chapter sections completely is not an easy |
| 5996 | 12 | | | | | Many statements are far too general although urban trends differ highly between different world regions and types of urbanity. There is no structure for a reasonable analysis of these differences that would allow an actual comparison and assessment of climate change mitigation strategies and opportunities. Why didn't you classify a number of different classical types of urban areas or trends? Overall, this leads to an unequal distribution of examples which obviously is mainly dependet on the authors' personal or professional context. This is insufficient for a global report on climate change. | Accepted: The chapter has been reframed and rewritten. |
| 6027 | 12 | | | | | Regarding chapter whole 12:<br>There is no common framework or concept visible for the whole chapter. Definitions and terms are used in a variety of different meanings, often definitions are missing. There is few reference to theoretical frameworks in this chapter, and those reference that are made are inconsistent. Overall, this leads to a missing logical structure of the whole chapter. | Accepted: The chapter has been reframed and rewritten. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 6028 | 12 | | | | | Regarding chapter whole 12:<br>There is no common framework or concept visible for the whole chapter. Definitions and terms are used in a variety of different meanings, often definitions are missing. There is few reference to theoretical frameworks in this chapter, and those reference that are made are inconsistent. Overall, this leads to a missing logical structure of the whole chapter. | Accepted: The chapter has been reframed and rewritten. |
| 5974 | 12 | | | | | You do not mention urban governance and institutions! You do not show the linkages between the three aspects of the section title. Delete this and refer to chapter 12.6! | Taken into account: This whole section is rewritten |
| 5178 | 12 | | | | | The Section fails to inform that there exists a resolution by the IPCC to establish a general International Standard for Determining Greenhouse Gas Emissions for Cities (IPCC, 2010)<br><br>Reference:<br><br>IPCC – Intergovernmental Panel on Climate Change (2010). International Standard for Determining Greenhouse Gas Emissions for Cities. Version 2.1, June 2010.<br>Available at: http://www.unep.org/urban_environment/PDFs/InternationalStd-GHG.pdf. | Accepted: We have rewritten chapter and we are not sure about its need to mention.. But we will consider again this is next round. |
| 16651 | 12 | | | | | Section needs references | Accepted: But who section is rewritten and this comment is no more relevant |
| 5723 | 12 | | | | | The Chapter authors are to be commended for their recognition of the literature on the advantages of polycentricity over monocentricity of urban form. Note the suggestion by Peter Gordon in “Thinking About Economic Growth: Cities, Networks, Creativity and Supply Chains for Ideas” (2012 – Annals of Regional Science) that “dispersal” has proceeded beyond “polycentricity” and still seems likely to be associated with gains in productivity. William Wheaton (2002) “Commuting, Ricardian Rent, and Housing Price Appreciation in Cities with Dispersed Employment and Mixed Land Use” finds a trend to steady flattening of urban land rent curves as land use becomes increasingly mixed. One of the advantages of this is, that “price” represents a less and less frequently encountered barrier to households locating closer to any particular job or urban amenity. This is in contrast to the very severe price rationing and locational “pricing out” effect in heavily-planned cities. | Accepted: The who chapter is rewrittent and the density argument have been made more balanced. |
| 18792 | 12 | | | | | The tele-working part is not relevant for this argumentation and should be moved. | Noted: the text to which comment was made was deleted in subsequent |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 5724 | 12 | | | | | The Chapter authors are to be commended for this observation. Neutral networks also have the advantage that the direction of travel in which roads are utilized during each distinct travel demand period, is less distinctly “one way”. This also reduces the likelihood of congestion. A significant element of the "iron law of urban dispersion" is that when the increased traffic burden consequent on increased demand (whether “planned” or natural) results in once free-flowing roads becoming "stop-start", the congestion delay that results is exponential, not linear. In fact, the number of cars transiting the road network over the crucial time periods is reduced even as the numbers of vehicles attempting to travel has increased. And “spill-back” slows the rate of travel over more and more of the network.<br><br>Once a given node of the urban area is effectively accessible by fewer vehicles at the crucial times of day (ironically because more vehicles are trying to get there) the incentive for urban activity to relocate elsewhere also increases exponentially. “Mode shift” does not compensate for this because traffic is “induced” just as effectively by mode shift as by capacity expansion (Anthony Downs’ law of triple convergence).<br>In a neutral network with dispersed patterns of travel, any road capacity expansion is far more effective because the percentage increase in capacity is greater when adding a lane to a single existing one, or to an existing pair or trio, than in the fruitless adding of a lane or two to a radial highway that already has 8, 10, or more lanes. It is radial highway planning that has “failed”, not “automobility” per se. □ | The text to which comment was made was deleted in subsequent rewriting and no more relevant. Connectivity and accessibility are discussed in 12.4. Detailed discussion of transportation planning is appropriate for the transport chapter. |
| 18793 | 12 | | | | | Not one reference. | Accepted: the text to which comment was made was deleted in subsequent rewriting and no more relevant but this |
| 18795 | 12 | | | | | Not one reference. | Noted: the text to which comment was made was deleted in subsequent |
| 16653 | 12 | | | | | This section is too brief. See previous comment about land use and built environment policies in different parts of the world. “Transit-oriented development” is a US-centric idea. | Noted: the text to which comment was made was deleted in subsequent |
| 2514 | 12 | | | | | This section was the hardest to understand as it is so fragmented and repetitive - this could be cut extensively - the focus on carbon is missing | Taken into account: Noted: The whole section is rewritten. |
| 16654 | 12 | | | | | First paragraph (like other meta-commentary on the chapter) could be omitted. | Taken into account: Done in 12.3 in SOD |
| 5179 | 12 | | | | | In Section 12.4.3 there are 12 sectoral mitigation opportunities listed and presented in Table 12,1, The meaning of the intensity of colours is not explained. | Taken into account: Explanation of the color code will be added in table which |
| 18954 | 12 | | | | | Section 12.4 should focus on system aspects and should not cover what is already contained in other sections or all mitigation options are listed in this section for the first time and referenced from other sections. This will also allow other sections (and possibly chapters) to incorporate numbers with a systems perspective. For section 12.4.1 it would be good to give estimates, possibly develop rough scenarios (or back of the envelope calculations) giving estimates for total emissions of the to-be-constructed building stock. This has the potential to be one of the key messages of the chapter. In case space is an issue then we suggest shortening the conceptual part of this section. | Accepted: These issues are serously taken into acount while rewriting and reframing of chapter in SOD. The revised chapter had addressed these comments. |
| 16655 | 12 | | | | | Describe the different kinds of infrastructure. The language about the systemic view and about socio-metabolic systems (p 15 line 44 to p 6 line 11) is not concrete or specific and could be omitted. | Taken into account: the text to which comment was made was deleted in subsequent rewriting and no more relevant. We have expanded disucssions |
| 3654 | 12 | | | | | What is the consequence of these linkages for climate change mitigation and adaptation policies and measures? Please elaborate or present a link to a subsequent chapter. | Accepted: the text to which comment was made was deleted in subsequent rewriting but we have improved these |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 11320 | 12 | | | | | Worth noting here that for the moment, there is no agreement on what an 'urban system' is. Ie. there are many definitions, models, and descriptions all of which are context specific (topical in other words) but nothing robust enough to generate consensus on a multi-topical definition. | Noted: The text to which comment was made was deleted in subsequent rewriting and no more relevant |
| 16657 | 12 | | | | | The authors are peddling a term called “urban metabolism” and make several statements about the sort of research that is better or worse to do. This takes up space. Better to omit all mention of this and simply cite and explain the results of the best studies, and cite and describe the problems with other studies. | Noted: The text to which comment was made was deleted in subsequent rewriting and no more relevant. |
| 16660 | 12 | | | | | 12.4.3.1 – repetition of material appearing here with material appearing in an earlier section. Consolidate. (Earlier in the chapter, should distinguish the various pathways of GHG production and how they relate to settlement patterns, built environment policies, etc (e.g., VMT, home energy consumption, embodied GHGs in goods). | Noted: The text to which comment was made was deleted in subsequent rewriting and no more relevant. |
| 18814 | 12 | | | | | Make Ch.11 aware that you are having this section as there might be overlaps | Accepted |
| 18818 | 12 | | | | | Link to Ch.10 | Accepted: Cross referenced, see SOD |
| 18820 | 12 | | | | | Link to Ch.11 Section 11.3.2 and - I suggest - only cover aspects particular to urban here | Accepted: Coss referencing with other chapters will be in next round looking at |
| 16661 | 12 | | | | | 12.4.3.2 et seq. – More repetition, as above. | Noted: The text to which comment was made was deleted in subsequent |
| 18570 | 12 | | | | | 2. Improve reviewing aspect:<br>There are whole paragraphs that contain bold claims without a single reference (e.g. 12.4.3.7. 2nd and 3rd paragraph). | Noted: The text to which comment was made was deleted in subsequent rewriting and reframing and no more |
| 18804 | 12 | | | | | Link to Ch.9 and reduce length | Noted: The text to which comment was made was deleted in subsequent |
| 18806 | 12 | | | | | add link to emissions of concrete over their lifetime (Luisa Cabeza of Ch.9 has sth. on that - will probably be in SOD Ch.9 - so you can link that) | Noted: The text to which comment was made was deleted in subsequent |
| 18807 | 12 | | | | | Link to Ch.8, clarify which chapter goes into detail and which references and keeps it short | Noted: The text to which comment was made was deleted in subsequent |
| 18811 | 12 | | | | | Link to Ch.7, possible reduce content | Taken into account in revised texts in |
| 2520 | 12 | | | | | This is much better presented than 12.4 | Noted |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 5180 | 12 | | | | | In Table 12.2 Section 15 implementation tools are listed, But there is no information on how much theses policies contribute to GHG mitigation. Moreover, with one exception, development fees, the most important policies, fiscal measures, such as property taxes or subsidies or loans, e.g. for retrofitting of buildings, or fuel taxes or cordon charges, are not addressed here but separately in Section 12.6.<br><br>This is disappointing as there exists a great volume of research assessing the likely impacts of urban planning policies, including fiscal measures, in different metropolitan areas in developed and developing countries with the help of integrated urban land-use, transport and environment models. Worldwide overviews of current models are Wegener (2004) and Hunt et al. (2005). The results of EU-funded modelling studies on European cities are Lautso et al. (2004), Fiorello et al. (2006) and Marshall and Banister (2007).<br><br>By simulating a large number of scenarios, forecasting models can be used for backcasting, i.e. for telling decision makers what types of policies are required to achieve predefined targets (Hickman and Banister, 2007). Another major advantage of these modelling studies is that they predict the positive and negative synergies between different policies. One example is that land use planning measures aiming at higher-density mixed-use urban land use are much more effective in reducing car traffic when they are supported by fiscal policies making car traffic more expensive and accompanying improvements in public transport. Therefore the sentence “A reduction in motorized transport can be achieved without limiting mobility and accessibility” (p. 30) does not reflect reality.<br><br>References:<br>Hickman, R. and D. Banister (2007). Looking over the horizon: transport and reduced CO2 emissions in the UK by 2030. Transport Policy, 14, 377-387.<br><br>Hunt, J.D., E.J. Miller and D.S. Kriger (2005). (2004): Oveview of land-use transport models. In: Hensher, D.A., Button, K.J. (Hg.): Transport | Noted: But generally such literature linking whole urban area GHG is very limited, these literatures are mostly on land-use and transportation. |
| 18821 | 12 | | | | | Link to Chapters 8, 9, 11 | Accepted: Since we rewrote chapter, we will do such cross-referencing in next round after we see SOD of other |
| 18940 | 12 | | | | | Section 12.5 stays too much on the conceptual level. More reference are needed and results, best quantified. | Taken into account: The whole section is re-written and is far refined. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 16662 | 12 | | | | | 12.5.1. There are in this section more strong claims about the efficacy of “integrated spatial planning.” Selling this concept is a distraction from the chapter and could be omitted or at least drastically shortened. The concept of integrated planning is as old as the hills, and the main concern is to give specific examples of policies that hold promise, not to wax poetic about the virtues of integration. The specific studies that ARE cited here are repetitive of main points made earlier and those articles should be integrated into those sections. The section comes across as advocating rather than a subjective account. | Accepted: The section is rewritten but will be further looked to make it balanced. |
| 2522 | 12 | | | | | This Section on Governance is important - it can again be shortened - with a stronger ending that leads into Section 12.7 - that much of the action is taking place at the city and city regional levels | Taken into account: Rewritten, very much shortened, and streamlined |
| 16664 | 12 | | | | | Sections 12.6 and 12.7 – I don’t know whether these sections assist in what I understand to be the main purpose of the chapter. | Noted: Both sections 12.6 and 12.7 are reframed and rewritten |
| 18829 | 12 | | | | | This first paragraphs of this section are not specific to Ch.12 and should be covered in 15.2.4 and referenced from here. The lower part of this section should become "12.6.1.1 NGOs" and the current 12.6.1.1 should become 12.6.1.2 | Taken into account: As suggested, the first two paragraphs of this section have been deleted. The next paragraph has been moved to a new section 12.6.1.1 |
| 16343 | 12 | | | | | An example of a civil society approach to implementing sustainable development paths based on limit to resources and equity is "one planet living" One Planet Communities (Desai, 2009) http://www.amazon.co.uk/One-Planet-Communities-Sustainable-Living/dp/0470715464/ref=ntt_at_ep_dpi_1 http://www.bioregional.com/oneplanetliving/what-is-one-planet-living/ | Noted: This is a nice example but does not seem really "civil society" driven, rather more driven by architects and planners, and perhaps belongs more |
| 18830 | 12 | | | | | In my view the informal sector should not be discssed here but in other sections of the report (e.g. informal sector in waste in Ch.10) | Noted: The text to which comment was made was deleted in subsequent rewriting and reframing and no more relevant.It would not be fair to discuss civil society organizations in 12.6.1 and completely omit discussion of the often |
| 18831 | 12 | | | | | Link to Ch.15 | Noted: The text to which comment was made was deleted in subsequent |
| 18832 | 12 | | | | | First paragraph is too much US focussed; in general I would expect that there is more literature that could be synthesized here. | Noted: The text to which comment was made was deleted in subsequent |
| 18833 | 12 | | | | | Rather than focussing on institutions and reduction plans (with no information whether these will be met) the focus should be on what the institutions have achieved and what actions/policies can be derived from that. | Noted: The text to which comment was made was deleted in subsequent |
| 18836 | 12 | | | | | This section has overlaps with the first paragraph of 12.7.1 | Noted: The text to which comment was made was deleted in subsequent |
| 5527 | 12 | | | | | One thing that is critical here for developing countries is appropriate infrastructure development. Here my knowledge base centers on waste management and options for decentralized versus centralized systems merit discussion | Noted: This section is rewritten completely. |
| 2533 | 12 | | | | | This Section again needs to be rethought as it seems to be rather bits and pieces with no common themes - the linkages with the previous sections is missing - there is no reflection and it is again very much based on the experience in selected developed cities - Tokyo, London, LA and Chicago - needs some balancing of examples | Accepted: The section is rewritten. |
| 3656 | 12 | | | | | Eventually reduce the number of examples to save space. | Noted: The section is rewritten |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 5181 | 12 | | | | | In Section 12.7 urban climate change mitigation plans are discussed. The section presents an impressive number of climate action plans with ambitious GHG reduction targets all over the world and a great variety of approaches and strategies and their linkage with adaptation, other sectoral benefits and tradeoffs. However, in no case the actual experience with these plans and strategies in terms of actually achieved GHG reductions is presented.<br><br>This is again disappointing because despite the lack of a generally accepted measure of urban GHG emissions, there exists a substantial literature on recent trends in GHG emissions of cities (Economist Intelligence Unit, 2009; European Environment Agency, 2006, p. 30; Kamal-Chaoui and Robert, 2009, p. 45; Brown et al., 2008). In developed countries the overall trend is that cities in general have been able to reduce the GHG emissions, but few of them enough to achieve their reduction targets. In North America many cities have continued to increase their GHG emissions (Brown et al. 2008, p.20). Without massive subsidies, retrofitting of buildings is sluggish, and more energy-efficient cars lead to the rebound effect of buying larger cars. The conclusion is that increased efforts will be necessary if the targets are to be achieved (GVA Grimley Ltd., 2011). In emerging or developing countries the rapid increase of middle-class and higher-income households who want to adopt the lifestyles of developed countries leads to fast growth in motorisation, construction and related GHG emissions. The worldwide prospects to achieve the GHG reduction targets of cities are therefore rather poor. This realistic view should be reflected in the Assessment Report.<br><br>References<br><br>Brown M., F. Southworth, and A. Sarzynski (2008). Shrinking the Carbon Footprint of Metropolitan America. Brookings Institution, Washington DC. Available at: http://www.brookings.edu/research/reports/2008/05/carbon-footprint-sarzynski.<br><br>Economist Intelligence Unit (2009). European Green City Index. London: Siemens AG. Available at: http://www.siemens.com/entry/cc/features/urbanization_development/all/en/pdf/ report_en.pdf.<br><br>European Environment Agency (2006). Emission Impossible: Can Cities Deliver on their Carbon Reduction Targets? London: GVA. Available at: http://www.gva.co.uk/WorkArea/DownloadAsset.aspx? id=4294970300.<br><br>Kamal-Chaoui, L. and A. Robert (eds.) (2009). Competitive Cities and Climate Change, OECD Regional Development Working Papers N° 2. Paris: OECD publishing.<br>Available at: http://www.oecd.org/gov/regionaldevelopment/44232251.pdf. | Taken into account: 12.7.4 in SOD has addressed implentation issues and the plan implemnetation has been slow. The section 12.7 has been completely rewritten and is more balanced. |
| 18941 | 12 | | | | | This section is far too detailed and lacks any synthesis. It also does not link to previous sections and does not show how the different aspects detailed in the previous sections are (best) combined. One first step forward would be to have a matrix that details mitigation options (or components of a mitigation strategy) on one axis and example projects on the other axis, ideally supplemented by numbers of reductions achieved. Alternatively, different options could be listed including summarized experiences. – In general, the focus of the chapter should be detailing experiences rather than project descriptions. | Taken into account: The section is completely rewritten. |
| 18950 | 12 | | | | | Section 12.7 needs to reference previous sections. | Noted |
| 18835 | 12 | | | | | The first paragraph overlaps with Section 12.6.4 | Noted: The text to which comment was made was deleted in subsequent |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 2549 | 12 | | | | | Needs better geographical balance | Noted: The text to which comment was made was deleted in subsequent rewriting and reframing and no more |
| 18949 | 12 | | | | | The difference between Sections 12.7.2 and 12.7.3 does not become clear from the content. 12.7.2 should be structured so that it synthesizes previous experiences in such a manner that information concerning the respective contribution to mitigation can be presented. | Noted: The section to which comment was made was rewritten in subsequent rewriting and reframing and no more |
| 2550 | 12 | | | | | Fuel decarbonization not cited here (biofuels for transport, solar systems etc) | Noted: The section to which comment was made was rewritten in subsequent rewriting and reframing and no more relevant. See table 12.12 in SOD which |
| 18004 | 12 | | | | | The use of the term trade-off (to describe adverse side-effects) is inconsistent with the agreements made in Wellington (p.35) whereby the term 'trade-off' might convey the impression "that a balancing of positive and negative side-effects of mitigation measures is being carried out... Such decision-making aspects" should be left to the policy chapters. Please liaise with the other chapters during the cross-cutting meeting to ensure consistent usage of the relevant terms across chapters. Since the term also shows up in the first-level heading, a potential change to achieve consistency across chapters needs to be discussed with the TSU. | Noted: Needs to be looked into once again in the next round in view of current SOD text here |
| 18848 | 12 | | | | | Link to Ch.4 | Accepted: All cross referencing with other chapters will be in next round |
| 18851 | 12 | | | | | Link to Ch.9 and WG II - initiate a process to decide where the main location of WG III AR5 will be to discuss UHI. | Accepted: All cross referencing with other chapters will be in next round |
| 15753 | 12 | | | | | Knowledge gaps should be identified and detailed out further as it would lead to better understanding of the current status of efforts taken for climate change. This could be done based on variety of geographic regions. | Taken into account: The text is rewritten |
| 3350 | 12 | | | | | crossreference to 8.4.2.2; note: 8.4.2.2 is likely to be further shortened and will crossreference to 12.2.3.1. | Noted: The text to which comment was made was deleted in subsequent |
| 3351 | 12 | | | | | Can examples be given for this? How relevant of a phenomenon is this? What are the implications in terms of GHG emissions? | Noted: The comments is not clear but texts in this subsection are deleted and |
| 3352 | 12 | | | | | policnentricity, economic activity, mixed use and telecommuting are all put into a singe paragraph. This is highly confusing. These are distinct features. | Noted: This seems to be comment on section 12.3.2.3.. The text is deleted and |
| 3353 | 12 | | | | | TOD --> see also 8.10 | Noted: The text is deleted and comment not valid.. But TOD is discussed in more |
| 3355 | 12 | | | | | This section has considerable overlap with 12.2.3.1. Possibility for a merger. | noted: must be 12.3.2.1 .. Not 12.2.3.1.. But both sections are rewritten.. And |
| 3356 | 12 | | | | | Delete, refer to 12.3, or the other way around | Taken into account:The chapter is reframed and rewritten and such |
| 3358 | 12 | | | | | Some redundancy with previous sections. Can be shortenend. | Taken into account: The texts are rewritten in prevoius sections. |
| 17285 | 12 | | 4 | | 5 | Urban areas generate more than 90% of global economy: I think it's useful specify more how it's possible to confirm that important issue,what are the references and indicators,because it's not convincing enough | Taken into account: The text is deleted in the revision. |
| 17303 | 12 | 0 | | | | The topics of (urban) human settlements, cities and local/regional governments in Chapters 12 and 15.8 need a clearer overall structure. It would be useful to make a clear distinction between human settlements and urban agglomerations on one side, regarding their physical characteristics, and local governments on the other side, regarding their political characteristics and their role within a multi-level setting. | Taken into account: The chapter is reframed and these distinctions (humand settlemtn and urban area) are clearer now. The role of multilevel governance is already in the text but, in revised chapter-framing and the |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 17305 | 12 | 0 | | | | The experiences of local governments and their networks as provided in chapter 12.6.2 and 12.7. nearly completely fails to capture the experiences of local governments in Europe, and networks such as theh Climate Alliance (www.climatealliance.eu) who started to commit to mitigation targets and actions already in 1990. | Taken into account: the section this comment refers to got deleted in the rewrite of the chapter for the SOD - the comment is no longer applicable. Hoever, the essence of European |
| 17325 | 12 | 0 | | | | With a view to cities, there is a study on the gender dimension of local climate policy:<br>Alber, Gotelind: "Gender, Cities and Climate Change", Thematic report prepared for the Global Report on Human Settlements 2011, available at<br>http://www.unhabitat.org/downloads/docs/GRHS2011/GRHS2011ThematicStudyGender.pdf | Noted: but less relevant |
| 16643 | 12 | 0 | | | | I appreciate the authors' efforts and recognize the challenge of writing a far-reaching chapter. My comments are critical but intended to be helpful. | Noted |
| 16644 | 12 | 0 | | | | There is language throughout the chapter making somewhat imprecise claims about the causality of urban form and settlements upon energy use. Phrases like "the impact of urbanization" do not acknowledge the fact that increasing productivity and urbanization are inextricable and that urbanization by itself is likely more mitgative of climate change than causing of it, when controlling for economic growth. Economic growth is the more properly understood cause of GHGs. The fact that urban areas contribute a large and growing share of GHGs does not mean that they are a cause of GHGs.<br><br>I would like to see a much more clearly organized set of concepts and to have those laid out from the beginning. List the relevant different aspects of urbanization and of urban settlement patterns (e.g., compactness of urban form, how the pace of urbanization affects GHGs, water-energy-carbon linkages). Then discuss the possible mitigation policies that can affect urban settlement patterns and infrastructure (e.g., urban containment policies, parking policies, transportation investment plans, organization and regulation of water and energy infrastructure). List and describe the accounting issues, but do so briefly and secondary to this main purpose (e.g., LCA, units of analysis, production versus consumption side allocation).<br><br>It is difficult to understand the purpose of many of the sections of the report, such as page 9, section 12.2.3.1, “rate, scale, and location”. The chapter seems like a loosely organized set of comments than a focused treatment of aspects of urbanization that affect GHGs differentially depending on selected explained characteristics. It also seems like an academic literature review discussing methods and pointing out uncertainty, which is not the primary purpose of this chapter—that purpose is to summarize the state of knowledge.<br><br>I stopped making detailed comments on page 25, but note a great deal of repetition of key concepts from section to section that could be collected in one place; a lack of a clear organization; the need to cite the basic evidence up front rather than burying it from section to section; and the need to be careful about making strong claims about how settlement patterns and infrastructure “cause” GHGs. | Noted: The chapter has gone through massive change from FOD, its is reframed and rewritten and we hope that it is clearer now. |
| 18023 | 12 | 0 | | | | The terms compact, sprawl, unplanned, settlements are not clearly defined. They can have different meaning in different countries. For example, a settlement that is considered low density in Europe would be considered as compact in the USA. Some quantification would be useful such as a density ranges and settlement sizes to have a global definition of compactness and settlement types. | Taken into account: The use of the terms have been paid attention and streamlined as much as possible in restructured SOD |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 18024 | 12 | 0 | | | | A lot of the analysis is based on general and selective comparisons such as one country has higher densities and lower GHG emissions than another, therefore higher density causes lower GHG emissions etc. However, there are many other reasons for differences between the energy use and efficiency of countries such as climate, cultural, building standards, and fuel costs relative to incomes. Broad comparisons between cities are not sufficient to show causation. | Accepted: The chapter is reframred and rewritten, we have paid attentions to these issues as much as we could. See 12.4.2 in SOD and revised texts of 12.4 |
| 18025 | 12 | 0 | | | | The text tends to focus on the density and compactness of cities even though it acknowledges that a large proportion of the urban population live in towns and smaller settlements and broader an more balanced consideration of settlement types would be helpful. | Accepted: We hope revised text is more balanced. |
| 18026 | 12 | 0 | | | | The text is generally written from the perspective of promoting compaction. For example 'compact or compactness' is mentioned 26 times usually in a favourable light. Alternatives to compaction are described as 'unplanned' or 'sprawl' usually in an unfavourable context. It would be useful to have some unbiased assessment of the potential for planned towns and settlements. As people become wealthier many will want more space and a greener living environment rather than live in large dense cities. | Noted: We have tried to be balanced in revised texts of the chapter. |
| 18027 | 12 | 0 | | | | Words such as 'strong' or 'significant' are often used without quantification | Noted |
| 18033 | 12 | 0 | | | | My general conclusion from the chapter is that spatial planning is a very slow way of impacting on climate mitigation in developed countries but it is very important in developing countries where the rate of urbanisation is much higher. In developed countries the infrastructure investment, vehicle and building technologies and demand management measures can have a bigger impact than spatial planning. The appropriate mix of investment, technologies and demand management is likely to vary according to settlement size and densities. The primarily role of planners is to create successful communities with a good quality of life. The mix of measures to mitigate climate change should be chosen to be appropriate to the planning of these communities rather than vice versa. | Noted: We believe that the tone in the revised chapter is that the opportunities are different in different type of settlements including existing and new settlemnts |
| 15747 | 12 | 0 | | | | The chapter addresses to the complexities of emission measurements in terms of scale. It analyses various asects of settlement planning and management concerning carbon emission. There is lot of repetition in sections concerning urban form, compact city, transport, mitigation possibilities, etc. Some concepts like compact city, mixed use pattern should be discussed differently in the context of developed and developing cities. Cities in developing countries have different DNA. Cities in developing countries have much higher densities and extremely poor infrastructural base than their counterpart in the developed countries. Application of compact city concept requires good infrastructural support. The chapter 12 needs to address to this differenciation and propose the mitigation policies accordingly. Sustainable neighbourhood is considered to be the unit of low carbon city concept but the chapter 12 does not discuss the concept. Chapter 12 has lot of repetition. The removal of repetition can help reduce the length of chapter 12. Urban context in the developing countries requires urgent attention. The chapter 12 gives more emphasis to cities in developed world. | Noted: We have rewritten entire text with these issues into consideration. We hope we are more balanced and have cut many redundencies in revised text. |
| 13242 | 12 | 0 | | | | Montgomery 2008 is quoted to put emphasize on the complexity of international comparison (varying boundaries for cities), which is right and useful to say. However it is not used later on : from the next sentence on, this remark has no effect on the discourse. We suggest to suppress that reference or to give clear examples on how this can affect the subsequent discussion. | Noted: the section this comment refers to got deleted in the rewrite of the chapter for the SOD - the comment is no longer applicable. |
| 18656 | 12 | 0 | | | | A general description and reasoning about urbanisation | Noted |
| 18657 | 12 | 0 | | | | Very little/nothing on infrastructures (and what role different approaches could play) | Accepted: In SOD discussion on infrastructure is scaled up.see 12.4 |
| 18658 | 12 | 0 | | | | “Strong political leadership is key”, true but what is the implication?<br>Very little on how different parts can/will/must interact | Noted: the section this comment refers to got deleted in the rewrite of the chapter for the SOD - the comment is no |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 11319 | 12 | 0 | | | | The chapter emphasizes issues but should provide more solutions. It is suggested to move up the point that there are neither agreed common methodologies for urban GHG emissions, nor an agreed framework for estimating emissions for cities, from section 12.2.3.2 to the beginning of the chapter; this basic point sets the stage for the rest of the chapter. Also notably, the linkage between adaptation and mitigation is not made anywhere in this chapter. There is only one use of this concept, in relation to a case study in Dhaka. A bit of an oversight considering adaptation is a tool often used to integrate mitigation programming. | Noted: the section this comment refers to got deleted in the rewrite of the chapter for the SOD - the comment is no longer applicable. However, there are adptation links mentioned in many places, please see 12.8 section. |
| 10400 | 12 | 0 | | | | The number of the tables and figures in this chapter should be reordered. | Taken into account: Re-ordered |
| 18565 | 12 | 0 | | | | Having been in the writing team of the GEA urbanization chapter I am very well aware how difficult it is to come up with a literature based assessment for the mitigation potential of human settlements given the scattered and partly incommensurable evidence. Nonetheless there is a lot of room for improvement here. I have three main comments with some specifications each. | Noted |
| 18566 | 12 | 0 | | | | 1. The structure of the chapter is an enigma.<br>Cut subheadings to one third (it does not make sense to have subheadings followed by texts of just one sentence or one paragraph). | Accepted: The chapter is reframed and rewritten.While many subheadings are yet there, they are better presented. |
| 18567 | 12 | 0 | | | | 1. The structure of the chapter is an enigma.<br>Delete redundancies within the chapter. Many topics appear more than once and seemingly unconnected. This is very confusing to read. Examples are: climate change mitigation, urban form, buildings, density, governance and institutions. | Accepted: The chaper is reframed and rewriten. Streamlining, connectedness and redundecncies are paid attention. |
| 18568 | 12 | 0 | | | | 1. The structure of the chapter is an enigma.<br>Develop a clear and comprehensible structure and make sure this is reflected in the subheadings. | Accepted: The chaper is reframed and rewriten. |
| 18569 | 12 | 0 | | | | 2. Improve reviewing aspect:<br>Redefine the scope of the chapter vis a vis the other chapters (especially chapters 8, 9, 14, 15, and 16) in WGIII. As it is now the claims expressed in the very first sentence of the introduction are continuously frustrated throughout the chapter. Also rural settlements are almost entirely neglected, so the title “human settlements” seems unjustified. | Accepted: The chaper is reframed and rewriten. Rural issues are also covered- See executive summary, 12.2.1, 12.3.1, 12.3.3 and others. |
| 18571 | 12 | 0 | | | | 2. Improve reviewing aspect:<br>Other references seem arbitrarily chosen, while important references are missing. Cross-checking with recent reviews and with assessment reports such as e.g. the Global Energy Assessment or the 2011 WBGU flagship report might help finding the relevant references. | Accepted: Reference is more balanced now |
| 18572 | 12 | 0 | | | | 2. Improve reviewing aspect:<br>There are whole paragraphs that contain bold claims without a single reference (e.g. 12.4.3.7. 2nd and 3rd paragraph). | Noted: The section this comment refers to got deleted in the rewrite of the chapter for the SOD - the comment is no |
| 18573 | 12 | 0 | | | | 3. Include an assessment:<br>Provide a quantitative assessment (a synopsis including a hierarchy), of mitigation potentials of human settlements in terms of (at least) technical potentials and costs. What would really make a difference and how much would it cost? Ideally feasibility of implementation is also included. | Accepted |
| 18574 | 12 | 0 | | | | 3. Include an assessment:<br>To this end it might be useful or even necessary to distinguish different types of settlements or world regions. | Accepted |
| 18575 | 12 | 0 | | | | 3. Include an assessment:<br>Ideally also synergies and possible trade-offs between mitigation and adaptation are addressed (possibly in cooperation with WGII). | Noted |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 18460 | 12 | 0 | | | | This draft is professional, interesting, and sometimes illuminating. The main issue is that, on reading through the draft, it often appears that the focus is on summarizing in considerable detail what is known about urban dynamics, well beyond clear connections with climate change mitigation. The best way to shorten the chapter for this IPCC assessment and add to its focus would probably be to review the text paragraph by paragraph, identifying sections where the connection with mitigation is either unclear or does not require so much information about how cities work – as contrasted with implications for GHG emissions and mitigation. But I would suggest to the authors that they save this draft as a starting point for another publication that is aimed at an urban management audience as well as a climate change response audience. Some of the material that won't make it into this WG III chapter because of space limitations is too good to waste – and might even be expanded somewhat in a subsequent book or monograph. | Noted: The SOD is reframed and rewritten. |
| 4215 | 12 | 0 | | | | These comments relative to infrastructure are provided here with recognition of their pertinence to chapters 7, 8, 9, and 10 which treat subsets of infrastructure. | Noted |
| 4216 | 12 | 0 | | | | Infrastructure (buildings, communications, energy, industrial facilities, transportation, waste, water and associated natural features) consists of constructed facilities that shelter and support most human activities. Infrastructure has a vital role in reduction of greenhouse gas emissions, which is the subject of WG III, and in measures to help society adapt economically, environmentally and socially to climate change, which is the subject of the contribution of WGII. The authors of AR5 will be challenged to treat infrastructure appropriately in both contributions without undue redundancy. | Taken into account: Infrastructure related discussions are scaled up substantially in SOD, please see 12.3.2, 12.3.4, 12.4 and others |
| 4217 | 12 | 0 | | | | Infrastructure systems affect human settlements for millennia (consider the ancient Roman road alignments still in service) and infrastructure elements typically have service lives of 50 to 100 years. This has benefits for mitigation of climate change, because of the enduring utility of the embodied energies, but challenges from: | Taken into account: Infrastructure related discussions are scaled up substantially in SOD, please see 12.3.2, |
| 4218 | 12 | 0 | | | | 1. The "lock in" effect of infrastructure systems constraining human settlements because of the economic, environmental and social costs of changing existing infrastructure. | Taken into account: Infrastructure related discussions are scaled up substantially in SOD, please see 12.3.2, |
| 4219 | 12 | 0 | | | | 2. The high costs of changing existing infrastructure systems to adapt to more extreme environments (resulting from climate change effects) that would render them dysfunctional or damaged, and/or the potentially higher costs to society of not adapting the infrastructure systems. | Rejected: Not directly relevant |
| 4220 | 12 | 0 | | | | Alex Gordon, while president of the Royal Institute of British Architects in 1972, addressed these issues by saying that buildings should exhibit: low cost, loose fit, and low energy (http://www.guardian.co.uk/news/1999/jul/29/guardianobituaries3). These qualities pertain to infrastructure systems in general. Infrastructure should be economically viable, adaptable to conditions that were not or could not be anticipated when they were designed and constructed, and produce small green house gas emissions in construction and use. | Noted: Added discussion of embodied emissions in infrastructure. |
| 4221 | 12 | 0 | | | | The chapter and report give substantial and appropriate attention to the knowledge bases in physical and social sciences and even states (e.g. 7.5.3) that they are adequate for mitigation of climate change through reduction of greenhouse gas emissions. However, the path from knowledge to successful implementation of greenhouse gas mitigating infrastructure must be addressed and made feasible. | Noted: Added discusssion on policies and implementation issues |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 4222 | 12 | 0 | | | | The path is: knowledge > standards > regulations & practices > enforcement, approvals & implementation > infrastructure systems. In democracies, all stakeholders have authoritative voices in:<br>• the development of standards (a systems integration process in which the direct and indirect effects of new knowledge are considered) (see www.standards.gov for a description of U.S. processes),<br><br>• the adoption of the standards in the regulations of local, state, and national governments and in international treaties,<br>• the approvals of infrastructure projects and urban developments subject to the authorities having jurisdiction and the preferences of the publics served and affected.<br>Stakeholders include:<br>• owners, public or private<br>• financers and insurers<br>• regulators<br>• users (such as residents and customers)<br>• neighbors (affected but not directly served)<br>• building professionals, contractors and labor<br>• materials and equipment suppliers<br>• environmental organizations | Noted: added discussion of policies and stakeholders |
| 4223 | 12 | 0 | | | | Development of standards, which implement knowledge for mitigation, requires the informed consent of the stakeholders. Studies and educational efforts defining the economic, environmental and social impacts are required. These require time and resources to conduct the needed impact studies. | Noted |
| 4224 | 12 | 0 | | | | Approvals of infrastructure projects and urban developments, which support mitigation of climate change, require the informed consent of stakeholders. These also require studies and educational efforts defining the economic, environmental and social impacts. | Noted |
| 4225 | 12 | 0 | | | | In the United States and other democracies, focused attention to improving the efficiency of the regulatory processes is required to reduce the time (often a decade or more) for approvals of urban developments or infrastructure that will reduce greenhouse gas emissions. According to Moving Forward: In-Depth Findings and Recommendations from the Consultative Council (2011), National Institute of Building Sciences, p11 http://nibs.org/client/assets/files/nibs/2011_MovingForward.pdf | Noted |
| 4226 | 12 | 0 | | | | Federal, state and local governments have established a variety of regulations to promote public health, safety and welfare and to protect the environment. Most of these are consistent in intent with sustainability, but many are prescriptive in nature and unsupportive of sustainability in specific situations. Many different regulatory agencies, each with its own procedures, have jurisdiction over different aspects of building and infrastructure projects. | Noted: The impottance of multilevel governance is described in 12.6.1 |
| 4227 | 12 | 0 | | | | Regulatory streamlining is a process, involving project proponents and all cognizant regulatory jurisdictions and stakeholders, to give simultaneous and coordinated attention to meeting the intents (performance requirements) of all regulatory requirements. Long, expensive delays often are imposed on building and infrastructure projects before approvals can be obtained from all regulators. Innovations for sustainability can exacerbate such delays. Modern information technologies, such as BIM, permit efficient sharing of pertinent information and can facilitate streamlining. | Noted |
| 4228 | 12 | 0 | | | | Additional information on regulatory streamlining is available from www.natlpartnerstreamline.org/ . U.S. Executive Order 13274 of September 18, 2002, Environmental Stewardship and Transportation Infrastructure Project Reviews provides federal authority for streamlining. | Noted |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 18827 | 12 | 0 | | | | The linkage between planning tools (Table 12.2) and policies (e.g. Table 12.7) needs to be made, i.e. there should be e.g. a table that details which policies support which planning tools. | Nored: The tables refered got deleted in the rewrite of the chapter for the SOD - the comment is no longer applicable. However, we have drastically changed |
| 18933 | 12 | 0 | | | | General Comment: The TSU is concerned about your chapter's current state and thinks that significant improvements are needed. The TSU is thus submitting a range of comments that may guide the author team in their work on the chapter, the core comments are labelled "Main Comment". | Noted |
| 18934 | 12 | 0 | | | | Main Comment 1: The chapter fails to answer core questions. Further, what has been done so far does not provide a structure to easily do so in the future. At their ZOD feedback the Co-Chairs asked you to answer the following questions:<br>(a) What are current global emissions from urban areas and infrastructure?<br>(b) What emissions are to be expected given current trends? What is the expected extend of the future mitigation challenge?<br>(c) What robust mitigation strategies exist, which are robust – including quantitative information or at least indicators on the order of magnitude?<br>(d) Make emission path dependencies of (to be) built infrastructure more explicit<br><br>This has not been done so far. Following up on these questions, we suggest to also cover the following aspects:<br>(I) Quantification of trends and drivers<br>(II) Extraction of potential data from Chapters 8 and 9<br>(III) GHG emissions or energy demand [reduction] estimates for different urbanization scenarios. | Taken into account: The reframing and rewriting of the chapter have addressed these issues as much as possible and the chapter is in far better shape then before. a,b) Estimated current and projected emissions for human settlements and infrastructure. C) summarized mitigation strategies for cities. D) we have limitation on treating all aspects of path dependencies, given available literature. I) Quantified trends and drivers. II) Section 12.4 extracts data from other chapters as much as posisble. III) Presented scenarios in sction 12.4 |
| 18935 | 12 | 0 | | | | Main Comment 2: The chapter has many redundancies and lacks inter-linkage. In our view this is in part due to the structure of the chapter. Removing redundancies and referencing other sections will improve the flow and coherence of the chapter. | Taken into account: The reframing and rewriting of the chapter have addressed these issues as much as possible and |
| 18936 | 12 | 0 | | | | Main Comment 3: One of our main points of critique from the Co-Chairs on the ZOD was the lack of (quantitative) data. This has in the view of the TSU not sufficiently improved with the FOD. The chapter lacks data, quantitative synthesis of studies and mostly gives single values instead of ranges. Improving this will also allow you to increase the currently very low number of quantitative figures. | Taken into account: The reframing and rewriting of the chapter have addressed these issues as much as possible and the chapter is in far better shape then |
| 18937 | 12 | 0 | | | | Main Comment 4: There needs to be far more synthesis, qualitative and quantitative, in the chapter. See detailed comments to Sections 12.5, 12.6.2.1/.2, 12.6.3.1/.2, 12.6.4.1/.2/.3/.4, 12.7 and 12.8 | Taken into account: The reframing and rewriting of the chapter have addressed these issues as much as possible and |
| 18938 | 12 | 0 | | | | Main Comment 5: The chapter has not started to fulfil its role as integrative chapter in the report. There are no linkages to Chapters 8 and 9 which also deal with infrastructure and urban areas. Also links to other chapters are missing. | Taken into account: The reframing and rewriting of the chapter have addressed these issues as much as possible and |
| 18939 | 12 | 0 | | | | Main Comment 6: Consumption based accounting is well introduced in the chapter – its consistent usage throughout the chapter still has to be implemented. | Taken into account: The reframing and rewriting of the chapter have addressed these issues as much as possible and |
| 18942 | 12 | 0 | | | | The TSU has the impression that thefollowing ZOD Co-Chair critiquhas not yet been taken into account: Ensure that SRREN outcome is taken into account. | Noted: Not explicitly used anything from SREEN, we can look into it further and see how knoledge from SREEN could |
| 18943 | 12 | 0 | | | | The TSU has the impression that thefollowing ZOD Co-Chair critiquhas not yet been taken into account: The carbon footprint of cities needs to be covered in the chapter. | Taken into account: The reframing and rewriting of the chapter have addressed these issues as much as possible and the chapter is in far better shape then |

|---|---|---|---|---|---|---|---|
| 18944 | 12 | 0 | | | | The TSU has the impression that thefollowing ZOD Co-Chair critiquhas not yet been taken into account: The difference between “urban area” and “city” needs to be defined and consistently applied. | Taken into account: The reframing and rewriting of the chapter have addressed these issues as much as possible and the chapter is in far better shape then |
| 18945 | 12 | 0 | | | | The TSU has the impression that thefollowing ZOD Co-Chair critiquhas not yet been taken into account: UN Habitat has worked on relating emissions to different types of structures, it would be good to take this in the chapter into account. | Noted: The reframing and rewriting of the chapter have addressed these issues as much as possible and the chapter is |
| 18946 | 12 | 0 | | | | The TSU has the impression that thefollowing ZOD Co-Chair critiquhas not yet been taken into account: As urban areas contribute to most emissions this surely needs to be the focus of mitigation efforts and chapter coverage. But rural areas should not be ignored and effects of decentralized (i.e. also rural) availability of energy through renewables and its effects should be covered in the chapter. | Taken into account: The reframing and rewriting of the chapter have addressed these issues as much as possible and the chapter is in far better shape then before. Rural is discussed explicitly but |
| 18947 | 12 | 0 | | | | The TSU has the impression that thefollowing ZOD Co-Chair critiquhas not yet been taken into account: The plan to focus more on scenarios, emissions, taxonomy, etc. has not been put into practice. | Taken into account: The reframing and rewriting of the chapter have addressed these issues as much as possible and |
| 18948 | 12 | 0 | | | | The TSU has the impression that thefollowing ZOD Co-Chair critiquhas not yet been taken into account: o Figures or sketches of figures were not used as planned to guide the process. | Taken into account: The reframing and rewriting of the chapter have addressed these issues as much as possible and |
| 18951 | 12 | 0 | | | | The definition of urban boundaries should be in one place and then only referenced from everywhere else (see e.g. 12.2.3.1, 12.2.3.2). | Accepted: The reframing and rewriting of the chapter have addressed these issues as much as possible and the |
| 18952 | 12 | 0 | | | | The same mitigation options and co-benefits/tradeoffs are discussed throughout the chapter in different context (e.g. spatial planning causing better air quality leading to better health [12.5.1]). Through a central table (e.g. building upon Table 12.1) and a central place where all options are listed (similar to Section 12.4.3) redundancies could be reduced and coherency improved. | Taken into account: The reframing and rewriting of the chapter have addressed these issues, all cobenefit discussion are in 12.8. Reduced redundancies |
| 18953 | 12 | 0 | | | | There should also be only one section discussing UHI, everywhere else there should only be brief references to this section. There need to be linkages from this section to the corresponding WG II chapter(s). | Taken into account: The reframing and rewriting of the chapter have addressed these issues, all UHI discussion are at |
| 18955 | 12 | 0 | | | | The chapter contains a lot of irrelevant information. E.g. Section 12.7 lists many activities without detailing their effects. | Taken into ccount: The section is rewritten. |
| 18956 | 12 | 0 | | | | The task of the chapter is to synthesize. Tables 12.4, 12.5 and 12.6 are not the level on which the chapter can be written. There is a need to condense and synthesize such information in order to make appropriate use of the given space and to be meaningful for the recipients. | Taken into account: The sections are rewritten |
| 18957 | 12 | 0 | | | | The framing of the chapter needs to be improved. It does not become clear why the urbanization is so relevant and why approaching mitigation from this perspective is so crucial. | Taken into account: The chapter is reframes and rewritten and this point is |
| 18958 | 12 | 0 | | | | The chapter has a focus on the limitations of the urban perspective. As other perspectives avoiding the problems of the urban perspective are also taken in the report, this chapter should instead focus on highlighting the opportunities of taking this perspective, such as the range of influence and the pioneer role. | Accepted: Discussed experiences and opportunities in 12.7 |
| 18959 | 12 | 0 | | | | There is no explicit section on policies and it does not become clear how policies relate to the mitigation options and perspectives covered throughout the chapter | Accepted: 12.5 discusses policies and systems integration |
| 18960 | 12 | 0 | | | | The chapter team must become very clear about what the added value of this chapter compared to the Global Energy Assessment (GEA) Chapter 18 is going to be. The GEA has to be referenced, too. | Accepted: Referenced GEA in 12.3 and 12.1 |
| 18961 | 12 | 0 | | | | Please take the following Worldbank reports on Infrastructure & Urbanization in Developing Countries to be found at http://www.infrastructureafrica.org into account. | Accepted |
| 3662 | 12 | 0 | 0 | | | Reduce amount and length of tables to save space. | Taken into account: The SOD is now |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 7607 | 12 | 1 | | 94 | | There is a limited treatment of increased exposure and vulnerability to climate hazards occurred in some areas of the western Mediterranean, in relation to the massive increase in residential building and infrastructure. This has provoked increasing risk territories. For example in areas of the Spanish Mediterranean coast is more likely in 2012 than it had in the late 1989 and 1990. And this has been caused by a massive occupation of land dedicated to housing and infrastructure (soil sealing). An analysis of this can be seen in Olcina (2010) and Olcina, Hernandez, Rico and Martinez (2010). | Rejected: Not directly relevant |
| 5177 | 12 | 1 | | | | Chapter 12 is a useful extension of Chapter 7 (Energy), Chapter 8 (Transport) and Chapter 9 (Buildings) by treating energy, transport and buildings in the urban context in a holistic and integrated way.<br><br>The present draft is an impressive collection of drivers and interdependencies of urban systems, GHG mitigation potentials strategies and their benefits, tradeoffs and spillovers and barriers to implementation.<br><br>However, the chapter contains too many statements of the kind (all taken form the Executive Summary):<br><br>- “A combination of compact urban form, integrated urban structure, high residential and employment density, and mixed land uses, provides a coherent urban model that can lower energy use and carbon emissions.”<br><br>- “As a system, urban areas and human settlements can increase the efficiency of the built environment, infrastructure and energy use beyond what is possible within individual sectors.”<br><br>- “Spatial planning can influence resource use and emissions through spatial development plans, land use, buildings, and the coordination of infrastructure, services and land use.”<br><br>But at the end of the chapter the reader has no clear view of what has been achieved so far and what needs to be done. | The chapter is reframed and rewritten. |
| 2368 | 12 | 1 | 5 | | | Re. how the chapter might be shortened. While section 12.7 is interesting, and should be published somewhere, much of it is based on sourcing of municipal government documents rather than scientific literature, and so perhaps could be cut (in particular the material on p. 45-47; and 50-56). Other potential cuts are given below. | Taken into account: The section is completely rewritten. |
| 16646 | 12 | 10 | | | | Discussions of the definition of “urban,” and discussions of what share of GHGs are in urban areas, as at top and middle of page 10, are a distraction from what the essential purpose of the chapter, which is to understand how policy-directed variation in human settlement patterns and practices could affect GHGs. This material could be omitted.<br><br>Some of the material appearing in the section at bottom page 10 could be re-oriented to the above purpose. | Taken into account: This whole section is rewriten and reframed. |
| 2487 | 12 | 10 | 1 | | | difference | Taken into account: This whole section is rewriten and reframed. The text in |

| 5720 | 12 | 10 | 30 | 10 | 49 | The most serious omission among the factors considered to affect CO2 emissions in urban areas, in all the established literature and hence missed by the IPCC Chapter Authors, is the cross-city disparities in the relationship between incomes and housing costs. The “median multiple” is a good proxy here. Cities with higher median multiples also have lower “discretionary incomes” after housing costs. Therefore there is highly likely to be a correlation between policies of strict urban growth containment and reduced CO2 emissions, but the mechanism is not necessarily efficiency gains, in urban form or anything else, but a reduction in household discretionary spending of all kinds. There are equity effects to be considered here. Gibbons, Overman and Resende in “Real Earnings Disparities in Britain” (2011) find that the greatest increases in “proportion of income spent on housing” as urban land prices inflate, is both in the lowest income groups and in the very highest income groups. This is because the highest income groups are paying increasing amounts of money to continue to “buy their way out” of the rationing system – their tennis courts, multiple garages, large gardens, swimming pools, multiple houses, and so on, are costing them quite a lot more, especially if at “premium” locations in the “city”. Meanwhile, the land thus consumed without regard to the intention of the “rationing” process, requires “compensation” via the land market mechanism; lower income earners making do with less and less space, at ever-more inefficient and undesirable locations, for which they still have to pay more and more. Every “attribute” of housing is rationed by price, and the price-rationing of “space” spills over into necessary rationing of quality and location and condition and amenities. I take it that the IPCC chapter authors do not regard it as controversial that urban growth boundaries always result in urban land price inflation. However, what is little understood as yet is that there is no example in the world where “density” has successfully ameliorated the effect on housing affordability. All the “affordable” cities in the annual “Demographia” Reports have minimal urban fringe growth constraint whether regulatory or geographic, and have much lower prices per LARGE lot in new developments than the unaffordable cities have per VERY SMALL lot. | Noted: This is important issue. In the reframed and rewritten chapter, existing text to which comments are made are deleted. But we have included discussions on land value capture issues as new sub section (12.6.4) and discussed housing related issues in 12.3.4 too. We have added small subsection on affordable housing as 12.4.8. |
| 2488 | 12 | 10 | 4 | | | these figures from IEA should be updated to 2010 - they are available | Taken into account: This whole section is rewriten and reframed. The text in question is deleted.. But IEA had not |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 17306 | 12 | 11 | | 11 | | Urban GHG inventories are dealt with in several chapters. I would recommend to deal with this issue, in particular with the various methodological approaches and their rationales, in one chapter more comprehensively. Moreover, it should be mentioned that there is no abolutely "true" method, and there are substantial problems with data and quantification (e.g. for individual transport, non-grid energy carriers etc.). Therefore it makes sense to chose a methodology depending on the purpose. If the purpose is primarily monitoring of mitigation achievements, a terriorial approach doesn't make sense for small units, as "imports" of, e.g. electricity play a major role (the boundary effects of trans-border trade of energy , trans-border transport etc. are relatively large for smaller units). | Accepted: but the whole section is rewriten and reframed. The comments are no longer directly relevant. The issues raised in this comments are addressed in 12.3.2 in SOD in detail. |
| 16647 | 12 | 11 | | | | Continuing on page 11, this is another list of what factors might influence emissions but it comes across as an unorganized list with little attempt by the authors to organize the literature, beyond saying “there is little agreement.”<br><br>The paragraph on page 11 from lines 19 to 36 is relevant and helpful, but again needs integration and is secondary to a summary of what is known and not known. | Accepted: but the whole section is rewriten and reframed. The comments are no longer directly relevant. The issues raised in this comments are addressed in 12.3 and 12.3.2 in SOD in detail. |
| 17178 | 12 | 11 | 13 | 11 | 17 | The arguments in the two sentences could seem to be contradictory in some way, since the consumption-based emissions from car travel are likely to be lower in the compact, vertical cities than in the low-rise expansive ones. The paragraph should therefore be made clearer and more nuanced. | Taken into account: This whole section is rewriten and reframed. The comments are no longer directly relevant. |

| 16650 | 12 | 12 | | | | Page 12 at top: To say that form and structure “determine” energy use and emissions is an overstatement. Empirical studies have struggled to clearly demonstrate causal relationships between urban form and emissions, and those that have been done do not show there are particularly strong relationships. A metastudy of US empirical studies relating urban form to vehicle miles traveled, for example, found so few reliable studies by category of urban form or structure that confidence intervals for estimates could not be constructed; and the elasticities were small, all at less than 0.10 (Ewing and Cervero 2010). In general, the chapter cites just one or two studies on a particular claim, does not discuss their merits, and tends to over-generalize.<br><br>This same section should also lay out the ways in which settlement patterns, urban form and structure, etc are thought to influence GHGs. None of this appears here and it is critical. | Noted |

| 17179 | 12 | 12 | 40 | 12 | 45 | Causality between urban spatial characteristics cannot be established through statistical analyses, but has been demonstrated through qualitative studies combined with theoretical analyses explaining the plausibility of such causal relationships. In order to substantiate that residential location is a (contributory) cause of differences in travel behavior between people living in different urban spatial contexts, we must show the basic mechanisms by which the location of dwellings influences travel behavior. Examples showing the rationales on which people base their frequency of participation in out-of-home activities, the location of these activities, the modes of travel used to reach these locations, and the routes followed make up important elements in this endeavor. Research investigating such causal mechanisms between residential location and travel behavior has in particular been carried out by North European researchers, including cases in Scandinavia but also in China. See Næss (2005, 2006, 2009, 2012 a and b). | Taken into account: The whole section is rewriten and reframed and these text are deleted. |

|---|---|---|---|---|---|---|---|
| 17189 | 12 | 12 | 24 | 15 | 13 | In section 12.3.2 there is generally a lack of mentioning of the influence on travel behavior and its related CO2 emissions from the location of dwellings as well as (office) workplaces relative to the main metropolitan city center. A host of empirical studies have shown distance to the city center, together with the overall population density within the urbanized are of the city and the metropolitan areas, to be the urban spatial characteristics exerting the strongest influences on transportation energy use and GHG emissions. Strong tendencies among suburbanites to travel longer overall distances and carry out a higher proportion of their travel by car than their inner-city counterparts, among whom walking and biking make up a higher share of the distance traveled) have been found in a large number of cities in different corners of the world, including Paris (Mogridge 1985, Fouchier 1998), London (Mogridge, ibid.), New York and Melbourne (Newman and Kenworthy 1989), San Francisco (Schipper et al., 1994), Austin, Texas (Zhou & Kockelman, 2008), Athens (Milakis, Vlastos and Barbopoulos, 2008), Santiago de Chile (Zegras, 2010), Copenhagen (Næss, 2005, 2006, 2009b and 2011), Oslo (Næss et al., 1995), a number of other Nordic cities (Næss, 2012) and Hangzhou (Næss, 2010).<br>Similarly, a number of studies have found that employees at suburban workplaces tend to commute by car much more frequently than employees at inner-city workplaces. Cities where lower proportions of car commuters and higher shares of employees traveling by public transit, bicycle or by foot have been found at inner-city than at suburban jobsites include the San Fransisco Bay area (Cervero & Landis, 1992); London and other large British cities (Dasgupta, 1994); the Dutch Randstadt area (Schwanen et al., 2001); Atlanta and Boston (Yang, 2005); and Paris (Aguilera et al., 2009), Oslo (Næss & Sandberg, 1996), Trondheim (Strømmen, 2001) and Copenhagen (Hartoft-Nielsen, 2001b; Næss, 2007). Several studies also show that job decentralization from inner to outer parts of cities and metropolitan areas usually does not contribute to reducing average commuting distances (Næss & Sandberg, 1996; Hartoft-Nielsen, 2001b; Næss, 2007; Strømmen, 2001; Cervero & Landis, 1992; Yang, 2005; Aguilera et al., 2009). Admittedly, according to some studies employment decentralization has reduced commuting times (Gordon et al., 1991; Cervero & Landis, 1992; Giuliano & Small, 1993). This has, however, mostly to do with the generally higher shares of fast modes of travel and higher driving speeds in the suburbs than in the inner city.<br>It is an serious shortcoming of the existing text that the influence of the location of dwellings and workplaces relative to the city center is not mentioned. This must be corrected. | Noted: The whole section is rewriten and reframed and these text are deleted. The comments are no longer directly relevant. But the land value capture and housing related issues are added in SOD. We have done limited discussion on transport (given there is another chapter on transport in WGIII) here. 12.4 in SOD has addressed accessibility, density, land use, connectivity, transport modes, and characteristics of the low carbon settlements. We look forward to improve these aspects further in next round. |

|---|---|---|---|---|---|---|---|
| 8564 | 12 | 13 | | | | RESEARCH REACHING ALTERNATIVE CONCLUSION NOT CITED<br>"There is a tendency in cities for more intensive activities, such as those activities requiring public support, to gravitate towards more continuous routes carrying public transportation, thus forming activity corridors – bands of higher density, more mixed uses (Curtis, C. and Tiwari, R., 2008). This form reduces vehicular generated greenhouse gas emissions by increasing the use of public transportation."<br>COMMENT:<br>Research in Melbourne, where this concept has been in operation in some years indicate no material increase in public transportation ridership along such corridors. See Monash University research at: McCloskly, D., Birrell, R., & Yip, R. (2009), "Making Public Transport Work in Melbourne," People and Place, September. Section 12.3.2.2 (Tendancies toward Linearity) should be expanded to cite the dissenting literature or be deleted. | Noted |
| 17180 | 12 | 13 | 1 | 13 | 14 | There is a general neglect in this paragraph of the influence of densification versus sprawl on the use of non-motorized travel modes. Research in Scandinavian cities has shown that inner-city residents use such modes to a higher extent than suburbanites do, and combined with the generally shorter daily traveling distances of inner-city residents, this leads to considerably higher non-motorized share of total daily traveling distance among residents living close to the city center. In cities like Copenhagen, the share of travel carried out by bike is particularly high among inner-city residents. See Næss (2005 and 2006). Similar patterns were also found in Hangzhou, China (Næss, 2010). | Taken into account: The whole section is rewriten and reframed as section 12.4 and these text are deleted in SOD. The comment is not relevant here now. |
| 12456 | 12 | 13 | 12 | 13 | 14 | Could it be clearified what is included in "utility services"? In addition to grids for electricity, street lightning, gas, water and sewage, telecommunications, also public transportation sytems and roads get longer in less compact urban developments with consequences for emissions from both construction and maintenance. Please consider to include this fact. | Taken into account: The whole section is rewriten and reframed. The same text is reproduced in 12.3.3 and used "utility lines". See 12.18 figure in SOD |

| 17181 | 12 | 13 | 25 | 13 | 25 | Norway should be added here, since this is the country where the perhaps strongest shift from urban sprawl to urban densification has taken place. In particular, this shift has been pronounced in Oslo Metropolitan Area. The population density within the continuous urban area of Greater Oslo (pop.: 0.93 mill.) increased by as much as 27% over the period 1985-2011. In spite of some development of dwellings and workplaces on previously undeveloped land in the outer part of the metropolitan area, the number of inhabitants per hectare of urbanized land within the region as a whole (including 1.2 million urban inhabitants in 2011) grew by 7.5 % over the years 2000-2011. See Næss et al., 2011a and b (and also Næss, 2012 with the latest updated figures, presented in a conference paper from the AESOP conference in Ankara this summer). | Noted |

| 5721 | 12 | 13 | 32 | 13 | 37 | "Many of the poorest households, who can least afford high transportation costs, can only obtain access to land on the periphery: the system contributes to a self-perpetuating cycle of poverty."<br>But it was commonly understood 120 years ago, (Peter Hall, "Cities of Tomorrow: An Intellectual History of Urban Planning") that as economies developed and incomes rose, urban land rents rose just as fast, meaning that the rentier class captured most of the gain. Land holdings going back centuries do not have to be particularly large in "rural" terms, to constitute a monopoly holding in what becomes a growing city. The necessity at one time that people walk everywhere, limited the scope for the amount of living space per person, and also rendered it impossible for "conversion" of land from rural to urban uses without the extraction of monopoly rents by the owners of the necessarily limited "supply" of land for conversion.<br>Furthermore, new migrants into the urban economy, with minimal income prospects at least initially, cannot hope to "house" themselves in competition with incumbent residents with already increased income levels. Hence either "informal" housing, multi-family shared housing, or horrifically over-crowded "market" solutions such as the infamous "Dumb-bells" tenements. It was well understood 100 years ago, by proto-urban-planners, social reformers, economists, and politicians, that there was a desperate need to increase "supply" of land in the urban economy so as to ameliorate not just the crisis of public health, but the crisis of social inequality, immobility, and unrest. Marxist solutions had considerable appeal that would only grow unless the "monopoly rent" issue was ameliorated. Hence, while the process of rail-based urban expansion was itself driven by rent-seeking, it had explicit approval from many of those who carried "social" concerns due to the effect that the increase of land supply must have on ameliorating "monopoly rent". The more competition between "developers" involved in urban expansion, the greater the amelioration of the "monopoly rent" effect.<br>The noted proto-urban-planner Ebenezer Howard initially supported the "nationalisation" of land but was persuaded by colleagues who were well versed in classical land economics, that rural land was so cheap compared to urban land that the ability to convert it to urban use with minimised uplift in value, was a better solution. Hence Howard's lifelong advocacy of "Garden cities" with a balance between housing and employment and other activities. Unfortunately, for whatever reason, all such proposals tended to end up as "dormitory suburbs" with the residents travelling in to the existing city daily.<br>The rent-seeking influence of the established city property owing interests is probably grossly under-estimated at all times in historical accounts of the modern city, right up to the present day. The classical land economics urban rent curve slopes up to a city centre. "Dispersion" flattens this land rent curve. William Wheaton (2002) "Commuting, Ricardian Rent, and Housing Price Appreciation in Cities with Dispersed Employment and Mixed Land Use". The ability to convert rural land to urban with minimal "planning gain" results in minimal "discontinuity" in the land rent curve at the urban fringe, which tends to keep the price of land lower throughout the urban area. Cheshire and Mills note in their Introduction to "The Handbook of Regional and Urban Economics" Volume 3 (1999):<br>"…….If we compare communities in the US and UK that are as comparable as possible except for the constraints their systems of land use regulation place on the supply of land, we observe that the price of retail land is up to 100,000 times higher in the most constrained community……"<br>It is noticeable that "housing affordability" analyses such as the Annual Demographia Reports, tend to find quite strong "sorting" characteristics, whereby there is one significant set of cities with median multiples of around 3 | Noted: The whole section is rewriten and reframed and these text are deleted in SOD. | 5722 | 12 | 13 | 45 | 14 | 2 | Anthony Downs (2007) “A Growth Strategy for the Greater Vancouver Region”:<br><br>".....The cost of land poses a key dilemma for urban planners everywhere who want to concentrate jobs together so they can be best served by public transit. Such concentration raises the costs of land near centers; in fact, it would confer a monopoly advantage on landowners who owned such land and could exploit firms trying to locate there. Now firms want to locate elsewhere to cut their land costs.<br><br>Planned concentration of jobs in a few centers is not consistent with private ownership and control of land. Some type of collective control over that land would be necessary to prevent monopolistic exploitation of land values. In theory, this could be done with high land taxes in such areas and special zoning rules. But adopting those devices is politically difficult in a free enterprise economy.....<br><br>".....A similar but less intensive dilemma concerns land near transit stops, where it would be most efficient to concentrate high-density housing and jobs. That also creates ownership monopolies over such land unless it is specially controlled or taxed. Yet focusing development near transit stops is a key to using more transit....."<br><br>The famous example provided by Curitiba, Brazil, did initially involve large amounts of compulsorily acquired land for “transit oriented development”, although most advocates analyses of Curitiba's wonderfully successful system are silent on this point, which is actually a crucial one. See Jonas Rabinovich, "Curitiba: Towards Sustainable Development" (1992), which at least mentions this reality although without identifying its importance. Curitiba’s planners also had the wisdom to go with buses and busways rather than rail based systems. Buses can pick up passengers anywhere before entering the high-speed busway, which has telling advantages over rail based systems that require “transfers” from other modes. Bus based systems can also be adapted to follow later urban development wherever it proves popular, rather than imposing self-defeating distortions in land market prices with fixed rail routes and strictly “planned” integration of transit and development. Curitiba has had considerable problems under the free market since the original project was completed, with lower income people being "priced out" of the transit-served locations, and further development at these locations being stalled by high land prices. □ | Noted |
| 17183 | 12 | 13 | 45 | 14 | 2 | I do not think the tendency toward linearity can be described as a general trend. In the Scandinavian cities where densification has been a strongly pursued strategy during recent decades, densification has typically more taken place at nodes, often on areas becoming vacant due to industries having moved to lower-cost countries, or due to prior relocation of harbor activities. (See, for example, Næss et al., 2011b). | Noted: The whole section is rewriten and reframed and these text are deleted in SOD. The comment is not relevant here now. |

| 18032 | 12 | 13 | 21 | 13 | 24 | The US National Research Council (2009) report found that "doubling density would only reduce VKT by 5% to 12%, and perhaps by 25% if coupled with higher employment concentrations, significant public transport improvements, mixed uses and other supportive demand management measures." Note however that these measures to achieve more than the 5% to 12% range are very dependent on having a strong local economy and investment in local improvements to public transport and streets and it would be difficult to achieve these conditions more generally in the more residential urban areas. Also a higher densities will increase congestion and crowding and lower vehicle fuel efficiency. Therefore density is a relatively weak lever for reducing vehicle emissions. I think this needs to be made clearer in the text and relates to my comments above that the chapter needs to have more quantification of the evidence and analysis of causation and feasibility of achieving climate mitigation through infrastructure and spatial planning | Noted: |

| 2371 | 12 | 14 | 35 | | | Operatonal energy use of buildings also depends on the function of the building and user behaviour. | Noted: The whole section is rewriten and reframed and these text are deleted |
| 5725 | 12 | 14 | 36 | 14 | 41 | The Chapter authors are to be commended for noting the relative inefficiency of high rise buildings. One of the problems we have in criticising a particular type of dwelling, is in identifying the scope for improvement that is related to each type of dwelling rather than trying to encourage a change in the type of dwelling that people choose. Patrick Troy (Australian National University) in “The Perils of Urban Consolidation” (1996) points out the considerable scope for “sustainability” represented by low density living, which in many features has potential that higher density living does not. “Pricing” of the variables that we want to affect, such as water consumption, energy consumption, waste and so on, would be sufficiently effective and would avoid the very serious “unintended consequences” of many popular proscriptive urban planning tools. There is more scope at lower densities, for the use of active and passive solar power, fresh air and sunshine for ventilation and clothes drying, on site power generation, the burning of biomass for heating and cooking, rainwater collection, on-site waste disposal and recycling, on-site food production, and the use of trees for shade. The fact that suburbanites do not yet habitually maximise the sustainability advantages represented by the densities at which they live, is because the incentives to do so are absent.<br><br>Since Troy’s book was published, geothermal heat pumps have been developed, which are an energy-saving “no-brainer” for which the scope is vastly reduced by higher urban densities. □ | Noted: But do we have suffieicnt published literature to support argument? Will be looked again in next round |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 11033 | 12 | 14 | 39 | | | The text states: 'Semi-detached and three storey buildings have been shown to be significantly more efficient in terms of operational energy, than single storey, free-standing units, while high rise buildings are the most inefficient, largely because of the use of the elevator (Myors et al., 2005).' This is misleading, as it ignores the benefits of high rise for reducing overall energy use, including in household travel. [Glaeser, E. (2009). Green Cities, Brown Suburbs. City Journal, 19(1) http://www.city-journal.org/2009/19_1_green-cities.html ] This whole paragraph should acknowledge how critical transport is. A minimal recasting could add the following sentence after 'Myors et al. (2005)': 'However, this operational energy requirement may be outweighed by other energy implications of buildings, such as those arising from location – for example, high rise buildings reduce needs for transport.' | Noted: The whole section is rewriten and reframed and these texts are deleted in SOD. |
| 6011 | 12 | 14 | 4 | 14 | 5 | Source is missing. | Noted: The whole section is rewriten and reframed and these text are deleted in SOD. The comment is not relevant |
| 17184 | 12 | 14 | 4 | 14 | 12 | What is written here about polycentricity is not sufficiently nuanced. It is necessary to specify the geographical scale at which polycentric settlement structures are favorable to reducing transport GHG emissions. Studies in the Nordic countries suggest that while at an intra-metropolitan scale a centralized pattern of development will require the least amount of energy for transportation (see, e.g. Næss et al., 1995; Næss, 2011; Næss & Sandberg, 1996; Hartoft-Nielsen, 2001a), decentralized concentration may be the most energy-efficient settlement pattern at a wider regional scale (Næss, 1993). According to Brotchie (1984), a decentralized settlement structure will be the most energy efficient and least transport-requiring one if the level of physical mobility in the society is low. In such a situation, the distance decay will be high, with rationales of distance minimizing distance outweighing those of choosing the best facility. In a highly -mobile society, however, the deterrent of distance will be low, with rationales of choosing the best facility generally dominating over distance minimizing distance (within some threshold of acceptable travel time). If a peripheral settlement is to function in a self-contained way in a high-mobility society, it must be located outside the catchment area of competing centers. Thus, Banister (1992) found that traveling distances were shortest and the proportion of walking highest in the most urbanized of six investigated parishes in the generally densely populated Southern England, while the most rural parish was distinguished by long trips and a high proportion of car driving. If residential development in peripheral rural areas and villages in a high-mobility society is to be compatible with modest average amounts of travel, the distances to the closest cities (and in particular, major metropolitan centers) must therefore most likely be quite long, and longer the stronger is the attraction of the main center (Breheny, 1992). | Noted: The whole section is rewriten and reframed and these text are deleted in SOD. These issues are given careful look in rewritten 12.4 |
| 14709 | 12 | 14 | 43 | 15 | 4 | Is this paragraph really useful ? It is somehow contradicted by the following paragraph. (I do not really understand why is it useful to say that something is true when the scale of observation is local if you write just after that is it actually false when looking at the big picture ?) | Noted: The whole section is rewriten and reframed and these texts are deleted in SOD. Carbon sink discussion are in |
| 17185 | 12 | 14 | 45 | 15 | 4 | An exclusively intra-city focus is completely irrelevant when discussing the carbon sink function of green space, since CO2 emissions are a global and not a local problem. The points made on page 15, lines 5-7 are thus the relevant important ones which should be brought to the front. There are many good reasons for saving intra-urban green areas, but carbon sequestering is hardly one among them (unless the protection of intra-urban green space takes place without any outward urban expansion whatsoever – this would require either that the construction of new buildings came to a halt, or that existing buildings inside the city were replaced with taller ones). | Noted: The whole section is rewriten and reframed and these texts are deleted in SOD. Carbon sink discussion are in 12.8.2 |
| 2498 | 12 | 14 | 5 | | | decentralised or distributed? | Noted: The whole section is rewriten and reframed and these text are deleted |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 14710 | 12 | 14 | 42 | | | I wonder if this section is really useful: the carbon sink created by urban spaces has only a marginal effect on the global concentration of GHG in the atmosphere (its impacts are really negligible when compared to any mitigation policy, as it acts on the stock of GHG in the atmosphere, not on the flux, i.e. on emissions; this very fact is actually written in section 12.4.3.6 ! ). I somehow feel including such a section may be confusing for the reader. | Taken into account: Deleted from here and moved to discussions in 12.8.2 |
| 5726 | 12 | 15 | 1 | 15 | 13 | The Chapter Authors are to be commended for their observation that lower density urban development actually co-exists to some extent, with local biospheres, whereas it is higher urban density that is more destructive. But the authors make the mistake of assuming that lower density urban areas are associated with higher amounts of private green space and lower amounts of public green space: "…..In the case of more dispersed forms, small pockets of public green space and large amounts of private green space remain……"<br><br>Actually, the inflated price of urban land consequent on regulations creates major pressures on the public owners of green space, to sell it for development, especially if a decreased urban footprint is a stated policy objective. Limiting the policy-induced "reduction in urban footprint" to PRIVATE space, has the effect that literally halving the private living space per person only reduces the total urban footprint by something like 15% to 25%. In fact the doubling of population on the 30% to 40% of an urban area that actually typically IS "housing", places pressure on the "public" land that is part of the remaining 60% to 70%. Schools, parks, hospitals and public buildings; and space for infrastructure and rights-of-way. If road space is not expanded, the congestion will more than negate the already minimal gain in shorter travel distances.<br><br>Peter Gordon, in "Thinking About Economic Growth: Cities, Networks, Creativity and Supply Chains for Ideas" (2012 – Annals of Regional Science), reiterates a claim he has been making for years, that urban economies find their own balance between agglomeration economies, and associated dis-economies of congestion, land prices, and transport costs. The danger with "forced" agglomerations as opposed to agglomerations that form naturally, is that the dis-economies end up outweighing the economies. But a line of research associated with the effects of the UK's Planning system, suggests that the UK's strict planning and inflated urban land prices actually "price out" potential participants in agglomeration economies. The McKinsey Institute (1998) "Driving Productivity and Growth in the UK Economy" specifically state that they doubt that anything like Silicon Valley could occur anywhere in the UK. Alan W. Evans (Spatial Economics Research Centre, University of Reading) expands on this research in his 2004 book, "Economics and Land Use Planning".<br><br>The result is serious losses of efficiency from agglomeration economies foregone, accompanied by "dispersion" driven not by natural economic balancing mechanisms but by a "pricing out" effect on households and businesses, and worst-case congestion. Social inequities and stresses result from inflated housing costs without any commensurate gain in urban efficiency; in so far as emissions might be reduced, it is the deprivation of households discretionary income that is responsible, usually accompanied by reduced rates of child-bearing household formation.<br><br>The affordability of housing associated with minimal restraint on horizontal urban growth, is also inevitably associated not just with greater consumption of private land per person, but with less cost pressures on developers and public agencies to turn the maximum possible amount of space into "earning" property. The prices of real estate per se tend to confuse us regarding the cost of the "raw" land. City A and City B might have new 3-bedroom homes coming to market with a 100% price difference between them; which is entirely typical if one is growth-constrained and the other is not. But in addition to this, the home in the affordable city will have a quarter | Noted: The whole section is rewriten and reframed and these texts are deleted in SOD. |
| 6012 | 12 | 15 | 10 | 15 | 11 | Sense of the sentence is not correct. Stockholm is a city IN Sweden. The comma suggests that Sweden is a city. | Noted: The whole section is rewriten and reframed and these texts are deleted in SOD. A more structured discussion |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 5727 | 12 | 15 | | | | The view presented here, that urban form can be shaped by regulations, fails to take into account the costs imposed on society via distorted real estate markets. There is a very real danger that the "success" of policies will be interpreted as having occurred via "more efficient urban form" rather than via the mechanism of reduced household discretionary income. It is likely that spending on everything in the household budget, not just spending on travel and energy, is reduced by the inflated housing costs that always result under schemes of regulatory rationing of urban land supply and the creation of quasi-monopoly rent for the owners of land favoured by the "plans". | Noted: The whole section is rewriten and reframed and these texts are deleted in SOD. |
| 6013 | 12 | 15 | 14 | 15 | 28 | The authors regard potentials for mitigation in fast growing, slow growing and stagnant cities. What will happen to shrinking cities? | Noted: The whole section is rewriten and reframed and these texts are deleted |
| 5728 | 12 | 15 | | | | The authors are to be commended for discussing the “systemic” nature of cities and the global economy of which they are a part. It is also important that urban planners take account of the widely disparate path dependent evolution of different cities, so that policies that have succeeded in one particular type of city are not mistakenly applied to other types of city. For example, expecting Detroit to turn into NYC without “Wall Street” being located there, just by imposing mandates on the kind of urban form Detroit is to have, would be the height of stupidity. Yet volumes of advocacy work regarding urban planning today are making assertions this absurd. The term “Manhattanise” or “Manhattanisation” will be found via Google, to be one in common use by politicians and advocates of “sustainable” urban form. | Noted: The whole section is rewriten and reframed and these texts are deleted in SOD. |
| 5985 | 12 | 16 | | 16 | | There is no explanation of this figure. What are numbers 1-6? Why are lines of differing size? What is others in Built Environment? The human settlement sectors are incomplete, urban governance is missing completely. What is the statement of this figure? | Taken into account: The figure is redrawn and relevant information are added in SOD |
| 6014 | 12 | 16 | | | | What are the circles with numbers 1-6 standing for? Why do these several arrows vary in their width? Furthermore, the figure 12.1 is not explained in the text. What is others in Built Environment? This figure is much too complex and incomplete. | Taken into account: The figure is redrawn and relevant information are added in SOD |
| 17577 | 12 | 16 | | | | What do the circled numbers in the figure represent? | Taken into account: The figure is redrawn and relevant information are |
| 12845 | 12 | 16 | | | | In the European Nitrogen Assessment also a chapter was devoted to urban landscapes, titled 'Nitrogen flows and fate in urban landscapes' . IPCC figure 12.1 has the same layout as ENA's figure 12.6. I propose to pay some attention in IPCC chapter 12 to non-GHG's as they use the same methodology and encounter the same problems. Maybe it can be done by producing a new Box, or insert some additional text. I have attached the ENA chapter with interesting material from the city of Paris. | Taken into account: The figure is redrawn and relevant information are added in SOD. But Including a box referring to nigrogen in Paris would be out of scope for this chapter. |
| 16656 | 12 | 16 | 13 | 16 | 22 | This is introductory material that should come in the first few paragraphs of the chapter introduction. | Noted: This section is reframed and rewritten and these text are deleted in the process. Thus the comment is no |

| 11036 | 12 | 20 | 8 | | | The text reads: 'This evidence therefore indicates that the smaller the territorial boundary of a spatial entity, the more important the role of that entity might be in the global system of production and consumption.' However, a better statement would be: 'This evidence indicates that the smaller the territorial boundary of a spatial entity, the more important the role of that entity in terms of the global exchange of emissions responsibility.' | Noted: The figure which refers that has been taken off in revising of this section and the comment is no longer relevant. |
| 15750 | 12 | 20 | 14 | 21 | | Application of compact city and mixed use should be evaluated in the context of environmental externalities which is missing in the discussions. Table 12.X should read as Table 12.1 | Noted: but the section has gone through massive restructuring and rewriting. Compact city and mixed use rlated discussion have been consolidated in 12.4 in SOD. We will furtther pay |
| 17115 | 12 | 20 | 6 | | | The International Local Government GHG Emissions Analysis Protocol (IEAP) is the first effort that provides a detailed explanation of government and community GHG emissions. LGOP is the first national (US) supplement of IEAP and it focuses only government emissions.GPC, developed by ICLEI, C40 and WRi in 2012 presents a more updated vision for community emissions. | Noted, but the text has gone massive transformation and this comment is not relevant.In Gaps of knowledge, we have mentioned that different accounting protocols yield significantly different |
| 2513 | 12 | 21 | | 94 | | the list of mitigation opportunities is not complete - this needs to be addressed | Noted: The table is revised to make a better sense . The table will be relooked |
| 7312 | 12 | 21 | 14 | 22 | 4 | It's not clear what this table is trying to accomplish for an "average" city [as stated in the caption]. Currently, no numbers are given (and it's unclear whether the authors plan to add numbers in subsequent drafts), so only qualitative "items" are listed. Also, what is meant by "average" city--average GDP/cap? average population? Given the diversity of the world's cities, is this meaningful? Would recommend deleting this table in its present form...IF deleted, pls ignore next 2 comments which also pertain to this table. | Rejected: The table is revised to make a better sense . The table will be relooked in next round. |
| 7313 | 12 | 21 | 14 | 22 | 4 | "waste" is missing "co-benefits" of waste management, including protection of human health & the environment, renewable energy benefits | Noted: The table is revised to make a better sense . The table will be relooked |
| 7314 | 12 | 21 | 14 | 22 | 4 | "waste" is also missing "drivers", including waste minimization/recycling, public health [= major driver for waste management, as well as a "co-benefit"] | Noted: The table is revised to make a better sense . The table will be relooked |
| 13243 | 12 | 22 | | | | (mitigation opportunities) : polycentric structure and transport mode relationship is not documented (paragraph 12.4.3.3 is poor). | Noted: The table will be further carefully checked in next round |
| 17580 | 12 | 22 | | | | The abbreviations used in this table should be defined in table notes. "Inside" and "outside" should be explained as these are not standard terminology. | Noted: The table will be further carefully checked in next round |
| 5876 | 12 | 22 | | | | Column 5 / agric./forestry: low carbon buildings will most probably have a higher share of wood instead of steel, aluminum or concrete, so striving for low-C buildings rises demand for wood. Also: the colour coding is not explained. See, for example, Sathre, R. & J. O'Connor (2010). A Synthesis of Research on Wood Products & Greenhouse Gas Impacts. Vancouver, B.C., FPInnovations. TR - 19R, 123 p. and the literature cited therein for examples for carbon-low constructions. | Noted: The table will be further carefully checked in next round |
| 11318 | 12 | 22 | | | | The use of bicycles should be treated as a separate " zero carbon urban transport". It is important to distinguish the use of bicycles, that use no fossil fuels, from other modes of transport that are fuel efficient. This is also to encourage use of bicycle both in urban and peri-urban centres. | Noted: The table will be further carefully checked in next round |

|---|---|---|---|---|---|---|---|
| 12462 | 12 | 22 | 1 | | | Changing food consumption as a mitigation of GHGs will not only effect the emissions from animals and manure, but also N2O-emissions from agricultural soils and carbon emissions from land use and land use change as the production of animal products occupies extensive land areas. This is stated clearly in WGIII chapter 11. Therefor it is suggested to add the words "emissions from land use and land use change" | Noted: The table is revised to make a better sense . The table will be relooked in next round. |
| 17190 | 12 | 22 | 13 | 22 | 13 | See my comment on the urban heat island above (cf. page 13, lines 38-39). | Noted |
| 5523 | 12 | 22 | 20 | | | Energy for heating is also signficantly reduced in high density developments- for multiple family dwellings | Noted: But the figure is only about |
| 12463 | 12 | 22 | 20 | 23 | 10 | Differences in electricity consumption between countries can not only be explained by urban density. The rate between electricity prices and other energy carriers will also be of importance. Norway has electricity prices, much lower than all other european countries whilst prices for oil and gas are at least at he same level as the rest of Europe. Because of this, electricity is used extensively for heating and industrial purposes which results in a very high per capita consumption of electricity. Similar differences could also be the case in other countries. This should be reflected in the text. Total energy use instead of only from electricity could be more correct. | Accepted: This will be incorporated in the next round |
| 17191 | 12 | 22 | 20 | 23 | 4 | The graph and the text is rather misleading as there is no mentioning of the fact that in some of the countries (especially Norway) nearly all electricity is produced from hydroelectrical power plants, thus resulting in no CO2 emissions. This electricity has traditionally been delivered at a low cost for the consumers, and in Norwegian cities electricity accounts for most space heating as well as other stationary energy use in dwellings as well as commercial buildings. Also, a considerable part of industrial energy use has been from electricity. Also in Sweden and Finland electricity makes up a high proportion of the energy used for the above-mentioned purposes, although not as high shares as in Norway.<br>Moreover, I doubt very much that the figures on urban densities are reliable. According to the graph, Norwegian cities are on average some six time denser than Turkish cities, which is obviously not the case in reality. I suspect that the authors of the graph have calculated densities within administrative borders instead of within the urbanized land. However, any effect of urban density on the need for electricity has nothing to do with whether or not a city municipality includes a lot of nonurban (rural) land within its administrative borders.<br>The text and the graph from page 22, line 20 to page 23, line 4 is thus highly misleading and should be deleted. | Noted: The figure will be given due check and supporting texts will be done carefully in the next round. |

|---|---|---|---|---|---|---|---|
| 5729 | 12 | 22 | | | | The claim that increased urban density involves greater efficiency of energy use in transport, is a controversial one. Newman and Kenworthy's influential work has been critiqued by several authors. For example, see Michael Breheny (1995) "The Compact City and Transport Energy Consumption"; Ray Brindle (1994) "Lies, Damned Lies and Automobile Dependence"; Ray Brindle (1996) "Transport and Urban Form: The Not-So-Vital Link"; Alan W. Evans (1998) "Dr Pangloss Finds His Profession: Sustainability, Transport and Land Use Planning in Britain"; Alan W. Evans (2012) "Planning, Density, Fuel Use and Emissions: a Survey"; Michael Breheny and Ian Gordon (1997) "Densities in the Sustainable City"; Ian Gordon (1997) "Densities, Urban Form and Travel Behaviour"; Ian Gordon (2008) "Density and the Built Environment"; Michael Wegener (1998) "Sustainable urban spatial structures: do we need to rebuild our cities?"; Marcial H. Echenique et al, (2012) "Growing Cities Sustainably: Does Urban Form Really Matter?"; Steve Melia et al (2011) "The Paradox of Intensification"; and Paul Mees (2010) "Density and Transport Mode Choice in Australian, Canadian and US Cities".<br><br>The reduction in urban footprint from increasing the density of housing, is not proportional to the increase in housing density, because typically more than 50% of an urban area is not housing. However road congestion increases in an exponential relationship with housing density. This is because roads on which traffic once flowed freely at crucial times of the day, become "stop-start" and end up carrying FEWER vehicles at those times of day than when housing density was lower. "Spill-back" of traffic occurs onto previously uncongested parts of the network. "Mode shift" is never sufficient to compensate for this effect. Even including Manhattan's level of density in data sets, finds no reversal of the trend to addition of numbers of vehicles in the given road space, as additional population is added. The rate at which vehicles are added merely reduces slightly for each increase in the population in the given space.<br><br>The data on trip times (as opposed to distances) and local air pollution, do not favour higher densities.<br><br>Toronto Board of Trade Paper:<br><br>Barcelona 48.4 minutes (ROUND TRIP)<br>Dallas 53.0<br>Milan 53.4<br>Seattle 55.5<br>Boston 55.8<br>Los Angeles 56.1<br>San Francisco 57.4<br>Chicago 61.4<br>Berlin 63.2<br>Halifax 65.0<br>Sydney 66.0<br>Madrid 66.1<br>Calgary 67.0 | Noted: This section has been restructured and rewritten. All density related discussions have been moved to 12.4 in SOD in 12.4.1 to 12.4.7. We will further look into these issues carefully in the next round. |
| 18034 | 12 | 22 | 11 | 22 | 11 | Newman and Kenworthy 1996 showed a correlation between density and fuel consumption and inferred that lower density cities cause higher fuel consumption. However, an alternative explanation is that for those cities that have cheap travel relative to income, people tend to travel further in order to have more living space, as property prices are lower outside central areas. Thus, lower real transport cost is the cause of lower density rather than higher density being the cause of lower fuel consumption. | Noted: This text is deleted in restructuring and rewriting of this section. |

| 18035 | 12 | 22 | 12 | 22 | 12 | Mitchell et al (2011) This paper was based on case studies which found that the effects of alternative spatial planning policies in the UK such as a more compact or more dispersed pattern would have a relatively small impacts on energy consumption compared to the policy trend over a 30 year period. A more recent paper describes the overall findings of this research:- Echenique Hargreaves Mitchell and Namdeo 2012 Growing Cities Sustainably; Does Urban Form Really Matter? Journal of the American Planning Association Spring 2012, Vol. 78, No. 2 pp. 121-137 . | Noted: The text to which this reference belongs to is deleted in restructuring and rewriting of this section. |
| 2376 | 12 | 23 | | | | The fit in this plot is poor; and the data shown perhaps suggests that cold climate or latitude is the main factor behind electricity use. | Noted: The figure will be given due check and supporting texts will be done |
| 13244 | 12 | 23 | | | | poor regression : we suggest to suppress that figure. | Noted: The figure will be given due check and supporting texts will be done |
| 17582 | 12 | 23 | 13 | 23 | 13 | What is "total settlement forms"? | Taken into account: The phrase doesnot appear in the revised chapter |
| 10405 | 12 | 23 | 4 | | | The sample points in the figure are not distributed symmertrical along the line .So the result is not convinced. | Noted: The figure will be given due check and supporting texts will be done |
| 18803 | 12 | 23 | 7 | 23 | 10 | Already mentioned above, try do reduce reduncancy: Consider shortening here and focussing on ref. to 12.3 | Noted: The texts has gone massive change in rewriting of the section. |
| 5730 | 12 | 23 | | | | Anthony Downs (2007) “A Growth Strategy for the Greater Vancouver Region”:<br><br>".....The cost of land poses a key dilemma for urban planners everywhere who want to concentrate jobs together so they can be best served by public transit. Such concentration raises the costs of land near centers; in fact, it would confer a monopoly advantage on landowners who owned such land and could exploit firms trying to locate there. Now firms want to locate elsewhere to cut their land costs.<br><br>Planned concentration of jobs in a few centers is not consistent with private ownership and control of land. Some type of collective control over that land would be necessary to prevent monopolistic exploitation of land values. In theory, this could be done with high land taxes in such areas and special zoning rules. But adopting those devices is politically difficult in a free enterprise economy.....<br><br>".....A similar but less intensive dilemma concerns land near transit stops, where it would be most efficient to concentrate high-density housing and jobs. That also creates ownership monopolies over such land unless it is specially controlled or taxed. Yet focusing development near transit stops is a key to using more transit....."<br><br>The famous example provided by Curitiba, Brazil, did initially involve large amounts of compulsorily acquired land for “transit oriented development”, although most advocates analyses of Curitiba's wonderfully successful system are silent on this point, which is actually a crucial one. See Jonas Rabinovich, "Curitiba: Towards Sustainable Development" (1992), which at least mentions this reality although without identifying its importance. Curitiba’s planners also had the wisdom to go with buses and busways rather than rail based systems. Buses can pick up passengers anywhere before entering the high-speed busway, which has telling advantages over rail based systems that require “transfers” from other modes. Bus based systems can also be adapted to follow later urban development wherever it proves popular, rather than imposing self-defeating distortions in land market prices with fixed rail routes and strictly “planned” integration of transit and development.<br>Curitiba has had considerable problems under the free market since the original project was completed, with lower income people being "priced out" of the transit-served locations, and further development at these locations being stalled by high land prices. | Noted: The section has been re-written. |

| 6018 | 12 | 24 | 1 | 24 | 11 | Sub-Sub-Chapters could be summarized. Maybe it would be more structured if the authors refer to polycentric structure, finger grain systems and land use mix in section 12.3 and give there a brief overview.<br>--> text would be shortened<br>--> sub-sub-chapters do not appear that short and empty | Taken into account: The whole section is restructured and rewritten. |
| 2377 | 12 | 24 | 1 | 24 | 11 | Could cut given the overlap with 12.3 | Taken into account: The whole section is restructured and rewritten. |
| 17192 | 12 | 24 | 1 | 24 | 4 | See my above comments on polycentricity related to the text on page 14, lines 4-12. Why are, by the way, the same issues as in section 12.3 repeated here on page 24? | Taken into account: The whole section is restructured and rewritten. |
| 6017 | 12 | 24 | 2 | 24 | 2 | Source is missing. This section is not correct. High density does not lead to higher emissions. Higher emission depends on the type of density etc. | Taken into account: The whole section is restructured and rewritten. |
| 2378 | 12 | 24 | 36 | | | These embodied energy percentages seem untypically high (although it depends on climate). Embodied energy in building materials is typically of the order 20 kWh/m2/yr, but can be as high as 100 kWh/m2/yr in some cases, see Sartori and Hestnes (2007) Energy use in the life cycle of conventional and low-energy buildings: A review article Energy and Buildings 39, 249–257. | Noted: These texts are deleted in restructuring and rewriting of the section. |
| 18805 | 12 | 24 | 36 | 24 | 37 | 60%/67% - have figure /table on this? | Noted: These texts are deleted in restructuring and rewriting of the section. |
| 5986 | 12 | 24 | | 24 | | This is wrong. You already state this in chapter 12.3.2.3 with reference to a source from 1995. It is wrong, that high density leads to higher emissions. As you say in other chapters, it depends on the type of density etc. | Taken into account: This is deleted in the rewriting of the chapter. |
| 12585 | 12 | 24 | | | | Urban greenscapes has many co-benefits other than attractiveness and limited C-sequestration. It has health (both mental & physical) benefits, support bio-diversity (thus alignining with goals of CBD), promote social interaction (increase Happiness Index), raise property values, reduces health costs, induce passive cooling, conserve rain water, regulate urban air temperatures and so on.... risks involved are unscientific urban plantation (location, species, spacings), poor planning/design/implementation and inadequate maintenace and management bu urban/civic bodies. | Taken into account: This is moved to 12.8 section of the chapter to be elaborated in the context of co-benefit and other contexts. |
| 5524 | 12 | 24 | | | | As per comments on table, this discussion is appreciated. Water use including reclaimed water, grey water and stormwater systems should be included in this section | Noted: This is moved to 12.8 section of the chapter to be elaborated in the |
| 11714 | 12 | 24 | 28 | 25 | 221 | This section should be coordinated with chapter 9. Percentage of GHG emissions in building sector (line 29-30) is different from chapter 9. Detailed explanation on the effect of building orientation, compactness, and configuration (line 39-41) doesn't appear in chapter 9. The role of building design and urban design should be distinguished and it should be emphasized both roles are important. | Noted: We have deleted this section in restructing and rewriting. We are not discussing buildings any more here but only in the context of integrated urban |
| 17584 | 12 | 25 | 16 | 25 | 20 | This sentence is very long. Delete "due to the high energy use related to the replacement of the building stock compared to the energy use of renovation measures" | Noted: These texts are deleted in restructuring and rewriting of the section. |
| 17193 | 12 | 25 | 22 | 26 | 16 | It seems a bit confusing to place the text of section 12.4.3.8 in a separate part of the chapter from the texts dealing with the impacts of urban structure/form on travel behavior. Moreover, I miss a discussion of the traffic-generating effect of expanding the road capacity in congested urban areas. See Litman, 2011; Noland & Lem, 2002; SACTRA, 1994; Mogridge, 1997; Næss et al., 2001. | Noted: The whole section is restructured and rewritten. |
| 11037 | 12 | 25 | 23 | | | The use of the term 'boundary conditions' in 'Transport generates assorted boundary conditions for social organization…' is unnecessary jargon and should be put more simply. | Taken into account: Removed such word in revised text. |
| 17585 | 12 | 25 | 24 | 25 | 25 | The logic of this claim is unclear. Why does the DISTINCTIVENESS of the amounts of infrastructure for urban transport mean that urban transport must consume VARIED amounts of material and energy? | Rejected. Different types of transport infrastructures demand different ammount of materials per passenger/km. In that sense, public transportation is more efficient in terms of material and energy demand per passenger/km. However among each |

| 18817 | 12 | 27 | 10 | 27 | 15 | Link to Ch.7 (they should [don't know if they actually do] somewhere discuss tension water-energy in detail) | Accepted, the text has been revised |
| 2380 | 12 | 27 | 18 | | | Doesn't the energy intensity of water from tankers vary depending on how far the tanker travels etc., Reference? | Accepted, the section has been revised |
| 17588 | 12 | 27 | 21 | 27 | 21 | Should "abstractions" be "extractions"? | editorial |
| 2381 | 12 | 27 | 35 | | | I don't follow this sentence, and think it may be an incorrect reference (I don't recall us making this point in that paper) | Accepted: The text has been revised |
| 18819 | 12 | 27 | 38 | | | Should read "Figure 12.5" instead of "Figure 1" | Accepted: The figure has been removed. |
| 17589 | 12 | 27 | 39 | 27 | 40 | Some discussion of the impact of waste prevention on GHG emissions should be included. U.S. Environmental Protection Agency and Office of Solid Waste and Emergency Response. 2009. Opportunities to Reduce Greenhouse Gas Emissions through Materials and Land Management Practices: U.S. Environmental Protection Agency. | Accepted: Cross reference Ch 10 |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 17590 | 12 | 27 | 40 | 27 | 41 | This statement about the quantity of GHG savings in the US should have a supporting reference. | Accepted: Reference given |
| 18541 | 12 | 27 | | | | Much of the text and data in this section may be more aptly placed in the excursus section on Waste in Chapter 10 - indeed much of the same text already appears there. Please liaise with Ch 10 CLAs on this point. | Accepted. Ch 10 referenced. |
| 17307 | 12 | 28 | | 28 | | Consumption is not specific to urban settlements. Regarding the overall strcuture of the report, I would recommend to treat this as a separate chapter, and, under "human settlements" or "urban issues" deal only with issues specific to urban agglomerations, such as urban planning etc. | Rejected: We have retained food discussions but but rewritten. |
| 17591 | 12 | 28 | | | | There is a word missing in item A in the legend -- "long distance transport SHOULD be avoided" The caption should indicate the date and region depicted in the figure. | Noted: The figure is deleted. |
| 7315 | 12 | 28 | 10 | | | This figure, as presented, is misleading. A broader survey of the waste literature gives very wide ranges for the emissions from various waste management strategies that is not adequately captured in this figure using only numbers from selective literature and, importantly, without the specific assumptions contained in that literature. Most of the literature cited is from various life-cycle analysis (LCA) studies which assume a variety of data inputs and conditions. Moreover, literature which directly measured emissions from various waste management processes is generally missing from this list. I would recommend consulting the AR4.WGIII report.Chapter 10.Waste as a starting point. | Accepted; The figure is deleted |
| 12467 | 12 | 28 | 10 | | | The figure shows that composting has a higher GHG saving potential per tonne of wet waste than anaerobic digestion. This seems to be in contradiction to the common perception that anaerobic digestion is better due its production of biogas which can be used to substitute fossil energy. The value of the nutrients in the restproducts should be more or less the same for both treatments. Please consider to ivestigate this further. | Taken into account: Figure deleted |
| 2518 | 12 | 28 | 14 | | 27 | same is true of the food consumption - perhaps extend these two and come back to them at the end | taken into account; This part is rewritten. |
| 17592 | 12 | 28 | 28 | 28 | 28 | The use of "metabolism" in this sense, while well known in industrial ecology and in some social science communities is not well known elsewhere. It should be explained and also added to the glossary. | Accepted |
| 5526 | 12 | 29 | 12 | | 17 | The previous chapter on forestry and agriculture has good information on emissions associated with different types of diets, showing signfiicantly reduced emissions with limited meat intake, particularly with elimination of meat from ruminants. In addition to the emissions associated with meat, dairy and chickens- it would be helpful to inclue an estimate on the potential contribution that urban and peri urban agriculture could make- here poultry and a range of fruit and vegetables could be produced in significant quantities and this would present a different picture | Noted: but such info is scarce at urban context, see 12.4.12 in SOD |
| 12468 | 12 | 29 | 18 | 29 | 27 | Please consider to make this text and numbers consistant with WGIII chapter 11 p.28 line13 to p.30 line 3 and WGII chapter 19 p.16. which treat these issues more extensively. The effect of diet changes on GHG emissions, land use and food security is empasized clearly in those paragraphs. | Accepted: The text are removed in rewriting |

| 11313 | 12 | 33 | | | | In the row entitled 'design-oriented codes', please spell out and briefly define TND and TOD, and briefly define Transect Zoning, SmartCode and Urban Village. | Noted: The table referred has been deleted in SOD while rewriting. The |
| 3658 | 12 | 35 | 1 | 35 | 38 | Pages with lot of space not used can be filled. | Noted |
| 17304 | 12 | 36 | | 41 | | and chapter 15.8.: Moreover, I would recommend to use the way of structuring according to modes of governance as suggested in Alber and Kern (2008) (which is cited several times, but not correctly). These governance modes can be applied both for national in relation to local governments, and local governments in relation to citizens and the local commercial sector. | Noted: The whole section is restructured and rewritten. |
| 17598 | 12 | 36 | 14 | 36 | 15 | Why is the DISSIMILARITY of land markets a reason why the real estate sector may be a good platform? | Noted: The text referred has been deleted in SOD while rewriting. The |
| 5987 | 12 | 36 | 2 | 36 | 5 | In many countries, national governments support climate change mitigation through spatial planning (cp. Your own chapter 12.7). In Germany, for example, with KlimaMORO, the federal government has supported a nationwide model program for climate change mitigation through spatial planning. This programme is now the base for a number of follow-up programmes, for example KLIMOPASS in the state of Baden-Württemberg. The idea that governments are sceptical about spatial planning contribution to mitigation is therefore too generalized and not valid for large parts of the world. | Noted: The text referred has not claimed that gov is sceptical about it. |
| 6020 | 12 | 36 | 2 | 36 | 5 | National governments support in many countries climate change mitigation and adaptation strategies through spatial planning (see your own chapter 12.7 and your given examples). E.g. in Germany, the government supported a nationwide model program dealing with mitigation and adaptation strategies, called KlimaMORO. Many national follow-up programs are based on KlimaMoro, for example the KLIMOPASS project in the state Baden-Wuerttemberg. | Noted: The texts has gone massive change in rewriting of the section. |
| 11043 | 12 | 36 | 23 | | | The text states: 'Market-based land policies aiming at compact urbanization are likely to be effective tools in emission mitigation.' This is one-sided. Suggested text: 'Both market-based and strong regulatory land policies aiming at compact urbanization are likely to be important tools in emission mitigation.' | Noted: The text referred has been deleted in SOD while rewriting. The setion has been reframed and rewritten. |
| 18828 | 12 | 36 | 23 | 36 | 24 | This claim should be substantiated by a reference. | Noted: The text referred has been deleted in SOD while rewriting. The |
| 11042 | 12 | 36 | 9 | | | The text states; 'Local mitigation strategies generally are instructed by the regional or national policies, which again are directed by international agreements (i.e. UNFCCC, Kyoto protocol) for reducing GHG emissions.' This may be true in some countries, but in others quite the reverse holds, e.g. in the USA and New Zealand, where national policies tend to be weaker than local policies. Suggested replacement text: 'Local mitigation strategies may be instructed by regional or national policies, in turn directed by international agreements (i.e. UNFCCC, Kyoto protocol) for reducing GHG emissions. However, in some countries, local strategies may have critical demonstration effects where national policies are weak.' | Noted: The text referred has been deleted in SOD while rewriting. The setion has been reframed and rewritten. |
| 15751 | 12 | 36 | | | | Most of the urbanisation is taking place in the developing countries. Local agencies play an important role in implementation of urban planning policies. Most of the cities in developing countries are associated with weak data base and governance deficit. | Noted |
| 16354 | 12 | 37 | 10 | 37 | 10 | The reference Robinson et al 2006 is missing | Noted: The reference referred has been deleted in SOD while rewriting. |

| 10029 | 12 | 42 | 37 | 42 | 39 | This part should be deleted completely. Tokyo cap & trade program is currently under the special measure for the Great East Japan Earthquake, which allows CO2 emission increase caused by home generation, which means the program is not implemented under normal condition. Therefore, Tokyo cap & trade program is not considered as a good example of cap & trade policy. | Noted: The comment is not relevant in revised text anymore. The related text is deleted. |
| 2386 | 12 | 43 | 2 | | | Perhaps too political here; straying from science - could be cut | Accepted: Taken care in revised text |
| 6022 | 12 | 43 | | 59 | | The authors describe this section as an assessment of urban climate change mitigation experience and their effectiveness in reducing GHG emission. They summarize the various urban mitigation action plans and describe the different types of mitigations srategies very well. Regarding my opinion of an assessment, there is a final sub-chapter missing. In this sub-chapter, you can conclude the issues of the different strategies and their reliablility in mitigation of CO2. Furthermore, an outlook can state junctions (efforts to address GHG emissions) in climate change mitigation, that could be important in the future regading the diverse stratgy plan and that have to be considered in the authors' view.<br>The brief assessment paragraph could create a smoother transition to section 12.8. | Noted: The section has been completely rewritten. Isssues of reliability has been addressed in the revised text with the statement that the achievibility of target remains uncertain. |
| 5992 | 12 | 43 | | 94 | | Why don't you give information about the actual progress in GHG reduction that was achieved by the programs you mention? | Accepted: see 12.7.4 in the revised text |
| 2544 | 12 | 44 | 15 | 44 | 15 | "feasibility of plans, rhetoric versus the ability to implement" is highly subjective and uncertain | Accepted: phrase and related text has not appreared in the in the revised text |
| 18837 | 12 | 44 | 19 | 44 | 31 | Consider turning this paragraph into a figure. | Noted |
| 2545 | 12 | 44 | 27 | 44 | 31 | Needs referencing | Noted: The text of entre section has |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 2525 | 12 | 44 | 37 | | | Hamburg | Editorial |
| 2526 | 12 | 44 | 44 | | 46 | Need to be bolder here - 36% is not enough - in developed cities we should be looking at 80% reductions in CO2 | Rejected: not relevant for the text |
| 2543 | 12 | 44 | 5 | 44 | 11 | Needs referencing | Noted: But the section has been |
| 2542 | 12 | 44 | 7 | 44 | 7 | "Non-obligatory commitments" is not a clear term. If enacted by law they are mandatory. | Noted: 12.7.1 in revised text has used this term. We will explore further in next |
| 17112 | 12 | 44 | 19 | 44 | 32 | In 2009, ICLEI and City of Copenhagen released Copenhagen World Catalogoue of Local Climate Commitments which captured moer than 3000 commitments of local governments worlwide. This was followed by carbonn Cities Climate Registry which as of July 2012 captures more than 700 actions, 300 commitments and 250 GHg inventories of more than 170 cities. | Noted: Useful info but text and section is re-done and these detail info is no longer there in the revised text |
| 17606 | 12 | 45 | | | | Figure is difficult to read in black & white. | Noted: Figure deleted |
| 2546 | 12 | 45 | | | | Mitigation graph should present also baselines where available | Noted: Figure deleted |
| 2529 | 12 | 45 | 11 | | 16 | Where are the largest cities - from India, China and SE Asia and S America? | Noted: Since related figure is deleted in SOD, this figure caption is no longer |
| 2528 | 12 | 45 | 17 | | | Note that this figure is only about 5% of the total urban population | Noted: Since related figure is deleted in SOD, this figure caption is no longer |
| 17608 | 12 | 45 | 17 | 45 | 17 | Population in what year? | Noted: Since related figure is deleted in SOD, this figure caption is no longer |
| 11788 | 12 | 45 | 18 | | | With regard to No.80, this sentence is not needed. | Accepted: Removed |
| 2547 | 12 | 45 | 18 | 46 | 21 | This part could show more e.g. a taxonomy table of actions pledged or conducted by cities, showing what a mayor can do in practice | Noted: The entire section is restructured and rewritten, we have not been able to do texonomy table but see revised text at |
| 2527 | 12 | 45 | 2 | | | This is a key point that needs expansion and to be in conclusions - there is very little monitoring of outcomes - this is central to any target achievement, namely that progress must be monitored and actions strengthened if targets are not met | Accepted: In Executive summary, we have reflected this in SOD |
| 2530 | 12 | 45 | 25 | | 26 | Question as why Delhi should have a reduction target - there has to be growth of CO2 emissions in the developing cities - but less than trend following - it is the developed cities that must make the major contributions - this central point is not made - otherwise the Chapter is taking a very developed country perspective | Noted: its is not implied here who should cut how much. The meaning here is that clear target is needed to check the goal, progress and achievement.... |
| 10407 | 12 | 45 | 4 | | | The figure plotted is based on the investigation which there are only 12 Asian cities,among them ,11 are Japansese, one in Thailand.This kind of investigation cannot be representive. | Accepted: Removed |
| 17607 | 12 | 45 | 9 | 45 | 9 | What website? | Noted: Since related figure is deleted in SOD, this figure caption is no longer |
| 2531 | 12 | 46 | 10 | | 15 | Unclear - the meaning of this section | Noted |
| 17310 | 12 | 46 | 15 | 46 | 15 | Wall fall profits accounted only for some 50% of the GHG emissions reductions in eastern Germany, as substantiated e.g. in<br>Joachim Schleich, Wolfgang Eichhammer, Ulla Boede, Frank Gagelmann, Eberhard Jochem, Barbara Schlomann & Hans-Joachim Ziesing: "Greenhouse gas reductions in Germany—lucky strike or hard work?" Climate Policy Volume 1, Issue 3, 2001. pages 363-380. They say "a diverse set of policies also had a significant effect on the reduction of greenhouse gases" which, for some major cities such as Dresden, amounted to some 50% already in the nineties. | Noted: will be looked into in the next round |
| 3659 | 12 | 46 | 22 | 46 | 38 | Pages with lot of space not used can be filled. | Editorial |
| 18839 | 12 | 47 | | | | Box 12.1 is too detailed. Cap-and-Trade should not be explained here but referenced from the policy chapter where it is introduced. | Noted: The box is deleted in line with restructuring and rewriting of the section. |
| 11789 | 12 | 47 | 2 | 47 | 45 | Refering to only Tokyo city's climate actions in the box isn't appropriate under discussing the policy including treatment of the new energy mix and climate change policy in Japan. Box 12.1 should be deleted all. | Noted: The box is deleted in line with the restructuring and rewriting of the section. |

|---|---|---|---|---|---|---|---|
| 17609 | 12 | 47 | 45 | 47 | 45 | What is "eco-driving"? | Noted: The text is deleted in line with restructuring and rewriting of the section. |
| 10030 | 12 | 47 | | | | This part should be deleted completely. Tokyo cap & trade program is currently under the special measure for the Great East Japan Earthquake, which allows CO2 emission increase caused by home generation, which means the program is not implemented under normal condition. Therefore, Tokyo cap & trade program is not considered as a good example of cap & trade policy. | Noted: The box is deleted in line with restructuring and rewriting of the section. |
| 2548 | 12 | 48 | | | | Needs better geographical balance | Noted: The table is deleted in line with restructuring and rewriting of the section. |
| 2532 | 12 | 48 | 12 | | 13 | Not sure that any city has taken an aggressive agenda - some like Freiburg have followed a consistent pathway over a period of time - political, business and local support. | Noted: The text is deleted in line with restructuring and rewriting of the section. |
| 18840 | 12 | 48 | 3 | | | Should read "Table 12.3" instead of "Table 12.7.1" | Editorial |
| 17618 | 12 | 49 | | 58 | | This section needs substantial revision and editing. The sentence structure and grammar needs correction. The content appears to have been taken verbatim from reports prepared by other entities -- probably the cities themselves. And, most important, the content is primarily composed of earnest and or promotional statements of intent, rather than dispassionate description and analysis. The section could also use subheadings. | Accepted: The section has been restructured and rewritten |
| 10408 | 12 | 49 | 2 | | | The content of this section is too much,which should be shorten.And this meets the need of the excutive summary.Table12.7 is enough. | Accepted: The section has been restructured and rewritten |
| 15508 | 12 | 49 | 2 | | | Mitigation strategies of urban climate change plans - Territorial Energy and Climate Plans can be included in this sub-chapter | Noted: The section has been restructured and rewritten |
| 19006 | 12 | 5 | 41 | 5 | 42 | The text says, 'While spatial planning can influence energy use and emissions, there are limited quantitative assessments of the emissions savings through spatial planning strategies'. Due to the very different urban contexts (city size, geographical setting, affluence level, dominant culture, social cohesion/segregation etc.), it should not at all be an aim to develop general figures for savings potentials. Rather, examples form different cities could be mentioned, leaving it up to the users of the information to assess whether the context of the example is sufficiently similar to the planning context at hand. (See Næss, 2004 and Næss & Strand, 2012 for more elaborate discussion.) | Noted. This comment actually refers to Ch.12. |
| 3332 | 12 | 5 | | 57 | | Many sentences start with "there are" or similar constructions. Such constructions can often be deleted by finding an appropriate verb, shortening sentences and clarifying content. | Noted |
| 3336 | 12 | 5 | | 6 | | The Executive Summary could be shortened by 1 paragraph, reducing its lenght to 1 page. There are a few statements that containt redundant messages. | Accepted: It is rewritten. However, text is crossing 1 page and it will be |
| 3331 | 12 | 5 | | 72 | | The FOD is well written and contains many valuable parts. I see options for shortening as follows: Reduce some redundancy between 12.3 and 12.4 (see below for details); reduce table overviews, e.g. delete the L.A. and Chicago examples (both US!). A valuable contribution would be to design a table that specifies the differences of human settlements across different world regions, and accordingly the different solution strategies in spatial plannning. | Noted: The entire chapter is reframed, rewritten and streamlined. |
| 3335 | 12 | 5 | 11 | 5 | 14 | Is the first part of the statement still true when GHG emissions from aviation are allocated to urban inhabitants? 12.4.2.2. indicates that inclusion of consumption-based emissions leads to a reversal of the statement. So perhaps, the statement should relate to "direct emissions", to avoid possible misunderstandings. | Noted: The text is deleted in subsequent revision. |
| 18772 | 12 | 5 | 11 | | | "When normalized by ..." to be deleted, as "per capita" is enough. | Noted: The text is deleted in subsequent |
| 2369 | 12 | 5 | 14 | | | While I agree that there is a need for a standardized methodology for city-level accounting, some recognition of recent efforts such as the global protocol (as per p.39, line 5) might be made | Noted: The text is deleted in subsequent revision. |
| 3333 | 12 | 5 | 2 | 5 | 3 | A bold statement. Is there evidence that in some quantitative way, urbanization is more importantn in structuring human settlements than say income or demographics? | Noted: The text is deleted in subsequent revision. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 2261 | 12 | 5 | 2 | 69 | 33 | There is no evidence that emissions of greenhouse gases hav any harmful effect on the climate. .This information is thus not a cause for concern so the whole Chapter is unnecessary. It is also surprising that while the supposed, unproven theory relies on changes in the atmospheric concentioin of greenhouse gases. you seem here to be exclusively concerned with emissions. which are not necessarily related to concentrations | rejected |
| 5997 | 12 | 5 | 2 | 5 | 3 | Statement is far too general and e.g. for German/ European cities it is not correct. The recent decades in European human settlement are characterised by suburbanization trends and only for the last decade re-urbanization tendencies can be observed (see figure in Champion, T. (2001). Urbanization, suburbanization, counterurbanization and reubranization, In Hadnbook of Urban Studies Ed, R. Paddison (Sage, London), p.147 ). | Noted: The text is deleted in subsequent revision. |
| 17172 | 12 | 5 | 20 | 5 | 20 | 'Intra-urban centralization of specialized jobs' should be added | Noted: The text is deleted in subsequent revision. A bit refined statement exist in SOD executive summary in later |
| 18773 | 12 | 5 | 24 | | | "lock-in": in line 39 "difficulty to change" talks about the same - bring this together | Noted: The text is deleted in subsequent |
| 5998 | 12 | 5 | 34 | 5 | 34 | To add: Not only coordination of infrastructure can influence resource use and emission. Furthermore, the degree of interconnectedness of infrastructure systems affects them. | Taken into account: The text is deleted in subsequent revision. However, importantce of connectivity is mentioed |
| 3334 | 12 | 5 | 4 | 5 | 5 | "global economy" = GNP?/GDP? Number of transactions? | Noted: The text is deleted in subsequent |
| 17174 | 12 | 5 | 44 | 5 | 45 | The text says, 'Governance of mitigation in settlements benefits from a poly-centric and multilevel governance approach'. I do not agree. In many metropolitan areas, competitions between municipalities leads to a more sprawling and car-based development than what could be obtained through a legally binding regional planning regime. See, for example, Næss et al., 2011 a and b. | Rejected: We have not used polycenrtic word in revised version but we stand-by that multi-level governance and institutional arrangements are required to move human settlements towards the principles of low carbon development |
| 18774 | 12 | 5 | 44 | | | There are also examples for the opposite with local governance being hindered by national laws or by things they want to do being beyond their jurisdiction. | Noted: The tone of our statement is different in revised text. We meant that, given the way urban areas are goverened now, multi-level governance |
| 18771 | 12 | 5 | 5 | | | "global economic goods and services" instead of "global exonomy" | Noted: The text is deleted in subsequent |

|---|---|---|---|---|---|---|---|
| 17197 | 12 | 62 | | | | Regarding the characterization of the promotion of urban agriculture in the right hand column of the second row: Why is this considered a win-win situation? I think this claim is rather unfounded. What is actually the advantage of having agriculture inside the city instead or just outside the urbanized area? If urban agriculture takes place inside the city, new buildings must be constructed elsewhere, resulting in encroachments on exurban farmland or natural areas. Moreover, such outward urban expansion will increase traveling distances and automobile dependence, cf. my earlier comments on this. (For a discussion, see, for example, Næss, 2006, chapter 12.6.) | Noted: the table is deleted in rewriting of this section. |
| 5225 | 12 | 62 | 1 | | | The suggestion that promotion of tourism, would be a probable co-benefit in urban mitigating emissions is very much in conflict with almost all that is said in chapter 10 about the inevitable strong growth of tourism's emissions and its current unsustainable development path. Please remove this example or replace with e.g. 'leisure activities'. Most larger urban areas tend to promote long haul inbound tourism, which has a carbon footprint up to an order of magnitude larger than average tourism trips per trip or tourist-night. | Noted: The table got deleted in the rewriting of this section |
| 3361 | 12 | 65 | | | | The following reference could be added, bolstering the case for very high co-benefits in commuting time, air pollution and noise reduction for urban transport measures: "F. Creutzig, D. He (2009)<br>Climate change mitigation and co-benefits of feasible transport demand policies in Beijing<br>Transportation Research D 14: 120-131" | Noted: The table got deleted in the rewriting of this section |

| 10209 | 12 | 66 | 15 | 66 | 17 | Could UHI lead to reduced neef for heating buildings wintertime at higher latitudes/ in cold regions? Related: reflecting roofs or absorbing roofs at higher latidudes? The first reduces UHI and radiative forcing (summertime) while the second may reduce the need for heating (wintertime) | Noted: It will be addressed in next round, after SOD. |
| 12471 | 12 | 66 | 23 | 66 | 25 | The figure 44 Gt CO2-ekv is of significant size, the same magnitude as the annual global emissions of GHGs. There are newer publications indicating significant uncertainty and conflicting views. The same researcher indicated in a newer publication an interval of 25-150 Gt of CO2 (Akbari et al March 2012) while there are also questions about the effect of white roofs and other urban serfaces (Jacobson, Mark Z., John E. Ten Hoeve, 2012). Please consider to check also there references. | Noted: It will be addressed in next round, after SOD. |
| 14716 | 12 | 66 | 26 | 66 | 26 | You could add that uncertainty around this figure is great. | Noted: Any reference suggestions? |
| 15752 | 12 | 66 | | | | Urban heat island phenomenon is linked to variation in urban form, densities, land cover types. The current studies done by Oke and Stewart (2010, 2011) which is very crucial to better understanding of UHI and mitigation approaches. But these studies does not find any mention in the chapter. UHI is also llinked to the climate type as well. | Noted: but the section is rewritten. However, if this reference look at urban form etc directly with mitigation, we will consider in final version. |
| 17198 | 12 | 66 | 1 | 67 | 20 | The text seems to take for granted that the urban heat island is always a problem for health and a contributor to high energy use for cooling. But for cities in cool climates, the urban heat island may reduce the need for space heating in winter, while the need for cooling during summer will be very low regardless of the urban heat island. This should perhaps be mentioned.<br>Moreover, the fact that some studies have found low-density urban development to aggravate the urban heat island (e.g. Stone & Rogers, 2001) should be mentioned. In the case of Tokyo: is it the density or the fact that the city is very large with many million inhabitants that causes its high heat island effect? Would the heat island effect have been lower if all the millions of Tokyo had been distributed over a sprawling and low-density urban structure? | Noted: It will be addressed in next round, after SOD. |
| 6941 | 12 | 66 | 34 | 66 | 35 | Rewrite first part of this statement to reflect that temperature changes are an expression of a changing climate, they are not CAUSED by climate change. | Noted: The section is rewritten |
| 2540 | 12 | 67 | 38 | | 44 | This is duplicates on p68 (1-8) and different figures used | Noted but no seemingly contradictory. |
| 17629 | 12 | 67 | 5 | 67 | 5 | How is heat discharged to the ground and how does this relate to urban heat island impacts? This is not obvious to the nonspecialist. | Noted: The sentence to which this comment belongs got deleted in |

|---|---|---|---|---|---|---|---|
| 6942 | 12 | 67 | 11 | 67 | 17 | Section on UHI: Please coordinate and ensure consistency with WGI, Chapter 2 and others. Strongly suggest to refer to WGI AR5 Chapter 2 (and 12/14?) here whenever appropriate. Parts of this section stray into the WGI area of expertise and thus might overlap with the assessment provided by WGI AR5. This should be avoided to not generate duplication and/or inconsistencies. | Noted: This section is rewritten and will harmonized with other WG. |
| 17199 | 12 | 67 | 21 | 69 | 7 | See my comments on the discussion of this issue on page 14. Narrowing the scope to the intra-city scale is irrelevant when discussing the carbon sink function of green space, since CO2 emissions are a global and not a local problem. | Noted |
| 14717 | 12 | 67 | 21 | | | This section seems redundant with section 12.4.3.6. This section is also strange, because the first paragraphs seem to contradict the paragraph beginning line 30 page 68. | Section 12.4.3.6 does not exist now. There is growing research that demonstrates the importance of urban green spaces as carbon sinks. There is no real conflict between the paragraph on page 68 and the first para of the section on page 67. The paragraph starting line 30 on page 68 merely highlights the need to take into account the carbon costs incurred in establishing and maintaining urban green spaces, concluding that green roofs and urban forests may therefore only compensate for the C expenditure incurred during planting, installation and establishment a |
| 5531 | 12 | 68 | 30 | | 34 | See above comment- use of grey water for irrigation, use of residuals based soil amendments or soils for soil and fertility and these concerns are largely accounted for- reuse of tree prunnings as a soil amendment would limit C loses as well | Noted: will be further looked into in the next round after SOD |
| 12472 | 12 | 69 | 11 | 69 | 11 | UNEP, World Bank and UN Habitat has recognized a pilot protocol for community scale greenhouse gas emissions, developed by C40, ICLEI, WRI and partners May 2012. Please consider to include this reference. | Accepted: There are some initiative to standardize inventory of cities which we will reference and illuciadates in the next |
| 2541 | 12 | 69 | 27 | | 33 | This is the first time that spatial and urban planning have been included in IPCC - it is important that this Chapter has some very clear messages that are positive and demonstrate the heterogeneity between cities - the co-benefits argument is important, as is the difference in interpretation of CO2 reduction between cities, the importance of leadership and participatory processes, good examples of practice, the need for mandatory and voluntary agreements, the lack of monitoring and data, the scale of change required, the lack of progress in reducing CO2, the links between energy consumption and CO2, the time scale necessary for changing the urban environment and many other issues. The authors should look at the OECD (2012) Report on Compact Cities - http://www.oecd-ilibrary.org/urban-rural-and-regional-development/compact-city-policies_9789264167865-en | Noted |
| 17630 | 12 | 69 | 3 | 69 | 7 | A discussion of landfills as carbon sinks should be included here. See, for example, Barlaz, M. A. 2006. Forest products decomposition in municipal solid waste landfills. Waste Management 26(4): 321-333. and Micales, J. A. and K. E. Skog. 1997. The decomposition of forest products in landfills. International Biodeterioration & Biodegradation 39(2–3): 145-158. | Noted |

| 6026 | 12 | 69 | | | | There are many more "gaps in knowledge".<br>What is about "a general definition of urban areas"? The authors themselves used several different definitions in this chapter without refering to each other and any source.<br>What is about the policy-science-interface?<br>... the practical implementation of mitigation/ adaptation strategies?<br>... the gap between what sience is working on and the need for decision-making.<br>...<br>Maybe, it would be more usefull, if each sub-section ends with its own conclusion. In this sub-section you could mention specific gaps in knowledge and give an outlook e.g. what to be in-depth researched. | Noted |
| 5994 | 12 | 69 | 8 | 69 | 11 | Is this a joke? This is not a paragraph. Either discuss the major points of chapter 12 or delete this chapter! | Taken into account: this section is now |
| 2479 | 12 | 7 | | | | First part not well written - difficult to read - lack of structure - littered with errors - needs more cohesion | Taken into account: The section is |
| 2512 | 12 | 7 | | 94 | | throughout the Chapter it is unclear as to whether the focus is on energy or carbon or something else - nothing is really said about energy mix and the importance of clean energy - the authors need to address this in the introduction | Taken into account: The section is rewritten and streamlined. Scope and focus clarified. |
| 16649 | 12 | 7 | 1 | 8 | 50 | Page 7 to 8: This section starts the chapter off on the wrong foot and could be elimimated. “Urbanization” should be distinguished from population and economic growth. I am really not sure it makes sense to discuss urbanization at all; it might instead be better to say the chapter focused on policies in the urban context because it is in that context that government services and regulations play an important role, and because most population will be concentrated there. I don’t see the need to go on for pages about the share of GHGs in urban areas, and I find it misleading to imply that urban areas cause” GHGs. The chapter should start by introducing hypotheses about how variations in urban structure and settlement patterns might affect GHGs, and discuss the difficulties in research establishing causal relationships.<br><br>Page 7, line 1. Modify sentence to read “This chapter assesses the mitigation potential of POLICIES TO INFLUENCE THE FORM AND STRUCTURE OF human settlements” (insertion in caps). | Noted: The chapter and this section has gone through reframing and rewriting, but not in a way suggested in this comment. |
| 12451 | 12 | 7 | 11 | 7 | 19 | Please consider to include some figures/examples of per capita emissions for cities/urban areas with different densities, transportation demands and solutions for transportation, with emissions allocated to the areas they are produced. This would be useful to illustrate the potential effect of different choices for development. | Noted: The text in this section has been rewritten. |
| 3339 | 12 | 7 | 14 | 7 | 16 | probably meant "in developed countries". | Noted: The text is deleted in rewriting of |
| 17574 | 12 | 7 | 14 | 7 | 14 | What does it mean to normalize data by "total urban population"? Doesn't that become per capita analysis? If so, why are both "total urban population" and "per capita" listed here? | Noted: The text is deleted in rewriting of the section. The comment is no more |
| 12452 | 12 | 7 | 15 | 7 | 16 | The sentence indicates that the per capita urban emissions are only a fraction of the national averages. This seems less consistant with the information in line 10 "if emissions are allocated to the places where they are produced urban areas are producing 60-80 % of global emissions" and line 46 " in 2009 over half of the worlds population is urban". Please consider to rephrase. | Noted: The text is deleted in rewriting of the section. The comment is no more relevant. |
| 2370 | 12 | 7 | 15 | | | Only in developed countries are per capita emissions lower than for countries (as per exec. summary). Perhaps change the term "a fraction" as it may imply "much smaller" which is not the case. | Noted: The text is deleted in rewriting of the section. The comment is no more |
| 18775 | 12 | 7 | 15 | 7 | 16 | Not in developing countries! | Noted: The text is deleted in rewriting of the section. The comment is no more |

|---|---|---|---|---|---|---|---|
| 6000 | 12 | 7 | 18 | 7 | 18 | The authors often write about infrastructure. It would be helpful to explain what they have meant by infrastructure (e.g. to give a common definition for the section) and above all which infrastructures (energy, water, transportation, communication ...) are particularly affecting the GHG. | Taken into account: First line of the second pragraph of revised intro section mentions the meaning/scope of infrastructure. In this chapter, infrastructures are broadly defined as those services and built-up structures that provide water, energy, food, shelter (construction materials) |
| 5968 | 12 | 7 | 2 | 7 | 4 | The distinction between mitigation and adaptation is not appropriate any more. Especially in cities, both is necessary and can hardly be distinguished from each other. | Taken into account: Ch 12 is about mitigation and we have some consideration to adaptation in Section 12.8 though UHI discussions. We will benefit from cross referencing and |
| 5969 | 12 | 7 | 20 | 7 | 22 | Besides the spatial form, the institutional framing and political setting and incentives of urban settlements are immediately connected and have both a major effect on transportation and travel behaviour. | Taken into account: The section is rewritten and streamlined. |
| 3340 | 12 | 7 | 23 | | | one "that" too much | Editorial |
| 18776 | 12 | 7 | 24 | | | also in line 27 "aerosols" - this is redundant in my view | Taken into accounted: the text is deleted |
| 11032 | 12 | 7 | 25 | | | The text states: 'The urban built environment is a significant forcing function on the weather-climate system because it is a heat source, a poor storage system for water, an impediment to atmospheric motion, and a source of aerosols'. Only aerosol emissions, among these, is likely to affect the climate system significantly, but GHG emissions certainly do. Suggest reword: 'The urban built environment is a significant forcing function on the weather-climate system because it is a heat, GHG and aerosol source, a poor storage system for water, and an impediment to atmospheric motion.' | Taken into account: The section is rewritten and streamlined. The text is deleted and comment no longer relevant. |
| 5715 | 12 | 7 | 25 | 7 | 27 | Low density urban areas, as in the case of the suburbs of many U.S. cities, will tend to not have the characteristics attributed here to "the urban built environment", i.e. "……a significant forcing function on the weather-climate system because it is a heat source, a poor storage system for water, an impediment to atmospheric motion, and a source of aerosols…..". There seems to be a lack of established literature making the case for the many potential gains that are of necessity associated with low density living rather than high density living. The foregoing points are among these. Patrick Troy (Australian National University) is the author of works on this subject, condensed into his 1996 book "The Perils of Urban Consolidation".12 | Taken into account: The section is rewritten and streamlined. The text is deleted and comment no longer relevant. |
| 18777 | 12 | 7 | 37 | | | "create" sounds planned - there are also many non-planned, right? | Taken into account: The section is rewritten and streamlined and this text is |
| 3341 | 12 | 7 | 45 | | | "urban to rural" --> "rural to urban" | Taken into account: The section is rewritten and streamlined and this text is |
| 17175 | 12 | 7 | 45 | 7 | 45 | Typing error - 'urban to rural migration' should be changed to 'rural to urban migration'. | Taken into account: The section is rewritten and streamlined and this text is |
| 3337 | 12 | 7 | 6 | 7 | 6 | delete "continue" (does not make sense either logically nor grammatically) | Editorial |
| 3338 | 12 | 7 | 7 | | | "of" missing | Editorial |
| 5999 | 12 | 7 | 7 | 7 | 7 | Source for statement "90% of the global economy" must be added. | Taken into account: Source added in |
| 18028 | 12 | 7 | 11 | 7 | 12 | The statement "a few wealthy cities contributing to a majority of the emissions is not backed up with evidence. Does this mean the consumption of the people in a "few wealthy cities" produces more consumption based emissions of the rest of the world population? Its a very vague statement because the terms "few" and "wealthy" are not defined | Noted: The text is deleted on subsequent revision of section. |
| 18029 | 12 | 7 | 16 | 7 | 16 | "Per capita GHG emissions are a fraction of national averages." GHG emissions per capita in cities are generally less than the national average but using the words "a fraction of" gives readers the impression that they are very small compared to the national average. This statement should be revised and state the percentage range of how much less than the national average. | Noted: The text is deleted on subsequent revision of section. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 7497 | 12 | 8 | 2 | 8 | 6 | "By 2050, urban population is projected to increase by 84 percent to 6.3 billion, from 3.4 billion in 2009, with growth concentrating in Asia (+ 1.7 billion), Africa (+ 0.8 billion) and Latin America and the Caribbean (+ 0.2 billion). Despite high level of uncertainty of these projections it is clear that the urban areas will become increasingly central in the climate debate". Increased urbanization will probably lead to increased slums. Slum dwellers may be dependent on biomass fuels for cooking and heating. Therefore it is important to have initiatives for improved biomas stoves and better ventilation and improved kitchen practices etc. | Rejected: Not significant comment |
| 5970 | 12 | 8 | 21 | 8 | 21 | The reclassification is an important hint. However, you do not mention anywhere, that the growth of small and middle-size cities is the most important driver of urbanization, particularly in developing countries. This is important because in these cities, capacities for controlled growth and therefore for climate change mitigation are often missing (cp. on this point also your remarks on fast growing cities in chapter 12, page 15, line 21). | Taken into account: The text is deleted in rewriting of section. Comment is no more relevent but we have not discounted the important role of small |
| 2481 | 12 | 8 | 25 | | | In the developing... | Comment not clear |
| 2482 | 12 | 8 | 25 | | | How can urban become an economic driver? | Taken into account: The text of this section is rearranged and deleted in the rewriting of section. Comment is no |
| 5971 | 12 | 8 | 26 | 8 | 27 | Instead of "expansion" write "change" or "development of the world's economy": Expansion is a term referring to an overcome growth-paradigm. | Taken into account: The text of this section is rearranged and deleted in the rewriting of section. Comment is no |
| 5972 | 12 | 8 | 29 | 8 | 32 | This sounds like multi-national cooperations make decisions that are independent from urban growth. This is wrong, it is a bi-directional relationship between investment decisions and urban development. Also, Sassen ignores in her theoretic framework on "World Cities" that many small and middle-size cities are increasingly becomming important! | Taken into account: The text of this section is deleted in the rewriting of section. Comment is no more relevent |
| 3342 | 12 | 8 | 34 | | | How can an adjective be used as a subject? | Editorial |

| 5717 | 12 | 8 | 38 | 8 | 43 | "Global" Real Estate investment tends to be strongest in "Central Business Districts", where the Real Estate market can have a dynamic of its own, especially if the city concerned is a "Global city" (regarding which Saskia Sassen's work is familiar) or a "Superstar City" (Gyourko, Mayer and Sinai 2006). Price volatility and hence potential for capital gains can be higher, but cyclical downside losses are also higher. Nicholas and Scherbina (2012) "Real Estate Prices During the Roaring Twenties and the Great Depression" analyse the unique magnitude of the Manhattan Real Estate market in particular. Economic rent seeking surrounding "urban planning" and "public" investments tends to be high, often claiming "sustainability" as the policy basis. Gordon and Richardson (1997) "Are Compact Cities a Desirable Planning Goal"?<br>The dispersed city discussed by Gordon and Richardson (op. cit.) presents very much lower opportunity for capital gain and rent-seeking, especially if its land prices are kept low and stable by the absence of constraints on the conversion of non-urban land beyond the fringe, to urban. Los Angeles is an example of a city that is "dispersed" but has very high and volatile urban land prices.<br>The next point made in the IPCC Draft is a good one, regarding specialised buildings and infrastructure for particular industries, and this would be tend to be less associated with the above kind of speculation and rent seeking in the local urban economy. However, the location of high-profile growth industries per se is frequently surrounded by political sweeteners and "gaming". □ | Taken into account: The text of this section is deleted in the rewriting of section. Comment is no more relevent |
| 5975 | 12 | 8 | 46 | 8 | 49 | This single-household trend may be correct for some cities where international capital and technology companies are present, but this is not a general trend for all urban areas. Especially workers in the second (industry) and third sector (low qualification services), often live in shared flats on very little space. | Taken into account: The text of this section is deleted in the rewriting of section. Comment is no more relevent |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 5718 | 12 | 8 | 46 | 8 | 49 | "…….international capital is changing urban form through the influx of an international workforce who often prefer single family housing……" This preference is frequently something about which there is limited choice in their countries of origin. But the reverse is also true, at least temporarily until the immigrants involved become financially established. The very much higher density "housing" that is associated with "Global" cities is frequently occupied to a disproportionate extent by recent immigrants who are accustomed to higher densities or worse living conditions, while the citizens of the already-developed nations have a preference against high density "housing" that results in them being under-represented in the "Global" city. It has been noted by many commentators that large numbers of long-term unemployed in the UK will not move to London in search of work, while there are no lack of immigrants from outside the country altogether who are locating in London and taking up the opportunities of employment. The role of housing preference is probably strong, especially considering the steep marginal incentives involved in the difference between being employed in London and paying one's own way for "housing", or being on welfare elsewhere and provided relatively superior "public" housing. | Taken into account: The text of this section is deleted in the rewriting of section. Comment is no more relevent |
| 4229 | 12 | 8 | 25 | 8 | 36 | This section briefly acknowledges the importance of the private sector and market-based economy in the health and growth of cities. Considering the importance of the topic to the sustainability of human settlements, it deserves deeper attention and guidance to the audience of AR5 on how to encourage economic success for cities. | Taken into account: The section is rewritten and streamlined and this text is deleted and the comment is no longer relevant. |
| 6003 | 12 | 8 | | | | It is unclear, how urban governance and institutions are connected to international capital. This section contains an explanation about changes in urban shapes caused by globalization, resources and international capital. Urban governance and institutions and their linkage to the three changes is not mentioned. I would recommend renaming the title of this section. | Taken into account: The section is rewritten and streamlined and this text is deleted and the comment is no longer relevant. |
| 16645 | 12 | 9 | | | | The chapter is not well-organized as to the nature of the evidence connecting urbanization to GHGs. Studies are cited but there is no critical discussion of this literature (e.g., page 9 at bottom citing O'Neill). | Noted: This whole chapter and sections are rewriten and reframed in SOD |
| 16648 | 12 | 9 | 1 | 9 | 49 | I am not sure what value this section provides to the rest of the chapter and perhaps it could be cut | Taken into account: This whole section is rewriten and reframed. Comment is |
| 2483 | 12 | 9 | 11 | | | increasingly | Rejected: Although text is deleted in rewriting, such phemenon is evident in published literature.. But it is on |
| 17176 | 12 | 9 | 11 | 9 | 11 | The text says: 'urban areas are increasing less compact'. 'on average' should be inserted between 'are' and 'increasingly' (and the latter word should be spelled this way). In some countries (e.g. Norway and Sweden), cities are actually becoming more compact, both in terms of buildings but also in terms of jobs and population. See Næss et al., 2011 a and b. | Noted: To be done in next round |
| 2484 | 12 | 9 | 14 | | 17 | No mention throughout of the rivers and estauries - and the potential problems of sea surges and flooding of rivers - many of the great cities are port cities - susceptibility to flooding - large literature on this | Taken into account: This whole section is rewriten and reframed. The text in question is deleted. Comment is no |
| 18780 | 12 | 9 | 18 | | | "turn of the" this might be misunderstood, write "to the 20th century" | Taken into account; The word has not |
| 5977 | 12 | 9 | 23 | 9 | 25 | Vague listing of possible factors, not all of them "increase the quality of life". This is a non-scientific assessment, what is meant by "increase the quality of life"? The source is from 1988, this is a quarter century! Paradigms and trends have changed since then towards an integration of ecology and economy! | Taken into account; The word has not appreared in SOD |
| 6005 | 12 | 9 | 24 | 9 | 24 | Which "other" are meant in the list of the results of GHG emission? Delete "others" and close the list with "and education". | Taken into account: This whole section is rewriten and reframed. The text in question is deleted. Comment is no |
| 3343 | 12 | 9 | 25 | | | Relationships between GHG emissions and QoL are complex, intertemporal, etc. Better to leave this topic to e.g. chapter 3, and delete this half sentence. | Taken into account: This whole section is rewriten and reframed. The text in question is deleted. Comment is no |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 11215 | 13 | | | | | This chapter gives no treatment to human rights in any detail (other than the brief mention in a confined context at page 29 of 92). The only specific section on rights relate to intellectual property rights. I could not find any reference to the REDD+ *safeguards* under the 2010 Cancun agreements and international obligations (though other aspects of this UNFCCC agreement are dealt with in some detail)? This appears to be a serious omission in this chapter that requires correction (though there is brief note of MDB safeguards these are quite distinct as they do not form part of an international treaty). Also no reference to recent recommendations of the Human Rights Council in relation to Human Rights.<br><br>Needs a specific sub-section on human rights in this chapter. Such a new section would do well to cite Fergus Makay's paper on REDD and the Saramaka case: http://www.forestpeoples.org/sites/fpp/files/publication/2010/08/surinamesaramakaandreddjudgmentmar09eng.pdf | Taken into account - combined with comment #2931 |
| 6986 | 13 | | | | | To me, “environmental effectiveness” means, did the policy reduce global emissions or limit concentrations? “Sustainable development” is a much richer concept, involving values. “Precaution” also can only be interpreted in terms of values (risk aversion), something I wouldn’t associate with “environmental effectiveness.”<br><br>The term, “aggregate economic performance,” in every day language, implies something like GDP growth, whereas you mean it to be more directly related to welfare/wellbeing. There are other terms you might use, like net national welfare. I would have thought that “sustainable development” and “precaution” would be more appropriately placed here.<br><br>Finally, I don’t understand why “fairness” would come under “institutional feasibility.” I would have thought that “enforcement” would be a more relevant consideration. | Noted; these comments apply to 13.2, not to 13.3. They will be addressed along with similar comments in 13.2. |
| 6989 | 13 | | | | | Top row: You say that Kyoto establishes a compliance procedure, including consequences for non-compliance. But for that to be binding, it must be agreed in an amendment, and there is no amendment. I don’t think Kyoto should be mentioned in this row.<br><br>I think the word “mandatory” should be explained. Obviously, participation in an agreement is not mandatory, so even if the word “mandatory” appears in a treaty, there remains a strong element of volunteerism. Also, I was confused about the distinction between a ”mandatory compliance system” (top row) and enforcement of “mandatory” obligations subject to “self-enforcement.” If Kyoto had a compliance amendment, it would operate as a self-enforcing agreement.<br><br>I also didn’t see how “mandatory” could apply to Copenhagen (row three). Not even being a treaty, Copenhagen is weaker than Kyoto. | taken into account. The table needs to be read in conjunction with the paragraph that precedes it, which spells out the meaning of bindingness. That paragraph has been revised to specify the meaning of mandatory - that it refers to the nature of the obligation actors undertake rather than whether they have choice or not whether to participate. |

|---|---|---|---|---|---|---|---|
| 3474 | 13 | | | | | One of the elements that I was expecting and is lacking from this chapter is the discussion concerning political feasibility of agreements. A large body of literature has numerically assessed the effects of different allocations/international participation to agreements and what they would imply in terms of redistribution and of international transfers. I know part of this will be in the section, still do be developed, on Performance Assessment. Still I would have expected this as a criteria discussed in 13.2.2 (there is something in line 43, page 13, but I believe some more discussion would really be beneficial).<br>For a detailed discussion on equity and sustainable development the reader is referred to Chapter 4. But Chapter 4 will provide the ethical and theoretical background, while some more discussion should be devoted here to issues like: what different allocation/schemes might imply for different regions of the world? are there schemes that hurt less more vulnerable countries while implying reasonable international transfers? What are the main regional obstacles to negotiations (e.g., across many models and under many allocation rules, MENA, Transition Economies and China are almost always major losers from climate change policy)? | Taken into account - this issue has now been throughly addressed in the revised Section 13.13 and in the discussion of instituaional feasibility in Section 13.2.2.4 |
| 3475 | 13 | | | | | Although a lot of new stuff is going on (see european project LIMITS and associated publications) most models have been running C&C schemes for a long time and this should be mentioned somewhere in this chapter. Meyer, A. & Hanmbock, R., 2004. Contraction and convergence. In Proceedings of the Institution of Civil Engineers–Engineering Sustainability. pagg 189–192. □ | Rejected - the suggested body of literature was assessed in AR4, new literature should be included, but no new references provided |
| 13195 | 13 | | | | | Sometimes Cancun is written is Spanish (Cancún) and other times is written without the stress. I suggest taking a unique writing criterion. | Editorial - copyedit to be completed prior to publication |
| 3727 | 13 | | | | | there is a lot of repetition between sections | Noted |
| 3728 | 13 | | | | | the discussion is still very unfocussed at this stage, very few implications are drawn from the literature, just a bunch of random and often overly brief summaries | Noted |
| 3729 | 13 | | | | | too much parochial self-citation by the authors, not enough reference to the broader literature | Noted |
| 3756 | 13 | | | | | see Biermann | Rejected - Biermann articles are cited but comment not specific about which |
| 8090 | 13 | | | | | This is a very good chapter. I have only a couple small comments. | Noted |
| 14344 | 13 | | | | | This figure contains various agreements and "forms of cooperation." The bubble on NAMAs and NAPAs seems out of place here. These describe one the one hand a broad array of nationally appropriate mitigatio actions (a loose category that includes any activity and is not necessarily related to initiatives or agreements), and on the other national adaptation plans of action, which are actual plans, again not initiatives or agreements. These do not belong here. | Taken into account in revision of Figure 13.1. |
| 18684 | 13 | | | | | Concepts, principles, etc. are defined at length, which is great, but are not used much in the remainder of the chapter. | Noted |
| 18697 | 13 | | | | | The chapter sets out to "survey and synthesize the scholarly literature". While I think it already does a good job, I believe the *synthesis* aspect needs to be strengthened to avoid producing a (however useful) commented reference list. | Noted |
| 2580 | 13 | | | | | The role of subnational and local governments in addressing Sustainable Development issues, notably climate change, has been increasingly recognized by the UM System. For instance, the Rio+20 final declaration has 23 matches to "subnationals" (initial draft had just a couple) | Noted - subnational and local actions are already depicted in Figure 13.1, mentioned in 13.3, and discussed in |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 15382 | 13 | | | | | International chapter needs to recognize the limits on national policy discussed in Ch 6 and Ch 15 – international policy can't be more than the coordination of national policies, and is subject to the same influences that make national policies inefficient. The discussion of capacity building is so bland and uncritical to be hardly worth including. But since the topic cannot be avoided, I strongly recommend being both specific and critical. Some forms of capacity building, such as education and scientific exchange, are unexceptional. But a discussion of other forms of capacity building – support for planning, policy making and enforcement, and creation of government agencies, for example, must differentiate what kind of capacity is being built, by whom, and how. Easterly's work (The White Man's Burden: Why the West's Efforts to Aid the Rest of the World Have Done So Much Ill and So Little Good, 2006.) is particularly relevant here, because much of the $2.3 Trillion in development aid whose failures he documents went for precisely this kind of centralized capacity building and planning rather than on the ground efforts to encourage entrepreneurial activity and address the immediate causes of poverty. | Taken into account - Section 13.10 has been heavily revised and additional literature on interactions of national and international policy has been included where appropriate |
| 13633 | 13 | | | | | See Comparing Climate Commitments: A Model-Based Analysis of the Copenhagen Accord, by W. McKibbin, A. Morris, and P. Wilcoxen, Climate Change Economics, Vol. 2, No. 2 (2011) 79-103. | Taken into account - reference has been assessed |
| 13638 | 13 | | | | | Example: Achieving Comparable Efforts through Carbon Price Agreements, with W. McKibbin and P. Wilcoxen, Viewpoints, The Harvard Project on International Climate Agreements, Harvard University Kennedy School, December 2009. | Taken into account - reference has been assessed |
| 13645 | 13 | | | | | The OECD also has tools, such as the Climate change expert group (formerly the Annex I expert group). | Rejected - the level of detail suggested |
| 7499 | 13 | | | | | No comments. | Noted |
| 7370 | 13 | | | | | There is a lot of repetitive text, particularly in the introductory parts of each section. | Noted |
| 2941 | 13 | | | | | This is a very interesting and revealing chapter. I am pleased to see these topics discussed in AR5, and can only hope that they inspire political action in the form of more effective international agreements to mitigate climate change. | Noted |
| 9970 | 13 | | | | | This section is duplicated with chapter 16. Financing instruments mentioned in this section are almost repteated in chapter 16. Maybe authors from these two chapters have to communicate. | Taken into account - overlap with Ch. 16 eliminated and cross-references made. |
| 3730 | 13 | | | | | this section covers one of the most important and promising areas of climate governnace that has emerged since the last IPCC report, and deserves much more elaboration. | Within the space limits, this section has been strengthened |
| 5917 | 13 | | | | | It may be useful to provide a table of international initiatives similar to Table 14.9, there may be limited assessment but it gives an idea of what is being done / available in various parts of the world. | Taken into account - a new tabel is now included |
| 11321 | 13 | | | | | The report may take note that UNDP and UNEP are only two of many UN programmes addressing climate-based issues. A bit mis-leading to leave readers thinking otherwise. | Accepted - text revised. |
| 12974 | 13 | | | | | Please check with Ch. 16 possible overlaps. | Taken into account - overlap eliminated and cross-references made |
| 6049 | 13 | | | | | Is there any literature that discusseshow these mechanisms are set up and/or evaluates how well they are working? | Taken into account - the (scarce) peer-reviewed literature evaluating these mechanisms has now been |
| 6051 | 13 | | | | | Could this section be re-organized to more explicitly use the evaluation criteria listed in line 3? | There are no criteria in line 3. |
| 6052 | 13 | | | | | This section might make more sense as an introduction to section 13.11. It seems to repeat some of the material in the previous sections. | Taken into account - section deleted and relevant material shifted into the |
| 7374 | 13 | | | | | This section should perhaps incorporate more of the policy ideas arising from the UNSG High Level Advisory Group on Climate Finance - such as an international transaction tax, taxes on international transport, and assessed contributions from developed countries.<br>http://www.un.org/wcm/content/site/climatechange/pages/financeadvisorygroup/pid/13300 | Accepted - AGF report now quoted with a list of instruments suggested. |
| 14668 | 13 | | | | | I do not understand why this section is in this chapter. There needs to be a stronger connection to the material in this section to the design, implementation, and/or success of international agreements/international efforts to combat climate change. | This section was included because of a plenary approved bullet. We have tried to strengthen the link with other sections |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 6053 | 13 | | | | | I would like to see a discussion of some of the literature that analyses the performance of PPPs. In addition to the sources listed in the first paragraph of this section, see also Biermann et al. 2007 (in Peter Glasbergen's book PARTNERSHIPS, GOVERNANCE AND SUSTAINABLE DEVELOPMENT. | Within space limits more recent literature by the same group of authos has been included. |
| 6054 | 13 | | | | | This section could also draw on literature that analyzes private sector governance. What are the governance issues raised (e.g. accountability issues)? | Additional literature on governance issues of the private sector are cited |
| 18357 | 13 | | | | | When the section is being developed for the Second Order Draft, authors clearly need to think in how far the previously discussed assessment criteria in addition to environmental effectiveness (i.e. aggregate economic performance, distributional and social impacts, and institutional feasibility) will be addressed. It is also not clear in how far the section will compile the insights from the rest of the chapter and e.g. discuss the different negotiation components (such as capacity building, technology transfer and finance etc). Also, the assessment of different burden sharing proposals should be based on the relevant discussions in Chapters 3 and 4 (which introduce equity principles underlying the UNFCCC and their translation into burden sharing regimes). | Taken into account - new text prepared |
| 18694 | 13 | | | | | The Introduction of the chapter (13.1) promised an evaluation "according to [the] criteria developed in section 13.2". This is indeed important to make section 13.2 meaningful, and this promise is not yet delivered upon in 13.13 (I realize that parts of the chapter are still missing, but it is also completely absent from the subsections that are present). | Taken into account - new text prepared |
| 10927 | 13 | | | | | The following two papers are relevant here: Peters, G.P., Minx, J.C., Weber, C.L., Edenhofer, O., 2011. Growth in emission transfers via international trade from 1990 to 2008. Proceedings of the National Academy of Sciences 108, 8903-8908.; Velders, G.J.M., Andersen, S.O., Daniel, J.S., Fahey, D.W., M.McFarland, 2009. The importance of the Montreal Protocol in protecting climate. Proceedings of the National Academy of Sciences 104, 4814-4819. | Taken into account - references included in 13.13<br><br>Also taken into account in 13.8. First reference is now cited. Second reference is interesting though it is not clear where |
| 7375 | 13 | | | | | The sub-sections appear to be focused on the mitigation-target elements of the UNFCCC and KP (and the function of the CDM). As both provide for a much more holistic mitigation response to climate change it would be desirable to include overview of how these institutions have supported (or not) e.g. financial and technology transfer to achieve mitigation actions - particularly outside the context of the CDM. | Taken into account - new text prepared |
| 18436 | 13 | | | 49 | | I think the summary should include a brief performance assessment on policy and institutions, especially regarding UNFCCC. Could be a suggestion for the second draft, considering that the authors are saying that that work is incomplete | Taken into account - new text prepared |
| 8778 | 13 | | | | | See the report of the CDM Policy Dialogue for an assessment of the performance of the CDM and recommendations for change. http://www.cdmpolicydialogue.org/ | Taken into account - the CDM policy diagloue is mentioned as an institution but its reports are not peer-reviewed; however the peer-reviewed references |
| 14670 | 13 | | | | | This assessment of Cancun is focused only on environmental outcome. First, it assumes compliance (and there is a long literature, much of which is referenced here, raising questions about that). Second, it ignores effeciency, cost-effectiveness, and equity. | Taken into account - Included more literature on costs-efficiency. |
| 8099 | 13 | | | | | Same comment as number 7 above | Taken into Account - Is addressed in |
| 11347 | 13 | | | | | It may be worth mentioning somewhere - either in the financing section or here in the assessment section - the problems of fraud and trade practices issues that can (and do) arise in private/voluntary schemes and which have particularly negative impacts on their efficacy and on consumer and investor confidence | Taken into account - new text prepared |
| 3753 | 13 | | | | | add a column on causal mechanisms, and indicate which types are complementary and which interfere with one another, and which have no interative effects | Rejected. The comment was not understood by the authors. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 18685 | 13 | | | | | Suggestion: the relations between the different terms that are defined in this section (principles inform goals, goals are fleshed out in targets, targets are implemented in policies, criteria are fleshed out in metrics, policies are evaluated according to metrics, ...) could be visualized in a diagram to make these basic concepts clearer. | Taken into account. The text has been rephrased to make clear what is the differences bewteen principles and criteria, and a more detailed explanation on goals, targets and metrics has been |
| 3173 | 13 | | | | | section 13.2.1: cross reference to the discussion in chapter 6 of international cooperation and transformational pathways. Chapter 6 makes a very important point that echoes the argument here about the need for participation. A cross reference would make this point much stronger and tie WG3 together more fully. | Accepted. Text in section 13.2.1.3 makes now reference to the point raised by the referee (section 6.3.6 International Strategies and Stabilization |
| 6030 | 13 | | | | | The chapter focuses on climate change as a commons issue but there are many scholars who approach their research from an alternative framing that emphasizes how climate change is embedded in the neoliberal global political economy, which in turn raises different types of challenges in terms of international cooperation. Could this be added as an alternative framing in the chapter to better reflect the literature? | Rejected. No scientific evidence/publication provided to support changes suggested by the reviewer. Commentator should provide a clearer |
| 2163 | 13 | | | | | From my point of view, one important approach to overcome undersupply of public goods should be included: the matching approach first suggested by Joel Guttman (1978), American Economic Review. This approach has been also highlighted by Scott Barrett (1990), Oxford Eview of Economic Policy. Recently there have been several papers analyzing this approach and applying it in the global public good / climate change mitigation context (Boadway et al 2007, Cornes at al 2011 etc.). | Accepted. Text has been revised to include the suggested matching literature under 13.2.1.1. after the mention on the role of prices to internalize "extrenal costs" since |
| 3740 | 13 | | | | | why these principles? How about other global principles, like sovereignty, human rights, respect for IPRs, WTO liberalization? | Accepted. Section 13.2.1.2 to 4 and 13.2.2. will be fully revised. |
| 12976 | 13 | | | | | It is not clear why "high cost-effectiveness may have negative impact on sustainable development if cost effectiveness is calculated on a short time horizon". The authors should expand on that or cancel the statement.<br><br>I think this is the right place to introduce the literature on the trade-off between efficiency and equity.<br><br>Given a mitigation target, the highest possible level of efficiency minimizes aggregate abatement costs. Equity can be achieved by means of transfers (Coase, 1960).<br>However, in the absence or in the impossibility to distribute the efficiency gains in an equitable way, efficiency might require some regions to bear a large fraction of the costs. If those regions are poor, efficiency might have impact on sustainable development.<br><br>Most IAM study global mitigation policies assuming an efficient distribution of abatement effort. However, this often implies a disproportionate cost for developing countries (in case of a carbon tax) or an unfeasible transfer scheme (global cap-and-trade). In the impossibility to redistribute efficiency gains, equity and development considerations might push towards less efficient distributions of abatement effort.<br><br>Unfortunately the trade-off between equity and efficiency is not well reflected in the estimates of mitigation costs.<br><br>I have recently done work with Massimo Tavoni on this issue and our paper is forthcoming on Energy Economics: http://dx.doi.org/10.1016/j.eneco.2012.02.005. | Accepted. The text " if cost effectiveness is calculated on a short time horizon" was eliminated because it was not clear. Section 13.2.1..3 was moved to 13.2.2.5. More explanation on efficiency equity trade-off was added. |
| 6032 | 13 | | | | | The sub-parts of this section are imbalanced with the discussions of environmental effectiveness and institutional feasibility much more detailed than the discussions of aggregate economic performance and distributional and social impacts. | Accepted. Text was better balanced, as suggested. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 3741 | 13 | | | | | what are the legitimacy of these principles? Who says they are legimate? What are the warrants? | Taken into account.These are principles discussed in the literature. Legitimacy is one of the criteria for the evaluation of the principles as stated in section |
| 12979 | 13 | | | | | The paragraph is not crystal clear. | Editorial-copedit to be completed prior to |
| 14343 | 13 | | | | | There are links between the "sub-criteria" - in particular between participation and flexibility. Because of the range of national circumstances, policy processes, legal institutions, etc… an institutional structure, to be feasible, will not only need to take into accoun flexibility to adapt to new information or changes, but also flexibility in terms of participation for the multiple actors involved. See Bodansky, Daniel, "The Durban Platform Negotiations: Goals and Options," Belfer Center Policy Brief, July 2012. | Taken into account. The suggested article is not peer reviewed literature. The link between Participation and Fexibility is now aknowledged. Not enough specific literature was found. Furthermore, the sentence on links |
| 3174 | 13 | | | | | 13.2.2.4: institutional feasibility should be unpaved a bit to include domestic politics. That's not just "compliance" but more generally all the work by scholars that has looked at how domestic political forces constrain (and sometimes vice-versa) the feasibility of international agreements. There's a big discussion of so-called "domestic politics" in the international relations literature in the Hafner-Burton et al (2012, American Journal of International Law) review article. Political science has done a ton of work in this area. Similarly, Lee Lane and others have been trying to get the IAM community to look at how institutional factors constrain (and make impossible) some climate goals—though that work has focused on the the "new instiitionalism" and "institutional economics" and I'm not sure if any of Lee's stuff has been published. | Accepted. An explicit reference to domestic policies and the literature on "two-level games" was introduced. Hafner-Burton et al (2012, American Journal of International Law) review article was added, as well as another more economic article by Kroll and SHogren (2008). Lee Lane (unclear) |
| 18696 | 13 | | | | | On the structure: section 13.3 seems unneccesarily brief, especially compared to later sections (e.g. 13.4 which gives rich details on the Kyoto Protocol, or 13.9 which is a nice introduction to the literature). 13.3 would benefit from more information on how the reported results were found. | Noted - but no specific text is proposed here, and 13.3 is intended to be brief because more detailed discussions are |
| 18698 | 13 | | | | | I'm missing a discussion of the literature on dynamic games and repeated games, both for the context of climate treaties. Examples are found in Dutta PK, Radner R (2004) Self-enforcing climate-change treaties. Proc Natl Acad Sci USA 101:5174–9; Dutta PK, Radner R (2006) A game-theoretic approach to global warming. Adv Math Econ 8:135–153; Rubio SJ, Casino B (2005) Self-enforcing international environmental agreements with a stock pollutant. Span Econ Rev 7:89–109; Rubio SJ, Ulph A (2007) An infinite-horizon model of dynamic membership of international environmental agreements. J Environ Econ Manage 54:296–310, Asheim GB, Froyn CB, Hovi J, Menz FC (2006) Regional versus global cooperation for climate control. J Environ Econ Manage 51:93–109; Froyn CB, Hovi J (2008) A climate agreement with full participation. Econ Lett 99:317–319; Asheim GB, Holtsmark B (2009) Renegotiation-proof climate agreements with full participation: Conditions for Pareto-efficiency. Environ Resour Econ 43:519–533; Weikard HP, Dellink R, van Ierland E (2010) Renegotiations in the greenhouse. Environ Resour Econ 45:573–596; Heitzig, J., Lessmann, K., Zou, Y. (2011): "Self-enforcing strategies to deter free-riding in the climate change mitigation game and other repeated public good games." Proceedings of the National Academy of Sciences (PNAS), 108, 38, 15739-15744 | Accepted by adding both text and numerous references (several of those provided by this comment, and others as well). |
| 11335 | 13 | | | | | This section seems particularly weak. In the introduction we are promised a review of lessons to be learned from climate and non-climate international agreements but instead, the introductory section focuses on a tour of game theory and a confusing discussion of IEAs and MEAs - the difference between which is not explained. The following subsections then focus most of their analysis back on the climate regime with little to no idenitifcation of lessons that might be learned from other regimes | Taken into account in revisions to 13.3, to clarify and strengthen the lessons learned from past practice and from theory. |
| 3747 | 13 | | | | | what are the implications for effective governance from this section? | Accepted by adding both text and |
| 18365 | 13 | | | | | The discussion could expand more on the importance of transfers in the context of establishing participation. | Accepted by adding both text and references on the role of transfers, in theory and in practice, including in |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 18687 | 13 | | | | | Section 13.4 picks up terms from 13.3, e.g. participation. The chapter can be improved by relating the two discussions to each other. | accepted. As of 2 December unable to do however, requries more coordination across the sections than we have been |
| 14653 | 13 | | | | | This sub-section seems abbreviated. Are there really only three elements of international cooperation -- legal form, participation/burden-sharing, and flexibility? Could an alternative way of framing this be: legal form, objectives, and implementation? In this latter formulation, one could envision more discussion of elements than just flexibility, e.g., policy surveillance, compliance incentives, etc. In addition, see comments on flexibility section. | Taken into account. Section reorganised and the nature of this discussion clarified. Additional element introduced (goals, actions and metrics), to be drafted.. Emphasised that this is not an |
| 18688 | 13 | | | | | This section picks up participation from 13.3 as a basic element, but not, for example, compliance. Either the role of compliance or its omittance needs some explanation. | accepted. As of 2 December unable to do however, requries more coordination across the sections than we have been |
| 3754 | 13 | | | | | does participation relate only to states, or to non-state actors as well? | Taken into account - text revised to mean participation can be by states or |
| 18689 | 13 | | | | | How does this discussion of participation relate to section 13.3.1? How can participation in climate architectures be interpreted in the light of the findings presented in 13.3.1? | accepted. As of 2 December unable to do however, requries more coordination across the sections than we have been |
| 14654 | 13 | | | | | This sub-section has an excessive focus on the CDM. Performance of international emission trading would also be useful to understand. It would also be important to note that international emission trading can be quite extensive (e.g., under the ETS) even though it is not formally through a KP Article 17 provision. It would also be useful to discuss the role of land use emissions under KP and REDD+ under post-KP agreements. It is also not clear how the CDM facilitates an international agreement. Does it serve as a stepping stone for developing countries to do more? Does it undermine environmental performance by lowering the price of carbon in developed countries (and risks bringing so-called anyway tons into Annex I countries)? Put another way, why is this an important element of an international agreement? I understand it for legal form and for participation/burden-sharing, but the case is not made clearly here. | taken into account. Section reframed (see response to #522) to take into account other forms of flexibility. Nevertheless, the literature on existing flexibility mechanisms is overwhelmingly on the CDM. Text introduced to expalin this. |
| 18686 | 13 | | | | | Discuss flexibility mechanisms with respect to "aggregate economic performance" and "institutional feasibility" as defined in 13.2. | Rejected - this evaluation is carried out in section 13.13 |
| 12985 | 13 | | | | | This is a long sub-section on CDM. Is CDM covered elsewhere in the AR5? If yes, please check if there are overlaps. My feeling is that this is not the chapter where the pros and cons of CDM should be discussed. In this chapter I expect to see a discussion of how CDM affects international cooperation or how CDM-type tools are treated by different regional policy initiatives. | rejected. A division of labour concerning where in AR5 the CDM is discussed has already been established. |
| 14655 | 13 | | | | | Are there lessons from the arms control treaty literature that would be relevant for a discussion of the governance challenges facing SRM? | rejected - space limits preclude a discussion. |
| 14340 | 13 | | | | | Generally, this section appears to not fully address the literature on criteria for design of international cooperation and governance of geoengineering; see literature mentioned above, e.g. - Bodle, Ralph, “International governance of geoengineering: Rationale, functions and forum”, in: William C.G. Burns and A. Strauss, (eds.), Climate Change Geoengineering: Legal, Political and Philosophical Perspectives, Cambridge: Cambridge University Press (submitted February 2011; in press);<br>- Lin A.C., International Legal Regimes & Principles Relevant to Geoengineering (in press). In: W.C.G. Burns and A. Strauss, (eds.), Climate Change Geoengineering: Legal, Political and Philosophical Perspectives. Cambridge: Cambridge University Press, Cambridge (submitted 2011, in press); | Noted. Commenter contacted for copies of the papers which are not yet published. (Not yet received). |
| 3755 | 13 | | | | | see Zurn, somehow this section belongs at the end. See comment 7, 12. | Reject - comment not clear enough to establish what changes it recommends |

|---|---|---|---|---|---|---|---|
| 12986 | 13 | | | | | CDR and SRM are very different. CDR should not be mentioned in this section. CDR is an emission abatement technology which suffers from all sorts of coordination problems as any other mitigation option because it is costly. SRM can instead provide local benefits and can be relatively inexpensive. CDR supplies a public good, some forms of SRM provide a private good. | Taken into account. Including CDR and SRM in the same subsection follows the treatment in chapter 6, section 9. Also included because they produce some similar challenges for international |
| 11340 | 13 | | | | | What si the justification for a subsection on SRM in a section on climaet oplicy architectures? And why is SRM given special prominence when other options are not discussed. | noted. Section reorganized, and place of SRM clarified as a consequence. Explanation of discussion also |
| 6040 | 13 | | | | | There are some other multilateral options that could be discussed such as mini-lateralism (e.g. moving discussions to for a like the G20) and/or creating clubs. | accepted. Notion of minilateralism included in revised section. |
| 16344 | 13 | | | | | Kyoto 2 http://www.kyoto2.org/ provides a simple alternative approach which is well researched and would be useful to draw attention of policy makers to. Kyoto (Tickell) 2008 ZED Books. Here is the simple explanation from the website.<br>Kyoto2 is a global framework for a Climate Treaty to limit emissions of greenhouse gases to a level that would prevent dangerous interference with the Earth's climate system, while generating enormous economic, social and environmental benefits. It is thus a delivery mechanism for the objective and principles of the Climate Convention (UNFCCC).<br>Greenhouse gases are global pollutants and can only be regulated under a global emissions cap. As a genuinely global system Kyoto2 applies the cap without regard to national boundaries, dispensing with national emissions targets, national allocations and the 'territorial accounting' that characterizes the Kyoto Protocol.<br>Permits to produce CO2 or other greenhouse gases are sold up to the cap by global auction using a Uniform Price Sealed Bid system subject to reserve and ceiling prices. The secure carbon price signal stimulates long term investments in a low carbon future. Any permits sold above the cap are clawed back in subsequent years and the extra money raised is invested to reduce future demand for fossil fuels.<br>Greenhouse gas emissions are regulated 'upstream' - at or close to where fossil fuels are produced, and at the source of other greenhouse gas emissions such as CO2 from calcinating lime in cement kilns - because this is where emissions are most reliably and inexpensively controlled.<br>The market mechanism is supplemented by direct regulation aimed at overcoming market failures, or where a market system would create unnecessary cost. Demanding efficiency standards are set for all energy consuming sectors, from housing to transport, industrial machinery and domestic appliances. Most of the powerful industrial greenhouse gases or PIGGs used in industry and refrigeration are phased out following the example of the Montreal Protocol.<br>The funds raised at auction - of the order of $1 trillion per year - are invested in solving the problems of climate change, with an emphasis on the needs of poor countries, poor people and those most adversely impacted, including to:<br>bring about a worldwide clean energy revolution and a prosperous low-carbon global economy through investments in energy research and development, energy efficiency, and the deployment of renewable energy infrastructure; I meet developing country costs of complying with the standards and regulations set out in [5] above via a 'Multilateral Fund';<br>finance developing country adaptation to climate change, and responses to climate-related health challenges and emergency needs;<br>conserve and sequester carbon within the biosphere - soils, peatlands, forests and other ecosystems - and reduce land-based emissions of other greenhouse gases including methane and nitrous oxide, while boosting soil fertility and water retention;<br>research low-cost, reversible and environmentally benign geo-engineering options that could in extremis halt a 'runaway greenhouse effect'.<br>Reducing emissions by cap and carbon price alone would require such a high carbon price as to cause hardship and economic pain. By contrast Kyoto2 uses three mutually supportive mechanisms: the cap-and-trade market; direct regulation; and the investment programme. Working together these can rapidly reduce emissions | Taken into account - text revised to concede that all the approaches discussed preclude the emergence of a supranational authority as proposed in the arguments by Tickell (2008). The Tickell text is cited. |

|---|---|---|---|---|---|---|---|
| 6039 | 13 | | | | | Is there much literature on this approach? What are the advantages and disadvantages? | rejected. The space for this discussiuon woudl be 13.13. This subsection (13.4.3.2, the commenter was asked for |
| 6044 | 13 | | | | | There is unevenness in this section where some agreements and institutions are discussed in extensive detail while others are merely mentioned without any consideration for their advantages/disadvantages or significance (e.g. Section 13.5.1.4) | Accepted, a new sub-section outlining dis/advantages of different architectures included |
| 7371 | 13 | | | | | This section is structured very strangely- it may be better to organise the elements of agreements under headings (e.g. the UNFCCC, the Kyoto Protocol), rather than listing parts in an ad-hoc manner. | Taken into account - further sub-headings included to organise the text. To improve the structure, new subsection added titled “Advantages and |
| 8098 | 13 | | | | | Suggest adding reference to the Clean Energy Ministerial following the MEF discussion | Accepted - text revised and new |
| 18366 | 13 | | | | | The assessment in this section would benefit from a closer linkage to Figure 13.1 and the related discussion in section 13.3. | In Section 13.5, Taken into account - new column to be added to Figure 13.1<br><br>In Section 13.9, Taken into account - |
| 11342 | 13 | | | | | Thsi section mixes treaty bodies and fora with non-treaty bodies and national initiatives. There is confusion between this and the following three subsections. | Accepted - unnumbered subheadings added to clarify structure of sub-sections |
| 18691 | 13 | | | | | I suggest to include an evualutation/interpretation of the past and future role of the listed coalitions. As it is, this section only enumerates the coalitions, which has little value by itself. | Taken into account - evalutation of dis/advantages in new 13.5.1.2 |
| 11344 | 13 | | | | | transanational' initiatives are better described as 'transnational arrangements'. And how are city-level schemes and the California scheme 'transnational'? | Rejected - proposed wording does not seem an improvement, and the initiatives mentioned have international dimensions; e.g. the California system is |
| 15726 | 13 | | | | | I wouldn't mention details on the WCI or the EU-ETS or other schemes here as this is anyway part of chapter 15, there is risk of overlap. Instead I would give a brief overview of the dynamics since Copenhagen regarding the emergence of cap-and trade schemes (AUS, SKorea, China…) and the danger that a fragmented international Carbon Market outside the UNFCCC may emerge. It would be important to mention the "framework for various mitigation approaches, including opportunities for using markets" as was considered to be established in the Durban Climate Conference. De Sepibus, Sterk and Tuerk, 2012, assess the possible roles of such a framework.: Top-down, Bottom-up or In-between: How Can a UNFCCC Framework for Market-Based Approaches Ensure Environmental Integrity and Market Coherence? NCCR Working Paper No 2012/31| July 2012 | Taken into account: refer to section where other national systems are described |
| 6046 | 13 | | | | | Why focus on WCI when RGGI is operational and arguably more prominent? | Taken into account: refer to section where other national systems are |
| 12923 | 13 | | | | | I would rather focus this section on issues like: incentives; has EU ETS led to mitigation and innovation?; the allocation process; concerns of competiveness and carbon leakage; dynamics of the carbon price; changes for 2013-2020 and linkages wth other carbon markets. I can provided references if needed. | Rejected - outside the scope of the chapter. It deals only with the interlinkages to international cooperation |
| 12987 | 13 | | | | | Any information on the actual emission reductions obtained by these regional initiatives? | Rejected - outside the scope of the chapter. It deals only with the interlinkages to international cooperation |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 12988 | 13 | | | | | I think the key question in this section should be: why do we observe many regional and sub-regional initiatives when theory says that free-riding should prevail (as mentioned in the first sections of the chapter)? Why should the EU, California, or other local initiatives start reducing emissions when the impact on global concentrations is negligible?<br><br>I can see three possible answers (but I am sure there is more in the literature):<br>- proactive behavior: they anticipate that some form of global regulation will be implemented in the near future;<br>- domestic political reasons and/or self-promotion of a "green" brand;<br>- experimenting solutions and building institutions at local level that will lower the cost of building global institutions.<br><br>Is there a literature that addresses these issues? This would be the right place to mention it. | Taken into account. Will coordinate with Chapters 14 and 15 as they are not particularly relevant to Chapter 13. |
| 7372 | 13 | | | | | Indicative information on the linking of the EU-ETS and the Australian Carbon Pricing Scheme should be included here. Details are available here: http://www.climatechange.gov.au/en/media/whats-new/linking-ets.aspx | Rejected. The linking is not to commence until 2018. No peer reviewed literature on this initiative. |
| 11345 | 13 | | | | | Mention should now be made of the Australia- EU linkage arrangements | Rejected. The linking is not to commence until 2018. No peer reviewed |
| 18361 | 13 | | | | | The treatment of trade and embedded emissions is a very sensitive issue and a clear vision of its coverage should be developed in cooperation with Chapters 4, 5 and 14. | Taken into account: discussion has been moved to the beginning of section 13.8; the discussion has been slightly expanded and appropriate cross- |
| 11346 | 13 | | | | | There is a striking omission of discussion of the work in the IMO. For a summary see Rayfuse, R., 'Climate Change and the Law of the Sea' in Rayfuse, R. and Scott S. V. (eds.), International Law in the Era of Climate Change (Edward Elgar, 2012) page 166 | Taken into account: additional reference have been cited and the part on the IMO has been expanded slightly. |
| 14667 | 13 | | | | | Note that MEF Leaders agreed to double R&D by 2015 at the L'Aquila summit in 2009 | Taken into account - text revised by adding suggested information plus reference at end of first paragraph in |
| 18358 | 13 | | | | | Please link this discussion to the relevant sections in Chapter 3 (3.12.6) and 16 (16.5) to sharpen chapter specific focus and avoid redundancies. | Taken into account - cross-cut references to chapters 3 and 16 added. |
| 15383 | 13 | | | | | This is good, it states the difficulties adequately. Principles, beyond net benefits, are vacuous and not helpful for determining the existence or stability of an agreement. They are associated with criteria: environmental effectiveness, cost-effectiveness, distributional considerations, and institutional feasibility. Lots of words to get to a commonsense list, could just take from Chapter 3 which develops them clearly | Taken into account. A statement on procedural justice was added (in addition to distributive justice, that was already in the text). That follows chapter 3 |
| 4232 | 13 | | | | | The distinction between these two sections seems artificial to me. Moreover, the material in the two sections is not sufficiently different to warrant two sections. As it is, some of it is repetitive. I would recommend combining the two sections into one section concerning linkage. Also, it is surprising that there is not more mention of the New Zealand system which is an example of a national system linked (totally) to the international system. | Rejected - Cannot merge the two sections because they are plenary-approved |
| 4235 | 13 | | | | | This section needs to be rewritten. It contains significant mis-statements as detailed below. | Taken into account - Section 6 has been |
| 15388 | 13 | | | | | This is really weak. It needs a correlation of international systems with national policies – in a mosaic world, national policies define what any agreement will coordinate. Different countries – different institutions – different policies. This is what sinks the global cap and trade ideal. Needs to be more carefully coordinated with national chapter – and eliminate massive repetition with regional. | Taken into account. Will coordinate with Chapters 14 and 15. |
| 15392 | 13 | | | | | The WTO section is good. | Noted: Thank you! |
| 15390 | 13 | | | | | This needs to be coordinated with investment chapter. | Taken into account - for later inter- |
| 15393 | 13 | | | | | IP section is good. | Noted |

|---|---|---|---|---|---|---|---|
| 11329 | 13 | | | | | The introductory paragraph suggests 5 topics to be surveyed in the chapter but the Executive Summary only addresses 4. Heading for 'the performance of climate policies and institutions? | Accepted - text revised |
| 11681 | 13 | 0 | | | | Overall, it is a very comprehensive survey and synthesis report on the international cooperations on climate change, finished by well-known scholars in this field, the report is very objective with careful citations, and the report structure is well organized with clarity. I only have some minor comments as follows. | Noted |
| 4231 | 13 | 0 | | | | Subject to the specific comments below, I thought the chapter was organized appropriately and written well. The works cited and the comments made reflect the literature as I know it. As such, the chapter provides a good summary statement of the literature for anyone interested in this subject. Also, I did not read sections 13.2 and 13.13, the latter of which is incomplete. | Noted |
| 16950 | 13 | 0 | | | | It is many years since I worked directly on global architecture issues. I was also asked opportunity to comment verbally on this chapter at the IPCC Washington meeting. Of my remarks there I will only underline the following.<br>The chapter really must address the apparent tension between the theoretical conclusions of the second paragraph:<br>("… as a result there is very little incentive for firms and individuals (and countries) to reduce emissions in the absence of international cooperation (High Agreement, Robust Evidence, Very High Confidence)").<br>which seems to contrast with the reality that MOST of the chapter appears to be about organisations, individuals (and countries) doing just that.<br>The chapter could consider two main explanations of this apparent paradox.<br>The first is that motivations and indeed the economics of climate change action are far more complex than assumed. In particular, they involve all three Domains of human decision-making and economic processes (Grubb, Hourcade and Neuhoff), and there are clear potentials for "win-win" opportunities in both the First and Third domains (and even potentially in the second, if more subtle views of pricing, including subsidy removal and market stabilisation, are considered).<br>The second (and somewhat related) is that the simpler versions of the international theories assume that States are unitary economic actors operating a world of purely Second Domain economic processes, and that emission reductions can be separated from other activities and international relations. These seem to be highly questionable assumptions.<br>Consequently, I incline to take the empirical evidence of the chapter more seriously than the theoretical statements of the Exec Sum 2nd paragraph, in which I would certainty dispute the level of confidence ascribed.<br>Certainly, I believe the chapter has to take far more systematic account of the different kinds of actions that countries are undertaking, to illuminate which are proceeding unilaterally / regionally, and which are seriously impeded. A reasonable hypothesis from the Three Domains perspective is that is easiest to pursue Pillar 1 actions (regulatory and engagement approaches) unilaterally, that Pillar 3 actions (innovation for infrastructure and innovation) could be done unilaterally particularly by larger countries but that more often some level of sub-global international cooperation is likely to be helpful; and that Pillar 2 actions (pricing) are likely to be most difficult unilaterally. The fact that the EU ETS was adopted in the context of the Kyoto Protocol would seem to mean that this does not disprove such a view (See comments on that section).<br>For details see Grubb, Hourcade and Neuhoff, Planetary Economics: the Three Domains of Sustainable Energy Development, Taylor & Francis forthcoming (Chapters 1 – 5 submitted, others in draft available on request).<br>A reference that may be of interest for its consideration of regime design interactions with possible US-EU participation is B.Lee and M.Grubb, "US in the World: the challenge of global warming", chapter in Robin Niblett (ed), America and a Changed World: A Question of Leadership, Wiley-Blackwell (2009); also published as a Chatham House Energy, Environment and Development Programme Paper 09/02, Royal Institute of International Affairs, London 2009. | Taken into account in the substantial revisions of 13.5 and 13.13. The confidence statements in the executive summary will be revised in the next round in concordance with the text. |

|---|---|---|---|---|---|---|---|
| 14256 | 13 | 0 | | | | I would be happy to provide additional comments if I had time (so, please let me know if the deadline is extended or if one can provide comments later/to later revisions). | Noted |
| 13545 | 13 | 0 | | | | Taking on the challenge of integrating an assessment of multilateral governance and instruments with emerging transnational and sub-national governance dynamics is a worthy endeavor for this chapter. Naturally given the balance of the literature and longer history of the multilateral approach, the chapter focuses significantly more in this area. However, too often when the chapter turns towards the alternative forms of international cooperation, the analysis appears to treat these alternative forms in the same way as multilateral governance when they are in fact very different institutional forms. The analysis of linkage, effectiveness, participation, compliance, feasibility, etc look very different in the transnational arena then they do in the multilateral arena. The holistic analysis of International Cooperation that is a strength of this chapter could be enhanced by providing additional analysis of the alternatives on their own merits and from standpoints relevant to the different governance dynamics characteristic of this different institutional form. Much of this literature is already cited, but could be drawn upon more extensively (Bulkeley 2005; Bulkeley et al 2012; Hoffmann 2011; Pattberg 2010; Bernstein et al 2010). Bulkeley 2005 citation: Bulkeley, Harriet. 2005. Reconfiguring Environmental Governance: Towards a Politics of Scales and Networks. Political Geography 24(8): 875–902.<br><br>An arguably more controversial suggestion that follows from this point, is to seek greater balance between the analysis of transnational and multilateral cooperation in discussions of possible architectures for the global response to climate change. Given that two decades of focus on multilateral negotiations has given us lots of experience with the challenges inherent in multilateral approaches, it may be time to focus more of our energies and advice about the design of institutions to the alternative forms of cooperation. | Noted - the suggested literature is covered by the text and Section 13.13 on performance evaluation (including evalution in term of institutional feasiblity) is now included |
| 13649 | 13 | 0 | | | | In this chapter the use of terms such as Robust Evidence and High Confidence is not an accurate statement as many assessments are quite subjective. It is however possible to use terms such as High Agreement, | Rejected - no scientific evidence/publication provided to support |
| 13650 | 13 | 0 | | | | subjective. | Rejected - comment unclear |
| 13653 | 13 | 0 | | | | Extensive re-writing of the chapter is required to reflect more accurately the role of the state. The chapter also inaccurately seeks to portray that the thrust of climate action is moving away from a negotiated binding climate treaty between states to a nebulous partnership of private sector players. It confuses proposals with the actual functioning arrangements. Nominal partnerships, like network of cities, are confused with serious working arrangements that make any serious dent on emission reduction. | Taken into account - covered in Section 13.13 |
| 18350 | 13 | 0 | | | | General comment: Chapter 13 could be improved through a sharpening of key findings and better integration across the different chapter sections. The TSU is thus submitting a range of questions that can guide the author team in focusing their discussions in the relevant sections. | Noted, this comment does not suggest a specific revision, but key findings are being continuously revised as the draft |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 18351 | 13 | 0 | | | | Guiding question: What has been achieved to date to solve the climate change/global commons problem, why has so little been achieved (i.e. identify barriers more clearly). It would be helpful to explain to what extent game theory explains the achievements and failures of climate policy (e.g. has been more or less achieved than projected by the Nash equilibrium?) | In Section 13.1, Taken into account - text revised in 13.1 with additional material<br><br>In Section 13.3, Additional text has been added on game-theoretic models and their lessons for participation, on empirical experience with actual participation, on options for improving participation and effectiveness in the future, and on the methodological difficulty of evaluating actual effectiveness compared to unobserved counterfactual scenarios.<br><br>In Section 13.13, Taken into account - |
| 18352 | 13 | 0 | | | | Guiding question: Which options may potentially be relevant for negotiators in the context of the UNFCCC process and what are the implications: a) keeping the process running, b) linking to national policies, c) focusing on climate finance only? In this context, could you clearly assess the role of different negotiation components, such as capacity building, technology transfer and finance (with a better linkage to Chapter 16) etc., and provide insights of their empirical relevance? This section can be written in policy neutral way because you explore simply the available options. | Taken into account through the creation of a new table (13.2) that updates AR4 Table 13.2. This table will be continuously updated through the next draft. |
| 18353 | 13 | 0 | | | | While sections 13.1-13.7 read very well and provide a good overview of the existing literature, the overlap between 13.3 and 13.4 could be reduced and the sections more closely linked. Also, section 13.3.1 should be clearer about the role of transfers in the context of achieving participation. | In Section 13.5, Taken into account - in new section 13.5.1.4<br><br>In Section 13.6, Rejected - not relevant here<br><br>In Section 13.8, Taken into account. |
| 18354 | 13 | 0 | | | | Sections 13.8-13.13 on the other hand still require quite substantial work to provide an in-depth assessment of the literature and need to be more closely linked. | Noted |
| 18355 | 13 | 0 | | | | Overall, game theoretical perspectives and discussions could be enhanced in the chapter and may be used more to organize the different themes. In this context, it is noted that from a game-theoretical point of view SRM (section 13.4.2) is an exceptionally interesting example but it has to become clearer to the reader why it has been selected and may be better discussed in another section. | Taken into account - combined with comment 18351 |
| 18356 | 13 | 0 | | | | Please check if the impacts of the financial crisis on the UNFCCC process can be described based on the available literature. Also, the issue of environmental rent taxation and its linkage to Chapter 16 should deserve some attention. | Taken into account - new text relating the financial crisis to the operations of the G20 included in 13.13.1.4. Other |
| 18364 | 13 | 0 | | | | The chapter could aim to inprove its linkage to Chapter 2 by more clearly addressing regulatory uncertainty. | In Section 13.2, Taken into account. A very short mentions (and reference) to regulatory uncertainty was introduced at |
| 4724 | 13 | 0 | | | | Generally, I think this chapter would benefit by having more discussion of the importance of ensuring an "effective" future climate agreement, i.e., one that leads to a lowering of emissions relative to what they would have been otherwise. Perhaps this is related to the compliance points but I think more attention to the importance of causing changes in emissions, even if there is low compliance, would seem important to a chapter on international agreements. | Taken into account - covered in the significantly revised Section 13.13 |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 4725 | 13 | 0 | | | | This chapter might also note the need for an effective climate change agreement to include some process for incorporation and response to new scientific findings. Without the ability to incorporate new science, the agreement will not foster the adaptive management that will undoubtedly be necessary to address the climate change challenge in the years ahead. | Taken into account - covered in Section 13.2 |
| 4726 | 13 | 0 | | | | This chapter might also note the need for an effective climate change agreement to include some process for incorporation and response to new scientific findings. Without the ability to incorporate new science, the agreement will not foster the adaptive management that will undoubtedly be necessary to address the climate change challenge in the years ahead. | Taken into account - combined with comment 4725 |
| 18660 | 13 | 0 | | | | Well-written and a joy to read<br><br>Excellent overview and clear conclusions<br><br>+ a complete draft!<br><br>Presents and defines the problem plus describes different efforts made<br>to handle | Noted |
| 18664 | 13 | 0 | | | | IPR is discussed in chapter 15, shouldn't it be included here (if included at all)?<br>DISCUSSED ON page 41 and onwards | Taken into account - covered in Section 13.9 |
| 9039 | 13 | 0 | | | | The chapter tends to argue that the existing multilateral policy regime for climate change under the UNFCCC is not effective in addressing climate change mitigation. The chapter seems to assume that the UNFCCC itself is flawed in terms of its design and architecture and hence there is a need for other arrangements to be designed. It therefore disregards the possibility and thus its treatment is not comprehensive that perhaps the failure of the UNFCCC as a regime is due to the lack of political will to fully implement it rather than to its design per se. | Taken into account - combined with comment 18351 |
| 9040 | 13 | 0 | | | | There are multiple instances of inaccurate characterizations of the Copenhagen Accord as being on the same political and legal footing as the UNFCCC COP16 Cancun Agreements. They are not the same as the Copenhagen Accordwas not adopted by the UNFCCC COP. Accurate characterization as the legal nature of the instrument is important because the chapter discusses international cooperation issues. | Taken into account - covered in Section 13.2 and 13.5 |
| 9041 | 13 | 0 | | | | The chapter can be commended for its treatment of the interlinkages between climate policy and other policy areas, particularly with respect to trade and intellectual property, which is good, but does so in a way that does not fully reflect developing country concerns with respect to the use of unilateral trade measures and to the barriers that IPRs may pose. On IPRs, for example, it emphasizes that strong IP enforcement regimes would have beneficial effects on technological investment but does not present alternative views on this issue. | Rejected – no scientific evidence/publication provided to support changes suggested by the reviewer |
| 9042 | 13 | 0 | | | | The chapter does not adequately survey and recognize the existingUNFCCC provisions regarding climate change-related technology transfer and climate finance as the policy jumping off point for discussions on international cooperation in these areas. | Rejected – no scientific evidence/publication provided to support changes suggested by the reviewer |
| 11586 | 13 | 0 | | | | All through the chapter there is a consistent statement that international cooperation is needed to mtigate climate change. While stating that there is uniform mixing of GHGs there is need to state that the impacts are not uniform and its those countries that are least able, and have not contributed to the problem, with little or no adaptive capacity that bear the brunt of the adverse effects of climate change. | Taken into account - text revised throughtout chapter |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 16174 | 13 | 0 | | | | Recommend moving section 13.5 before 13.2. The "Framing concepts" are highly abstract and presented in technical terms specific to the authors' disciplines such that, while they are valuable, it is likely to be difficult for non-specialists to easily read, understand and engage with the material. By sequencing the framing concepts after the discussion of current agreements and institutions readers will be well positioned to deepen their understanding of the theoretical research and to apply it to climate change. | Rejected - we believe the current organization to flow logically |
| 16175 | 13 | 0 | | | | Human rights agreements and instruments are increasingly relevant to international climate change arrangements, and so warrant mention here. The widely-subscribed UN Charter and Universal Declaration of Human Rights (U.N.G.A. Res. 217A (III) U.N. Doc. A/810 (Dec. 10, 1948) provide the basis for claims by indigenous peoples and small island states that reduction of GHG emissions is a legal obligation. Three UN Human Rights Council resolutions (Resolution 7/23 (2008), Resolution 10/4 (2009), and Resolution 18/22 (2012) addressed the link between continued GHG emissions and human rights. Whether human rights consitute a legally binding obligation on states to minimize climate change is controversial. (Wolfgang Sachs. 2006. Human Rights and Climate Change in Interactions between Global Change and Human Health. 349 Pontifical Academy of Sciences 349; Lavanya Rajamani. The Increasing Currency and Relevance of Rights-Based Perspectives in the International Negotiations on Climate Change J Environmental Law (2010) 22(3): 391-429.) There has also been extensive discussion of the human rights effects of climate change agreements and policies (for example, the consequences of the promotion of biofuels), which should be mentioned. Many other sources are available in the literature on this topic, should it be agreed that it ought to be included in the next draft. | Taken into account - combined with comment 2931 |
| 16176 | 13 | 0 | | | | While carbon tax is a policy that is implemented at the national or subnational level, it seems like a gap in coverage not to mention it as a policy option and note that would not be implemented at an international/multilateral level because international instruments do not have capacity to impose taxes. | Taken into account - carbon taxes are mentioned as an instrument under strong multilateralism and harmonized |
| 16358 | 13 | 0 | | | | Whilst the chapter draft gives a comprehensive overview of international negotiations, agreements and partnerships, it currently contains quite a lot of repeated material that makes it difficult to read in its entirety (eg discussion of CDM design and shortcoming comes up in several sections, as do national and non-national agreements and partnerships outside of the UNFCCC). Also, the concluding sections on finance and investment (13.11) and public/private involvement (13.12) deserve to be more comprehensive and take a stronger role in the overall chapter. | Noted |
| 11328 | 13 | 0 | | | | The chapter is very heavily focused on economics, trade and investment issues and does not adequately incorporate legal aspects or address the interlinkages between the international climate regime and other areas of international law and policy making. It misses a significant aspect of the international cooperation interface which is the possibility for substantive and procedural fragmentation and/or conflict between and among climate and non-climate regimes. For a comprehensive assessment of these interlinkages see the various chapters in Rayfuse, R. and Scott S. V. (eds.), International Law in the Era of Climate Change (Edward Elgar, 2012). The Australia EU linking arrangements will also need to be considered | Taken into account - our survey of the legal literature has improved, including citations to the Rayfuse and Scott book. |

|---|---|---|---|---|---|---|---|
| 7133 | 13 | 0 | | | | The broadening of the institutions and policies addressing climate change is a consequence of the increase in the complexity of the climate debate, but also of the climate impacts, and of the public awareness on the matter.<br>All those elements are connected. With the goal of keeping the increase of temperature below 2 degree a much more aggressive mitigation policies are required at global, regional, national and subnational levels. The needs for adaptation are also increasing the need for several modalities of cooperation.<br>The Chapter makes reference several times at the increase in the complexity of climate arrangement since AR4, and maybe it could be useful to try to explain why it is happening.<br>This explanation could be useful also because in the way it now appears in the document produce the impression that is taken place a fragmentation of the global climate policies. That broadening is not necessarily detrimental to UNFCCC, but supportive in many cases. It is not the case of facing UNFCCC vs other modalities, but taking all – or at least many of this institutional arrangement – as part of a system with the same final porpoises.<br>Is also important to remark that International cooperation on climate change is not only expressed through direct actions for mitigation (targets, timetables, taxes, cap and trade, and so), but also by means of finance, tech and capacity building support, as is the case of UNFCCC, that is also strong multilateralism. In fact, UNFCCC is mainly about that kind of cooperation, due to the fact that no specific and enforceable mitigations goal appears in the Convention. That kind of cooperation paved the way for specific mitigation actions that resulted in the KP. | Taken into account - combined with comment 11328 |
| 11127 | 13 | 0 | | | | Reading is somehow disperse and complex. It would improve with reduction of text. It would also help to explain and discriminate concepts such as governance, authority and government, for example: the difference between authoritarian and command-control policies, on the one hand, and democratic participation on the other. | Noted |
| 3976 | 13 | 0 | | | | Overall, the chapter does a commendable job of integrating the state of the art on international climate policy, comprising a variety of disciplines and viewpoints. My main general concern relates to the Chapter's structure. The chapter rightly points to the complexity of international climate policy as a recent theme in the literature. However, it does so in a rather confused and disorganised fashion. For instance, the issue is first highlighted with Figure 13.1 in a subsection that barely addresses the issue. The issue is next touched upon in Section 13.3.1, but again only tangentially. The issue returns again in Sections 13.5.1.2-13.5.1.4, but also in 13.6, 13.8, 13.9 and 13.11. The problem with this scattered approach to the issue is that it becomes unclear which questions are being addressed. The Executive Summary does a better job at raising and addressing these questions (to the extent the literature allows). My suggestion is to be clearer about the specific questions that are being addressed. These include : 1) How does the regime complex for climate change look like - this is addressed in part by Figure 13.1 and its accompanying text; 2) What are the advantages and disadvantages of addressing climate change through a variety of institutions rather than through a single institution (this is in part addressed in section 13.5.1.2); 3) What are the possible responses to complexity? These responses could include linkages (which are discussed in Sections 13.6 and 13.7) but they are also discussed in other sections (e.g. 13.8 discusses how to respond to climate-trade interactions). | Taken into account - text revised throughout to focus discussion on complexity and fragmentation |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 3977 | 13 | 0 | | | | Related to the first point, it is unclear why the chapter has chosen to single out interactions between international climate policies and issues such as international trade, technology transfer, capacity building and investment and finance. While I do not dispute the importance of these issues, there is virtually no attention for the institutional interactions between climate change and biodiversity; climate change and ozone depletion; climate change and local air pollution; climate change and marine pollution, to name but a few examples. There is no lack of literature on these issues. To give but a small sample: On biodiversity: 1) Sagemüller, Imke (2006). Forest Sinks under the United Nations Framework Convention on Climate Change and the Kyoto Protocol: Opportunity or Risk for Biodiversity? Columbia Journal of Environmental Law 31(2), 189-242; 2) Asselt, Harro van (2011). Integrating Biodiversity in the Climate Regime's Forest Rules: Options and Tradeoffs in Greening REDD Design. Review of European Community and International Environmental Law 20(2), 139-149; 3) Jacquemont, Frédéric, and Alejandro Caparrós (2002). The Convention on Biological Diversity and the Climate Change Convention 10 Years after Rio: Towards a Synergy of the Two Regimes? Review of European Community and International Environmental Law 11(2), 139-180; 4) Long, Andrew (2011). Global Climate Governance to Enhance Biodiversity and Well-Being: Integrating Non-State Networks and Public International Law in Tropical Forests. Environmental Law 41(1), 95-164; 5) Morgera, Elisa (2011). Far Away, So Close: A Legal Analysis of the Increasing Interactions between the Convention on Biological Diversity and Climate Change Law. Climate Law 2(1), 85-115; 5) Pittock, Jamie (2011). A Pale Reflection of Political Reality: Integration of Global Climate, Wetland, and Biodiversity Agreements. Climate Law 1(3), 343-373; 6) Savaresi, Annalisa (2012). Reducing Emissions from Deforestation in Developing Countries under the UNFCCC: Caveats and Opportunities for Biodiversity. Yearbook of International Environmental Law 21. On ozone depletion: 1) Oberthür, Sebastian, Claire Dupont, and Yasuko Matsumoto (2011). Managing Policy Contradictions Between the Montreal and Kyoto Protocols: The Case of Fluorinated Greenhouse Gases. In: Oberthür, Sebastian, and Olav Schram Stokke (Eds.), Managing Institutional Complexity: Regime Interplay and Global Environmental Change. (115-142). Cambridge, MA: The MIT Press; 2) McCabe, Daniel G. (2007). Resolving Conflicts between Multilateral Environmental Agreements: The Case of the Montreal and Kyoto Protocols. Fordham Environmental Law Review 18(2), 433-466. On local air pollution/short-lived climate forcers: Rosenthal, Erika, and Robert Watson (2011). Multilateral Efforts to Reduce Black Carbon Emissions: A Lifeline for the Warming Arctic? Review of European Community and International Environmental Law 20(1), 3-10. While I appreciate it may not be possible to integrate all these topics, at the very least the emerging body of literature on these institutional interactions should be acknowledged. | Taken into account - discussion of multiple interactions of climate change with other policy areas has been strengthened throughout.<br><br>In the next round of revisions, the links between climate policy and international conventions on biodiversity and desertification will be highlighted more thoroughly. |
| 3978 | 13 | 0 | | | | The term 'regime complex' is nowhere defined in the chapter. Does it only include multilateral, negotiated regimes? Or also public-private or even private initiatives? If the latter (which seems to be implied in the chapter), is the term even accurate? | Taken into account in the ES and Section 13.2 |
| 3172 | 13 | 0 | | | | CHAPTER 13<br><br>This chapter is in fine shape. I have lots of detailed comments, but that is mainly because this is one of the few chapters that is essentially complete (with a couple notable exceptions) and not so massively over-limit in length that it is impractical to review the text. | Noted |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 18432 | 13 | 0 | | | | The chapter has two major problems. The first one is avoiding addressing the strong contradiction between the outcome of climate science and the outcome of the UNFCC climate process. This process is presented with a bias in favor of authors that view the process in an optimistic way. Authors that have made a negative assessment of the UNFCCC process are reviewed but their conclusions have small weight in the overall tone of the chapter. This is very clear in pages 26 and 27, where the failures of the process are listed: end of Kyoto Protocol, new global agreement expected only in 2015 (whose probabilities are low), the insufficiency of Cancun pledges to avoid 2C target, and the problems of adaptation funds. However, the frame of the segment is too optimistic: the UNFCCC and the KP led to more climate action than any other agreement (pag 26 par 1). This is not wrong, but it should be presented in other way: current climate policy architectures are clearly failing, so other paths should be explored. There is a major mistake in the whole chapter: the argument that the UNFCCC negotiations are good, even when it has almost no impact in terms of emission reduction and other related goals. A second problem is not addressing the recent trajectory of carbon emissions and the assessment of climate/energy policies in each one of the major carbon emission countries. It could be the G20 countries, maybe adding some others like Nigeria, Egypt, Democratic Republic of Congo, Iran, Venezuela, Pakistan and Vietnam. | Rejected – no scientific evidence/publication provided to support changes suggested by the reviewer |
| 11435 | 13 | 0 | | | | The chapter tends to argue that the existing multilateral policy regime for climate change under the UNFCCC is not effective in addressing climate change mitigation. Hence, it argues, there is a need for regime change. However, the chapter does not have a clear discussion of exactly why the UNFCCC is not effective – e.g. whether the arguable ineffectiveness is due to the policy design and architecture of the UNFCCC itself (e.g. a in se flaw in the regime) or to the failure of implementation of the UNFCCC by those supposed to implement it (e.g. an implementation flaw). The chapter seems to assume that the UNFCCC itself is flawed in terms of its design and architecture and hence there is a need for other arrangements to be designed. It therefore disregards the possibility that perhaps the arguable failure of the UNFCCC as a regime is due to the lack of political will to fully implement it rather than to its design per se. | [draft single response will be made in line for comment #29] |
| 11436 | 13 | 0 | | | | There are inaccurate characterizations of the Copenhagen Accord as being on the same political and legal footing as the UNFCCC COP16 Cancun Agreements. They are not the same as the former was not adopted by the UNFCCC COP. Accurate characterization as the legal nature of the instrument is important because the chapter discusses issues | Taken into account - combined with comment 9040 |
| 11437 | 13 | 0 | | | | The chapter makes a strong pitch for the use of carbon market mechanisms as a key feature of any new international cooperation regime on climate change. It gives a lot of space for a discussion on the interlinkages between climate policy and other policy areas, particularly with respect to trade and intellectual property, which is good, but does so in a way that does not fully reflect developing country concerns with respect to the use of unilateral trade measures and to the barriers that IPRs may pose. On IPRs, for example, it emphasizes that strong IP enforcement regimes would have beneficial effects on technological investment but does not present alternative views on this issue. | Taken into account - combined with comment 9041 |
| 11438 | 13 | 0 | | | | The chapter does not adequately discuss UNFCC provisions regarding climate change-related technology transfer and climate finance as the policy jumping off point for discussions on international cooperation in these areas. | Taken into account - combined with comment 9042 |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 14700 | 13 | 0 | | | | Related to my comment no 3. The chapter's overall use of key terms like "agreement" (in my understanding: an individual accord between governmental and / or non-governmental actors) , "regime" and "institution" appears eclectic and interchangeable. This may create difficulties, since one of the chapter's explicit purposes is to give an overview of the complexity of global climate governance - and its different institutional elements. It therefore would be useful to briefly define and distinguish these terms for the purpose on the report based on some widely acknowledged international relations or international law definitions (as suggested in my comment no. 3 for 'regime' and 'institution') - and then use them accordingly throughout the report. | Taken into account - consistent usage of terminology has been improved, but we will continue to check for such confusing issues in the next round |
| 14701 | 13 | 0 | | | | This section gives a concise and much needed overview on the institutional nexus between climate and trade. However, it raises the question why other crucial institutional overlaps between climate change and other issue areas are not equally treated here in their own sections of chapter 13. This goes, for instance, for climate change and security, climate change and biodiversity, etc. I understand that these issues are partly dealt with in different chapters of the report. Still, giving climate and trade (and in the next sections: climate and technology; climate and investment) this extra attention in chapter 13, while leaving out other ovelaps, appears a bit selective. A solution would be to at least briefly introduce an overview of overlaps (that also accounts for: climate and forestry institutions; climate and biodiversity institutions; climate and energy institutions; climate and security institutions; climate and development institutions) - and then refer to the respective chapters and sections of WGIII AR5 where these institutional overlaps are addressed. | Taken into account - combined with comment 3977 |
| 10446 | 13 | 0 | 0 | | | I would urge you to refer http://planningcommission.nic.in/reports/genrep/index.php?repts=report_carbon.htm for future plans of India in terms of development as spelled out by its 12th five year plan | Rejected - outside of the scope of Chapter 13 |
| 6324 | 13 | 1 | | 58 | | The chapter contains useful information, but some aspects might need to be addressed, in particular the following: 1) Frequently, there are comparisons between diferent approaches without specifying what of these approaches has been implemented in practice and what are "paper approaches" prepared or suggested by scholars, but not implemented. This information should be provided; 2) In some sections the bibliographic sources of given statements and, even, of whole paragraphs are not identified. This does not allow to know if the authors missed to include the bibliographic sources or if the written statements come from the own author's ideas or views; 3) In some cases the sections do not reflect different opposite views in areas that are known to be controversial. | Taken into account - primarily covered in Section 13.13 |
| 14669 | 13 | 1 | | 92 | | A few overarching comments. First, I felt like much of this chapter read like a catalog. It would provide much more value to the reader if it could include more synthesis. Why are capacity building, or technology transfer, or finance important for the design and implementation of an international climate policy architecture? How do they relate to the principles presented at the top of the chapter. Second, I strongly recommend a sub-section on policy surveillance (i.e, national communications, emission inventories, MRV, and ICA). This is an important issue and needs more than the few, brief discussions in the current draft of the chapter. Third, and I suspect the next draft will highlight this in section 13.13, it is important to note the effectiveness of the various approaches taken to date on the elements that receive attention in specific sub-sections. For example, can one understand how the structure of agreements related to adaptation have impacted the effectiveness of adaptation efforts? Fourth, insights on how a reader may think about the evolution of international climate policy architecture would be helpful. The UNFCCC was originally charcterized by voluntary emission goals for about 35 nations. Today, the discussion is about whether to make legally binding commitments around a whole host of policy elements -- emission goals, financing goals, tech transfer, adaptation, etc. -- for developed and developing countries. In addition, the emerging role of SRM/geoengineering and how that affects the design, participation, implementation, and compliance with an international climate agreement is important. | Taken into account - deeper synthesis has been included in this draft; MRV discussion in 13.3 has been strengthened; the revised 13.13 synthesizes the literature on performance assessment in subsectors; the evolution of the UNFCCC is also covered in the revised 13.13; SRM governance is discussed in the revised 13.4 |

|---|---|---|---|---|---|---|---|
| 3965 | 13 | 10 | 27 | 10 | 28 | It is not so easy to characterize the climate change as “global commons” in international law. Climate change has been characterized in several ways including “common property”, “common heritage” and “common concern”. Common property, or res communis, refers to areas such as the high seas that are open for legitimate use by all States, and which may not be appropriated to the sovereignty of any individual State. Airspace above the high seas is in this sense “common property.” However, like sovereign airspace, common property is fundamentally a spatial dimension, and is therefore insufficient to deal with the atmosphere as a global unit as described in paragraphs 83-86 above.<br>The concept of common heritage was employed in UNCLOS Part XI on deep sea mining and in the Moon Treaty. However, Malta’s attempt at the UN General Assembly in 1988 to have the global atmosphere declared part of the common heritage of mankind was unsuccessful. Since ‘common heritage’ implies that a resource must be exploited and conserved for the benefit of mankind as a whole, such designation would usually require a far-reaching institutional apparatus to control the allocation of exploitation rights and benefits. If the atmosphere were treated as part of the common heritage of mankind, it would, in effect, place atmospheric problems under collective management - something widely considered premature.<br>While the concepts of common property and common heritage may not be appropriate indicators of the legal status of the atmosphere, the notion of common concern is, and should be included in its legal status under international law. In 1988, the UN General Assembly declared in resolution 43/53 on the “Protection of global climate for the present and future generations of mankind” that climate change was a “common concern of mankind”, somewhat mitigating the failure of Malta’s proposal mentioned above. The same concept was incorporated in the 1992 UN Framework Convention on Climate Change (preambular paragraph 1). In view of the growing recognition of the linkages between transboundary air pollution and global climate change, application of the concept of common concern to the whole of atmospheric problems should be considered appropriate.<br>The legal content of the concept of common concern is that States can no longer claim that atmospheric problems are within the reserved domain of domestic jurisdiction, because the issues now legitimately fall under “matters of international concern”. It will certainly lead to the creation of substantive legal obligations on the part of all States to protect the global atmosphere as enforceable erga omnes. It may be too early at present to interpret the concept of common concern as giving “all States a legal interest, or standing, in the enforcement of rules concerning protection of the global atmosphere,” in view of the absence of appropriate procedural law to implement such an interpretation. It may also be premature to consider that the concept of common concern creates rights for individuals and future generations.<br>Based on the foregoing analysis, it may be concluded that the atmosphere, and climate change in particular, has the legal status of an international resource, whether shared or common, indispensable for sustaining life on earth, health, crops and integrity of ecosystems that it is a common concern of mankind. | Coverage of the legal literature is presented in the current draft, but conceptualization from other disciplines is also included. Perhaps more could be done to distinguish which disciplines the cited literature come from, but our mission is to synthesize across disciplines. |
| 4714 | 13 | 10 | 31 | 10 | 32 | "These characteristics create incentives for actors to “free ride” on others’ investments in climate protection." True but, in addition, as US behavior makes clear, a MAJOR obstacle to international cooperation is not agreement that climate change mitigation is worthwhile but we want others to pay for it but, instead, that we are not sure that climate change mitigation makes sense (whether because of scientific disagreement or because of valuing the benefits of emitting carbon over the costs of restricting such emissions). The point is that some countries, in principle, and many others in practice, are behaving in ways that suggest they believe that addressing climate change is less important then economic growth, full stop. A Tragedy of the Commons problem involves everyone agreeing on the goal but some not wanting to contribute to achieving that goal -- in the climate case, however, that captures part but only part of the problem. A separate obstacle is the disagreement among countries over the goal itself, or the priority of the climate goal relative to other goals. | Rejected. The tragedy of the commons involve overuse of the commons because of free-riding. So, what matters is action, not goals. Those exploiting the commons do not share the goal of sustainable use with others. |

| 13546 | 13 | 10 | 8 | 10 | 18 | The connections between chapter 13 and chapter 15 could be strengthened. Specifically, the idea that sub-national, national, and transnational policy experiments (see Hoffmann 2011; Bulkeley et al 2012, Rabe 2007b) could be the source of coalitions that make multilateral cooperation more likely is under-explored in Chapter 13. The focus of chapter 13, not unsurprisingly given what the bulk of the literature focuses on, concerns top-down forms of cooperation—how treaties and/or large multilateral agreements can be designed effectively to motivate and channel action. The literature on climate governance has begun to more significantly explore how climate action in other arenas could be the catalyst for action and that multilateral process might instead serve a coordinating role (Abbot 2011) or even follow from subnational and transnational action (Selin and Vandeveer 2009, Hoffmann 2011; Bulkeley et al 2012) | Editorial-copyedit prior to publication. Linking other levels of government is already discussed in chapter 13 (e.g. section 13.8) and linking among different levels of government is also analyzed. Most references are incomplete. However, attempt will be made of tracking them before publication. |
| 13911 | 13 | 10 | 1 | 10 | 5 | This sentence appears as a statement which does not follow logically: The first part states that coordinated action may be more effective than uncoordinated action, the second lists the reasons for this (diverse preferences and perceptions; geographically widespread emissions sources; uncertain and non-homogenous mitigation costs and climate change impacts). However, these seem to be more the barriers to cooperative action, than reasons behind its benefits. See Barrett, S., "Environment and Statecraft: The Strategy of Environmental Treaty-Making", Oxford, OUP, 2003. Barrett shows that the reasons behind the presumed effectiveness of cooperative action are: climate stabilization is a public good that cannot be provided by single actors (except potentially geo-engineering); the need to deter free riders; the possibility for pareto optimizing negotiation and effort sharing; the possibility for positive international spillovers resulting for more efficient, larger-scale actions | Taken into account. Text has been rephrased. Barrett (2003) was already cited. |
| 13912 | 13 | 10 | 11 | 10 | 13 | This list of ways to smooth the internalization of externalities is maybe missing the literature on effort sharing negotiations (see Ringius, L., "Differentiation, Leaders, and Fairness: Negotiating Climate Commitments in the European Community", International Negotiation, 4: 133–166, 1999); and the oppotunity to link climate policy to other policy agendas, such as fiscal reform, energy security, or sustainable development (see Huberty, M., "Green growth as necessity and liability:<br>The political economy of a low-carbon energy systems transformation in the European Union", Berkeley Roundtable on the International Economy, Working Paper no. 200, 2011. | Rejected. The first recommended is a bit "old". The second recommended paper is interesting, but grey literature. If published in time, better inserted at line 22 of page 10. |
| 6948 | 13 | 10 | 27 | 10 | 32 | Please see previous comments on this particular phrasing -- in addition, suggest not to simply copy/paste text here (in particular if it's partly incorrect) to avoid repetition and duplication. | Accepted. Change the word “depository” such as with the word “receptor” |
| 10806 | 13 | 10 | | 11 | | It is worth locating these principles more robustly, particularly with relevance to international law. While all these princples listed here may be relevant, they are not all equally clearly articulated, nor as widely accepted. One way to sort through them is to note which ones are enshrined in international law, and and how robustly. Absent this location and grounding, this section is very weak. | Taken into account. The reasons for the choice of principles and criteria that were selected has been clarified. |
| 14246 | 13 | 10 | | | | The discussion of various "principles" is a bit ad-hoc, artificial and mysterious. In economics we are concerned with simply efficiency and distribution, and that captures all the variants you here refer to. Cost-effectiveness is implied by efficiency (pareto efficiency, or as here utalitarianism: the maximization of global net benefits). The precautionary principle follows from uncertainty and risk aversion. Sustainability follows from both distribution and efficiency if discount rate is sufficiently low. Fairness refer to distribution, etc. | Taken into account. The reasons for the choice of principles and criteria that were selected has been clarified. The link among criterias has been analyzed more in depth. |
| 11588 | 13 | 10 | 48 | 11 | 29 | Equity is a key issue and should be included as a principle | Rejected. "Equity" is stated on page 11 line 4. It is also included under the principle of CBDR and respective |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 18437 | 13 | 11 | | 13 | | I think one central principle is missing, the effectiveness of any treaty in terms of emission reduction with strong reference to the demands of science (pag 11 paragraph 2). This principle is common in literature, such as Stern or Keohane, but here seems not to be presented in an explicit way. Missing this principle, the others are incomplete: how to discuss efficiency and equity absent clear mitigation targets? Even more, the tradeoff (conflict) between effectiveness and equity has been always at the center of international climate politics. Those principles listed on page 11 are all related to "how", but no one focuses on "what" has to be done. This is rather strange because the reference to effectiveness appears immediately after as a criteria to assess the success of international cooperation (pag 12 par and last paragraph2; pag 42 par 1), along with efficiency and equity (pag 13 par 6 and 7).<br>I think the paper should talk about potential unpleasant tradeoffs between justice and effectiveness: it might discuss if there is a hierarchy in principles, and with the growing evidence of the climate crisis, effectiveness should not be gaining terrain in relation to efficiency and justice. | In Section 13.2, Rejected. Text in Section 13.2.2. and (Table 13.1) already includes environmental effectiveness.<br>We distinguish environmental effectiveness from compliance and from equity. Conflicts and complementarities among criteria are discussed in the text.<br><br>In Section 13.3, Section 13.2 already explicitly discusses environmental effectiveness as a primary objective, which is also highlighted in Table 13.1. Then, section 13.3. does explicitly |
| 2306 | 13 | 11 | 1 | 92 | 1 | GENERAL COMMENT: On the whole, this chapter is quite sound, although it does not get to the heart of the political issues involved. Perhaps a cogent political analysis is impossible in the IPCC context since these issues are so sensitive. I really liked Figure 13.1. | Noted. No action required. |
| 2164 | 13 | 11 | 12 | | | Sometimes first names (or their abbreviation) are stated and sometimes not (whole chapter 13). Please check! | Editorial -copyedit to be completed prior |
| 2268 | 13 | 11 | 15 | 11 | 18 | The precautionary principle is based o the assimption of maximum effort for the least risk . It is the opposite of common sense. | Rejected. Normative comment. No literature suggested for the statement. |
| 3742 | 13 | 11 | 15 | 18 | | differentiate between outcomes and outputs | Rejected. Comment unclear, there is no mention of outcomes/outputs in the text |
| 3966 | 13 | 11 | 15 | 11 | 15 | The term "precautionary principle" is misleading and inappropriate, treating as if it was a "legal" principle. The principle is not yet established, apart from specific treaty provisions, as customary international law. The Draft should continue to use the expression "precaution" or "precautionary measures (or approaches)". See, ILA Committee on Legal Principles relating to Climate Change, First Report, 2010, Second Report, 2012, http://www.ila-hq.org/en/committees/index.cfm/cid/1029 See also, Report of the National Committee, "Legal Principles relating to Climate Change: Preliminary Issues on the Methodology and Scope of the Work", Japanese Yearbook of International Law, vol. 52, 2009, pp. 508-511. | Taken into account. The term "precautionary principle" was change to the "precaution" principle. |
| 2407 | 13 | 11 | 15 | 11 | 15 | Comment on specific text: The core of the precautionary principle is that it creates policy space for regulators to act to guard against risks even in the face of scientific uncertainty. Your definition does not quite capture that. | Taken into account. The precaution principle was linked to risk by mentioning Weitzman dismal theorem |
| 2267 | 13 | 11 | 19 | 11 | 21 | Sustainable Development is impossible, There are only two directions, forward and backward. Future generations will make up their own minds up on what they want and they will not appreciate what we have willed upoin them. Currently we have plunged the next generatikon into mass unemployment. | Rejected. Normative comment. No literature suggested for the statement. No action required. |
| 3967 | 13 | 11 | 19 | 11 | 19 | On "sustainable development", add to the reference the ILA's final report and resolution: http://www.ila-hq.org/en/committees/draft-committee-reports-sofia-2012.cfm | Noted. This reference would need to be vetted. Hold for consideration in the next |
| 17098 | 13 | 11 | 19 | | | the principle of sustaianble development, as it is now emerging in the climate negotiations (China and the African Group calling for looking at concentrations of GHG's and sharing the carbon budget, at the most recent talks in Bangkok) and the literature cited above, as well as my peer reviewed work published in recent editions of 'Climate and Decelopment' need to be acknowledged, rather than the IPCC of 2007 and the World Bank on 2010. As the Cancun Agreement stated the political issue is equitable access to sustaianble development in the context of ecological limits and is about sharing the global commons, or sinks, or the carbon budget | Taken into account. Instead of citing a few papers on the vast sustainable development literature, a reference to chapter 4 review on that issue was added. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 11440 | 13 | 11 | 19 | 11 | 21 | This is an inaccurate characterization of the concept of sustainable development. The multilaterally accepted definition of sustainable development is contained in paragraph 2 of the 2002 Johannesburg Plan of Implementation (see http://www.un.org/esa/sustdev/documents/WSSD_POI_PD/English/WSSD_PlanImpl.pdf) and in paragraph 4 of the 2012 Rio+20 Outcome Document (see http://www.uncsd2012.org/content/documents/727The%20Future%20We%20Want%2019%20June%201230pm.pdf). The multilaterally agreed definition of sustainable development emphasizes the integration of the three pillars of sustainable development – economic development, environmental sustainability, and social development – rather than the temporal aspect of the academic definition of sustainable development that came out of the Brundtland Commission report and which were picked up by the IPCC and the World Bank. | Combined with comment # 17098 |
| 6833 | 13 | 11 | 2 | 11 | 8 | Inaccurate to characterize Rio Declaration and UNFCCC as 'literature' - these are legal instruments of varying degrees of legal bindingness and gravitas. This entire section needs to be further researched and nuanced. | Taken into account. Text was rephrased. |
| 14640 | 13 | 11 | 22 | 11 | 29 | Why are CBDR/RC and fairness treated as separate principles? Isn't CBDR/RC any interpretation of fairness? | Taken into account. We follow UNFCCC (art 3.1.) by not merging both concepts: "The Parties should protect the climate system for the benefit of present and future generations of humankind, on the basis of equity and in accordance with their common but differentiated |
| 14342 | 13 | 11 | 22 | 11 | 25 | With regard to "common but differentiated responsibilities and respective capabilities" - the text here assumes that this concept has been defined as purely a "historical" metric. In fact, there is no agreed definition of this concept, and certainly no agreement that it refers only to historic responsibility or capabilities. Current and/or future responsibility and capability are just as relevant. It is also important to note that both CBDR and equity are both closely linked to action, as in Article 3.1 of the 1992 Convention which says that all should act to protect the climate based on CBDR and equity. So they cannot be viewed outside of the context of action. | Rejected. The current text clearly mentions current responsibility and does not seem to give the impression that the concept should not relate to concrete action. |
| 3968 | 13 | 11 | 22 | 11 | 22 | On CBDR principle, add to the references the above ILA Committee on Legal Principles relating to Climate Change, First Report, 2010, Second Report, 2012, http://www.ila-hq.org/en/committees/index.cfm/cid/1029; and also the excellent study by Lavanya Rajamani, Differential Treatment in International Environmental Law (Oxford University Press, 2006. See also, Report of the National Committee, "Legal Principles relating to Climate Change: Preliminary Issues on the Methodology and Scope of the Work", Japanese Yearbook of International Law, vol. 52, 2009, pp. 505-508. | Taken into account. Some of the reference are grey literature. The Lavanya Rajamani book reference was added. |
| 14641 | 13 | 11 | 26 | 11 | 29 | An alternative view of fairness is one focused on outcomes. An agreement can be characterized as "fair" if countries willingly participate and comply with it. By their actions, they reveal their interpretation of the agreement as fair if they submit to the commitments represented therein. | Taken into account. Text was rephrased to include both outcomes and procedural fairness. A link was made to chapter 3 |
| 3743 | 13 | 11 | 26 | 29 | | elaborate this | Taken into account. Text was rephrased. |
| 12796 | 13 | 11 | 26 | 11 | 29 | You may like to provide a link and make a cross reference to chap. 4. | Taken into acccount. Cross reference to chapter 3 (on ethics) was added. No reference here on chapter 4 since it |
| 15662 | 13 | 11 | 26 | | 29 | To link more clearly with the discussion at the top of the page and avoid further proliferation of concepts, the principle of "fairness" could be used synonymously with the principle of "equity". This is common in the literature. See for example Soltau, F. 2009. Fairness in International Climate Change Law and Policy. New York: Cambridge University Press. | Taken into account. Cross reference to Chapter 3 included. |
| 6835 | 13 | 11 | 26 | 11 | 29 | None of the principles in FCCC Article 3 referred to above, engage notions of fairness that cover distributive justice within countries. Need to specify whether this is sourced to the FCCC or suggested in the literature. Cannot blur boundaries between the two without running the risk of erroneously converting aspirations/opinions expressed in secondary literature into interpretations of legal text. | Rejected. Fairness among countries and within countries belong to the generation of justice. Text in its present state is not saying that art 3 affirms it is. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 2165 | 13 | 11 | 26 | | | Fairness does not only involve distributive fairness, but also procedural fairness (agents' conduct in the negotiation process). This should be mentioned here. Also reference could be made to Rabin (1993), American Economic Review and the concept of kindness functions in his game-theoretic approach. | Taken into account. The different aspects of fairness have been added as procedural and outcome fairness. The |
| 17099 | 13 | 11 | 26 | | | the principle is NOT "fairness" but "equity". The developed countries are describing this element as fairness while the developing countries refer to equity. You also refer to equity, but in the grouping club it under fairness. It should be EQUITY. | Editorial -copyedit to be completed prior to publication. This issue may be asked to co-chairs. See my answer to |
| 13630 | 13 | 11 | 30 | 11 | 41 | Suggest an example or two here. | Taken into account. Text was elaborated. |
| 3744 | 13 | 11 | 31 | 41 | | elaborate the tradeoffs/conflicts | Taken into account. Text was elaborated. |
| 7138 | 13 | 11 | 46 | 12 | 2 | "There are also goals not related with mitigation e.g the 100 billions on finance agreed on Cancun. As stated before, climate change agreements are not only about mitigation goals…" | In Section 13.2, rejected. Goals are those that imply reduction in concentrations. Funding is a mean to achieve that goal in a more equitable (and more feasible) way. Nevertheless, finance issues are considered important in international negotiations and so are treated in Section 13.11. |
| 4957 | 13 | 11 | 9 | | 29 | six broad categories: .. ~ but there are only five ? | Taken into account. Text rephrased to list five principles, by linking cost benefit |
| 8093 | 13 | 11 | 9 | 11 | 9 | Suggest changing "broad categories: The principle" to "broad categories: First, the principle" as on initial read it was unclear that lines 9-14 were related to the first principle only. | Taken into account. Text rephrased to list five principles, by linking cost benefit |
| 18692 | 13 | 11 | 9 | | | "[…] six broad categories" - I believe only give categories are covered in the following. | Taken into account. Text rephrased to list five principles, by linking cost benefit principle to cost effectiveness. Several |
| 6834 | 13 | 11 | 9 | 11 | 29 | Need to first source these principles (in the order in which they appear in Article 3 if that is the primary source), provide widely accepted legal interpretations of them, and then introduce secondary literature on these. Currently the legal interpretation and the aspirational/normative views on it have been conflated. Also need to cite work by the numerous Southern scholars that have worked on these principles. Among others, I have written an Oxford University Press, UK manuscript on Differential Treatment/CBDRRC, and numerous articles on peer-reviewed legal journals on CBDRRC. Also see the two Reports of the International Law Association Committee on the "Legal Principles Relating to Climate Change." http://www.ila-hq.org/en/committees/index.cfm/cid/1029 | Taken into account. Rajamani Lavanya (2012) is now cited, as it is peer-reviewed. Other literature would have to be throughly vetted. |
| 11333 | 13 | 11 | | | | What are the four criteria listed by Gupta referred to in line 1? What are the six broad categories referred to in line 9? How does this relate to the five principles listed and described? | Taken into account. The reasons for the choice of principles and criteria that were selected has been clarified. The difference between principles and criteria |
| 13914 | 13 | 11 | 15 | 11 | 18 | The discussion of the principle of precaution could also reference Weitzman's article, as it integrates the fat-tail risks particular to climate change with an empirical analysis of how these relate to the principle of cost-effectiveness, and in particular the discount rate used to measure same. See Weitzman, M., "A Review of The Stern Review on the Economics of Climate Change", Journal of Economic Literature, Vol. XLV (September 2007), pp. 703–724 | Accepted. There was a reference to Weitzman (2009, not 2007) in page 13 line 28 (section 13.2.2.1). That reference was replaced and Weitzman work conclusion on fat-tails was included in |
| 11682 | 13 | 11 | 9 | 11 | 29 | The author notes that "These principles can be grouped into six broad categories:", used Second, third, fourth, fifth, I think after the first principle, A related principle is also one category, the wording is a little bit confusing, so I think better to write a separate para. for the 2nd principle - cost-effectiveness, then it is much clear with six categories | Accepted.. Principles have been reduced to five by groping together two related principles: benefit/cost analysis and cost-effectiveness. The text was |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 13913 | 13 | 11 | 9 | 11 | 29 | This section only numbers 5 categories of principles, not six as stated. If "cost effectiveness" is one of these six, it should be numbered as such for clarity. | Accepted.. Principles have been reduced to five by groping together two related principles: benefit/cost analysis |
| 2930 | 13 | 11 | 18 | 11 | | l. 18 as said clearly in ITLOS Advisory Opinion n°1, Case No. 17, Responsibilities and obligations of States sponsoring persons and entities with respect to activities in the Area (Request for Advisory Opinion submitted to the Seabed Disputes Chamber) | Reject. Comment unclear. |
| 2929 | 13 | 11 | 2 | 11 | 8 | what about principles of cooperation and prevention ? | Rejected. The principle of prevention can be linked to that of precaution appearing the text. And, the principle of cooperation is implicit in Section |
| 5684 | 13 | 11 | 33 | 9 | 34 | The conflict between cost-effectiveness and sustainable development is not obvious, particularly because much of the cost savings from market-based policy instruments is achieved dynamically (in the long run, not "on a short time horizon," as noted in the text). I don't know the source cited here, van Asselt and Gupta (2009), and that might clear up my confusion, but it is not in the list of references. | Taken into account. The part of the sentence referred to "short run" was deleted because it was indeed confusing. van Asselt and Gupta (2009) |
| 11334 | 13 | 11 | | | | This heading is inappropriate. You have listed principles in a previous section. This section discusses goals. It may be more helpful to have a heading that clearly indicates the 'concepts' you are addressing and then combine 13.2.1.3 and 13.2.1.4 | Taken into account. The reasons for the choice of principles and criteria that were selected has been clarified. The difference between principles and criteria has also be pointed out. The distinction |
| 5690 | 13 | 11 | 42 | 12 | 2 | Having a section entitled "principles and goals", just two sections after one entitled "principles" (sec. 13.2.1.2) is confusing, and this one-paragraph section does not add much. The authors could consider simply adding a sentence at the end of 13.2.1.2, stating that the goals that are incorporated in international climate change agreements flow from principles, and then drop section 13.2.1.4. | Accepted. Section 13.2.1.4 was dropped. Part of its content will move to a new subsection in 13.4.2.2 |
| 10807 | 13 | 12 | | | | How and why does the principle of "fairness" pertain to instituional feasibility? Institutional outcomes often do affect fairness, but why feasibility then? If the link is between institutional issues and principles, a case could be made for including all the principles: instituitonal design can affect sustainable development, precaution etc. It all depends what the institution is designed to do. | Taken into account. The reasons for the choice of principles and criteria that were selected has been clarified. The difference between principles and criteria |
| 14247 | 13 | 12 | | | | "Fairness" is too loose, as there are so many variants of what fairness could mean. | Taken into account. Text has been |
| 14248 | 13 | 12 | | | | "Institutional feasibility" is not a criteria but a constraint which cannot be violated. | Rejected. With the same logic, Environmental effectiveness is also a |
| 13631 | 13 | 12 | | | | Somewhere in here there should be a discussion of the political feasiblity of a particular approach as means to evaluate its prospects. Important tradeoffs apply. Equity is a fine principle, but it's clear that demand for net transfers from rich to poor countries, or any transfers for that matter, make it far more difficult to reach conclusion. Indeed some parties have used equity arguments precisely to inhibit progress (remember the compensation discussions under Kyoto promoted by the OPEC countries?) | Taken into account. The text makes it clear that political feasibility is included under the umbrella of institutional feasibility. |
| 3969 | 13 | 12 | | | | On “Principles and Criteria”, the concept of “fairness” is extremely ambiguous and confusing. The same is true with the concept of “legitimacy” in Page 14, Line 25. In this context, the concept of “equity” is more appropriate as a principle and criteria to be applied. Equity has three dimensions in international law (see for instance the 1985 ICJ judgment on Frontier Dispute (1985 ICJ Reports): equity infra legem, equity praeter legem and equity contra legem, which should be strictly differentiated. See Report of the National Committee, “Legal Principles relating to Climate Change: Preliminary Issues on the Methodology and Scope of the Work”, Japanese Yearbook of International Law, vol. 52, 2009, pp. 515-521. | Taken into account. Discussion to a precise definition of fairness was referred to the corresponding chapter 3. That chapter discusses ethics, and within it, considers that fairness is part of justice. |
| 6107 | 13 | 12 | | | | Principle of fairness is an important factor in evaluating institutional feasibility. However "cost" is another important factor for the evaluation of thie criterion. Here "cost" does not mean cost effectiveness. It does not necessarily mean economic efficiency. However it may be misleading to avoid to mention "cost" as a factor of evaluation of institutional feasibility. It may be better to add some explanation on cost as a footnote. | Taken into account. Text and figure were reworked. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 13915 | 13 | 12 | 12 | 12 | 13 | To what extent the criteria of "institutional feasibility" solely draws upon the principle of fairness is questionable. Other principles may be relevant, such as cost effectiveness or administrative capacity to implement the policy. It would be useful to clarify what exactly Gupta (2007) means by "institutional feasibility". | Taken into account. Text was reworked and figure changed. |
| 8168 | 13 | 12 | 12 | | | There is much more to institutional feasibility than fairness. Designs can be fair but unwieldy; they can also be feasible even though many consider them to be unfair. | Taken into account. Text was reworked and figure changed. |
| 12797 | 13 | 12 | 12 | | | The table is not well described in the text. It might be helpful to explain the indicated relationships between criteria and principles to verbalize the additional information of the table. Esp. The link regarding Fairness is missing (resp. firstly found on p.13) | Taken into account. Text reworked and table changed. |
| 10411 | 13 | 12 | 12 | 12 | 13 | The criterion “Maximizing global net benefits” for the principle of aggregate economic performance should be revised, as this criterion does not take account of the circumstance of the developing countries. Only maximizing the global net benefit will bring the unfair issues, and even enlarge the economic gaps between developed countries and developing countries. So, countries convergence to certain economic level should be considered. Another criterion “mutual growth”should be added. In fact, such researches have been developed in developing countries and achieve some mitigation strategies, such as Wang,Zhang, Wu(2012). | Rejected. Maximizing global net benefits is what yields effficiency at the global level. This is correct. Equity is a different criteria, though it is related to efficieny. |
| 6987 | 13 | 12 | 18 | | 20 | The word “biased” wouldn’t seem relevant here, since you are emphasizing a difficulty to predict. Please just clarify what you mean. | Accepted. Tex rephrased. |
| 12798 | 13 | 12 | 20 | | | Is interaction typically costly as laid out in Levinson? You may like to cite some literature on issue linkage taking a different view point. | Accepted. Literature on conflicts and complementarity was added. |
| 14642 | 13 | 12 | 28 | 12 | 33 | There is a potential disconnect between the objective of the FCCC and the 2 degrees C goal elaborated first in Copenhagen (technically, first elaborated by the MEF Leaders, more on that below). The FCCC objective is focused on stabilizing concentrations. The temperature goal under Copenhagen could be achieved through geoengineeering (e.g., SRM as described in this chapter) and yet concentrations may not stabilize for some time. And the damages from a given concentration level may vary not only with the extent of geoengineering, but also with the investments made for adaptation. Is the FCCC objective still operational for evaluating environmental effectiveness? At the time the FCCC was being negotiated, policymakers were not seriously thinking about adaptation and geoengineering. How does the emergence of these options affect our understanding of environmental effectiveness? This is hinted at in the subsequent discussion, but could be made more explicit. | Accepted. A reference to the Copenhague Accord 2 degree idea was added. A cross-reference to the different ways to achieve environmental effectiveness as defined in chapter 6. Mention to geo-engineering was more explicit. |
| 12978 | 13 | 12 | 29 | | | I suggest cancelling "in this area". | Accepted. "in this area" was deleted. |
| 17100 | 13 | 12 | 3 | 3 | 27 | the 'criteria' to assess means of cooperations MUST include equity, which is not the same thing as 'distributional impacts'. Again, this is the developed country position that equity will be reflected in mitigation measures (different levels of reduction) and in adaptation (diffeent levels of vulnerability), whereas developing countries see equity in terms of "access to sustaianble development, for example, which is about comparable standards of living, poverty eradication as the overriding objective and sharing the carbon budget. The problem arises because euity is absent from the principles and sustaianble development is not defined in the UNFCCC context. There is no refeence to related peer reviwed literature from developing countries, including my work. | Editorial. See answer to comment 169. |
| 6108 | 13 | 12 | 33 | 13 | 1 | Citation of J.B. Smith is unnecessary. "Article 2 of UNFCCC" is enough. | Accepted. Refernce to Smith was |
| 9044 | 13 | 12 | 8 | 12 | 12 | The Chapter failes to recognize the possibility that principles and objectives set out in Articles 2 and 3 of the UNFCCC can also be used as assessment principles and criteria in themselves. To be comprehensive, AR5 should assess the effectiveness of international cooperation arrangements in the context of the implementation of the UNFCCC, rather than assess the effectiveness of the UNFCCC per se as an international cooperation regime. That is, the assessment focus should be on the implementation of the UNFCCC rather than on the design of the UNFCCC | Taken into account. The text is related to principles and criteria in general, not those specifically stated in the UNFCCC. However, text was rephrased to add more clarity. |

| 11441 | 13 | 12 | 8 | 12 | 12 | In addition to the reiteration of the IPCCAR4 principles and criteria for policies and arrangements as the potential criteria for assessing means of international cooperation for AR5, there should also be a discussion looking at how the principles and objectives set out in Articles 2 and 3 of the UNFCCC can also be used as assessment principles and criteria in themselves. This would then allow the IPCC to also assess the effectiveness of international cooperation arrangements in the context of the implementation of the UNFCCC, rather than assess the effectiveness of the UNFCCC per se as an international cooperation regime. That is, the assessment focus should be on the implementation of the UNFCCC rather than on the design of the UNFCCC. | Taken into account. The text is related to principles and criteria in general, not those specifically stated in the UNFCCC. However, text was rephrased to add more clarity. |
| 2408 | 13 | 12 | table | 12 | table | Comment on Table 13.1: I thought it would be helpful to specify more clearly the relationship between the criteria and the principles. What does it mean to say that a criterion 'draws upon' a principle in this way? In the main the principles seem to specify the components which make up the outcome (or criterion). Criteria and components might capture this relationship. Aggregate economic performance is made up of economic efficiency and cost-effectiveness. Institutional feasibility was harder to figure out here. Institutional feasability implies the task of identifying components which makes the emergence of an agreement which meets the other three criteria more likely. It suggests that institutional arrangements are purely a means to an end. High institutional feasibility arises when institutional arrangements deliver on the other three criteria. Is this what you mean to say? In this case, you will have to justify the assertion that fairness (presumably procedural fairness) as well as participation, compliance, legitimacy and flexibility (p. 14) are the components which make institutional arrangements likely to deliver on the three substantive criteria. Or do you mean to say that there are certain institutional attributes which, while one hopes they will deliver on the other three criteria, are of independent normative value. In which case you might end up having to discuss not only trade-offs between economic performance and distribution but also between environmental effectiveness and institutional appropriateness. | Taken into account. The reasons for the choice of principles and criteria that were selected has been clarified. The difference between principles and criteria has also be pointed out. Table 13.1. has been improved. |
| 11683 | 13 | 12 | 12 | 12 | 13 | In the Section 13.2.2 and Table 13.1, this section list the relationship to the six categories of principles discussed in section 13.2.1.1. The section title 13.2.2.3 is "Distributional and Social Impacts", but in the Table 13.1, only "Distributional Impacts", so Social impacts is missing; second, I think the matrics is slightly confusing, for instance, sustainable development is actually very comprehensive but vague, I think not only environmetnal effectiveness, and distributional impacts would related to the principle of sustainable development, the other two criteria are also could draw on "sustainable development", so the 4x6 matrix is slightly confusing regarding the concept connotion and relationship. | Taken into account. Table and text realaborated to make it clearer. |
| 5685 | 13 | 12 | 12 | 12 | 13 | I was surprised that "sustainable development" is not listed as a principle relevant to "aggregate economic performance," in the second row. | Taken into account. Text and table have been reworked. |
| 16178 | 13 | 12 | 3 | | | The list of criteria omits two important and related criteria: concerns about a democratic deficit in international administrative bodies and consequent lack of representativeness and legitimacy; and public participation. National governments' concerns about the former is one of several barriers to concluding successful climate change agreements. The mention on p 14, line 30 is useful but it should be addressed here as well. | Rejected. The two concerns (which are more specific than environmental effectiveness or efficiency or equity) are already incorporated withing the criteria |
| 15454 | 13 | 12 | 3 | | | When assessing the performance of international cooperation (or international regimes), it should be noted that there is always a problem of comparing it against counterfactual case. The "true" effect of cooperation (or regime) cannot be known unless it is compared with a counterfactual case with no cooperation. The problem is well known in the existing studies on international regimes. For example, Arild Underdal and Oran R. young (eds.) (2004) Regime Consequences: Methodologial Challenges and Research Strategies. Dordrecht: Kluwer Academic Publishers. Second, there could be different stateges of "effectiveness." For example, international cooperation might cause behavioral changes of parties but that do not necessarily mean the expected environmental changes would happen. National policies may fail even if parties did act. Although the issue is not solved yet, at least the complexity of "effectiveness" has been already identified in existing studies on international regimes and thus it should be acknowledged in this report too. | Rejected. Effectiveness is not understood in the text as the difference between BAU and actual, but as if goals are reached. This is clear in 13.2.2.1.. The comment on effectiveness stages is not relevant in this section, but is likely relevant to section 13.13. |

| 12977 | 13 | 12 | 4 | 12 | 27 | This section is not clear. The reader does not understand the main message. The table increases, rather than reducing, confusion. | Taken into account. Table and text realaborated to make it clearer. |
| 6328 | 13 | 13 | | | | NAMAs and NAPAs go along the three dimensions and should not be located only at national/regional level. Support to them is international and, in many cases, the direct beneficiaries of NAMAs and NAPAsare at the local level. | belons to 13.4 |
| 4943 | 13 | 13 | 1 | | 3 | There were efforts by the IPCC itself to deal with the interpretation of the Article 2 and the dangerous anthropogenic interference and consequent vulnerabilities. | Rejected. Original sentence seems to be clear enough. |
| 8169 | 13 | 13 | 1 | 13 | 3 | This statement seems too absolute. Perhaps "some other" forums do not take a holistic approach, but it seems incorrect to imply that "all other" forums share that characteristic. | Accepted. Text was rephrased. |
| 12980 | 13 | 13 | 1 | 13 | 2 | This sentence is not clear. Not clear what "this objective" is. | Rejected. The objective is to stabilize GHG concentrations, as stated on page |
| 4958 | 13 | 13 | 11 | | | {Cor} storing {those} [emissions] underground<br>That is:<br>storing those underground | Accepted. Text revised as suggested. |
| 6836 | 13 | 13 | 13 | 13 | 17 | Not clear why SRM is listed here – why has this been chosen over other geo-engineering options? What gives it credibility? Need to establish. | Taken into account. SRM was not chosen over other options. However, the text was rephrased to make that clear |
| 3477 | 13 | 13 | 13 | 13 | 17 | This is a very brief and inadequate discussion of SRM and its potential benefits and risks. It needs references to a much larger discussion in the WG I and WG II reports. In WG I, the discussion is in Chapter 7.7. | Taken into account. SRM advantages and disadvantages are discussed in chapter 6. Here the interest in based on the need of not of international |
| 3479 | 13 | 13 | 13 | 13 | 17 | This is the wrong definition for mitigation. SRM is not mitigation. It is geoengineering, which is an attempt to actively control the climate. Mitigation is defined as reducing the emissions of greenhouse gases and aerosols that cause global warming. | Accepted. Text was rephrased. |
| 4959 | 13 | 13 | 14 | | | reflect solar radiation through .. | Accepted. Text was rephrased. |
| 5914 | 13 | 13 | 17 | | | Include references re acidification. Add: “and the associated ecosystem damage” (Doney, SC, Fabry, VJ, Feely, RA and Kleypas, JA. 2009. Ocean acidification: The other CO2 problem. Annual Review of Marine Science, 1: 169–192.; Fabry, VJ, Seibel, BA, Feely, RA and Orr, JC. 2008. Impacts of ocean acidification on marine fauna and ecosystem processes. ICES Journal of Marine Science: Journal du Conseil, 65(3): 414–432.). Solar radiation management also risks stratospheric ozone depletion, with ensuing health risks from increased ultraviolet radiation ( Rasch, PJ, Tilmes, S, Turco, RP, Robock, A, Oman, L, Chen, C-C, Stenchikov, GL and Garcia, RR. 2008. An overview of geoengineering of climate using stratospheric sulphate aerosols. Philosophical Transactions of the Royal Society A – Mathematical Physical and Engineering Sciences, 366(1882): 4007–4037, Tilmes, S, Müller, R and Salawitch, R. 2008. The sensitivity of polar ozone depletion to proposed geoengineering schemes. Science, 320(5880): 1201–1204.) | Taken into account. Geo-engineering definitions needed here follow now closely from chapter 6.3. Discussion in chapter 13 (not this Section 13.2, but Section 13.4) is limited to discuss the need of international governance, not scientific evidence on SRM impacts (which is reviewed in Section 6.9). |
| 15723 | 13 | 13 | 19 | 13 | 25 | would be important to mention impacts on water quality. What about side-effects on adaptation polices? | Taken into account. A mention and references were added to the link |
| 11696 | 13 | 13 | 24 | 13 | 25 | Final comments, I feel the refernce citation is not quite consistent, some provide detail page number, some are not, and some with first name initial but some are not) | Editorial- copyedit to be completed prior to publication. |
| 14643 | 13 | 13 | 37 | | | Could cite 1996 Wigley, Richels, and Edmonds Nature paper that provides an early, and effective illustration of cost-effectiveness analysis | Rejected. This is not a new literature post AR4. |
| 6110 | 13 | 13 | 38 | 13 | 39 | Add "(benefit)" after performance in the following sentence. It does not require environmental performance to be monetized. This makes the meaning clearer. | Accepted. Text was rephrased. |
| 11791 | 13 | 13 | 4 | 13 | 8 | Nuclear power should be put into example of low carbon emitting methosds. | Rejected. The text is giving an example of cleaner technologies, not a list of all of them. So, there seem to be no need to |

|---|---|---|---|---|---|---|---|
| 6837 | 13 | 13 | 40 | 14 | 6 | Unbalanced treatment – one paragraph on distributional and social impacts – there are reams of literature on this, including by several developing country academics/policy scientists, that is not referred to here. | Taken into account. Text was more reworked. Space is still limited. |
| 2166 | 13 | 13 | 41 | | | Please also refer to procedural fairness and put it in context when you also discuss "legitimacy" on page 14. | Accepted. Mentions to procedural fairness and procedural legitimacy are |
| 3979 | 13 | 13 | 43 | 14 | 39 | The terms political and institutional feasibility are never really defined either. The lack of such a definition becomes apparent in the discussion of the subcriteria: On lines 18-20 of page 14 it is stated that compliance can challenge institutional feasibility. So what exactly does it challenge? Its environmental effectiveness? Its legitimacy from those who want the institution to succeed? On line 34 of page 14, this aspect of 'success' is again mentioned - but doesn't this mean that institutional feasibility simply replaces other criteria already mentioned (including environmental effectiveness or aggregate economic performance)? Only if institutional feasibility is more clearly defined can it be useful as a criterion for assessing policies. Otherwise, anyone could simply insert his or her definition of feasibility, clouding the judgment. | Taken into account. Text was added and existing text was rephrased. |
| 9519 | 13 | 13 | 6 | 13 | 7 | Please, replace 'by switching from …storage' with 'by improving energy efficiency in direct combustion and end use and deploying low carbon rechnologies such as renewables and nuclear' (WEO 2010, p393 and Figure 13.9). | Taken into account. The sentence was rephrased and shortened. |
| 3478 | 13 | 13 | 9 | 13 | 12 | This is the wrong definition for mitigation. CDR is not mitigation. It is geoengineering, which is an attempt to actively control the climate. Mitigation is defined as reducing the emissions of greenhouse gases and aerosols that cause global warming. | Accepted. The whole subsection on environmental effectiveness was rephrased to follow closely chapter 6 definitions on mitigation, CDR (including |
| 3480 | 13 | 13 | 9 | 13 | 12 | This is a very brief and inadequate discussion of CDR and its potential benefits and risks. It needs references to a much larger discussion in the WG I and WG II reports. In WG I, the discussion is in Chapter 6. | Taken into account. Discussion on subsection on environmental effectiveness was shortened and cross- |
| 6109 | 13 | 13 | 9 | 13 | 9 | GHG concentrations can be reduced by, "in addition to emission reductions", methods of sequestration --. | Accepted. Text revised as suggested. |
| 13916 | 13 | 13 | 43 | 13 | 43 | Some confusion over the terminology could arise between "political feasibility" evoked here, and "institutional feasibility" evoked in the next section. What is the difference, where do they overlap, etc? | Taken into account. Text was rephrased. |
| 11684 | 13 | 13 | 45 | 13 | 46 | Revise "assessed along several dimensions" to "assessed along two dimensions", since only two: intra-generational equity and inter-generational equity | Accepted. Text was corrected. |
| 2931 | 13 | 13 | 3 | 13 | 6 | include a reference to human rights | In Section 13.5,taken into account - section 13.2, 13.5. For the next draft, the authors will review the literature on |

|---|---|---|---|---|---|---|---|
| 15384 | 13 | 14 | | | | This page gives an excellent but far too brief discussion of the critical issues in formation of international agreement. This should be the heart of the discussion, not buried in an obscure paragraph. I would focus the discussion on the observation that 20 years after signing of the Framework Convention, there is still no enforceable agreement on mitigation and the prospects are universally recognized to be worse now than they were thought to be then. It is necessary to recognize and explain these historical events before any other discussion of international agreements is worthwhile. The answer has been clearly laid out by Scott Barrett and Bossetti et. al., and I would characterize the problem as being that negotiators have pursued national interests in the negotiations, not some global optimum, and if agreements do not promote those interests, they will be discarded when they taken home – as was the Kyoto Protocol in several countries that voted for it in Kyoto. The discussion needs to start here, then discuss possible solutions for some measure of progress (and their likelihood). Maybe the fact that Solar Radiation Management does not require collective action moves it up in the ranking, since the game theoretic models of Barrett (Why Cooperate?: The Incentive to Supply Global Public Goods. New York: Oxford University Press, 2007.; Environment & Statecraft: The Strategy of Environmental Treaty-Making. New York: Oxford University Press, 2003.), Bossetti ("The Incentives To Participate In And The Stability Of International Climate Coalitions: A Game-Theoretic Approach Using The Witch Model, OECD Economics Department Working Papers No.702.), and others show that only low level, individually motivated action on mitigation is likely. | Taken into account. Section 13.13. deals with the performance assessment. Suggested Barrett (2003,2007) are already cited in section 13.2.1 Bossetti et al (2009) is also cited (in Section 13.3.1.) |
| 12799 | 13 | 14 | 1 | 14 | 3 | Maybe you like to consider not speaking only of burden but also of benefit sharing. It is also expected to make a difference in the assessment of burdens and benefits if the focus is on a second best world (cost-effectiveness) or on welfare maximization (first best focus) as well as on whether there is a right to pollute (no mitigation duty per se) or a rigeht to protect (posing a mitigation duty). Maybe you like to add some words on these issues. | Taken into account. Space is limited so no nots can be added. However, we introduce the suggestion to talk about burden and benefits sharing. |
| 6033 | 13 | 14 | 12 | | | Is it possible to provide some examples of the types of incentives included in the literature? | Accepted. Examples were included, as |
| 6034 | 13 | 14 | 12 | 14 | 17 | I think this paragraph needs a general statement about why participation matters (see introductions to the subsequent sub-criteria). | Taken into account. The last sentence of this paragraph to the beginning after |
| 4715 | 13 | 14 | 18 | 14 | 24 | The relationship of compliance to institutional feasibility needs to be better delineated. Compliance has some relationship to institutional effectiveness but the linkage to getting agreement is less clear. As the signing and ratification of Kyoto and the UNFCCC made clear, most countries did not assess compliance costs before signing up - they signed up because that was the politically correct thing to do. In any event, showing how compliance relates to feasibility needs to be clarified. | Rejected. Text was considered clear. |
| 16180 | 13 | 14 | 2 | 14 | 2 | Add external funding to the list of burden-sharing options in international agreements. | Accepted. Have added "and funding or technology transfers" at the end of the |
| 15663 | 13 | 14 | 2 | | | Criteria for burden sharing also relate to financial transfers | Accepted. Have added "and funding or technology transfers" at the end of the |
| 12475 | 13 | 14 | 22 | 14 | 24 | Please note that national trade partners may be allowed by WTO or others (p 38) to tax or ban goods from companies in other contries that do not comply. | Rejected. Unclear comment. I.e., What p.38 refers to? |
| 4944 | 13 | 14 | 22 | | 24 | It is true, however, sometimes compliance is facilitated through incentives and/or sanctions either within the same agreement or in another agreement/mechanism (see options by the Compliance Cmte of the Kyoto Protocol and the eligibility conditions for funding of the GEF in relation to climate projects ). | Taken into account. GEF funding conditions may be a too specific incentive for UNFCCC compliance. |
| 7665 | 13 | 14 | 22 | 14 | 22 | Another ref. would be Heitzig, Lessmann, Zou (2011) PNAS, doi:10.1073/pnas.1106265108 | Accepted. Suggested reference was |
| 17667 | 13 | 14 | 22 | 14 | 24 | Maybe you should rather say "in international agreements, it is hard to establish an authority (…)" instead of "in international agreements, there is no authority (…)", because it's not impossible to establish one (see WTO Dispute Settlement Body) | Accepted. Text was rephrased. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 4716 | 13 | 14 | 23 | 14 | 23 | "compliance is fundamentally problematic in international agreements, as there is no authority that can reliably impose sanctions upon national governments" -- much of the international relations literature on this point has shown Downs, Rocke, and Barsoom 1996 to be wrong. Chayes and Chayes, Mitchell, Brown Weiss and Jacobson, and others have all shown the power of various other forms of social control, including shaming, norms, preclusive policies, etc. to be important ways of influencing state behavior. | Taken into account. Text was added. |
| 2409 | 13 | 14 | 23 | 14 | 23 | Comment on specific text: You say that there is no authority that can reliably impose sanctions on national governments. Not only does this seem quite a sweeping statement when you think about the powers of the UN Security Council but also it depends upon how you define the concept of sanctions. If you take a broad understanding, including for example, reputational sanctions then many international organizations can 'sanction' the behaviour of states. | Taken into account. Text was rephrased. |
| 16363 | 13 | 14 | 25 | 14 | 31 | Legitmacy discussion would benefit from more discussion of political drivers and barriers " at home" for each country | Taken into account. A sentence on domestic feasibility was added in the first paragraph discussing institutional |
| 8170 | 13 | 14 | 28 | 14 | 29 | This statement seems too absolute. Perceived legitimacy of rules may be based on their expected consequences, including but not restricted to distributed fairness; perceived legitimacy may also acrue from a belief that the rules do not create perverse outcomes (e.g. single country veto). | Taken into account. Text was rephrased. |
| 12800 | 13 | 14 | 29 | 14 | 31 | You may like to make a cross reference to chap. 4. | Accepted. A reference to chapters 2 and 4 was added, since in both concepts of |
| 17101 | 13 | 14 | 3 | | | the phrase "emissions budget over time" is NOT used in the literature or in the negotiations commonly. The commonly used term "carbon budget" should be used here. | Taken into account. The sentence was rephrased and shortened. |
| 6036 | 13 | 14 | 41 | 16 | 6 | I really like the discussion about how the broad landscape of climate change governance has changed since AR4 and think it's an important context that needs to be addressed in the chapter. But I'm not sure it fits in Section 13.3 at least in its current form where there is relatively little explicit discussion about the lessons to be learned from some of these different types of initiatives. This makes for an awkward transition to the discussion of game theory and rationalism. | Rejected - Figure 13.1 should stay in 13.3 because 13.3 does begin to discuss the lessons of the regime complex across the landscape of proliferating agreements (which are then |
| 4945 | 13 | 14 | 43 | | 45 | "since the publication of AR4" ~ better to avoid an interpretation that the sole reason for such a change is the AR4 (there are equally essential e.g. political factors), moreover | Accepted in part, by revising text to explain "in 2007". |
| 8171 | 13 | 14 | 45 | 14 | 46 | For the only published review of those efforts, see Michonski and Levi (2010), cited in other chapters. | Noted; the paper cited is already mentioned in 13.5.1.2 and included in |
| 3980 | 13 | 14 | 45 | 46 | | There are a few publication that should be mentioned here: 1) Hoffman, Matthew J. (2011). Climate Governance at the Crossroads: Experimenting with a Global Response after Kyoto. Oxford, UK: Oxford University Press; 2) Zelli, Fariborz (2011). The Fragmentation of the Global Climate Governance Architecture. WIREs Climate Change 2(2), 255-270; 3) Biermann, Frank, Philipp Pattberg, Harro van Asselt, and Fariborz Zelli (2009). The Fragmentation of Global Governance Architectures: A Framework for Analysis. Global Environmental Politics 9(4), 14-40; 4) Bausch, Camilla, and Michael Mehling (2011). Addressing the Challenge of Global Climate Mitigation – An Assessment of Existing Venues and Institutions. Berlin: Friedrich-Ebert Stiftung. | Accepted. These publications by Hoffmann 2011, Zelli 2011, and Biermann et al. 2009, are already cited in section 13.5. Citations to them, and also the book Biermann et al. 2010, are now being added to the beginning of section 13.3 as well. (Bausch and Mehling 2011 is in the grey literature.) |
| 14697 | 13 | 14 | 45 | 14 | 46 | There is a much larger body of literature on the institutional complexity (or fragmentation) of climate governance. Further texts to be referred to here include: Biermann, F., P. Pattberg, H. van Asselt, and F. Zelli (2009). The Fragmentation of Global Governance Architectures: A Framework for Analysis. Global Environmental Politics 9(4), 14-40; Hoffman, Matthew J. (2011). Climate Governance at the Crossroads: Experimenting with a Global Response after Kyoto. Oxford, UK: Oxford University Press; Zelli, F. (2011). The Fragmentation of the Global Climate Governance Architecture. WIREs Climate Change 2(2), 255-270. | Accepted. These publications by Biermann et al. 2009, Hoffmann 2011, and Zelli 2011, are already cited in section 13.5. Citations to them, and also to the book Biermann et al. 2010, are now being added to the beginning of |
| 6111 | 13 | 14 | 5 | 14 | 6 | Why poverty is not included here? | Reject. Poverty is important, but not for this part of the text. Here the text refers to the difficulty of assessing security |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 2305 | 13 | 14 | 7 | 14 | 39 | The discussion of political feasibililty of institutions is curiously apolitical. The political science literature is quite clear that the most important condition of institutional feasibility is consistency between the interests performed by the institutions and the interests of powerful member states -- those whose participation is required for the institution to be effective. National capacity is also important. See Haas et al (1993), especially 398-408. | Taken into account. Text was clarified. |
| 11685 | 13 | 14 | 1 | 14 | 6 | Since it mentioned intra-generational equity and inter-generational equity, it would be better in this paragraph, not only discussing the otpions for burden sharing across countries, but also how the distributions of burden across the generation, are there any examples on these? also what might be the social impacts, this part also needs to extend a little bit, and the lengthes is slightly too limited compared to other principles | Taken into account. Intra and inter generational equity I smentioned in the previous paragraph. A cross reference to chapters 3 and 4 (where distributional issues are discussed in more depth) has |
| 13918 | 13 | 14 | 32 | 14 | 39 | The discussion here could reference the literature on designing policy to balance flexibility and certainty, in particular regarding the need to clearly define objective criteria for policy adjustment and delegating policy adjustment to independent authorities. See Brunner, S., et al, "Credible commitment in carbon policy", Climate Policy 12 (2): 255-271, 2012 | Accepted. The drade-off between flexibility and regulatory uncertainty was inserted. The reference was added. |
| 16232 | 13 | 14 | 38 | | | Suggest inserting a penultimate sentence to paragraph: "Flexibility also has the virtue of attracting participation by governments even in the face of uncertainty about policy options and future political demands (Thompson, 2010)." The cite is to Thompson, A. (2010). Rational design in motion: Uncertainty and flexibility in the global climate regime. European Journal of International Relations 16, 269-96. | Accepted. Text has been modified and reference inserted. |
| 13917 | 13 | 14 | 7 | 14 | 11 | There is a risk of confusion between the criteria of "institutional feasibility" and the criteria of "distributional impacts" and the principle of "fairness". Reading your sub-criteria (participation, compliance, legitimacy, flexibility), they seem to relate more to institutional effectiveness, than feasibility. "Institutional feasibility" could be changed for "institutional effectiveness" | Taken into account. Text has been rephrased. "Feasible" seems better than "effective" for institutional issues. Have decided not to change wording. |
| 14644 | 13 | 15 | | | | I recommend including Arctic Ministerial and Clean Energy Ministerial under the Other Multilateral Clubs category | Rejected - the legend of Figure 13.1 only lists a few examples of each type, and there is not space in the legend to add more examples. More details on specific |
| 6035 | 13 | 15 | | | | Overall I like this figure but I would suggest revising the Legend note to clarify that this figure is meant to illustrate the broad range of initiatives. I find the language "but either a representative set of examples or the principal ones" a little confusing. Which is it, representative or principal? In the end, I don't think it really matters, again because this is really meant to be illustrative rather than comprehensive, right? | Taken into account in revised new version of Figure 13.1. As the comment states, Figure 13.1 is only meant to be illustrative. |
| 11686 | 13 | 15 | | | | It needs explanation what is "NAMAs, NAPAs" | Taken into account in revised version of |
| 10808 | 13 | 15 | | | | Nice figure! Perhaps useful to cross reference with Ch 15, and find ways of expanding the national and sub-national rings. | Noted; there are already cross-references to section 13.5 and Chapters |
| 4960 | 13 | 15 | | | | Fig 13.1: these are agreements and various cooperative mechanisms; some others to be added: Non-UN IOs: GEF; Other multilat: UNCCD | Taken into account in revised version of Figure 13.1. Caption revised to add "and institutions". Some additional examples will be included, but Figure |
| 18661 | 13 | 15 | | | | Page 15: Useful figure presenting the landscape of agreements on climate change | Noted. |
| 17668 | 13 | 15 | | | | I do not find the figure very useful; Note: In the legend to figure 13.1, it is not specified what "Regional governance" and "NAMAs/NAPAs" entails; this should be added to make the legend complete | Taken into account in revised version of Figure 13.1. The legend is only illustrative and cannot go into every |
| 11589 | 13 | 15 | | | | This figure is the UNFCCC with an attempt to capture the infrasture of support to the work including the decisions taken under the UNFCCC. The link with other institutions clearly point to the climate change issue as cross-cutting. | Noted. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 16181 | 13 | 15 | | | | Should include sectoral agreements - industry-based measures may need to be distinguished from "other multilateral clubs" which are, presumably, inter-state. Human Rights Council should be included in list below figure. | Taken into account in revised version of Figure 13.1. Not every variation can be shown in the figure. The legend lists |
| 16364 | 13 | 15 | | 15 | | In this list, would be good to split out priate sector partnerships (eg Green Growth Action Alliance, CCS Institute, Climate Group), from other non-business partnerships. Other multilateral clubs could also include IEA implementing agreements | Taken into account in revised version of Figure 13.1. Not every variation can be shown in the figure. The legend lists |
| 11103 | 13 | 15 | | | | Please include Global Superior Energy Performance Partnership (GSEP) as examples of "Other multilateral clubs." Please rename "Partnerships" as "Public-Private Partnerships." In addition, please include IPCC as another example of "Other UN Intergovenmental Organizations." | Taken into account in revised version of Figure 13.1. Not every variation can be shown in the figure. The legend lists |
| 3981 | 13 | 15 | | | | The Figure is a good effort as mapping the global climate governance landscape. However, there are a few issues: 1) it uses the term 'agreements' and 'international agreements'. While this may be appropriate for most international institutions, it is difficult to capture transnational initiatives such as city networks under this term; moreover the presence of NAMAs/NAPAs becomes all the more confusing; 2) The lines are confusing - are they representing existing relationships? If so, what kind of relationships (these are often quite unclear), or are they representing desirable relationships (one where different non-UNFCCC governance arrangements link to the UNFCCC)? And is it really necessary to have these lines?; 3) The figure groups many different institutions which have different characteristics (e.g. private initiatives; treaties; international organizations) - it would be helpful to add a distinction (e.g. in the shape of the box) that highlights some of these differences; 4) It is debatable whether clubs such as the G20, APP or MEF are 'multilateral' - the better characterization is probably 'plurilateral' (conform WTO terminology), or to use a more fashionable word: minilateral; 5) the correct name of the APP is the Asia-Pacific Partnership on Clean Development and Climate; the correct name of Methane to Markets is the Global Methane Initiative (others may need checking as well). | Accepted by revising Figure 13.1 to reorient and add several of the items; by revising the caption of the Figure to add "and institutions"; by explaining the connecting lines in Figure 13.1 in the subsequent text in section 13.3.1 that again discusses Figure 13.1; and by editing the legend of Figure 13.1. Also, the term "plurilateral" is added to the text discussing the evolution of multiple coalition agreements in the trade/WTO context. |
| 14698 | 13 | 15 | 5 | | | Figure 13.1 seems to draw on a similar "onion" figure by Biermann et al. , dating back to 2009,that also assigns institutions into different spheres of the fragmentation of climate governance. But even if Figure 13.1 originated without being familiar with the Biermann et al. figure, the latter one should be referred to here. Unlike figure 13.1 (that uses scale as the criterion for distinguishing spheres), the figure by Biermann et al. used the predominant jurisdiction or subject matter of the institutions to distinguish between different spheres (namely, from inside out: climate regime; climate and energy-related multilateral partnerships; non-climate environmental institutions; non-environmental institutions). The reference for this figure is: Biermann F., P. Pattberg, and F. Zelli (2009). Global climate governance after 2012. Architecture, agency and adaptation. In: Making Climate Change Work for Us. M. Hulme and H. Neufeldt, (eds.), Cambridge University Press, Cambridge, UK, pp. 263-290, (ISBN: 978-0521119412). Moreover, Figure 13.1 should also clarify the meaning of the connectors/ arrows between some types of agreements. | In Section 13.3, Accepted, by adding citation to Biermann et al. 2009 (and also Biermann et al. 2010 and other citations) in the text at the beginning of section 13.3, near Figure 13.1; by revising Figure 13.1; and by revising the text in section 13.3.1 where Figure 13.1 is again discussed (including to explain the meaning of connecting lines in Figure 13.1).<br><br>In Section 13.5, Taken into account- |
| 7722 | 13 | 15 | 1 | 15 | 5 | In the Figure, interaction between UNFCCC and other environmental treaties is shown and in Footnote 4, Montreal Protocol is shown as an example. The lessons form the successful Montreal Protocol to the Kyoto Protocol are very important. I recommend to cite Chapter 10 'Lessons from the Success of the Montreal protocol' in the book entitled "The Montreal Protocol celebrating 20 years of environmental progress -Ozone Layer and Climate Protection-" edited by Donald Kaniaru, published 2007 by Cameron May Ltd. Insertion of a new sub-chapter will be desirable to describe or cite Lesson 1 to Lesson 11 in the book from page130 to page152. | Accepted in part, by adding a citation to Kaniaru 2007 in a new sentence in section 13.3 referring to lessons from the Montreal Protocol. The specific chapter 10 in Kaniaru noted in the comment is by Sarma, Anderson and Taddonio; we are now adding a citation to their book (2007) as well. But there is not sufficient space in section 13.3 to add an |

|---|---|---|---|---|---|---|---|
| 14249 | 13 | 16 | | | | You write that the game-theoretical literature assumes that no IEA can enforce agreements. Well: In reality, by requiring domestic ratification, domestic stake-holders (e.g., in the USA) can hold a government accountable if it breaks its pledges, so some enforcement is possible by requiring ratification. Some game-theoretical analysis takes this into account and analyses the implications of the limited enforcement-possibility on the design and optimal duration of IEA: see e.g. Harstad, Bard, 2012: "Climate contracts: a game of emissions, investments, negotiations, and renegotiations," Review of economic studies, forthcoming, or the companion paper "The dynamics of climate agreements." | Taken into account in revised text mentioning the role of domestic actors in enhancing international cooperation. But if an IEA "requires" domestic ratification, it must still provide incentives for countries to ratify, hence still "self-enforcing" regarding participation/abatement. |
| 15385 | 13 | 16 | | | | Where are Bossetti et al ("The Incentives To Participate In And The Stability Of International Climate Coalitions: A Game-Theoretic Approach Using The Witch Model, OECD Economics Department Working Papers No.702.)? How about a discussion of the issue of a non-cooperative equilibrium with low levels of action? | Bosetti et al. 2009 was already cited (although sometimes it was misspelled Bossetti), and is now being cited additionally in 13.3. The issue of a non-cooperative equilibrium with low levels of action is discussed above in 13.2, and in the climate change framework chapter. |
| 18018 | 13 | 16 | 13 | 6 | 13 | The sentence of "absence of ..a binding international agreement on climate change" does not reflect the fact that UNFCCC and KP are actually binding agreements. | Taken into account by revising the sentence including adding "universal." Also, the sentence is referring to |
| 3745 | 13 | 16 | 19 | 24 | | this literature isn't game theoretic | Taken into account by revisions to this paragraph which explain that actual institutions may play roles not fully |
| 16183 | 13 | 16 | 19 | 16 | 20 | Here or in subsequent discussion of WTO sanctions mechanisms, should discuss CITES trade sanctions, which are highly relevent to the question of enforceability of environmental agreements. See, e.g., Peter H. Sand, Whither CITES - The Evolution of a Treaty Regime in the Borderland of Trade and Environment, 8 Eur. J. Int'l L. 29 (1997) | In Section 13.3, taken into account by expanding the discussion of trade sanctions in 13.3.1, but without referring specifically to CITES which would take too much space here.<br><br>In Section 13.8, Rejected: Interesting comment but cannot be included for the following reason. The issue here is the link between climate policy and trade. There is a reference to the Montreal Protocol in that sense (p. 19, line 14), which is closely linked to climate. CITES |
| 7663 | 13 | 16 | 20 | 16 | 20 | "IEAs are self-enforcing" should be replaced by "IEAs need to be self-enforcing to ensure compliance" since history shows that some IEAs have not been sufficiently self-enforcing, leading to compliance issues. | Taken into account in revisions to this sentence. |
| 17669 | 13 | 16 | 20 | | | I recommend to write "IEAs should be self-enforcing" instead of "IEAs are self-enforcing" because they are not necessarily self-enforcing | Accepted. |
| 3746 | 13 | 16 | 24 | 28 | | elaborate with names of countries, and consequencs for the effectiveness of governance. Is this really significant for any country other than China? | Rejected - no need to name specific countries in this discussion of the general concept of the distribution of net |
| 12981 | 13 | 16 | 25 | 16 | 33 | I suggest rephrasing this paragraph. It reads as a patchwork of citations. | Taken into account in revised paragaph. |
| 7139 | 13 | 16 | 26 | 16 | 29 | How that fix with the CBDR principle? If responsibility of major emitters is accepted, it is hard to expect a symmetric distribution on net gains, or compensatory measures. | Taken into account in revised paragraph. |
| 7664 | 13 | 16 | 31 | 16 | 31 | If only "some suggest" that countries pursue their interests rather than the global interest, this sounds like altruism was the standard assumption in this analysis. To my knowledge, it is rather standard to assume countries maximize their own welfare instead of global welfare. | Taken into account in revised paragraph. |
| 12982 | 13 | 16 | 35 | 16 | 36 | Please provide a definition of open and exclusive participation. | Accepted - done. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 16184 | 13 | 16 | 35 | | | Should read "membership" not "accession". Accession is "the route followed by a state that did not originally negotiate or sign a treaty, but that subsequently wishes to adhere to the agreement." Janis, International Law (5th ed. 2008, Wolters Kluwer) 22. | Accepted - clarified. |
| 16185 | 13 | 16 | 36 | | | Given the lack of empirical evidence, "major" overstates this theoretical result. | Accepted - reframed in revised |
| 4946 | 13 | 16 | 39 | | 41 | Just contrary in practice, as it was demonstrated in case of some recent negotiation rounds with exclusive participation of a limited number of Parties/actors during the UNFCCC COP sessions. | Taken into account in revised paragraph, but citing other exclusive memberships such as Annex I/non-Annex I, EU ETS, |
| 7659 | 13 | 16 | 39 | 16 | 41 | Is there a reference for this claim? It seems that whether exclusive membership helps in practice can only be judged once it has actually been tried in practice. Has it? The formation of a coalition bottom-up, e.g. by linking carbon markets, which is a form of „closed membership“ coaliton, has been suggested and seems to be tried already. | Taken into account in revised paragraph. See comments 303 and 285. |
| 6838 | 13 | 16 | 39 | 16 | 41 | In the context of ‘treaty’ negotiations that appears to be the focus of this section, there is an exclusive institution with authority to host climate change negotiations i.e. the UNFCCC. I’m not sure what point, therefore, is being made here. In any case, it needs to be explained | Taken into account in revised paragraph. See comments 303 and 285. |
| 9045 | 13 | 16 | 40 | | 43 | These statements are in erroneous. The UNFCCC is, by intent and design, the primary multilateral institution and forum for climate negotiations. Nothing prevents states from making commitments at the sub-multilateral level on climate change and establish plurilateral or bilateral regimes but the UNFCCC is designed to be a comprehensive legally binding global treaty on climate change | Taken into account in revised sentence, although the sentence is discussing the conceptual option of multiple coalition agreements and is not saying that the |
| 11442 | 13 | 16 | 40 | 16 | 43 | These are factually incorrect statements. The UNFCCC is, by intent and design, the primary multilateral institution and forum for climate negotiations. States may, of course, also undertake negotiations at the sub-multilateral level on climate change and establish plurilateral or bilateral regimes. Furthermore, the UNFCCC is designed to be a comprehensive legally binding treaty on climate change. | Taken into account in revised sentence, although the sentence is discussing the conceptual option of multiple coalition agreements and is not saying that the |
| 11443 | 13 | 16 | 40 | 16 | 47 | This is factually incorrect because it assumes that the UNFCCC is not a comprehensive legally binding agreement. | Taken into account in revised sentence, although the sentence is discussing the conceptual option of multiple coalition agreements and is not saying that the |
| 8172 | 13 | 16 | 42 | 16 | 47 | "Multiple agreements can be an interim solution". Why interim? What evidence is there that multiple agreements cannot be a permanent solution (or that single agreements can be)? | Taken into account in revised sentence. |
| 9043 | 13 | 16 | 42 | 16 | 43 | The Chapter fails to recognize that the Framework Convention is comprehensive and legally binding. Line 42-43 in page 16 states: “Multiple agreements may be an interim solution, in the absence of a comprehensive legally binding treaty on climate change” despite the fact that the Concvention itself is a comprehensive legally binding treaty on climate change. | Taken into account in revised sentence. The sentence is discussing conceptual options; it is not saying that the UNFCCC is not legally binding. |
| 16186 | 13 | 16 | 42 | | | Instead of "interim", use "alternative". There is no reason that a single omnibus treaty is necessary. | Taken into account in revised sentence. |
| 16365 | 13 | 16 | 42 | 16 | 45 | Would be useful to split out the "single comprehensive" aspect from the " legally binding" aspect and treat these separately here | Taken into account in revised sentence, but the sentence is contrasting a single universal agreement to a set of multiple |
| 6839 | 13 | 16 | 42 | | | Isn’t it too early in the chapter to reach this conclusion? Is this borne out by the literature? | Taken into account in revised paragraph. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 7134 | 13 | 16 | 42 | 17 | 8 | Express the idea that multiple agreements may be an interim solution, in the absence of a comprehensive legally binding treaty on climate change. That could be theoretically correct considering the analysis in a vacuum, but does not apply to reality do to the existence of UNFCCC.<br>The vision in this Section, but also in other parts, of the Chapter, seems to downplay de role of UNFCCC, by locating the Convention as one among many international agreements. See list on 13.1. In our view that is no accurate in various senses, including that the list make a very broad consideration of what an agreement is, eg. UNEP, UNDP, these UN bodies does not make or negotiate climate policies, but work on supporting UNFCCC work.<br>In fact, the UNFCCC has been progressing on creating the basis for future developments, as showed by the Durban decisions which include the negotiation of a new legally binding instrument in the framework of the Convention, with a strong focus on mitigation. | Taken into account in revised paragraph, which now references the universal design of the UNFCCC and the Durban Platform. |
| 3983 | 13 | 16 | 42 | | 43 | "Multiple agreements may be a pragmatic interim solution in the absence of a comprehensive legally binding treaty on climate change". This is not only suggestive that they are indeed a solution, it also provides an incorrect dichotomy. There IS already a comprehensive legally binding agreement (the UNFCCC) and there are already multiple agreements. The correct question is to ask how they could or should relate to each other to effectively address climate change. | Accepted - revised in rewritten paragraph. |
| 4947 | 13 | 16 | 47 | 17 | 2 | "Whether these will evolve into an effective global agreement.." This is crucial point for the critical stage of the climate negotiations. There are examples with subjects closer to climate change, e.g., the JREC (Johannesburg Renewable Energy Coalition as response to the failure to agree on global targets on renewables at WSSD that lately expanded but could not become global; or the more recent problem on more concrete agreement on corporate sustainability reporting at the UNCSD, 2012 and the formation of the Group of Friends of this procedure.) Another very concrete aspect not mentioned here in context of multiple agreements and linking various agreements is the one that is now inherent element of the ongoing climate negotiations: the parallel negotiations since 1997 on the extension of the Kyoto Pr. and the new instrument with the intended universal participation and commitments. | Taken into account in revised paragraph, althoug not using all of the examples proposed here. |
| 11444 | 13 | 16 | 47 | 16 | 48 | The reference to the emergence of “bilateral and multilateral” (this should properly be called “bilateral and plurilateral” because the WTO is the multilateral regime) trade agreements, there is no empirically proven causal relationship between the slow progress of the WTO Doha negotiations and the emergence of such bilateral and plurilateral trade agreements. Negotiations on such bilateral and plurilateral trade agreements have taken place both before and during the WTO Doha negotiations. | Taken into account in revised text. |
| 13547 | 13 | 16 | 7 | 16 | 41 | This section is indicative of theoretical unevenness throughout Section 13.3 International Agreements: Lessons for Climate Policy and that to some extent characterizes much of the chapter. Rational choice approaches certainly have a great deal to say about the issues raised in this section and have produced significant insights. However, the sociologically-oriented literature on international agreements has some equally strong theoretical findings about international agreements that have significant empirical evidence behind them. This literature is cited in the chapter, but is not as extensively drawn upon in the analysis as the rational choice literature. The lessons about why the multilateral process have faced challenges are often different as are the solutions to those challenges. | Taken into account in revisions to 13.3, such as regarding norms, acculturation, and legitimacy, but this comment does not suggest specific literature to cite. |
| 4717 | 13 | 16 | 7 | 16 | 12 | As just noted, there is an extensive literature in IR that goes beyond the "rationalist school in political science" and lays out a range of mechanisms that have been shown, empirically, to be central to the processes by which international agreements influence state behavior or do not. States rarely negotiate "treaties with teeth" and, when they do, rarely apply them. The mechanisms of behavioral influence are rather broader and, if the goal is to have those designed into the follow-on to Kyoto, it would be valuable to mention the range of other strategies that international treaties use to get states to adjust and comply. | Taken into account in revisions to 13.3, such as regarding norms, acculturation, and legitimacy, but this comment does not suggest specific literature to cite. |
| 16182 | 13 | 16 | 7 | 16 | 12 | Add Chayes & Chayes, A New Sovereignty. The managerial approach is still important and was historically significant in the existing climate architecture. | Taken into account in new text on reputation, norms and legitimacy. |

|---|---|---|---|---|---|---|---|
| 3982 | 13 | 16 | 7 | | 12 | Not only is this sentence a quite abrupt transition from the discussion of the governance landscape to one of lessons learned from game theory, it never states clearly what lessons are learned. Moreover, the list of references at lines 11-12 is very random, and does not support the argument preceding these. | Taken into account in revised and expanded text. |
| 16234 | 13 | 16 | 23 | | | I suggest replacing the cite to Keohane 1989 with Keohane 1984, which is the classic work on transaction costs and international cooperation. Keohane, R.O. (1984). After Hegemony: Cooperation and Discord in the World Political Economy. Princeton University Press, Princeton, NJ. | Accepted by adding citation to Keohane 1984. |
| 16235 | 13 | 16 | 24 | | | Suggest adding a sentence at the end of the paragraph: "International organizations can also promote cooperation by orchestrating the activities of other actors and institutions, both public and private, involved in the governance of an issue area (Abbott and Snidal, 2010)." Abbott, K., and D. Snidal (2010). International regulation without international government: Improving IO performance through orchestration. Review of International Organizations 5, 315-44. | Accepted by adding citation to Abbott and Snidal 2010. |
| 5304 | 13 | 16 | 7 | 16 | 12 | the first sentence implies that the game-theoretic approach is limited to environmental economics. Game theory is itself a big subject in political science, particularly in international relations (see Avenhaus and Zartman, 2007, diplomacy games. Formal models and international negotiations). Furthermore, it would be interesting to show that there is a huge community of scholars on negotiation, several of which focusing on climate (environmental) regime and cooperation (for instance Sjöstedt 1993 International Environmental Negotiation). | Accepted by clarifying that game theory is used in both disciplines, and adding citations to Sjostedt 1993 and Avenhaus and Zartman 2007. |
| 8086 | 13 | 16 | 7 | 16 | 33 | On line 7, it is surprising that under the heading “lessons from game theory” the coalitional stability issue (a game theoretic controversy of long standing, and recognized in AR3 as well as in AR4) is not mentioned, although the controversy has made progress recently, as in Bréchet, Gerard and Tulkens (2011). The conceptual progress consists in (i) clarifying the different logical nature of two coalitional stability concepts involved (namely, core stability vs. “Internal-external” stability), and (ii) in testing either one of them on the same IAM numerical model. One policy implication one can derive from that comparison is that one concept is more appropriate when considering the a priori design of cooperative international agreements, whereas the other suits better for the study of compliance of existing such agreements.<br>Reference:<br>Bréchet, Th., F. Gerard and H. Tulkens (2011). Efficiency vs. Stability in Climate Coalitions: A Conceptual and Computational Appraisal, The Energy Journal 32 (1), 49-75. | Accepted by adding discussion of coalitions, and citations to work by Brechet et al. and others. |
| 16233 | 13 | 16 | 8 | | | The classic cite for the rationalist school in political science, which I suggest adding before the Downs et al. cite, is: Koremenos, B., C. Lipson, and D. Snidal (2001). The Rational design of international institutions. International Organization 55, 761-99. | Accepted by adding citation to Koremenos, Lipson and Snidal, 2001. |
| 14645 | 13 | 16 | | | | Denny Ellerman has a chapter in Aldy and Stavins 2010 book about lessons from the EU ETS for international climate policy. Isn’t the EU climate policy, negotiated among an exclusive club (EU members), an example of an effective climate agreement (if at the regional level as opposed to global)? | Accepted by explaining this in the text, and citing Ellerman 2012 (a newer chapter on this topic). Cross-references to Chapter 14 also made throughout |
| 14646 | 13 | 16 | | | | A more nuanced take on participation could benefit the reader. What does it mean for developing countries to participate in the Kyoto Protocol if it does not impose any emission commitments on them? What lessons can we learn in terms of promoting participation in global climate agreements from the effective prohibition under the Kyoto Protocol of any new country taking on an emission commitment? In 1999, Argentina proposed an emission commitment (similar in form to what China and India proposed in 2009), but there is no mechanism under the Kyoto Protocol for Argentina to accede to Annex B. | Accepted by explaining the possibility of different types of participation with different commitments, as under the Annex I/non-Annex I distinction in the Kyoto Protocol and potential evolution in subsequent agreements such as the |

|---|---|---|---|---|---|---|---|
| 6988 | 13 | 16 | | | | I am rather skeptical of the value of "exclusive membership" for providing a global public good. If the cited papers can explain this, the paragraph should at least mention the mechanisms they identify which give this result. At a minimum, exclusivity raises problems of legitimacy as regards global public goods. The Antarctica Treaty is exclusive, and in my view lacks legitimacy for that reason. The WTO is also exclusive, but the WTO is not trying to provide a global public good.<br><br>Lines 40-41 say that there is no exclusive institution with the "authority" to host climate negotiations. I was confused here, because several such institutions (or organizations) have undertaken minilateral initiatives—an example being the MEF. You might explain what you mean by "authority." Do you mean the UNFCCC?<br><br>In the trade area, while it might be argued that preferential or regional trade agreements (RTAs) can lead to a multilateral agreement, the opposite argument is at least as powerful. RTAs create trade diversion, and so can have negative consequences for countries outside the "region." But, as noted above, trade is not a global public good, so the relevance of this should be explained. You might cite the paper by Asheim, Bretteville Froyn, Hovi, and Menz (2006) on the utility of small agreements for addressing climate change.<br><br>On the role of transfers, I would suggest citing Carraro and Siniscalco (1993), who show that, assuming countries are symmetric, transfers won't help increase participation (without commitment); and Barrett (2002), who shows that, if countries are strongly asymmetric, transfers can increase participation dramatically (asymmetry becomes the source of commitment).<br><br>You discuss trade later, but the role that trade restrictions can play in increasing participation should be mentioned here; see Barrett (1997) below, though this point is also made in Barrett (2003), which is already cited in your chapter. Note also that I have always looked at compliance and participation jointly. I don't think they should be considered separately. See Barrett (1999), though again this same point is made in Barrett (2003), already listed in your references. Asheim, G.B., C. Bretteville Froyn, J. Hovi, and F.C. Menz (2006). "Regional versus global cooperation for climate control," Journal of Environmental Economics and Management 51: 93-109.<br><br>Barrett, S. (1999). "A Theory of Full International Cooperation," Journal of Theoretical Politics, 11: 519-41.<br><br>Barrett, S. (1997). "The Strategy of Trade Sanctions in International Environmental Agreements," Resource and Energy Economics 19: 345-61.<br><br>Barrett, S. (2001). "International cooperation for sale." European Economic Review 45: 1835-1850.<br><br>Barrett, S. (2011). "Rethinking Climate Change Governance and Its Relationship to the World Trading System," The World Economy, 34(11): 1863-1882. | Accepted by revising text to note both pros and cons of exclusivity and to discuss actual examples of open vs. exclusive climate agreements. Then, transfers and trade sanctions are discussed a little later in this subsection, where this comment is again accepted by adding several sentences and citations. |
| 6579 | 13 | 16 | 45 | 16 | 47 | Supply more details about "the practical difficulties encountered in negotiating short term"constitutionally. | Taken into account by revising this paragraph; this sentence is redundant with the first sentence of the paragraph. Text is now inserted to explain the |
| 6578 | 13 | 16 | 47 | 17 | 8 | Good example. | Noted. |
| 8006 | 13 | 16 | 47 | 17 | 8 | I fully support this part because both globally centralized and de-centralized scheme & intiatives are required for the effective and practical policies & measures against climate change. | Noted. |
| 3750 | 13 | 17 | | | | fairness - how is this operationalized? Absolute effort, MC of effort, environmental outcomes, procedural approaches, representation in decisions? | Noted, but a detailed comparison of different conceptions or measures of fairness is beyond the scope of this |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 14250 | 13 | 17 | | | | Is there a trade-off between depth and breadth? Maybe not: (i) In reality, Kyoto 1 performs badly on both, (ii) in theory, a large coalition internalizes the externality of more countries, suggesting a positive relationship between breadth and depth, (iii) this is consistent with a recent analysis that investigates the relationship between depth, breadth, and duration of the agreement (see Marco Battaglini and Bård Harstad, 2012, "Participation and Duration of Climate Contracts") | Accepted. |
| 12801 | 13 | 17 | 13 | 17 | 14 | "equity concerns arising…" How is it meant? Do you refer to precursor behaviour in the sense of the Kyoto Protocol, here? | Taken into account in revised sentence. |
| 3749 | 13 | 17 | 19 | 28 | | elaborate | Taken into account in expanded |
| 15386 | 13 | 17 | 19 | | | This is also very important – it is hard to even tell what they are talking about, which in plain language is: thus there is a fundamental conflict, that even with no transfers to developing countries and full participation, the net benefits of undertaking the globally optimal mitigation burden are less than the costs to necessary participants. Therefore national interests are clearly opposed to any "equity" solution. The research challenge is to determine how robust this conclusion is under different formulations of the damage function for major emitters. Some is on 18. It is agross understatement that "sanctions are not fully credible" under Kyoto Protocol – its one thing to say that the literature has opposing views, another to water down what articles actually say. I don't see how it is possible to mention participation on p. 21 without the 16 – 19 game theory. | Taken into account in revised paragraph on transfers and equity in 13.3.1. (The end of this comment 326 appears to be addressing a different section, p.21 in section 13.4.) |
| 12802 | 13 | 17 | 19 | 17 | 28 | See former comment; it may be worthwile to not focus only on burden but also on benefit sharing (you may like to check for the whole chapter). | Taken into account in revised paragraoh on transfers. |
| 6840 | 13 | 17 | 24 | 17 | 26 | This statement is not clear i.e. "it is not sufficient to consider only plausible and widely accepted equity criteria for the redistribution of the gains from cooperation" – this seems to suggest that implausible and less well accepted criteria should be taken into account? If that's the argument, it needs further explanation. | Taken into account in revised paragraph on transfers and equity in 13.3.1. |
| 13634 | 13 | 17 | 26 | | | This is the point I was making earlier about equity notwithstanding, countries won't act against their own interests. | Noted, and clarified in revised text. |
| 3751 | 13 | 17 | 29 | 39 | | elaborate - which linkages foster agreement,w hich inhibit it? | Taken into account in revised text. |
| 13632 | 13 | 17 | 29 | | | Note that important linkages exist whether or not there are formal linking agreements. An important transmission mechanism is through prices of traded fuels. Our research has found that some of the countries most affected by mitigation are not those mitigating. Rather, the greatest GDP hit can fall on energy exporters. | Accepted and added in revised text. |
| 16187 | 13 | 17 | 29 | 17 | 39 | Add linkages to human rights and biodiversity. | Accepted. |
| 16366 | 13 | 17 | 29 | 17 | 32 | Important to mention fossil fuel subsidies. Note OECD and IEA work in this area | Noted, but fossil fuel subsidies are not the kind of linkage discussed here, which is from climate treaties to non- |
| 11445 | 13 | 17 | 29 | 18 | 3 | The treatment of issue linkages (e.g. between mitigation, adaptation, finance, technology) in these lines should be improved in terms of what the advantages are. The way that the phrasing is made currently, it creates the implication that issue linkaging in the context of climate negotiations has become a stumbling block to concluding multilateral climate negotiations. | Clarified in revised text. |
| 2410 | 13 | 17 | 3 | 17 | 7 | Comment on specific text: Global administrative law emerges not only from the specific recommendations of organisations such as the subsidiary bodies of UNFCCC but also from the routine practice of governance. One of the distinctive things about the methodology of GAL is that it is formed also from the bottom-up. GAL principles are viewed as of normative significance, regardless of whether a particular institution has expressly endorsed them or not. This may also be of relevance when you are thinking about institutional feasibility/appropriateness as discussed above. | Accepted in revised text. |
| 8173 | 13 | 17 | 30 | 17 | 32 | It would seem appropriate to add international security to the set of issues with significant linkages. | Accepted along with coment 332 regarding human rights and biodiversity. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 18693 | 13 | 17 | 40 | 17 | 43 | The effect of linking with R&D (or technology oriented agreememts) needs references, poss ibly Nagashima and Dellink (2008) and/or Lessmann and Edenhofer (2011). Also, the language in these lines is rather strong ("can only work"). Unless the author adds references that I am not aware of, some qualifications are needed. | Accepted, text revised. |
| 8174 | 13 | 17 | 41 | 17 | 42 | Linking can work even if benefits of R&D spread to nonmembers so long as *some* benefits do not. | Accepted. |
| 12983 | 13 | 17 | 45 | 17 | 46 | This first sentence repeats what said at p. 17 line 29. | Accepted and revised in line 29. |
| 7140 | 13 | 17 | 45 | 18 | 3 | This analysis does not take fully into account the fact that all the elements under negotiation are connected and the progress in one area (e.g. mitigation), is related with advances in other areas (e.g. finance). This paragraph, among several others in this Chapter, suggests a non-UNFCCC approach as the preferred one. | Taken into account in revised paagraph. |
| 3748 | 13 | 17 | 9 | 12 | | is this talking about G20 versus UN? | Noted; the sentence is speaking conceptually, not specifically about the G20 versus UN. See revised paragraph. |
| 8088 | 13 | 17 | 26 | 17 | 28 | This reviewer wishes to suggest that what is mentioned in these two lines be more explicitly connected with what is said in lines 37-40 and 45-47 of p. 62 of chapter 4: the transfers discussed here (in chapter 13) do have a fundamental role in making the Paretian approach (discussed in chapter 4) a feasible one in terms of voluntary agreements.<br>Astonishingly, both here in chapter 13, and there (throughout chapter 4), the inescapable necessity of a voluntary character of any international agreement is pretty much ignored, the authors seeming to be dominated by the quest for equity. But on this subject, undermining the voluntary dimension is a severe lack of realism.<br>NB : in referring to p. 62 of chapter 4, I ignore lines 41-44, because they are an extreme, and actually, as stated, incorrect implication of paretianism. There are better things to say on Pareto improvements in international affairs. | Accepted and added in revised text.<br>Note that the "voluntary character of any international agreement" is already discussed in 13.3 in terms of the lack of a supranational coercive institution and the need for IEAs to be self-enforcing; but this "voluntary" or "consent"-based character is now mentioned there as well. |
| 8087 | 13 | 17 | 9 | 17 | 18 | The paragraph devoted to the alternative “breadth vs. depth” introduced by Barrett (2002) does not, in this reviewer’s opinion, reflect correctly the state of this interesting question. Hence two suggestions:<br>– After mentioning that the “breadth first” option is (rightly) credited to Schmalensee (1998), it could be added to the text at the end of line 12:<br>“The entire chapter 11 of Barrett (2003) is devoted to justify this option in formal terms. However, a weakness of this justification is pointed out in Chander and Tulkens (2009) (pp. 180-181) who therefore find the preference for this option not well established in theory.”<br>– In the text then continuing with “Other scholars…” it would be good to have some reference appearing in support of the alternative view.<br>Reference<br>Chander, P. and H. Tulkens (2009). “Cooperation, Stability and Self-Enforcement in International Environmental Agreements: A Conceptual Discussion”, chapter 8 in R. Guesnerie and H. Tulkens, eds, The Design of Climate Policy, The MIT Press, Boston. | Accepted - citations added. |
| 8175 | 13 | 18 | 2 | 18 | 3 | This risks appearing dated if there is progress in negotiations. | Revised to remove "current" and make the sentence more conceptual. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 6329 | 13 | 18 | 27 | 18 | 36 | This paragraph is controversial and, to certain extent, subjective. The sentence that begins in line 31, to certain extent, put in doubt one of the main findings of the AR4 on the need to carry adaptation action together with mitigation action. The sentence that begins in line 32 need to be expanded and clarified: the current wording could be perceived that, in general, mitigation and adaptation actions counterrest each other and this is not the case. Finally, its last sentence, which is not supported by any bibliographic source, might be controversial. For this reason the referred experimental evidence should be described. In addition, the concept that adaptation is private might be no appropriate and does not reflect the agreements of the international community that request to give the same attention to adaptation than to mitigation, as stated in the preambular language of the Cancun agreeemnts (decision 1/CP.16) | Taken into account in revisions to paragraph. |
| 12984 | 13 | 18 | 27 | 18 | 36 | These two papers provide an analysis of the optimal mix of adaptation and mitigation:<br>Bosello, Francesco, Carlo Carraro, and Enrica De Cian. 2010. “Climate Policy and the Optimal Balance Between Mitigation, Adaptation and Unavoided Damage.” Climate Change Economics 01: 71. doi:10.1142/S201000781000008X.<br>de Bruin, K., Rob Dellink, and Shardul Agrawala. 2009. Economic Aspects of Adaptation to Climate Change: Integrated Assessment Modelling of Adaptation Costs and Benefits. OECD Publishing. http://ideas.repec.org/p/oec/envaaa/6-en.html. | Accepted. |
| 13635 | 13 | 18 | 27 | | | One challenge with adding adaptation into the mix is that many adaptive policies are adopted by sub-national governments. It is difficult for some national governments to bind or speak on behalf of their sub-federal entities. | Noted. |
| 7141 | 13 | 18 | 27 | 18 | 28 | This is an idea hard to sustain. Adaptation is key for all, but particularly for more than a hundred countries in the UNFCCC process. Those countries, if taken together, amount just a very small portion of the GHG, the broad participation in the UNFCCC is a consequence of a broad approach to CC, which include mitigation and adaptation together, in addition to compromises on means of implementation. | Noted. The text already indicates that adaptation is crucial for many countries. |
| 2175 | 13 | 18 | 27ff | | | Highly vulnerable countries (island states) are frequently minor carbon emitters. So the linkage between mitigation and adaptation looks a bit blurred. I guess, some better distinction between different adaptation measures could also be helpful (maybe a reference to adaptation related chapters of the report?). | Taken into account in revised text which clarifies that this paragraph is discussing incentives to participate in supporting |
| 11446 | 13 | 18 | 29 | 18 | 29 | The reference to “highly vulnerable” countries should be reworded because it could create unintended categorizations among countries that would depend on how one defines what “highly vulnerable” means. Under the UNFCCC, the phrasing is with respect to “particularly vulnerable” countries (which is defined in preambular paragraph 19 and Article 4.8 of the UNFCCC) | Accepted. |
| 2167 | 13 | 18 | 32 | | 34 | I think that it would be more helpful to refer to empirical papers investigating substitutability of adaptation and mitigation. Referring to theoretical papers in this respect is of lesser relevance, I guess (in the context of this paragraph; otherwise mentioning these theoretical paper is very appropriate, I think) | Taken into account in revisions to paragraph to highlight the need for empirical research here. Unfortunately, |
| 11572 | 13 | 18 | 34 | 18 | 36 | Here, it may be fruitful to distinguish between "direct" and "indirect" benefits. The direct benefits of types of adaptation may be local and private but indirect benefits may be global and public. If people near the sea benefits directly from an adaptation policy, people living elsewhere may benefit indirectly if the adaptation policy secures the sustainability of the sea community (and thereby reduces the pressure on other communities). | Taken into account in revised paragraph. |
| 14647 | 13 | 18 | 37 | 18 | 45 | This literature showing that reducing uncertainty could reduce the participation incentive seems to mask a participation-compliance trade-off. That is, at the compliance stage, uncertainty should be reduced (countries will know their costs of compliance), and thus even if participation is high before the resolution of uncertainty, then compliance may be low once that uncertainty is resolved (a possible real-world example of this could be Canada under the Kyoto Protocol). | Taken into account in a revision to the text. But the text already captured this point by saying that "as parties learn of the actual costs of mitigation, so their incentive to participate may shrink," and then by adding that reduced uncertainty |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 6841 | 13 | 18 | 37 | 18 | 42 | What is 'experimental' research and 'experimental' evidence. Need greater clarity here on what this is and is not. | Noted. The word is not necessary to the sentence. It refers to laboratory experiments using volunteers, but there |
| 6037 | 13 | 18 | 4 | 18 | 21 | This is an important point but I'm not sure it belongs in the section on lessons for participation. | Kept in current location because it addresses how to deal with regime |
| 8176 | 13 | 18 | 4 | 18 | 5 | What is the evidence for this claim? It is unclear that "better articulation" of linkages is necessary for "adequate" aggregate effect, which itself is undefined. | Taken into account in revised sentence. |
| 2411 | 13 | 18 | 4 | 18 | 4 | Comment on section of text: I liked the section on linkages but felt that it could be expanded a little more and perhaps organized a little better. In a sense, you have an opportunity here to set out an agenda for creative thinking on the part of the different 'elements' and for research.<br>I thought it might be worth stressing very clearly at the beginning of the discussion that linkages need to be designed/evaluated from the point of view of the criteria and principles set out earlier in the chapter. This is, I think, what is meant here by 'adequate aggregate effect'. But also that fragmentation/interaction provide opportunities to contest and develop what the appropriate criteria are, mean and require.<br>Drawing on non-climate change literature examining fragmented/multi-level governance I thought it might be worth trying to identify certain values that could inform the design/evaluation of actual or proposed interactions/linkages. Several come to mind:<br>i) mainstreaming: horizontal integration of climate change policies and objectives into all other policy spheres. EU experience with 'environmental integration' or 'gender mainstreaming' are relevant here.<br>ii) Redundancy: Fragmented governance can provide 'safety nets' to guard against the negative effects of under-regulation elsewhere. This is expressly discussed in the US federalism literature. See e.g. Robert Schapiro on polyphonic federalism.<br>iii) Accountability: e.g EIRS: Empowering Responsible Investment<br>iv) Learning: e.g. UN database on local coping strategies<br>With the emphasis upon outcomes (criteria) and values, there is space for all sorts of different kinds of institutional frameworks for linkage. You see this kind of approach in Sabel & Zeitlin's work where they insist that their vision of 'experimentalist governance' should be understood in functional rather than structural/institutional terms. The different elements that make up experimentalist governance can be performed through a variety of different institutional arrangements (http://www2.law.columbia.edu/sabel/learning%20from%20difference%20ELJ%202008.pdf p. 274).<br>Still it might be possible to try to identify certain kinds of interactions/linkages that may be productive from the point of views of the outcomes (criteria) and values above. Again, it should be possible to illustrate by reference to climate change and non-climate change governance literature. Some candidates overlapping with your section on p. 18:<br>i) hierarchy<br>ii) catalyst:<br>iii) networks<br>iv) monitoring/peer review<br>No doubt reflecting my own current research interests, I would like to see you pay more attention to the catalyst potential inherent in actions by individual (powerful) states and supranational organizations such as the EU. The EU-ETS aviation example and biofuels again come to mind. There is a rich IR and legal literature that points to the potential or unilateral action to galvanize global change, whether as a result of emulation of norms or as a result of ensuing global agreement. Beth Simmons writing in the area of financial regulation offers one very well known example of this. | Accepted - several points here added to this revised paragraph, although unfortunately there is not space in 13.3 to go into detail on all of these. |
| 6463 | 13 | 18 | 40 | 18 | 42 | Meaning of "transfer" should be clarified, such as technical tranfer, financial transfer, or both. | Noted. It refers to the transfers discussed on the previous page, |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 11447 | 13 | 18 | 46 | 19 | 41 | The section on compliance needs to have text relating to positive or incentive-based compliance regimes (such as the provision of support similar to what is contained in Art. 4.7 UNFCCC) rather than simply focusing on punitive or sanction-based compliance regimes. | Accepted in revised text. |
| 8177 | 13 | 18 | 47 | 18 | 49 | I would characterize this as the view of one scholar rather than as an undeniably true statement. It is far from clear that "a high frequency of reporting" is necessary to effective compliance strategies. | Noted and clarified in the text, with cross-references to preceding sections and to |
| 7142 | 13 | 18 | 47 | 18 | 48 | MVR is not only about mitigation, since the Bali Action Plan there is also MRV of means of implementation." | Noted. The paragraph on MRV does not confine itself to mitigation. |
| 4961 | 13 | 18 | 48 | | | MRV is used for measurement, reporting and verification AND for monitoring, reporting and verification ~ recently, the latter version is used for c.c. negotiations | Added in the text. |
| 16367 | 13 | 18 | 49 | 19 | 4 | Important to specify that these initiatives are for MRV regimes under FCCC. Also, would be good to introduce tiering options as discussed in Ellis et al (2011),FREQUENT AND FLEXIBLE: OPTIONS FOR REPORTING GUIDELINES FOR BIENNIAL UPDATE REPORTS http://www.oecd.org/environment/climatechange/48073760.pdf | MRV applies to the UNFCCC but also potentially to other initiatives and institutions. |
| 14648 | 13 | 18 | | | | Some real-world grounding for the discussion of transfers is warranted. The scale of transfers discussed in the literature -- and by some in international negotiations, especially those who care that the form of transfers is by and through governments -- does not seem feasible given the current fiscal outlook in the US, EU, and Japan. This goes beyond my area of expertise, but is there some political science literature that could shed light on how foreign aid varies with a donor country's fiscal outlook? | Taken into account in text added on feasibility of transfers via allowance allocation rather than government aid, citing Ellerman 2012. |
| 13919 | 13 | 18 | 22 | 18 | 26 | The issue of technological change, unilateral action and participation under repeat interactions is also discussed in a game theoretic: See Pitel, K. and D. R bbelke, "Transitions in the negotiations on climate change: from prisoner's dilemma to chicken and beyond", International Environmental Agreements, DOI 10.1007/s10784-010-9126-6. ü | Accepted. |
| 7507 | 13 | 18 | 22 | 18 | 26 | Important point. | Noted. |
| 13920 | 13 | 18 | 42 | 18 | 45 | This section could also reference Weitzman's article (Weitzman, M., "A Review of The Stern Review on the Economics of Climate Change", Journal of Economic Literature, Vol. XLV (September 2007), pp. 703–724 ) which shows that negative damage risks should lower discount rates and hence increase incentives to mitigate/participate. | Accepted. |
| 4718 | 13 | 18 | 46 | | | This section has two problems. First, even the Montreal Protocol has sought to facilitate compliance as much as to enforce it, but that approach receives no mention. Second, the larger issue of inducing "adjustment" or achieving "effectiveness" is replaced with a now passe notion that compliance is what matters. Compliance can be coincidental and hence unimportant (ie, not due to the treaty and counterfactually, would have occurred anyway) whereas non-compliance can reflect important efforts that fell short of compliance but nonetheless would not have occurred absent the treaty. Indeed, one imagines that eventual analyses of the Kyoto Protocol will show very low levels of compliance but, we hope, at least some effectiveness in leading to emission trajectories that were ever-so-slightly less than they would have been in the absence of the Protocol. This literature noting that effective behavior change is more important than compliance should be reflected in this chapter, I believe. | Accepted; see new paragraph on effectiveness. |
| 17663 | 13 | 18 | 47 | 19 | 41 | It might be useful to note that the withdrawal of Canada from Kyoto I, also revealed some important lessons with respect to compliance. If a country expecting to fail to meet its commitments can withdraw from a treaty without sanction the effectiveness of even the most sophisticated compliance mechanism is ultimately undermined. | Accepted as a conceptual point to add regarding noncompliance and withdrawal. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 17664 | 13 | 18 | 47 | 19 | 41 | Note that the implications of incomplete enforcement of a treaty differ among the regulatory approaches, i.e. between a cap-and-trade system and international emission taxes. Overselling and underbuying of permits undermines the environmental integrity under cap-and-trade regulations while international harmonized emission taxes are additionally exposed to the risk of fiscal cushioning, i.e. the adjustment of domestic fiscal policies to offset the emission tax incentive effect (Rohling and Ohndorf (2012)). For example, tax exemptions, special provisions for exporting firms, or subsidies for pollution intensive sectors undermine the international tax rate. Enforcing fiscal cushioning is difficult as detailed directives on domestic fiscal policies can be considered as unacceptable infringements in the countries' sovereignty (Wiener (1999), Victor (2001), Hoel (1993), Nordhaus (2007), Aldy et al. (2008), ).<br><br>Aldy, J. E., Ley, E. and Parry, I. W.: 2008, A tax-based approach to slowing global climate change, Discussion Paper RFF DP 08-26, Resources for the<br>Future.<br><br>Hoel, M.: 1993, Harmonization of carbon taxes in international climate agreements, Environmental and Resource Economics 3, 221–231.<br><br>Nordhaus, W. D.: 2007, To tax or not to tax: Alternative approaches to slowing global warming, Review of Environmental Economics and Policy 1(1), 26–44.<br><br>Rohling, M. and Ohndorf, M.: 2012, Prices vs. Quantities with fiscal cushioning, Resource and Energy Economics 34, 169–187.<br><br>Victor, D. G.: 2001, The Collapse of the Kyoto Protocol and the Struggle to Slow Global Warming, Princeton University Press, Princeton, N.J.<br>Wiener, J. B.: 1999, Global environmental regulation: Instrument choice in legal context, Yale Law Journal 108, 677–707. | Accepted; new paragraph added on these points. |
| 3473 | 13 | 19 | | | | Section 13.4 is in general very clear (although I believe 13.4.2 schould not be a section) | Noted. Purpose of section on SRM more |
| 14345 | 13 | 19 | 1 | 19 | 1 | This references a paper by Ellis and Moarif from 2009, which is a follow up to the original paper from the previous year: Ellis J. and K. Larsen, "Measurement, Reporting and Verification of Mitigation Actions and Commitments," OECD/IEA, Paris, 2008. The original paper should be referenced here. | Accpted. |
| 4948 | 13 | 19 | 10 | | 14 | It is not fully clear, since possible sanctions in the compl. system under the KP include the suspension of eligibility to take part in the flexibility mechanisms (in particular, in trading with AAUs) which proved to be a "credible" provision to some extent. | Accepted. |
| 8178 | 13 | 19 | 10 | 19 | 11 | I would suggest listing and/or citing some of the proposed alternatives. | Accepted, per comment 377. |
| 12804 | 13 | 19 | 13 | | | Can you provide a reference? | Unfortunately, the comment did not suggest a reference. Found Feldstein |
| 8754 | 13 | 19 | 14 | 19 | 21 | A fundamental point about trade sanctions is that they are costly for the countries imposing the sanctions as well as the countries sanctioned. This increases the reluctance to use them. See Kemfert et al., Can Kyoto Protocol Parties Induce the US to Adopt a more Stringent Emissions Target?, Interdisciplinary Environmental Review, v. 5, n. 2, 2003, pp. 119-141. | Accepted. Added to earlier text on trade sanctions in 13.3.1. |
| 8094 | 13 | 19 | 14 | 19 | 21 | Would mention here that trade-related measures can also be used to prevent emissions leakage, as well as sanctions instruments, and the WTO considerations are different in each case. | Noted, but this point relates to national policies seeking to avoid leakage, whereas this section is on international |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 2302 | 13 | 19 | 14 | 19 | 21 | The claim that "in any case, trade sanctions run the risk of reducing cooperation" is misleading, because the absence of strong self-interested incentives, such as the prospect of trade sanctions, also runs the risk of reducing cooperation due to the collective action problem. This paragraph is more negative on trade sanctions than justified, since it does not consider the incentive effects of the prospect of trade sanctions. If trade sanctions are actually imposed, they will have failed; the positive impact comes prospectively. The discussion on pp. 36-37 of the same issue is much more balanced, and it seems to me that the discussion on p. 19 is inconsistent with it. | Taken into account in revised text on trade sanctions in both 13.3.1 and 13.3.2. |
| 8179 | 13 | 19 | 14 | 19 | 21 | This does not appear to acknowledge the option of altering the WTO. | Taken into account in text. |
| 3175 | 13 | 19 | 15 | 19 | 17 | p.19, lines 15-17. Perspectives are evolving here, and certainly my view is a bit different from how I am quoted here. I laid out in some detail in Victor (2011) the tradeoffs involved here—on the one hand, trade measures open the door for mischief (and in hard economic times the incentives for mischief are legion). On the other hand, the free rider problems are nearly impossible to solve without punishments for free riders and semi-appropriable benefits for "club" members. | Noted with added reference to Victor 2011 and this dilemma, at the end of the paragraph. |
| 12551 | 13 | 19 | 18 | | | After “2011”, add -- “For example, Hoerner (1996) showed that a symmetrical border tax levied on ozone-depleting chemicals by the US was trade-compliant.” J. Andrew Hoerner, 1996. Tax Tools for Protecting the Atmosphere: The US Ozone-depleting Chemicals Tax. In Green Budget Reform: An International Casebook of Leading Practices, Robert Gale, Stephan Barg, Alexander M. Gillies, International Institute for Sustainable Development, Earthscan. | Noted, but this example is too specific to the Montreal Protocol to add here, where we cite more recent analyses on the WTO-legality of border taxes on GHGs or embedded carbon. (which may raise |
| 3970 | 13 | 19 | 19 | 19 | 19 | The sentence that "trade sanctions pose significant risk of reducing cooperation" should be strengthened. Trade sanction as a measure for compliance is grossly inappropriate: See Shinya Murase, “Conflict of International Regimes: Trade and the Environment”, in S. Murase, International Law: An Integrative Perspective on Transboundary Issues, Sophia University Press, 2011, pp. 130- 166. | Taken into account by revising the text to note the difference between threatened and imposed trade sanctions, adding this and other citations, adding a cross-reference to the discusion of trade |
| 13636 | 13 | 19 | 21 | | | A border tax on even one good by one party, the airline fuel tax in the EU, has produced strong backlash. | Noted, but not mentioned for now because no literature is yet identified discussing this airline fuel tax example, |
| 15072 | 13 | 19 | 21 | | | An example illustrating the possiblity that border taxes could harm the countries intending to punish others appears in WJ McKibbin and PJ Wilcoxen, "The Economic and Environmental Effects of Border Tax Adjustments for Climate Policy," in L Brainerd and I Sorkin, (eds), Climate Change, Trade and Competitiveness, The Brookings Institution, pp. 1-34, 2009. | Accepted. |
| 7662 | 13 | 19 | 22 | 19 | 23 | In my understanding punishments are not mainly targeted at misreporting only but at missing the targets. | Text clarified to indicate that sanctions |
| 12805 | 13 | 19 | 22 | 19 | 25 | Can you provide a reference? | This text just states the rationalist observation that parties will comply if the benefits exceed the costs. The text also seems out of place; it belongs earlier in |
| 17670 | 13 | 19 | 22 | 19 | 25 | It would be valuable if you gave some examples for "deterrence machnisms" in this context and cite some literature | Text revised, see comment 391. |
| 7661 | 13 | 19 | 23 | 19 | 25 | One such mechanism is described in Heitzig, Lessmann, Zou (2011) PNAS, doi:10.1073/pnas.1106265108 | Already inserted per comment 377. |
| 6330 | 13 | 19 | 26 | 19 | 28 | Is it necessary to use this extensive list of literature from 1998 to 2006. Was not this issue covered by the AR4? If so, possibly it could be cited instead. There are not more updated literature on this matter? | Taken into account by adding newer citations. Deleted Doelle 2004 which is about a different topic. Older citations |
| 10809 | 13 | 19 | 26 | 19 | 41 | Consider citing a recent book on Climate Change Liability by Lord, Goldberg, Rajamani and Brunee. Cambridge 2012. | Accepted. |
| 16188 | 13 | 19 | 26 | 19 | 41 | Add Daniel A. Farber. 2011. The UNCC as a Model for Climate Compensation in Gulf War Reparations and the UN Compensation Commission: Environmental Liability. Cymie R. Payne and Peter H. Sand, eds. New York: Oxford University Press. | Accepted. |

|---|---|---|---|---|---|---|---|
| 6842 | 13 | 19 | 26 | 19 | 41 | There is a vast quantity of more current literature on climate litigation that has not been referred to. See for instance, Richard Lord, Silke Goldberg, Lavanya Rajamani and Jutta Brunnée (editors), CLIMATE CHANGE LIABILITY: TRANSNATIONAL LAW AND PRACTICE (Cambridge University Press, UK, 2011); See also work by Osofsky and Burns | Lord et al. 2011 now added. Burns was already cited. |
| 6843 | 13 | 19 | 26 | 19 | 41 | There is also an increasing emphasis on human rights remedies that should be mentioned. See work by Stephen Humphreys, formerly of ICHRP, for instance, as well the work on the OHCHR on this. In the context of the climate negotiations see also:The Increasing Currency and Relevance of Rights-Based Perspectives in the International Negotiations on Climate Change, 22(3) JOURNAL OF ENVIRONMENTAL LAW 391-429 (October 2010) | Human rights are important but are not the topic of this paragraph on civil liability litigation as a complance enforcement mechanism; instead, the role of human rights in international law related to climate change is being |
| 2412 | 13 | 19 | 26 | 19 | 41 | Comment on specific text: As above, I think it would be helpful to specify what you mean by legal remedies here. It seems that you have private law remedies (especially tort) in national legal systems in mind? The concept of legal remedies seems quite vague and to cover a lot of things that are also discussed elsewhere. | Text clarified. |
| 3752 | 13 | 19 | 45 | | | define durability | The term is used in its ordinary sense and is explained in the cntext of the |
| 4962 | 13 | 19 | 5 | | 6 | Actually, the compliance system was not established by the KP per se, but that was elaborated and adopted several years later (in 2001 as rightly indicated in Table 13.2 on p.20), but formally/legally it is "under" the KP. | Noted and text revised to add "and its follow-on accords". |
| 12803 | 13 | 19 | 5 | | | MEAs (not explained; reference was IEA so far) | Text revised to refer only to IEAs |
| 7660 | 13 | 19 | 7 | 19 | 9 | A credible sanctioning mechanism for the Kyoto protocol and similar architectures has recently been suggested in the game-theoretic literature (Heitzig, Lessmann, Zou (2011) PNAS, doi:10.1073/pnas.1106265108) | Accepted, and statement that "few alternatives have been identified" is removed. |
| 14649 | 13 | 19 | | | | The discussion of compliance could expand the brief text on MRV to include lessons learned from non-envl international policy surveillance programs, such as IMF Article IV consultations, OECD economic policy reviews, WTO trade policy reviews, etc. May also be useful to draw lessons from arms control treaty surveillance. | Taken into account in revised text. |
| 5686 | 13 | 19 | 26 | 19 | 41 | If legal remedies for climate damages are to be discussed as a potential solution, it would be helpful if this paragraph offered an example of a case in which this has happened. In addition, the paragraph should mention the lack of an international legal system with the power to enforce credible penalties/sanctions. This would seem to be a key barrier to the liability approach, and very similar to the more general problem of enforcing international agreements, discussed earlier in the chapter. | Taken into account in revised text. |
| 2933 | 13 | 19 | 39 | | | add a reference to Lord et all, 2011 : Richard Lord QC, Silke Goldberg, Lavanya Rajamani, Jutta Brunnée (eds.) (2011), Climate Change Liability: Transnational Law and Practice, CUP, 712 p. | Accepted. |
| 13921 | 13 | 19 | 5 | 19 | 9 | The discussion on the Kyoto compliance regime could benefit from further nuance. The references cited (Obertuer and Lefeber, 2010; Doelle et al, 2012) show that the Kyoto regime has been successful in inducing compliance with onerous reporting requirements, which itself can raise the detection risks and political costs of non-compliance. They also argue that, whatever its failings, the Kyoto compliance regime presents important elements and lessons-learned that could feed into future regimes, in particular with regard to the MRV requirements. | Accepted. |
| 2932 | 13 | 19 | 6 | | 7 | include WHILE others MEAS… | Accepted. |
| 18662 | 13 | 20 | | | | Page 20: Useful typology of commitment in international agreements for climate change | Noted |
| 3971 | 13 | 20 | | | | On typology of commitments, the first Colum, the reference to WTO is not appropriate, since the WTO dispute settlement enforces States to comply only with future commitments (such as amending the non-compatible national laws for the future) without demanding the ex-post-facto restitution or redress. WTO mechanism looks quite rigid at first sight, but actually quite “soft” allowing flexibility. See, Shinya Murase, “International Lawmaking for the Future Framework on Climate Change: A WTO/GATT Model”, in S. Murase, International Law: An Integrative Perspective on Transboundary Issues, Sophia University Press, 2011, pp. 167- 180. | Taken into account - text revised to recognise the claim re the WTO was too strong in the earlier version. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 3972 | 13 | 20 | | | | There should be an additional Colum between “Mandatory provision in a legally-binding agreement” and “Mandatory provision in a non-legally-binding (“political”) agreement”, regarding “Mandatory provision of legally binding agreement with flexible commitments” to which the WTO/GATT mechanism belongs. See, Shinya Murase, “International Lawmaking for the Future Framework on Climate Change: A WTO/GATT Model”, in S. Murase, International Law: An Integrative Perspective on Transboundary Issues, Sophia University Press, 2011, pp. 167- 180. | Taken into account. The clarification of the meaning of "mandatory" (see response to #418) has specified that this could include obligations that contain flexibility, so the proposed extra row is unnecessary. The suggested refernce |
| 11590 | 13 | 20 | | | | The table is a clear demonstration how the UNFCCC has met all the requirements for an international agreement.It is the burden sharing that is causing difficulties because those who are supposed to take a leadership role are not doing so. | Noted |
| 16189 | 13 | 20 | | | | Should read "somewhat more weight than a political agreement …." | Accepted - text revised. |
| 11336 | 13 | 20 | | | | A 'mandatory provision in a non-legally binding 'political' agreement'- is not binding as a matter of law - but only as a matter of morality. Theer are no degrees of bindingness. | Taken into account. The opening paragraph has specified that bindingiess may be legal but may come in other forms - these are not "degrees" but types |
| 11448 | 13 | 20 | | | | The reference to the Copenhagen Accord in the third row, third column, of Table 13.2 is factually inaccurate. The Copenhagen Accord is not an official document of the UNFCCC COP. In this context, UNFCCC Parties submitted mitigation pledges and NAMAs in response to UNFCCC COP decision 1/CP.16 (the Cancun outcome) rather than the Copenhagen Accord. If UNFCCC Parties made submissions pursuant to the Copenhagen Accord, they did so legally not as UNFCCC Parties but rather as individual States. The conclusion in the fourth row, third column, that UNFCCC Art. 4.2 is a non-mandatory provision in a legally binding agreement is not accurate. Art. 4.2 – particularly paragraphs (a) and (b) therefore – is a mandatory provision because it specifically commits and requires Annex I Parties to undertake specific actions. The “aim” language relates to the mitigation target of returning emissions to 1990 levels by 2000 and should be read as a legal requirement because it is in the context of the mandatory requirement of Annex I Parties to report on the mitigation actions that they are to undertake in compliance with Art. 4.2(a) of the UNFCCC. It is a standard rule in treaty interpretation that the text of treaty provisions should not be read in isolation but rather in terms of their context and ordinary meaning. | Part I (Copenhagen Accord) - accepted - text revised. Part II (Article 4) - taken into account - text revised to distinguish beteen article 4.2(a) and (b). |
| 6112 | 13 | 20 | 18 | | | In the 4th column of Example, there is a description that "The UNFCCC target for developed countries to return their emissions to 1990 levels by the year 2000" (Article 4.2). This is incorrect. Correct wording is "the return by the end of the present decade to earlier levels". Then US President Bush senior opposed to sign the treaty if it is written as to stabilize at 1990 level by 2000. After the final negotiation, the wording "return -- to earlier level" has been agreed. Please change "1990" to "earlier". | Accepted - text revised. |
| 6844 | 13 | 20 | 6 | 21 | 27 | There are, again, southern legal scholars that have written on these topics in peer reviewed international legal journals but are not cited here. Among others, I have written numerous pieces on the issue of legal form. A more comprehensive literature survey(going beyong American journals/scholars) and reflecting greater balance and diversity in the voices/literature cited would be helpful. For instance, L. Rajamani, The Copenhagen Agreed Outcome: Form, Shape and Influence, XLIV (48) ECONOMIC AND POLITICAL WEEKLY 30-35 (28 November 2009)<br>L Rajamani, Addressing the Post-Kyoto Stress Disorder: Reflections on the Emerging Legal Architecture of the Climate Regime, 58(4) INTERNATIONAL & COMPARATIVE LAW QUARTERLY 803-834 (October 2009) | Accepted. Rajamani's second suggested article incorporated (The first, in EPW, is not peer-reviewed, but also more of a commentary on the copenhagen negotiations rather than a detailed exploration of the legal form question). However, in the next round of revisions, the authors will consider more literature from developing country authors. |
| 4963 | 13 | 20 | 7 | | | these are generally not among governments, but among States (usually represented at the negotiations by gov. representatives) | Accepted - text revised. Similar consequent change also made in FAQ |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 10811 | 13 | 20 | | 23 | | The sub-sections of 13.4.1 do not seem to me to cover the full range of issues on which international cooperation is needed, nor those on which discussion is, in fact, already ongoing. The discussion as currently written tilts too much toward mitigation alone, with no real space given to the cooperation required on adaptation, financing, technology and so on. There are two ways forward: If the current construction is retained, it would be good to explain where the categories of legal binding, burden sharing and flex mechs come from. And then to make sure the substantive themes such as adaptation, finance etc., are appropriately discussed in brief, most likely under burden sharing (and to a greater extent than a single word reference, which is what exists at the moment). Another option would be to use other alternative typologies available, for example, by drawing on the UNFCCC process in general and the Bali Action Plan pillars in specific. Either way, the underlying point is that the scope of international cooperation should be widened to, at minimum, encompass the current discussions. | taken into account. Section structure reorganised. Additional subsection on "goals, actions and metrics" added, to be drafted yet. Emaphsised that these elements are not the only ones that could be discussed. |
| 14650 | 13 | 20 | | | | The legal bindingness section should include some discussion of how treaty obligations vary across nations as a function of their respective domestic law. As I understand it, a ratified treaty in the United States carries the force of domestic law, while in other nations ratified treaties do not necessarily provide standing for domestic constituents to sue for compliance by their soveriegn. | Accepted - text revised. |
| 5311 | 13 | 20 | 1 | 21 | 27 | It is interesting to see the typology of commitment in international agreements for climate change. It may be useful to add the growing literature on "norm-building" in international relations especially in the absence of a legally binding agreements. For instance, although we do not have an international treaty on nuclear tests (the CTBT is not yet in force), there is always a huge international protest when one country announces nuclear tests. In the climate change context, norms may be more effective than legal binding agreements. | accepted. Discussion of this incorporated into section on legal bindingness. |
| 11141 | 13 | 20 | 6 | 21 | 27 | The word "bindingness" does not exist in the English language. Please clarify in all instances. | Rejected - the comment is incorrrect about the existence of the word bindingness. First use according to the |
| 3176 | 13 | 20 | 6 | | | section 13.4.1.1 and section 32.4.1.3. There's a lot of literature (by lawyers and political scientists alike) on bindingness and on flexibility. The Hafner-Burton et al (2012 AJIL) article reviews the political science literature in some detail. Helfer's work, among others, addresses the law. Also, I think the section on flexibility is overly focused on the CDM as a source of flexibility when, in fact, countries have used (and have available in the future) lots more—such as the ability to adjust (before a treaty is finalized) their targets, possible designs that include more explicity target or commitment flexibility (e.g., pledge and review), etc. This text makes is sound like the CDM is the cat's meow for flexibility. | taken into account. Opening paragraph added empahsising plural ways that flexibility might be organised. The argument in Hafner-Burton used as an example. But overall focus of section remains on Kyoto flexibiltiy mechanisms. Re the final point (the "cat's meow"), it is worth noting the section cites a good deal of mateiral highly critical of the CDM. See also response to #107 |
| 6990 | 13 | 21 | 1 | | 10 | You might note that an agreement can require that parties adopt domestic legislation for compliance. | Rejected. The text already states that agreements may "set in motion domestic legal-implementation |
| 16368 | 13 | 21 | 1 | 21 | 10 | Could metnion here analysis and literature on examples of where domestic law has been triggered by international commitments (eg EU ETS) | Rejected. This comment is correct but not relevant here. The sentence refers only to the different sort of authority relations in domestic and international law, not to the dynamci relationship between the two levels. This comment |
| 11337 | 13 | 21 | 1 | | | There is no such thing as a nonbinding treaty (even though a treaty may contain non-binding or non-enforceable 'obligations') | taken into account. The word treaty has been replaced with agreement to be consistent with the rest of the section, |

|---|---|---|---|---|---|---|---|
| 10810 | 13 | 21 | 11 | 21 | 19 | The definition of soft law used here is imprecise. Better to use the most accepted definition by Abbott, Kenneth W. and Snidal, Duncan, Hard and Soft Law in International Governance (2000). International Organization, Vol. 54, p. 421. They distinguish hard and soft law on three axes: obligation, precision, and delegation. These actually map quite well to Werksman's latter three categories of obligatory language, sufficient detail for compliance and mechanims (his fourth is legal form), which is citied at the beignning on 13.4.1.1. Making the link locates this discussion in a broader context of international relations thinking and scholarship. | accepted - text revised to make the definition of soft law more precise. |
| 11338 | 13 | 21 | 14 | | | enactnment of domestic legislation is not necessarily indicative of a state's acceptance of something as legally binding. It may do so for purely pragmatic or political reasons | reject. This comment is mistaken. The sentence does not imply that all domestic action is evidence that states regard an international agreement as binding - just that if states do treat it as binding this may lead to domestic |
| 4949 | 13 | 21 | 16 | | 19 | There is also a climate policy related example: the declaration in 2001 (the "Bonn Declaration") by the EU members and some other developed countries to provide a concrete amount of financial means to the developing countries. | rejected. It is too unclear if the bonn declaration has had the effect implied in the text - that states have regarded such |
| 6331 | 13 | 21 | 25 | 21 | 27 | This last sentence of this paragraph is not backed by any literature source. In addition, it is not clear that the cited section 13.3.1 backs this statement. | accepted. Sentence on administrative law deleted here, because not strictly relevant to the question of legitiamcy - whi ch here is introduced to explain why legal bindingness may not always be central to a successful agreement. |
| 6991 | 13 | 21 | 25 | | 27 | Please explain the shift in the direction of administrative law. I didn't find the description here or in 13.3.1 to be satisfactory. I didn't even understand what was meant by the term. Please also give evidence of the "shift." Perhaps you could give examples? | see response to #447 |
| 8180 | 13 | 21 | 25 | 21 | 27 | This is a huge statement. At a minimum, I would recommend explaining what you mean by "less and less important" (i.e. less important in what sense). I would recommend considering deleting this. | see response to #447 |
| 11339 | 13 | 21 | 25 | 21 | 27 | What is your authority for the statement that international law is shifting in the direction of administrative law? What relevance the x reference to section 13.3.1 which merely refers to literature asserting that international organisations may be developing some form of global administrative law. The literature cited here is old and while it may be arguable that administrative aspects are developing within international law that is not the same thing as saying that internationnal law is becoming nothing more than administrative law - which is what your statement suggests. | see response to #447 |
| 14651 | 13 | 21 | 26 | | | I do not understand this reference to administrative law and the reference to see the section on participation. | see response to #447 |
| 16190 | 13 | 21 | 26 | 21 | 27 | This understates the importance of national governments' concerns about the democracy deficit in international organizations that assume significant decision making authority through administrative structures. | rejected - This comment is not relevant here. The sentence refers to argumetns that empirically, the character of international law is changing. Governments' concerns about this may |
| 6845 | 13 | 21 | 26 | 21 | 27 | This is quite a sweeping claim i.e. that international law is shifting in the direction of administrative law and the issue of state consent is becoming less and less important. This lacks context and nuance. There are a group of primarily American scholars that hold this view but this by no means undisputed. | see response to #447 |

|---|---|---|---|---|---|---|---|
| 17102 | 13 | 21 | 28 | 22 | 11 | burden sharing methods is only PART of the new rules since Copenhagen-Cancun, because ecological limits has brought on assessments by UNEP, which were discusses in the most recent informal negotiations of the UNFCCC at Bangkok, on "resource sharing" and considering the global carbon budget. Burden sharing is now being discussed in the literature and the negotiations interms of BOTH costs and carbon budget. The terminology used, "share of global GHG emissions covered" is not a commonly used term in the literature of in the negotiations and should be replaced with the term "global carbon budget". | taken into account. Title of subsection changed to "participation, equity and effort sharing methods". Section expanded in response to other comments. Discussion of on carbon budgets introduced.. |
| 6846 | 13 | 21 | 34 | 21 | 39 | Principle 7 of the Rio Declaration is not identical to Article 3 of the UNFCCC. There are important differences - and these were negotiated in by the US primarily because the legal status of the two instruments (Rio Decl and UNFCCC) are different. Cannot conflate in this manner. | Accepted - text revised. |
| 14652 | 13 | 21 | 36 | | | This quote should also include "respective capabilities." | Accepted - text revised. |
| 8095 | 13 | 21 | 36 | 21 | 36 | Change "common but differentiated responsibility" to "common but differentiated responsibilities and respective capabilities" | Accepted - text revised. |
| 6992 | 13 | 21 | 37 | | | I don't see how the UNFCCC's mention of avoiding "dangerous" interference relates to burden sharing. It's a collective goal. | rejected - the overall objective of the FCCC creates a set of limits to GHG emissions that thus imply distributive questions. The line is however amended to read "… the objective of |
| 4965 | 13 | 21 | 39 | | | burden sharing (here and generally): recently it was replaced with a "positive" terminology in the EU's climate-energy package and pol. documents, namely: with "effort-sharing" .. | taken into account. Section title changed to effort sharing, clarification in the text |
| 4964 | 13 | 21 | 7 | | | {Add} objective of {}avoiding "dangerous anthropogenic .. | rejected - unclear to which bit of text this comment applies. Clearly not relevant |
| 7143 | 13 | 21 | 9 | 21 | 10 | That's right, but there is also a fact that international law produces the development of domestic law, which is the case of climate change, e.g. The European normative. In the absence of UNFCCC and, particularly, of the KP, must of the current domestic legislation related with CC never have been issued | rejected. This comment is correct but not relevant here. The sentence refers only to the different sort of authority relations in domestic and international law, not to the dynamci relationship between the two levels. This comment |
| 13922 | 13 | 21 | 1 | 21 | 10 | The discussion on bindingness and effectiveness could benefit from a reference to Raustiala's paper: Raustiala, K., "Form and Substance in International Agreements", The American Journal of International Law, 99, 2005. He makes the point that there is often an inverse relationship between bindingness, stringency and the means of enforcement with an IEA, as government's seek to reduce the potential costs of non-compliance. | accpted. Text revised accordingly. |
| 5305 | 13 | 21 | 7 | 21 | 7 | loss of reputation should be changed to "loss of good reputation". | rejected - the term "good" is redundant - to lose a reputation implies to lose a good reputation. This is particularly |
| 10812 | 13 | 21 | | 22 | | The participation and burden sharing section is disproportionately small compared to legal bindingness and flex mechs. Yet there is a huge literature on this topic, and a great deal of new insight generated in the last 5 years since AR4. I realize there is a section 13.13.2.2 assessing burden sharing still to come. But for balance, this section needs to set up the problem better. At minimum, the resource versus burden sharing frameworks should be laid out, with representative studies of each of these. The citations in lines 8-10 p. 22 are broadly right, but perhaps some survey articles are worth mentioning. I am not fully aware of the literature, but one by D. Narasimha Rao in Handbook of CLimate CHange and India, Navroz Dubash (ed.) OUP/Earthscan 2012 has some key citations. | Accepted. Section significantly reorganized and expanded. |
| 13923 | 13 | 21 | 28 | 22 | 11 | The discussion on participation could reference (Raustiala, K., "Form and Substance in International Agreements", The American Journal of International Law, 99, 2005.) on the relationship between legal form and substance: the legal nature of commitments and the participation that the regime is likely to attract. | rejected. Article consulted, the point about the relationship between legal form and participation seems relatively |

|---|---|---|---|---|---|---|---|
| 6580 | 13 | 21 | 28 | 22 | 11 | Consider coorelation between "Participation" and "Degree of Legal bindingness".<br>Examples of examination objects are as follows.<br><br><Mandatory provision in a legally-binding agreement with enforcement mechanism: Kyoto Protocol><br>At the time of the adoption of the Protocol, it covered 58% of global emissions. Because of US withdrawal and rapid increase of emissions from emerging economies, coverage has shrunk to only 27% in 2008 (figures are based on ener-gy-related CO2 by IEA statistics). And at COP 17 in 2010, Japan, Russia and Can-ada made it clear that they do not commit any numerical figure for the second commitment period of the Kyoto Protocol. This has led to the outcome that the protocol covers less than 15% of global CO2 emissions in 2009 No treaty without the United States and emerging economies is effective.<br><br><Mandatory provision in a non-legally-binding ("political") agreement: The Copenhagen Accord><br>The Copenhagen Accord is quite welcome in that it adopted the pledge and review style, and almost all coun-tries agreed to submit their pledges. | taken into account. Revision of text in line with #434 addresses this point. |
| 12000 | 13 | 22 | 12 | 23 | 25 | Note that the Schneider study came to the conclusion that there is theoretical gaming possibility but that there is no evidence of this having happened. Also, it is wrong to imply that all projects are financed by the project owner and it is wrong to imply that there is something wrong with the cases where the projects are indeed financed by the project owner because that is simply a question of financing. The importance lies in the incentive in the form of the carbon price (from industrial countries), the international exposure, the access to new customers and international currency the CDM provides: by putting a price on the currently issued credits, investors are incentivized to develop the next project. Otherwise it is like asking a constructor to build a house and then when she is done and wants the bill paid, you say "well, clearly you built my house without me giving you the money upfront i.e. you do not need my money!" Wrong approach.<br><br>Please make sure to refer to the High Level Policy Panel's study findings that are now available at cdmpolicydialogue.org/ i.e. a lot of the governance issues have been fixed or are currently being fixed. Also, it is important to mention here the necessity for continuous demand, be it for specific methodologies and countries, in order to maintain that price signal of the CDM. This statement needs to be made prominently, as it is at the very basis of the CDM: The market has collapsed, people have been leaving for the past year and a half. Less than one more year like this and we do not need to mention the CDM anymore as it won't matter, the capacity will have disintegrated beyond a critical point. | taken into account. Reference to final report of CDM Policy Dialogue included. The text includes already the point re the Schneider paper. The text does not imply that unilateral proejcts are necessarily more problematic than others. |
| 15724 | 13 | 22 | 12 | 23 | 25 | Green Investment Schemes should be mentioned. More than 300 Mio AAUs were traded so far under GIS. | In Section 13.4, taken into account. More approrpaite for section 13.13 than here.<br><br>Section 13.7, Taken into account - green |
| 11450 | 13 | 22 | 12 | 23 | 25 | The discussion on flexibility mechanisms erroneously highlights these mechanisms as main components of international cooperation arrangements on climate change. Under the UNFCC and the Kyoto Protocol, such flexibility mechanisms are rather subsidiary mechanisms that are intended merely to assist in achieving compliance with mitigation commitments rather than serve as the primary vehicles for achieving such compliance. | Rejected. The focus on flexibility mechanisms as elements in existing agreements is appropriate. The chapter also discusses other aspects of international climate agreements, in this |
| 6993 | 13 | 22 | 13 | | | Flexibility mechanisms cannot have the desired effects mentioned here unless backed up by enforcement. This kind of observation is important for readers trying to connect one part of your chapter with another. | rejected. Unnecessary detail for this section. All types of agreements entail a question about enforcement. Dealt with |

| 11688 | 13 | 22 | 13 | 23 | 25 | In the section 13.4.1.3, many flexible mechanisms are discussed including trading allowances, CDM, JI etc, but I feel that the pricing regime is neglected somehow, for instance, the Australia carbon tax might be able to link with future trading regime, so I wonder if it is better to include discussions or surveys of carbon tax related policies, so maybe change the title to "carbon pricing and flexibility mechanisms"? | rejected. The title of flexibility mechanisms includes the dimension of carbon pricing in that they frequently operatve by generating a carbon price. The main discussion of Austrlaia's new |
| 8181 | 13 | 22 | 13 | 22 | 13 | "Utilize markets": I recommend being more specific. Does this mean emissions permit markets or markets in general? | accepted- text revised. |
| 8755 | 13 | 22 | 30 | 22 | 31 | "which takes advantage of Article 4 of the Kyoto Protocol, which allows parties to meet their Kyoto commitments jointly" is not relevant to the use of Kyoto units in the EU ETS. Delete the phrase. | accepted. The statement in the text is correct but not pertinent to the point about the EU ETS being the driver of |
| 4966 | 13 | 22 | 31 | | | to set/define and meet their Kyoto commitments jointly ~ otherwise it would mean the JI .. | rejected. Text no longer in given response to previous comment. |
| 4967 | 13 | 22 | 32 | | | {Cor} entities (companies or {their installations} [plants])<br>That is:<br>entities (companies or their installations) | accepted - text revised. |
| 8756 | 13 | 22 | 34 | 23 | 25 | Revise this section using the reports prepared for the CDM Policy Dialogue. See http://www.cdmpolicydialogue.org/ Three background reports were prepared and should be available on the site by mid-October. The reports review the literature on all substantive and governence issues related to the CDM. | taken into account. See response to #473. |
| 17103 | 13 | 22 | 34 | | | the negotiations are focussing on equity, and not fairness. There was also a workshop to discuss this issue, and reflects a clear position of the majority of countries. The meaning of this term, as is emerging in these negotiations , is NOT burden sharing rules about how parties are " differentially obligated" as is in the text (this is the position of developed countries in the negotiations), while developed countries (especially the African Group, ALBA and China) are focussing on sharing the carbon budget, or equitable access to sustaianble development, and you need to refer to the most recent consensus on this in the Cancun Agreement, including in the literature referred to in this section, but has not been specified. This omission gives a distorted picture of the literature. | Taken into account. Response to #454 addresses also the concern in this comment |
| 17671 | 13 | 22 | 36 | 22 | 38 | Can you specify what the "market price effect" is and what role it plays in the context of baselines and leakage. This is not clear without further information. | taken into account .reference consulted and the meaning of this term specified. |

| 6038 | 13 | 22 | 7 | 22 | 8 | Include a sentence that characterizes the "considerable discussion of burden-sharing in the scholarly literature" | accepted. Text revised as explained in response to #438. |
| 12476 | 13 | 22 | 7 | 22 | 11 | This sentence states that "There is considerable discussion of burden sharing in the scolarly literature". Then 11 different references are given. But there is nothing about results or findings from these references. Please consider to include some of the findings, if the references are to be listed. | accepted. Text revised as explained in response to #438. |
| 6847 | 13 | 22 | 7 | | | Where is this right to sustainable development sourced to? Article 3 - refers to the "right to and should promote" SD. Not the same thing. | taken into account. Text revised to be more precise in citing the FCCC, article |
| 6848 | 13 | 22 | 7 | 22 | 11 | Again, Many southern voices not reflected - as for instance work by Jayaraman et al, TISS, Mumbai, on the global carbon budget approach. | accepted. Text revised as explained in response to #438. |
| 6332 | 13 | 22 | 12 | 23 | 25 | To facilitate the understanding of the reader on flexibility mechanisms it is needed to describe in numbers the magnitude achieved by the different flexibility mechanisms, in terms of emission reductions and financial amounts. A table with this information would be ilustrative and useful. | reject- this discussion will take place in 13.13.1.2 |
| 11687 | 13 | 22 | 7 | 22 | 11 | In this part, it is written "there is considerable discussion of burden-sharing in the sholarly literature", however there are no discussions of these studies at all except just a long list of the literature. Or if skip the discussion then need to provide a reference to the section 13.13.2.2 which will discuss more on burden sharing | accepted. Text revised as explained in response to #438. |
| 11573 | 13 | 22 | | | | Flexibility mechanisms of the market are mentioned. What about flexibility mechanisms of political institutions and administrative procedures? | Rejected. The text makes clear what flexibility mechanisms are to refer to, and the sorts of flexibility implied by the |
| 3177 | 13 | 22 | 1 | | | section 13.4.1.1 and section 13.4.1.3. There's a lot of literature (by lawyers and political scientists alike) on bindingness and on flexibility. The Hafner-Burton et al (2012 AJIL) article reviews the political science literature in some detail. Helfer's work, among others, addresses the law. Also, I think the section on flexibility is overly focused on the CDM as a source of flexibility when, in fact, countries have used (and have available in the future) lots more—such as the ability to adjust (before a treaty is finalized) their targets, possible designs that include more explicity target or commitment flexibility (e.g., pledge and review), etc. This text makes is sound like the CDM is the cat's meow for flexibility. | same comment as #422. see response to that comment. |
| 16236 | 13 | 22 | 23 | | | Suggest adding a sentence at the end of the paragraph: "Flexibility is politically valuable because it allows governments to reduce emissions at a lower cost overall and because it offers governments a toolkit of policy options that can be adjusted over time as circumstances change (Thompson, 2010)." Thompson, A. (2010). Rational design in motion: Uncertainty and flexibility in the global climate regime. European Journal of International Relations 16, 269-96. | Reject. The point made in this comment is already reflected at pp22, line 13. the point is also ubiquitous in literature on this subject back to the early 1990s. Little gain is to be had by a single |
| 11142 | 13 | 22 | 38 | 22 | 40 | This "conclusion" has been rejected by the CDM Executive Board and has not been accepted (please see EB papers). | Rejected. The reference to EB papers is too vague to be useful, and are not peer-reviewed literature in any case. The text also only states that thereis an incentive to increase emissions in the HFC |

| 6582 | 13 | 22 | 43 | 23 | 25 | Add following 7 problems of CDM. CDM has both good and bad points.<br><br>Quote>><br>1.The Clean Develop Mechanism's (CDM) credits, CERs, are worth the same as EU ETS credits and can be submitted by ETS installations instead of EUAs. CERs are generated by extra-EU emission reducing projects to be sold on, to incentivise green investment, especially in developing nations. The EU is effectively offloading its ETS obligations in a 'do as I say, not as I do' move.<br>2.The CDM is a 'zero sum' mechanism. For example, a CDM project reducing emissions by 1,000 tCO2e will generate 1,000 CERs, which can be bought by ETS installations to allow the emission of 1,000 tCO 2.<br>3.The CDM is vulnerable to corruption. A study of the top five UN-accredited CDM validatory bodies found that on a scale from 'A' (very good) to 'F' (very poor), none scored higher than 'D'.<br>4.A 4,000MW coal plant in Gujarat, India, has received CERs because it is marginally less polluting than other coal stations. This is despite the fact it emits 26 million tonnes of CO2 per annum, will do so for at least 25 years, is India's third largest source of emissions and is the 16th largest worldwide.<br>5.Industrial gas credits reap huge profits. HFC-23 generates 11,700 credits per tonne destroyed at approximately €12, but costs only €0.17/tCO2e to destroy: a 7,000 per cent markup. As a result, some companies are creating HFC-23 just to destroy it in order to generate credits. If the scheme did not exist, these emissions would never have been produced.<br>6.This is especially rife in China where, because it is so lucrative, the government<br>taxes CDM revenues at 65 per cent, expecting to generate £1.7 billion by 2013.<br>7.While gas credits have been banned from May 2013, lobbying led to a delay in the ban and 412 million credits are still waiting to be issued through the scheme.<br><br>For citation: David Merlin-Jones (2012). CO2.1 Beyond the EU's Emissions Trading System. 17-27 | Rejected. The proposed source is not in the peer-reviewed literature and cannot thus be cited. |

|---|---|---|---|---|---|---|---|
| 6581 | 13 | 22 | 48 | 23 | 5 | Especially for projects for energy saving, it is difficult to work for CDM.<br>It is necessary to establish new frame work to evaluate contributions of technology transfer seeing following analysis.<br><br>Quote>><br>The CDM under the Kyoto Protocol is generally believed to lower economic barriers with the introduction of climate friendly technologies. According to authors' experiences in promoting energy saving projects under the CDM scheme in China since 2005, however, CDM procedure is extremely complex and its socalled additionality check is excessively strict in validating a qualifying project. Additionality check requires an investment analysis. For a project to be qualified as ''CDM'' there is a need to show that the investment will not be decided without CO2 credit.<br>Economic or environmental additionality is a typical item.<br>''Economic additionality'' in CDM context, for example, is used in the following manner. If a certain project is profitable enough to invest without an economic benefit of CDM credit, this project is not appropriate as a CDM project due to being recognized as a business-as-usual project (IGES, 2010). As the initial investment in steel sector is generally too large to be paid back by the economic incentive accruable by CDM credits, there have been many cases where energy saving technologies were adopted by steel companies in developing countries, without waiting for CDM Executive Board's decision, which were frequently rejected later (an example of the rejected CDM application is available in UNFCCC (2010)). Even in such cases, steelmakers can still get benefit from energy saving investments primarily by lowering their energy costs. Typically, an energy saving investment yields an annual saving of 20–30% (depending on the price of energy) relative to the initial investment. Even if a project is qualified<br>under the CDM scheme, the value of the resulting credits will be much smaller than the benefit of the energy cost reduction by a factor of 10. For a typical smaller CDQ facility, an initial investment is about f3.5 billion per facility and the annual reduction in energy consumption (crude oil equivalent) is approximately 14,000 t-crude oil/year. The annual energy saving benefit is about 28% of the initial investment (Refer to NEDO (2008)). This means CO2 reduction is approximately 0.1million t-CO2/year and the value of the CO2 credit (if calculated at f1000/t-CO2) is only about one-tenth of this benefit. Since the value of credits is only a minor factor concerning the investment decision, the benefit of removing the economic barrier through CDM would probably not be significant. In order to promote technology transfer, it is necessary to establish a new framework to evaluate contributions of technology transfer from developed to developing countries in more practical manner than that of current CDM. In addition, the length of the CDM procedure presents major risks for project owners, letting them cast doubts on the reasons for the very existence of the CDM scheme.<br><br>For citation: Okazaki T, Yamaguchi M (2011). Accelerating the transfer and diffusion of energy-saving technologies steel sector experience - lesson learned. Energy Policy 39. 1296-1304 | taken into account - reference added into to list of references on debates about CDM governance. |

|---|---|---|---|---|---|---|---|
| 16370 | 13 | 23 | 15 | 23 | 25 | Discussion would benefit from fuller treatment of host country government involvement in sectoral initiatives, including the need to overcome incentive problems to individual actors, and the resulting need for the host government to impose some form of binding compliance or penalty regime on covered emitters. On baselines, see Prag and Briner (2012), CROSSING THE THRESHOLD: AMBITIOUS BASELINES FOR THE UNFCCC NEW MARKET-BASED MECHANISM (OECD/IEA info paper) | accepted. Text revised. Reference introduced. |
| 3984 | 13 | 23 | 26 | | | The heading seems to be incorrect, as not only SRM is discussed. Moreover, why is the term geoengineering not used (as it is in many of the references cited)? | Accepted. Subsection title changed. |
| 8182 | 13 | 23 | 27 | 23 | 28 | Is the international policy itself adapting or is it helping countries adapt? Unclear. | accpted- text revised to clarify. |
| 14339 | 13 | 23 | 31 | 23 | 31 | the cross-reference to chapter 5, section 5.8 seems to be wrong | Accepted. Cross reference referred to section in the First Order Draft, this has been moved to chapter 6. cross |
| 3482 | 13 | 23 | 32 | 23 | 39 | This needs a reference to WG I report, Chapters 6 and 7.7, where these ideas and problems with them are discussed in great detail. | accepted - cross reference inserted. |
| 3476 | 13 | 23 | 35 | | | Change "upper atmosphere" to "lower stratosphere" | accepted- text revised. |
| 3481 | 13 | 23 | 35 | 23 | 36 | Change "increasing clouds with reflective properties" to "making low clouds more reflective" | accepted- text revised. |
| 8525 | 13 | 23 | 35 | 23 | 35 | “sulfate particles” instead of “sulfur particles”. “Sulfur particles” means that the particles consist of elemental sulfur. | accepted- text revised. |
| 8526 | 13 | 23 | 35 | 23 | 35 | It is better to say “into the stratosphere” instead of “to the upper atmosphere”. The upper atmosphere is higher than 50 km. | accepted- text revised. |
| 8528 | 13 | 23 | 35 | 23 | 36 | Examples of SRM should include ground-based option – enhanced reflective properties of the ground surface (different kinds of vegetation, roofs and so on – see Section 9.5.2) | accepted. Example included. Not clear what 9.5.2 refers to. |
| 8527 | 13 | 23 | 36 | 23 | 36 | «increasing clouds with reflective properties» It is better to say “increasing of clouds reflectivity” or “increasing of cloud brightness” | taken into account. Text revised as suggested by #510 |
| 16193 | 13 | 23 | 39 | | | Consider reference to Robock, Alan, 2012: Will geoengineering with solar radiation management ever be used? Ethics, Policy & Environment, 15, 202-205 and/or Robock, Alan, 2008: 20 reasons why geoengineering may be a bad idea. Bull. Atomic Scientists, 64, No. 2, 14-18, 59, doi:10.2968/06400200 | Rejected. These references refer generally to the pros and cons of geoengineering, not to specific questions |
| 6335 | 13 | 23 | 40 | 24 | 8 | The text is useful, but it seems to be apologetic in relation to SRM. It might be needed to include some bibliographic source(s) that point out to risks and disadvantages of SRM 1. | Taken into account. Most of this comment is more relevant to chapter 6, section 9. Revisions to this passage however in response to other comments |
| 6994 | 13 | 23 | 40 | | 43 | David Victor has suggested that individuals might deploy geoengineering. I have not suggested that, and so the writing here could be more specific. Also, I have pointed out that many countries would have an interest in deploying (combined with an ability to deploy) geoengineering, but I wouldn’t put “small” countries in this category. Geoengineering is “cheap” relative to the size of India or Indonesia but not Tuvalu or Mauritania. | accepted. Text revised to reflect these citations more precisely. |
| 11574 | 13 | 23 | 40 | 23 | 45 | What is the incentive for small states to engage in SRM? The authors claim that smaller-scale actors may perceive advantages to be first-movers with SRM, in order to ensure both global climate protection and a favourable distribution of regional impacts from their SRM projects. Several premises should be clarified. Do small-scale actors want to ensure global climate proctection? If they would, there may be easier and more inexpensive ways to make local solutions. Second, what kind of SRM does only have regional impact? More should be said about what kind of SRM projects the authors are talking about. | taken into account. Text revised, clarified, example introduced, citation given. |
| 6995 | 13 | 23 | 45 | | 48 | You should explain why countries might “rush” to use geoengineering. You’re implying there is a first mover advantage. Why? | rejected. The text already explains why an actor might percieve first moveer |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 14338 | 13 | 23 | 45 | 23 | 48 | The text "hardly any cooperation might be needed" suggests that unilateral pursuit of geoengineering would be politically easy. However, it has been shown that there are several strong reasons why it is in the national interest to participate in an international governance framework even for those states that could pursue geoengineering unilaterally (Bodle, Ralph, "International governance of geoengineering: Rationale, functions and forum", in: William C.G. Burns and A. Strauss, (eds.), Climate Change Geoengineering: Legal, Political and Philosophical Perspectives, Cambridge: Cambridge University Press (submitted February 2011; in press).<br>First, the mere potential for transboundary impacts even at an early (field testing) stage could have serious foreign policy implications and entail the risk that other nations may hold the researching or deploying state responsible for alleged impacts. Second, the public debate could become framed in terms outright rejection or support, which could eventually polarize and divide the science community and public opinion in a way similar to the broader debate on climate change. Third, depending on the particular technique, research and experiments are likely to require coordination at the international level in order to attribute data to particular experiments and ensure valid results (Bodle, Ralph, Geoengineering and International Law: The search for common legal ground, Tulsa Law Review. Geoengineering Symposium issue, 46 Tulsa Law Review 2 (2010) 305-322, at 322) | rejected due to space constraints. Article from Tulsa Law Review inaccessible. |
| 8183 | 13 | 23 | 47 | 23 | 47 | Recommend qualifying "benefits" and "damages" with "perceived" -- leaders make decisions based on their beliefs rather than based on actual costs and benefits. | taken into account. Text revised - percoieved added, "risk-adjusted" |
| 6333 | 13 | 23 | 6 | 23 | 14 | First sentence: it is not clear that by whom was thought. Second sentence: Seems that the process of unilateral CDM is driven by consultants, and not by the companies or national authorities of a given country and this might not be exact. Possibly, this sentence might be redrafted. Sentence starting in page 11: Although the clause " even if unfounded" softens the meaning, it would be more balanced that in addition to the current sentences, to provide information of the current efforts and future plans of emission limitation that might have the countries that more practice unilateral CDM. This would contribute to balance the content of this paragraph. | accepted. Text revised accordingly. |
| 4951 | 13 | 23 | 6 | | 14 | Concerning CDM, it is a sensitive question to mention only its benefit for the relevant developed countries (cost-eff. in meeting the target), since it was basically accepted by the developing countries as a mechanism contributing to their sustainable development – in this sense, it is a kind of a compensatory instrument .. | accepted. Additional paragraph on this introduced. |
| 16238 | 13 | 23 | 19 | | | Suggest adding a reference at the end of this sentence to Keeler and Thompson, 2009. Keeler, A., and A. Thompson (2009). Mitigation through resources transfers to developing countries: Expanding greenhouse gas offsets. In: Post-Kyoto International Climate Policy: Implementing Architectures for Agreement. J.E. Aldy and R.N. Stavins, (eds.), Cambridge University Press, Cambridge and New York, pp. 439-68. | accepted. Refernce added. |
| 16237 | 13 | 23 | 5 | | | Suggest ending the paragraph with the following sentence: "While some progress has been made to standardize methodologies and streamline the approval process, the CDM is currently supporting a relatively narrow set of projects and benefitting a limited set of countries (for example, few least-developed countries are able to participate)." | accepted. Text incorporated. |
| 14251 | 13 | 23 | | | | On SRM, one may notice that (i) since SRM can be implemented unilaterally, the risk is that one party implements it despite negative consequences for others, (ii) Risk aversion (or the precautionary principle) suggests one should be overly careful with SRM, (iii) humans do not have a good track-record w.r.t. solving one ecological problem by influencing other parts of the environment. For these reasons, the possibility or "threat" of future SRM is an additional reason for early abatement / emission reduction. | Taken into account. First part accepted - text revised to bring in this point. Other points rejected, for space reasons. |
| 8355 | 13 | 23 | | | | I suggest section 13.4.2 be moved into Box because 13.4.2 is unnatural in terms of hierarchy in 13.4. | Noted. Section reorganized and title changed to clarify its relation to the rest |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 8402 | 13 | 23 | | | | A point that should be made in this section is that, as shown in our recent paper, the same conditions that might require SRM (in particular, a high climate sensitivity) also require substantial emission mitigation. Therefore, should such conditions be percieved to be in place, governance that assures that mitigation and SRM would be conducted in concert is needed. Reference: Smith, Steven J and PJ Rasch (2012) The Long-Term Policy Context for Solar Radiation Management Climatic Change (accepted). | accepted. Point and reference incorporated. |
| 11689 | 13 | 23 | 26 | 23 | 26 | The section title is "Cooperation in solar radiation management (SRM)", but in the main text CDR and SRM have similar lengths, so the title might be better to include CDR as well | Accepted. Subsection title changed. |
| 4719 | 13 | 23 | 26 | | | Although exciting and new, should the notion of regulating SRM be central to the argument being made here? I think it is a smaller piece of the puzzle and unlikely to be addressed in international negotiations (given the problems in mitigation and adaptation already on the table). I would recommend this be given less space and more be dedicated to the more central themes that are likely to take up negotiators time in the foresseeable future. | noted. Section reorganized, and place of SRM clarified as a consequence. Explanation of discussion also introduced into subsection. |
| 6949 | 13 | 23 | 26 | | | It's necessary here to refer to WGI AR5, Chapter 7, and its assessment of the physical science basis of SRM and CDR technologies. Please avoid re-assessing the natural science components here in order to avoid duplication and inconsistencies in assessment between WGs. We suggest to also consider the cross-WG IPCC Expert Meeting Report on Geoengineering held in June 2011 (IPCC, 2012: Meeting Report of the Intergovernmental Panel on Climate Change Expert Meeting on Geoengineering [O. Edenhofer, R. Pichs-Madruga, Y. Sokona, C. Field, V. Barros, T.F. Stocker, Q. Dahe, J. Minx, K. Mach, G.-K. Plattner, S. Schlömer, G. Hansen, M. Mastrandrea (eds.)]. IPCC Working Group III Technical Support Unit, Potsdam Institute for Climate Impact Research, Potsdam, Germany, pp. 99. ). | Taken into account. Current draft of WGI report, chapter 7 read, and cross reference inserted. No inconsistencies between our presentation here and that chapter observed, and the focus here clearly on implications for international agreements rather than the natural science aspects. |
| 8401 | 13 | 23 | 31 | | | Discussed also in chapter 6, section 6.9 | Noted. Text corrected as in response to |
| 6568 | 13 | 23 | 40 | | 43 | Explain what is "SRM options" that appears first and "other SRM approaches" that appears next or give examples for them. | Accepted. An example of cheap SRM options given. The other approaches are too variable to specify here - they are |
| 5915 | 13 | 23 | 26 | 24 | 8 | This sub section is not mentioned in the introduction and seems incongruous to the heading “architecture”. SRM is well covered in chapter 6.9.2. The relevance for chapter 13 is that international agreement is required for the governance of SRM. An agreement on SRM would also be subject to debate on fairness as the most poor and vulnerable parts of the world are the least likely to have access to this technology, consequential changes to other parts of the climate system are uncertain and cannot be limited, and there is the risk of the unilateral use by a country or individual to the detriment of others.. (Lin A. (2009): Climate engineering governance. Issues in Legal Scholarship, Vol. 8, No. 3., Article 2; Barrett S. (2008): The incredible economics of climate engineering. Environmental and Resource Economics, Vol. 39, No. 1, pp. 45–54. ) | Taken into account. Section revised to restrict discussion only to questions of international cooperation. Particular relation of this subsection to the overall section more clearly explained. Barrett reference is already cited; Lin reference incorporated. |
| 3470 | 13 | 24 | | | | 13.4.3 Approaches to international cooperation, a Figure or a scheme to represent different nuances of cooperation prociding existing examples would be very insightful | accepted. A figure has been produced to represent the options discussed in this section and facilitate greater |
| 6996 | 13 | 24 | 1 | | 8 | I have argued in favor of an international agreement on geoengineering with open participation because of the governance problems. I mention this because many people (at least in conference discussions) have proposed exclusive membership. | Noted |
| 3484 | 13 | 24 | 1 | 24 | 8 | This section needs to include a discussion of and reference to the SRMGI report: Solar Radiation Management Governance Initiative (SRMGI), 2011: Solar radiation management: The governance of research. | 4968 | 13 | 24 | 18 | | 19 | {Cor} ETS: here sometimes system or scheme, but latter is the official one .. the EU ETS for {all EU member states} [participating EU nations])<br>That is:<br>ETS: .. scheme ..<br>the EU ETS for all EU member states) | accepted. Scheme is the correct term for the EU ETS. Changed here. Other places noted to be changed also. |
| 10032 | 13 | 24 | 20 | 24 | 27 | This part should be deleted completely. EU-ETS is based on the Kyoto Protocol. But the Kyoto protocol has substantially become ineffective in the second commitment period because the condition of meaningful participation has not met. In addition, EU-ETS has several problems. Volatility of emission permit prices affects volatility of product prices as evidenced by fluctuating price developments in the EU-ETS. Therefore, the market-based policy tools of cap-and-trade cannot provide credible incentives for the technological change, as described in (Montgomery, 2005, abstract) and (Baldursson, 2009, page29). In addition, CO2 leakage caused by the implementation of the ETS happened actually through transfer of industry from one country to others. Market mechanisms at least under Kyoto-like international scheme, where the condition of all countries' meaningful participation is not met, does not work well, as shown in (Rosendahl, 2011, abstract), (Aichele, 2012, page336), and (Peters, 2011, page1). These two literatures are listed in the No50 line of this table.<br><br><Reference><br>[1] Montgomery, W.D., and Smith, A.E.(2005). Price, Quantity and Technology Strategies for Climate Change Policy, CRA International. Price Volatility and Risk Exposure: On the Interaction of Quota and Product Markets. Available at: http://ssrn.com/abstract=1394342 or http://dx.doi.org/10.2139/ssrn.1394342 | rejected. This comment is too evaluative for this section. The argumetns are in effect already dealt with in 13.13. some suggested references are not peer-reviewed but industry consultant reports, and the one article (Baldersson et al) is in a solid journal but is tangential to the discussion in this section. |
| 6998 | 13 | 24 | 28 | | 33 | Copenhagen couldn't be considered "strong multilateralism" by any sensible definition. It's not even a treaty! | tken into account. The figure helps understand the necessary simplification the ideal types introduce, and the title has been changed to reflect its character. Nevertheless, Copenhagen did introduce a process whereby states |
| 14346 | 13 | 24 | 28 | 33 | | This paragraph characterizes the Copenhagen/Cancun pledge and review system as "voluntary" in nature. Decisions taken by the COP are not considered to be voluntary simply because they are not legally binding. The mitigation pledges contained within the Cancun and Durban decisions are not considered voluntary by most (though some claim they are conditioned on international financial support). It would be more accurate todescribe them not as "voluntary" but as non-legally bindding. | taken into account. Point contradicts #541. word voluntary removed, text revised. |
| 7369 | 13 | 24 | 28 | 24 | 33 | It is unclear how 'pledge and review' requires "cooperation to come to an agreement" in the same sense as the agreements listed above (Kyoto, the EUETS). The determination of 'targets' and the 'bindingness' of that target are the key elements of international agreement on mitigation, 'pledge and review' requires no cooperation to reach agreement on those elements and so should be classified seperately. The current discussions in the UNFCCC reflect how distinct 'pledge and review' is, with countries having distinctly different targets in terms of form and accounting rules in contrast to the Kyoto Protcol period 2008-2012. | taken into account. Section has been reorganised. Figure clarifies that pledge and review may have a range of processes of coordination, with the Copenhagen accord at the more "centralised" end of the spectrum. |

|---|---|---|---|---|---|---|---|
| 10033 | 13 | 24 | 28 | 24 | 33 | This part should include the advantages of "voluntary target scheme" and successful examples in the world. Each industry in Japan has voluntary target and the voluntary target scheme has played a big role, as described in (Yamaguchi, 2012, page35 and 154), (Manuel, 2010, page 6 and 13), and (Yamaguchi, 2010, abstract). In addition, there is also a successful example of "voluntary target scheme" in Netherlands, as shown in (Martijin, 2002, page162).<br><br><Reference><br>[1] Yamaguchi et al (2012). Climate Change Mitigation, A balanced approach to climate change, Springer, London<br>[2] Manuel Frondel et al (2010). Economic Impacts from the Promotion of Renewable Energy Technologies: The German Experience, Ruhr Economic Paper #156, Energy Policy 38, 4048-4056. Available at: http://www.rwi-essen.de/publikationen/ruhr-economic-papers/74/<br>[3] Yamaguchi ( 2010 ) . Voluntary CO2 emissions reduction scheme: Analysis of airline voluntary plan in Japan, Transportation Research Part D: Transport and Environment, Volume 15, Issue 1, January 2010, Pages 46-50. Available at: http://www.sciencedirect.com/science/article/pii/S1361920909000856<br>[4] Martijin G. Rietbergen, Jacco C.M. Farla, Kornelis Blok (2002). Do agreements enhance energy efficiency improvement? Analysing the actual outcome of long-term agreements on industrial energy efficiency improvement in The Netherlands, Journal of Cleaner Production 10 153-163 | rejected. This suggestion is not appropriate for chapter 13 but for chapter 15. it focuses on domestic action alone, not on how they may be connected or coordinated. |
| 11451 | 13 | 24 | 28 | 24 | 29 | There is no need to reference the Copenhagen Accord together with the Cancun outcome. The official UNFCCC instrument in relation to pledge and review is the Cancun outcome rather than the Copenhagen Accord. | reject. The focus of the chapter is not only on the UNFCCC, but all instances of international cooperation over climate |
| 6337 | 13 | 24 | 31 | 24 | 31 | It seems questionable to consider as "strong multilateralism" the pledges presented in Copenhagen and Cancun. If it is so, how to consider an approach as the Kyoto Protocol with legally binding targets?? It might be considered not to use the adjective "strong" . | taken into account. See response to #541 |
| 13637 | 13 | 24 | 34 | | | This gives WAY too short shrift to the potential for price-based agreements! All sorts of proposals have been advanced that would treat climate negotiations more like economic or trade negotiations. In my view, as a former negotiator, price based agreements have a lot of potential. And harmonized national policies don't only have to be negotiated in decentralized ways. There could be strong multilateralism involved. | taken into acount. The figure 13.2 reflects the diveresity of way that price agreements mgiht be governed as suggested here. But overall, the text |
| 14656 | 13 | 24 | 37 | | | Another example of a harmonized national policy would be an agreement to phase out fossil fuel subsidies, as the G20 and APEC leaders agreed to in 2009. | accepted. Example incorporated into text |
| 16372 | 13 | 24 | 40 | 24 | 46 | Note that linking ETS can be an example of the harmonised policies described in 13.4.3.2 - would be good to highlight this, or not make the distinction between these two subsections | taken into account. The figure shows that ETS linkage may be more or less decentralised depending on hos much harmonisation of rules is involved, and |
| 2413 | 13 | 24 | 40 | 24 | 40 | If I am not mistaken, whenever you talk about decentered linkages you always use the example of tradeable permits. There must be other examples of loose coordination between the activities of differnet states? The EU's sustainability criteria for biofuels and European Commission endorsement of private biofuels certification schemes in e.g. Brazil might be one example. Giving rise to transnational, public-private (hybrid) interactions. | accepted. Example incorporated into text. |
| 8184 | 13 | 24 | 42 | 24 | 44 | This should cite Victor et al, "A Madisonian Approach to Climate Policy", Science, 16 September 2005. | accepted. Citation incorporated. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 8757 | 13 | 24 | 47 | 25 | 3 | See also Mehling and Haites, Mechanisms for linking emissions trading schemes, Climate Policy, v. 9, n. 2, 2009; Climate Policy, v. 9, n. 4, 2009 , a special issue on linking emissions trading schemes. It is useful to distinguish a unilateral link (common) from a bilateral link (none yet). Most links have quantity constraints that affect price convergence -- see Linking Emission Trading Schemes: A Short Note, Georg Grull and Luca Taschini, Economics of Energy & Environmental Policy, V. 1, N. 3, 2012. The conditions mentioned apply to a bilateral link but not to a unilateral link. In addition the compatibility of the linked systems must be sustained -- see Ensuring the environmental effectiveness of linked<br>emissions trading schemes over time<br>E. Haites & X. Wang, Mitigation and Adaptation Strategies for Global Change (2009) 14:465–476. | taken into account. Mehling & haites reference incorporated. But detail not introduced here - more appropriate for 13.6. |
| 6336 | 13 | 24 | | 25 | | The 1st general comment to chapter 13 (see comment no.1 above) is specially valid for this section: "1) Frequently there are comparisons between diferent approaches without specifying what of these approaches has been implemented in practice and what are "paper approaches" prepared or suggested by scholars, but not implemented. This information should be provided". The differentiation between actual and potential approaches would be important to understand properly this section. The consideration of the potential peformance of not actually implemented approaches is useful, but this performance has not been demonstrated yet and the reader should be informed on this. | accepted. The distinction between agreements in place and those proposed is made more clear throughout the text. The new figure also helps indicate this. |
| 10813 | 13 | 24 | | 25 | | This section is conceptually murky and incomplete. The distinctions between the three categories are not clear. Exactly what separates each category? Lines 10-11 flag degree of centralization in organization and management as key distinguishing factors. These categories suggests a four box diagram along these axes. But I don't really see evidence of high-low organization/management in the three categories that follow. Is it the extent of overall agreement on outcomes? Or the overall agreement on means and instruments? Or harmonization of those? Putting pledge and review in the "strong multilateralism" bucket further confuses matters. If that is strong multilateralism, then it certainly seems bizarre to put mutual recognition of permits, which is a far stronger form of cooperation, in the third category of decentralized architecture and coordinated national policies. Second, the literature often refers to "top down" and "bottom up" approaches, which the chapter may wish to refer to. Admittedly, this is simplistic and conflates things that should really be teased apart. But moving away from the accepted language without clear conceptual distinctions between your categorizations is not so useful. Xinyuan Dai "Global Regime and National Change" in Climate Policy 10(2010) represents one effort to move beyond these binary distinctions. Dubash and Rajamani "Beyond Copenhangen, CLimate Policy 10 (2010) represent another. It might be helfpul to acknowledge the use of the crude top down and bottom up terms in this section, and then problematize it by showing that there are, in fact hybrid spaces. Without recourse to the literaure, and without clear definitional clarity, these three categories here are unhelpful. | taken into account. section reorganized and various elements of the comment here clarified. Figure introduced to clarify. Reference to the "top-down vs bottom up" distinction made, as well as the limits of this sort of framing |
| 10814 | 13 | 24 | | 25 | | A second point about 13.4.3 is that all the examples of coordination and harmonization are market based. But there are other forms of coordination that are arguably more realistic given current debates, in particular around reporting, information and so on. There is a literature on how common reporting can lead to linkages between domestic and international policy, again, see Xinyuan Dai "Global Regime and National Change" in Climate Policy 10(2010). The broader point is that harmonization taxes or cap and trade, or allowing for recognition of credits do not constitute the full set of possibilities of international collaboration. | accepted.a number of examples not about market-based agreements now introduced. See in particular responses to #532, #548, and #550, that make similar points with specific suggestions. Reference also incorporated into text. |
| 14252 | 13 | 24 | | | | The strongest form of "strong multilateralism" (13.4.3.1) is to combine it with harmonization (not discussed as a weaker form, 13.4.3.2): while this is "inefficient" when countries are heterogeneous, I think such harmonization-clauses (which the EU has, for example) can facilitate the negotiation process (my arguments are explained in "Harmonization and Side Payments in Political Cooperation", American Economic Review 97 (3), 2007: 871-889 ) | rejected. This comment is interesting in the detail but in general, but the article on which it is based operates with a different definition of centralization than that adopted in this section, and the |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 11575 | 13 | 24 | | | | The authors stress the degree of international cooperation and focus on the distinction between centralised (global) and decentralised (local) policies. Nonetheless, other combinations may be fruitful to mention. Especially, global centralised but thin policies that are combined with local decentralised policies should be considered (Cf. David Miller "Global Justice and Climate Change", Tanner Lectures, 2008; Elinor Ostrom “Green from the Grassroots” (Project Syndicate, June 12, 2012). | taken into account. Nuance in the rlationship between centralized and decentralised account has been dealt with as in response to #524. ostrom peer-reviewed article dealing with the same |
| 6583 | 13 | 24 | 15 | 24 | 33 | EU-ETS and pledge and review should not be in same term. Separate them in terms of legally bindingness. | reject. A) the criteria of legal bindingness is not central to the definition of centralised-decentralised in this typology. B) the figure and discussion has nuanced that the boundaries |
| 5312 | 13 | 24 | 15 | 24 | 33 | It is implied here that only multilateralism is the legitimate approach to international cooperation. It may be useful to include the prominent typology used in the international relations literature regarding international cooperation: multilateralism, bilateralism, unilateralism, minilateralism, exclusive multilaterialism, inclusive multilaterialism. Another important point is to show that all approaches may enhance international cooperation. | rejected. Comment mistaken that the section privieges multilateralism. Proposed alternative typology has no supporting citation and the source is not |
| 5306 | 13 | 24 | 24 | 24 | 24 | "normative notions of fairness…": Is there any non-normative notion of justice and fairness at all? I would suggest to make the storyline here clearer, saying that targets-and-timetables has been coupled with notions of fairness (…) which are normatively laden leading to (XXXX, e.g. complexity, delays in decision making, unreachable goals). | taken into account. Text revised, removing the word "normative", replacing with "specific". The implied evaluation of fairness questions - that they lead to delays, etc, is not |
| 13924 | 13 | 24 | 34 | 24 | 39 | It is not sure that the single classification criteria "central organization and management" is sufficient. International approaches to cooperation can contain different permutations along multiple axes: multilateral vs. plurilateral/unilateral geometries of participation; targets and timetables or policies and measures, or both; deep or shallow coordination and management. The single criteria of central organization and management makes it difficult to reflect the actual variety of international regimes (e.g. Kyoto, EU climate and energy package), and the evolution of the international regime from Kyoto to Copenhagen and Cancun. | taken into account. The figure introduces a second dimension (cooperating over means vs ends), which corresponds to some of the other axes mentioned in the comment here. Some of these are also dealt with elsewhere, notably the question of participation in 13.3. IT is correct that there are multiple axes along which approahces might be analysed. |
| 16371 | 13 | 24 | 34 | 24 | 39 | Could build out analysis of harmonisation options, including agreement of international standards (through ISO or otherwise). For carbon markets, see Prag et al (2012 forthcoming) Making Markets (OECD/IEA Information paper, www.oecd.org/env/cc/ccxg). | accepted. Standardisation example incorporated. The Markets example not incorporated since other comments (#525, for example) point out that the section is already over-reliant on market- |
| 16239 | 13 | 24 | 34 | 24 | 39 | Would it make more sense to fold this section into the next one, on Decentralized Architectures and Coordinated National Policies? It fits well under that theme. | taken into account. The new figure emphasises that the boundaries between the three types are porous, |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 14657 | 13 | 24 | | | | Aren't decentralized architectures more than just linking? For example, Pizer's chapter in the Aldy and Stavins 2007 book discusses bottom up pledge and review that may involve implicit targeting of domestic programs to a common (or similar) carbon price without explicit linking. And this is one paper that builds on the work of Schelling, which may be worth referencing in this sub-section as well. Are there lessons from the emergence of the international trade regime that would be relevant here? For example, at Bretton Woods, there were negotiations for an International Trade Organization, and unlike the World Bank and IMF, those talks failed. Instead, a bottom-up system of bilateral and small regional trade agreements emerged that established norms and trust that yielded some four decades later the Uruguay Round culminating in the World Trade Organization. | In Section 13.4, taken into account. Section reorganized. This subsection edited to restrict the meaning of "linking" to the meaning in the comment, while making clear that policies could be connected in a variety of ways. Other examples introduced in response to other comments. Pizer reference consulted but not incorporated here.<br><br>In Section 13.3, the text has been revised to refer as well to highly decentralized architectures of only implicitly coordinated national policies, distinct from linkages. But this |
| 16240 | 13 | 24 | 42 | | | Suggest adding a second sentence to this paragraph: "A virtue of more decentralized approaches is that they accommodate a wider range of interestrs and circumstances across jurisdictions, attracting participation even under heterogeneity." | In Section 13.4, reject. This discussion more appropriate for 13.13.<br><br>In Section 13.13, Taken into account - this notion is incorporated in Section 13.13 with relevant references to the |
| 3664 | 13 | 25 | 10 | 25 | 43 | Is there no special FAQ-section foreseen in the text? Please consider to intergate in a separate chapter. | Noted |
| 13640 | 13 | 25 | 15 | | | I think "legitimacy" is subjective, and I'd use another term. If legitimate includes actually being effective at reaching agreements with measurable environmental impact, the UNFCCC is anything but. | taken into account. The comment is mistaken that legitimacy is a "subjective" term - there is a large and elaborate literature in political science on legitimacy as an empirical concept. The sentence has been revised to make clear |
| 8185 | 13 | 25 | 18 | 25 | 19 | This is not true. Many other institutions (e.g. the G20, MEF, etc) host negotiations on climate change. | accepted. Text revised accordingly. |
| 11453 | 13 | 25 | 19 | 25 | 24 | The treatment of the use of smaller, exclusive gatherings outside of the UNFCCC to advance UNFCCC negotiations should be more nuanced, because questions of legitimacy will arise with respect to these smaller groups. | rejected. The text refers to 13.5 which disucsses these, including the different legitimacy questions they raise, in detail. Text added to refer also to figure 13.1 |
| 6569 | 13 | 25 | 21 | | 23 | Add the Clean Energy Ministerial (CEM) as one of the examples. | rejected. There is a longer more inclusive list in section 13.5 and 13.12 and in figure 13.1. The list presented |
| 12806 | 13 | 25 | 26 | 25 | 28 | This paragraph summarizes shortly most of the important results of the literature about the impact of integrating adaptation on agreements in an appropriate way. Nevertheless, a discussion paper from Eisenack/Kähler (2012) leads to new insights with regard to the effect of integrating adaptation on overall mitigation. The model of Eisenack/Kähler (2012) is based on the results of Ebert/Welsch (2012) and indicates that unilateral action (with respect to mitigation and adaptation) leads to Pareto improvements (i.e. increased total mitigation) if a type of country with a certain damage and benefit structure exists. References: Eisenack, K and L Kähler (2012): Unilateral emission reductions can lead to Pareto improvements when adaptation to damages is possible, Oldenburg Discussion Papers in Economics, http://www.vwl.uni-oldenburg.de/download/DP_V-344_12.pdf and Ebert, U and H Welsch (2012) Adaptation and Mitigation in Global Pollution Problems: Economic Impacts of Productivity, Sensitivity, and Adaptive Capacity. Environmental and Resource Economics 52, 49-62). | In Section 13.4, Noted. comment more appropriate for section 13.3.1 (page 18, lines 27-36).<br><br>In Section 13.3, References added in 13.3.1 in the paragraph on adaptation, mitigation and participation. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 12807 | 13 | 25 | 26 | 25 | 28 | The definition of "policy architecture" is quoted without detailed and formal definition (as on p. 19 l. 43). You may like to make a cross reference or to avoid this technical term, maybe by "basic policy sturcture". | accepted. Reoss-reference inserted. |
| 16194 | 13 | 25 | 29 | | | The FAQ is the first mention of "politically pragmatic". The chapter would be strengthened if information related to this important concept were more sytematically referenced to this term. See also comments above on democratic deficit concerns. | taken into account. :"plitically pragmatic" is replaced with "institutionally feasible" which is a criteria for evaluating the |
| 8308 | 13 | 25 | 36 | 25 | 38 | Mention that harmonizing national policies can also be achieved by coordinating GHG regulations (e.g., Canada and U.S. on vehicle fuel efficiency regulations) | Taken into account. too much detail for the FAQ, but discussed in relation to 13.4.3.2 (old section number - section |
| 13641 | 13 | 25 | 38 | | | Again, negotiated carbon prices could be developed through a very multilateral approach. (Note I would use the term "negotiated" rather than "harmonized." The prices don't have to be similar; the differences just have to be mutually acceptable.) Think of tariff rate quota negotiations under GATT as an example. | taken into account. Too much detail here for the FAQ, but the variation in how centrally organised such price |
| 9046 | 13 | 25 | 4 | | 8 | Developing countries have consistently opposed non-multilateral policies (including border tax adjustments) justified as climate change policies. This chapter on international cooperation should recognize the fact the use of policies in other areas, such as trade, for climate change purposes have not been acceptable to developing countries. | Taken into account, though in section 13.8. See Tax border adjustments. |
| 10034 | 13 | 25 | 4 | 25 | 5 | The example of "cap and trade linked with carbon tax" should be deleted completely. Levying "carbon tax" and "cap & trade" simultaneously is not meaningful and would fail to reduce CO2 emission because carbon tax and cap & trade are theoretically same mechanism to reduce CO2 emission, as described in (Clive, 2007, page4-5). This literature is listed in the No5 line of this table. | taken into account. The comment reflects a misunderstanding of the text, which is about the situation where one jurisdiction has a tax, and another has an ETS (as in current negotiations between Australia and the EU), and |
| 11452 | 13 | 25 | 4 | 25 | 8 | The reference to linking sub-multilateral policies through trade mechanisms (such as import allowance or border tax adjustments) or carbon trading could be dangerous in terms of the implication that such sub-multilateral linkaging could take place independent of what might happen in terms of multilateral negotiations. This could give rise to increased national actions on establishing border tax adjustment measures on the grounds of climate change, something that many developing countries have consistently opposed. | Taken into account, though in section 13.8. See Tax border adjustments. |
| 11793 | 13 | 25 | 5 | | | Delete the example. Sedction 3.8.3 describes there is no need for combination of carbon tax and cap&trade. | reject. Not clear what 3.8.3 refers to (it is not 13.8.3, which doesn'T discuss this). The comment is also mistaken in the same way as #555 - the paragraph does |
| 6041 | 13 | 26 | 10 | 26 | 11 | Technically isn't the EU ETS a supra-national policy rather than a set of national policies? | Taken into account - text revised for |
| 16374 | 13 | 26 | 10 | 26 | 25 | Recommend moving whole para on "achievements" of KP to section 13.13. Also, it is no longer reasonable to say that CDM project documents project over 2bn CERs to be issued by end 2012. It may be more useful to use this point to emphasise that i) info in project documents is not always reliable and ii) a range of factors have meant that on average (with key exceptions) CDM projects have been less effective than expected (factors including tech problems, monitoring difficulties, process delays etc). | Taken into account- 13.5.1.1 on CERs, topic also relevant to 13.13 - consider in combination with comment 597 |
| 2414 | 13 | 26 | 10 | 26 | 25 | Comment on section: To talk about the key achievements of the Kyoto Protocol here is to pre-empt the performance assessment at the end of the chapter, especially in relation to the CDM. ETS and CDM are only achievements if they have been effective in bringing about emission reductions. | Taken into account with comment 593, text revised to be covered in section 13.13, s.t. ongoing drafting |
| 12026 | 13 | 26 | 10 | 26 | 25 | It should be shown why Kyoto Protocol as compared to Montreal Protocol failed to involve or retain major emitters. Analysis of the differences of incentives between two systems should be included. | Taken into consideration - text revised in 13.5.1.4 |
| 8758 | 13 | 26 | 11 | 26 | 11 | The EU ETS covers 30 countries, noty just the 27 EU member states. | Accepted - text revised |
| 8759 | 13 | 26 | 21 | 26 | 21 | The quantity of CERs issued by ther end of 2012 may be about 1.1 billion (1 billion have been issued), but not close to 2 billion. | Taken into account with comment 593, text revised |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 8096 | 13 | 26 | 26 | 26 | 31 | In saying the pledges under the Copenhagen Accord are inadequate in achieving 2 degrees, is that because the commitments only go to 2020 or because the level of the 2020 commitments precludes subsequent reductions consistent with 2 degrees. These two points often get confused in discussions of "adequacy" and it would be useful to clarify both here and in the executive summary where this is referenced. | Accepted - text revised to clarify |
| 14348 | 13 | 26 | 26 | 26 | 27 | This sentence omits the fact that several developing countries also pledged absolute emission reductions (e.g. Marshall Islands, Antigua Barbuda, PNG, Moldova) and a couple even pledged carbon neutrality (e.g. Costa Rica, Maldives). | Accepted - text revised to reflect diversity of pledges |
| 11454 | 13 | 26 | 26 | 26 | 31 | References to the Copenhagen Accord are not needed. The Copenhagen Accord does not have the same official nature as an instrument of the UNFCCC COP as compared to the Cancun outcome (decision 1/CP.16). | Taken into account - reference to the Accord is retained, but its legal status |
| 4969 | 13 | 26 | 34 | | | {Add} The Durban {session of the} conference | Rejected - stylistic preference |
| 4970 | 13 | 26 | 36 | | 37 | for clarity, it would be reasonable to add that the extension of the KP (if any) will be anyway w/o the participation of the USA (as a "non-Party" to the KP) | Accepted - additional text added |
| 6849 | 13 | 26 | 41 | 26 | 42 | The 2010 Article of mine cited here is one in a series of articles deconstructing the climate negotiations: L. Rajamani, The Cancun Climate Change Agreements: Reading the Text, Subtext and Tealeaves, 60(2) INTERNATIONAL & COMPARATIVE LAW QUARTERLY 499-519 (April 2011) & L. Rajamani, 'The Durban Platform for Enhanced Action And the Future of the Climate Regime', 61(2) Int'l & Comp. L. Qtrl'y 501-518 (April 2012) | Accepted - reference included |
| 14347 | 13 | 26 | 6 | 26 | 7 | I am not sure that there are any other climate agreements. How can the UNFCCC be compared when no other comprehensive system exists? | Accepted - text revised |
| 4720 | 13 | 26 | 1 | | | Section 13.5 describes various elements about what is going on but provides little analysis of which are the best strategies, institutions, etc. Having a clearer sense of what the literature suggests are better or worse strategies and approaches would seem beneficial here. In short, this section is too descriptive and not sufficiently analytic. | Taken into account - new subsection added titled "Advantages and disadvantages of different forums." |
| 16373 | 13 | 26 | | | | Suggest reorganising this section as the categories listed by subsection are not very coherent: 13.5.1.1 could be better entitled Negotiations under UNFCCC, and could include those "coalitions" currently listed in their own subsection but which are really only relevant under UNFCCC (umbrella, EIG, BASIC). 13.5.1.2 could be other UN forums relevant to climate (and should include UNCSD/Rio+20 and World Bank/IFC). Next would be good to have other international state-level partnerships (as 13.5.1.3) including not only the other groupings currently under 13.5.1.2 but which would be better made distinct from UN (eg MEF, G20, G8) plus others not mentioned such as G77. 13.5.1.4 could then cover other relevant international institutions (but please see specific comment on OECD/IEA below). | Taken into account - further sub-headings included to organise the text. |
| 11591 | 13 | 26 | 5 | 27 | 39 | This should include the Vienna Convention on protection of the Atmosphere and the Montreal Protocol on ODS.As it is its only a discussion on the UNFCCC. | Taken into account - both protocols/conventions are discussed in |
| 6999 | 13 | 26 | | | | I'd like to see this section summarize what we know about what the ETS and CDM have achieved in terms of global emission reductions. This means a rigorous analysis, which takes into account what countries would have done in the absence of these initiatives and trade leakage. The ETS is impressive from an institutional perspective, but has it had much effect in terms of emission reductions? The CDM, of course, has more serious problems, some of which are discussed in the chapter. | Taken into account- 13.5.1.1 on CERs, 13.6.1.1. on ETS Mt - topic also relevant to 13.13 - consider in combination with comment 589 |

| 10815 | 13 | 26 | | 27 | | This section is a bit dissapointing. It simply goes negotiating session by negotiating session, rather than providing a sense of the broader debates. Even on individual sessions, it provides little insight into the key moments and key debates. In anybody's book, since AR4, Bali, Copenhagen and Durban have been the key moments. It would be worth structuring the section around these focal points, their substantive implications and the debates on the political import and implications of these moments. There are statements of interpretation in the section but in a scattered and ill organized way. Perhaps it woudl be useful to hark back to other organizing frameworks: bindingness, burden sharing, and implementation mechanisms, for example, and sort out the implication of each key session according to these. It would lend more coherence to the chapter.This section appears disconnected from previous sections. | Taken into account - text revised with some changes to organsation; first section reatins descriptive tone and new subsection with more analysis added on "Advantages and disadvantages of different forums." Focusing on only some points, for example excluding Cancun, would not be balanced. |
| 16196 | 13 | 26 | | | | Note that the discussion of emissions trading is very uncritical and does not reflect the literature on this. In particular, empirical analysis of the impact of emissions trading on actual GHG emissions and CDM impacts on sustainable development in non-Annex I countries are highly relevant. | Taken into account - combined with comment 587 - topic relevant to 13.13 |
| 11455 | 13 | 26 | | 27 | | The entire section in relation to the climate agreements under the UN seems to imply that the lack of mitigation ambition in the UNFCCC is due to its policy architecture or design rather than to the lack of political will among the Parties that were supposed to have mitigation ambition in the first place. It conflates a failure in implementation as equivalent to a flaw in the policy design. The discussion should be more nuanced. If the argument is that the UNFCCC's policy design itself is flawed, then there should be arguments saying why this is so. But if the failure being pointed at is the lack of political will or failure of implementation, then arguing that such are due to a design flaw should not be done unless a strong causal link is made between design flaw and implementation failure. Such a link has not been established in this case. | Taken into account - text added in new 13.5.1.3 "Advantages and disadvantages of different forums." |

|---|---|---|---|---|---|---|---|
| 6590 | 13 | 26 | 10 | 26 | 14 | Especially for projects for energy saving, it is difficult to work for CDM.<br>It is necessary to establish new frame work to evaluate contributions of technology transfer seeing following analysis.<br><br>Quote>><br>The CDM under the Kyoto Protocol is generally believed to lower economic barriers with the introduction of climate friendly technologies. According to authors' experiences in promoting energy saving projects under the CDM scheme in China since 2005, however, CDM procedure is extremely complex and its socalled additionality check is excessively strict in validating a qualifying project. Additionality check requires an investment analysis. For a project to be qualified as ''CDM'' there is a need to show that the investment will not be decided without CO2 credit.<br>Economic or environmental additionality is a typical item.<br>''Economic additionality'' in CDM context, for example, is used in the following manner. If a certain project is profitable enough to invest without an economic benefit of CDM credit, this project is not appropriate as a CDM project due to being recognized as a business-as-usual project (IGES, 2010). As the initial investment in steel sector is generally too large to be paid back by the economic incentive accruable by CDM credits, there have been many cases where energy saving technologies were adopted by steel companies in developing countries, without waiting for CDM Executive Board's decision, which were frequently rejected later (an example of the rejected CDM application is available in UNFCCC (2010)). Even in such cases, steelmakers can still get benefit from energy saving investments primarily by lowering their energy costs. Typically, an energy saving investment yields an annual saving of 20–30% (depending on the price of energy) relative to the initial investment. Even if a project is qualified<br>under the CDM scheme, the value of the resulting credits will be much smaller than the benefit of the energy cost reduction by a factor of 10. For a typical smaller CDQ facility, an initial investment is about f3.5 billion per facility and the annual reduction in energy consumption (crude oil equivalent) is approximately 14,000 t-crude oil/year. The annual energy saving benefit is about 28% of the initial investment (Refer to NEDO (2008)). This means CO2 reduction is approximately 0.1million t-CO2/year and the value of the CO2 credit (if calculated at f1000/t-CO2) is only about one-tenth of this benefit. Since the value of credits is only a minor factor concerning the investment decision, the benefit of removing the economic barrier through CDM would probably not be significant. In order to promote technology transfer, it is necessary to establish a new framework to evaluate contributions of technology transfer from developed to developing countries in more practical manner than that of current CDM. In addition, the length of the CDM procedure presents major risks for project owners, letting them cast doubts on the reasons for the very existence of the CDM scheme.<br><br>For citation: Okazaki T, Yamaguchi M (2011). Accelerating the transfer and diffusion of energy-saving technologies steel sector experience - lesson learned. Energy Policy 39. 1296-1304 | Rejected, outside the scope of this section, CDM treated elsewhere |

|---|---|---|---|---|---|---|---|
| 6591 | 13 | 26 | 10 | 26 | 14 | Add following 7 problems of CDM. CDM has both good and bad points.<br><br>Quote>><br>1.The Clean Develop Mechanism's (CDM) credits, CERs, are worth the same as EU ETS credits and can be submitted by ETS installations instead of EUAs. CERs are generated by extra-EU emission reducing projects to be sold on, to incentivise green investment, especially in developing nations. The EU is effectively offloading its ETS obligations in a 'do as I say, not as I do' move.<br>2.The CDM is a 'zero sum' mechanism. For example, a CDM project reducing emissions by 1,000 tCO2e will generate 1,000 CERs, which can be bought by ETS installations to allow the emission of 1,000 tCO 2.<br>3.The CDM is vulnerable to corruption. A study of the top five UN-accredited CDM validatory bodies found that on a scale from 'A' (very good) to 'F' (very poor), none scored higher than 'D'.<br>4.A 4,000MW coal plant in Gujarat, India, has received CERs because it is marginally less polluting than other coal stations. This is despite the fact it emits 26 million tonnes of CO2 per annum, will do so for at least 25 years, is India's third largest source of emissions and is the 16th largest worldwide.<br>5.Industrial gas credits reap huge profits. HFC-23 generates 11,700 credits per tonne destroyed at approximately €12, but costs only €0.17/tCO2e to destroy: a 7,000 per cent markup. As a result, some companies are creating HFC-23 just to destroy it in order to generate credits. If the scheme did not exist, these emissions would never have been produced.<br>6.This is especially rife in China where, because it is so lucrative, the government<br>taxes CDM revenues at 65 per cent, expecting to generate £1.7 billion by 2013.<br>7.While gas credits have been banned from May 2013, lobbying led to a delay in the ban and 412 million credits are still waiting to be issued through the scheme.<br><br>For citation: David Merlin-Jones (2012). CO2.1 Beyond the EU's Emissions Trading System. 17-27 | Rejected, outside the scope of this section, CDM treated elsewhere |
| 6584 | 13 | 26 | 14 | 26 | 22 | Delete from "As of 31..." to "...2012)". These contents has been already covered on chapter 14. | Taken into account – policy chapters discussed distribution of assessment of mechanisms in Wellington explicitly, and agreed that issues related CDM |
| 6570 | 13 | 26 | 24 | | 25 | Specify the "levels consistent with the lower stabilization levels assessed by Metz et al.". | Accepted - text revised to lowest level, specifying 450 ppm, and referencing |
| 16195 | 13 | 26 | 4 | | | Incorporate reference to the benefits of reporting (actions, emissions) under the UNFCCC and COP measures, which are substantial. You can't regulate what you haven't measured. | Taken into account - text on MRV elaborated - includes reporting and more |
| 6806 | 13 | 26 | 43 | 26 | 45 | Reference must be made to one of the drawbacks of Copenhagen Accord, namely that it is not a legally binding agreement, but rather a political agreement, and its failure to ensure commitments for all states in an equitable manner and to ensure continuity of Kyoto Protocol and the UNFCCC. | Accepted - text revised to give clarity |
| 4313 | 13 | 26 | 43 | 26 | 45 | Sentence implies that there were two different but equal views on Copenhagen. However, analysis shows that Copenhagen was perceived as the major failure in/of international climate politics. (no source) | Taken into account - along with comment 584 |

|---|---|---|---|---|---|---|---|
| 6585 | 13 | 26 | 46 | 26 | 47 | Indeed, Cancun save the multilateral process.<br>A top down, legally binding type of international treaty does not work effectively because of a following reason.<br><br>Quote>><br>The author would like to focus on the nature of a top-down, legally binding treaty. The Kyoto Protocol is an example under which Annex I countries have legally binding numerical targets23. It is the author‟s view that this type of international treaty does not work effectively. Take Canada‟s case for example. Legally speak-ing, Canada should have purchased credits, say, from Russia and by doing so, it could comply with its reduction target. It did not. Instead, it simply announced one year before the Kyoto period started that it would be impossible for Canada to comply with the target. In the Protocol, there were no penalty provisions. A legal-ly binding international agreement without any penalty provision will be toothless. On the other hand, if it has a penalty provision, the United States is unlikely to join. Lawrence Summers, recalling his experience as U.S. Secretary of Treasury, writes on international emissions trading as follows: As one who has sought, with mixed success, to induce the US Congress to support transfers in low hundreds of millions of dollars to international financial organizations at a time when the US economy was imperiled by international financial instability, I am skeptical that US policy would ever contemplate transfers in the billions of dollars. I fear this kind of political constraint may be every bit as real as the various natural constraints imposed by the laws of chemistry and physics (Summers 2007).<br>This means that the U.S. Government would not spend taxpayers‟ money to comply with its target under the treaty24. To sum up, any legally binding treaty without a penalty would not work effectively, but the United States would not join any legally binding treaty with a penalty, making the treaty ineffective. In this connection, what kind of agreement will be reached to reflect “a protocol, legal in-strument or an agreed outcome with legal force” decided at COP 17 in Durban is yet to be seen.<br><br>For citation: M.Yamaguchi (2012).Climate Change Mitigation, A Balanced Approach to Climate Change. 34-35 | Taken into account - topic relevant to 13.4 |
| 5307 | 13 | 26 | 5 | 26 | 6 | The first sentence ("due to ist universal…") is the exact repitition of the sentence on line 15 on page 25. | Taken into account - repetition may be |
| 14658 | 13 | 27 | 13 | 27 | 17 | Recommend referencing the discussion of Durban and CBDR from the Aldy and Stavins 2012 Science article. | Accepted - text revised |
| 11341 | 13 | 27 | 13 | 27 | 17 | This paragrph seems oddly out of place - mixing process and principle | Taken into account - covered in section |
| 11457 | 13 | 27 | 13 | 27 | 17 | Given the importance of the principle of CBDR for developing countries in the climate change context, this paragraph should be substantially expanded in order to give wider scope for a discussion of the application of the principle in international climate change agreements. | Taken into account - covered in section 13.2 |
| 5308 | 13 | 27 | 17 | 27 | 17 | Winkler, 2010: either wrong citation (+Beaumont) or missing in the reference. Hertel 2011 is also missing in the reference. | Accepted - citations corrected |
| 4952 | 13 | 27 | 18 | | 39 | The subselection of the institutions is unclear and misguiding. There are two other funding mechanisms (Special Fund and LDC Fund), there is the basic "external" funding institution (the GEF). Moreover, the concrete negotiations have been undergoing in very specific institutional settings, namely in ad hoc (i.e. temporary) negotiating frameworks (AGBM for the KP, Ad hoc WGs for the new agreements since 2005 and 2007 or more recently the one related to the mandate from the "Durban Platform for Enhanced Action". | Taken into account with comments 622 and 623 - text revised to add clarity, unnumbered sub-heading added |
| 8761 | 13 | 27 | 18 | 27 | 18 | The introductory sentence does not relate to the rest of the paragraph, which deale with the Adaptation Fund. A number of specialised bodies of varying composition have been established including the CDM Executive Board, the JI Supervisory Committee, the Technology Committee, Adaptation Committee and Standing Committee (finance). Most of these bodies have voting rules so, unlike the COP, they are not constrained by the need for consensus. | Taken into account with comments 621 and 622 - text revised to add clarity |

|---|---|---|---|---|---|---|---|
| 14349 | 13 | 27 | 18 | 27 | 39 | This paragraph omits the many institutions created in Cancun: the Climate Technology Center and Network, the Adaptation Committee, etc… It also states that the Green Climate Fund is "under the Convention," which it is not. | Taken into account with comments 621 and 622 - text revised to add AC and CTC&N; GCF - text revised to clarify |
| 8760 | 13 | 27 | 20 | 27 | 20 | The 2% levy is applied to CERs issued (not CER transactions) for most, but not all, CDM projects. | Accepted - text revised; 2% levy already addressed correctly in 13.11, removed |
| 6338 | 13 | 27 | 26 | 27 | 27 | Check context. "This" does not connect with previous sentences . Therefore, it is difficult to understand the meaning of "this". | Accepted - text revised |
| 11792 | 13 | 27 | 3 | 27 | 5 | International coorperation has brought about not policital agreement but recognize. It shoud be amended to correct expression. | Taken into account - combined with comment 604, 609, text revised |
| 6464 | 13 | 27 | 3 | 27 | 5 | In Cancun, the Parties did not agree to quatify the climate stabilization objective of 2 degrees Celcius, but just recognized the scientific view. Therefore, the sentence should be changed to, for example;<br>“In Cancún, parties to the UNFCCC reached a political agreement that deep cuts in GHG emissions are requried accroding to scientific view to hold the increase in global temperature below $2^0$C above pre-industrial levels (UNFCCC, 2010)”. | Taken into account - combined with comment 604, 608, text revised |
| 8097 | 13 | 27 | 3 | 27 | 8 | Suggest noting the number of countries that put forward mitigation commitments under the Cancun Agreements and their share of global emissions. | Accept - text revised |
| 9520 | 13 | 27 | 3 | | | Please, replace political agreement with international goal.(Decision1/CP16, paragraph4) | Taken into account - combined with |
| 10669 | 13 | 27 | 3 | 27 | 5 | Refer my comment No. 3. | Noted |
| 3181 | 13 | 27 | 3 | 27 | 8 | p.27, lines 3-8. IN fact, most scenarios that are connected to reality DON'T deliver 2 degrees. That probably should be acknowledged, and cross refs added to the chapter (6?) that deals with the impossibility (or not) of various goals. Also, fyi the official goal now is "1.5 or 2 degrees" not just 2 degrees. (Some countries are trying to lower the goal to 1 degree, which is proof that reality is no obstacle to a bold-sounding goal, but so far the 1 degree is not regularly repeated as an official-type UNFCCC goal.) | Rejected; 1.5 degrees was included and comment makes judgement on what is realistic |
| 6113 | 13 | 27 | 3 | 27 | 4 | The expression "In Cancún, parties to the UNFCCC reached a political agreement to quantify the UNFCCC’s climate stabilization objective in terms of a limit to temperature increases of $2^0$C above pre-industrial levels" is not correct. Actual wording of the Cancun agreement (Decision 1/CP.16 is "Further recognizes that deep cuts in global greenhouse gas emissions are required according to science, and as documented in the Fourth Assessment Report of the Intergovernmental Panel on Climate Change, with a view to reducing global greenhouse gas emissions so as to hold the increase in global average temperature below 2 °C above preindustrial level". Dr. Pachauri said at the IPCC scoping meeting plenary (held in July 2009 in Venice) on the declaration of L'Aquilla G8 Summit that the leaders of G8 have agreed to 2 degree target. The wording was "We recognise the broad scientific view that the increase in global average temperature above pre-industrial levels ought not to exceed 2°C". I have pointed out that this is not the correct interpretation. They did not agree but they recognized. Not only Dr. Pachauri but nobody else did not argue back against at the plenary. As a matter of fact, I had many LAs supporting my argument (later thruough coffee break). Though the wording is a little bit different between G8 and Cancun Agreement, the substance or essense is the same. IPCC report should not interprete the wording in its own way. Therefore please rewrite as "In Cancún, parties to the UNFCCC reached a political agreement to recognize the UNFCCC’s climate stabilization objective in terms of a limit to temperature increases of $2^0$C above pre-industrial levels". This is very important point. | Taken into account - combined with comments 604, 605, 609, 611 |
| 16197 | 13 | 27 | 30 | | | Effectiveness and environmental impacts are additional important criteria. | Accepted - text revised |
| 5241 | 13 | 27 | 30 | | | The coalition for climate and clean air (CCAP, The Climate and Clean Air Coalition to Reduce Short-Lived Climate Pollutants, http://www.unep.org/ccac/) could also be mentioned in the text. | Taken into account - already mentioned in section 13.5.1.4 "International |

|---|---|---|---|---|---|---|---|
| 6339 | 13 | 27 | 35 | 27 | 37 | This sentence is not exact. The Adaptation Fund, established under the Kyoto Protocol, exists before the Copenhagen and Cancun conferences. In addition, it might not be appropriate to rename the UNFCCC process as the "Kyoto/Copenhagen/Cancun process": other important confences in which key decisions were adopted by the UNFCCC are ignored, such as the Marrakech Conference (where the main architecture to implement the Kyoto Protcol was adopted), the Montreal Conference (where the Kyoto Protocol entered in force) and the Bali Conference (where the process that led to the the Copenhagen and Cancun results started). The new Technology Committee would avoid fragmentation in technology matters, but not in adaptation policy. It might not be appropriate, to cite an UNFCCC source to back this sentence as it stands now. | Accepted - text revised to improve accuracy and clearer structure |
| 14659 | 13 | 27 | 8 | | | These analyses all assume zero geoengineering/SRM. | Taken into account - text revised |
| 11456 | 13 | 27 | 9 | 27 | 12 | This paragraph should simply copy and paste paragraph 2 of decision 2/CP.17 rather than try to paraphrase it so as to avoid any interpretative controversies in the future arising from the IPCC report. | Taken into account with comment 614 - text rephrased, but IPCC assessment |
| 6573 | 13 | 27 | 10 | | 11 | Correct the description, as in UNFCCC Decision 1/CP.17 COP only "Decides that the Ad Hoc Working Group on the Durban Platform for Enhanced Action shall complete its work as early as possible but no later than 2015 in order to adopt this protocol, another legal instrument or an agreed outcome with legal force at the twenty first session of the Conference of the Parties and for it to come into effect and be implemented from 2020" but not "agreed to reach and agreement by 2015 [...]". | Accepted - text revised. |
| 6571 | 13 | 27 | 3 | | 5 | Correct the description, as in Cancun Agreements COP only "recognizes that deep cuts in global greenhouse gas emissions are required [...], with a view to reducing global greenhouse gas emissions so as to hold the increase in global average temperature below 2 degrees C above preindustrial levels [...]; also recognizes the need to consider [...] strengthening the long-term global goal [...], including in relation to a global average temperature rise of 1.5 °C" but not "reached a political agreement to quantify the UNFCCC's climate stabilization objective [...] of a limit to temperature increase of 2 degrees C [...], with the expressed possibility of strengthening it further to 1.5 degrees C". | Taken into account - text revised, but without repeating precise legal text in IPCC assessment |
| 6572 | 13 | 27 | 9 | | | Specify a reference paper for "the Durban Platform for Enhanced Action". | Accepted - reference included |
| 10816 | 13 | 27 | | 30 | | The section on other climate related forums (fora?) would also benefit from some intellectual work to categorize and sort the various forums being described. Apples and oranges are too frequently lumped together. For example, to go from MEF to IRENA (which I would not include in this section) - lines 20-35 --without any discussion of how these differ and how they fit into a larger framework mis leads the reader. Relevant axes might be: extent of explicit linkage with UNFCCC- strong connection vs weak connection; narrow sectoral focus vs. broad meta focus. This woudl result in a four box diagram. For example, the REDD+ agreement would be UNFCC related and sectoral. The World Bank's programs would be non-UNFCCC and sectoral; the MEF would be non-UNFCCC and broad, and so on. I think forums like the MEF and G-20 deserve special commentary and discussion as parallel and perhaps complementary fora operating at the political rather than the technical level since there is much written on their usefullness and salience. I would also argue that there is a category of important discussions that are highly relevant to climate change but are not explicitly articulated as such. These include ongoing discussions on global energy governance (see Cherp, A., Jewell, J. and Goldthau, A. (2011) 'Governing Global Energy: Systems, Transitions, Complexity', Global Policy, 2 (1), pp. 75–88. Goldthau, A. and Witte, J. M. (2009) 'Back to the Future or Forward to the Past? Strengthening Markets and Rules for Effective Global Energy Governance', International Affairs, 85 (2), pp. 373–390. and Dubash and Florini, "Mapping Global Energy GOvernance". Global Policy Volume 2 . Special Issue . September 2011. | Taken into account - section divided by unnumbered headings and order revised |

|---|---|---|---|---|---|---|---|
| 18433 | 13 | 28 | | 29 | | There is bias against smaller structures of negotiation, such as MEF or G20 (pag 28, last paragraph, pag. 29 last paragraph). The disadvantages of these kinds of instruments are highlighted. There are treated as complementary negotiation forums to the UNFCCC, and not as potential alternatives.<br>In conclusion, the chapter is good, it does acknowledge the fragmentation of climate governance since 2007, but it fails to highlight that the fragmentation is, in part, due to the failures of intergovernmental schemes, especially the UNFCCC. | Taken into account - this will be addressed in new subsection added titled “Advantages and disadvantages of different forums.” |
| 8186 | 13 | 28 | 20 | 28 | 21 | This is not correct. The MEF has not been focused on clean energy technology policy. | Accepted - text revised |
| 13642 | 13 | 28 | 22 | | | It was actually the Major Emitters Meetings | Accepted - text revised |
| 14660 | 13 | 28 | 29 | | | This discussion of the MEF ignores the L'Aquila Leaders Declaration of 2009. This was a negotiated agreement, and included several elements worth referencing in this chapter. First, it represents the first time that leaders of developed and developing nations embraced a 2 degrees C objective. It represents the first time that developing countries agreed that their emissions should peak and decline. And it included a pledge to double energy R&D. | Rejected - the L'Aquila declaration was by G8 leaders, not MEF, and it is cited in the chapter |
| 17672 | 13 | 28 | 32 | 28 | 35 | It would be valuable to get some evaluation of IRENA: How successful is the process so far? Are there any first results to report about IRENA acitivites? | Taken into account - to be included in 13.13, subject to ongoing drafting and |
| 7407 | 13 | 28 | 41 | 28 | 41 | The G20 refered to "inefficient" fossil fule subsideis, which implies that not all fossil-fuel subsidies are bad. | Accepted- text revised |
| 14661 | 13 | 28 | 43 | | | The G-20 leaders agreed to phase out, not reduce, fossil fuel subsidies. | Accepted - text revised |
| 13192 | 13 | 28 | 43 | | | the statement "…though in subsequent meetings it has given much less attention to climate and energy." seems to be too strong, mainly taking into consideration that in Seoul (2010), leaders announced their commitment to fight against climate change, addressing it as an urgent priority for all nations. Leaders reaffirmed the objective, provisions, and the principles of the UNFCCC. They welcomed the work of the High-Level Advisory Group on Climate Change Financing established by the UN and supported and encouraged the delivery of fast-stat finance commitments (G-20, 2010). In Cannes (2011), leaders recalled the commitment made by developed countries to assist developing countries to mitigate and adapt to the impacts of climate change, and requested Finance Ministers to report at the next Summit on progress made on climate finance (G-20, 2011). Also in 2011, a report coordinated by the World Bank and the IMF entitled "Mobilizing Climate Finance: A Paper prepared at the request of G20 Finance Ministers" was presented to the G-20. Moreover, in their Communiqué of April 2012, Finance Ministers established a study group to consider ways to effectively mobilize resources to fight climate change. In Los Cabos (2012), leaders welcomed the creation of that study group and asked to provide a progress report to Finance Ministers in November 2012 (G-20, 2012). In this sense, I recommend removing that statement and incorporate in the paragraph that begins in line 36 some of the above information.<br>References: G-20 (2010). The Seoul Summit Document. | 6114 | 13 | 28 | 45 | 28 | 46 | The text describes "culminating in the G8 leaders agreeing on 2°C as a goal for the limit to temperature increases (G8, 2009)". This is misinterpretation of the wording. Actual wording is "We recognise the broad scientific view that the increase in global average temperature above pre-industrial levels ought not to exceed 2°C". When Dr. Pachauri said at the IPCC scoping meeting plenary (held in July 2009 in Venice) on the declaration of L'Aquilla G8 Summit that the leaders of G8 have agreed to 2 degree target, I have pointed out at the plenary that this is not the correct interpretation. leaders did not agree but they recognized. Not only Dr. Pachauri but nobody else did not argue back against at the plenary. Therefore the wording should be changed to "culminating in the G8 leaders recognizing the the importance of broad scientific view that temperature increase ought not exceed 2°C (G8, 2009)". | Accepted - text revised |
| 6340 | 13 | 28 | 5 | 28 | 10 | It might worth to mention the regional banks. The African, American and Asian regional banks also have supported some adaptation initiatives. | Accepted - additional text added to 13.5.1.2 |
| 11458 | 13 | 28 | 9 | 28 | 10 | The reference to “direct international flows of finance” should be reworded as the flows being referred to would be ODA rather than other types of finance flows (such as investments) | Accepted - text revised |
| 6574 | 13 | 28 | 32 | | | Add the Clean Energy Ministerial (CEM) somewhere after MEF. | Accepted - text revised to include |
| 6575 | 13 | 28 | 44 | | 46 | Correct the description, as in G8 Leaders Declaration (2009) Leaders only "recognize the broad scientific view that the increase in global average temperature above pre-industrial levels ought not to exceed 2°C" but not "agreeing on 2°C as a goal for the limit to temperature increases". | Accepted - text revised |
| 15441 | 13 | 29 | 10 | | | DELETE: "may" All of the these treaties / agreements are relevant for geoengineering, including ENMOD. While ENMOD was created to deal with hostile uses of weather modification, the expected unequal regional impacts of some geoengineering techniques will make determining whether motivations are hostile, or not, less straightforward. According to Article 5 of the ENMOD treaty, Parties are under an obligation to consult one another and cooperate in solving any problems that may arise in relation to the Convention. If, for example, a geoengineering experiment by one Party perturbed the precipitation patterns of another country (a risk of SRM, for example), such an act could be considered hostile without necessarily being an act of war or even having military involvement. (The text of the ENMOD treaty is online: http://www.fas.org/nuke/control/enmod/text/environ2.htm) | Rejected - original text is more conservative, as literature is not definitive that all agreements apply to geoengineering, nor where intended for that purpose |
| 12552 | 13 | 29 | 13 | | | The word “statement” is not fully accurate and should be changed to “decision.” This was included in Decision X/33 of the 10th Conference of the Parties of the CBD. http://www.cbd.int/climate/geoengineering/ | Accepted - text revised |
| 15442 | 13 | 29 | 13 | | 14 | DELETE: "...which adopted a statement at its COP 10 in October 2010 calling for a moratorium on geo-engineering (Tollefson, 2010)" REPLACE WITH: "...agreed a moratorium on all geoengineering activities that may affect biodiversity at its COP 10 in October 2010 (CBD, COP 10 Decision X/33 paragraph 8(w) [online] http://www.cbd.int/decision/cop/?id=12299)." | Taken into account - joined with comment 652, text revised |
| 6042 | 13 | 29 | 21 | | | I don't think the term "geoengineering" appears in the earlier discussion. It might be good to introduce it then since readers may be more familiar with this term than SRM or CDR. | Rejected - WGIII specifies terminology that described the distinction should be |
| 11343 | 13 | 29 | 21 | | | Section 13.4.2 does not deal with geoengineering and its governance. It merely refers a bit to SRM. If you are going to deal with geongineering then you need to do so more fully. You will find discussions of geoengineering governance in the chapters on Space Law (Lyall), Environmental Law (Redgewell) and Law of the Sea (Rayfuse) in Rayfuse, R. and Scott S. V. (eds.), International Law in the Era of Climate Change (Edward Elgar, 2012). See also Rayfuse R. and Warner, R., 'Climate Change Mitigation Activities in the Ocean: Turning up the Regulatory Heat' in Schofield C and Warner R. (eds) Climate Change and the Oceans: Gauging the Legal and Policy Tides in the Asia Pacific Region (Edward Elgar, 2012). See also the various publications by Karen Scott on geoengineering. | Rejected - guidance to WGIII is to refer to SRM, and ch 13 deals with aspects related to international cooperation, hence scope is narrow |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 18367 | 13 | 29 | 22 | 30 | 2 | This is an important discussion but may better be merged with section 13.3.1. | Taken into account - new subsection introduced and thereby highlight |
| 15387 | 13 | 29 | 22 | | | This pretty much get it right | Noted |
| 11592 | 13 | 29 | 22 | 29 | 34 | The UNFCCC is the only international forum where climate change action can be evaluated for compliance and that is why I believe other institutions dealing with climate change try to associate themselves with the UNFCCC. Its wrong to say it has failed. There is almost universal membership.The required actions have implications for development hence the sensitivities and the foot dragging by certain parties | Noted |
| 15664 | 13 | 29 | 22 | 30 | 2 | It would be useful to mention the possibility of an intermediate approach between universal (or 'inclusive') multilateralism and "club" approaches (also known as "exclusive minilateralism"), namely "inclusive minilateralism", for example in the form of a smaller council _within_ the UNFCCC chosen in a representative fashion. This proposal is outlined in Eckersley, R. 2012. Moving Forward in Climate Negotiations: Multilateralism or Minilateralism? Global Environmental Politics 12 (2):24-42. | Taken into account - new figure to be introduced to make clear different points on continuum from de- to centralised architectures. |
| 13643 | 13 | 29 | 23 | | | It wasn't just resistance to costly measures that doomed negotiations; it was the insistence on them by the EU and others. Talks at COP6 collapsed because the EU did not accept offers by the US that now would be considered quite ambitious. | Rejected - interpretive comment, no literature provided, beyond remit |
| 4953 | 13 | 29 | 5 | | | Actually, there are so many similar multinational / intergovernmental forums: so either it should be indicated that all the above are a few examples, or ? – e.g. Arctic Council, forums initiated by the UNSG on climate change, OECD and IEA are also extensively dealing with these issues etc-etc. (IEA and OECD are mentioned later in another context on p.30). | Taken into account -at outset of 13.5.1.2 |
| 15439 | 13 | 29 | 5 | | | At end of line 5, INSERT: The WPCCC declaration also called for a ban on geoengineering, due to the many and significant environmental, social and political disruptions it is expected to cause. Geoengineering was also addressed as a potential warfare instrument and an intensifier of climate injustice. | Rejected, WPCCC declaration does not mention a ban on geoengineering; IPCC WGIII addressing solar radiation |
| 15074 | 13 | 29 | 5 | | | Add a reference to CD Stone, 1972, Should Trees Have Standing? Toward Legal Rights for Natural Objects, S. Cal. L. Rev. 450. | Accepted - reference included; seminal ones suggested plus a more recent one |
| 2304 | 13 | 29 | 6 | 29 | 7 | There is no regime for SRM and CDR, only a very loose regime complex. | Accepted - text revised |
| 15440 | 13 | 29 | 6 | | 7 | DELETE: "The regime of SRM and CDR related fora has also begun to take shape and is similarly comprised of many institutions." It is an overstatement to suggest that something called "the regime of SRM and CDR" exists. The only regulations on geoengineering are the moratoria established at the Convention on Biological Diversity (CBD) on ocean fertilization (2008), extended to all geoengineering activities that may affect biodiversity (2010) and at the London Convention/Protocol (which has limited membership as compared to the CBD -- 87 States are Parties to the London Convention; 42 States are Parties to the London Protocol; 193 States are Parties to the CBD), which holds that, given the uncertainty surrounding negative impacts, ocean fertilisation other than 'legitimate scientific research' should not be permitted. The London Convention/Protocol has established an assessment framework, including criteria for determining legitimate scientific research.<br>REPLACE WITH: Several mulitlateral fora have recently begun to take up the issue of SRM and CDR. | Accepted - text revised |
| 18438 | 13 | 29 | | | | There is no reference to Hartwell Paper and Climate Pragmatism approach in the discussion regarding the feasibility of a comprehensive, integrated regime (pag 29, par 3). | Rejected - peer-reviewed literature addresses issues and is assessed |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 16375 | 13 | 30 | 11 | 30 | 20 | Several factual inaccuracies in this para. The IEA is in fact an autonomous agency of the OECD, so this should be stated without making them sound like independent institutiosn. IEA was established as a response of OECD countries to the oil shocks, not a "consortium of oil-importing countries". IEA membership requirements do include a minimum oil stocks level which has restricted some OECD members from also being full members of IEA (notably Mexico). OECD has recently granted membership to Korea, Chile, Israel, Slovenia and Estonia and is in accession talks with other developing countries, all of which might become IEA members in due course. OECD and IEA have been jointly supporting the UNFCCC negotations since 1993 throught the Climate Change Expert Group (CCXG, formerly Annex I Expert Group AIXG, see www.oecd.org/env/cc/ccxg ), the work of which directly influenced several aspects of the KP and ongoing agreements. OECD also has a long history of broader climate analysis, most recently OECD Environmental Outlook to 2050, REF, as well as the 2009 document currently cited. IEA is already the world leader in gathering energy and emissions data, including the flagship publication World Energy Outlook. So it would be great if this para could recognise both organisations as already contributing heavily to global knowledge on energy and climate, with a more direct potential influence on member governments than NGOs. | Taken into accout - comment joined with comments 661,672, 673 to add clarity |
| 11459 | 13 | 30 | 11 | 30 | 20 | The identification of the IEA and the OECD as “potentially relevant institutions”, while couched as examples, gives priority to the institutions of developed countries and could have the unintended effect of granting IPCC recognition to these institutions as potential alternative multilateral governance or negotiating forums on climate change away from the UNFCCC. This should be avoided as the UNFCCC remains the sole legitimate universal multilateral negotiating forum on climate change. | Accepted, text revised |
| 14662 | 13 | 30 | 15 | | | IEA membership is determined by OECD membership. Thus, it includes several oil exporting nations, such as Norway, Mexico, and the UK (which may have transitioned from net exporter to net importer by now). OECD membership has expanded to nations as their incomes increase and as they satisfy other policy conditions. Would be more appropriate to refer to recent entrants as middle income (e.g., Chile). | Taken into accout - comment joined with comments 661,671, 672 |
| 6043 | 13 | 30 | 21 | 30 | 34 | There are other links to MEAs that could be discussed as well…e.g. the Biodiversity Convention and the Convention to Combat Desertification. | Taken into account - CBD in 13.5.1.2 |
| 4954 | 13 | 30 | 21 | | 31 | The relation between these legal instruments and their provisions (on ODS and on GHGs) has not been so smooth as it is described here .. | Accepted, text revised |
| 13644 | 13 | 30 | 3 | | | There are several other institutions with potential roles to play. The IMF, for example, has done recent work on ways in which fiscal policy (e.g. carbon taxes) can mitigate climate change: http://www.imf.org/external/Pubs/FT/books/2012/climate/climate.pdf | Taken into accout - joined with comment 667 to include more institutions in 13.10.2 |
| 6850 | 13 | 30 | 36 | 30 | 40 | Durban, Cancun, and Copenhagen are under the UNFCCC and Kyoto negotiations. It would be inaccurate to place them like this. | Accepted - text revised |
| 11593 | 13 | 30 | 38 | 30 | 38 | The bracketted part, these are all UNFCCC for a. | Text revised - as with 676 |
| 8841 | 13 | 30 | 41 | 30 | 9 | It is important to start this paragraph mentioning the Group 77 and China, which is the largest and one of the more active and determinant coallition of countries in the UNFCCC negotiations. It is constituted by 131 developing countries. The Group of 77 is the largest intergovernmental organization of developing countries in the United Nations, which provides the means for the countries of the South to articulate and promote their collective economic interests and enhance their joint negotiating capacity on all major international economic issues within the United Nations system, and promote South-South cooperation for development. | Accepted - text revised to include G77 |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 6341 | 13 | 30 | 41 | 31 | 9 | The mentioning of country grouping in the climate change process is politically sensitive and needs to be handle with care. The following comments and suggestions try to address this issue: 1) As a general principle, it would be convenient that If the members of some coalitions of coutries are mentioned, the members of all coalition should be also mentioned to avoid possible perceptions on differentiation, except these coalitions with large memberships for obvious reasos. 2) Norway, Russian Federation and Ukraine are missing in the Umbrella Group. 3) In the particular case ofthe Environmental Integrity Group, in which it is mentioned that is the first coalition of industrialized and developing countries, the membership (Switzerland, Republic of Korea and Mexico) should be mentioned to inform the reader the scope of this particular coalition. 4) Although it is might not worth to mention all numerous members of the Coalition of Rainforest Nations a brief description on this coalition would inform better the readers. 5) The groups of Least Developing Countries (LDC) and the African Group, both very active in negotiations and with a membership of around 50 countries each, must be mentioned, likely at the begining of the paragraph as the AOSIS. 6) Several other groups also work together in the climate change process, including countries from the Organization of Petroleum Exporting Countries (OPEC)and a group of countries of Central Asia, Caucasus, Albania and Moldova (CACAM). | Accepted - text revised to reflect sensitivity to the description; but space does not allow full listing of all groupings |
| 11460 | 13 | 30 | 41 | 31 | 9 | The identification of negotiation coalitions in the climate negotiations makes no mention at all of the biggest primary negotiating group for developing countries – the Group of 77 and China composed of 133 developing country Parties of the UNFCCC, of which AOSIS is a sub-group. The section also ignores the existence of regional groups that have tended to act as such – i.e. the African Group and the Arab Group – and also makes no mention of the Least-Developed Country (LDC) Group. Furthermore, the section mischaracterizes the political nature of some of the coalitions that it refers to – i.e. the Cartagena Group and the BASIC group of countries are political groupings that meet regularly but do not officially negotiate as their own groups in the UNFCCC negotiations. | Text revised, as with comment 679 |
| 14664 | 13 | 30 | 43 | | | The Umbrella Group, when created for the 1997 climate talks, included more than JUSCANZ countries. For example, it included Russia, and I believe Ukraine. | Text revised |
| 12477 | 13 | 30 | 43 | 30 | 43 | Please note that the Umbrella Group consists of more countries than the JUSCANZ, hence they are not the same. | Taken into account - joined with comments 677 - 680 - text revised |
| 4971 | 13 | 30 | 43 | | 45 | {Add} ".. and New Zealand {and some other developed countries})" ~ because Switzerland, Norway also attended that informal meetings (so it was also called JUSSCANNZ), moreover, Russia and Ukraine sometimes also participated. .. "first coalition of {a few} industrialized and developing countries" | Taken into account - joined with comments 677 - 680 - text revised |
| 14350 | 13 | 30 | 43 | 30 | 44 | The Umbrella Group is not also known as JUSCANZ, as it also includes other members, including: Norway, Russia, Ukraine, and Kazakstan. | Taken into account - joined with comments 677 - 680 - text revised |
| 10618 | 13 | 30 | 11 | | | The IEA (and the OECD with which it is linked) may be promising contributors to data collection. However, as I mention in my comments on Chapter 7 (Energy), the international energy regime is quite fragemented, and the IEA/OECD are hampered by the fact that their membership is mostly developed, oil-consuming countries -- rather than oil-producing countries (e.g., Saudi Arabia) or emerging big consumers (e.g., China, India). For an overview, see: [Colgan, J, T van de Graaf, and R. Keohane. 2012. Punctuated Equilibrium in the Energy Regime Complex. Review of International Organizations. 7(2): 117-143.] | Accepted - text revised |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 10620 | 13 | 30 | 21 | | | The international regime dealing with ozone depletion is one of the most promising partners for the climate regime, in part because the Kyoto Protocol explicitly states its relationship (particularly, concerning the division of labor in substances regulated) vis-a-vis the earlier Montreal Protocol of the ozone regime. But the report misses the fact that the burgeoning international forests regime also may be a partner for the climate regime in the future -- consider, for example, two new institutions launched within the last 5 years: the Forests Carbon Partnership Facility (FCPF) launched by the World Bank, and the UN Collaborative Initiative on Reducing Emissions from Deforestation and Forest Degradation (UN-REDD) launched by the United Nations. For an overview of how various environmental regimes fit together, see: [Johnson, T., and J. Urpelainen. 2012. A Strategic Theory of Regime Integration and Separation. International Organization 66(4): 645-677.] [ABSTRACT: States frequently disagree on the importance of cooperation in different issue areas. Under these conditions, when do states prefer to integrate regimes instead of keeping them separate? We develop a strategic theory of regime integration and separation. The theory highlights the nature of spillovers between issues. Positive spillovers exist when cooperation in one issue area aids the pursuit of objectives in another issue area; negative spillovers exist when cooperation in one issue area impedes this pursuit in another issue area. Conventional wisdom suggests that both positive and negative spillovers foster greater integration. We argue that negative spillovers encourage integration while positive spillovers do not. States integrate not to exploit positive spillovers but to mitigate negative spillovers. To test our theory, we examine the degree of integration or separation among four environmental regimes: climate, deserts, forests, and ozone.] | Taken into account, section 13.5.1.4 |
| 14663 | 13 | 30 | | | | Would also be worth referencing the IMF and World Bank. The former has been active on fossil fuel subsidies and has recently advocated for carbon taxes. The latter has been active in climate finance through the CIFs. These organizations, in contrast to the IEA and OECD, do have near universal participation/membership. | Taken into account - 13.10.2 includes World Bank, to add IMF |
| 17673 | 13 | 30 | 11 | 30 | 20 | In this section, I missed other UN bodies and the Bretton Woods institutions that contribute to the debate with analytical work and reports (besides IEA and OECD), e.g. UNEP, UNDP, UNCTAD, World Bank, etc. | Taken into account - 13.10.2, 13.11.1.2 |
| 11143 | 13 | 30 | 28 | 30 | 31 | Please add USA/Canada/Mexico proposal | Accepted, reference added |
| 7408 | 13 | 30 | 3 | 30 | 34 | Not only IEA, but institutions such as OPEC are also relevant for climate change issues | Taken into account - section 13.5.1.4 |
| 4721 | 13 | 30 | 3 | | | Although it is addressed later in the chapter, the authors should point out that the major other "potentially relevant institution" is the WTO. | Accepted, text revised to include cross-reference to 13.8 |
| 5309 | 13 | 30 | 35 | 31 | 9 | It would be worthwhile to introduce a typology of coalitions. While others are issue related (AOSIS), some are process oriented (G77 and China). While some coalitions are inherited from other domains in the international system (G77, G20, G8, OPEC) some have been established in the climate change context and during the climate negotiation process (AOSIS, BASIC). Important is to see whether these coalitions are actually complementing each other or competing among each other (see mutually exclusive membership between coalitions). To my view, they are complementing each other, and therefore claims regarding the fragmentation of blocs of both developed and developing countries should be questioned. | Accepted, text revised |
| 5310 | 13 | 30 | 36 | 30 | 40 | The comparison between coalitions and subgroups or clubs is not appropriate or is unclear, because two different analytical levels are chosen to show the difference between the two. Coalitions are groups of countries presenting coordinated positions in the international treaty. Does it mean that subgroups or clubs do not present positions in the international treaty? On line 39, subgroups and constrated as countries seeking to regulate GHG emissions in their region of the world. Are coalitions for instance OPEC, EU not seeking to regulate GHG emissions at all? | Accepted - text revised to give clarity |
| 8187 | 13 | 31 | 20 | 31 | 20 | "global corporations": Why just "global" ones? They attempt to influence single-country corporations too. | Accepted - text revised |
| 17674 | 13 | 31 | 25 | 31 | 27 | Another good citation for price differentiation in the realm of voluntary markets is: Conte, M. N. and Kotchen, M. J.: 2010, Explaining the Price of Voluntary Carbon Offsets, Climate Change Economics 1(2), 93–111. | Accepted - reference included |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 6342 | 13 | 31 | 27 | 31 | 28 | The section 13.12 does not describe how certification schemes have been used in CDM. Bibliographic sources are needed to back this statement. | Accepted - text revised |
| 6045 | 13 | 31 | 29 | 31 | 32 | Theses initiatives are also discussed in ch. 15. | Accepted - text revised |
| 8188 | 13 | 31 | 37 | 31 | 37 | "regional (i.e. multi-country)": I would delete regional. Multi-country efforts are often not regional. | Rejected - stems from the plenary- |
| 8189 | 13 | 31 | 38 | 31 | 39 | "Generally, regional collaboration has been triggered by the setup of an international regime": I would describe this as the view of one author; it is far from clear that it is generally true. | Accepted - softened the language to not make a "general" satement |
| 11690 | 13 | 31 | 41 | | | The title of the section 13.6.1 is "interaction of Regional and International Carbon Markets", it may understand as interations between the regional and international markets, however, in the following contexts more are discussing on EUETS and linkage to other like CDM or more on EU ETS itself, and more discussions on WCI itself, so the section title is easy to cause confusion | Taken into account: adjusted the headings to make the content of the sextion clearer |
| 16377 | 13 | 31 | 41 | 31 | 46 | There are numerous other EU policy integration initatives besides carbon markets (eg energy efficiency labelling, building efficiency standards etc etc) so this should be recogised in the first sentence. Also, would be good to note that WCI is sub-national but involves sub-national jurisidictions in more than one country, and may therefore have implications for national emissions accounting under UNFCCC (see Prag et al. (2011), Tracking and Trading:EXPANDING ON OPTIONS FOR INTERNATIONAL GREENHOUSE GAS UNIT ACCOUNTING AFTER 2012, http://www.oecd.org/env/climatechange/49101167.pdf) | Rejected - outside the scope of the chapter. It deals only with the interlinkages to international cooperation not a full assessment of the systems |
| 15725 | 13 | 31 | 42 | 31 | 43 | "Due to the scale effects that occur when carbon markets are enlarged, carbon markets have been the primary means of regional policy integration": better: "may" be primary means of regional policy integration. So far there are only plans, the EU-Norway ETS link, the only existing link so far... | Accepted |
| 4955 | 13 | 31 | 44 | | 45 | Some countries were involved in the ETS after its pilot phase, i.e. from 2007 (Cyprus, Malta; and also Bulgaria and Romania as these two became EU-members later). Besides Norway, 2 more non EU Member States also joined the ETS (Iceland, Liechtenstein), as it is correctly referred to later. There is a national ETS in New Zealand. | Taken into account - Iceland and Liechtenstein now included in text. |
| 8762 | 13 | 31 | 44 | 32 | 2 | National ETS are operating in the EEA (EU ETS covering 30 countries), Switzerland, New Zealand and Japan all of which are linked to Kyoto units. Many more are proposed. At a sub-national level, RGGI and Alberta have operating systems, although neither is linked to other systems. This chapeau needs to introduce what follows. The EU ETS clearly needs to be discussed. It is not clear why California should be discussed in preference to other systems. If experience with linking is the subject, then Japan and NZ should be discussed. | Taken into account: refer to section where other national systems are described |
| 10211 | 13 | 31 | 44 | | | Should it be EU Emissions Trading System or EU Emission Trading Scheme (see e.g. p. 32, l. 3)? | Accepted |
| 12478 | 13 | 31 | 45 | 31 | 45 | Please note that the EU ETS is linked with the system of all the countries in the European Economic Agreement (EEA), which consists of all the 27 countries in the EU pluss Norway, Iceland and Lichtenstein. | Accepted - text reflects this |
| 15075 | 13 | 31 | 45 | | | As noted above, the new Australian carbon policy will link to the ETS by 2018 | Taken into account: refer to section where other national systems are |
| 12922 | 13 | 31 | 45 | 31 | 45 | Should mention the Australian ETS and agreement to link with EU ETS. | Taken into account: refer to section where other national systems are |
| 11461 | 13 | 31 | 5 | 31 | 9 | The characterization of the “Climate and Clean Air Coalition” should be nuanced in that it is not a negotiating coalition in the UNFCCC climate negotiations context, but rather a coalition for dialogue and discussion outside of the UNFCCC context for the States and non-State partners thereof. | Accepted - text revised |
| 11104 | 13 | 31 | 1 | | | Please consider adding the following sentence after Nhamo, 2010, in order to capture the recent event. "In 2012, a new coalition is formed among 30-40 like-minded developing countries, including China, India, Saudi Arabia, and other Asian, Latin American, Middle East, and African devolping countries. The group requests developed countries to reduce their emissions more aggressively and provide large-scale financial and technological assistance to developing countries. Among BASIC countries, Brazil and South Africa do not join it." | Accepted, text revised |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 16376 | 13 | 31 | | | | I wonder about the utility of this sub-section as it is; given that there is a whole section on pub-priv and priv-priv arrangements (13.12) might be best to keep this discussion for that section | Rejected - section makes clear that typology and placement - "The first two (dealing directly or indirectly with private sector initiatives) will be dealt with in |
| 17117 | 13 | 31 | 29 | | | It should be acknowledged that ICLEI´s climate programmes have started in 1993 whereas C40, majority of which also are members of ICLEI, have started only in 2005. This chapter does not have any acknowledgement of the global climate advocacy efforts of local governments that has focused through Local Government Climate Roadmap in 2007. A major outcome of the process was the Global Cities Covenant on Climate - the Mexico City Pact which has an international secretariat and regularly monitors progress of signatories. carbonn Cities Climate Registry in an important effort of local governments for measurable, reportable, verifiable climate action, which captures information of more than 170 cities worldwide as of July 2012. Recognition of local governments as governmental stakeholders in para.7 of Cancun Decisions is also important reflection of all these efforts in to UNFCCC processes. | Taken into account - text revised to incorporate suggestions |
| 10817 | 13 | 31 | 29 | 31 | 35 | It will be important to coordinate with Ch 15 on this discussion, since many of these initiatives are also covered there. | Noted |
| 4722 | 13 | 31 | 36 | | | This section also seems far more descriptive than analytic. | Taken into account - Section 6 has been |
| 18663 | 13 | 32 | | | | Page 32: Description of EU ETS (2/3 page), fair but too general. No direct reasoning on the effects or price level. | Rejected - outside the scope of the chapter. It deals only with the interlinkages to international cooperation |
| 13646 | 13 | 32 | | | | It would be worth pointing out that leakage is likely to be greater in subnational arrangements than in national approaches because both capital and labor are more mobile within economies. | Rejected - outside the scope of the chapter. It deals only with the interlinkages to international cooperation |
| 8763 | 13 | 32 | 15 | 32 | 16 | During the 2005-2007 period Norway had a unilateral link with the EU ETS as well as the CDM. Norway did import some EUAs but neither Norway nor the ERU ETS used CERs during that period because they were more expensive than the domestic allowances. | Rejected - outside the scope of the chapter. It deals only with the interlinkages to international cooperation |
| 4237 | 13 | 32 | 19-20 | | | There were no limits on CER/ERU use during the pilot phase, but there was never any possibility to import these credits since the international transaction log had not yet been created and linked to the EU ETS registry. | Reject - comment could not be verified |
| 4238 | 13 | 32 | 20-21 | | | Forestry credits are indeed not allowed, but other credits were also banned. I don't recall the specifics but there is a negative list that includes large hydro and some other types of mitigation projects. | Taken into account - relates to large hydro |
| 2415 | 13 | 32 | 22 | 32 | 26 | Comment on specific text: My understanding of the EU position is that no CERs can be used in the ETS DURING THE THIRD TRADING PHASE (2013-2020) from projects registered after 2013 unless the projects are in LDCs. See Article 11a Directive 2003/87. Also, my understanding is that CERs from new projects in non-LDCs will be accepted after 2013 where the EU has concluded a bilateral agreement with the country in question regulating their level of use. No agreements of this kind have so far been concluded. | Accepted |
| 4239 | 13 | 32 | 23-24 | | | The provision referred to on these lines applies to the third phase, not the second as implied by the sequencing of statements. | Accepted - rephrased |
| 4240 | 13 | 32 | 27 | | | It should be stated that the 1.74% annual decline in the EU ETS cap continues indefinitely beyond 2020. | Accepted |
| 4973 | 13 | 32 | 28 | | | .. that is a 20% overall reduction by 2020 compared to the 1990 level. | Accepted |
| 16379 | 13 | 32 | 29 | 32 | 34 | Note that EU ETS HAS become more centralised in its later phases (see Prag et al, (2012 forthcoming), Making Markets www.oecd.org/env/cc/ccxg ). For the final two sentences, see my comment above (noting also that the ITL exists for international movements outside of Europe too; it's the link between the ITL and the EU system (CITL, now EUTL) that is important for this point) | Accepted - text reworded |
| 12027 | 13 | 32 | 3 | | | The effects of later participation of East European countries should be described together with analysis of marginal abatement costs among members. | Rejected - outside the scope of the chapter. It deals only with the interlinkages to international cooperation |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 6343 | 13 | 32 | 33 | 32 | 34 | It might worth to mention that the international transaction log has been created under the UNFCCC. Although it was developed with a close collaboration with the EU, this log is not part of the EU ETS. | Accepted - text reworded |
| 4241 | 13 | 32 | 34 | | | It is not accurate to say that the International Transaction Log has been created for the purpose of enabling the coupling of AAUs with EUAs. The ITL exists independently to record and effect all transfers of Kyoto units, just as the Community Independent Transaction Log exists to transfer EUAs. The linkage between the two ensures that AAU's accompany EUAs when the latter are traded across member-state borders. Moreover, if the member-state has not met the Kyoto requirements for enabling trading, AAUs cannot be traded and therefore EUAs are similarly restricted in the EU ETS from being traded across borders. | Accepted - text reworded |
| 8764 | 13 | 32 | 35 | 33 | 2 | The purpose of this section is not clear. It could be dropped. If you keep it add a reference to Haites and Mehling, Linking existing and proposed GHG emissions trading schemes in North America, Climate Policy, v. 9, n. 4, 2009. | Rejected - This section is plenary-approved |
| 8191 | 13 | 32 | 36 | 32 | 36 | "strong": This seems like a value judgment that is not supported. Recommend deleting. | Accepted - rephrased |
| 4972 | 13 | 32 | 4 | | | {Add} The EU ETS is the key means for the Europe{an Union} .. | Accepted |
| 8190 | 13 | 32 | 4 | 32 | 4 | This claim requires a citation. | Taken into account - now sais: "The EU ETS was designed as the key means". |
| 16378 | 13 | 32 | 4 | 32 | 5 | Whilst EU ETS is indeed independent of UNFCCC, would be worth noting that it was designed to operate embedded within international emissions trading (i.e. until 2012 EUAs are created by converting AAUs). Although from 2013 the unit link will be less direct (EUAs will be created rather than converted from AAUs), the point is still important as it affects Europe's position in the KP negotiations - it would be easy to continue KP because the infrastructure is all set up via the EU ETS systems. | Taken into account - rephrased to be more accurate: "although the system could exist independent" |
| 16951 | 13 | 32 | | | | Given the topic of the chapter, I think it would be worth saying that the European Commission intervention cut the allocations proposed in National Allocation Plans by almost 10% in total, and that the principal legal basis for doing so (in relation to the western European countries) was compliance with the EU's Kyoto Protocol targets. The Member States accepted this ruling (note that the Commission rulings on the New Member States used the other legal provision (preventing hidden subsidies) and these were contested.<br>I'd guess this has been written up elsewhere but for one account see Carbon Trust (2007), EU ETS Phase II allocation: implications and lessons (The Carbon Trust, report CTC715, London). □ | Accepted - issue and literature added |
| 17675 | 13 | 32 | | | | After this section, I missed some evaluation of the EU-ETS (criticisms, potentials for improvement, planned reforms, etc.) | Rejected - outside the scope of the chapter. It deals only with the interlinkages to international cooperation |
| 13925 | 13 | 32 | 29 | 34 | 42 | The political underpinings of the ETS also relate to the fact that EU-ETS is embedded in a broader suite of policies addressing multiple agendas (See Huberty, M., "Green growth as necessity and liability: The political economy of a low-carbon energy systems transformation in the European Union", Berkeley Roundtable on the International Economy, Working Paper no. 200, 2011; Haug, C. and A. Jordan, "Burden sharing: distributing burdens or sharing efforts?", in A. Jordan et al (eds), "Climate Change Policy in the European Union: Confronting the Dilemmas of Mitigation and Adaptation?", Oxford, Oxford University Press, 2010. | Rejected - outside the scope of the chapter. It deals only with the interlinkages to international cooperation not a full assessment of the systems |

|---|---|---|---|---|---|---|---|
| 6586 | 13 | 32 | 29 | 32 | 31 | Delete "than decentralised approaches" or express bad points of EU ETS clearly.<br>Other decentralised approaches should NOT be compared to EU ETS since EU ETS has not only good points but also bad points such as following problems.<br><br>Quote>><br>The EU's Emissions Trading System (EU ETS) is the flagship mechanism by which the EU hopes to reduce its carbon dioxide ($CO_2$) emissions via the principle of cap-and-trade.<br>It has run from 2005 and will continue at least until 2020. However, it has failed to have the impact hoped for and is not the cheapest method by which to lower $CO_2$ emissions. It needs dismantling and replacing, while retaining the same aim of providing emission<br>reductions at the lowest necessary cost.<br><br>Why it fails to reduce net global emissions<br><br>There has been a huge over-allocation of credits via under-ambitious targets. The 2012 caps for 20 member states, including the UK, are higher than the measured emissions in 2005. Many companies will not need to make any reductions in their emissions<br>until 2016-18 so even the tightening of the EU ETS in 2013 fails to have a real effect.<br><br>The over-allocation of free credits is leading to huge windfall profits as companies pass through the non-existent credit cost to consumers or sell their credits if unrequired. The power sector alone is likely to have made €16-€50 million by passing on non-existent costs to consumers.<br><br>The EU ETS actually risks raising global emissions. Companies whose competitive<br>advantage has been undermined by the EU ETS emigrate to countries with slacker emission regulations and then the EU imports their products. In the UK this means that from 1990-2005, while production of carbon has fallen by 15 per cent, carbon consumption has actually gone up by around 19 per cent via imports.<br><br>Whether the price of EU ETS credits rises or falls, emissions will not be lowered. A rise will result in carbon leakage and, if the price falls, it will be cheaper for companies simply to buy credits rather than install emission abatement equipment.<br><br>The operation of the Clean Development Mechanism (CDM), a source of offsetting<br>credits for the ETS, is racked with corruption and profiteering, involving billions of pounds. All five main project validating bodies failed UN accountability tests.<br><br>The CDM's subsidies for emission reductions mean some emissions are being deliberately created to be destroyed and generate CDM credits. The gas HFC-23 generates 11,700 credits at €12 per tonne destroyed, but costs only €0.17/t$CO_2$e to destroy: a 7,000 per cent markup | Rejected - outside the scope of the chapter. It deals only with the interlinkages to international cooperation not a full assessment of the systems |
| 2934 | 13 | 32 | 34 | | | add a reference to Maljean-Dubois & Tabau, 2010 for : S. Maljean-Dubois, A.-S. Tabau, « Non-compliance Mechanisms: Interaction between the Kyoto Protocol System and the European Union », European Journal of International Law, 2010, vol. 21, pp. 749-763 | Accepted - issue and literature added |
| 10818 | 13 | 32 | 32 | | 33 | This is really a sub-national initiative. But I can see the problem, since there are so few cases of large scale carbon markets, it is hard not to talk about this. Ch 15 has an equivalent problem - that chapter talks of the California case, but the EU ETS is outside its scope. | Taken into account - WCI is transnational, so belongs in this section |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 4236 | 13 | 32 | 8-9 | | | The sentence in these two lines suggests that the ETS was an optional or negotiable part of the accession negotiations. I believe this is incorrect. The ETS had been enacted before any of the new member-states acceded to the EU and was therefore part of the acquis communitaire. New member states would have been aware that the ETS was part of the price of joining the EU since the final agreement on the ETS Directive in 2003 and the accession negotiations were contemporaneous; however, unless corrected by some one much closer to the accession negotiations than I, whether or not the new member-states would be subject to the ETS was not a matter of negotiation. | Accepted - point here is that the ETS was expanded, not the negotiations |
| 11691 | 13 | 33 | 20 | 35 | 25 | In this section, the section structure is laid out differently compared to other sections, it starts with an "overview" then a special sub-sector on "linkages between the Kyoto instruments and national policies", I think this section can be further extended to include more materials, or put more sub-titles to make the structure more clear | Accepted. Text revised, headings streamlined. |
| 10212 | 13 | 33 | 33 | 33 | 38 | Examples on how international and national climate policy, or centralized vs decentralized political structure, matters would be interesting. | Noted. |
| 6344 | 13 | 33 | 38 | 33 | 38 | It is not clear for a reader what does means "the consensus culture in Netherlands" in comparison with the centralized and descentralized national policy structures mentioned in this paragraph. | Rejected. Literature cited adequately explains the term. |
| 4975 | 13 | 33 | 38 | | | it was also centralized in Hungary but with the participation of many scholars from different disciplines (e.g.: Climate change and Hungary: mitigating the hazard and preparing for the impacts, 2010, ISBN 978-963-508-605-4 http://www.vahavahalozat.hu/files/vahava-2010-12-korrigalt-2.pdf | Rejected. The example does not add significant additional information. |
| 10213 | 13 | 33 | 42 | 33 | 46 | This sencence is difficult to read and unclear | Accepted. Text revised. The sentece is broken into three sentences. |
| 4974 | 13 | 33 | 6 | | | " It included countries that had not ratified the Kyoto Protocol, " it was valid only for the USA and for a while for Australia .. | Rejected - current text correct |
| 6115 | 13 | 33 | 9 | 33 | 9 | After "(Heggelund and Buan, 2009).", add "The Asia-Pacific Partnership for Clean Development and Climate was globally expanded from 7 to 24 countries and formerly taken over in July 2010 by the Global Superior Energy Performance (GSEP). (Okazaki et al. 2012). For citation Okazaki, T., Yamaguchi, M., Watanabe, H. Ohata, A., Inoue, H. Amano, H. (2012), Technology Diffusion and Development. In: Climate Change Mitigation, A Balanced Approach to Climate Change. M. Yamaguchi, (ed.), Springer, London pp. 179-221. | Accepted - text added |
| 16380 | 13 | 33 | | | | Might be better to cove the Asia-Pacific partnership in section 13.5 above. | Rejected - placement correct |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 6587 | 13 | 33 | 3 | 33 | 9 | Add the description of GSEP.<br>After the final meeting of theAPP in April 2011 activities of Cement, Power Generation and Transmission and Steel Task Force were formally inherited to the GSEP.<br><br>Quote>><br>Transition from the APP to the GSEP<br>The GSEP was launched as one of the key initiatives that came out of the Clean Energy Ministerial meeting in 2010 and has also been accepted as a task group under the International Partnership for Energy Efficiency Cooperation(IPEEC).4 The objective of the GSEP is to reduce global energy use by encouraging industrial facilities and commercial buildings to pursue continuous improvements in energy efficiency and promoting public–private partnerships for cooperation on specific technologies or in individual energy-intensive sectors.5 In addition to the majority of the APP countries, 6 GSEP members will include Denmark, the European Commission, Finland, France, Mexico, Russia, South Africa and Sweden.<br><br>Like the APP, the GSEP adopts a working method based on sector-specific working groups. In the GSEP, members do not have to participate in all<br>the working groups. The aim is to provide a forum for public–private dialogue and cooperation, involving the public, private and academic/research sectors in order to exchange information on improved technologies and create practical projects through public–private partnerships in a bottom-up manner.7 It started with six working groups, covering 1) certification, 2) power, 3) steel, 4) cement, 5) cool roofs and pavements and 6) combined heat and power and efficient district heating and cooling (see Figure 1). In June and September 2011, the GSEP working groups organised the first workshops to define strategic objectives and discuss work plans.8 Among others, the GSEP Working Groups on Power, Steel and Cement will build upon activities initiated through the corresponding APP task forces. The groups will concentrate more on energy efficiency and environmental performance and expand the scope of participation.<br><br>For citation: Noriko Fujiwara (2012). Sector-specific Activities as the Driving Force towards a Low-Carbon Economy From the Asia-Pacific Partnership to a Global Partnership. CEPS POLICY BRIEF No. 262. Available at: www.ceps.eu/ceps/download/6569 | Accepted - text added |
| 7508 | 13 | 33 | 3 | 33 | 9 | It should be explained that main activity of the APP has been succesfully inherited to GSEP.<br><br>GSEP has been lauched as an official activity of the Clean Energy Ministerial meeting(CEM) and the International Partnership for Energy Efficiency Cooperation(IPEEC). GSEP is typical non-legally binding type international scheme and is applying methodology successfully developed by the APP and is expandin participation. APP type scheme has been proved effective to improve energy efficiency(Fujiwara(2012)and consequential reduction of CO2 emission from industry, which is main source of CO2 emission.<br>Noriko Fujiwara (2012). Sector-specific Activities as the Driving Force towards a Low-Carbon Economy From the Asia-Pacific Partnership to a Global Partnership. CEPS POLICY BRIEF No. 262. | Accepted - text added |
| 6576 | 13 | 33 | 4 | | 6 | Add a note that the activities of three sectoral task forces (one each for Power, Steel, and Cement) under APP were incorporated in the activities of the Global Superior Performance Partnership under the Clean Energy Ministerial (Fact sheet: Global Superior Performance Partnership, 2012). | Accepted - text added |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 17116 | 13 | 33 | 10 | | | ICLEI - Local Governments for Sustainability is the correct name of the referred organization. However, I completelt disagree with this comment. ICLEI´s more thn 1200 members are from more tha 70 countries worldwide. ICLEI led initiatives like Mexico City Pact, carbonn Cities LCimate Registry and World Mayors Council on Climate CHange, as well as Local Government Climate Roadmap are truly global and have worllwide recognition. | Taken into account - name changed, added "global" |
| 13926 | 13 | 33 | 20 | 35 | 25 | This section should mention that, how and why new actors are lobbying for an acknowledgement of their role in fighting CC within UNFCCC agreements. See Lefevre, B., 2012, Incorporating cities into the post 2012 climate change agreements, Environment & Urbanization, Vol 24(2): 1–21 This paper examines the legal, political, technical, economic and financial implications of fitting commitments by cities into the post-2012 climate change agreement; Bentley, H., Zikman, S., 2010, Local Governments Key to Cancun Climate Talks, Natural Resources & Environment Volume 25, Number 2. | Taken into account. Covered in 13.5.2. |
| 11576 | 13 | 33 | | | | Focus is on efficiency. What about social commitment? David Miller argues for example that national politics may be more efficient (and legitimate) because people may be more committed and engaged (Cf. Miller 2008). | Rejected. Outside the scope of the Chapter. The WG may consider taking "social commitment" into account at a |
| 10819 | 13 | 33 | 22 | 38 | 33 | This section will also have to be closely coordinated with Ch. 15. IN terms of linkage, Xinyuan Dai "Global Regime and National Change" in Climate Policy 10(2010) may be worth referring to for other mechanisms of linkage. | Taken into account. Will continue coordination with Chapter 15 and ensure inclusion of the reference depending on agreement with Chapter 15 either in this |
| 16381 | 13 | 34 | 1 | 34 | 4 | Would be good to also include China's pilot ETS initiatives here, certainly an example of sub-national policy experimentation with a view to expanding to national level | Rejected. Outside the scope of this Chapter, although Figure 13.2 makes reference to these initiatives. Chapter 15 however might consider use of this along with such domestic laws including |
| 16382 | 13 | 34 | 14 | 34 | 16 | Note that some countries do both, eg many EU countries, such as Denmark CDM/JI programme via DEA | Accepted. Text revised. |
| 6116 | 13 | 34 | 18 | 34 | 18 | Add after (Michalowa and Buen,) "Also Japanese firms have commited to purchase credits of more than 300Mt/CO2 to comply with their commitments under Industry Voluntary Action Plan. The total purchase amount is estimated around $4.5-6 Billion for the Kyoto period (Yamaguchi 2012)". For citation, Yamaguchi M., Policies and Measures. In: Climate Change Mitigation, A Balanced Approach to Climate Change. M. Yamaguchi, (ed.), Springer, London pp. 129-159. | In Section 13.7, Accepted. Text revised.<br><br>In Section 13.13, quantificaton not included at this stage |
| 16383 | 13 | 34 | 19 | 34 | 25 | Note also political motivation to be ensuring emissions reductions "at home" both to promote home-grown technologies, ensure modernisation of the economy for future competitiveness, etc | Accepted. Text revised. |
| 10035 | 13 | 34 | 19 | 34 | 22 | This part should be deleted completely or revised to explain Japan's situation. Japan does not limit imports of Kyoto credits. Furthermore, artificially keeping carbon price high is contradictory for the original idea of using market mechanism. | Accepted. Text revised from "all" to "many". |
| 15727 | 13 | 34 | 19 | 34 | 10 | "All industrialized countries limit imports of credits generated by the Kyoto mechanisms for various reasons" Do you mean: limit imports into their cap- and trade schemes? I don't agree that all industrialized countries limit credit imports for national Kyoto target achievement. Austria eg purchases 75 Mio Kyoto credits, the majority of Austria's reduction requirement. | Accepted. Text revised. Also see response to comment no. 763. |
| 6117 | 13 | 34 | 19 | 34 | 19 | "All industrialized countries" is incorrect. Change this phrase to "Some industrialized countries". USA and Japan did not limit imports of credit for several reasons. Also this paragraph (from lines 19-31) is so much inclined to European Situation. This kind of expression will be appropriate for Chapter 14. | Accepted. Text revised. also see response to comment no. 763. |
| 8765 | 13 | 34 | 2 | 34 | 2 | Why is RGGI ignored? | Accepted. Text revised. Figure 13.2 already shows RGGI. In addition RGGI |
| 8192 | 13 | 34 | 2 | 34 | 2 | It is not clear that the "most notable" example of sub-national experimentation is in California. It may be the "most notable" within the United States, but I would be careful in making this claim globally. | Accepted. Text revised. |
| 15076 | 13 | 34 | 2 | | | RGGI should be mentioned here. | See the comment to response comment |

| 12971 | 13 | 34 | 20 | 34 | 20 | It seems that the authors endorse the idea that keeping the price high induced technological innovation in the country, and that this is good. This is debatable and I suggest the authors should rephrase the sentence to convey this message. | Rejected. There is no endorsement of any particular policy in the text. It is drawn from the literature cited already. An additional paper by Alex Bowen is cited as well. There is literature |
| 12972 | 13 | 34 | 20 | 34 | 22 | Why should environmental effectivenes be lower if emission reductions occur in other jurisdictions? If additionality is satisfied, it does not really matter where emission reductions occur. It additionality is not satisfied (or only partially satisfied) it is a different story. Maybe it is sufficient to delate "or" at line 22. | Accepted. Text revised. |
| 12989 | 13 | 34 | 20 | 34 | 22 | Why should environmental effectivenes be lower if emission reductions occur in other jurisdictions? If additionality is satisfied, it does not really matter where emission reductions occur. It additionality is not satisfied (or only partially satisfied) it is a different story. Maybe it is sufficient to delate "or" at line 22. | Accepted. Text revised. |
| 6047 | 13 | 34 | 22 | 34 | 24 | The example of limits on AAUs doesn't really fit with the point being made which is focused on the use of credits from the CDM and JI. | Rejected. This comment is not relevant, as the point made is a separate one. |
| 4976 | 13 | 34 | 23 | | 24 | .. but it did not exclude the opportunity for an EU Member State to transfer such credits (AAUs) to/from another Member State (therefore at national level but not at company level, i.e. outside the ETS). | Rejected. The length given to the treatment of EU-ETS is adequate. This |
| 12809 | 13 | 34 | 23 | 34 | 25 | Can you provide more detailed reason for "more attractive" | Accepted. Text revised. |
| 15728 | 13 | 34 | 23 | 34 | 25 | "For example, the European Union has prohibited the import of Assigned Amount Units into the EU-ETS in order to prevent the use of surplus units from countries in transition, colloquially called “hot air” (A Michaelowa and Buen, 2012)" Important to mention that A1 countries use AAUs from Green Investment Schemes for national target achievement. Japanese companies use AAUs for meeting their voluntary targets...see eg Tuerk A., Frieden D., Sharmina M., Schreiber H., and D. Ürge-Vorsatz; 2012: Green Investment Schemes: First experiences and lessons learned http://www.joanneum.at/climate/GIS.html | Accepted - text revised |
| 12001 | 13 | 34 | 25 | | | Note that leakage has been assumed widely and researched extensively, including by the meth panel and found to be non-existing based on the assessed evidence. The EU has taken a decision to ban these projects based amongst other an assumption rather than evidence. Today, these emissions are again emitted freely, so we have cheap abatement technology, transferred from Annex I countries, having solved a problem within a few years which the Montreal Protocol has not been able to solve in decades and we through the whole thing out rather than fix it. This is a scientific report i.e. the current state of evidence needs to be mentioned rather than the 2011 hypotheses by Schneider ("... due to possible emissions leakage").<br><br>Otherwise, the CDM presentation is very good. It should also be mentioned under its contributions that it is at the basis of the South Korean and the Chinese Emissions Trading Schemes. | Rejected. Not supported by the peer-reviewed published literature. |
| 8766 | 13 | 34 | 26 | 34 | 31 | Literature relating to the regional distribution of CDM projects is reviewed in the Impacts report prepared for the CDM Policy Dialogue. See http://www.cdmpolicydialogue.org/ | Accepted. Reference added. |
| 5916 | 13 | 34 | 26 | 34 | 31 | Cross-reference CDM in ch 7, ch 16, and specifically ch 14.3.4.3 re geographical distribution of CDM projects. | Noted. No text revision is necessary in this chapter. Coordination with other chpaters, however, is an ongoing |
| 8193 | 13 | 34 | 26 | 24 | 31 | The relevance of this passage to the rest of the discussion is not clear. | Noted. No text revision is necessary in this chapter. Coordination with other chpaters, however, is an ongoing |
| 12973 | 13 | 34 | 26 | 34 | 31 | It is not clear why an uneven distribution of mitigation action across countries would motivate a limit to imports of credits. In general, I don't think it is appropriate to introduce here problems of the CDM. | Accepted. Geographic distribution is important and the placement is adjusted so that the idea stands alone in a |
| 17676 | 13 | 34 | 26 | 34 | 31 | Here, I would mention that the EU-ETS was reformed exactly in this direction, i.e. by restricting the trade to CERs from LDCs. It is mentioned in another section, but I would at least reference here to this section or mention it again. | Accepted. Text revised. Necessary citation provided. |

|---|---|---|---|---|---|---|---|
| 16384 | 13 | 34 | 26 | 34 | 31 | I would question whether the discussion of geographical distribution of CDM is relevant here | Accepted. See response to 777 above. |
| 12808 | 13 | 34 | 32 | 34 | 40 | This para could be rephrased, also some coherences should be provided in order to better inform the reader on the main point. | Noted. |
| 16385 | 13 | 34 | 33 | 34 | 35 | This sentence is not very clear; I know what you mean, but the phrasing makes it difficult to understand. Suggest instead: "The EB decided that the effects of new policies implemented in host countries should not be considered when assessing the additionality of new projects, to avoid perverse incentives etc...". Would also be good to note in this para that the consideration of impacts of policy measures is an important issue when considering future market mechanisms (see Prag et al (2011), KEEPING TRACK: OPTIONS TO DEVELOP INTERNATIONAL GREENHOUSEGAS UNIT ACCOUNTING AFTER 2012 http://www.oecd.org/env/climatechange/48125645.pdf). | Accepted. Text revised. |
| 8767 | 13 | 34 | 46 | 34 | 46 | It is useful to distinguish unilateral and bilateral duirect links. All existing links are unilateral. They are easy to implement. Bilateral links are difficult to implement and none is yet in place although Australia and the EU announced their intention to implement one between 2015 and 2018. | Rejected. The chapter dealt with unilateral and bilateral linkages although no definition was advanced as it was not |
| 16386 | 13 | 34 | 46 | 34 | 46 | It seems the subsequent discussion covers direct/indirect linkage of ETSs in general; suggest therefore deleting reference to Kyoto mechanisms from this sentence | Accepted. Text revised. |
| 7000 | 13 | 35 | | 39 | | You might want to look at Barrett (2011) for a discussion of the use of trade restrictions in climate agreements. I think they could be used strategically in some very narrowly focused agreements.<br><br>Barrett, S. (2011). “Rethinking Climate Change Governance and Its Relationship to the World Trading System,“ The World Economy, 34(11): 1863-1882. | Noted. Comment will be taken up in 13.8 |
| 3468 | 13 | 35 | | | | Figure 13.2 is not completely accurate (US did not puu out of 2nd period Kyoto but of first period two; what does white and red stripes stand for?; ) | Accepted. Figure will be adjusted. |
| 6577 | 13 | 35 | | | | Explain "Japanese bilateral mechanism" either in Figure 13.2 or in 13.4.1.3 Flexibility mechanism. (MOEJ Initiatives on Bilateral Offset Credit Mechanism for Mitigating Climate Change, 2012) | Accepted. Text revised. See response to comment 787. |
| 16387 | 13 | 35 | | | | Nice figure, but given the tenuous current nature of the Japan bilateral offset system it seems to get undue coverage in this map; as far as I know, the countries marked have only had feasibility studies of varying degress of detail, so cannot really be considered projects. Would also be good to have a bit more definition on the China pilots, and of course the EU-Aus link (I realise this happened after the first draft was written). | Accepted. Figure will be revised. Also see response to comment 787. |
| 15729 | 13 | 35 | | 35 | | Figure 13.2. Cap and trade schemes and linkages: you mean Cap and trade schemes with existing and possible linkages? | Taken into account -- title changed to "Cap and trade schemes with existing |
| 6345 | 13 | 35 | 10 | 35 | 25 | There are comparisons between diferent kind of linkages without specifying what of these linkages have been implemented in practice and what are the linkages prepared or suggested by scholars that have not existed yet. This information should be provided. | Rejected. The text is clear. |
| 8771 | 13 | 35 | 10 | 35 | 12 | A unilateral direct link does nothing if the linked units are not the marginal supply -- in that case the linked units are a form of price cap although the exact price is not known. With a bilateral link the benefits mentioned occur (subject to restrictions on use of the linked units). In addition a bilateral link value also reduces leakage, output losses in countries with the ETS, and lower welfare losses. See ALTERNATIVE APPROACHES FOR LEVELLING CARBON PRICES IN A WORLD WITH FRAGMENTED CARBON MARKETS, Elisa Lanzi, Jean Chateau and Rob Dellink, OECD Environment Directorate, 2012. | Accepted. Text revised. Citation included. |
| 13647 | 13 | 35 | 10 | | | Offsets are fundamentally different in carbon tax regimes than in cap and trade. They are tax expenditures. | Rejected. Not relevant for this |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 16388 | 13 | 35 | 10 | 35 | 25 | Important additional references on linking are Dellink et al (2010), "Towards Global Carbon Pricing: Direct and Indirect Linking of Carbon Markets", doi : 10.1787/5km975t0cfr8-enand Elis and Tirpak (2006),LINKING GHG EMISSION TRADING SCHEMES AND MARKETS http://www.oecd.org/environment/climatechange/37672298.pdf. Would also be good to add a final para to this section, discussing the impact of regional linking of ETSs on international emissions accounting both under KP and broader FCCC agreements (eg see Prag et al (2011), Prag et al. (2011), TRACKING AND TRADING:EXPANDING ON OPTIONS FOR INTERNATIONAL GREENHOUSE GAS UNIT ACCOUNTING AFTER 2012, http://www.oecd.org/env/climatechange/49101167.pdf). This would also provide a nice link back to the KP systems, where the section begins by discussing. | Accepted. Reference added on the first point. Second point needs more research. |
| 4234 | 13 | 35 | 13-14 | | | Ditto comment above (page 6, line 32); second time this incorrect statement is made. | Noted. Will be responded in the revisions to the Executive Summary. |
| 12810 | 13 | 35 | 2 | | | Check wether "pull-out…"-symbol is not better placed after "links" | Accepted. Figure will be changed. In the changed version Tokyo will be |
| 4243 | 13 | 35 | 21-23 | | | What is the difference between a reciprocal unilateral link and a bilateral link (referred to in the preceding sentence)? I don't think there is any. The two sentences seem to concern mostly the formality of the agreement by which mutual recognition is achieved. | Accepted. Text clarified. |
| 10214 | 13 | 35 | 23 | 35 | 25 | Expand on indirect linkage; how dies it work? | Taken into account. Detail is contained |
| 12811 | 13 | 35 | 29 | 36 | 1 | The different levels of interaction of climate and trade are mentioned without any further description of the effects or conclusions derived from this information. The implications of this statement are not self-evident and should be explained- Otherwise the sentence does not provide any additional information nor does it help to structure the chapter. | Taken into account: examples provided. |
| 9294 | 13 | 35 | 3 | | | A minor comment. The projects under Japanese bilateral mechanism also include Djibouti, Ethiopia, Kenya, Maldives, Moldova, Mozambique and Myanmar,<br>References<br>http://www.meti.go.jp/press/2012/04/20120426004/20120426004.pdf (in Japanese)<br>http://www.meti.go.jp/press/2012/07/20120726002/20120726002.pdf (in Japanese)<br>http://www.meti.go.jp/press/2012/07/20120726003/20120726003.pdf (in Japanese)<br>http://www.nedo.go.jp/content/100495085.pdf (in Japanese)<br>http://gec.jp/main.nsf/en/Activities-Climate_Change_Mitigation-adopt2012 | Accepted. Figure will be changed. |
| 12479 | 13 | 35 | 4 | | | The figure shows "Projects under Japanese bilateral mechanism". We can't fine any place where this mecahnism is explained. Please consider to include some information about the mechanism in the text, if it's to be included in the Figure. | Accepted. Text revised in 13.7.3 |
| 6048 | 13 | 35 | 5 | 35 | 6 | The Norway- EU ETS link doesn't appear in Figure 13.2 | Rejected. The figure treats only present |
| 8768 | 13 | 35 | 5 | 35 | 5 | Norway had a unilateral direct link with the EU ETS during 2005-2007 -- Norwegian firms could use EUAs for compliance, but EU ETS installations could NOT use Norwegian allowances for compliance. The Chicago Climate Exchange also had a unilateral direct link with the EU ETS, but they terminated that link when the price of phase I EUAs fell to just above the price of CCX allowances. | Rejected. The figure treats only the current and future situation. |
| 15077 | 13 | 35 | 6 | | | The Australian system will now (as of August 2012) be directly linked to the ETS by 2018. | Accepted. The figure will reflect this |
| 8769 | 13 | 35 | 7 | 35 | 7 | Switzerland and Japan also have ETS that accept Kyoto units for compliance. They could also be used in RGGI if the price rose above $10/ton CO2. These systems all accept ERUs, most CERs and, for Australia and NZ, RMUs, so not just the CDM. | Noted, although it is unclear if the figure can accommodate all this detail. Over to Axel! |
| 8770 | 13 | 35 | 8 | 35 | 9 | Estimates of compliance cost savings are provided in the Impacts report prepared for the CDM Policy Dialogue. See http://www.cdmpolicydialogue.org/ | Accepted. Reference added. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 4242 | 13 | 35 | 8-9 | | | A finding that "EU demand has driven the price of CDM credits" does not directly lead to an implication that costs were reduced in the EU ETS. The surrender of CERs implies that these credits are less costly on the margin than EUAs or internal abatement, but the co-movement of EUA and CER prices and the cost savings from the use of CERs are two different things. Whether the cost savings from CER use are substantial also depends on the quantity of CERs surrendered in addition to whatever is the reduction in price. I would suggest that little is known about the price-quantity relationship for abatement in the EU ETS so that the finding of "substantial" cost savings seems to me unsubstantiated. No doubt there are some, but whether they are substantial is another matter. | Accepted. Text clarified. |
| 5687 | 13 | 35 | 2 | 35 | 3 | Figure 13.2 identifies several cap-and-trade regimes that I did not see mentioned in the text (e.g., RGGI, Korea, Taiwan). It would be helpful to mention these briefly, if they are shown on the map. | Noted. Reference is made although detailed treatment is in Chapter 15. |
| 14253 | 13 | 35 | | | | One should note the important consequence of trade as pointed out by Brian Copeland, e.g., "Free Trade and Global Warming: A Trade Theory View of the Kyoto Protocol" (with M. Scott Taylor), Journal of Environmental Economics and Management, 49 (2005): 205-34. | Taken into account: reference included. |
| 15389 | 13 | 36 | | | | Either explain what is in yellow or don't even include it | Rejected: Unfortunately, this comment cannot be related to the text. |
| 6118 | 13 | 36 | 10 | 36 | 10 | After The Kyoto Protocol, "(UNFCCC, 1998)" is unnecessary. Remove it. | Accepted and changed |
| 2303 | 13 | 36 | 13 | 36 | 30 | This discussion could be further improved by citing Victor (2011) who says that he now views trade sanctions as "essential" to effective climate change mitigation. On the whole, this paragraph gives a balanced view, unlike the paragraph on p. 19. | Accepted: Reference included including additional nuanced view. |
| 10215 | 13 | 36 | 13 | 36 | 25 | References lacking | Taken into account, new references |
| 11462 | 13 | 36 | 20 | 36 | 22 | The reference to "economic analysis of trade issues typically assumes that there are gains from free trade based on countries' comparative advantages and that government intervention tends to create inefficiencies, albeit with some exceptions" highlights only the orthodox neoliberal economists' view. It disregards a growing body of empirical evidence that highlights the flaws in such assumptions. | Taken into account: However, lack of space precludes to survey the entire lietrature on non-orthodox approaches. We have phrased this sentence now |
| 2416 | 13 | 36 | 25 | 36 | 29 | Comment on specific text: The language of 'trade sanctions' is loaded . It immediately sounds like a bad thing. Trade measures might be a more neutral phase. When does something become a trade sanction? Already there are all sorts of trade measures in place: product standards e.g. CO2 emissions from cars or from energy-using equipment; process standards e.g. biofuels; application of EU-ETS to flights taking off from or landing in EU. All of these simply involve the application of domestic law to imported goods or services and this happens all the time across many sectors without anybody talking about trade sanctions. | Accepted, phrasing has been changed in accordance with reviewer's suggestion. |
| 11463 | 13 | 36 | 25 | 36 | 27 | The reference to "trade sanctions or trade enticements could be used to address free-rider problems of international agreements – specifically participation and/or compliance problems" has no empirical backing. It is not clear whether or not trade measures could, in fact, engender improved compliance. Having the IPCC refer to such use of trade measures could give rise to future trade-related disputes in the event that States use such IPCC reference as the "scientific" imprimatur for the adoption of such trade measures. | Taken into account; phrasing is now more careful. Note, however, that some other comments had to be taken into account when changing this paragraph. |
| 14665 | 13 | 36 | 27 | | | There is an Aldy, Orszag, and Stiglitz 2001 paper that calls for trade sanctions to promote participation and compliance. Full cite in the Aldy, Barrett, and Stavins 2003 13+1 Climate Policy paper. | Taken into account in so far as additional literature has been considered regarding this issue. However, given space |
| 2417 | 13 | 36 | 31 | 36 | 32 | Comment on specific text: Suggested addition to text: ….consistent with principles of non-discrimination and other WTO discplines such as the 'necessity' test. WTO law does not only discipline discriminatory measures. For example the TBT Agreement provides that technical regulations should not be more trade restrictive than necessary to achieve a legitimate objective. | Rejected: The text says a central issue which implies that this is not the only issue. However, non-discrimination is an important issue as the referee confirms |
| 2169 | 13 | 36 | 31ff | | | Maybe it would make sense to compare fairness aspects w.r.t. those related to climate policy and those related to trade policy (see e.g. Suranovic, S.M. (2000)World Economy. | Rejected: Though this is an interesting idea, section 13.8.1 is on WTO-related issues to climate change. Fairness is an |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 16952 | 13 | 36 | | | | Actually this conflates two rather distinct topics and if possible with the constraints, I would suggest to separate them. One is the literature on production vs consumption accounting. The other concerns instruments and how they relate to WTO. It would be a great pity if the former – accounting - issues got complicated politically by mixing them up with the latter. | Taken into account: we have seperated both issues. |
| 10617 | 13 | 36 | 41 | | | An overview of WTO-permissible environmental instrument is provided in [Johnson, T., and R. Brewster. 2012. Information Revelation and Structural Supremacy: Explaining the International Trade Regime's Perceived Hostility to Environmental Policy. Duke University, Durham NC. 28 pp.] [ABSTRACT: The World Trade Organization (WTO) offers numerous instruments for privileging environmental goals over freer trade. What explains these instruments' common form, with use conditional on states' revelation of private information about environmental policies? We emphasze the WTO's need to mitigate industrialized countries' fear of "trade at all costs" and developing countries' fear of "green protectionism." And why is the WTO nevertheless accused of hostility toward environmental goals? Trade law is unusual, because states submit to third-party dispute resolution. This "structural superiority," combined with the WTO's information-revealing mechanisms, means that TRADE officials apply TRADE law to assess the appropriate balance of trade and environmental goals. Thus, the WTO's perceived hostility is fueld not only by actual rulings -- but also by the WTO being in a position to issue rulings at all. We demonstrate with the General Agreement on Tariffs and Trade (GATT) and the Sanitary and Phytosanitary (SPS) Agreement.] And section 13.8 also would benefit from acknowledging the wider debate in which the Johnson & Brewster article engages: whether the World Trade Organization (particularly, its dispute settlement body) is an appropriate institution for addressing environmental issues -- or whether environmental issues would be better served by a forum (and dispute settlement body) of their own. Other research in this debate includes: [Conca, K. 2001. The WTO and the Undermining of Global Environmental Governance. Review of International Political Economy 7(3): 487-496.]; [Keleman, D. 2001. The Limits of Judicial Power: Trade-Environment Disputes in the GATT/WTO and the EU. Comparative Political Studies 34(6); 622-650.]; [Neumayer, E. 2004. The WTO and the Environment: Its Past Record Is Better than Critics Believe, but the Future Outlook Is Bleak. Global Environmental Politics 4(3): 1-8.]; [Thomas, U. 2004. Trade and the Environment: Stuck in a Political Impasse at the WTO after the Doha and Cancun Ministerial Conferences. Global Environmental Politics 4(3): 9-21.]; [Shaffer, G, and J. Trachtman. 2012. Interpretation and Institutional Choice at the WTO. Virginia Journal of International Law. 52: 103-153.] | Taken into account: all references have been carefullt checked and cited if appropriate. It is clear that this an interesting but also highly complex issue which cannot be discussed in its entire dimension in the text. Section 13.8.1 tries to hint at least at the most important issues, though admittedly at a very superficial level. |
| 11464 | 13 | 36 | | 37 | | Some of the discussion relating to the various WTO-related issues identified in this section should also be further expanded by the inclusion of discussions or references to Martin Khor, The Climate and Trade Relation: Some Issues (Research Paper 29, South Centre, May 2010), in order to provide more balance to the discussion. | Taken into account: reference has been checked for additional information and useful information has been included, given our strict space limitations. Reference needs to be approved |
| 12812 | 13 | 36 | 32 | 36 | 32 | You might like to consider giving introduction like the following paragraph: "There are two basic approaches to discuss WTO concerns in conjunction with the given climate regime: First, to analyze the compatibility between existing WTO-rules and climate change rules (legality), second, to analyze the potential of normative changes, either of WTO rules or of the climate regime in future (policy dimension). [It might also be helpful to add a new headline here "13.8.1.1 Border Adjustment Measures" or at least a new paragraph and then to introduce with:] Further, there are two types of Border Adjustment Measures: import-related and export-related Border Adjustments since it depends on this categorization which norms apply on Border Adjustments (i.e. that Border Adjustments can consist of a combination of export and import measures but it is also possible that Border Adjustments are based on only one of these types either. | Taken into account: even though we have not introduced new headings (as they are determined by the IPCC guiding rules), we have given BAMs a much more prominent role, expanding on this issue, trying to give a balanced view on the economc, legal and political issues. Needless to say, space restrictions required to sketch only roughly the main arguments |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 12813 | 13 | 36 | 32 | 36 | 32 | The elimination of quantitative restrictions (article XI GATT) could be added in the introductory sentence because chapter 13, section 13.8.1, line 47 refers to non-tarrif barriers as well and not only the non-discrimnation rules. Kateryna Holzer considers article XI GATT as one important basis for the jurisprudential evaluation of Border Adjustments, too (see Holzer, Kateryna, Perspectives for the Use of Carbon-related Border Adjustments in Preferential Trade Agreements, NCCR Climate Research Paper 4/2011, Bern 2011, p. 8). | Rejected: Though interesting, and certainly a possibility to account for environmental issues in WTO/GATT, the introductory sentence refers to WTO-folks and their view. |
| 16050 | 13 | 36 | 36 | 36 | 37 | need more evidence to justrify that WTO agreements, annexes are pertinanet to climate change | Rejected: section 13.8 provides plenty of evidence why WTO is pertinent to |
| 18439 | 13 | 37 | | | | Pag 37 par 5: I think the paper dodges the problem of embedded emission in exports, presenting it as an ethical issue. Maybe it should be some kind of guide in how to deal with the subject in this part. | Taken into account; we are now more explicit about the issues involved in embbed emissions. However, the issue has to be discussed in other chapters |
| 3757 | 13 | 37 | 25 | 31 | | unclear | Rejected: formulation seems clear; however, paragraph has been relocated |
| 16389 | 13 | 37 | 25 | 37 | 31 | Could be interesting to note here that the UNFCCC system has built up a system of national emissions targets, and correspodning inventory reporting processes, which provide a certain impetus to remain national-level emissions accounting, rather than a consumption-based system | Accepted: suggestion has been integrated in the rewriting of this paragraph which has been relocated |
| 6346 | 13 | 37 | 29 | 37 | 31 | It might be necessary to explain the use of the adjective "ethical" in this context or to consider deleting it. It might be also necessary to make reference to chapter 14 where is presented information on "embedded GHG emissions" at regional level. | Accepted: suggestion has been integrated in the rewriting of this paragraph which has been relocated |
| 6119 | 13 | 37 | 29 | 37 | 31 | This is not necessarily 100% ethical issue. For example the issue has something to do with equity, burden sharing as well as who should pay mitigation cost. Suggest to rewrite. | Accepted: suggestion has been integrated in the rewriting of this |
| 14254 | 13 | 37 | 30 | | | Is this an "ethical" issue? I would consider it a highly technical issue, instead. | Accepted: suggestion has been integrated in the rewriting of this |
| 12814 | 13 | 37 | 30 | 37 | 30 | The question whether emissions should be based on importing or exporting countries is indeed ethical if we think about the related responsibility principle. But it can be an economic question, too (Droege, Susanne, Using Border measures to address carbon flows, in: Droege, Susanne (Ed.), Do border measures have a role in climate policy?, in: climate policy, Consuming and producing carbon: what is the role for border measures, Routledge, pp. 1191-1201). | Accepted: suggestion has been integrated in the rewriting of this paragraph which has been relocated within section 13.8. |
| 16953 | 13 | 37 | 32 | | 45 | The paragraph notes that these issues are “especially problematic and consequential ..”. Given this, the paragraph really needs to be more precise an in particular its final sentence is very problematic. I believe the literature shows consensus that whether “border measures” are compatible with WTO depends entirely on the question of what kind of border-related measures and how they are designed (this was the main message of the WTO’s own study). The most simplistic – a straightforward inclusion of specific carbon-intensive imports into a trading scheme benchmarked on the basis of product only – clearly satisifies both the core GATT criteria (non-discrimination and MFN) and is directly analogous to excise duties which most countries already do: it thus does not even need Article 20 exemption. There is then a broad panoply of measres that involve more or less PPM / discriminatory / exemption requirements.<br>The essential point to communicate in this paragraph is that there are in fact two entirely different discourses: one on how to ‘level’ carbon costs at the border; and the other how to ‘leverage’ action in other countries. The former is intrinsically non-discriminatory in intent. The latter is explicitly discriminatory, and thus infinitely more contentious. Legally they are entirely different discussions and should not be confused. For details see the Carbon Trust report, Tackling Carbon Leakage: specific approaches in a world of unequal carbon prices (2010), which is also being written up as an academic article by Grubb and Das for the Journal of World Trade. | Taken into account: We agree that this paragraph did not convey enough message. The paragraph has been substantially expanded, though it still has to remain rather superficial due to space limitations. However, we hope that now the main arguments are clear, with the message that BAMs can be in line with WTO-GATT, but there is also a political dimension which requires also support from non-Annex B countries for implementation. |

|---|---|---|---|---|---|---|---|
| 8772 | 13 | 37 | 32 | 37 | 45 | See ALTERNATIVE APPROACHES FOR LEVELLING CARBON PRICES IN A WORLD WITH FRAGMENTED CARBON MARKETS, Elisa Lanzi, Jean Chateau and Rob Dellink, OECD Environment Directorate, 2012 for as comparison of the effects of linking and border adjust mechanisms. | Taken into account: study has been studied and cited. |
| 15078 | 13 | 37 | 36 | | | Another study examining the role of border tax adjustments is WJ McKibbin and PJ Wilcoxen, "The Economic and Environmental Effects of Border Tax Adjustments for Climate Policy," in L Brainerd and I Sorkin, (eds), Climate Change, Trade and Competitiveness, The Brookings Institution, pp. 1-34, 2009. | Taken into account: study has been studied and cited. |
| 14666 | 13 | 37 | 42 | | 43 | Recommend citing Aldy and Pizer 2009 Pew report in context of econometric studies on competitiveness. I'm not positive the papers cited here are econometric in their methods. | Taken into account: study has been studied and cited. We also corrected "econometric" to "empirical" and include |
| 11692 | 13 | 37 | 43 | 37 | 45 | The authors note that " There has been less consensus in legal-institutional studies …", it is better to provide more discussions, and why there are less consensus, what are the major differences | Taken into account: the phrasing has been changed as our previous statement was not illuminating as the referee |
| 13927 | 13 | 37 | 32 | 37 | 45 | For a comprehensive analysis on WTO rules and border adjustments, see Tamiotti, L., "The legal interface between carbon border measures and trade rules", Climate Policy, 11(5), 2011. | Taken into account: reference was already included but reference has been studied again carefully to see whether |
| 12815 | 13 | 37 | 36 | 37 | 40 | To arrange the research on Border Adjustment Measures you may like to consider a structure sub-dividing the arguments since: "It makes a difference for WTO law compatibility how the climate protecting measure is structured. An ETS-Border Adjustment Measure underlies different requirements than a Border Tax Adjustment (cf. Holzer, Kateryna, Proposals on Carbon-Related Border Adjustments: Prospects for WTO Compliance, in: Carbon & Climate Law Review 2010, S. 51-64). Even if Border Adjustment Measures do not a priori violate WTO law their justification (legality) depends on several questions: judicial and technical respectively economical ones. Judicial emphasis is to be put on a) the question which agreements apply to which type of measures, b) the question how to resolve WTO law-internal conflicts if several WTO-Agreements apply to the same measure, c) how to avoid WTO law-external conflicts or at least how to reduce conflicts between trade and climate protection norms within the existing international law d) the Like products question in the different WTO-Agreements, especially concerning the production methods that cannot be retraced in the final product (non-product-related process and production methods) and e) the necessity criteria respectively the criteria of disguised restriction within the climate-related exceptions (article XX GATT) of WTO-law. Technical and economic questions directly affecting legality questions are a) the relevance of carbon leakage, b) the measurement of the effectiveness of carbon leakage policies, eg. Border Adjustment Measures, c) the determination of the carbon footprint within all the uncertainties when monitoring climate politics in foreign countries and within the limits of international law's sovereignity of other states, d) the estimation of the costs of Border Adjustment Measures." (see for these emphases: Holzer, Kateryna, Proposals on Carbon-Related Border Adjustments: Prospects for WTO Compliance, in: Carbon & Climate Law Review 2010, pp. 51-64; McGrady, Benn, Necessity Exceptions in WTO Law: Retreaded Tyres, Regulatory Purpose and Cumulative Regulatory Measures, in: Journal of International Economic Law 2008, pp. 153-173; Du, Michael Ming, The Rise of national regulatory Autonomy in the GATT/WTO Regime, in: Journal of International Economic Law 2011, S. 639-675; Condon, Bradley J., Climate Change and unresolved Issues in WTO Law, in: Journal of International Economic Law 2009, pp. 895-926; Veel, Paul-Erik, Carbon Tariffs and the WTO: An Evaluation of Feasible Policies, in: Journal of International Economic Law 2009, pp. 749-800). | Taken into account: references have been considered and critically investigated whether additional information should be included. The paragraph on tax-border adjustment has been restructured. However, the nuanced arguments on the legal compatibility of various policy measures and WTO/GATT rules, though very interesting, would require too much space. As we have included all suggested reference, we hope the interested reader will find sufficient references on this subject. |

These elements will prove very important within the newly bottom-up approach to climate change policy architecture. | I am note sure whether I get the point. Unilateral trade measures to supprt climate policy by a subgroup of countries have been dealt with under BAMs, an |
| 8194 | 13 | 39 | 12 | 39 | 12 | "have received little attention thus far": From whom? They have received attention from policymakers. Perhaps this refers to scholars? | See comment 845. |
| 7135 | 13 | 39 | 12 | 39 | 14 | There has been an intense discussion on the Convention on that issue, particularly under the “shared vision” LCA negotiation, there is not a Decision on that because position remain divided, but the fact is that a group of G 77 countries has been elaborating in the need to address that from the Convention, due to the worries of trade being used as protectionism. That discussion also came under the “sectoral approach” negotiation, with developing countries concerned with the use of harmonized standards and concepts like a level playing field for international competitiveness, which again would open the door to protectionist trade measures against developing countries’ products. The discussion is also linked to the economic and social consequences of response measures under 1(b)(vi). So it has not been a minor issue under the Convention, and, at that moment, discussions are still ongoing. | See comment 845. |
| 11466 | 13 | 39 | 12 | 39 | 13 | The reference to “there has been some interest in adopting a prohibition on the use of unilateral trade measures, such as offsetting border measures” should be further expanded considering that this is an issue that is likely to face the climate-trade community in the near future and is one that many developing countries in the context of the UNFCCC climate negotiations have already expressed support for such adoption as part of the negotiated outcome in the Ad-Hoc Working Group on Long-Term Cooperative Action (AWG-LCA) of the UNFCCC. | See comment 845. |
| 6852 | 13 | 39 | 14 | | | Is it not worth referring to the numerous Indian proposals on prohibiting unilateral trade measures here? | Taken into account: this section has been rewritten; the critical views of develpoing countries about trade measures is now mentioned under BAMs, though not with explicit reference |

|---|---|---|---|---|---|---|---|
| 6348 | 13 | 39 | 17 | 39 | 17 | Use UNFCCC secretariat rather than UNFCCC alone. | Accepted, text revised. |
| 8195 | 13 | 39 | 34 | | | "Technology" is undefined in this section. It seems to refer variously to physical capital (not just ideas embedded therein) and to ideas themselves. It would make sense to either define the term or to be clear in the various passages about which definition is being used. This section also seems to neglect the tension that many countries find between promoting technology transfer and national competitiveness. It is difficult to understand technology transfer discussions without including this force in one's model. | Taken into account - any revisions to text are pending Glossary decisions and contents. |
| 11467 | 13 | 39 | | 40 | | The section on the rational for mechanisms for technology development, transfer and diffusion contains no reference at all on the fact that under Art. 4.5 of the UNFCCC, technology transfer is an explicit treaty commitment on the part of Annex I Parties. Furthermore, under Art. 4.7 of the UNFCCC, compliance by Annex I Parties with such a commitment could, inter alia, spur increased levels of implementation by developing countries of their own UNFCCC commitments (such as on mitigation and adaptation). The existence and importance of such treaty commitments would be a very important element of the rationale for having such technology transfer mechanisms at the multilateral level. | Taken into account. The chapter text already mentions this point explicitly in section 9.3.2, though not in section 9.1. An U872insertion has been made in the first sentence of section 9.3.2 to refer specifically to Article 4.5. Also see response to comments 900 and 901. |

| 6588 | 13 | 39 | 35 | 40 | 13 | In order to remove "implicit cost"(such as preferences, perceived risk and Transaction, Information and research cost) for technology transfer, information sharing based on technologies and experts is essential as a first step. Good example is steel sectoral approach such as APP, GSEP and worldsteel etc.<br><br>Quote>><br>The steel industry's ''voluntary'' sectoral approach for technology transfers and diffusion has been examined based on the bottom-up approach in APP and briefly at the ''worldsteel'' activities (mandatory sectoral benchmark approach and its effect on technologies will be examined in the following section). It is the authors' belief that advancing industry's voluntary sectoral approach supported by governments' policies as stated in (2) above can effectively remove barriers for technology transfer and diffusion. APP is a framework that brings together the public and private sectors, and still a prime example of the voluntary sectoral approach by individual industries. APP has eight task forces, including the steel sector. The eight task forces are cleaner fossil energy, renewable energy and distributed generation, power generation and transmission, steel, aluminum, cement, coal mining, and buildings and appliances. This approach is explained from a practical standpoint followed by an examination of its effectiveness.<br>The APP steel task force has three major activities that are called ''flagship projects'': sharing information on technologies,<br>establishing a common methodology for targets setting and increasing the implementation of technologies. One of the highest priorities is compiling an energy efficiency database using a uniform method for all seven APP member countries. That database provides the foundation for establishing targets<br>and taking measures to secure them. Finally, task force members discuss the methodology for establishing targets that will be ambitious yet open to re-examination as required. In addition, the task force sends experts to, where needed, such as China and India, to help improve energy efficiency. As a result, there have been several concrete cases of technology transfers. Benefits are starting to be seen in the form of technology transfers and other activities. For example, in China, companies are installing equipment based on evaluations made at steelworks about desulfurization technology for sintering exhaust gas and energy saving technologies like CDQ. In this context, technologies have been transferred on a commercial basis. To be specific, actual achievements in APP Steel Task Force, which is basically in the category of voluntary sectoral approach, are in the followings. (1) Sharing information on the energy saving technologies and local environmental technologies in the SOACT handbook has been established. (2) A common evaluation methodology for energy efficiency of steelworks and a common APP 7 nations' database have been established. (3) A common methodology for target setting has been established. (4) A common methodology for expert diagnosis at the site has been established, including pre-study survey sheets, actual site visit and reporting with recommendation to a particular steelworks visited. (5) Some steelworks in China, after diagnosis and recommendation, have already decided to invest energy saving technologies and also denitration technology. Next to the APP is the sectoral voluntary approach of the ''worldsteel''. This approach has four elements: data collection, technology transfers, development of innovative technologies and promotion of eco-product. The fundamental concept is to establish suitable targets for each country's steel sector in the post-Kyoto framework through negotiated agreements with respective governments. The voluntary sectoral approach of the steel industry is very ''flexible and soft'' in comparison to, for example, the | Rejected - too much detail about a particular industry and based to a great extent on work of APP which has been disbanded. |
| 15391 | 13 | 40 | | 41 | | This gets it | Noted - no change needed. |

|---|---|---|---|---|---|---|---|
| 3178 | 13 | 40 | 1 | | | sections 13.9.2 and 13.9.3. For my taste these sections are overly focused on IP and not enough on other fundamentals such as protection of property, sanctity of contracts, etc. There's a ton of practical (and to some degree academic—such as in the int' finance, int'l investment law and some of the international political economy literatures) experience with how these kinds of factors actually drive investment outcomes and diffusion of technology. Somewhere WG3 should deal with that—if not here then (better) in the industry chapter (chapter 10, which is devoid of most real world industrial concerns) or the finance chapter (chapter 16, which is a mess). □ | Taken into account - text revised with sentence and reference added at the beginning of section 13.9.3. Also note that the point is already made in this section including in the second paragraph of 13.9.2.<br><br>Not covered in section 13.11 |
| 6589 | 13 | 40 | 26 | 40 | 31 | Not only pricing on GHG but also following voluntary action should be added. For example, voluntary industry sectoral approach follows 4 steps.<br><br>Quote>><br>Through discussions in this paper, pros and cons in sectoral voluntary approach has become apparent. This approach should be applied as one of the several measures taken to compliment other policies. In view of the fact that there are few studies on this approach, however, the authors have tried to draw readers' and policymakers' attention to the importance of voluntary sectoral approach based on the steel industry's actual experience in various international forums. The success of the approach will depend on the four factors discussed below, which can be applied<br>to other industries.<br><br>First is the sharing of information. Companies must make information about established technologies (best available technologies<br>and best practices) readily available. Accessibility to information about the latest development is also imperative. For example, all companies must follow benchmarks that use common definitions for diffusion ratio, unit energy consumption and other parameters. This category should also include identifying<br>any barriers to the widespread implementation of technologies and determining the potential for reducing CO2 emissions.<br><br>Second is the establishment of challenging numerical targets on a voluntary basis. These targets should include intensity goals as well as goals for the diffusion rate of technologies.<br><br>Third is to utilize communications, especially among experts, promoting more widespread use of technologies to achieve the set targets. For example, engineers from many countries should create a forum to evaluate existing technologies, and to encourage the implementation of more advanced technologies. Model projects could be conducted if necessary.<br><br>Fourth is the setting up and sharing of, a common long-term vision. Companies would need to follow a unified program for developing innovative technologies (such as participation in the ''worldsteel'' CO2 Breakthrough Program).<br><br>The authors would like to add a word about international standardization here. Creating a database is one of the most critical elements of the voluntary industry sectoral approach. This information must be collected using indicators based on a single.<br><br>For citation: Okazaki T, Yamaguchi M (2011). | 9157 | 13 | 41 | 18 | 42 | 16 | M&A is another way of international tech transfer - Indian steel and Chinese wind power/ PV are examples. | Taken into account - text revised to include international M&As |
| 9158 | 13 | 41 | 18 | 42 | 16 | It should be noted that more than half of PV are produced in developing countries. | Rejected - not a necessary addition to |
| 16390 | 13 | 41 | 2 | 41 | 5 | Very relevant here is the OECD's policy framework for green infrastructure investment. See Corfee-Morlot et al (2012, forthcoming), Towards a Green Investment Policy Framework: the Case of Low-carbon Climate-Resilient Infrastructure. Email virginie.marchal@oecd.org for info | Taken into account - reference added. |
| 13597 | 13 | 41 | 21 | | 27 | the literature referenced in Chapter 15 is not exclusive to low carbon -- so wondering if it's also useful to point out some that pertain to clean tech / low carbon (e.g. Dechezleprêtre et al 2010 http://ideas.repec.org/f/pde570.htmland Abdel Latif (2012) in Ockwell and Mallett (eds) 2012 | Rejected - not a necessary addition to the paragraph. |
| 6349 | 13 | 41 | 28 | 41 | 40 | It would be necessary to add bibliographic sources that indicates that IPR might act as a barrier for technology transferin order to provide a balanced view of this very controversial matter. There are literature sources from scholars of some developing countries that supports this view. | Rejected - discussion is already balanced in several paragraphs. |
| 12553 | 13 | 41 | 28 | | | “Stronger” IP may well impede effective technology diffusion for climate response, and there is substantial literature and debate on this point. IP is not a normative continuum from “weak” to “strong.” It requires a balancing of interests. | Rejected - discussion is already balanced. Seems balanced in several paragraphs. |
| 7373 | 13 | 41 | 28 | 41 | 40 | This passage is focused on technology transfer in the context of market transactions. That should be clarified and space given to consider the role of IPRs in non-market-based technology transfer possibilities. | Taken into account - text revised by adding sentence in section 13.9.3.1 at |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 4004 | 13 | 41 | 9 | 42 | 16 | Without having any empirical proof at hand, I am convinced that the underlying thesis of the authors is correct that strong IP protection increases technology transfer, whereby strong IP protection in my view as a patent law expert contists particularly of two aspects: a) a patent prosecution system allowing foreigners to apply for patents and to register patents under internationally harmonized and clear conditions, and, b) a strong system to forbid patent infringements effectively and quickly. Both aspects are the basis of strong IP protection in any country.<br><br>One of the treaties administered by WIPO is the PCT (Patent Cooperation Treaty) which supports applicants to extend their (national) patent applications to all countries which are members of the PCT. The Paris Convention is another treaty which goes beyond this and laid down several principals in patent law the member states agreed to comply with.<br><br>I also support the idea that the link between strong IP protection and licenses may be stronger than strong the link between IP protection and exports, as licensing typically, at least very often, is accompanied by the provision of know how which is necessary or helpful to distribute the licensed products by licensee in its country.<br><br>However, as it is up to the patent owners, if there is a technology transfer by R&D agreements, by (cross-)licensing agreements or cooperations, it is up to the international community to find incentives for patent owners to share their knowledge. Compulsory licenses will in most cases not be a solution. They can be a solution, if the inventors manage to implement an invention as standard specification and if the law (typically jurisdiction) confirms that there is a right for a compulsory license, however such right will never be for free. | Noted - no change needed. |
| 14255 | 13 | 41 | | | | One may here discuss the important relationship between IP-agreements (TRIPS) and the ideal design of climate agreements, since they are both influencing the incentive to develop new technology (e.g., I discuss this relationship in a recent working paper, Harstad, Bård, 2012, "The dynamics of climate agreements"). | Taken into account - point is already made in section 13.8 and cross reference to 13.8 has been added in 13.9.3.2 at end of first para, but |
| 11664 | 13 | 41 | | | | The relationship between IPRs and technology transfers also depends on the characteristics of industries, products and technologies. For example, Ivus (2010) groups industries into patent-sensitive and insensitive to examine the impacts of stronger IPRs on exports. Reference: Ivus, O. (2010) Do stronger patent rights raise high-tech exports to the developing world? Journal of International Economics, 81(1), pp.38-47 | Taken into account - text revised by adding sentence and reference at end of 1st para in section 13.9.3. |
| 11144 | 13 | 41 | 14 | 41 | 16 | This paragraph appears to draw an unreferenced conclusion (use of word "impediment") prior to the discussion of IPR in section below. | Rejected - point is addressed in other sections of the chapter. |
| 7509 | 13 | 41 | 6 | 42 | 31 | Climate-friendly technologies are often energy efficient technologies naturally with profit in industry field. Proper IP protection is indispensable to accelerate climate-friendly technology. A lot of energy efficient technologies were tranfered to developing countries and imitated. | Noted - no change needed. |

|---|---|---|---|---|---|---|---|
| 7001 | 13 | 41 | | | | Patents promote technological development, but as you know they also limit the use of new technologies by setting price above marginal cost. I am aware of no theorem supporting the view that patent arrangements should be harmonized. The extension of the patent system (as under TRIPS) may stimulate some new technological development, but it will also have redistributive effects, with no advantages for efficiency (much of this investment in R&D would have occurred with more limited patent protection). There should be some mention of approaches like “prizes,” which promote R&D without granting patent protection. These require that the goal of technological development be pre-specified—a clear weakness. However, they also allow new technologies to be sold at marginal cost (assuming competitive markets, of course), helping to spread the new technologies. This is especially important if R&D into new energy technologies is aimed at providing the global public good of climate change mitigation. We want these technologies to spread. | Taken into account - text revised by adding paragraph at the end of 13.9.3.1. |
| 11468 | 13 | 41 | | 41 | | The section on IPRs makes a case stating that stronger IP protection fosters exports, FDI and technology licensing to middle income countries. This section (in page 42, line 10) also states that “IP protection has elicited innovation without significantly impeding technology transfer, although problems could arise if new, very broad patents were granted that impede the development of future, more efficient technologies.” In stressing that stronger IP protection could foster technology transfer, the section completely disregards other studies that have highlighted the barriers that IPRs pose to technology transfer. Examples of such studies are Martin Khor, Climate Change, Technology and Intellectual Property Rights: Context and Recent Negotiations (Research Paper 45, South Centre, June 2012) and Carlos Correa, Mechanisms in International Cooperation in Research and Development: Lessons for the Context of Climate Change (Research Paper 43, South Centre, March 2012) | Taken into account - text revision in response to comment 877 (i.e. new paragraph added at end of 13.9.3.1 ) is also responsive to this comment - but suggested references in the comment are not in refereed soruce. |
| 4637 | 13 | 41 | 18 | 41 | 21 | Add the following phrase after the words "GHG-reducing technologies": Apart from the intellectual property regime remedying the problem of public goods, producers of innovative products can internalize some of the benefits of their research efforts by requiring purchasers to enter into long term contracts and licensing agreements that prohibit reproduction of the product and dissemination of information embodied in the product. | Taken into account - text revised to include suggested sentence. |
| 6805 | 13 | 41 | 18 | 41 | 21 | Add the following phrase after the words "GHG-reducing technologies": Apart from the intellectual property regime remedying the problem of public goods, producers of innovative products can internalize some of the benefits of their research efforts by requiring purchasers to enter into long term contracts and licensing agreements that prohibit reproduction of the product and dissemination of information embodied in the product. | Taken into account - text revised to include suggested sentence. |
| 7789 | 13 | 42 | 17 | | 25 | In addition to the current description on the options which contribute to technology transfer, also address that international public-private partnership by sector played an important role for technology transfer.<br>(Okazaki and Yamaguchi, “Accelerating the transfer and diffusion of energy saving technologies -steel sector experience-lesson learned. Energy Policy 39,pp.1296-1304, 2011) | Taken into account - text revised and reference added |
| 8774 | 13 | 42 | 18 | 42 | 31 | There is extensive analysis of the contribution of the CDM to technology transfer. Most analyses are based on statements in the project documents. Technology Transfer and the<br>Clean Development Mechanism (CDM), Erik Haites, Grant A. Kirkman, Kevin Murphy and Stephen Seres, Chapter 9 of Ockwell and Mallett, eds., Low-Carbon Technology Transfer, Routledge, 2012 is the mosrt recent publication, but an updated paper will appear in a special issue of Climate Policy on technology transfer in 2013.<br>A second approach is to use duplicate papetnts as a measure of technology transfer via all channels and then test whether CDM makes a significant contribution. Hascic and Johnstone, CDM and international technology transfer: empirical evidence on wind power, Climate Policy, v. 11, n. 6, 2011, pp. 1303-1314 applies that approach. | Taken into account - reference added to 13.13. |
| 6121 | 13 | 42 | 25 | 42 | 25 | After "World Bank, 2008a)", add the following sentence. "It is also noteworthy that international public private partnership by sector played an important role for technology transfer (Okazaki and Yamaguchi 2011)". For citatione purpose, refer to Okazaki T, Yamaguchi M (2011) Accelerating the transfer and diffusion of energy-saving technologies steel sector experience – lesson learned. |---|---|---|---|---|---|---|---|
| 4005 | 13 | 42 | 8 | 42 | 12 | I would like to emphasize that there might of course be problems in further technical development, if there is a key patent which cannot be bypassed. However, international patent law provides for the application of "dependent" patents, which openly admit that the key technology must be used, but, however, can comprise additional features for the technical development, which might make the key invention even more valuable. Very brought patents as mentioned in line 11 are typically reduced to a significantly smaller scope once it comes to discussions on the validity of such patents within annullity actions or infringement cases. Thus, this wording is, in my eyes, a bit too general. | Taken into account - text revised by adding phrase to clarify distinction in comment. |
| 11105 | 13 | 42 | 8 | | | (1) Please explain the reason whty research on IP's role in climate-friendly technologies is limited. To my understanding, it is because most of the related studies, including Barton (2007) cited in this section, only analyze selected cases qualitatively and do not provide quantitative econometric evidence.<br>(2) In addtion to Barton 2007, it may be useful to mention other studies and categorize them into three (a)studies that implies that IPRs are not significant barrier on technology transfer (Barton 2007, Copenhagen Economics 2009, Lewis 2007, Ueno 2009), (b) studies that implies that IPRs actually or potentially prevent technology transfer (South Centre 2009, Ockwell 2008), (c) studies that says it is inconclusive whether IPRs prevent technology transfer (UNEP/EPO/ICTSD 2010). Full citations are as follows:<br>Copenhagen Economics (2009). Are IPR a barrier to the transfer of climate change technology?, Copenhagen: Copenhagen Economics.<br>Lewis J. (2007). Technology Acquisition and Innovation in Developing World: Wind Turbine Development in China and India. Studies in Comparative International Development 42, 208-232.<br>Ueno T. (2009). Technology Transfer to China to Address Climate Change Mitigation. Resources for the Future Issue Brief 09-09. Available at: http://www.rff.org/RFF/Documents/RFF-IB-09-09.pdf.<br>South Centre (2009). Accelerating Climate-friendly Technology Innovation andn Transfer to Developing Countries: Using TRIPS Flexibilities under the UNFCCC. SC/IAKP/AN/ENV/1, Geneva, Switzerland: South Centre.<br>Ockwell D. (2008). UK-India Collaboration to Overcome Barriers to the Transfer of Low Carbon Energy Technology: Phase 2, Intellectual Property Rights and Low Carbon Technology Transfer to Developing Countries - A Review of the Evidence to Date.<br>UNEP, EPO, and ICTSD (2010), “Patents and clean energy: Bridging the gap between evidence and policy,” UNEP, EPO, and ICTSD. | Taken into account - text revised by adding clarifying phrase and adding three refereed journal articles. |
| 7413 | 13 | 42 | 17 | 42 | 31 | Also cite literature arguing that strict enforcement of IP policies creates a barrier to technology transfer to developing countries by increasing the cost of licensing . | Taken into account - text revision in response to comments 877 and 878 (i.e. new paragraph added at end of 13.9.3.1 |
| 16049 | 13 | 42 | 18 | 42 | 31 | need to elaborate more on technology transfer under the UNFCCC, incl. the current status of TT, the gap and means of bridging the gap. | Taken into account - text revised by adding sentence at end of 13.9.3.2 and |
| 17678 | 13 | 42 | 31 | | | After this section, I missed some evaluation: Are the 6 bio. US-$ enough? What else is needed for effective technology transfer? | Taken into account - text revised by adding sentence at end of 13.9.3.2 and |
| 13600 | 13 | 43 | | | | wondering if it would be helpful to flag the difficulty in trying to measure innovation / that R&D is still considered to be a key metric in which to do so | Noted. Innovation and R&D are relevant but not for this chapter. The comment is suggested to be sent to Chapter 5 or |
| 10216 | 13 | 43 | 18 | 43 | 20 | Was that goal reached? | Taken into account - text revised to include actual amount achieved relative |
| 8198 | 13 | 43 | 34 | 43 | 36 | Why is capacity building only useful to developing countries? | Accepted - text revised. |
| 13648 | 13 | 43 | 34 | | | This section ignores the potential for institution and capacity building for price based measures. For example, countries with solid tax administration measures could assist other countries in adopting exise taxes on carbon. Likewise there are bilaterals on the development of cap and trade measures. | Rejected - outside the scope of this chapter. The focus here is not on the capacity building for a specific |

|---|---|---|---|---|---|---|---|
| 6350 | 13 | 43 | 35 | 43 | 39 | This sentence is not exact. Indeed, Article 10e of the Kyoto Protocol mentions explicitly "national capacity building". More important, although the Climate Convention does not mention explicitly capacity building, articles 4.1 (i) and Article 6 address education and training that are constitutive elements of capacity building. These articles also set the grounds for the further elaboration of capacity building in COP decisions, including the Marrakech accords. (Marrakech accords are part of the many decision adopted by the Parties in the UNFCCC and not something independient). | Accepted - text revised and combined with comments #908-912. |
| 4977 | 13 | 43 | 36 | | 39 | As a matter of fact: already UNFCCC: Art. 4.5 "support the development and enhancement of endogenous capacities", KP Art. 11/1 endorsing that provision. These were the initial general sources of reference for c.b.; there were two more specific areas, namely, for observations-research and education-awareness (that is the Art.10.e of KP). That is true that the Marrakech Accords introduced the details for addressing with this item. | Accepted - text revised and combined with comments #908-912. |
| 7136 | 13 | 43 | 36 | 43 | 37 | Convention do mention capacity building under the functions of the SBSTA, see Article 9 2.d | Accepted - text revised and combined with comments #908-912. |
| 16954 | 13 | 43 | 37 | | | I thought that both UNFCCC and Kyoto contained substantial articles and processes that could only be interpreted as “capacity building”?<br>IN this broad area, an important source of analysis of industry internaitonal flows and policy options are the Carbon Trust reports, Tackling Carbon Leakage: specific approaches in a world of unequal carbon prices (2010); and Global Carbon Flows (2011). The former suggests an evolutionary approach to international strategy that delineates in part along sectoral lines. □ | Accepted - text revised and combined with comments #908-912. |
| 12554 | 13 | 43 | 37 | | | The claim is made here that capacity building is not referred to in the UNFCCC or Kyoto Protocol. Article 9(2)(d) of the UNFCCC provides that the Subsidiary Body on Scientific and Technological Advice (SBSTA) shall “Provide advice ... on ways and means of supporting endogenous capacity-building in developing countries.” In the Kyoto Protocol, Article 10(b)(2) provides that non-Annex I Parties “shall seek to include in their national communications, as appropriate, information on programmes which contain measures that the Party believes contribute to addressing climate change and its adverse impacts, including the abatement of increases in greenhouse gas emissions, and enhancement of and removals by sinks, capacity building and adaptation measures.” Section 10(e) provides that all Parties shall “[c]ooperate in and promote at the international level, and, where appropriate, using existing bodies, the development and implementation of education and training programmes, including the strengthening of national capacity building, in particular human and institutional capacities and the exchange or secondment of personnel to train experts in this field, in particular for developing countries, and facilitate at the national level public awareness of, and public access to information on, climate change. Suitable modalities should be developed to implement these activities through the relevant bodies of the Convention, taking into account Article 6 of the Convention.” The extensive inclusion of programmatic work on capacity building in the Bali Action Plan and subsequent decisions was not therefore plucked out of thin air as the current draft language implies. | Accepted - text revised and combined with comments #908-912. |
| 6351 | 13 | 43 | 40 | 43 | 45 | The statements of this paragraph are not supported by any bibliographic cite. | Taken into account - additional references incorporated throughout |
| 11577 | 13 | 43 | 40 | 43 | 45 | Reference to chapter 4 about response capacity. | Accepted - text revised. |
| 10957 | 13 | 43 | 11 | 43 | 33 | Confer: Torvanger and Meadowcroft (2011), The political economy of technology support: Making decisions about carbon capture and storage and low carbon energy technologies, Global Environmental Change, 21(2), 303-312. Confer also: Fischer, Torvanger, Shrivastava, Sterner, Stigson (2012), How should support for climate-friendly technologies be designed?, Ambio, 41(Suppl. 1), 33-45. | Taken into account - text revised and references added at end of 13.9.4.2 end of 1st paragraph. |

|---|---|---|---|---|---|---|---|
| 8199 | 13 | 44 | 18 | 44 | 19 | "capacity-building agents know what works": I doubt that this is always true. | Accepted - text revised by introducing the original sentence in the reference |
| 6353 | 13 | 44 | 2 | 44 | 3 | The statement summarizing the views of Armitage, 2005; J.Barnett, 2008) needs to be exapanded. As it stands now is contradictory and does not provide information to the reader to understand the | Noted - Section 10 has been heavily revised, but this specific revision will be |
| 11470 | 13 | 44 | 25 | 44 | 25 | The assertion that the "climate regime provided capacity-building support to create an enabling environment …" is not supported by any empirical evidence or studies. In the context of the UNFCCC negotiations in relation to climate change actions-related capacity-building, there continues to be multilateral consensus among UNFCCC Parties that "gaps still remain in addressing the priority issues identified in the framework for capacity building in developing countries as contained in decision 2/CP.7" (see UNFCCC COP decision 13/CP.17) – i.e. that the support for capacity building provided by Annex II Parties continues to fall far short of what the expressed needs for capacity building are under the UNFCCC. | Accepted - text revised. |
| 6354 | 13 | 44 | 26 | 44 | 29 | The process of developing and implementing NAPAs by LDC and the preparation of national communications of developing countries supported by the Consultative Group of Experts from have been very important in enhancing capacity building on adaptation and mitigation in developing coutries. Consider to mention these two element that have been more instrumental in enhancing capacity building in developing countries. | Accepted - text revised for the first case. However, reference papers on the preparation of national communications of developing countries supported by the |
| 10217 | 13 | 44 | 29 | 44 | 32 | "require patience" is mentioned twice in this sentence | Accepted - text revised. |
| 6355 | 13 | 44 | 33 | 44 | 34 | Capacity building for REDD+ has also been important in supporting mitigation. | Accepted - text revised. |
| 4978 | 13 | 44 | 33 | | | It did not solely focused on CDM, but e.g. also to assist to monitor the ghg-emissions at national level, to develop national mitigation policies (lately the NAMAs, as already correctly referred to at the end of this para.). | Accepted - text revised. |
| 16391 | 13 | 44 | 33 | 44 | 34 | It could be argued that capacity building has focused on much more than setting up DNAs. Notably World Bank initiatives such as Carbon Market Dialogue but also many developed country initaitves working on emissions inventories, specific emissions factors in developing countries, devleoping robust national baseline scenarios (eg search for Danish Energy Agency baselines workstream) | Accepted - text revised. The World Bank's role has been referenced. However, refercenced papers on developed country initiatives on |
| 5688 | 13 | 44 | 1 | 44 | 8 | I do not see the connection between the social change theory discussed in this paragraph and any capacity-building designed to address climate change. In addition, the paragraph is very confusing. It seems to be referring to development aid, and suggests that such aid (1) cannot be expected accomplish development; and (2) can be effective under certain conditions. But what is the measure of development aid effectiveness, if not development? How is this relevant to aid targeted at climate change mitigation or adaptation? | Taken into account - Section 10 heavily revised |
| 5689 | 13 | 44 | 9 | 44 | 23 | Similar to lines 1-8, this paragraph just does not make sense here. By definition, investments in capacity-building for climate mitigation or adaptation would have an externally-imposed goal -- climate mitigation or adaptation. How would one operationalize "collective reflection, struggle and engagement with power relations" with respect to these goals? | Accepted - text revised by adding two explanation sentences in the papagraph, one at the top and one at the end, to facilitate understanding the meaning of |
| 16241 | 13 | 44 | 32 | | | Suggest adding the following two sentences at end of paragraph: "The most important source of multilateral funding for adaptation is the Global Environment Facility. Donations to its adaptation funds have been insufficient and, in general, demand for adaptation financing far exceeds the supply (Global , 2010, p. 89). The situation should improve with the newer Adaptation Fund, which is financed mainly by a tax on certified emission reduction credits generated under the CDM." Reference is to: GEF (2010). OPS4: Progress toward Impact. Global Environment Facility Evaluation Office, Washington, D.C. Available at http://www.thegef.org/gef/OPS4. | Noted. This section is on capacity building issue within the climate regime context. However, the comment is on financial issue and beyond the scope of this section. Therefore, it is suggested that this comment be sent to Chapter 16 |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 17096 | 13 | 45 | | | | the statement "international cooperation has brought about political agreement on limiting global temperature increase to no more than 2 degrees C above pre-industrial levels" is not factually correct. The Cancun Agreement specified that this will be achieved in conjunction with equitable access to sustaianble development. Ignoring the equity dimension of the negotiations around international cooperation is a serious gap in this chapter and affects other sections also. The differnt approaches in terms of burden sharing and resource sharing need to be specified. Please see my articles in 'Climate and Development' and 'Climate Policy'. | Taken into account - text has been completely restructured |
| 2170 | 13 | 45 | 11ff | | | Mabe some distinction could be made between Green Climate Fund (GCF) and the 100bn USD pledge (Cancun). At least it should be better explained how GCF and 100 bn USD pledge are related (and that they differ). | Taken into account - GCF now covered in section 13.11.1 .1 on UNFCCC-related vehicles, while 100 billion is |
| 8775 | 13 | 45 | 12 | 45 | 17 | Buchner, B., Falconer, A., Hervé-Mignucci, M., Trabacchi, C., Brinkman, M. (2011a) The Landscape of Climate Finance, A CPI Report, 27 October 2011 provides an essential overview of current climate finance. | Accepted - now cited in the intrduction (albeit full coverage only in Ch. 16.2.2.2) |
| 4980 | 13 | 45 | 20 | | | {Add} "Financial support is provided {}primarily to developing countries under .. ~ some GEF and SCCF sources can also directed to EiTs (and indeed there were quite a few such GEF-funded projects). | Accepted, - countries in transition now mentioned as possible recipients in |
| 8776 | 13 | 45 | 20 | 45 | 30 | Climate finance has no agreed definition, either overall or under the UNFCCC. Buchner et al estimate current climate finance at $97 billion per year. Under the UNFCCC Annex II Parties can provide finance through bilateral and multilateral channels. The last summary (UNFCCC, 2011) of Annex II reports of climate finance provided for the 6 years from 2005 through 2010 totalled $58.4 billion, an average of just under $10 billion per year. The funds mentioned in this paragraph are operating entities of the financial mechanism of the UNFCCC. The funds disbursed by those entities is less than $1 billion per year. In short climate finance under the UNFCCC is about 10% of total climate finance and climate finance channeled through the operating entities of the UNFCCC is less than 1% of total climate finance. | Taken into account - literature on definition of climate finance now cited. Numerical estimates of climate finance are covered in Ch. 16.2.2.2. |
| 2172 | 13 | 45 | 21 | 22 | | Maybe there should also be an explanation about the "development" aspects of SCCF and LDCF. | Rejected - discussion at this level of detail would blow up the text beyond the |
| 2171 | 13 | 45 | 25 | | | I suggest replacing "focusing on mitigation" by "focusing on global benefit augmentation". The GEF funding has global benefit orientation but is not only dedicated to climate but also to other fields (biodiversity etc.). | Taken into account - text has been fully restructured |
| 13193 | 13 | 45 | 28 | | | I suggest removing all the text after "Cancun" (line 28) and include the following: "…Cancun and launched at COP-17 in Durban. The GCF is linked to the commitment by developed countries to jointly mobilise $100 billion per year by 2020. At present, the Fund is preparing to begin operations. Together with the long term financing commitment, developed countries also committed to provide new and additional resources through existing international institutions, approaching $30 billion for the period 2010-2012. This short term pledge is known as “Fast-Start Finance”. | Taken into account - FSF and 100 billion now mentioned in introduction to section 13.11.1 |
| 7378 | 13 | 45 | 28 | 35 | 30 | In referencing "fast start financing" it would be useful to be explicit to the extent to which that represented "repackaged" ODA rather than new finance, as was detailed in the ACPC report of 2011, http://new.uneca.org/Portals/acpc/documents/Fast-Start-Finance-lessons-for-long-term-climate-finance-under-UNFCCC.pdf | Taken into account - question of new and additional covered in introduction to 13.11 |
| 6050 | 13 | 45 | 37 | 45 | 45 | It would nice to see something like this in the previous section. | Rejected - due to lack of clarity |
| 6356 | 13 | 45 | 38 | 45 | 38 | Delegated by whom? Not clear the meaning of the cited statement. | Taken into account - problematic text |
| 4979 | 13 | 45 | 4 | | | There was a rather significant multiyear program reaching very many countries by GEF addressing the national institutional capacities for the "Rio Conventions": "National capacity self-assessment for global environmental management (NCSA)" | Noted - discussion of the GEF in Section 11 has been revised |
| 6357 | 13 | 45 | 43 | 45 | 48 | This cited statement needs to be expanded. It is not clear for the readers the reasons behind. | Taken into account - text moved into section 13.11.2 on private finance and linked toquestion whether public |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 13928 | 13 | 45 | | 47 | | This section should emphasis the necessity 1) to analyse the impacts of financing decisions, 2) to reallocate budget and redirect investments (instead of looking for new money). See for example for transportation sector Sakamoto, K., Dalkman, H., Palmer, D., 2010, A paradigm shift towards sustainable low-carbon transport. Financing the vision ASAP, ITDP | Rejected - section 13.11 does only look at international collaboration for financing, not the sector-specific impacts. These are discussed in |
| 10820 | 13 | 45 | | | | Somewhere in this section it would seem to be important to have a discussion on the tricky concept of financial additionality, the demand from some countries that climate finance not represent a deviation of funds fromd development expenditures, and the tricky conceptual and implementation issues this poses. | Taken into account - Stadelmann et al. (2011) discussion on baseline definition quoted in the introduction, and |
| 16392 | 13 | 45 | | | | This section is very important and deserves to be beefed-up and made more comprehensive. I would bring current section 13.11.4 right to the front - that is the crux of the issue, notably the important role of private sector capital, and how to leverage it effectively with public funds. A good reference to introduce the section could be Buchner et al. (2011), The Landscape of Climate Finance http://climatepolicyinitiative.org/wp-content/uploads/2011/10/The-Landscape-of-Climate-Finance-120120.pdf . In general would be good to highlight when you are talking about finance (structures to provide funding for upfront capital etc) and when you mean funding (the money flow itself). See my specific comments on subsections that follow | Taken into account - section deleted and relevant material shifted into the introduction. Buchner (2012) now cited, but the full coverage of that report is now in Ch 16.2.2.2 - thus not duplicated here. |
| 13930 | 13 | 45 | 11 | 47 | 39 | This section should mention the emergence of carbon markets at the local level (Local Emission Trading Schemes) and their links with regional carbon markets. See Kolher, G., Lefevre, B., 2011, Cities and Emission Trading Schemes, A comparative analysis, jointly, International Journal of Global Energy Issues, special issue "Carbon Markets: An International Perspective", vol 35, n°2/3/4 | Rejected - the reference is not relevant for international finance. It may be relevant for Ch. 15 |
| 12816 | 13 | 45 | 11 | | | The structure of subsection 13.11 is not clear because different dimensions of structuring the issue are used: subsections 13.11.1 and 13.11.2 refer to multilateral vs. bilateral climate finance while 13.11.3 refers to private sources of finance; lastly, subsection 13.11.4 provides a general overview about public and private finance of mitigation and adaptation. It would be better to follow a general structure (public vs. private flows), and create further subsections which deal with, e.g. bilateral vs. multilateral public sources. The structural relationship of subsection 13.11.4 is to be determined. As it provides an overview of public and private sources it might serve as an introductive part, i.e. at the beginning of 13.11 or 13.11.1. | Accepted - section now restructured into subsections on public and private flows, and text substantially rearranged. |
| 15665 | 13 | 45 | 12 | | 17 | The discussion of financing in the context of international cooperation would benefit from significantly elaborating the theoretical justifications for providing finance. Finance may not only create direct benefits (e.g. via low-cost mitigation in areas not suitable to market-based mechanisms) but may also create indirect benefits through generating trust in negotiations. Mitigation and adaptation finance show important differences in this regard, particularly due to their characteristics as global and primarily local / regional public goods respectively. For more on these issues see: Rübbelke, D.T.G. 2011. International Support of Climate Change Policies in Developing Countries: Strategic, Moral and Fairness Aspects. Ecological Economics 70 (8):1470-80. Indeed given the emphasis of the chapter it may make sense to focus this section (13.11) primarily on the role of finance in the context of broader international cooperation, and leave detailed discussion of funding arrangements to Chapter 16, in order to avoid overlap. | Taken into account - Reference Abadie et al. (2012) quoted regarding bias towards mitigation. Reference Rübbelke (2012) regarding adaptation financing should be covered in Working Group II.. |
| 16393 | 13 | 45 | | | | Would be good to see a fuller discussion of the GCF, higher up in the paragraph. It is likely to be much more important than the LDCF etc. Would be good to mention here too the $100bn commitment under the UNFCCC, and the difficulties with measuring and tracking progress (see Clapp et al (2012) Tracking climate finance: what and how, http://www.oecd.org/env/climatechange/50314405.pdf ). | Taken into account - 100 billion commitment now mentioned in Intro to section 13.11.1. So far no peer-reviwed literature on GCF performance exists. |
| 11471 | 13 | 45 | | 45 | | The treaty commitment of Annex II Parties to provide financing to developing countries pursuant to Art. 4.3 of the UNFCCC is completely ignored in this section, notwithstanding that such treaty commitment is the underlying multilateral policy regime basis for climate finance to take place. | Taken into account - this commitment has never been operationalized. Voluntary financing to the different |
| 17679 | 13 | 45 | 30 | | | After this section, I missed some evaluation: Was the money for the fast start finance really delivered? Was it additional? See e.g. BNEF – Bloomberg New Energy Finance (2011): Have Developed Nations Broken Their Promise on $30bn ‚Fast-Start' Finance? Bloomberg New Energy Finance White Paper. London: BNEF. | Rejected - this is covered in Ch. 16.2.2.2. However, emerging literature should be watched. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 14997 | 13 | 45 | 31 | | | This or the following section should address the World Bank's Forest Carbon Partnership Facility, which is emerging as a major locus of activity and potential funding for building capacity for implementing REDD+ strategies as well as consensus around key elements of those strategies. | Rejected - discussion at this level of detail would blow up the text beyond the allotted page volume. |
| 11594 | 13 | 46 | 1 | 46 | 35 | There should be a discussion on direct access and countries setting up insitutions to deal with climate funds | Taken into account - Section 13.11.1.1 mentions direct access |
| 6352 | 13 | 46 | 18 | 46 | 18 | This statement is valid for the Adaptation Fund only. The GEF Council does not have majority of developing countries members. | Accepted - text corrected |
| 4981 | 13 | 46 | 18 | | | GEF Council: of the 32 members 16 repr. developing countries (32=16+14+2 where 2 are from EiTs) | Accepted - text corrected |
| 15667 | 13 | 46 | 18 | | | The role of developing countries in GEF governance is not directly comparable to that under the Adaptation Fund. Whereas under the AF developing countries have an absolute majority, under the GEF developing countries have an equal number of seats (16) to the combination of "developed countries" (14) and "economies in transition" (2). Under the Green Climate Fund, economies in transition such as Russia, Poland, Hungary and the Czech Republic are classed as "developed countries", suggesting that the balance of representation under the GEF is more like the GCF than the AF. | Accepted - text corrected |
| 2173 | 13 | 46 | 25ff | | | The size of the funds (AF, LDCF, SCCF) should be stated in order to put them into perspective (against the recent funding pledges (Cancun). | Taken into account: Ch. 16.2.2.2 lists the current size of the funds |
| 15668 | 13 | 46 | 37 | | | The text could clarify that ODA is not just provided through bilateral channels, but may also be provided through multilateral channels. Indeed most of the multilateral channels referred to in the previous section (with the exception of the Adaptation Fund) are largely ODA-funded. Therefore any concerns about additionality would likewise apply to multilateral channels to the extent that they are ODA-funded. | Noted - Section 11 has been heavily revised. |
| 12555 | 13 | 46 | 40 | | | A useful reference is Robert L. Hicks, Bradley C. Parks, J. Timmons Roberts, and Michael J. Tierney, 2006. Greening Aid? Understanding the Environmental Impact of Development Assistance, Oxford University Press. | Taken into account - text on bilateral aid flows has been deleted, issue is covered in Ch. 16 .6.2.3 (albeit not with that |
| 2174 | 13 | 46 | 41 | | | With respect to the level of aid flows (mitigation) official data might be a better source?!? Or does such a source not exist (I am uncertain in this point)? | Taken into account - text on bilateral aid flows has been deleted, issue is covered |
| 15669 | 13 | 46 | 43 | | 46 | The concern about diversion of ODA is presented in a somewhat simplistic fashion. In principle it would be possible to avoid diversion as long as climate-related ODA is 'additional' to a business as usual level of ODA. Part of the difficulty is that it is practically complex to develop an accurate baseline. This is an area of public debate that is frequently muddied, and there is an opportunity for the IPCC to clarify these issues. For a nuanced discussion see: Stadelmann, M., J.T. Roberts, and A. Michaelowa. 2011. New and Additional to What? Assessing Options for Baselines to Assess Climate Finance Pledges. Climate and Development 3 (3):175-92. | Accepted- reference inserted in introduction |
| 8200 | 13 | 46 | 8 | 46 | 8 | There are formulaic approaches to allocation other than "performance based allocation". | Taken into account - Actual allocation modes of GEF and AF explained in |
| 15666 | 13 | 46 | 8 | | | Allocation of public finance may be "formulaic" without being "performance-based", e.g. if adaptation finance is allocated on the basis of a formula for vulnerability. | Taken into account - Actual allocation modes of GEF and AF explained in |
| 13194 | 13 | 46 | | | | I suggest incorporating in this Section some information about the Standing Committee, since it is another key financial outcome of the COP-16 | Rejected - discussion at this level of detail would blow up the text beyond the |
| 14998 | 13 | 46 | 1 | | | This and/or the preceding section should address the World Bank's Forest Carbon Partnership Facility, which is emerging as a major locus of activity and potential funding for building capacity for implementing REDD+ strategies as well as consensus around key elements of those strategies. The FCPF is distinctive for a decisionmaking body that includes strong representation from countries receiving funds as well as from the donors. | Rejected - discussion at this level of detail would blow up the text beyond the allotted page volume. |

|---|---|---|---|---|---|---|---|
| 11472 | 13 | 46 | | 46 | | The section relating to bilateral climate finance conflates ODA with the required climate finance under Art. 4.3 of the UNFCCC. In doing so, such section reflects the practice of developed countries even if such practice is not consistent with the multilateral consensus that climate finance must be “new and additional” (see e.g. paragraphs 18, 95, 97 of COP decision 1/CP.16 and paragraph 59, and paragraphs 13 and 18(f) of Annex I, of COP decision 2/CP.17) | Taken into account - Section 13.11.1.1 addressed diversion of ODA. |
| 14999 | 13 | 46 | 36 | | | This chapter and/or chapter 16 should include discussion of the major bilateral commitments that some countries have made to climate mitigation. Norway's contributions to Brazil's Amazon Fund and to Indonesia to support REDD+ activities stand out in this regard as cases where a major bilateral investment is supporting significant mitigation activity and stimulating the development of climate mitigation policy and practice across an entire sector. | Taken into account - these aspects are covered in Ch. 16, as Ch. 13 will only cover fully international collaboration. |
| 12818 | 13 | 47 | 18 | 47 | 35 | The sentence of p. 35 ll. 18f. is repeated verbally on the same page l. 35. This might have happened because section 13.11 is not clearly structured and can be part of both subsections 13.11.3.2 (private sector flows) as well as 13.11.4 (sources of finance of mitigation and adaptation). Section 13.11 should be restructured as proposed in a previous comment. | Taken into account - text substantially restructured |
| 8777 | 13 | 47 | 2 | 47 | 14 | The revenue generated by the sale of CERs is estimated using the quantity of CERs transferred from the CDM registry - transferred to the buyer - and information on CER prices. Over 750 million CERs had been transferred from the CDM registry by the end of 2011. This was over 92 per cent of the CERs issued over the same period. The total revenue from the sale of CERs is at least $9.5 billion (primary market prices) and could be as high as $13.5 billion (secondary market prices). | Taken into account - numerical information on different instruments is covered in Ch. 16.2.2.2 |
| 10821 | 13 | 47 | 22 | 47 | 25 | This discussion of export credit agencies needs a sentence or two more to show how significant these agencies are to the landscape of finance, and the challenges of governing them and coordinating their functioning. Since AR4 the new challenge is the rise of ECAs outside the OECD, and therefore outside the OECD's Export Credit Arrangement, the existing governing mechanism. See Christopher Wright, Export Credit Agencies and Global Energy. Vol 2, special issue (September 2011). | Taken into account - ECAs are not an issue of international collaboration. Therefore, text has been deleted. |
| 8201 | 13 | 47 | 25 | 47 | 25 | Not everyone agrees that MBD efforts lack legitimacy. I would write "some argue…" | Taken into account - text has been |
| 18244 | 13 | 47 | 41 | | | “international responses to climate change depend on private sector action”, can have prescriptive interpretation. International response to climate change is part of a global effort of States within the framework of an international instrument, the United Nations Framework Convention on Climate Change (CMNUCC), and the international response will depend of the fulfillment of responsibilities and obligations established in this instrument, particularly the commitments of the Parties which are an Annex of the Convention. | Taken into account - text has been substantially rephrased. |
| 18021 | 13 | 47 | 41 | | | The reference that “international response to climate change depend on private sector again” is not consistent with the international agreement as well as the reality. | Taken into account - text has been substantially rephrased. |
| 18020 | 13 | 47 | 41 | 47 | 41 | Incorrect statements regarding the UNFCCC ‘s status. UNFCCC is widely recognized as the primary multilateral institution and center channel for climate negotiation as well as major forum for international cooperation. | [draft single response will be made in line for comment #983] |
| 16395 | 13 | 47 | 41 | 48 | 11 | This intro para is written as though the private sector are enemies of the climate "regime". Would be better to reprhase this in terms of economic incentives - the private sector recognises and responds to long-term trends in regulatory changes, as well as short-term regulatory requirements. | Taken into account - text has been substantially rephrased. |
| 11474 | 13 | 47 | 41 | 47 | 41 | The statement that “international responses to climate change depend on private sector again” implicitly shifts the legal obligation to spur climate change action away from States (where such obligation is currently located under the UNFCCC) to non-State actors. This could create questions of legal and policy accountability, considering that the locus of such obligations would then become diffused given the large number of private sector actors. It furthermore disregards the essential role that State regulation can play in terms of shaping private sector actions and activities. | Taken into account - text has been substantially rephrased. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 8202 | 13 | 47 | 43 | 47 | 44 | "private companies will generate most of the investment…." Not obvious that this is true given the large role of SOEs in some major emitters. | Taken into account - text has been substantially rephrased. |
| 6358 | 13 | 47 | 9 | 47 | 14 | The reference supporting this statement is missing. | Accepted - taxt deleted |
| 12817 | 13 | 47 | | | | There is little message, here. In case you have to shorten the chapter, you may find potential, here. | Accepted- text shortened significantly |
| 16394 | 13 | 47 | | | | This section would benefit from restructuring and expanding: call it Private sector finance. Market mechanisms should just feature as one mechanism governments have used to increase private sector action, rather than appearing on an equal footing with "private sector flows". Para on private flows (13.11.3.2) needs much more detail (eg sentences such as "financing will follow if policy makers continue to focus on climate change" need substantiating). More importantly, the discussion should be based around a discussion of how public finance can leverage the necessary finance flows, see Buchner et al and Clapp et al refs above. Socially responsible investment is just a small part of the funding pool that could contirbute to climate finance. See Kaminker et al (2012), Role of institutional investors in financing clean energy http://www.oecd.org/sd-roundtable/publications/50363886.pdf | Accepted - text restructured; sub-sections deleted. |
| 7414 | 13 | 47 | 15 | 47 | 25 | Under market based mechanism private sector flows will be directed to activities that result in highest returns, which may not be the activities that have the highest return from climate perspective. This makes comment 18 above more compelling inrelation to the role and scope of private sector financing to climate change. | Taken into account: leverage discussion added in section 13.11.2 |
| 11473 | 13 | 47 | | 47 | | This entire section relating to market mechanisms and private sector flows confuses the role of market mechanisms and private sector investments in climate change-related activities as climate finance under the UNFCCC. Private sector investment in carbon markets or in climate change-related activities are not climate financing that falls under Art. 4.3 and Art. 11 of the UNFCCC. Carbon market private sector investments, for example, such as the provision of financing in projects that generate carbon credits that can then be sold in the carbon markets are not climate financing but rather compensatory payments to the host country for assisting the investor's country in meeting its mitigation commitments by having the host country undertake emission reductions on behalf of the investor's home country. By conflating private sector climate-related investments as equivalent to Annex II Parties' climate financing, this section gives that impression that Annex II Parties may then comply with their treaty commitments on climate financing by taking the credit for their private sector's investments in climate activities in developing countries. | Rejected - the introduction to section 13.11. now specifies clearly that there is no universally accepted definition of climate finance. Section 13.11.2 provides the literature on leveraging private sector investment through different types of climate finance flows. |
| 7415 | 13 | 47 | 26 | 47 | 39 | Assess the adequacy of climate financing in view of the requirements (Copenhagen Accord) that such funding be additional, new, adequate,and predictable and the extent to which private finance may satisfy these requirements. | Taken into account - new and additional issue covered in the introduction to section 13.11 |
| 15670 | 13 | 47 | 27 | | 39 | The discussion of potential financing sources is extremely superficial and is perhaps best omitted and cross-referenced to the more extensive discussion in 16.2.3. | Taken into account - section deleted and references to Ch. 16 made in the |
| 15000 | 13 | 47 | 40 | | | Given the interest that has emerged in private sector contributions to international climate finance (governments have referred to private sector contributions as important to meeting the $100 billion pledged in annual climate finance for 2020), it would be particularly interesting if this section could provide some additional thinking about various means of stimulating private sector finance. | Some ideas on stimulating private sector finance have been added |
| 5691 | 13 | 47 | 40 | 49 | 9 | Some of the material in section 13.12 overlaps with the discussion in section 13.5.2. It is not clear to me which is the better place for the discussion of certification schemes, etc., but can these sections be combined and shortened? | Links with Section 13.5 made to avoid repetition |
| 3180 | 13 | 47 | 1 | | | section 13.13 is the most crucial section of this chapter but not possible to review at this stage. The material on CDM is repetitive from before. I worry about leaving 13.13 to the SOD when this is likely to be the most radioactive part of the chapter. | Comment not relevant to this sections |
| 6122 | 13 | 48 | 19 | 48 | 19 | Add after "McGee and Taplin, 2009" the following literature. " (Okazaki and Yamaguchi 2011)". For citatione purpose, refer to Okazaki T, Yamaguchi M (2011) Accelerating the transfer and diffusion of energy-saving technologies steel sector experience – lesson learned. Energy Policy 39:1296–1304. | The reference has been addded, since the paper is relevant and looks at the steel sector. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 6123 | 13 | 48 | 20 | 48 | 20 | Add after "Fujiwara, 2012" the following literature. " (Okazaki et al. 2012). For citation Okazaki, T., Yamaguchi, M., Watanabe, H. Ohata, A., Inoue, H. Amano, H. (2012), Technology Diffusion and Development. In: Climate Change Mitigation, A Balanced Approach to Climate Change. M. Yamaguchi, (ed.), Springer, London pp. 179-221. | This reference has not been added as the comment does not suggest any new element highlighted by the literature |
| 9522 | 13 | 48 | 27 | 48 | 30 | Please, replace the whole paragraph with the following; International PPPs have a significant role to facilitate development and commercial deployment of low carbon technologies as governments remove barriers to the entry and provide stakeholders with new business frameworks and industries also demonstrate leadership through active involvement with regards to their technologies, investments and know-how. (ETP 2010, p52 and p469) | Elements of the proposed sentence have been merged with existing text and referenced. The reference has been included. |
| 6359 | 13 | 48 | 38 | 48 | 41 | This statement is valid for the voluntary carbon market, but not (at least entirely) for the carbon market supported directly by UNFCCC. The main registry for emission trading, CDM and Joint Implementation exchanges are based on the internatinal transactional log, that is not governed by private sector actors or NGOs. | The sentence has been rephrased accordingly |
| 4244 | 13 | 48 | 9-11 | | | The last sentence of this paragraph implies a connection that is not obvious. The setting of a target, especially if it is aspirational, does not have any necessary connection with the commitments of the "largest international companies." However, if governments have indeed taken action to internalize the externality, such as in a cap-and-trade system or a carbon tax, it is a matter of enforcement and not "commitment" by large international companies. Moreover, to the best of my knowledge, where carbon taxes have been implemented (Norway) or cap-and-trade systems instituted (EU ETS), I don't know of any cases in which large multinational companies are out of compliance in not paying the tax or surrendering permits. | This section has been accordingly been modified |
| 16396 | 13 | 48 | | | | This sub-section is interesting as it is but would benefit from further para on PPPs introduced to construct and maintain infrastructure in various countries, as this could be important for green investment (see Corfee-Morlot et al (2012 forthcoming), Towards a Green Investment Policy Framework: the Case of Low-carbon Climate-Resilient Infrastructure. | Within the space limits, this section has been strengthened and a figure included from the suggested author |
| 6790 | 13 | 48 | 26 | 48 | 27 | Suggest to add the following text: "At the same time, Public-Private-Partnerships have also been adapted to suit rural energy needs. For instance, United Nations Economic and Social Commission for Asia and the Pacific (ESCAP) promotes the Pro-Poor PPP (5P) approach to power rural areas using locally available renewable energy resources" | A few words were included to this effect. |
| 16397 | 13 | 48 | | | | The title of this subsection is a bit misleading, perhaps " private sector-led initiatives" instead. Also, whilst CDP is an excellent initiative, it is not an example of institutional investors requiring reporting | The title has been amended as recommended. The text on the CDP has |
| 11694 | 13 | 49 | 10 | 52 | 11 | I feel in this section, the structure of the sub-secion is not very clear, why pick CDM, Cancun Agreements, Kyoto Protocol and policies outside of UNFCCC, it is not clear to me what are the criteria to choose these sub-tier contexts, for instance, why not EU ETS included, why CDM, and CDM is also part of the Kyoto Protocol flexible mechanisms? | Noted - all issues are covered and broken into subsections for clarity and based on the size of the available literature. The ETS is covered in |
| 8204 | 13 | 49 | 20 | 49 | 20 | "induced by": How does one determine which reductions were induced by the KP and which would have occurred anyhow? | Taken into acocunt - text revised |
| 9310 | 13 | 49 | 27 | 50 | 11 | I fully recognize that CDM is one of the international offset mechanisms to facilitate clean technology transfer from developed country to developing country. However, in spite of high potential projects to reduce the CO2 emissions, CER acquired by the cement industry is only less than one per cent of all CER from CDM projects due to severe definition of "Additionality". Therefore, it is absolutely unattractive for the cement industry. (https://cdm.unfccc.int/UserManagement/FileStorage/HT5JLR43VZ12BUFQ0XKMCW7OP9IDS6) | Noted |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 11475 | 13 | 49 | | 49 | | While firms are legally accountable to States only in the jurisdictions in which they are registered and legally recognized as juridical persons, the statement that “direct regulation of firms at the international level is unavailable” is not necessarily accurate. Firms can be regulated at the international level if, for example, a sufficient number of States agree to common regulatory frameworks in relation to corporate activities that they would then implement at the national level using common modalities or policies. By outright dismissal of such possibilities for international regulation, the statement implicitly downgrades the possibility of using the UNFCCC, for example as the framework through which multilateral regulation of corporate activity in relation to climate change can take place. | Noted - this comment is too detailed for the length of the chapter. |
| 9523 | 13 | 49 | 5 | | | Please, mention motivation of public sector likewise private sector, such as reduction of fiscal burden and means to stimulate economy. | Taken into account - new text prepared |
| 8203 | 13 | 49 | 10 | | | It is odd that there is a subsection devoted to Cancun but not one to Copenhagen. | Noted - The section on the Cancun Agreements is basically on the reduction proposals under the Copenhagen Accord |
| 16398 | 13 | 49 | | | | Would be good if future version of this section separated issues to do with the KP itself, from wider gobal emissions effects such as developing country emissions growing faster than expected. Could also include some text currently earlier in the chapter, eg in section 13.5. | Accepted |
| 6592 | 13 | 49 | 16 | 49 | 24 | This section is well written as an objective finding. Should not be deleted. | Noted |
| 16399 | 13 | 49 | | | | First para as it stands is not very clear, would be good to restructure to focus on where are the key areas that CDM has "worked' (renewables as well as HFC/N2O) and where it hasn't worked. Could also regroup some of the CDM anlaysis earlier in the chapter which would be relevant here instead. | Taken into account - Text adjusted. However, all empirical evidence on CDM should remain in this section, whereas |
| 2342 | 13 | 49 | | | | According to the Peter Newell et. al argument (2009), the governance in practice in CDM is rather different from the expected framework realization with good governance which provide strong state, functioning market and active, free civil society. Contrary, there are not well established good governance principles in many part of world. Under these circumstances, they identified "recipients" and "Providers" in the many countries (Newell et al. 2009:6). The “Providers” include private sectors that constitute private finance. Gold Standard of CDM, the Voluntary Carbon Standard and the Carbon Disclosure Project are significant private governance mechanism of private finance. These private governance schemes govern the CDM by adapting regulation and standards (Newell et al. 2009:10).<br>Reference:- Newell,P., Jenner, N. Baker,L.(2009) Governing Clean Development: A Framework for Analysis. Working Paper 001, The Governance of Clean Development Working Paper Series. School of International Development, University of East Anglia UK. | Taken into account: a paragraph on CDM governance exists in section 13.4.1.3 |
| 13929 | 13 | 49 | 27 | 50 | 28 | This section should mention the consensus that project-based approach such as CDM do not work for key urban sectors (such as transporta and building). See Zegras, C., 2007. As if Kyoto mattered: The clean development mechanism and transportation. Energy Policy, 35; Dalkmann, H., Stek, W., Bongardt, D., Wittneben, B., Baatz, C., 2007, The sectoral Clean Development Mechanism – A contribution from a Sustainable Transport Perspective, JIKO Policy Paper, Wuppertal Institute for Climate, Environment and Energy, Wuppertal, Germany | Taken into account - used more recent reference for CDM problems in the transport sector (Millard-Ball and Ortolano 2010) |
| 3962 | 13 | 5 | | 52 | | Overall, references to international law material and literature in the Draft Chapter 13 are very poor in spite of the fact that it is dealing with international law problems. I must say, regrettably, that this section is poorly drafted from the viewpoint of international law. | Noted |
| 8162 | 13 | 5 | 11 | 5 | 11 | Benefits of emissions reductions are distributed globally regardless whether or not there is cooperation. | Taken into account - text revised to add |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 10802 | 13 | 5 | 14 | 5 | 18 | The global commons framing does indeed suggest that there is little incentive to reduce emissions in the absence of cooperation. However, in the last 5 years there has been growing efforts to construct a different framing around the complementarities between emissions reductions and other social and environmental goods. Under this narrative, countries, firms and individuals would act in the absence of an agreement. While the dominant framing remains the global commons, this alternative framing, appropriately contextualized as one on which there is NOT HIgh agreement (and indeed controversy), should perhaps also be mentioned. I am thinking here of the work of Victor, the Hartwell House document, and others. See specific cites in comments on Sec 13.2.1.1. | Taken into account - text revised to include the notion of co-benefits |
| 10798 | 13 | 5 | 18 | | | It is not always that commons face the tragedy of disapearance. According to late Nobel Laureate Dr. Elinor Ostrom in her worldwide survey, commons are not in peril when they are run by a three-parts cooperation among communites, market forces and government. She called it polycentric governance of complex economic systems. Left to markets and government ony, commons run the risk of damages and impacts. Commons linked to climate change, such as rivers, forests, fisheries, water could be run by a polycentric governance. | Noted - however this is too detailed for the ES<br><br>In Section 13.2, taken into account. The point is right. Because of space limitations we decided not to add it to the ES. However, following the comment, we have changed the litle of section 13.2.1.1 from "The tragedy of |
| 4793 | 13 | 5 | 19 | 5 | 23 | Please take care of mentionning difference between economic performance and financial performance. There is a gap between those 2 performances, which need to be overcome. It is necessary to recognise all benefits and to associate an economic value to all fo them) | Noted |
| 2262 | 13 | 5 | 2 | 52 | 42 | There is no evidence that emissions of greenhouse gases hav any harmful effect on the climate. .This information is thus not a cause for concern so the whole Chapter is unnecessary. It is also surprising that while the supposed, unproven theory relies on changes in the atmospheric concentioin of greenhouse gases. you seem here to be exclusively concerned with emissions. which are not necessarily related to concentrations | Rejected - beyond the mandate of WG III - comment refers to the science of climate change |
| 3731 | 13 | 5 | 2 | | | :synthesizes" chapter doesn't yet synthesize. At best it selectively summarizes. To "syntehsize" it will require more attention to the mechanisms associated with each of the governance approaches, and the extent to which they complement or interfere with one another. This will require a new section 13.4.4 (should be 13.4.3 with the existing 13.4.3 becoming 13.4.4) that discusses the social mechansims associated with approaches to climate change govenrnace - namely coercion, inducements, political economy market factors, norms, and learning. | Taken into account - covered in Section 13.3 and 13.4 |
| 6325 | 13 | 5 | 20 | 5 | 23 | It would be important to add that these criteria consider the principles on which the UNFCCC is based such as, "equity", " common but differentiated responsibilities and different capabilities", "precaution", "cost-effectiveness so as to ensure global benefits at the lowest possible cost" and "sustainable development". | Taken into account in Section 13.2. |
| 13651 | 13 | 5 | 26 | 5 | 27 | Modify the sentence as -- the landscape of proposed mechanisms of international cooperation on climate | Rejected - the suggested text is too |
| 13652 | 13 | 5 | 27 | | 28 | A significant literature is now devoted to studying an increasingly broad range of policies, and institutions, which span all scales of governance | Noted |
| 6326 | 13 | 5 | 30 | 5 | 40 | This comparison in the summary between three approaches without the arguments presented in the section 13.4 could be misleading in the sense that the reader can interpret that the three approaches could be equally effective. It would be necessary to mention that the strong multilateralism is perceived as the more effective way to address climate change due to characteristics of climate change. | Taken into account - with text under a new subheading at the end of the ES synthesizing Section 13.13 |
| 3733 | 13 | 5 | 30 | 5 | 32 | approaches rather than models. Some bullets indicating what they are would help, as well as a discussion of which are complementary and which operate at cross purposes | Taken into account - by switching the word to "approaches." Further |
| 6984 | 13 | 5 | 32 | 5 | 34 | At least to my ears, “coordination” isn’t something I would associate with “strong multilateralism” (though I’ve never heard of that term before). To a game theorist, coordination doesn’t require enforcement, and I would think that “strong multilateralism” must involve some measure of enforcement. Harmonization of standards, mentioned later in the paragraph, normally does involve coordination. | Accepted - text revised |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 13628 | 13 | 5 | 36 | | | the end of the extreme shouldn't be characterized as cooperation at all. But it is action. | Taken into account - text revised to be |
| 2404 | 13 | 5 | 36 | 5 | 36 | Comment on specific text: 'Harmonized' is a strong word implying a high level of centralization and little if any room for differentiation. Might 'coordination' of national policies capture the idea better here? This also comes up as an issue on p. 24 (line 35) where you imply that harmonization connotes similar or equivalent policies. Harmonization implies more than equivalence, the latter being instead is a form of mutual recognition. | [respond to this comment after making changes in 13.4 and reflecting these changes in the ES] |
| 18240 | 13 | 5 | 37 | | | “harmonized carbon taxes” This example should not be used within the document because for national legal and political structure of some countries, as Venezuela, this tax harmonization is not accepted, nor in the context of international negotiations, neither in local policy. There should be a consideration of implication of its use as a prescriptive policy of the IPCC report. | Rejected - harmonized carbon taxes are offered only as an example not as a policy prescription. |
| 8091 | 13 | 5 | 42 | 5 | 42 | Recommend changing "the only climate policy institution with virtually" to "the only climate policy institution with both virtually" | Accepted |
| 8163 | 13 | 5 | 42 | 5 | 44 | It is not clear that the UNFCCC is the only institution with "the authority" to serve as a negotiating forum. (It is not clear who would give or deny other institutions such authority.) Perhaps is is the only institution whose charter explicitly acknowledges that function? Suggest a weaker statement. | Taken into account - combined with comment 8091 |
| 6830 | 13 | 5 | 42 | | | Need to define institution - why characterize the UNFCCC as an 'institution' rather than a regime, for instance. Need more generally to define the terms "institution", "agreements," "instruments" and "regime" - UNFCCC is for instance arguably an agreement, an instrument, an institution and a regime. How then are different modes of cooperation being characterized and delineated. | Taken into account - definitions for these terms are cross-cutting issues to be covered by the Glossary |
| 11790 | 13 | 5 | 44 | 5 | 47 | International coorperation has brought about not policital agreement but recognize. It shoud be amended to correct expression. | Accepted - text revised |
| 9516 | 13 | 5 | 44 | | | Please, replace political agreement with international goal.(Copenhargen Accord) | Taken into account - combined with |
| 10668 | 13 | 5 | 44 | 5 | 47 | Refer my comment No. 3. | Noted |
| 6566 | 13 | 5 | 44 | | 45 | Explain when and where such a "political agreement" was brought about or modify the description, as e.g. in Cancun Agreements COP only "recognizes that deep cuts [...] are required [...], with a view to reducing global greenhouse gas emissions so as to hold the increase in global average temperature below 2 degrees C" but not agreed on limiting temperature increase to no more than 2 degrees C. | Taken into account - combined with comment 11790 |
| 2942 | 13 | 5 | 45 | 5 | 47 | "level of mitigation ..appears inadequate [to limit temperature increase to no more than 2 degrees]". This just about the weakest form of words that could be used to describe this fact. It would be more accurate (in my view) to say something like "Comparing the growth in GHG emissions from 2000 to 2010 to Figure 5.1 of the AR4 Synthesis Report strongly suggests that current mitigation measures are clearly inadequate to achieve this goal, and therefore that stronger actions are needed". | Rejected - no scientific evidence/publication provided to support changes suggested by the reviewer. The text is sufficiently nuanced |
| 3734 | 13 | 5 | 47 | | | effects rather than consequences? | Taken into account - text revised |
| 4510 | 13 | 5 | 8 | 5 | 18 | This paragraph needs to be qualified to include the point that the very large emitting countries and blocs (e.g., the U.S., China, the EU) could unilaterally bring about dangerous climate change if they were to undertake a course of unabated emissions. Thus it is not strictly true that individual countries have no incentive to abate because the benefits to themselves would be negligible. The global benefits are greater than the benefit to an individual country, but the individual country benefits are not insignificant. | Rejected - text is already sufficiently nuanced |
| 2263 | 13 | 5 | 8 | 5 | 9 | This is not true. None of the greenhouse gases, including the most important, waterr vapour. mix uniformly with the atmosphere and this fact is concealed by restricting the sites where they are measured to places where the wind blows from the sea. . | Taken into account with comment 6944 |
| 3732 | 13 | 5 | 8 | | | "global commons problem" this claim is repeated in a subsquent section. It is actually a k-group problem, as collective acdtion by 10 countries would solve the problem. Discussion needs to recognize this fact - and justify why discussions of technology transfers and equity with developing countries is necessary. | Taken into account. But, this discussion belongs to Section 13.2.1 and not to ES. Literature on minilateralism is now cited. |
| 13624 | 13 | 5 | 8 | 5 | 18 | This section conflates action with cooperation. I would say that there's little incentive to reduce emissions in the absence of emissions reductions by other major emitters. That abatement doesn't necessarily have to derive from international cooperation. | Taken into account - text revised to add additional nuance |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 15123 | 13 | 5 | 8 | 5 | 9 | Climate change is a global commons problem, because greenhouse gas (GHG) emissions from any source mix uniformly in the atmosphere and have global impacts mainly in most vulnerable regions. | Noted |
| 4567 | 13 | 5 | 10 | 5 | 16 | After "mitigating climate change" , add the following sentence "The inherent characteristics nature of climate protection as a public good with taxonomical features of non-rivalrous competition, non-excludability, and non-appropriability, presents an economic difficulty". What follows up to "As a result" is an explanatory to this added sentence. | Rejected. Text does not seem to improve readibility of the Executive Summary. |
| 4636 | 13 | 5 | 10 | 5 | 16 | After "mitigating climate change" , add the following sentence "The inherent characteristics nature of climate protection as a public good with taxonomical features of non-rivalrous competition, non-excludability, and non-appropriability, presents an economic difficulty". What follows up to "As a result" is an explanatory to this added sentence. | Rejected. Text does not seem to improve readibility of the Executive Summary. |
| 6804 | 13 | 5 | 10 | 5 | 16 | After "mitigating climate change" , add the following sentence "The inherent characteristics nature of climate protection as a public good with taxonomical features of non-rivalrous competition, non-excludability, and non-appropriability, presents an economic difficulty". What follows up to "As a result" is an explanatory to this added sentence. | Rejected. Text does not seem to improve readibility of the Executive Summary. |
| 10801 | 13 | 5 | | 7 | | The ES does not, to my mind, sufficiently capture the full range of issues that characterize understandings and interpretations of internaitonal cooperation on climate change over the last five years. There is insufficient representation of and distinction between the legal status of various instruments, insufficient discussion of the Kyotyo Protocol, insufficient treatment of the challenges to the global commons frame, an over-emphasis on market instruments as a form of cooperation as compared to other, notably information based regulatory instruments, a failure to represent political analyses of the challenges to cooperation, exemplified by thin treatment of the principle of common but differentiated responsibility, and weak attention to non-mitigation aspects of cooperation, notably adaptation. | Noted |
| 13907 | 13 | 5 | 10 | 5 | 16 | This sentence could also make the point that, in comparison with other environmental externalities, responsibility is highly defuse and therefore unilateral emissions reduction by any one individual, firm or country is unlikely to have any significant climate benefits. Yes climate stabilization is a non-excludable public good, but the real challenge is that it can only be provided by coordinated global action, with the potential exception of geo-engineering. | [draft single response will be made in line for comment #112] |
| 6943 | 13 | 5 | 2 | 5 | 2 | "scholarly literature"? Is this meant to be an acronym for peer-reviewed? Please be specific and use the IPCC terminology used in the cross-WG "General Guidance on the Use of Literature in IPCC reports". | Taken into account - text revised by deleting the word "scholarly" |
| 13908 | 13 | 5 | 35 | 5 | 40 | It is not sure that the single classification criteria "central organization and management" is sufficient. International approaches to cooperation can contain different permutations along multiple axes: multilateral vs. plurilateral/unilateral geometries of participation; targets and timetables or policies and measures, or both; deep or shallow coordination and management. The single criteria of central organization and management makes it difficult to reflect the actual variety of international regimes (e.g. Kyoto, EU climate and energy package), and the evolution of the international regime from Kyoto to Copenhagen and Cancun. | Taken into account - text revised with text to make clear that there are other dimensions |
| 14638 | 13 | 5 | 45 | 5 | 45 | Technically, the Copenhagen Accord is ambiguous about the baseline for the 2 degrees C goal. Paragraph 2 of the Accord simply states "We agree that deep cuts in global emissions are required according to science, and as documented by the IPCC Fourth Assessment Report with a view to reduce global emissions so as to hold the increase in global temperature below 2 degrees Celsius, and take action to meet this objective consistent with science and on the basis of equity." | Taken into account - text revised to reflect the Copenhagen Accord more accurately |
| 16230 | 13 | 5 | 9 | | | should specify that "widespread" international cooperation is necessary | Accepted - text revised to include the |
| 18434 | 13 | 5 | | | | I liked the frame of global commons and the acknowledgment of other scales of governance in terms of climate policy.<br>However, there is again a moderate vision regarding UNFCCC (page 5 last paragraph: “appears inadequate”) | Noted |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 18435 | 13 | 5 | | 7 | | And when it talks about linkages between climate and other policies, the emphasis is too much on institutions and agreements, and does not acknowledges the reality, for example unilateral trade barriers based on carbon intensity (pages 6 and 7). | Rejected - this topic is too detailed for the ES |
| 12473 | 13 | 5 | 1 | | | The the Executive Summary should focus on the policy-relevant key findings of the text in the chapter. Some of the text is more of an discriptive nature. | Noted |
| 16177 | 13 | 5 | 41 | | | The ozone agreements (Vienna, Montreal) should be included in the discussions of existing international agreements. The approach of using a framework agreement implemented by a protocol is historically relevant to the UNFCCC and Kyoto Protocol and may continue to be a useful approach to designing narrower operational agreements. The Montreal Protocol has provided both significant GHG reduction benefits, albeit the intent was to protect the ozone layer not the climate. The Montreal Protocol's influence on the use of certain chemicals (e.g., HFC-134a) may also provide an example of the unintended consequences of pursuing one goal (reducing ozone-damaging chemicals) without taking into consideration the impacts on another (reducing climate-damaging chemicals). | Accepted - text revised to include the Montreal Protocol as an example of other fora. |
| 17104 | 13 | 50 | 29 | | 46 | Assessments of Cancun have been in terms of seeing the "mitigation gap" in terms of the carbon budget - see literature from UNEP, for example. The term used in the text "emissions gap" does not reflect this work or the negotiations, or even Cancun, and should be replaced with the term " carbon budget gap". Even in terms of science there is no such thing as the 'emissions gap"!!K44 | Rejected - the emissions gap is clearly defined in the UNEP gap reports and in other literature. As we are assessing the literature, we keep the same terminology. |
| 6361 | 13 | 50 | 3 | 50 | 28 | These 2 paragraphs describe in detail the shortcomings of CDM. The section is finalized with two comparisons in which the authors found that some projects certified by Gold Standards outperform CDM projects. This might lead to the perception that projects from the voluntary market certified by Gold Standard are better than CDM projects and this might not be real in many cases. The samples are limited: for the initial comparison 39 projects, and for the second 18, respectively, were used. By the way, in this later comparison it is not clear the meaning of "projects otherwise certified". Were they CDM projects or other projects from the voluntary market? | Taken into account - Text clarifies that Gold Standard projects are registered as CDM as well. |
| 18245 | 13 | 50 | 31 | | | “Copenhagen Accord”, in 2009 during COP XV there was no agreement among the Parties on the document entitled “Copenhagen Accord”, it is therefore suggested to delete references to reduction of emissions of this document and include only those of the Cancun Accords. | Rejected - Ananlysis of the reduction proposals under the Copehagen Accord are clearly described in the UNEP gap |
| 18246 | 13 | 50 | 39 | | 46 | This paragraph, besides prescriptive, must kept the principle of common but differentiated responsibilities and the historical debt that developed countries have in the accomplishment of an ambitious quantified goal of carbon, whose solution is not the commercial exploitation of nature through forest markets, but through domestic reductions. This is a paragraph which directly depends on the international negotiations and should, therefore, be deleted. | Rejected - The text reflects the available peer-reviewed literature and does not make policy recommendations |
| 6362 | 13 | 50 | 47 | 51 | 2 | The idea of this important paragraph seems incomplete. It would be important to expand it. | Taken into account - new text prepared |
| 12028 | 13 | 50 | 6 | 50 | 10 | Supplemental explanation of why there is a negative correlation should help understand the problem. | Taken into account - shortened the text |
| 18440 | 13 | 50 | | | | Even when the segment is under construction, the actual information is quite pessimistic regarding global climate policy; this should be the central message of the chapter, especially in relation to the little effectiveness of UNFCCC.<br>There is some kind of optimism regarding then national pledges included in cop 15 and 16: it is also like the chapter assumes that those targets will be implemented, and does not even acknowledge that some of them are very uncertain. (Pag 50 par 5). It would be key to compare the pledges of the Copenhagen Accord and the trajectory of emissions between 2010 and 2012 in the major players. My guess is that the outcome is very poor. | Noted - the text reflects the available scholarly literature and key messages will be presented in the executive summary of the chapter |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 6360 | 13 | 50 | | 51 | | To facilitate the understanding of the reader on CDM it is needed to describe in numbers the magnitude achieved by this mechanism, in terms of emission reductions and financially. A table with this information would be ilustrative or, at least, refer to the related information provided in section 13.5.5.1. This would contribute to frame the teorethical analysis of this section. It also would be convenient to know how many projects have been certified with the Gold Standards, which 57 of them have been used in the comparisons referred to in this session. | Taken into account: Data on CDM are available in section 13.5.1.1. |
| 6363 | 13 | 51 | | | | The characteristics of conditional and unconditional pledges are necessary to be explained. . | Rejected - discussion at this level of detail would blow up the text beyond the allotted page volume. We refer to the |
| 12819 | 13 | 51 | | | | Range of gap should be explained in the text. | Taken into account - we extended the textt in the caption of the Figure of the |
| 12820 | 13 | 51 | 12 | | | CDP (abrev. firstly explained later) | Rejeted - CDP already explained in 13.12 |
| 6364 | 13 | 52 | 1 | 52 | 5 | What is the source of the first sentence of the paragraph? In accordance with the GHG Guidelines used to prepare national GHG inventories all GHG reductions that takes place in a territory will be reflected in the national GHG inventory. | Taken into account - text revised |
| 17105 | 13 | 52 | 13 | | 15 | My peer reviewed work in 'Climate and Development' is relevant for this section. | Rejected - not able to find assessment in this body of work and no specific |
| 11695 | 13 | 52 | 26 | 52 | 42 | It seems there will be a very detail literature review on the burden-sharing, section 13.4.1.2 also discussed on burden-sharing methods, so these two parts need to coherently integrated, otherwise might have some repetition | Taken into account - however the coverage of burden sharing arrangements has moved to Chapters 4 |
| 6055 | 13 | 52 | 5 | | | Various publications by Harriet Bulkeley and Kristine Kerr would seem of relevance here. | Taken into account - these authors are cited in this chapter already |
| 18247 | 13 | 52 | 9 | | | “developed in private sector agreements may then become incorporated into government regulations (Knox-Hayes and DL Levy, 2011)”, this will depend on the legal system of each State and on respect of national interests. | Rejected - text is already sufficiently nuanced |
| 7416 | 13 | 52 | 12 | 52 | 42 | Suggestions include: 1- assess targets achieved vs. costs, 2- Exante vs Expost 3- spillover and burden sharing/shifting among broad groups of countries classified by level of vulnerability | Taken into account - new text prepared |
| 15671 | 13 | 52 | 16 | | 42 | This is arguably one of the most important contributions that the IPCC can make to furthering the literature on burden-sharing arrangements (and an unenviable task). One aspect that would be useful to consider is whether net costs across different regions could also be presented not only once emissions trading is incorporated, but also once any further financial transfers (outside the scope of emissions allowances, eg grants and loans) stipulated by the particular burden-sharing proposal are accounted for. The IPCC SAR's chapter on equity (WG III, Ch 3) provides a useful precedent for the value of considering trading and financing as separate components. Some assessment of the technical feasibility of different burden-sharing proposals would be useful (in a similar vein to EMF 22 studies that have explored the implications of different participation regimes: see eg Russ, P., and T. van Ierland. 2009. Insights on Different Participation Schemes to Meet Climate Goals. Energy Economics 31, Supplement 2:S163-S73 and other articles in the same journal issue). Finally, it would also be useful to compare the implications of different proposals in 2020 with the implications of _current_ burden-sharing arrangements under the Cancun Agreements (on both mitigation and finance). | Taken into account - the text will reflect these issues per the available peer-reviewed literature; however the coverage of burden sharing arrangements has moved to Chapters 4 and 6 |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 17106 | 13 | 52 | 16 | | | the assessment of burden sharing arrangements MUST consider both cost sharing and resource sharing. That is, sharing the carbon budget. The approach suggested of comparing the GHG emissions reduction targes is not appropriate because it is a response to a particular decision in the negotiations and does not reflect the "potential burden sharing arrangements". Equitable access to sustainable development, or sharing the carbon budget, should be included as an example. Since two different principles are involved - emissions and concentrations - it is not possible to put them together. They need to be looked at separtely and the implications for countries compared in a single table, but the concentration based approach cannot be reduced to an emissions based approach. THe question is not only about emissions reduction targets but also about sharing the carbon budget equitably to determine the emission allowances, even if they are negative. This section must capyure the recent peer reviewed literature, including my papers in 'Climate Policy' and Climate and Development' . | Taken into account - the text will reflect these issues per the available peer-reviewed literature; however the coverage of burden sharing arrangements has moved to Chapters 4 and 6. The concepts for structuring an agreement, including carbon budgets is covered by 13.4 and 13.5 |
| 6124 | 13 | 52 | 16 | | | Just for team's information, I would draw your attention on burden sharing issue to the following literature that proposed defferent sharing for Annex I and non-Annex I countries. "Akimoto, K., (2012). Mitigation Targets and Effort-Sharing Among Regions and Countries. In: Climate Change Mitigation, A Balanced Approach to Climate Change. M. Yamaguchi, (ed.), Springer, London pp. 43-62. | Taken into account - however the coverage of burden sharing arrangements has moved to Chapters 4 and 6 |
| 3471 | 13 | 58 | 17 | | | Bossetti V should be Bosetti | Editorial - copyedit to be completed prior |
| 9517 | 13 | 6 | 1 | | | Please, clarify the meaning of agreeing to reduction targets for 2012 and 2020 and actions for 2020. | Taken into account - covered in Section |
| 6567 | 13 | 6 | 1 | | 2 | Explain when and where such "consequences [...] agreeing to reduction targets for 2012 and 2020 and actions for 2020" took place, as such targets seems to be agreed on only in the Kyoto Protocol for period between 2008 and 2012. | Taken into account - text revised and also covered in detail in Section 13.5 |
| 7368 | 13 | 6 | 1 | 6 | 2 | Is it correct to say that reduction targets have been "agreed" to for 2020 in the same way they were for 2012? Given the continued work of the AWG-LCA and the lack of a finalised second commitment period for the Kyoto Protocol (to 2017 or 2020), it may be more correc to say: "agreed to targets for 2012, and negotiated possible targets through to 2020" or something similar. | Accepted - text revised with additional nuance |
| 6831 | 13 | 6 | 1 | | | No reference to the Kyoto Protocol here - the 2012 targets are not under the UNFCCC but the Kyoto Protocol. Need to introduce the KP here | Accepted - text revised with additional nuance |
| 13639 | 13 | 6 | 12 | | | Empirically, leakage estimates aren't all that big. Check out the new work by the Energy Modeling Forum on border adjustments, for example. | Taken into account - text revised to take into account additional nuance |
| 3736 | 13 | 6 | 14 | | | linkages- need to disaqggregate between vertical linkages between levels of scale, including the application of global norms; and horizontal linkages that take the form of regime complexes, and synergies. These linkages can either be positive or negative, so more empricial attention is necessary. | Taken into account - covered in Sections 13.6 and 13.7 |
| 6327 | 13 | 6 | 15 | 6 | 27 | Consider to briefly explain to the reader to what credits are referred to in this section. | Taken into account - text revised |
| 18241 | 13 | 6 | 15 | | 34 | regarding paragraph “Linkages between Climate Policies” is considered a prescriptive paragraph because it present carbon markets as the solution implemented to promote mitigation. However, this is a mechanism for commercial exploitation of natural resources that should be seen in the perspective of national environmental policies of States. | Rejected - text is already sufficiently nuanced |
| 10804 | 13 | 6 | 15 | 6 | 27 | The Linkages section seems to focus very heavily on market linkages. But there are other literatures, that suggest information mechanisms, framing devices and procedural mechanisms all provide means for international law to affect domestic policy. See specific comments below on secs 13.3,4,5 | Taken into account - combined with comment 13910 |
| 11439 | 13 | 6 | 15 | 6 | 15 | The reference to “absence of … a binding international agreement on climate change” is factually incorrect as the UNFCCC and its Kyoto Protocol are, in fact, such binding international agreements. | Taken into account - text revised to correct the original text |
| 15721 | 13 | 6 | 17 | 6 | 17 | and "can" function as a de facto international policy. Better: "may" function as de facto international policy. We don't know whether in the absence of a binding international agreement bottom-up approaches will lead to substantial emissions cuts... | Taken into account - combined with comment 13909 |
| 8165 | 13 | 6 | 18 | 6 | 18 | "the scale effects": This sort of jargon won't mean anything to many ES readers | Taken into account - text revised to |
| 5240 | 13 | 6 | 21 | | | What is the unit for 1 billion? Tonnes of CO2 or dollars? | Taken into account - text revised with |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 4795 | 13 | 6 | 22 | 6 | 27 | It could be interesting to mention that the Australian government and the European Commission announced that Australia and Europe will be linking their emissions trading systems (ETS), and the full-way link is to commence no later than 1 July 2018. | Taken into account - combined with comment 11145 |
| 8752 | 13 | 6 | 22 | 6 | 25 | The sentence is not clear. In addition to the EU ETS there are operating ETS in Switzerland, Japan and New Zealand. The EU, Japanese and NZ ETS have used Kyoto units for compliance. Switzerland allows Kyoto units for compliance, but none have been used. RGGI would allow international units for compliance if the RGGI price exceeds $10/ton CO2. Alberta has no links with any other ETS. In addition to the California - Canadian provinces link, other near term developments include negotiation of a link of the Swiss ETS with the EU ETS, announcement of a 2015-2018 link between the Australian ETS and the EU ETS, and possible links for ETS in China, Korea, Mexico, Khazakstan, Ukraine, etc. | Taken into account with further nuance here and more detail in Sections 13.6 and 13.7 |
| 12918 | 13 | 6 | 22 | 6 | 22 | Note the agreement between EU and Australia on linking their emissions trading systems. | Taken into account - combined with |
| 12919 | 13 | 6 | 22 | 6 | 22 | California is not 'national level' | Taken into account - text revised with |
| 15073 | 13 | 6 | 24 | | | The new Australian carbon policy will link to the ETS by 2018 | Taken into account - combined with |
| 16359 | 13 | 6 | 25 | 6 | 27 | California and WCI is itself example of sub-national policy linkage, so last sentence not needed | Accepted - text revised |
| 15722 | 13 | 6 | 26 | 6 | 26 | "Another recent development has been experimentation in policy linkages at the sub-national level": there are plans, but not so much experimentation so far… | Taken into account - sentence deleted, combined with comment 16359 |
| 8753 | 13 | 6 | 28 | 6 | 29 | In addition the larger market created by linked ETS can lead to introduction of additional financial instruments (options, forwards) and lower transaction costs (exchange trading). Linked ETS also reduce leakage, output losses in countries with the ETS, and lower welfare losses. See ALTERNATIVE APPROACHES FOR LEVELLING CARBON PRICES IN A WORLD WITH FRAGMENTED CARBON MARKETS, Elisa Lanzi, Jean Chateau and Rob Dellink, OECD Environment Directorate, 2012. | Taken into account - covered in Section 13.6 |
| 13625 | 13 | 6 | 28 | 6 | 34 | This paragraph importantly fails to mention an important drawback of linkages: the transmission of shocks. If two countries have linked cap-and-trade programs and one experiences a macro shock, that can be transmitted to the other via permit prices. See "Expecting the Unexpected: Macroeconomic Volatility and Climate Policy", by Warwick McKibbin, Adele Morris, and Peter Wilcoxen, in J Aldy and R. Stavins (eds), Implementing Architectures for Agreement: Addressing Global Climate Change in the Post-Kyoto World, Cambridge University Press. | Taken into account - covered in Section 13.6 |
| 12920 | 13 | 6 | 28 | 6 | 28 | Linking also signals international collaboration and a commitment to long-term climate policy and multilateralism. This may in turn provide larger predictability for investors in carbon intensive industries. Linking carbon markets from different regions may equalize carbon prices and hereby reduce competitive distortions between the regions. I can provided references if needed. | Taken into account - covered in Section 13.6 |
| 3735 | 13 | 6 | 3 | 7 | | private governance is a huge topic that has to be addressed. Look at the work by Biermann, Abbott&Snidal, and Gereffi/Meyer. | Taken into account - covered in Section 13.12 |
| 8164 | 13 | 6 | 3 | 6 | 7 | The first sentence seems to be at best tenuously related to the rest of this paragraph. Yes, climate change is addressed in other forums, but the text here incorrectly implies that those other forums are primarily ones that have nothing to do with sovereign states. | Taken into account - text revised with clarifying language |
| 16360 | 13 | 6 | 30 | 6 | 34 | Para refers only to market-based linkages; need to specify this or broaden the sense of the para | Taken into account - combined with |
| 9518 | 13 | 6 | 31 | 6 | 34 | Good comment | Noted |
| 12975 | 13 | 6 | 31 | 6 | 34 | I suggest rewording lines 31-34. It is not correct to say that "linked systems are only as stringent as the weakest among them". In case of two cap-and-trade systems linkage increases efficiency but does not change the aggregate level of abatement. Abatement increases in the system with lower marginal abatement cost and decreases elsewhere. Maybe the authors mean to say that the system with lax certification rules of emission credits would introduce "hot air" in the larger market. | Taken into account - text revised with additional nuance |
| 12921 | 13 | 6 | 31 | 6 | 31 | A problem of linking two regions with different political objectives may be the loss of control and compromising of the original policy priorities in each system. With linking, the scope for regulatory interventions of the single system is reduced. I can provided references if needed. | Taken into account - covered in Section 13.6 |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 4233 | 13 | 6 | 32 | | | The sentence in parentheses makes no sense. Linking two systems of differing stringency will cause the price in the less stringent system to rise and the price in the more stringent system to fall. The only circumstance in which the price of the linked systems would fall to the level of the less stringent system is when the latter is very large and the more stringent system is very small. As a general statement, what is asserted here is wrong. | Taken into account - combined with comment 12975 |
| 8166 | 13 | 6 | 35 | 7 | 6 | This section seems to be missing interactions with international security policy, which can be large. | Accepted - text revised |
| 6029 | 13 | 6 | 36 | 6 | 37 | Delete "sustainable development…public health" since these issues aren't mentioned in the subsequent text. | Rejected - okay to mention these here even if not subsequently fleshed out |
| 16361 | 13 | 6 | 36 | 6 | 38 | Important to mention fossil fuel subisidies and fuel taxes (excise duty etc) here as important other interactions | Accepted - text revised |
| 11331 | 13 | 6 | 36 | 6 | 38 | Interactions also exist between climate change mitigation policy and environmental protection, human security, human rights etc. For example, literature has examined synergies and conflicts in the context of the law of the sea and ocean fertiltisation proposals. Other policy linkages relatign to geoengineerign may also be relevant. These issues are not addressed in the corresponding sections of the report. | Accepted - text revised |
| 18242 | 13 | 6 | 39 | | 42 | Climate change issue and actions in the multilateral level should stay in its natural forum, that is the framework of UNFCCC. In this forum, is under discussion financing for climate change and a new legal international instrument, thus, discussion should not be diverted to WTO and ICAO. This paragraph can be read as prescriptive. | Rejected - text is already sufficiently nuanced |
| 11330 | 13 | 6 | 4 | | | The reference to 'international agreements not centred on soverign states' is difficult given that termionologically 'international agreements' is geenrallt taken to refer precisley to agreemetns between states. Better terminology would be to refer to the broad range of other arrangements and initiatives as 'international arrangements not centred on ...' | Taken into account - text revised with clarifying language |
| 2405 | 13 | 6 | 4 | 6 | 4 | Comment on specific text: The term 'international agreements' does not seem quite right here to capture the practices you describe below. Transnational initiatives would be better. | Taken into account - combined with comment 11330 |
| 4794 | 13 | 6 | 8 | 6 | 13 | I fully support this statement. However there is potential competition distorsion | Noted |
| 10803 | 13 | 6 | 8 | | | The term "regime complex" is not sufficiently widely used to merit inclusion in the executive summary, and without definition. Indeed, later in the text, too, the term appears well before it is defined. Moreover, Keohane and VIctor's work on this term has been robustly critiqued by Abbot (cited later in the chapter). While the concept certaintly deserves mention in this chapter as an important new idea, it should not be introduced in the ES, and it should be well defined when introduced, and the criticisms of the concept aired. | Taken into account - text revised |
| 6832 | 13 | 6 | 8 | | | Term 'regime complex' introduced here with no definition, explanation or justification | Taken into account - combined with |
| 17097 | 13 | 6 | 8 | | | the new regime complex includes discussion around sharing the carbon budget. Recent analyses are now arguing that what really matters is the total greenhouse gas budget we allow ourselves, because of the scientific uncertainty associated with emission rates and concentration targets*, which cannot be accurately inferred from quantities we can observe . The United Kingdom already has legislation establishing a national carbon budget , and the National Academy of Sciences of the United States concludes that the “policy goal must be stated as a quantitative limit on domestic GHG emissions over a specified time period – in other words a GHG emissions budget …… national shares of global emissions need to be agreed at the multilateral level as the basis for developing and assessing domestic strategies” . The scientific analysis notes that its efforts are “based on ‘global least cost’ economic efficiency criteria for allocating global emissions among countries, and using other criteria, different budget numbers could be suggested; for instance, based on global ‘fairness’ concerns, a more aggressive U.S. emission reduction effort is warranted – and this is what equity is all about. | Taken into account in Section 13.4 |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 14699 | 13 | 6 | 8 | | | The term "regime complex" that is first mentioned here (but never defined) and then predominantly used in chapter 13 to depict the institutional complexity of global climate governance. However, 'regime complex' is but one concept used in the literature to depict this growing complexity. Other terms - that have been established earlier and have also been used by communities other than internatinoal relations (e.g. international law) - include: "institutional fragmentation" and "institutional complexity". The simple but crucial advantage of these other terms is that they speak of institutions, not just regimes. This does justice to a well-established, classical typology in international relations - for example reflected in the works by Robert Keohane who uses "institution" as the generic term and then distinguishes different types of institutions, including organizations and regimes (see: R.O. Keohane (1989). International Institutions and State Power. Essays in International Relations Theory. Westview Press, Boulder, CO, p. 3). 'Regime' is hence just one type of institution, describing sets of connected agreements, or, in Keohane's words: sets of "explicit rules, agreed upon by governments" (see: R.O. Keohane (1993). The Analysis of International Regimes. Towards a European-American Research Programme. In: Regime Theory and International Relations. V. Rittberger, (ed.), Clarendon Press, Oxford, UK, pp. 23-45, p. 28). Thus, the term 'regime complex' may suggest to many readers that the intricate governance architecture on climate change consists only of (intergovernmental) regimes. However, as chapter 13 clearly stresses, the institutional complexity of climate governance is much more diverse - and also includes other types of international institutions, namely international organizations (e.g the UN and several of its bodies) and transnational or hybrid institutions (such as public-private partnerships). Given this diversity of institutions involved, it would be much more accurate to speak of an "institutional complex" here, not just of a "regime complex". One reference for the term "institutional complexity" is: S. Oberthür and O.S. Stokke, (eds.) (2011). Managing Institutional Complexity: Regime Interplay and Global Environmental Change. The MIT Press, Cambridge MA. | Taken into account - combined with comment 10803 |
| 11145 | 13 | 6 | 15 | 6 | 27 | Please add EU- Australia linkage | Accepted - text revised |
| 13909 | 13 | 6 | 15 | 6 | 17 | There seems to be an inappropriate normative judgement implied in the sentence "…can function as a de facto international policy" : it seems that it would be just as effective as an international binding agreement. | Taken into account - text revised by deleting this phrase |
| 13910 | 13 | 6 | 28 | 6 | 34 | Further benefits of linkage could be mentioned: reduced risk of carbon leakage; economies of scale and positive spill-overs from innovation and changing markets. Further disadvantages of linkage could also be mentioned: increased transaction costs and policy complexity in the linked systems. A general comment: this discussion of linkage seems to focus exclusively on linkage of carbon markets. Policy linkage may however take other forms, some of which are discussed in the text such as joint product standards, free trade agreements for low carbon products, harmonized taxes etc. These may have other benefits/advantages which are not discussed here. | Taken into account - text revised to include additional nuance |
| 14639 | 13 | 6 | 3 | 6 | 7 | It seems odd to note other fora (line 3), and then immediately pivot to public-private partnerships, private sector governance initiatives, etc., and fail to mention other important plurilateral and multilateral fora, including the Major Economies Forum, the G20, the G8, APEC, the Montreal Protocol, the Arctic Ministerial, etc. The ES should include some reference to these other fora. | Accepted - text revised with clarifying language |
| 16231 | 13 | 6 | 3 | 6 | 7 | After discussing UNFCCC-based agreements, this paragraph covers "other fora" but only mentions private and transnational initiatives. You might first mention the variety of regional intergovernmental intiatives, such as the Regional Greenhouse Gas Initiative in the North America and, of course, the EU. At a minimum, perhaps the second sentence of the paragarph could begin like this: "In addition to a number of intergovernmental efforts at the regional level, a prominent development since AR4..." | Rejected - regional initiatives are discussed in Ch. 14 |
| 18243 | 13 | 7 | 5 | | | Should insert the subject of research and investment for adaptation to climate change, and not consider exclusively the subject in the mitigation level. | Accepted - text revised |
| 16362 | 13 | 7 | 5 | 7 | 6 | Not clear what this refers to, please clarify | Taken into account - this paragraph has |

| 14416 | 13 | 7 | 6 | | | Should emphasize the breakthrough at Copenhagen through enlisting China and other major emerging market economies in undertaking mitigation goals, in contrast to the earlier exclusion of all developing countries from mitigation efforts in Kyoto | Taken into account - covered in Sections 13.3 and 13.5 |
| 8968 | 13 | 71 | 1 | | 3 | IPCC (201b) is a flawed report that does not consider the history of the field, its link to military technologies, or its social implications. Here are my detailed comments on that report. "The concept of geoengineering can be traced back to the 1960s." (p. 2) -- It is in fact an ancient concept, rooted in classical myth and hubris, and discussed throughout history, including the 1830s when building an "artificial volcano" was being discussed. Geoengineering was widely discussed after 1945 and practiced in fact (not a concept) in 1958 and 1962 in projects Argus and Starfish Prime using nuclear weapons to intervene in Earth's magnetosphere. The USSR made similar efforts. Note that this was high atmospheric and near space geoengineering.<br>References.<br>J.R. Fleming, Fixing the Sky: The checkered history of weather and climate control. Columbia University Press, 2010. J.R. Fleming, “Iowa Enters the Space Age: James Van Allen, Earth’s Radiation Belts, and Experiments to Disrupt Them.” Annals of Iowa 70 (Fall 2011), 301-24; available in America: History & Life with Full Text.<br><br>"There are basically three ways to change the climate." (p. 19) -- Yet according to climatologist C. E. P. Brooks writing in 1950, "There are at least nine and sixty ways of constructing a theory of climatic change, and there is probably some truth in quite a number of them."<br>Reference:<br>J.R. Fleming, Historical Perspectives on Climate Change. Oxford University Press, 1998.<br><br>"Are there some aspects of SRM that require expertise that is missing from the author teams of Working Group I, II and III? Are there other things the author teams can do to improve their ability to develop a high quality assessment? The BOG felt that there is no obvious missing expertise amongst the lead authors. For specific questions that may need further consideration, it is advisable to involve others as contributing authors." (p. 93) -- Obviously, there was no sense of history in the report, and seemingly a rather perfunctory discussion of ethics. | Noted - discussion of SRM has been updated with support from Working Group I |

| 18695 | 13 | 8 | 18 | 8 | 21 | The summary of section 13.3 does not mention that 13.3 discusses conclusions from formal modeling of possible agreements. | Rejected - the introduction will not include this level of detail |
| 2264 | 13 | 8 | 2 | 8 | 3 | This is not true. None of the greenhouse gases, including the most important, waterr vapour. mix uniformly with the atmosphere and this fact is concealed by restricting the sites where they are measured to places where the wind blows from the sea. | Taken into account - combined with comment 6944 |
| 7137 | 13 | 8 | 2 | 8 | 4 | This is one reason, but the need for international cooperation has a broader basis. It is not only a matter that everyone has to mitigate, because a common good is affected, but it also necessary to consider the very different contribution – historical and current- to the GHG problems, and the very different capacity of each country in order to deal with those problems. There are also differences in the degree and gravity in which the climate change problems affect each country, depending of the vulnerability (environmental, but also socio and economic vulnerabilities), in this situation the international cooperation in critical, to create global conditions to deal with this problem- That’s why international cooperation is not only about mitigate, but also related with finance, technology, capacity building, and, of course, adaptation. " | Taken into account - covered in Section 13.2 |

| 3737 | 13 | 9 | 22 | 26 | | see comment 7, climate engineering belongs in a separate section on responses. See comment 1. | Taken into account. The reference to the regional nature of SRM impacts have being clarified. Since the literature on SRM is so new, the local (and not global) impacts of such policies was stated as hypothetical and a reference to |
| 12040 | 13 | 9 | 22 | 10 | 46 | The tragedy of the global commons and the current state of international political deadlock is well explained. | Noted. No action required. |
| 18690 | 13 | 9 | 22 | 9 | 25 | This point is very specific, surely some references can be given. | Taken into account. Sentence was rephrased following other comments too. |
| 13626 | 13 | 9 | 22 | 10 | 7 | It is not technically free riding if a country would not experience costs from climate change and accordingly chooses not to mitigate emissions. | Taken into account. The text on free riding was revised following also |
| 2265 | 13 | 9 | 23 | 9 | 24 | This is not true. None of the greenhouse gases, including the most important, waterr vapour. mix uniformly with the atmosphere and this fact is concealed by restricting the sites where they are measured to places where the wind blows from the sea.. | Accepted. "uniform" was removed. Same for FAQ 13.1. |
| 2266 | 13 | 9 | 23 | 9 | 24 | There is again the curious emphasis on emissions when the supposed effect is changes in atmospheric concentrations, which are not neceasarily related to emissions | Rejected. The relationship is explained elsewhere in IPCC reports. |
| 6985 | 13 | 9 | 28 | | 29 | You should explain how solar radiation management could create excludable benefits. That's an entirely new idea that I can't comprehend. | Taken into account. This issue of regional impacts of SRM is discussed extensively in 6.9.2. Section 13.4.2. already discusses the international governance aspects of SRM. A link to those two sections was added here. Text |
| 5912 | 13 | 9 | 28 | 9 | 29 | It is not be possible to geographically limit the effects of solar radiation management (Robock, A, Oman, L and Stenchikov, GL. 2008. Regional climate responses to geoengineering with tropical SO2 injections. Journal of Geophysical Research–Atmospheres, 113(D16) D16101), a claim supported by literature on climate system feedbacks. Uncertainty around the effects of SRM and associated rapid rates of change to ecosystems is a key argument for employing the Precautionary Principle with regards to geoengineering (Brewer, PG. 2007. Evaluating a technological fix for climate. Proceedings of the National Academy of Sciences, 104(24): 9915–9916; Trenberth, KE and Dai, A. 2007. Effects of Mount Pinatubo volcanic eruption on the hydrological cycle as an analog of geoengineering. Geophysical Research Letters, 34(15) L15702; Nancy Tuana, Ryan L. Sriver, Toby Svoboda, Roman Olson, Peter J. Irvine, Jacob Haqq-Misra, Klaus Keller (2012) Towards Integrated Ethical and Scientific Analysis of Geoengineering: A Research Agenda, Ethics, Policy & Environment, 15, 2). | Taken into account. More on this to be covered in section 13.4.2. There is literature on risk and SRM and ethics and SRM. More detail on the benefits excludability is added here (section 13.2). |
| 2161 | 13 | 9 | 28 | | | the benefits are not global public goods, but mitigation is a global public good providing benefits globally | Accepted. Phrase was clarified because benefits are not public goods but mitigation and sinks actions towards |
| 12795 | 13 | 9 | 29 | | | Solar radiation management is firstly explained on p.13 ll. 13f. ; you may like to make a cross reference | Taken into account. A general definition of SRM was added here. |
| 2162 | 13 | 9 | 29 | | | I do not understand to which word "These" refers. | Accepted. Text was reorganized to make |
| 16179 | 13 | 9 | 39 | 10 | 22 | A discussion of sectoral policies (discussed later in the chapter) inserted here, with some analysis of how Ostrom's criteria for collective action apply more effectively within a sector than between states, will integrate the sectoral approach more logically into the discussion. | Taken into account. Sectoral approach was cited and referenced to 13.4.1, where it is discussed in more depth. |
| 2406 | 13 | 9 | 42 | 9 | 42 | Comment on specific text: I think you need to clarify what you mean by legal remedies here and how these relate to the broader point about internalising externalities. Is law an instrument to bring about such an internalisation here or something else? | Accepted. Text has already changed slightly in response to another similar comment. |

|---|---|---|---|---|---|---|---|
| 8085 | 13 | 9 | | 13 | | In this text, a cascade of concepts is proposed to approach (and supposedly understand) the complex phenomenon of international cooperation. The exposition goes<br>– from six "principles" (economic efficiency, precaution, sustainable development, common but differentiated responsibilities, fairness)<br>– to four "criteria" (environmental effectiveness, aggregate economic performance, distributional impacts, institutional feasibility)<br>– the last one of which (institutional feasibility) further contains four "sub-criteria" (participation, compliance, legitimacy, and flexibility).<br>The reason for the above listing is to express the surprise that among the so many aspects of the phenomenon, the word "stability" (group-wise, as well as time-wise) is never mentioned. Of course, specialists understand that this is part of the "participation" sub-criterion. But for the non specialist, this is not so evident. Shouldn't that notion (a principle, a criterion or a sub-criterion, I am not sure) appear somewhere? A main reason for that is that, the factual lessons that will be reported on further down the text (in particular p. 26, lines 32-47 and 1-2 of p.27 on the fate of the Kyoto Protocol) bring in the forefront the issue of the stability (group-wise, as well as time-wise) of the agreement.<br>It is suggested here that some room be made in this section for the stability notion, integrating it in the otherwise interesting "cascade" just reviewed. | Accepted Stability was explicitly mentioned in the text together with participation. Specific references on stability of coalitions were added. |
| 17665 | 13 | 9 | 16 | 9 | 20 | Another important feature of climate change is that emission reduction strategies create high costs for certain industries/countries; it requires the change of whole economic systems and lifestyles, which makes international cooperation extremely difficult | Taken into account. For dicussion on climate change impacts within countries, refer to chapter 15. A reference to differential costs among |
| 11587 | 13 | 9 | 28 | 9 | 31 | This statement should be removed.Free riding is all over by developed countries on the attempts to deal with climate change. This section is also skewed as it does not also take into consideration of the suffering of countries that have not contributed to the climate change problem. | Accepted. A statement about consequences of free riding (i.e. "…and thus imposing harm to others") has been |
| 10805 | 13 | 9 | 22 | 10 | 46 | As noted above, the discussion of the global commons frame should also include some discussion of a counter frame that seeks rationales for action in the complementary gains from climate mitigation and various other economic growth or development focused actions. This idea creeps in at the very end of the section in lines 20-22 of p. 10, but perhaps deserves a short para in the section, to note that this perspective has grown in significance, perhaps as a reaction to the challenges of winning political agreement around the global commons frame. David Victor's work (http://www.cfr.org/climate-change/madisonian-approach-climate-policy/p8885), the Harwell House document (http://eprints.lse.ac.uk/27939/1/HartwellPaper_English_version.pdf), Stephen Rayner "How to eat an elephant: a bottom-up approach to climate policy" (2010) in Climate Policy Vol 10 are all good references. This counter frame is controversial for sure, but represents a new current since AR4 and as such is worth mentioning as a subsidiary theme. In my own work, I have argued the usefulness of such a co-benefits frame to induce developing country actions, although contra the papers above, I am at pains to point out I don't think this frame is suitable for industrializing country actions (Dubash, "Climate CHange and Development" in Stewart, Kingsbury and Rudyk eds., Climate FInance, NYU Press, 2009. | Accepted. Mention was more explicit with respect of other policies that generate co-impacts for climate (suggested literature on bottom-up approaches was included). A sentence was added with respect of co-impacts that climate has on other policies (those are analyzed in depth in section 5.10). |
| 3963 | 13 | 9 | 22 | 9 | 22 | The word "tragedy," being an expression sounding rather emotional to non-economists who are not familiar with externality problems, is not appropriate for an IPCC report. | Accepted. The title in section 13.2.1.1. was changed and "tragedy" was |
| 6945 | 13 | 9 | 23 | 9 | 24 | See comment to introductory section 13.1 above. The uniform mixing contributes, but is not the only reason for local emissions having global impacts, c.f. teleconnections through atmospheric and oceanic dynamics. Need to revise this non-precise statement. | Accepted. "uniform" was removed. Same for FAQ 13.1. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 6946 | 13 | 9 | 23 | 9 | 31 | The sentence "overuse of the atmosphere as a depository of GHGs is likely" is awkward (i) as it seems to imply we are purposely "using" the atmosphere as a DEPOSITORY of GHGs rather than unintentionally polluting it, and (ii) the uncertainty assessment "likely" is unsupported by evidence or reference to, e.g., the WGI contribution to AR5. Please note that depository commonly refers to a place where something is stored for safekeeping (e.g., a bank).... Furthermore, the subsequent focus on geoengineering and the link to mitigation further confuses the purpose of this opening paragraph. Considering all our comment on this particular first paragraph, we suggest a careful revision. As it currently stands, it provides in our view a very bad start into this chapter/section. | Accepted. Change the word “depository” such as with the word “receptor”. Same for FAQ 13.1. |
| 3964 | 13 | 9 | 24 | 9 | 24 | The term “atmosphere” used here and elsewhere in the Draft is not defined. It is crucial to define the term appropriately in order to address the linkages of climate change with other atmospheric problems such as ozone depletion and transboundary air pollution. See (1) Shinya Murase, “Protection of the Atmosphere”, Annex B, Report of the International Law Commission, Sixty-third session, 2011, General Assembly, Official Records, Sixty-sixth session, Supplement No. 10(A/66/10), pp.315-329, http://www.un.org/law/ilc/; (2) Shinya Murase, “Protection of the Atmosphere and International Law: Rationale for Codification and Progressive Development”, Sophia Law Review, vol. 55, nos. 3-4, 2012, pp. 1-58, http://www.sophialaw.jp/faculty/paper/index.html; (3) Shinya Murase, “Protection of the Atmosphere and International Lawmaking”, in Miha Pogacnik, ed., Challenges of Contemporary International Law and International Relations: Liber Amicorum in Honour of Ernest Petric, The European Faculty of Law, Nova Gorica, Slovenia 2011, pp. 279-297.<br>I would suggest the following definition of the Atmosphere: “Atmosphere” means the layer of gases surrounding the earth in the troposphere and the stratosphere, within which the transport and dispersion of airborne substances occurs."<br>Commentary<br>(1) While the relevant conventions and legal documents have refrained from defining the term “atmosphere” or “air,” (although the definition of “air pollution” is given in a number of conventions and documents (e.g., Article 1 (a) of the 1979 ECE Convention on Long-Range Transboundary Air Pollution; 1987 Institute of International Law Resolution on Air Pollution across National Frontiers).<br>(2) The definition is not intended to be an “objective” definition but simply to be a practical “use of term(s)”. It is nonetheless considered appropriate to formulate a legal definition in such a way as to reasonably correspond to the scientific definition. The major international issues to be dealt with by the present Draft are transboundary air pollution, ozone layer depletion and climate change as they relate to the troposphere (up to 18 km from the surface of the earth) and the stratosphere (up to 50 km), which scientists call “lower atmosphere”. Eighty per cent of air exists in the troposphere and twenty per cent in the stratosphere. The present Draft is concerned only with these two layers. Since virtually no air exists in the upper atmosphere (mesosphere and thermosphere) and outer space, they are of little concern for the present Draft.<br>(3) It is necessary to address not only the substantive aspect of the atmosphere as the layer of gases but also the functional aspect of the atmosphere as a medium for transporting and dispersing airborne substances (pollutants). This latter aspect of the atmosphere as a medium for transporting pollutants is extremely important: even if some of the pollutants are relatively innocuous while in the atmosphere, they can accumulate in Polar Regions and have serious concentrated effects on fauna and flora, and, through food chains, on humans, as in the cases of persistent organic pollutants (POPs) and mercury (Hg). It is not appropriate to identify specific “pollutants” in the Draft. That is an exercise that should be left to the provisions of specific conventions and domestic laws. Therefore, the more neutral term “substances” is employed here.<br>(4) Currently, gaps in the existing treaty regime are significant; the lack of a treaty regime addressing the link between transboundary air pollution and climate change despite growing scientific evidence in recent years that so-called “tropospheric ozone” and “black carbon” in the atmosphere directly threaten both air quality and climate change. It has been said that the so-called greenhouse gases identified in the UNFCCC are responsible for only 60 to 65 percent of climate change, while these other substances are responsible for some 35 to 40 percent. This | Rejected. There is a clear definition of atmosphere in the glossary. |
| 6947 | 13 | 9 | 36 | 9 | 36 | Re "global nature of climate change": Could refer to WGI and WGII reports here, providing the link to the underlying assessments of the physical science basis and impacts and adaptation of climate change. | Taken into account. The TSU will handle this. |

| 15041 | 14 | | | | | It is not possible to read legends in Figure 14.11. | Accepted. A larger font will be used. |
| 15038 | 14 | | | | | It is not possible to read legends in Figure 14.8. | Accepted. A larger font will be used. |
| 15039 | 14 | | | | | It is not possible to read legends in Figure 14.9. | Accepted. A larger font will be used. |
| 15395 | 14 | | | | | This systematically ignores economic valuation in discussion of development patterns, energy use and adaptation – what are WTP measures of "healthy" vs actual diets – similarly for urban density and household lifestyle preferences. The discussion presents what is largely an energy and carbon theory of value, that ranks every action solely in terms of effects on carbon emissions. The discussion of diets is just silly – has no one read Danzig account of optimal solutions to the diet problem as a warning about oversimplified modeling (see George B. Dantzig, ''The Diet Problem.'' Interfaces 20, 4 (1990) pp. 43–47)? Diet is a matter of taste, even in the poorest countries, and there would be large welfare losses from imposing such diets that are completely missed by the failure to mention consumer valuation in any way. The level of detail about development patterns is highly excessive – it is elevator economics reciting numbers from tables without developing/obscuring any insight. The chapter discusses projections of climate impacts to 2100 as if they should guide current adaptation decisions. I believe this is at variance with the recommendations found in papers by Mendelsohn and others that decisionmakers should manage for current climate – then update. Dealing with large scale and long lived investments such as dams and afforestation required looking further forward, but predictions of local climate are not possible with the current state of GCM's. Without reliable predictions of long term climate at the required level of geographic detail, there is not enough information to change decisions from what it would be with current climate.Suggested papers by Mendelsohn: Robert Mendelsohn and Ariel Dinar Climate Change and Agriculture: An Economic Analysis of Global Impacts, Adaptation, and Distributional Effects, Edward Elgar Publishing, England, 2009. Mendelsohn, R., A. Dinar and A. Sanghi. 2001. "The Effect of Development on the Climate Sensitivity of Agriculture", Environment and Development Economics 6: 85-101. Mendelsohn, R. 2000. "Efficient Adaptation to Climate Change", Climatic Change 45: 583-600. Mendelsohn, R., W. Nordhaus and D. Shaw. 1994. "Measuring the Impact of Global Warming on Agriculture", American Economic Review 84: 753-771. Mendelsohn, R., A. Dinar, and L. Williams. 2006. "The Distributional Impact of Climate Change On Rich and Poor Countries" Environment and Development Economics 11: 1-20. Robert Mendelsohn The Impact of Climate Change on Land. Ch. 4. Climate Change And Land Policies Edited by Gregory K. Ingram and Yu-Hung Hong, Lincoln Institute of Land Policy,2011 pp 62-83. | The point is well taken. In the descriptive sections, we are just examining trends and drivers without undertaking an economic valuation of those. This is now clarified. Moreover, the section on diet is no longer in the chapter as indeed the claims are controversial. We also drastically shortened the detail of development patterns. |
| 10448 | 14 | | | | | Maybe the explanations can be removed | Accepted. The text will be shortend. |
| 10449 | 14 | | | | | Maybe the explanations can be removed | Accepted. The text would be shortend. |
| 10450 | 14 | | | | | Maybe the explanations can be removed | Accepted. The text will be shortend. |
| 10799 | 14 | | | | | Graphs and tables should replace the long paragraphs describing regional issues, thus reducing the number of pages while keeping the information. | Implemented. Text has been shortened drastically. |
| 10936 | 14 | | | | | Does the Asia-Pacific Partnership still exist? | Taken into account. Status of APP at time of final report should be checked |

| 4007 | 14 | | | | | Under the "improved forest management" row I believe information beyond rotation length could be highlighted such as the effect of species selection, management of other C pools (e.g., dead wood) and impats of fertilization should be mentioned. Also, the references for this row are all over 7 years old, there has been tremendous new work in this area since that time | Accounted for. References updated and related-data were included. This issue is also accounted for in section 14.3.2.3 Regional examples of synergies and |
| 6125 | 14 | | | | | The clasification of region is very difficult. It seems that in this chapter, regions are grouped by geographycally as well as development stage. I have a sympathy with this process. However what this way of regional groupings misses is difference in culture. For example regional culture is quite different between people (region) whether they believe in polytheism or monotheism. Even among the latter people, Islam and Christianity is quite different. Those are not reflected in this classification. Another example is that Japan, China, Korea share the same culture to the certain extent in that price mechanism may not function well. On the other hand, Australia and NZ are the countries where price mechanism may well function. However, actual grouping is that China and Korea are classified as East Asia and Japan and Australia/NZ is classified as JPAUNZ. When we discuss the effectiveness of certain mitigation policies, this grouping may not necessarily be appropriate. That said, I know it is quite difficult to have another grouping because we do not have such literatures. What I wish Chapter 14 team to do is to draw readers' attention on this limitation in the footnote. | It is hard to come up with a grouping that suits all needs. We used one that was principally related to the level of economic development (plus geography) to make it consistent with the modelling exercises and useful for the purposes of our chapter. When discussing the literature, we have to follow the regional groupings of the literature, which is now stated in the chapter. |
| 15396 | 14 | | | | | Adapting to Category 4 and 5 hurricanes is not easy – maybe not worthwhile. | Noted. This is a comment no directly related to the text and very specific to |
| 15397 | 14 | | | | | Don't confuse mitigation and adaptation – not a win-win, they are not the same – don't let mitigation test interfere with increased air conditioning as a response to heat stress. | Noted. This is an specific comment on a case in which there is not possible a win-win solution between adaptation and mitigation. Many authors have identified multiple activities in which synergies between adaptation and mitigation are not only possible, but convenient in some sectors. Part of the text that has been moved to section 14.3. This text refers to actions that could be taken at regional level to potentiate these |
| 18376 | 14 | | | | | This section could be significantly shortened by removing redundancies and focusing the discussion. | We have implemented this. |
| 10447 | 14 | | | | | This section is not necessary here, since it is dealt with in a separate chapter | Accepted, although there is not any other independent chapter dealing with this. Part of the content of regional character was moved to section 14.3, |
| 18374 | 14 | | | | | Improve linkage and coordination with Chapter 12 regarding the coverage of urbanisation trends. | Taken into account: The text has been shortened. Part of the description of urbanization trend has been moved to |
| 18669 | 14 | | | | | 14.2 – the regionalisation is changed to ? | I don't understand this comment. |
| 3665 | 14 | | | | | Delete or massively reduce to save space as overlapping with chapter 12.2. | Taken into account: The text has been shortened. Part of the description of urbanization trend has been moved to |
| 10285 | 14 | | | | | T. Homma et al., "Quantitative evaluation of time-series GHG emissions by sector and region using consumption-based accounting", Energy Policy (forthcoming) will also provide consumption emissions by region including non-CO2 GHG, and additional information on the consumption CO2 emission pattern. | Accepted, will read through the paper and reference accordingly. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 11677 | 14 | | | | | As for the analysis on consumption-based emissions, regional analysis by sector done in many studies should be also comprehensively reviewed. Although a sectoral analysis of consumption-based emissions is reviewed on page 29-31, it seems that only one study is reviewed. It has been widely acknowledged in many studies that while manufacturing industries in many developed countries are net CO2/GHG emissions importers, those industries in developing countries with high CO2 intensity are net emissions exporters (e.g. Figure 14.20, Peters et al. (2011), Nakano et al. (2009), Barett et al. (2011), Homma et al. (forthcoming). For example, Sinden et al. (2011) which focus on an analysis of aluminium sector in EU, show that the net import of CO2 emission embodied in aluminium imported into Europe results in one-third of aluminium consumed in Europe in 2004, therefore, it can conclude that the impacts of EU-ETS on the aluminium consumed in EU is marginal. On the other hand, Homma et al. (forthcoming) in which consumption-based emissions including CH4 and N2O are analyzed, reveal that regional tendency of consumption -based GHG emissions in agricultural sector is different from that in manufacturing sector due to the different trade structure. That is, the major agricultural commodities importers like Japan and the EU15 are consistently net GHG emissions importers for the agricultural sector from 1990 to 2005 while major exporters like the U.S., Australia and New Zealand are consistently net GHG emissions exporters. Reference: G. E. Sinden, G. P. Peters, J. Minxd and C. L. Webere (2011) “International flows of embodied CO2 with an application to aluminium and the EU ETS,” Climate Policy, 11 (5), pp. 1226-1245. Barrett J., Owen A., Sakai M. (2011) UK Consumption Emissions by Sector and Origin, Report to the UK Department for Environment, Food and Rural Affairs by University of Leeds,http://randd.defra.gov.uk/Document.aspx?Document=FINALEV0466report(2).pdf | Agreed. The last section of 14.2. 5.2 selectively addresses the consumption based emission at sectoral level. The text will be revised. |
| 3666 | 14 | | | | | Delete or massively reduce to save space as overlapping with chapter 11.2. | Accepted. The text was reduced here. |
| 18377 | 14 | | | | | Much of the material presented in this section should be merged with the discussion in section 14.2 in order to cover past trends and possible future (projected) developments in one place. Based on this, section 14.3 could instead focus on identifying and discussing the resulting barriers and opportunities. Also, some of the material presented in section 14.3.2.4 refers to impact studies which are better covered by WGII; instead cross-referencing to the relevant sections in the WGII report should be included here. | We now merged sections 14.2 and (previous) 14.3 in the new 14.2 to address this issue. |
| 10451 | 14 | | | | | The sectoral issues has to be rewritten with more references | Accounted for. References were |
| 3667 | 14 | | | | | Delete or massively reduce to save space as overlapping with chapter 12.2. | Taken into account: The text has been shortened. Part of the description of urbanization trend has been moved to |
| 5897 | 14 | | | | | Please shorten the text - you do not need to give information in the text and in the figures. In addition, you deviate from the main topic too much. Please concentrate on things relevant for development and mitigation, avoid delving into studies and you should come up with about one third the length of the text. | Accounted for. The text was reduced to 2 pages and refocused on development and mitigation. |
| 3668 | 14 | | | | | Delete or massively reduce to save space as overlapping with chapter 12.2. | Accounted for. The text was reduced to 2 pages and refocused on development and mitigation in order to avoid |
| 18379 | 14 | | | | | In addition to the CDM and JI discussion, could you expand your analysis to address in how far regional policies are able to encourage investment and/or generate funds as agreed in Wellington (section 3.4 page 9)? Also, for some material in section 14.3.4.2 the specific regional focus and related distinction to Chapter 16 is not clear. | There really is not much regional policy on these matters and thus hard to discuss. |
| 3670 | 14 | | | | | Delete or massively reduce to save space as overlapping with chapter 16. | Yes, implemented. |
| 3671 | 14 | | | | | Cut chapter by 60%, reduce amount of graphs. Overlaps with chapter 15.2.3. | Accepted. Check with Ch. 15 regarding |
| 18378 | 14 | | | | | Please note redundancies regarding the discussion of the APP (page 65, lines 1-24 and page 82, lines 19-31) | Accepted – text revised. |

|---|---|---|---|---|---|---|---|
| 10930 | 14 | | | | | An underlying theme in this section is that regional cooperation may have advantages and trade is mentioned a lot. A barrier is leakage. However, as discussed a little in this paper, it is perhaps beneficial to base climate policy around regional groupings as it will reduce leakage. This may be a relevant reference in several places? Peters, G.P., Hertwich, E.G., 2008. CO2 Embodied in International Trade with Implications for Global Climate Policy. Environmental Science and Technology 42, 1401-1407. | Accepted. |
| 3672 | 14 | | | | | Cut chapter by 60% to save space. | Accepted. |
| 3673 | 14 | | | | | Cut chapter by 60% to save space. | Accepted. Section on cooperation in the energy sector has been reduced |
| 18373 | 14 | | | | | The section on trade is in parts very well developed but would benefit from a better linkage to the sectoral issues discussed in sections 14.2 and 14.3. | Rejected due to lack of space. This would be desirable, but requires |
| 10454 | 14 | | | | | This section is very dense to read and it would be preferable to put in some bullet points | Rejected. We don't use bullet points, but we streamlined the whole section such that readability is improved. The section |
| 10937 | 14 | | | | | A relevant refence on the effect of trade on climate policy is Peters, G.P., Minx, J.C., Weber, C.L., Edenhofer, O., 2011. Growth in emission transfers via international trade from 1990 to 2008. Proceedings of the National Academy of Sciences 108, 8903-8908. | Accepted. |
| 18375 | 14 | | | | | Please coordinate coverage and discussion of REDD(+) with Chapters 11 and 15 in order to develop specific regional focus of the assessment. | Taken into account. Parts of the text (e.g the box on Latinamerican forestry activities) were deleted. In line with the new structure of the chapter the current text focuses on regional cooperative efforts where synergies between mitigation and adaptation are necessary. What is written in this text does not |
| 10455 | 14 | | | | | A problem with this section is that synonyms are numerous and it would be preferable if one gets an index for easy reference | Taken into account -there will be an index (glossary) included |
| 16229 | 14 | | | | | This para. states good example for S-S co-operation, but I guess it's good to talk and encourage developing countries for more co-operation by make a spot and give more examples of developing countries that have a good resources and give advice how they could share and exchange to gain more benefits for them as a developing countries. Co-operation between Asia and Africa is good example; e.g. China, India and Malaysia at Asia side; South Africa, Algeria and Egypt on the other hand. It's good also to encourage the Regional Banks to support that co-operation. | Taken into account - this is convered in s 14.4.3.4 as supported by the literature. |
| 7417 | 14 | 0 | | | | Spillover effects , burden sharing, and burden shifting are important dimensions at the regional level when assessing climate change policies but unfortunately are not well covered in this chapter and executive summary lacks any statements related to these dimensions. | These issues are discussed in detail in chapter 13 and to some degree in chapter 15. The division of labor |
| 16955 | 14 | 0 | | | | This seems to be a really interesting chapter and I regret not having had time to review it in depth. It does need closer coordination with some other chapters, I think most notably Chapters 4, 5, and 12. I confine my remarks to just one, very specific issue, though my remarks on interpreting the data may have broader implications across the chapter (and maybe more widely). | We now interlink our chapter much more closely with chapters 4, 5, and 12. |
| 14897 | 14 | 0 | | | | It would be useful to revise the chapter with an eye toward greater clarity as to the answers to some key framing questions, namely: What is the potential value of this chapter? Who is the audience? What sort of information would you like them to take from it? What is the key story that this chapter tells? | We streamlined the chapter now so that answers to these questions are now more apparent. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 14898 | 14 | 0 | | | | 1) More clarity and consistency about the definitions of the regions would be helpful. Section 14.1.3 states that the chapter considers 10 specific regions (p. 7/27-31), but elsewhere the chapter refers to different sets of regions (e.g. p. 43/Table 14.4 and p. 45/Table 14.5 – 6 regions; 40/Figure 14.25 – OECD, BRIC, Other; 41-42/Figure 14.26 – other regions; 52/Table 14.6; 57/fig 14.41; 58/f14.43). Are the key points in the chapter about the 10 identified regions or about supranational regions in general? Or are they about country groups at differing levels of economic development? | We stick to our 10 region definition whereever the data is available; this definition is particularly suitable to assess the development and mitigation challenges of different regions. Otherwise we have to use the regional |
| 14899 | 14 | 0 | | | | a. The chapter also deals with subnational regions in pp.49-50. | We dropped this. |
| 14900 | 14 | 0 | | | | b. Some of the figures in 14.1 suggest that belonging to a region could explain development level; others suggest that certain development indicators are independent of region. How to make sense of this in the narrative? | The charts are meant to simply illustrate regional differences without implying causality. This is now clarified. |
| 14901 | 14 | 0 | | | | c. How important are regions for all of these issues? In some cases (e.g., journal articles, high tech exports (Fig 14.6)) individual countries may be more important than regions. In other words, does belonging to a region explain variance? Is there less variance across countries than across regions? | Point well taken. We have now streamlined this discussion and focused more on issues where regions matter. |
| 14902 | 14 | 0 | | | | To streamline the text and reduce its length, it may be helpful to | Have done this. |
| 14903 | 14 | 0 | | | | (continued from comment above) Cut back on text that is duplicative with sectoral chapters (e.g., in 14.3.2). For example, examine the following issues in comparison with specific chapters: (i) Agriculture with chapter 11; (ii)Regional scale trading initiatives: EU/ETS, WCI vis a vis 13.6; (iii) Urbanization with chapter 12; (iv) Finance with chapters 13, 14, 16; (v) the public/private finance discussion overlaps with chapter 13. Also it would be valuable to integrate the discussion of trade flows with trade discussion in chapter 13. | We have implmented the suggested cuts |
| 14904 | 14 | 0 | | | | Leapfrogging – This seems like an important issue, and one regarding which it seems the chapter could go into greater depth. More detailed and precise discussion of the capacity barriers to leapfrogging and how they play out across various countries and regions would be useful, for example. Also, are there historical analogs in which leapfrogging occurred successfully that could provide examples for how to break through financial, capacity constraints? | We have added some more discussion on this. Unfortunately, the literature is rather thin on this important issue and are conclusions reflect this uncertainty. |
| 14905 | 14 | 0 | | | | a. Adaptation -- The integration of mitigation and adaptation strategies is likely to be important in some contexts. The AR5 should find some way to highlight and address this issue in the overall report and presumably in WGIII. Chapter 14 would seem to be a good place to do it, given the regional nature of these strategies and how they intersect. | Accepted. There is some discussion on the relation adaptation-mitigation in the chapter. Particularly referred to regional cooperation schemes in subsection |
| 14906 | 14 | 0 | | | | Regional cooperation – With respect to regional cooperation, are there lessons to be learned about what differentiates successful and less successful regional cooperation initiatives? | This is now drawn out more clearly. The problem is, however, that the level of regional cooperation (outside of the EU) is rather low so that it is hard to make |
| 14907 | 14 | 0 | | | | The text is dense in places. Presentation of text is therefore highly important – bolding text, using bullets, etc. to provide visual distinction and relief is very important for this chapter and for the whole report. A number of sections of this chapter could be improved in this way, for example, the executive summary and the discussion of regional cooperation mechanisms. | We will address this in the next round of the report. |
| 14908 | 14 | 0 | | | | It is important to standardize units throughout the chapter and indeed, the AR5. For example, Figure 14.21 is expressed in GTC, whereas most discussion refers to CO2. | Yes, will stribe to standardize where possible. |
| 18362 | 14 | 0 | | | | The treatment of trade and embedded emissions is a very sensitive issue and a clear vision of its coverage should be developed in cooperation with Chapters 4, 5 and 13. | As it is an important part of our story, we decided to retain it here. But we are cooperating closely with the other chapters on the treatment of the issue; we also discuss the sensitivity and |
| 18368 | 14 | 0 | | | | General comment: Chapter 14 could be improved through a sharpening of key findings and better integration across the different chapter sections. The TSU is thus submitting a range of questions that can guide the author team in focusing their discussions in the relevant sections. | Have focused message and streamlined chapter. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 18369 | 14 | 0 | | | | Guiding question: What can be learnt from linking the analysis of differences in regional mitigation capacities to the assessment of regional cooperation options for mitigation?<br>Given that mitigation capacity is low in all developing countries, what are the implications of this insight for different world regions:<br>• Should Africa focus on leapfrogging and technology transfer alone?<br>• How could development and mitigation in resource rich countries be linked to induce investments in important infrastructure (see relevant literature of Venables and van der Ploeg)?<br>• What are implications for industrialized countries in terms of selecting suitable partners (Africa or BRICS countries) when thinking about different investment strategies?<br>• What does this mean in the context of the green growth and sustainable development debate?<br>• Which role do envisaged urbanization trends in Africa in the context of mitigative capacity and cooperation options play, with megacities yet to be built and the development of rural areas largely shifting out of focus of decision makers?<br>In order to answer some of these questions, a number of issues need more focus and attention: at present, sections 14.2, 14.3 and 14.4 remain largely disconnected. Although there is interesting material presented in each of these sections, the assessment carried out does not connect the insights gained in order to build up a coherent storyline. While 14.2 provides an interesting description of the status quo, section 14.3 does not identify opportunities and barriers that may be relevant in altering the trends identified in 14.2 or forging regional cooperation initiatives in the sectors discussed (energy, agriculture, urbanisation), and in section 14.4, the sectoral focus is almost completely lost. | We are now addressing some of these questions in the chapter. To answer all of them is difficult as there are complex country and regional specificities to consider. Some brief reply to the bullets: Africa has the potential to leapfrog but will only succeed if the substantial barriers to doing so are removed (with international help). The urbanization challenge is now discussed in the chapter. The other bullets really go beyond the scope of our chapter. |
| 18370 | 14 | 0 | | | | Improve linkage to Chapter 3 regarding the usage of relevant assessment criteria in the assessment of policies. | We closely liaise with chapter 3 on this (although the X-Cuts in Vigo were poorly planned and did not advance the linkages to chapter 3 much as there was |
| 18371 | 14 | 0 | | | | The following sections could be improved through a better internal linkage: introductory section (14.1.5.1 and Figure 14.6), section on leapfrogging & technology transfer (14.3.3), section on investment and finance (14.3.4) and section on technology-focused agreements (14.4.3). Also, as the treatment of sub-national issues is beyond the focus of this chapter, the treatment of sub-national regions in section 14.3.3.1 may be removed. | Now done. Thanks for pointing this out. |
| 18372 | 14 | 0 | | | | Guiding question: What do we learn from consumption based accounting? Although the relevant sections on consumption are well developed their purpose for the chapter remains unclear. What needs to be more clearly developed in the assessment is a clear insight to what we learn from consumption based accounting and international emission flows (see related comment on embedded emissions and trade). Its role as a useful tool to assess the distribution of mitigation efforts needs to be evaluated in strong coordination with Chapters 4 and 5. | We now discuss more clearly the relevance of consumption-base accounting. They matter as they pose special challanges for mitigation for carbon exporters and carbon importers (also, e.g. in terms of border tax |
| 18380 | 14 | 0 | | | | Please remember to convert all monetary units to 2010 US$ (methodology, common exchange rates and deflators are provided by Metrics & Methodology CLAs). | Yes will do (when the literature allows it). |
| 19005 | 14 | 0 | | | | In your analysis of development trends and implications on emissions at the regional level in section 14.2, please include relevant regional scenario analyses such as from the Asian Modeling Exercise, EMF 22/27, or Low Carbon Societies. You may wish to liaise with your colleagues from Chapter 6 for more information on this. You may also wish to discuss with chapter 6 authors using regionally specific results from the scenario database, which is compiled for the purpose of the AR5. | We are in close touch with chapter 6 on these matters. |
| 18665 | 14 | 0 | | | | 86 pages, 46 over target!<br><br>A disaster in comparison to chapter 13, more of a rough outline than a draft | Now heavily stramlined. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 18666 | 14 | 0 | | | | Is the aim to describe the situation in different regions and compare them or to discuss how regional coop. can drive mitigation? The first part is to a big extent covered by earlier chapters (though the division into regions tend to differ in an uncontrolled way). | The chapter does both and now says it more clearly; the overlapy have been reduced and we are the only chapter to present data and issues at a highly regionally disaggregated level (10 |
| 18667 | 14 | 0 | | | | A problem is that the division used seems to be mainly geographical or economic/geographical – not according to existing cooperations. | This is true and, in our view, necessary for the regional heterogeneity portion of our chapter (14.2); we explicitly discuss |
| 18668 | 14 | 0 | | | | The chapter contains a lot of descriptive material – will have to be sorted out since the expectation is to have 40 pages. | Yes, now mostly sorted out. |
| 18670 | 14 | 0 | | | | Handles themes that are already handled (or should be handled) in other chapters such urbanisation. Interesting as such but shows a lack of coordination. | Urbanization was a specific bullet to be tackled in our chapter. We now coordinate more closely with the other |
| 18671 | 14 | 0 | | | | The chapter is all over the place – a clear need to sort out what is or should be handled in other chapters and what is the overall theme for this chapter. My understanding is that the idea is to go through regional cooperation form a policy/mitigation perspective but not implemented in that way. | Regional cooperation is a central theme, now in 14.3, but regional heterogeneity is also a central theme, now in section |
| 18673 | 14 | 0 | | | | EU ETS (in reality wider, a climate and energy package)<br><br>WCI<br><br>EU ETS is also described in chapter 13 (more structured but also more limited in scope) | We have a clear division of labor with chapter 13 on what to include in our chapter (the main assessment of the EU ETS) while they focus on the linkage to global deals. |
| 3182 | 14 | 0 | | | | The purpose of this chapter is elusive. It seems to cover the same territory as the sectoral chapter. There's a lot of discussion of CDM and REDD (both topics discussed to death in earlier chapters) and also on decentralized agreements (discussed in chapters 2 and 13 among other places). What is the center of gravity of this chapter and its main goal? | In streamlining the chapter, we have now focused on the importantce of regional heterogeneity for mitigation oppounities and capacities and the |

|---|---|---|---|---|---|---|---|
| 13602 | 14 | 15 | | | | while increase in per capita income along with population growth are important in terms of GHG emissions, also think one needs to flag the changing landscape and how supply chains are global now and what the implications are of this. E.g. Watson and Wang (2007) did a study entitled Who Owns China's Emissions, which suggest that a fair chunk of its emissions can be traced to goods for those outside of its borders. www.tyndall.ac.uk/content/who-owns-chinas-carbon-emissions Glen Peters has also done work http://www.sciencedirect.com/science/article/pii/S0301421508002905 | Taken into account. The consumption-based emissions are dealt with in Section 14.2.3. |
| 5885 | 14 | 16 | | | | Please user larger font in the figure. Labels at the x-axis are too small. | Accepted. A larger font will be used. |
| 14931 | 14 | 16 | 3 | | | Does the CO2 data include AFOLU other than forest fires? | Accepted. A clear indication on the exclusion of AFOLU will be made. |
| 14932 | 14 | 16 | 3 | | | Does the CO2 data include AFOLU other than forest fires? It would seem important to include this. | Accepted. EDGAR DB, which is used here, includes AFOLU emissions in forestry fire partly. The exact relationship between AFOLU, LULUCF and foresty fire in EDGAR will be defined later in the |
| 5886 | 14 | 16 | 8 | 16 | 18 | Text can be shortened considerably, is redundant to figure 14.10. | Accepted. The text will be shortend. |
| 14933 | 14 | 17 | 10 | | | This is an important figure. Some version of it should be made salient in the chapter and considered for inclusion in the technical summary. | Noted. |
| 8938 | 14 | 17 | 12 | 18 | 2 | This is a far too short representation of the lively and elaborate scientific debate on the EKC. The existence of the EKC for air pollutants is already debated, but for CO2 there is a huge body of literature, that mostly does not find an EKC. | Rejected. More discussion on EKC does not seem to be appropriate here considering that there is little empirical evidence available and that it is hard to |
| 5887 | 14 | 17 | 16 | 18 | 2 | Text can be shortened, if you have no indication of EKCs you do not need to mention them. | Accepted. The text will be shortend. |
| 14934 | 14 | 17 | 18 | 18 | 2 | The meaning of this sentence is unclear. Does it mean to say that Figure 14.12 provides evidence of an Environmental Kuznets Curve with respect to CO2? Or does it mean to say that 14.12 suggests a hockey-stick trend. Figure 14.12 doesn't seem to clearly support either hypothesis, though it is seems more consistent with an EKC. | Taken into account. It is not possible to derive any general conclusions on EKC. This section shows regional heterogeniety w.r.t greenhouse gases |

|---|---|---|---|---|---|---|---|
| 16956 | 14 | 18 | | | | I find this format of data fantastically rich and important. Unfortunately, quite a lot of this richness is lost in the level of aggregation, and also the text which seems to be hunting for one specific thing (evidence of a Kuznets curve peak) and fails to find it. This blinds the authors to far more interesting observations. However, a number of these would only be possible at a more disaggregated level, not least to avoid the big gap between US$10 and US$20,000/capita income which seems to be where the really interesting questions arise.<br>Grubb, Hourcade and Neuhoff present a version of the chart which is more disaggregated, in terms particularly of Annex I but also containing a number of other specific countries. It seems easiest to offer the thoughts that the Chapter offers from this:<br>There is a clear pattern of emissions rising in the early to mid stages of economic development – up to around $10,000 per capita – though even here there is huge divergence between Brazil and some other mid-income countries, which emit more than twice as much for the same levels of wealth (never mind Russia, which is much higher still). Economic recovery in eastern Europe and Russia was not accompanied by corresponding emission increases.<br>Economic growth has not uniformly increased emissions, once countries have reached a basic stage of industrialisation. Above incomes of about $10,000-$20,000 per capita, there is little sign of consistent relationship and indeed emissions per person seem to have roughly stabilised in many industrialised countries for the past 20 years, and more recently for some of the most advanced "developing" countries of Asia and Latin America. However there is clear divergence between North American and Australia on the one hand, and the major industrialised economies of Europe and Asia on the other: … [the section goes on to explore in more detail and concludes .. ]<br>"This makes future trends and possibilities all the more interesting. Most of the world's populations reside in the emerging and developing economies. The apparent stabilisation and "open jaw" of different per-capita emission levels at incomes above $10-20,000 per capita is then hugely significant . Given the weight of billions of poor people, the global average income level is around $10,000. Across Asia overall and much of Latin America, it averages at around $6,000 but is rising rapidly. It makes a massive difference whether their future trajectories emulate those typical in the US and Australia in moving towards 20tCO2 per capita; the 10 tCO2 typical in Europe and Japan; or closer to the 5-6 tCO2/cap of France…. [Or ] emulating the current energy sector emission levels of Brazil … "<br>The tone of the current IPCC text appears to be that Annex I countries have failed to cut emissions– a focus of message which seems a combination of blame and hopelessness; if this were uniformly true through the peak of climate change concerns and efforts (broadly the mid 1990s to mid 2000s), it would be an extremely depressing conclusion and would inexorably lead us to conclude that the world has no real hope of tackling climate change. The actual message from the data, across Annex I and elsewhere, seems far more subtle and intriguing.<br>The more detailed analysis of policies in the book (notably Chapters 5 - 7) suggest that this is due to a combination of Pillar 1 (regulation and engagement) and Pillar 2 (prices and markets) policies.<br>Reference: Grubb, Hourcade and Neuhoff, Planetary Economics: the Three Domains of Sustainable Energy Development, Taylor & Francis forthcoming (Chapters 1 – 5 submitted, others in draft available on request). | Taken into account. Due to the lack of evidence about environmental Kuznets curve, the explanations on the graph will be shortend and will describe just regional differences. |
| 10914 | 14 | 18 | | | | A relevant figure may be Steinberger, J.K., Timmons Roberts, J., Peters, G.P., Baiocchi, G., 2012. Pathways of human development and carbon emissions embodied in trade. Nature Clim. Change 2, 81-85. | Rejected. The figure here aims to show regional differences, not national ones. Country-by-country discussions are better fit in other chapters, such as 15 |
| 12496 | 14 | 18 | 4 | | | This figure is the same as figure 5.4.2 in chapter 5. In order to cut text, coordinate which information that needs to be included in this chapter, and what is already included in chapter 5. | Accepted. I will try to coordinate with Chapter 5 authors. |

|---|---|---|---|---|---|---|---|
| 5892 | 14 | 21 | 28 | 21 | 30 | What does this mean? Poor people emit more if relocated in an urban area, middle income groups less than when dwelling in small towns and high income groups emit the same wherever they live? If this is the case, what do you want to point out here? Please either elaborate a little further why you give the information here or delete text. | Taken into account: The text has been rewritten. |
| 14938 | 14 | 21 | 8 | 21 | 10 | syntax is unclear; delete “than”? | Editorial. corrected |
| 12498 | 14 | 22 | 2 | | | Part of the ledgend is missing | Taken into account: fixed (figure |
| 14940 | 14 | 22 | 2 | | | legend is incomplete, missing several regions | Taken into account: fixed (figure |
| 14942 | 14 | 22 | 20 | 22 | 24 | Is this phenomenon evidence of a “leapfrogging” of sorts? | Editorial: text removed |
| 14944 | 14 | 24 | 13 | 24 | 14 | Perhaps surprisingly, the per-capita energy consumption of developing country cities does not appear much lower than that of developed country cities in Figure 14.16, in contrast to the statement here. | Noted and included |
| 14943 | 14 | 24 | 7 | 24 | 10 | The reference to “Asian” would appear to encompass East Asian, yet East Asian cities have higher than average per capita energy use according to Figure 14.16. | Noted |
| 11665 | 14 | 24 | | | | The content of the text in 14.2.4 nearly overlaps with those of 5.5.3 (Consumption trends) and 5.5.4 (Embedded carbon in trade). While the related research results shown in 5.5.3 and 5.5.4 are reviewed in a balanced manner, the text in 14.2.4 tends to be biased toward presenting particular research results. | Overlaps are acknowledged and will be removed. Cross-references will be used to guide the reader to the relevant sections. Efforts will be made to mitigate |
| 11666 | 14 | 24 | | | | The uncertainties of the consumption-based CO2/GHG emissions are not stated in the text. This is an important issue, and many studies pointed out these uncertainties. It has been acknowledged in the related literature that the consumption-based emissions highly depend on the data used, data coverage (geographical/sector/gas (energy-related CO2 only, or energy-related CO2+non-energy-related CO2 from industrial process etc, or GHG emissions including non-CO2) and aggregation and the methodologies. (e.g. Lenzen (2001), (Lenzen et al. (2004), Lenzen et al. (2010)). Reference: Lenzen, M. (2001) Errors in Conventional and Input-Output–Based Life-Cycle Inventories, Journal of Industrial Ecology, 4(4), pp. 127-148., Lenzen, M., Pade, L. and Munksgaard, J. (2004) CO2 Multipliers in Multi-region Input-Output Models, Economic Systems Research, 16(4), pp. 391-412., Lenzen, M., Wood, R. and Wiedmann, T. (2010) Uncertainty Analysis for Multi-Region Input-Output Models: A Case Study of the UK's Carbon Footprint, Economic Systems Research, 22(1), pp. 43-63. | Agreed - uncertainty of the consumption approach is a very important issue. This will be briefly acknowledged, however, detailed discussion (with references to the literature) may be better located in ch 5. where consumption approaches are first introduced. |
| 10916 | 14 | 24 | | | | I thought this was an interesting and well written section. It has a nice graphical presentation of the results, showing many relevant aspects. What is the relationship with this section, and the similar sections in Chapters 4 and 5? | The close relationship with this section and 5.5 and 4.4 is acknowledged. Cross-referencing will be used to avoid duplication. The relationship between |
| 10921 | 14 | 24 | | | | One regional aspect that was not captured in this section, but is worth including, is the trade in fossil fuels: Davis, S.J., Peters, G.P., Caldeira, K., 2011. The supply chain of CO2 emissions. Proceedings of the National Academy of Sciences 108, 18554-18559. | Accepted. This aspect will be included in the SOD. |
| 11667 | 14 | 24 | 32 | 24 | 34 | As for the purpose of the UNFCCC national inventory, the quotation of Glen P. Peters (2008) is not appropriate. The UNFCCC states the purpose of the inventory in its own website at http://unfccc.int/national_reports/items/1408.php. | Accepted. |
| 11668 | 14 | 24 | 34 | 24 | 35 | The text states that there are three emission accounting methods. However, the terriorial approach is almost the same as the production approach. Therefore, there are two emission accounting methods. | Although territorial and production approaches are similar, there are important differences highlighted in the literature. However, changes to the text |
| 12499 | 14 | 24 | 31 | | | Take out what is already in chapter 5 with cross references to this chapter. | Accepted. The close relationship with this section and 5.5 and 4.4 is acknowledged. Cross-referencing will be used to avoid duplication. The |

| 7329 | 14 | 25 | 11 | 25 | 11 | Many reference lacked even though you cited in texts, e.g. Manfred Lenzen et al. 2007 | Efforts will be made to comprehensively cite relevant studies in the SOD. |
| 7328 | 14 | 25 | 13 | 25 | 15 | Peters et al. (2011) on Nature Climate Change updated these numbers up to 2010. doi:10.1038/nclimate1332 | Accepted |
| 11670 | 14 | 25 | 13 | 25 | 15 | The quotation of Glen P. Peters, Jan C. Minx, et al. (2011) is not necessary as the sentence "Global CO2 emissions (CDIAC data, which includes fossil-fuel, cement and gas-flaring sources) grew…" only explains the statistic data of CDIAC. | Accepted. Associated paragraph will be removed in SOD. |
| 11669 | 14 | 25 | 13 | 25 | 30 | It should be mentioned clearly whether the emissions stated in this paragraph are production-based or consumption-based. | Accepted. Emissions stated are production-based. Associated paragraph |
| 11671 | 14 | 25 | 22 | 25 | 23 | The quotation of Dabo Guan et al. 2008; Dabo Guan et al. 2009; Gregg et al. 2008 is not necessary as the sentence "East Asia has seen its production emission increase…the United States." only explains the statistic data of CDIAC. | Accepted. Associated paragraph will be removed in SOD. |
| 10917 | 14 | 26 | 11 | | | "largely drives this growth". Disentangling what drives the growth may be difficult. While trade has grown, the question is really what drives the growth in trade. It is perhaps worth mentioning that studies generally do not analyse what is driving the growth in trade (otherwise it might look like you are indirectly saying trade is the problem). | Accepted. |
| 10918 | 14 | 26 | 23 | | | A good reference here is Chakravarty, S., Chikkatur, A., Coninck, H.d., Pacala, S., Socolow, R., Tavoni, M., 2009. Sharing global CO2 emission reductions among one billion high emitters. Proceedings of the National Academy of Sciences 106, 11884-11888. | Accepted. |
| 11672 | 14 | 26 | 20 | 26 | 29 | The definition of "carbon footprint" is not clealy described. Also, it is not clear the relationship between the carbon footprint and the consumption-based emissions. | Definition of 'carbon footprint' will be provided with cross-reference to 4.4 or |
| 11678 | 14 | 26 | 30 | 26 | 37 | Evaluation periods should be mentioned. | Accepted |
| 11673 | 14 | 26 | 38 | 28 | 29 | It seems that the text presents only the results using GTAP and CDIAC statistics. In terms of global estimations, other studies such as Nakano et al. (2009) using OECD and IEA statistics should be referred as well in a balanced way, because according to Sato (2012) and Homma et al. (forthcoming), large uncertainties on estimations of net emissions transfers are observed in many studies. Even if the same MRIO estimation method is used, it is widely recognized that there are large difference in results, as shown in Sato (2012). Furthermore, the uncertainties in GTAP data used in Peters et al. (2011) should be mentioned. Reference: Peters G.P., J.C. Minx, C.L. Weber, and O. Edenhofer (2011). Growth in emission transfers via international trade from 1990 to 2008. PNAS.<br>M.Sato (2012), Embodied carbon in trade: a survey of the empirical literature, Centre for Climate Change Economics and Policy Working Paper No. 89. Homma et al. (forthcoming). Quantitative evaluation of time-series GHG emissions by sector and region using consumption-based accounting, Energy Policy | This is an important issue and will be addressed accordingly. We are still discussing the best description and format to present the uncertainty of consumption based accounting with Chapter 5. This will be covered in SOD (either in our chapter or chapter 5). |
| 11674 | 14 | 26 | 38 | 28 | 29 | Data source should be mentioned. | Mentioned in Figure caption, but will also be given in main-body text. |
| 9128 | 14 | 27 | | | | As for abbreviation for Japan, the word "JAP" is used in the figure 14.18 and in the sentences in page 19 to 30. I would like to recommend using the abbreviation JPN or JAPAN instead. | Accepted. |
| 9159 | 14 | 27 | | | | good figure | Noted. |
| 9160 | 14 | 27 | | | | good figure | Noted. |
| 14946 | 14 | 27 | 12 | 27 | 12 | -“is” should be “was”, given that this is discussing 2004. | Accepted. |
| 14945 | 14 | 27 | 5 | 29 | 27 | may be able to save space here by cutting back on examples. | Accepted. |
| 11676 | 14 | 27 | | 29 | | It should be mentioned whether the evaluated CO2 emissions are energy-related CO2 emissions only or sum of energy-related CO2 and non-energy-related CO2 (from industrial process etc.). | Accepted. |
| 11675 | 14 | 27 | 12 | 27 | 15 | In the text, it says that North America is the largest net emission importer in 2004. As far as I see from Figure 14.18, Western Europe is the largest net emission importer (1072 Mt). | Accepted. Figure was revised without necessary changes being made in the |
| 14948 | 14 | 28 | 21 | 28 | 23 | This is a sentence fragment. | Accepted. Sentence will be revised. |
| 14947 | 14 | 28 | 4 | 28 | 4 | This sentence attributes 1366 MT CO2 to East Asia, whereas Figure 14.19 attributes 1266 MT CO2. | Accepted. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 9127 | 14 | 28 | 4 | | | The growth of traded CO2 emissions of East Asia is 1266 MtCO2, while in the sentence which appears in page 28, the number is 1366 MtCO2. | Accepted. |
| 9129 | 14 | 29 | | | | The changes from 1990 to 2008 include the effects of the collapse of the Soviet Union. The world trade increase accelerated in the 2000s. Therefore referring the growth from 2000 to 2008(?) is better than the period starts from 1990. The following paper mentions at this point. Hoshino, Y., Sugiyama, T., Ueno, T. 2010. International Comparison of trade embodied CO2 emissions, Journal of Japan Society of Energy and Resources 31 (4), 8-14 (in Japanese), http://www.jser.gr.jp/journal/journal_pdf/2010/journal201007_2.pdf , English Abstract can be downloaded from the following URL.. http://www.gispri.or.jp/english/symposiums/images110706/Dr_Sugiyama-2.pdf | This is an important issue. 1990 has been used as it is the base-year for the Kyoto Protocol. Reference will be given to the acceleration in world trade from 2000 |
| 8309 | 14 | 29 | 11 | | | Correction: delete reference to intra-region traded CO2 emissions, "e.g. between US and Canada" between 1990 to 2008 as trade between those countries will only begin after 2013 | Throughout this section, 'trade in CO2' refers to virtual transfers of CO2 associated with physical trade in products rather than monetary trades |
| 12500 | 14 | 29 | 2 | | | Figure 1.7.b in Chapter 1 summarises this point. Consider to refer to this figure in order to save space. | Overlap between two figures acknowledged. Cross-reference will be given. Value-added by fig 14.19 will be |
| 12501 | 14 | 29 | 2 | | | Figure 1.7.b in Chapter 1 summarises this point. Consider to refer to this figure in order to save space. | Fig. 14.20 and associated text to be |
| 14949 | 14 | 29 | 28 | 31 | 8 | This is the beginning of an interesting discussion. But is it relevant to include here, given that only two regions are represented in Figure 14.20? It would be better to treat topic this more comprehensively, including emissions intensity in addition to absolute emissions. This section could then be linked up with a discussion on trade. | Fig. 14.20 and associated text to be revised in SOD |
| 10919 | 14 | 30 | | | | This is a nice figure. Is it possible to split the sectors into Primary, Secondary Energy Intensive, Secondary non-Energy Intensive, Tertiary and plot them as different colours? It would be interesting to see how the different types of sectors vary by region. | Fig. 14.20 and associated text to be revised in SOD. Consideration will be given to the visual categorisation of |
| 14950 | 14 | 31 | 19 | | | This figure needs further explication. For example, which time period does it cover? The caption and the figure should provide more information about the RCP pathways, etc. It would also be valuable to include information on AFOLU emissions in one of these figures. | Accounted for. The explanation is provided in a paragraph that was inserted previously to the figure, as follow: "Global estimates of changes during the period 1850-2005 in ecosystem carbon associated with land use and land cover change show that 65 GT have been released into the atmosphere (Lawrence et al., 2012; Pongratz, et al., 2009). These ecosystem carbon losses have been larger in South East Asia, East Asia, Sub Saharan Africa, and Latin America (Lawrence et al., 2012; Houghton, 2003; Hurtt et al., 2011; Pan et al., 2011; |

|---|---|---|---|---|---|---|---|
| 5893 | 14 | 31 | 21 | 32 | 6 | Please correct text and figure subscript. Wood harvest does not constitute a Land-use change. Wood removed during land clearing for other land uses than forestry is usually not considered "harvested". And cumulating harvests in a naturally re-growing system and terming the result "land use flux" without considering the regrowth is just false. Please check the sources and, if in doubt, consult a forester. | Rejected. The fraction of the carbon accounted as wood harvest from land clearing is variable and dependent on the coincident activities of land transformation and forestry. In many cases, especially in the historical period, the wood carbon harvested is zero. Following the pathway of carbon in CMIP5 Earth System Models only the fraction of carbon harvested for wood products is then transferred to product pools that have various decay times to release to the atmosphere. The remaining above ground carbon is either lost to the atmosphere through fire or remains in the ecosystem as litter and coarse woody debris. From a common sense point of view counting the harvest of regrowth carbon to landuse seems inconsistent, however the convention within earth system models is to keep the fluxes of land use separate from those of regrowth so that there is no double accounting for the regrowth flux. Hence a landuse flux from regrowth will appear as both a flux for the terrestrial ecosystem sink and a landuse flux giving |
| 10920 | 14 | 31 | | | | To include the trade in biomass carbon (C in wood products, C in crops, etc), then see Peters, G.P., Davis, S.J., Andrew, R., 2012. A synthesis of carbon in international trade. Biogeosciences 9, 3247-3276. | Rejected for the Agriculture section. This would be more suitable for the regional carbon trade section and is covered |
| 5894 | 14 | 31 | | | | Why do you give the RCPs' land-use emissions here? This should be placed in chapters 5 or 11, delete here. | Rejected. Neither chapters 5 or 11 refer to regional patterns, which is the focus of this Chapter. Projections seek to portrait how RCP´s relate to regional |
| 14951 | 14 | 31 | 9 | | | This discussion requires further context about the RCPs. Presumably this will be elsewhere in the volume. The text on p. 32 is written in some places as though it refers to a historical event rather than modeled pathways. The discussion seems very much in the details: is it possible to pull back a bit and distill some larger lessons and observations from the results of the modeling? | Accounted for. The figure on RCP´s was remade to make it clearer. A part of the section deals with historical data. Projections are contrasted against them. An explanation was included as to how |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 7500 | 14 | 32 | 21 | 33 | 6 | "Historical cumulative global wood harvest is estimated to be around 65Gt C (excluding slash) between 1850 and 2005 (Hurtt et al., 2006, 2011; Lawrence et al., 2012). Regionally the largest historical wood harvest amounts were in South East Asia, Sub Saharan Africa and North America (Figure 14.21). As a result of the historical increases in agricultural land and wood harvest, the cumulative global land use flux to the atmosphere between 1850 and 2005 is estimated to have been between 115Gt C (Pongratz et al., 2009; Lawrence et al., 2012) to over 150Gt C (Houghton, 2003; Canadell et al., 2007). Regionally, the largest historical land use fluxes were in South East Asia, Latin America, Sub Saharan Africa, and North America (Figure 14.21)". I don't know if the figure of 65 Gt C includes woodfuel and poles. The yearly average of 0.42 Gt C seems low. The estimated harvest in 2009 is 3.5 Gt C. It is difficult to believe some of the cumulative land use fluxes in figure 14.21. | Rejected. This is what the peer-reviewed literature shows. |
| 15042 | 14 | 33 | 1 | 33 | 1 | Although there is an item on sectoral issues for "low carbon development at the regional level", transport sector was not considered. Knowing that transport sector consumes most of fossil fuel in the world, it is recommended to be considered. | This is true but not something we can change easily at this stage (also given the tight page budget), also since there was no bullet for transport (but other sectoral issues). It is also not as clear as with the other 'sectoral' issues that the issues arising in the transport sector can usefully be discussed at the regional |
| 15043 | 14 | 33 | 8 | 33 | 9 | "… there are, in principle. Different pathways available…" | Thanks |
| 13607 | 14 | 33 | | 47 | | I was rather surprised at how quantitatively heavy this section is. While on the one hand, the focus here is on 'regions', there is an appetite for the richness and details and insights afforded by case studies (to do with regions, countries or subnational geographic settings pertaining to certain regions). All this to say I would suggest more of a balance between these quantitative / econometric studies and some insights from case studies (which tend to come from 'real world' examples of attempts at implementing, encouraging, etc. GHG emissions reductions -- there are some rich, insightful qualitative studies which I think are important -- see references throughout (U of Sussex work; various chapters in Ockwell and Mallett (eds) 2012; Haselip et al. 2011; etc.). (some are noted on page 50-51 but suggest more 'real estate' be allotted to these other types of studies / approaches and especially their insights) | The chapter has cut down on the quantitative section and includes, where relevant, regional case studies (but there are not that many that can be drawn on in the peer-reviewed literature). Peer-reviewed work by Ockwell refers to national-level low carbon technology transfer, which is useful but does not relate particularly to Agriculture. |
| 14952 | 14 | 33 | 3 | | | – It would be useful to expand this opening subsection by one or two paragraphs to provide some further framing for the discussion that follows. | Now restructured and includes a discussion. |
| 6791 | 14 | 33 | 1 | 85 | 7 | It may be helpful to shorten and merge contents under sections 14.3 and 14.4. This move may be helpful to reduce the number of pages and yet retain the flow. The revised section 14.3 may be further renamed to appropriately reflect the revised contents. | We have merged the contents of 14.3 and 14.4 as suggested. |
| 12502 | 14 | 33 | 19 | | | Make sure that this secion in line with the findings in the IPCC SRREN report, or point out why there are differences. New information, disagreements, etc. | Will consider in the SOD |
| 15950 | 14 | 34 | | | | This is now rather old data, and much has changed in the cost of both wind and pv, and no doubt gas as well; and rather misleading; as it doesn't take into account project timelines, water footprint, subsidies, etc. | Will look for more updated information. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 17387 | 14 | 34 | 19 | 34 | | "Table 14.3: Costs of electricity generation" does not seem to be very clear or complete, though cited from the source of the IEA report. As already indicated in the previous page (33 of 166), " Local costs are country-specific and may vary widely. They depend on two main features of a country or region." , however this table does not give any information related to such mentions, that is, one is unable to understand if the numbers are world averages for a certain period or specific to a particular region for a given time ? In addition, if the data represent an average across the world, then they are not so much meaningful enough. Anyway this table is a bit confusing and dissociated from the texts or arguments there in the narrative. Still more, the numbers in the first row look a little strange or unusual, one would wonder if they refer to the unit capacity of that kind of technology, if so, then they are not typical or understandable enough. For the 7th row, the unit "year" should not have been omitted in that case. | Table will be dropped. |
| 14954 | 14 | 34 | 27 | 35 | 34 | – This discussion could be streamlined with references to chapter 7, focusing only on the regional elements. | Yes, will do so. |
| 14953 | 14 | 34 | 8 | 34 | 26 | This discussion is useful context, but seems likely to be duplicative with chapter 7 and could be eliminated to save space. | Thanks, will consider cutting it. |
| 6764 | 14 | 34 | 9 | | 18 | Renewable energy, such as solar PV and wind power generation, has an unstable output and their energy density is low. Therefore, according to the regional peculiarity, the power grid expense accompanying extensive introduction is required.<br>DeCarolis and Keith (2006) [1] published a peer-reviewed detailed article on the economics of large-scale wind power which included the costs of long-distance electricity transmission, storage, and gas turbines to supplement the variable wind power output in order to meet a realistic time-varying load.<br><br>[1] J.F. DeCarolis and D.W. Keith (2006) The economics of large-scale wind power in a carbon constrained world, Energy Policy 34, p. 395, column 2, lines 9-20. | Thanks for the reference. |
| 6765 | 14 | 34 | 9 | | 18 | The evidence of "carbon cost at $30 per tonne CO2" is not clear. The reference must be described . | Now provided. |
| 5895 | 14 | 34 | 9 | 34 | 18 | Neglecting the costs of building a power grid puts energy generating options that work in small, "de-centralized" units at a disadvantage. By omitting grid construction costs coal, nuclear and gas are favored, wind and solar hindered. The same holds true for all other infrastructure - how do you get gas and coal to the e.g. CHPP? | A point that we will mention. |
| 15951 | 14 | 34 | 9 | | 18 | This statement a) uses very old data; and b) makes its analysis on very incomplete information about the real issues facing investors in the power sector - among others, fuel price volatility, water consumption, total quantity of the capital required, existing subsidies which will be triggered at cost to the utility, etc. Suggest it be caveated or deleted. | Will clarify point in revision. |
| 6766 | 14 | 35 | 10 | | 14 | Renewable energy, such as solar PV and wind power generation, has an unstable output and their energy density is low. Therefore, according to the regional peculiarity, the power grid expense accompanying extensive introduction is required.<br>DeCarolis and Keith (2006) [1] published a peer-reviewed detailed article on the economics of large-scale wind power which included the costs of long-distance electricity transmission, storage, and gas turbines to supplement the variable wind power output in order to meet a realistic time-varying load.<br><br>[1] J.F. DeCarolis and D.W. Keith (2006) The economics of large-scale wind power in a carbon constrained world, Energy Policy 34, p. 395, column 2, lines 9-20. | Thanks for this. |
| 14955 | 14 | 35 | 35 | 38 | 32 | – The urbanization discussion is important but presumably belongs in Chapter 12 and could be deleted here to save space. Discussion of the regional elements of urbanization may be appropriate here. | Taken into account: The text has been shortened. Part of the description of urbanization trend has been moved to |
| 15044 | 14 | 35 | 42 | 35 | 45 | The connection is missed between "… dioxide emission." and "Because traditional…". | Noted |

| 10922 | 14 | 38 | 34 | 38 | 50 | This paper gives similar numbers, but for GHG which may be quite relevant Hertwich, E.G., Peters, G.P., 2009. Carbon Footprint of Nations: A Global, Trade-Linked Analysis. Environmental Science and Technology 43, 6414-6420. | Noted |
| 14956 | 14 | 38 | 33 | | | Consumption. This section should be elevated in the subchapter hierarchy; consumption is not a sector per se. Also, some of this discussion seems generic, rather than regionally-focused. Should it perhaps be relocated to another chapter of the report (e.g., chapter 11)? | Take into account: Text shortened. You are not answering the first part of the comment |
| 10923 | 14 | 39 | 9 | 39 | 35 | This focus on food means you miss about 80% of household impacts, Hertwich, E.G., Peters, G.P., 2009. Carbon Footprint of Nations: A Global, Trade-Linked Analysis. Environmental Science and Technology 43, 6414-6420. | Taken into account: text removed |
| 10924 | 14 | 39 | 9 | 39 | 35 | The allocation between meat and non-meat depends on the metric used. You have used GWP100, but others are equally defendable. See Ch8 WGI | Taken into account: text removed |
| 12487 | 14 | 4 | 1 | 4 | 5 | Please rewirte this paragraph in a clearer language to bring through the essens. Suggestion: It is important to define regions based on socioeconomic issues for two distinct reasons: | Thanks, will implement. |
| 2269 | 14 | 4 | 1 | 87 | 31 | Once more, this Chapter is useless because there is no evidence that increases in greenhouse gases have a harmful effect on the climate. Again it is strange that the emphasis is on emissions, when the supposed effects are due to atmospheric concentrations | The link between emissions and concentrations is taken up in other chapters (and other working groups). For us, the focus of policy influence in |
| 12488 | 14 | 4 | 22 | 4 | 37 | This part can be shortened considerably. Please focus the excecutive summary on results rather than text book text. | Now shortened. |
| 14913 | 14 | 4 | 23 | 4 | 37 | this is one of the richer paragraphs in the Executive Summary (and the chapter), but the point made here is not easily found in the underlying text within the chapter. | Now the link between ES and chapter is made more clearly. |
| 14914 | 14 | 4 | 24 | 4 | 24 | Should this say “low income countries in Sub-Saharan Africa” or is MNA also included? As written, it seems to deviate from the regional framework that is set out in the chapter. | Yes, it should say low-income country in Sub-Saharan Africa. |
| 8077 | 14 | 4 | 35 | 4 | 37 | it is unclear whether the statement related to domestic finance only relates to developing countries or to all countries | We now have very little discussion of finance where we mostly refer to chapter 16 (esp. When it comes to concrete |
| 14915 | 14 | 4 | 37 | 4 | 37 | The identification of the degree of agreement and evidence in the conclusions presented in the Executive Summary seems useful. | Thanks |
| 12489 | 14 | 4 | 38 | 4 | 46 | This part can be shortened considerably. We suggest that you spend most of the excecutive summary on results rather than text book text. | Now done. Thanks for pointing this out. |
| 14916 | 14 | 4 | 43 | 4 | 46 | This sentence is important and should be more salient in the Exec Summary. | Will address this in the SOD. |
| 14909 | 14 | 4 | 1 | | | The Executive Summary should be revised to bring forth more strongly a narrative thread for this chapter. The existing text provides some good material for that, although it could be rewritten in a somewhat tighter and more direct style. For example, the opening sentence is particularly dense and somewhat unwieldy, and should be revised. | We have tightened the ES. |
| 14910 | 14 | 4 | 1 | | | What is the overarching goal of the chapter?Why do regions matter? Is this just a clever way of discussing countries without naming them? | Now clarified. Regions matter as they are different (in this sense it is an easier way to talk about them than about individual countries) and regional |
| 14911 | 14 | 4 | 1 | | | The overall frame of regional heterogeneity vs regional cooperation seems useful. | Thanks. |
| 14912 | 14 | 4 | 1 | | | Need to distinguish what belongs here from what belongs in Chapter 4. To what extent are these issues of development vs. purely regional issues? Another way to think about this is to consider the question: is there something about an OECD country in East Asia that is characteristic of East Asia rather than characteristic of OECD countries? Or is there something characteristic of a European country with a relatively low income per capita that stems from its location in Europe rather than its place on the per capita income distribution? | This is an interesting point. We will cover it in the sense that in some (geographic) regions the scope for regional cooperation appears to be much larger than in others. Being close to an area of deep regional integration (such |
| 14958 | 14 | 40 | 15 | 40 | 27 | The opening paragraph should be replaced with a reference to chapter 11. | Accounted for. It begins with a reference |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 5896 | 14 | 40 | 15 | 40 | 17 | Again: please don't confuse agriculture and forestry with land-use change. | Noted. Precision is made within the text |
| 10925 | 14 | 40 | | | | The allocation between CO2, CH4, and N2O depends on the metric used. You have used GWP100, but others are equally defendable. See Ch8 WGI | Accounted for. This paragraph was deleted. |
| 10926 | 14 | 40 | | | | This whole section seems to depend on one reference, Smith? | Accounted for. The section was much reduced and relience is made on Ch. 11. Therefore the reference to Smith is no |
| 2344 | 14 | 40 | | 47 | | In the "Agriculture" section, authors have perfectly elaborated their arguments to prove how regional disparities causes GHG emission under food demands of growing world population. However, concerning the issue of over pages, they can choose some selected figure for supporting main argument. | Accounted for. The page was reduced to 2 pages |
| 14957 | 14 | 40 | 14 | | | This section should be consolidated with chapter 11. Much of the material in here could be replaced with references to chapter 11. The regional issues should be drawn out more strongly in what is retained here. | Accounted for. The section was rewritten |
| 10221 | 14 | 41 | | 42 | | it would be more comprehensive if the same regions used inthe rest of the chapter (including the same abbreviations/acronyms) were also used in this figure | Accounted for. Abbreviation/Acronyms have been harmonised along the Chapter, while in its introduction the |
| 7419 | 14 | 41 | 1 | 41 | 11 | The cited (Smith et al, 2007) results on GHG emissions growth in the Middle East needs cross confirmation. The argument that the increase in emissions for this region is a result of growth in demand for livestock products is not plusible given that a lot of the livestock products consumption is met from imports and not domestic production. | Accounted for. The statement was deleted, as the text was much reduced and relies on Ch. 11 |
| 10452 | 14 | 41 | 12 | 41 | 27 | This section of Agriculture does not contribute much to the chapter and can be removed | The subsection aims at presenting regional mitigation opportunities and barriers in a sector that importantly contributes to carbon emission and has an important place in adaptation/mitigation development |
| 14773 | 14 | 42 | | 45 | | The discussion on these four pages relies entirely on IIASA's study that is more than 10 years old. It is necessary to provide a balanced view of alternative assessments of this kind. | Accounted for. This paragraph and reference were deleted. |
| 15045 | 14 | 42 | 19 | 42 | 21 | To use corn to produce ethanol is really a bad practice and it leads to a land misuse. | Accepted. This sentence was deleted |
| 14959 | 14 | 42 | 19 | 42 | 33 | This paragraph could be replaced with a reference to chapter 11. | Accepted. The paragraph as shortened and reference made to Ch. 11 |
| 15046 | 14 | 42 | 23 | 42 | 26 | It is not the case if the correct feedstock is used. It is not the case of corn. | Accepted. This sentence was deleted |
| 15047 | 14 | 42 | 30 | 42 | 33 | Why not sugar cane? | The paragrafh was deleted |
| 14960 | 14 | 42 | 34 | 42 | 43 | The regional implications could be drawn more strongly in this paragraph, or the paragraph eliminated. | This paragraph was deleted |
| 10453 | 14 | 42 | 7 | 42 | 33 | All lines from 7 - 33 can be removed and only regional comaprisions need to be included | Accounted for. The page was reduced to 2 pages to focus on |
| 5899 | 14 | 43 | | 45 | | Please consider combining both tables. | Accounted for. Tables were deleted |
| 10222 | 14 | 44 | | | | category NS=not suitable, is not shown in the graph | Accounted for. Figure was deleted to avoid overlap with Ch. 11 |
| 10223 | 14 | 44 | | | | category NS=not suitable, is not shown in the graph | Accounted for. Figure was deleted to avoid overlap with Ch. 11 |
| 5898 | 14 | 44 | | | | Please amend figure subscript: what does "with IR" stand for? | Accounted for. Figure was deleted to avoid overlap with Ch. 11 |
| 10224 | 14 | 46 | | | | the symbol for South America should be dark grey since change in productivity negative (-5) | This is the original figure. Can we modify it? Editorial - edit to be completed prior |
| 3302 | 14 | 47 | 29 | 48 | 11 | This short section could be eliminated, but keep the longer section 14.3.3.1, which is more directly relevant to chapter's regional focus. | Accepted - text in this section has been revised |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 13608 | 14 | 48 | 24 | 48 | | suggest a definition for technological capabilities (e.g. a region, firm, organization's, etc. ability to contend with technological change) or an adaptation is innovation capabilities See Ockwell (2012) policy brief By “innovation capacities” we mean the technological capacities to adopt, operate, adapt and innovate around new technologies within specific local contexts. p. 2 http://steps-centre.org/wpsite/wp-content/uploads/Low-Carbon-Development-briefing.pdf | Taken into account -definitional issues such as this one are being coordinated across multiple chapters. |
| 13609 | 14 | 48 | 25 | | 26 | how are number of researchers being defined? 'hard / natural scientists and engineers'? Suggest noting the distinction between BERD and GERD as that would suggest that relevant policy levers will change depending on whether or not business or govt agencies are key avenues for R&D | Taken into account - will clarify definition according to original source. |
| 14961 | 14 | 49 | 2 | | | This is an interesting figure, and a key figure for the leapfrogging discussion, but its implications are not discussed in any detail in the chapter (though they are in the Executive Summary). It would be very useful if it could be discussed further. Also, there are a few issues with the figure including as it relates to the regional discussion in the chapter: (1) Australia and New Zealand appear in the figure but are not represented in the legend. (2) Japan is treated in the figure as part of East Asia rather than as part of JPAUNZ. (3) Latin America (LAM) and Sub-Saharan Africa (SSA) are each represented by only one country, raising questions about whether the figure can claim to represent those regions (4) Middle East and North Africa (MNA), South Asia (SAS), and Southeast Asia and Pacific (PAS) are not represented. Is there a way to broaden the representation of the figure, perhaps by using measures for which data would be more widely available? | Taken into account - figure has been revised to make sure legend is accurate and regional groupings are consistent with rest of chapter. Due to data limitations some regional data are not available. We now discuss this in more detail in the chapter. |
| 14962 | 14 | 49 | 6 | 50 | 12 | Should the subnational discussion be relocated to Chapter 15? | Accepted - the subnational discussion has been deleted and given to chapter |
| 3669 | 14 | 49 | 6 | 50 | 12 | Delete or massively reduce to save space as overlapping with chapter 15. | Accepted - the subnational discussion has been deleted and given to chapter |
| 4796 | 14 | 5 | 15 | 5 | 18 | Personnaly I am in favour of the ETS as an appropriate instrument to mitigate climate change. But for instance the EU ETS only incorporate some sectors (i.e. not all), and this scheme could be improved in order to reach the targets, even ambitious ones. | The problems of EU ETS are discussed in detail in the SOD |
| 12490 | 14 | 5 | 20 | 5 | 22 | Include one good example | Will look for one. |
| 5878 | 14 | 5 | 26 | 5 | 28 | Cooperation does not necessarily mean tranfer of sovereignity. Please re-phrase sentence or delete it. | Ok |
| 12480 | 14 | 5 | 28 | 5 | 31 | Please consider this finding again. Since the intended mitigation objective will be reached per definition in a cap-and trade system, as long as the cap is set, such as in ETS. The challenge might be related to other aspects of the policy measure, such as the carbon price. | Will reconsider this finding as suggested. |
| 12491 | 14 | 5 | 28 | 5 | 31 | Please consider this finding again. Since the intended mitigation objective will be reached per definition in a cap-and trade system, as long as the cap is set, such as in ETS. The challenge might be related to other aspects of the policy measure, such as the carbon price. | Will reconsider this finding as suggested. |
| 6603 | 14 | 5 | 28 | 5 | 31 | Important messege for policy makers. Should not be deleted. | Will retain in. |
| 14917 | 14 | 5 | 29 | 5 | 30 | It is not clear from the chapter text that “the EU ETS has so far not been as successful as anticipated in actually achieving the intended mitigation objective.” The chapter does not really discuss anticipation of what the EU ETS might achieve. The EU ETS was a pilot program in many respects, and therefore provided a natural -- and useful, under principles of adaptive management -- laboratory to learn about how to design a cap-and-trade program to address carbon dioxide emissions. | Yes, this is an advantage of the EU ETS, but it was not just meant to be an experiment but a tool to achieve actual mitigation. But we will emphasize these issues more in the revised version. |
| 4797 | 14 | 5 | 38 | 5 | 43 | It should be noted that European Union undertook a climate-energy package till 2020 with associated targets (20% energy efficiency, 20% renewables, aned at least 20% CO2 emission reduction) | This is discussed now. |
| 12492 | 14 | 5 | 38 | 5 | 40 | Please rewrite or delete , "are to date, " | Will consider. |
| 7418 | 14 | 5 | 5 | 5 | 13 | Emphasize the mismatch in terms of scale between mitigation and adaptation. Modeling results related to mitigation are usually at high level of geographical and sectoral aggregations (chapter 6) whereas adaptation is essentially at local and sectoral levels. There is a real challenge for the IAM models to downscale to the sectoral and local levels and clear difficulties for the adaptation folks to aggregate to the IAM regional groupings. | Good point. Will mention in next version. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 13610 | 14 | 50 | 1 | | 9 | See comment 22 which I think may also be of interest (Abdel Latif 2012) | Rejected - not clear what this comment refers to (comment 22 where?) |
| 14963 | 14 | 51 | 3 | 51 | 16 | Should the sources in this paragraph be integrated into other chapters (e.g., Chapter 7) rather than being presented here? | Taken into account - coordinating with other chapters dealing with simliar topics |
| 14964 | 14 | 52 | 8 | 52 | 20 | The text should elaborate on the investment need differential in Table 14.6. This seems like an important issue for the chapter to cover, yet it is not really discussed in any detail here. | Taken into account -will be included as data and available literature permits. |
| 14965 | 14 | 52 | 21 | | | This general discussion of climate finance should be integrated into chapter 13. | We cut the discussion and largely refer to chapter 16 for financy issues. |
| 13611 | 14 | 55 | | | | the date says 2013 | Noted |
| 15048 | 14 | 57 | 7 | 57 | 8 | If NAMAS for transport sector are the most frequent actions for mitigating GHG emissions, why the transport sector is not considered elsewhere? | Accepted. Sectoral distribution of NAMAs referred to Ch. 15 |
| 14966 | 14 | 57 | 7 | 57 | 14 | This sectoral distribution of NAMAs probably belongs in a different chapter (15?) | Accepted. text shortened accordingly. |
| 14967 | 14 | 58 | 23 | 58 | 25 | The mention of CDM appears to be an editorial comment. What is meant by this? This should be explained further or deleted. | Accepted. Deleted as indeed not belonging into this section. |
| 14968 | 14 | 59 | 29 | 59 | 47 | Suggest breaking out the different categories mentioned here using bullets to improve readability. | Rejected. Section wille shortened substantially. Clarity is achieved without |
| 10928 | 14 | 59 | 33 | 59 | 34 | Sure, the transport will have a climate impact, but perhaps the trade reduces impact? The idea of trade is to allocate production more efficiently. While the current allocation may not be optimal for climate, with policies in place it may become optimal. Just because trade has transport, does not mean trade is bad for the environment. | Taken into account. This is a demand for better clarification. What is meant is not that trade is harmful since it involves transport, but that transportation is an |
| 10929 | 14 | 59 | 35 | 59 | 36 | This paper disucsses using regional trade blocks for policy will reduce leakage Peters, G.P., Hertwich, E.G., 2008. CO2 Embodied in International Trade with Implications for Global Climate Policy. Environmental Science and Technology 42, 1401-1407. | Taken into account. The reference seems to be more related to page 61. However, the discussion of leakage will be shifted to Chapter 5. A remark: It is true that leakage is smaller if there are less countries in the rest of the world. Figure 3 in the paper does not depict leakage but only emissions embodied in trade. Leakage would be those emissions i the rest of the world that are due to climate policies of the EU. Leakage can occur even if the emissions embodied in imports are nil. If an exporter of carbon intensive goods. |
| 15049 | 14 | 59 | 6 | 59 | 6 | It was not clear how transport systems are mentioned if no emphasis in these systems is considered along the text (item 14.3). | Taken into account. Transport systems will not be mentioned here. |
| 9095 | 14 | 59 | | | | it should review the barriers of Regional Cooperation and Mitigation and indentify key factors. | Taken into account. The review is the subjetc of the remainer of Section 14.2, |
| 4798 | 14 | 6 | 32 | 6 | 34 | I am not sure of this statement. Could you please provide evidence of this sentence (in particular effect of ETS vs. taxes) | Will discuss in more detail |
| 14918 | 14 | 6 | 8 | 6 | 9 | It is helpful that the introduction begins with comparison to AR4 | Thanks |
| 5879 | 14 | 6 | 38 | 7 | 17 | Section can be deleted - in my opinion, talking about what you want to show instead of presenting this is a waste of space. Instead, provide readers with a concise summary. | Yes, now streamlined. |
| 12481 | 14 | 60 | 14 | 60 | 15 | It is not necessarily a problem that the ETS do not cover all GHG emissions, if the other emissions are covered by other policy instruments. In many cases it is more important to regulate emissions by other instruments. Examples are Phase-out schemes of CFC as in the Montreal Protocol. Direct regulation of methane emissins from landfills are in place in many countries. The ETS also covers in some cases other GHGs than CO2, e.g. some European countries have opted in N2O in the ETS. | Taken into account. Wording is adjusted. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 12503 | 14 | 60 | 14 | 60 | 15 | It is not necessarily a problem that the ETS do not cover all GHG emissions, if the other emissions are covered by other policy instruments. In many cases it is more important to regulate emissions by other instruments. Examples are Phase-out schemes of CFC as in the Montreal Protocol. Direct regulation of methane emissins from landfills are in place in many countries. The ETS also covers in some cases other GHGs than CO2, e.g. some European countries have opted in N2O in the ETS. | Taken into account. Wording is adjusted. |
| 6767 | 14 | 60 | 14 | | 22 | I agree these probrems with existing trading systems. | Accepted. |
| 10036 | 14 | 60 | 14 | 60 | 22 | This part should be kept in SOD. Market-based mechanism such as emission trading has several problems. Volatility of emission permit prices affects volatility of product prices as evidenced by fluctuating price developments in the EU-ETS. Therefore, the market-based policy tools of cap-and-trade cannot provide credible incentives for the technological change, as described in (Montgomery, 2005, abstract) and (Baldursson, 2009, page29). These literatures are listed in the No62 line of this table.<br>In addition, CO2 leakage caused by the implementation of the ETS happened actually through transfer of industry from one country to others. Market mechanisms at least under Kyoto-like international scheme, where the condition of all countries' meaningful participation is not met, does not work well, as shown in (Rosendahl, 2011, abstract), (Aichele, 2012, page336), and (Peters, 2011, page1). These literatures are listed in the No50 line of this table. | Accepted. |
| 7420 | 14 | 60 | 23 | 60 | 33 | Please also reference the literature pointing to problems related to using border tax adjustment to fix the carbon leakage problem, particulary in relation to WTO and the UNFCCC principle of common but differentiated responsibilities. | Rejected. WTO issues are discussed in Chapter 13 and we refer to that in the chapter. |
| 10932 | 14 | 60 | 23 | 60 | 24 | Can you reference this? My reading of the literature would suggest that environmental legislation is a minor factor in location decisions. | Taken into acount. But it was not said that this effect is strong. |
| 12482 | 14 | 60 | 44 | | | This Box may be overstating the effect of carbon leakage, when stating in the first line that carbon leakage may fully offset regional climate policies. It is important to note that carbon leakage issues is not only related to the market prices . Some industries will prefer to stay in their original country due to other factors, such as competence, stable political situation etc. Please also consult other studies that have investigated this, an example might be : Vista Analyse Report, 2012-06. | Taken into account. Systematic treatment of leakage will be discussed in Chapter 5 in the SOD. |
| 12504 | 14 | 60 | 44 | | | This Box may be overstating the effect of carbon leakage, when stating in the first line that carbon leakage may fully offset regional climate policies. It is important to note that carbon leakage issues is not only related to the market prices . Some industries will prefer to stay in their original country due to other factors, such as competence, stable political situation etc. Please also consult other studies that have investigated this, an example might be : Vista Analyse Report, 2012-06. | Taken into account. Systematic treatment of leakage will be discussed in Chapter 5 in the SOD. |
| 10933 | 14 | 60 | 44 | 62 | 8 | There are different ways of defining leakage, and the choice taken here is a CGE approach (which is indirectly critiqued). For a more detailed discussion of ways of defining leakage, the following references are of use: Peters, G.P., 2010. Managing Carbon Leakage. Carbon Management 1, 35-37.; Peters, G.P., Hertwich, E.G., 2008. CO2 Embodied in International Trade with Implications for Global Climate Policy. Environmental Science and Technology 42, 1401-1407.; Peters, G.P., Minx, J.C., Weber, C.L., Edenhofer, O., 2011. Growth in emission transfers via international trade from 1990 to 2008. Proceedings of the National Academy of Sciences 108, 8903-8908. | Taken into account. Systematic treatment of leakage will be discussed in Chapter 5 in the SOD. We used the definition of leakage used by UNFCCC and by IPCC. Definition ssues are moved to Chapter 5. |
| 10931 | 14 | 60 | 6 | 60 | 22 | This paper is a good reference for parts of this paragraph Peters, G.P., Minx, J.C., Weber, C.L., Edenhofer, O., 2011. Growth in emission transfers via international trade from 1990 to 2008. Proceedings of the National Academy of Sciences 108, 8903-8908. | Taken into account where appropriate. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 10934 | 14 | 61 | 33 | | | A better refernece for this is, Peters, G.P., Minx, J.C., Weber, C.L., Edenhofer, O., 2011. Growth in emission transfers via international trade from 1990 to 2008. Proceedings of the National Academy of Sciences 108, 8903-8908. | Rejected. Why is a simple input-output analysis better than a structural econometric model that uses instrumental variable techniques to correct of endogeneity bias? Since we are interested in the effects of climate |
| 14969 | 14 | 61 | 40 | 62 | 6 | This paragraph should also acknowledge that leakage would be mitigated if the major economies (and preferably, all or nearly all economies) were to place caps on emissions. Similarly, the implementation of NAMAs in a broad range of countries could help to reduce the risk of leakage, depending on the design of those NAMAs. | Taken into account. You suggest to rephrase line 7 and 8, which can be done. However, the discussion of leakage issues is moved to Chapter 5. |
| 10935 | 14 | 61 | 47 | | | A paper taking up the same issue from a quantitative viewpoint is Davis, S.J., Peters, G.P., Caldeira, K., 2011. The supply chain of CO2 emissions. Proceedings of the National Academy of Sciences 108, 18554-18559. | Taken into account. Systematic treatment of leakage will be moved to |
| 18672 | 14 | 62 | | | | Page 62: So far, regional policy initiatives have been rare. | Rejected. Comment unclear. |
| 12164 | 14 | 62 | | | | My suggestion is to remove the Table 14.8, after all, this information or compilation of analyses, for many, will look like contradictory and inconsistent. | Rejected. The commentator does not make clear why the table is inconsistent; |
| 14971 | 14 | 62 | 14 | 62 | 14 | It is unclear why the WCI is included as a regional initiative, but the Regional Greenhouse Gas Initiative in the Northeastern U.S., is not. Is it because the WCI is transnational (including, as it does, Canadian provinces)? Query whether the WCI belongs in Chapter 15, as arguably the RGGI program does. (See note above on line 9.) | Rejected. WCI is clearly regional, as spanning Canada and the US, and thus in the scope of Ch. 14 |
| 8310 | 14 | 62 | 15 | | | Re: WCI…included several states in the US and Canada, please add "provinces in" before Canada | Accepted. |
| 14972 | 14 | 62 | 21 | 62 | 24 | This discussion should refer to Table 14.9. | Editorial team to take into account |
| 14973 | 14 | 62 | 25 | 65 | 24 | Suggest using subheads for each regional initiative described. Also, does the APP really belong here? Why select the APP as distinct from one of the other regional initiatives described in Table 14.9? As noted on p. 65 (lines 25-30), the EU ETS is not truly comparable with the WCI and the APP. | Rejected. APP has been included because it is clearly a regional initiative. Its different (and much weaker) |
| 14974 | 14 | 62 | 27 | | | See note above about WCI. Also, it seems strange to include the APP here, as it is a much different sort of partnership than the other two regulatory programs (EU ETS and WCI). As Table 14.9 notes, there are many other such partnerships. | Rejected. APP has been included because it is clearly a regional initiative. Its different (and much weaker) |
| 6126 | 14 | 62 | 27 | | | Asia-Pacific Partnership on Clean Development and Climate (APP) has turned in July 2010 into Global Superior Energy Performance (GSEP). Paticipating countries now increased to 24 including Germany, France and the UK. Decision making is decentralized way (unchanged since APP (Okazaki et al. 2012)). For citation Okazaki, T., Yamaguchi, M., Watanabe, H. Ohata, A., Inoue, H. Amano, H. (2012), Technology Diffusion and Development. In: Climate Change Mitigation, A Balanced Approach to Climate Change. M. Yamaguchi, (ed.), Springer, London pp. 179-221. | Accepted. Text and reference added. |
| 14970 | 14 | 62 | 9 | 62 | 10 | – It seems worth reiterating the operating definition of “regional” here, as there are many levels of regional cooperation processes (from sub-national within a country to transnational sub-national efforts, to supra-national efforts). | Rejected. Given the previously clear definition and in order to save space, there is no need to reiterate the definition |
| 12505 | 14 | 62 | 9 | | | It is relevant to include cooperation such as the Convention on Long-range transboundary air pollution (LRTAP). Mitigating air pollution might in several cases lead also to mitigation of climate change. | Rejected. LRTAP has actually increased climate change, by reducing the aerosol load over Europe. Air pollution only contributes to reduction of climate change if it addresses blackcarbon and tropospheric ozone. As these are not yet |
| 6127 | 14 | 63 | 22 | 63 | 23 | Reduction estimate figures are ambiguous, i.e.from when to when? In page 51 of Chapter 10, estimate is for the period of 2005-2008. | Accepted. Text clarified to refer to pilot phase 2005-2007. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 6128 | 14 | 63 | 23 | 63 | 23 | Add after "(Anderson and Di Maria, 2011)", though these figures are rather rough because of the impossibility of knowing counterfactual BAU emissions (Ellerman et al. 2010). For citation, Ellerman AD, Convery FJ, de Perthuis C (2010) Pricing carbon—The European Union emissions trading scheme. Cambridge University Press, Cambridge. | Accepted. Text adjusted accordingly |
| 14975 | 14 | 63 | 32 | 63 | 35 | This passage makes a key point. The discussion of the EU ETS should include the general point that price volatility and investor uncertainty tends to be increased by the EU ETS's practice of setting relatively short (5-year) commitment periods. The economics and policy literature supports the principle that creating longer commitment periods can help to create more policy certainty and therefore greater investor certainty. These tendencies facilitate a lower and less volatile price regime. See, for example:<br><br>-William Blyth, Richard Bradley, Derek Bunn, Charlie Clarke, Tom Wilson, Ming Yang, Investment risks under uncertain climate change policy, Energy Policy, Volume 35, Issue 11, November 2007, Pages 5766-5773, ISSN 0301-4215, 10.1016/j.enpol.2007.05.030.<br><br>-Ming Yang, William Blyth, Richard Bradley, Derek Bunn, Charlie Clarke, Tom Wilson, Evaluating the power investment options with uncertainty in climate policy, Energy Economics, Volume 30, Issue 4, July 2008, Pages 1933-1950, ISSN 0140-9883, 10.1016/j.eneco.2007.06.004. | Taken into account. Relevant comment, but should refer to the generic discussion of trading schemes in Ch. 15, as it is not unique to the EU ETS. |
| 6768 | 14 | 63 | 37 | | 42 | Although there is a description that higher shares of auctioning are not jeopardizing competitiveness, this concrete evidence is unknown and it should be deleted.<br>And more, there is a reveiw that analyzed the effects of all-auction-approach in Australian ETS by Paul Simahuser [1], executive of Infrasture division at Babcok & Brown Limited.<br><br>[1]Paul Simshauser<br>On Emission Permit Auction vs. Allocation and the Structural Adjustment of Incumbent Power Generators in Australia Original Research Article<br>The Electricity Journal, Volume 21, Issue 10, December 2008, Pages 30-41 | Rejected. This comment relates to the generic design of trading schemes, and should thus be covered by Ch. 15. As the Australian auction has not yet been implemented, empirical eveidence for the assertion made by the commentator does not exist. |
| 6129 | 14 | 64 | 17 | 64 | 19 | The text desribes as "Most of this literature concludes that the EU ETS is not generating price signals high enough to mobilize renewable energy and energy efficiency investments and thus specific support policies are justified". However, there are two points worth for attention. First, especially for energy efficiency, this may not be based on solid evidence. As well known among experts, there are large rooms for energy efficiency improvement even at a negative cost. Main barriers for those potentials not being materialized are the lack of information, people's irrational behavior etc. Second, whether a permit price is not high enough to mobilize renewable energy has nothing to do with whether the policy (low permit price of EU ETS) is relevant or not. By reading through this paragraph, readers may have impression that low carbon price may not be appropriate. Suggest rewriting this sentence. | Rejected. The text coveys clearly what is written in the quoted literature. The commentator should be invited to suggest literature supporting his statement. |

|---|---|---|---|---|---|---|---|
| 6769 | 14 | 64 | 21 | | 37 | Competitive implications of mandatory cap and trade schemes can be teoretically softened by border tax ad j ustments or benchmarks. It is only theoretical view to the last, and you should emphasize that these would have small effects in fact as described.<br>As for border tax adjustments, Eichenberg[1] pointed out three of the primary complaints raised concerning BTAs for the costs of GHG regulations as follows; (1) that an efficient methodology would be almost impossible to achieve, resulting in reduced economic efficiency, unreasonable transaction costs, and the potential for widespread systemic fraud, (2) that BTAs for greenhouse gases would not be in conformity with various international trade regimes that favor free trade, primarily those of GATT and the WTO, and (3) that BTAs are politically destructive because of their association with protectionist trade policies and their potential to destroy delicate negotiations toward cooperation on GHG emissions reductions.<br><br>[1]http://digitalcommons.law.ggu.edu/gguelj/vol3/iss2/3/ | Taken into account. Discuss within writing team whether BTA discussion should be moved to Ch. 13 where trade issues are discussed in depth, or to Ch. 15, and take reference into account there. |
| 10037 | 14 | 64 | 21 | 64 | 28 | This part should explain whether BTA or benchmark method work well or not in the real economy. Even if they are theoretically effective, questions about the effectiveness are raised, as described in (Carolyn, 2012, page214) and (Wakabayashi, 2007, page36 and 40).<br><br><Reference><br>[1] Carolyn Fischer and Alan K. Fox (2012). Comparing Policies to Combat Emissions Leakage: Border Carbon Adjustments versus Rebates, Journal of Environmental Economics and Management Volume 64, Issue 2, Pages 199-216. Available at:<br>http://www.sciencedirect.com/science/article/pii/S0095069612000186<br>[2] Wakabayashi et al. (2007). A Review on Effectiveness of Emissions Trading Schemes: Empirical Evidences of Their Implementation, No.Y06010 | Taken into account. Discuss within writing team whether BTA discussion should be moved to Ch. 13 where trade issues are discussed in depth, or to Ch. 15, and take reference into account there. |
| 14976 | 14 | 64 | 39 | 64 | 41 | This sentence ("By 2008 [the WCI] looked like it was set to be the second largest trading system in the world, behind only the EU-ETS, due to a rise of the relevance of mitigation policy under the Obama administration.") is factually incorrect as written; the Obama Administration did not commence until January 2009 and was not the reason for the momentum generated in 2008 (before it was evident President Obama would be elected). Suggest deleting this sentence. | Accepted. Reference to 2008 indeed flawed, now reads 2009. |
| 14977 | 14 | 64 | 44 | 64 | 45 | The statement that "generally the WCI was to take the role as testing ground for a federal cap and trade system" is too strong. While proponents of the WCI may have had that intent, it was not clear in 2008 that the WCI would be implemented before a federal cap-and-trade system could be adopted. Suggested text: "It seemed possible that the WCI could play a role as a testing ground for a federal cap and trade system." | Accepted. Wording suggested by commentator is appropriate and has been accepted. |
| 14978 | 14 | 64 | 46 | 64 | 46 | "Federal cap and trade had been defeated in . . . the US . . ." This statement is technically incorrect. Federal cap and trade legislation passed the U.S. House of Representatives and was not brought to a vote in the full Senate. Suggested replacement text: "Efforts to enact federal cap-and-trade legislation in the U.S. had failed." | Accepted. Wording suggested by commentator is appropriate and has been accepted. |
| 9096 | 14 | 65 | | | | it will be better to examine the participation of major developing econony in Regional Climate Initiatives | Rejected. Comment unclear. |
| 12034 | 14 | 65 | 1 | 65 | 24 | It looks the statement puts too much emphasis on political ties between Asian countries and the US. APP can contribute to foster good international relations, however, economic merits come first as the initiative heavily relies on private partnership. | Rejected. The text as it stands reflects the peer-reviewed literature quoted and thus should not be changed. |
| 6130 | 14 | 65 | 1 | 65 | 24 | APP has turned successfully into GSEP (Global Superior Energy Performance with number of paticipating countries increased to 24 including Germany, France and the UK (Okazaki et al. 2012). For citation Okazaki, T., Yamaguchi, M., Watanabe, H. Ohata, A., Inoue, H. Amano, H. (2012), Technology Diffusion and Development. In: Climate Change Mitigation, A Balanced Approach to Climate Change. M. Yamaguchi, (ed.), Springer, London pp. 179-221. Therefore this information should be added. | Accepted. |---|---|---|---|---|---|---|---|
| 7790 | 14 | 65 | 10 | | 24 | The role of Asia-Pacific Partnership on Clean Development and Climate (APP) should be highly evaluated, especially in terms of information sharing, networking and improved access to existing technologies and know-how. Importance of APP's approaches in each task force including i) public-private partnership in a bottom-up manner, ii) project-based approach, iii) long-term commitments, and iv) horizontal nature of an international partnership should be duly considered.<br>Above-mentioned points are comprehensively explained in "Sector-specific Activities as the Driving Force towards a Low-Carbon Economy From the Asia-Pacific Partnership to a Global Partnership" (Noriko Fujiwara, CEPS Policy Brief N0. 262 January 2012). | Rejected. The text as it stands reflects the peer-reviewed literature quoted and thus should not be changed. The reference quoted by the commentator is not peer-reviewed and thus should not be included. |
| 6131 | 14 | 65 | 10 | 65 | 11 | The text "explain the willingness of Asian countries to participate by the wish to maintain good diplomatic relations with the US, and to generate revenues through transfers" is not correct and suggest removing this citation. If you wish to keep this citation, please add the essense of the follwoing with the citation. Major incentive for Japanese industrial sectors, one of major players of APP, for participation is to promote technology diffusion, never just to maintain good diplomatic relations with the US nor to generate revenues through transfers. If Ch. 14 LAs learn more precisely of actual activities in Iron and Steel sector in APP, you will understand the argument above very clearly. For the actual activities in Iron and Steel sector in APP, refer to Okazaki T, Yamaguchi M (2011) Accelerating the transfer and diffusion of energy-saving technologies steel sector experience – lesson learned. Energy Policy 39:1296–1304 | Taken into account. Reference is relevant and has been added. Other text reflects peer-reviewed literature and will not be changed. |
| 6770 | 14 | 65 | 15 | | 18 | The description that APP activity has not led to direct emission reduction is unsuitable, because a technological improvement such as APP activity leads to great emission reduction as a result. | Rejected. Commentator statement not supported by peer-reviewed literature. |
| 9161 | 14 | 65 | 25 | | 30 | delete ths paragraph - what matters is the impact on emissions, not the style of policy. EU ETS had limited impacts on emissions. | Rejected. Commentator statement not supported by peer-reviewed literature. |
| 9162 | 14 | 65 | 25 | | 30 | EU is special since it is politically highly integrated from the outset, the characteristics is absent elsewhere in the world. | Noted. This is reflected in lines 25-28 |
| 14979 | 14 | 65 | 35 | | | Should include the Energy and Climate Partnership of the Americas (ECPA) under Latin America (see http://www.ecpamericas.org/). | Accepted. Added |
| 7520 | 14 | 65 | 1 | 65 | 24 | More impartial and balanced description is required for APP. 1. The Charter of the APP clearly stated that the purposes of APP were consistent with the principle of the UNFCCC and were intended to complement but not replace the KP. 2. "The willingness of Asian countries to participate by the wish to maintain good deplomatic relations with the US and to generate revenues ." is vague and miss leading description. It requires an official report from these countries to agree with the authors view to wite the current description. Asian countries in the APP were China, India, Japan and Korea. As far as steel group concern, no goverment and private participants agreed with the description. | Rejected. The text as it stands reflects the peer-reviewed literature quoted. The commentator is invited to provide peer-reviewed literature to support his statements. |
| 12645 | 14 | 65 | | | | There is an alliance called "East Asia Low Carbon Growth Partnership" under "East Asia Summit"<br>http://www.mofa.go.jp/policy/environment/warm/cop/ealcgpd_1204/index.html<br>http://www.kettha.gov.my/en/content/east-asia-low-carbon-growth-partnership-dialogue | Accepted. | Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 11270 | 14 | 7 | 26 | 7 | 28 | This chapter considers North America as a region, but composed only by USA and Canada. Mexico is part also of this region, partially in geographical terms, but above all in economic terms, since NAFTA (1994).<br>The interest of looking at this region, with the participation of Mexico, is that integration -both its benefits and disadvantages- could be examined as a process with the participation of two developed countries and one developing country. In this framework it is not possible to avoid the analysis of asymmetries, and it is necessary to be more cautious with some assessments as:<br>9: L: 1-3 This report will treat regions … as actors of cooperation and integration that could further promote mitigation<br>In fact, this chapter mentions NAFTA recognizing this regional integration reality, but contradictions can emerge with the initial definition.<br>p. 68: L 38-42<br>There are nine multilateral preferential trade agreements, among which the best known are (….) The North American Free Trade Agreement (NAFTA)<br>P. 70:<br>1 – 6: In the case of NAFTA, the participating countries … | The question of how to deal with Mexico is indeed a tricky point. In order to keep our analysis consistent with other chapters, we had to ensure that our regions aggregate up to the 5 RCP regions (and Mexico and the US/Can are in two different regions then). But we do consider NAFTA as one of the most important forms of regional cooperation in the chapter. Note also that the regional definition matters only for section 14.2, while in 14.3 regional cooperation itself defines the region. |
| 14920 | 14 | 7 | 26 | 7 | 31 | The text should explain how the 10 proposed regions are used in the chapter when they are introduced here. They are not used universally as the existing text might suggest. Why does it make sense to consider these specific regions? | These are regions that are economically somewhat homogenous and aggregate up to RCP 5 regions. They can be used to illustrate the regional specificities of |
| 14921 | 14 | 7 | 42 | 8 | 8 | The discussion here is really about level of economic development, not about geography. Regions are geographic constructs. Note that the regions selected are constructed in such a way as to emphasize common levels of economic development. Perhaps that should be explicit. | Yes, we make this more explicit now. |
| 2343 | 14 | 7 | | 11 | | Under the section, “Why Regions Matter?” , authors have given very comprehensive description to prove their line of argumentation by using UNDP figures. Here, author can summarized or illustrate one or two figures and its rationality in the text for reducing total pages. | Now implemented. |
| 7791 | 14 | 71 | | | | Add the following sentence “On the other hand, in 2012, APEC leaders committed to promote trade and investment in environmental goods and services and reaffirmed to reduce the applied tariff rate to 5% or less on the goods on the APEC list of Environmental Goods by the end of 2015. Although these political declarations’ legal status is “non-binding” these “soft law” can help to define the standards of corresponding what is nowadays to be expected from a “well-governed State. (M. Dupuy.”Soft law and the international law of the environment”, Michigan Journal of International Law, p.434,1991), also Abbot and Snidal said it is often more practical to negotiate a softer agreement, and this provides for flexibility in implementation.(Abbot and Snidal, “Hard and Soft Law”, International Organization, pp.444-445,2000) | Accepted. The sentence is added and supported by the suggested references. |
| 11795 | 14 | 71 | 28 | 71 | 29 | Delete this sentence. | 7421 | 14 | 71 | 5 | 71 | 14 | Note the risk of using PTA as a back door to climate change policies bypassing the UNFCCC provisions and distorting the international trading system. | Accepted. The risk is mentioned. |
| 7422 | 14 | 74 | 13 | 74 | 28 | Is there any published literature assessing the cost-effectiveness of the EU directives from climate change perspectives? If so please provide citations. | Taken into account. Unfortunately, besides some general estimates provided by the European Commission, there has been no assessment of the cost-effectiveness of EU directives on Renewable Energy and Energy Efficiency from a climate perspective. Only now, the literature of the scientific community is starting to consider the issue, in the context of the interactions between these technology-oriented directives and the EU Emissions Trading System (EU ETS). Available literature (cited in this section) has only evaluated the cost-effectiveness of the support schemes of the EU member states in the deployment of renewables. Specifically, a comparison between the costs of technologies and the support provided by feed-in tariffs, feed-in premiums and quota schemes . Evidence has been found that there is room for optimization of the |
| 14982 | 14 | 75 | 48 | 75 | 49 | This sentence is incomplete. | Accepted. Sentence has been completed |
| 5176 | 14 | 77 | 37 | 77 | 37 | small hydropower - SRREN use small "scale" hydropower, where size is depending on national policies rather than physical or technical criteria - maybe a footnote? (SRREN 5.3.1 and 5.4.3.4) | Accepted. Text has been shortened and sentence was removed |
| 14983 | 14 | 79 | 3 | 79 | 29 | Box 14.5 (REDD+ in the Congo Basin) -- This box should be rewritten to acknowledge and grapple with the actual REDD+ programs that are being implemented in the Congo Basin, for example the Congo Basin Forest Partnership and the Congo Basin Forest Fund, the U.S. government's Central African Regional Program for the Environment and others. As currently drafted, it is principally focused on a series of issues that are generic to REDD+, and as such, are appropriately addressed in Chapter 11. For example, lines 12-19 should be deleted, and the content taken up in Chapter 11.<br>For discussion of the CBFP, see http://pfbc-cbfp.org/home.html (the CBFP website)<br>One example of an article that begins to address the success of REDD-type interventions is:<br>Sayer, J.A., D. Endamana, M. Ruiz-Perez, A.K. Boedhihartono, Z. Nzooh, A. Eyebe, A. Awono, and L. Usongo, "Global financial crisis impacts forest conservation in Cameroon." International Forestry Review, Vol.14(1), 2012.<br>This text box should provide a more comprehensive examination of the subject and draw on existing literature to do so. This may require going beyond the academic literature. | Accepted. Generic REDD issues were deleted. Now the subsection refers to regional cooperation schemes in which integration of adaptation and mitigation are necessary. However, there is not possible due to the page limitations to refer to specific cooperation on-going projects supported by different donors. New elements referred to the Congo Basin Forest Partnership were included in the text. The suggested article was included in the bibliography. |

|---|---|---|---|---|---|---|---|
| 14989 | 14 | 86 | 36 | | | – The second reason articulated here seems more compelling than the first. While it is true that "mitigation challenges and mitigation/development trade-offs differ greatly by region," the chapter draft has not clearly established that this is a function of geography. Rather it seems likely to be a function of the level of economic development of countries within each region, and hence the aggregate or average level of development of the region. The potential opportunity for regional integration and collaboration could still be a sufficient basis for doing a regional analysis, though.<br>I suspect there may be greater regional commonality than has been explored in this chapter draft, however. For example, many regions share in common natural resources, and are thus exposed to characteristic risk factors connected with climate change impacts (such as the potential change in regional hydrology in South Asia associated with disruption of monsoons and changes in pattern and volume of Himalayan glacial melt; or the effects of the Amazon rainforest on regional weather patterns). Similarly, land use patterns and natural resource endowments differ by region, and that plays a role in determining the pattern of emissions and the relative cost-effectiveness of different mitigation strategies. (The discussion on pp. 43-46 and the associated figures and tables point to one example of this – climate and soil constraints and other associated factors that create regional differences with respect to agricultural potential and associated emissions and mitigation strategies, although the regions used in this part of the chapter don't match up with the official AR5 regions.) Thus, the recommendations for the "best" mitigation strategies and for integration of mitigation and adaptation strategies could vary by region. (This is a reason why it would be useful to treat adaptation within WGIII; not doing so leaves little room for addressing integration of mitigation and adaptation strategies.)<br>Finally, there are different cultural factors or social or institutional elements that operate in common within several of the selected regions that may cause certain mitigation strategies to be better received or more effective in some regions than others. | We believe that regional heterogeneity in the mitigation challenge is a function of geography and economic development (which is reflected in our regional definition); |
| 6950 | 14 | 86 | 25 | 86 | 35 | Suggest to make this FAQ specific to the WGIII report or even to this Chapter as WGI (and WGII?) will not use the same regions. Thus the current title referring to "the AR5" in general is misleading. | Yes will do that. |
| 14990 | 14 | 87 | 15 | 87 | 21 | This discussion begs a few questions: Are there exceptions to this rule? If so, what characterizes them? And what can be done to address the barriers and obstacles that less advantaged countries and regions face, e.g., in order to enable leapfrogging? It would be very useful if the chapter could address these questions. | This is an issue we now discuss more clearly. |
| 5881 | 14 | 9 | 1 | 9 | 5 | Regional cooperation treaties - for example - may also be detrimental to mitigation and / or adaptation if measures one country wants to implement would violate - e.g. - free trade agreements or prohibit the use of certain technologies. Please be sure you do not overlook such possibilities. | Thanks for pointing this out. Will consider carefully. |
| 14923 | 14 | 9 | 22 | | | Is unemployment a development measure? Are these snapshots taken at one point in time or are they averages over several years? If this figure is retained, the individual figures should be given separate letters (e.g., 14.2a, 14.2b) for ease of reference. | Noted. It depends on the prism one uses.<br>Accepted suggestion on the years and |
| 4008 | 14 | all | | | | I found this entire chapter to an exhaustive examination of forests and agriculture…I applaud the efforts of the authors. During revisions I suggest authors focus on what matters most to people: how much is AFOLU contributing currently to GHG? How much could forests/ag mitigate GHG emissions, how could this change under a scenario of rapid climate change ? What do we need to do as a society to ensure AFOLU mitigate instead of contirbute to GHG in the future? | We now focus much more the discussion of AFOLU in our chapter. |
| 13603 | 14 | overall | | | | as I read through this, wondering if it's worthwhile to flag the difference between energy (getting something to do work -- be it fuel, animals, ourselves) and electricity | Where approrpiate, we now make this distinction. |

|---|---|---|---|---|---|---|---|
| 17118 | 15 | | | | | This chapter does not have any acknowledgement of the global climate advocacy efforts of local governments that has focused through Local Government Climate Roadmap in 2007. A major outcome of the process was the Global Cities Covenant on Climate - the Mexico City Pact which has an international secretariat and regularly monitors progress of signatories. carbonn Cities Climate Registry in an important effort of local governments for measurable, reportable, verifiable climate action, which captures information of more than 170 cities worldwide as of July 2012. Recognition of local governments as governmental stakeholders in para.7 of Cancun Decisions is also important reflection of all these efforts in to UNFCCC processes. | Noted. |
| 14302 | 15 | | | | | Row "United Kingdom" - Note that the 2009 Low Carbon Transition Plan has been superceded by the "Carbon Plan" (2011). See http://www.decc.gov.uk/en/content/cms/emissions/carbon_budgets/carbon_budgets.aspx | Table deleted |
| 4152 | 15 | | | | | My comments are based on the observation that more attention needs to be paid to political barriers to stronger action on climate change due to their significance in preventing progress. The texts below, which have been prepared in conjunction with my colleague Ian Bailey, are designed to help remedy this. A table setting out political barriers and examples of actions designed to overcome them will be sent separately. | Noted. |
| 4153 | 15 | | | | | Climate change itself will create repeated opportunities to strengthen climate policies due to the strong likelihood that it will cause extreme weather events to become more frequent and more extreme (IPCC 2007). The literature on agenda-setting reviewed by Pralle (2009) points out that issues can rise to the top of decision making agendas as a result of dramatic focusing events that grab the attention of the public and policy makers alike (Downs 1972, Cobb and Elder 1983, Hilgartner and Bosk 1988, Kingdon 1995, Baumgartner and Jones 1993, Birkland 1998). To the extent that media coverage connects increasingly severe floods, hurricanes, heat waves and droughts with climate change, public support for stronger climate policies is likely to rise, creating windows of opportunity for activist governments. There is some evidence that this dynamic is already in operation, as opinion polls show that the percentage of respondents who consider climate change to be very serious rose both in Europe after the heat wave of 2003 and in the US after Hurricane Katrina in 2005 (Compston and Bailey 2012: 77).<br>Baumgartner, F. and B.D. |---|---|---|---|---|---|---|---|
| 4154 | 15 | | | | | One of the characteristics of mass audiences is that they are often more open to persuasion by vivid and plausible stories than by logic and evidence (Hajer 1995). For this reason accurate information about climate change needs to be supplemented by messages formulated as stories that take advantage of narrative devices such as beginnings, middles and ends as well as heroes and villains and struggles ending in dramatic resolutions. To some extent this is already being done. The disaster story casts proponents of mitigation as good guys striving against opposition to prevent catastrophe. The justice story stresses how unfair it is that those who have contributed least to climate change are likely to suffer the most. The security story posits that climate change will cause conflict due to effects such as competition over diminishing water supplies and that we therefore need to mobilize as we would to the threat of invasion. A more positive story focuses attention on solutions: climate change is a big threat but we know what needs to be done, the tools are at hand to solve it, so if we stick together and persevere we can do it. The opportunity story builds on this by adding the sub-plot that reducing emissions will involve creating new jobs and business opportunities (Compston and Bailey 2012: 56-63).<br>The development of even more appealing stories may help to increase public support for stronger mitigation. One example of the sort of innovation required is the effort by the Apollo Alliance, a coalition of US labour, business, environmental and community leaders, to liken the required action to the Apollo programme of the 1960s that put a man on the moon (Apollo Alliance 2008). Another is the attempt by a group of economists, journalists and green activists to turn the economic crisis of 2008 to advantage by proposing what they called a Green New Deal (Green New Deal Group 2008).<br>Apollo Alliance (2008), The New Apollo Program: Clean Energy, Good Jobs, http://www.apolloalliance.org/downloads/fullreportfinal.pdf, 4 September 2010, pp. 2-3.<br>Compston, H., and I. Bailey (2012), Climate Clever: How Governments can Tackle Climate Change (and Still Win Elections), London: Routledge.<br>Green New Deal Group (2008), A Green New Deal, New Economics Foundation, http://www.neweconomics.org/publications/green-new-deal, 3 September 2010, p.2.<br>Hajer, M. (1995), The Politics of Environmental Discourse, Oxford: Oxford University Press. | Noted. |
| 4155 | 15 | | | | | Institutional barriers and resistance from major industry groups can inhibit action in both developed and developing countries. The means to address these will vary by country but, in general terms, two options exist. The first involves negotiation with potential opponents on the terms of policy amendments or compensatory measures that may reduce opposition. These may relate to the climate policy under discussion or to other policy areas, such as business regulation (Bailey and Compston 2012). The second is to increase inter-sectoral coherence and governmental decision-making powers by means such as integrating climate and energy ministries (Carter 2008), nurturing cross-party consensus on climate change, requiring the official objectives of all relevant departments to include reducing greenhouse gas emissions, setting up high-profile independent climate change commissions (Giddens 2011), and creating framework policies (such as the UK's Climate Change Act and national climate strategies in China, India and Brazil) that establish long-term goals, targets and mechanisms for climate mitigation policy (Compston and Bailey 2012).<br>Bailey, I. and H. Compston (eds) (2012), Feeling the Heat: The Politics of Climate Policy in Rapidly Industrializing Countries, Basingstoke: Palgrave Macmillan.<br>Carter, N. (2008), 'Combatting climate change in the UK: challenges and obstacles', Political Quarterly 79, 194–205.<br>Compston, H., and I. Bailey (2012), Climate Clever: How Governments can Tackle Climate Change (and Still Win Elections), London: Routledge.<br>Giddens, A. | 2943 | 15 | | | | | in general, I thought this chapgter needed to focus more on program evaluation (the title of this part of WGIII) with less emphasis on program description, background social science such as definitions, etc. | Noted. |
| 14876 | 15 | | | | | Shorten substantially or entirely delete sect 15.5.4.8, /9./10 since long compared to other sub chapters albeit limited in regional scope (US) and scale compared to other existing instrumnets (eg promotion of renewable energy) | Noted. The section on emission trading will be completely rewritten in the SOD. |
| 14877 | 15 | | | | | very limited number of examples from developing countries; too heavy focus on US and Europe | Noted. Despite the paucity of peer-reviewed studies in developing countries, the SOD will include more |
| 14894 | 15 | | | | | There is a substantial overlap between Chapter 15 and Chapter 7 section 11 on policies please align and refer rather than duplicate and contradict | Accepted. |
| 14880 | 15 | | | | | examples from small island states and least developped countries missing | Table deleted |
| 14893 | 15 | | | | | Project Carbon Fund missing; Sources? | Noted. Already covered in Chapter 16. |
| 2581 | 15 | | | | | The role of subnational and local governments in addressing Sustainable Development issues, notably climate change, has been increasingly recognized by the UM System. For instance, the Rio+20 final declaration has 23 matches to "subnationals" (initial draft had just a couple) | Noted. |
| 13616 | 15 | | | | | maybe you've seen this study http://repository.cmu.edu/cgi/viewcontent.cgi?article=1095&context=epp but in case not, think it would be helpful | Noted. |
| 13619 | 15 | | | | | Would like to again flag comment 22 - Abdel Latif (2012) which highlights the 'trigger' of the Kyoto Protocol | Noted. |
| 13621 | 15 | | | | | I just wanted to bring to your attention the report we did for NBS nbs.net/wp-content/uploads/NBS-Executive-Report-Policy.pdf | Noted. |
| 17479 | 15 | | | | | entry for the UK: the 2011 Carbon Plan supersedes the 2009 Low Carbon Transition Plan. Also relevant are the series of Energy Bills and Acts (e.g. Energy Acts 2008, 2010, 2011; May 2012 Energy Bill) which contain provisions for various energy efficiency and low-carbon measures | Table deleted |
| 15398 | 15 | | | | | The executive summary exaggerates the negative cost statement. It claims cost-savings from standards but needs to mention cost of tax/cap and trade. This needs critical assessment of national actions, not merely repetition of government descriptions of plans or directives but assessments of change attributable to policies. Claims about US regional action are simply absurd: California is the only state left in the WCI, and RGGI is unraveling – see Chapter 14 for an accurate description. Combining standards and labeling is completely inappropriate. Studies have isolated regulation – and regulation will in principle restrict choices and impose costs while information has no cost other than administrative. | Accepted. The negative cost statement will be qualified. The section on tradable permits will be rewritten, as will the section on institutions and governance. Standards and labeling will be discussed in different sub-sections. |
| 7501 | 15 | | | | | No comments. | Noted. |
| 5903 | 15 | | | | | Please explain "AI" and "NAI". The table can be shortened to 1 - 2 representative examples for Annex I / non Annex I each or, if you want to include a wider variety, 4 -5 countries max. No table giving examples only should exceed 1 page in length. | Table deleted |
| 11076 | 15 | | | | | The styles of writing vary significantly from section to section, which makes reading difficult. For example, the styles of 15.5.3 and 15.5.4 are very different, although both of them belong to the arguments of explicit carbon pricing instruments. I prefer the style of 15.5.3. It is much more scientific. | Noted. |
| 4289 | 15 | | | | | I am missing the fact that VAs or Laws requring energy management may not only be regarded to include technical measures. This comment holds for the whole chapter. Please see Thollander and Palm (2012) (Improving Energy Efficiency in Industrial Energy Systems - An Interdisciplinary Perspective on Barriers, Energy Audits, Energy Management, Policies, and Programs, Chapter 8 (and chapter 6), ISBN 978-1-4471-4161-7) where it is shown in Figure 4, chapter 8, that energy management could contribute to significantly higher energy efficiency potentials. Please also see Backlund, S., Thollander P, Palm, J., Ottosson, M., 2012. Extending the energy efficiency gap. Accepted for publication in Energy Policy holding the same line of arguments. | Noted. |

|---|---|---|---|---|---|---|---|
| 18455 | 15 | | | | | (5) In the spirit of helping update the US sub-national portion of this chapter, I point the authors to my 2011 law review article co-authored with Vicki Arroyo (Director, Georgetown Law Climate Center). We asked, what factors seem to explain why some states in the US have moved ahead in the GHG arena and others have not?<br>We found that state action or inaction was likely attributable to a combination of the following factors: dependence on fossil fuels, affluence, presence or absence of energy shocks, energy prices, public salience, political leadership, political culture,<br>professionalized legislatures, and patterns of campaign finance.<br>Vivian E. Thomson and Vicki Arroyo, "Upside-Down Cooperative Federalism: Climate Change Policymaking and the States,"<br>Virginia Environmental Law Journal 29(1)(2011): 1-61. | Noted. |
| 18453 | 15 | | | | | (3) The EU ETS program appears to be included only in Table 15.1.<br>That program should be described, as should the literature on the EU ETS's strengths and weaknesses. | Table has been deleted. EU ETS discussed in Ch 14 |
| 12065 | 15 | | | | | The bar for 2009 seems out of proportion and this development is not explained in the text | Noted. The figure has been revised and this section rewritten. |
| 18008 | 15 | | | | | It is not quite clear to me in what way the second and the third column interact or cover the same ground. | Considered. This table has been deleted |
| 5902 | 15 | | | | | Can be deleted completely - the reader just read almost everything stated here in the executive summary above. | Noted. Will be rewritten. |
| 11080 | 15 | | | | | This chapter can be shortened. Some discriptions seem appropriate in the conclusion chapter, which, very interestingly, lacks in this chapter, and overlap what are mentioned in the Executive Summary. | Noted. Will be rewritten. |
| 4997 | 15 | | | | | The advantage of tradable permits are not only cost-effectiveness but also political easiness compared with tax, which is always politically difficult to introduce. | Rejected. Taxes are used in some countries, so political feasibility varies |
| 4999 | 15 | | | | | It is not clear what the imperfact policy coordination means. | Noted. |
| 12204 | 15 | | | | | What is the goal of this subchapter? It is not clear why it touches on selected sub-issues and others not. | I followed the list of subtitles closely, and addressed – the best as I could – all of them. The list itself was given to me by |
| 12205 | 15 | | | | | The title of the chapter is on mitigation/adaptation capacities. 1.) In the text you also refer to policies and public good characteristics of climate change. It is not clear how this relates to mitigative/adaptive capacities. 2.) it is not clear what you mean by 'capcities', accordingly, the sentence "mitigative and adaptive capacities are fundamentally disjoint" is unclear. In addition, this statement seems to be in contradiction with chapter 4.6.1, page 54, where the authors write that hat there is a strong correlation between the capacity to develop sustainably and climate response capacity (pls. see comment on this text passage above) | I the revised version I removed the economics terminology. It was appropriate since climate protection requires a concerted global action, while adaptation can be carried out locally. Nevertheless, since some reviewers did not like the jargon, I rephrased the relevant sentences. I also removed the words 'fundamentally disjoint'. I am |
| 12206 | 15 | | | | | You write that the stated objective of governments and int. organizations is to meet economic needs of a population. I think this statement is false. Meeting economic needs is one goals among other development goals. | The referee is right. Meeting economic needs is one of the many goals. I rephrased the relevant sentence. |
| 12207 | 15 | | | | | What is the task of this sub-chapter? The content of this sub-chapter is very selective. The title of 15.10 is "links to adaptation" yet here you also include mitigation. | Please see my response to 12204. Mitigation was only addressed to the extent it was unavoidable in the |
| 2962 | 15 | | | | | dealt with elsewhere in WGIII, I think, so maybe delete here. | Noted. Revised section after meeting with Chapters 13 and 16 teams to |
| 2963 | 15 | | | | | this is a subjective judgment, but I felt that this section talked down to the reader. | Noted. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 8499 | 15 | | | | | Governance is not necessarily about institutional change. It would be more accurate to state that governance is about better understanding the actions of governing, and the ways in which formal institutions and actors (eg, elected officials, etc) interact with, grant authority to, and are influence by informal actors and organizations that participate in the process of governance. | Definition of governance removed. Covered in the glossary |
| 2945 | 15 | | | | | this subsection was abstract and not very helpful to policymakers -- I'd suggest deleting. | shortened substantially, with a focus on how and why institutional change is |
| 11082 | 15 | | | | | This chapter is well written. I like this academic flavour. IPCC report is meant to be science-based and this chapter is one of the best examples. | Thanks! |
| 12046 | 15 | | | | | The section focuses very much on the theoretical aspects of institutions and governance and how they have a tendency to block change towards mitigation policy. It should however also address capacity constraints in existing institutions or the absence of important institutions. I would argue that these are also important elements that prevent change in policies, as it is sometimes not a question of lack of will but lack of possibility to bring about change. | Emphasis on role of institutions in restricting change is included. |
| 2946 | 15 | | | | | the individual case studies are too long and detailed, although the table is very helpful. I suggest shortening by 50%. | Ccase studies re-written thematically. Table removed |
| 12049 | 15 | | | | | It is not clear what the objective of this section is and how the list of national policies interacts with the analysis of institutional structures and governance. The table takes up a large amount of space without delivering much information on the issues that should be addressed under section heading 15.2. The text in the table could be shortened considerably and if examples of sub-national policies and responsible institutions would be added could contribute to the discussion on institutions. | Re-written around clear themes and messages. Table removed to be replaced by a map. A sub-section on sub-national policies is included |
| 2558 | 15 | | | | | Quebec province has also a target beyond national, http://www.mddep.gouv.qc.ca/communiques_en/2009/c20091123-cibleges.htm | Table removed |
| 2560 | 15 | | | | | Worth citing the Climate Group´s billion tree endowment, http://www.theclimategroup.org/what-we-do/news-and-blogs/mike-rann-what-states-can-do-part-vii-plant-forests/ | Section re-written to be thematic. |
| 5904 | 15 | | | | | Can be shortened considerably. What does Germany bring into focus that could not be explained / shown at the example of e. g. Denmark or the USA? So adding a new example seems not to be necessary. | Section re-written to be thematic. |
| 11084 | 15 | | | | | The very issue of "Subsidy Reduction" is missing in any case. | Covered in detail elsewhere in the |
| 12050 | 15 | | | | | Agree with author to drastically shorten the section! A new structure could take into account a) the different levels of jurisdictions and how they interact (community, provinces/states, national) and b) the different institutions, actors and governance structures within each level | Section re-written to be thematic. |
| 18728 | 15 | | | | | Inclusion of Germany will add interesting further dimensions to the conclusions on national and subnational trends, notably the concerted effort to define and plan pathways for full decarbonization across all major sectors of the economy over the medium and long term through a carefully balance instrument mix (albeit also highlighting the significant difficulties in getting this balance "right", and the ongoing and controversial debate on individual instruments such as the renewable energy feed in tariff). | German examples will be added |
| 12051 | 15 | | | | | The conclusion section should not focus on policies, but more on the institutional setup and what can be learned from the experiences. I.e. what is important to consider when setting up institutions or defining governance structures for mitigation activities. | Accepted; text modified |
| 10459 | 15 | | | | | This section needs to be expressed in a tabular format | Section shortened into text box |
| 11085 | 15 | | | | | I would prefer delete this section. The concept of NAMA is not matured yet, due to its strong policital implications to developing countries under the UNFCCC negotiation. NAMA used to be a general expression, i.e. just "nationally appropriate mitigation actions", in the Bali Action Plan, but became very much politicized since then. I would suggest IPCC make itself isolated from the ongoing hot political debates under the UNFCCC. | NAMA discussion limited to a text box. It is retained because empirically NAMAs do provide one hook for national actions. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 18729 | 15 | | | | | This section is somewhat fragmented, or incomplete - it successfully introduces the concept of NAMAs based on the evolution of the concept in the climate negotiations (specifically the BAP), proceeds to emphasize the definitional/coneptual uncertainties, but then - in an attempt to draw on empirical case studies - quickly gets lost in "possible NAMAs", with little systematic inference and hence limited added value. At least the concept itself should be given some more attention before leaving the reader to a vague uncertainty; e.g. breaking down the term and what it means for the definition of the concept of a NAMA ("national", "appropriate", "mitigation", "action"); differentiating the options (credited or C-NAMAS); linking the concept to more recent negotiation outcomes (what e.g. of Cancún and Durban?); and drawing on more recent literature (e.g. CCAP (2011). Nationally appropriate mitigation actions (NAMAs) and the Clean Development Mechanism (CDM). CCAP; Levina E., and N. Helme (2009). Nationally Appropriate Mitigation Actions by Developing Countries: Architecture and Key Issues. Centre for Clean Air and Policy (CCA), Washington; Okubo Y., D. Hayashi, and A. Michaelowa (2011). NAMA crediting: how to assess offsets from and additionality of policy-based mitigation actions in developing countries. Greenhouse Gas Measurement and Management 1, 37–46; Olsen K.H., J. Fenhann, and M. Hinostroza (Eds.) (2009). NAMAs and the Carbon Market -- Nationally Appropriate Mitigation Actions of developing countries. UNEP Risø Centre; Wang-Helmreich H., W. Sterk, T. Wehnert, and C. Arens (2011). Current developmens in Pilot Nationally Appropriate Mitigation Actions of Developing Countris (NAMAs). Wuppertal Institute for Climate, Environment and Energy, Wuppertal. | NAMA discussion has been reduced substantially in response to comments. Definitional issues will be covered more completely. |
| 11087 | 15 | | | | | If some aspects of NAMA is to be mentioned, this section deserves to remain, because linking national policies to international support is indeed the core of the concept of NAMA and, therefore, has been politicized. If policy scientist can provide negotiators with any science-based studies, it would surely be highly appreciated. | Section shortened into text box |
| 18730 | 15 | | | | | As noted in an earlier comment, the role of active stakeholder outreach and engagement for the success of policies is borne out by practical experience in a variety of contexts, such as the introduction of complex market mechanisms (EU ETS, Chinese pilot ETS), where understanding and hence acceptance among stakeholders are often lacking. This is indeed an important sections and needs to be included. | New section will be added |
| 18731 | 15 | | | | | While aptly summarizing many of the preceding observations, some of the conclusions do not seem to be backed by earlier sections; one example: "Sixth, since implementation is in its early stages, it is difficult to assess the extent of leakage across jurisdictions, but there are few signs of a “race to the bottom.”" - was this discussed in more detail in a preceding section? This reviewer at least only recalled brief mention of leakage as a potential problem, but no survey or assessment of actual incidences of leakage. | Accepted. The conclusion of this section will not mention race to the bottom issues. |
| 5751 | 15 | | | | | I think the need for gradually removing fossil fuel inventives and biofuels feed-in tariffs is just touched on while it should be more prominent (this is also part of the recommendations by the 2011 OECD-FAO prepared for the G20) | Rejected. This section now just describes in general the different policy alternatives, normative considerations |
| 8500 | 15 | | | | | Note again the importance of typologies for public policy, as well as for instruments (Lowi, etc) | Taken into account. Not only policy instruments but also policy types are now considered in 15.4. Section 15.2 |
| 14882 | 15 | | | | | little information, terms are not used in the further analysis in section 15.5; integrate in 15.5 or delete | Noted. Section 15.5 will incorporate the criteria and 15.6 will follow this |
| 11193 | 15 | | | 26 | 18 | One should add that the subsidy generates a burden to the public finances, which makes the policy vulnerable for policy changes in times of crisis (e.g. downsizing feed-in-tariffs in renewable policies) | Accepted. Revenue demands from subsidies included in text |
| 11386 | 15 | | | 26 | 18 | One should add that the subsidy generates a burden to the public finances, which makes the policy vulnerable for policy changes in times of crisis (e.g. downsizing feed-in-tariffs in renewable policies) | Accepted. Revenue demands from subsidies included in text |
| 3677 | 15 | | | | | Integrate with chapter 3.8. as chapter 3.8. lacks climate change related examples. | Noted. A more practical and illustrative approach to climate change mitigation is |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 18732 | 15 | | | | | A brief acknowledgment of the epistemological challenges of the main criterion (environmental effectiveness: how to establish causality in complex physical and socioeconomic systems? How to define the environmental outcome that serves as the benchmark of effectiveness when mitigation policies typically pursue so many different and not always compatible environmental and other (social, economic, innovation etc.) objectives? Etc.) and the inevitable contingency, i.e. proneness to value judgments of all other criteria would seem helpful here, as it is barely discussed in ch. 3. Social science and humanities literature has begun looking at the limitations of the criteria developed in neo-classical economics, but is still scarce. See Mehling, Michael (2002): “Betwixt Scylla and Charybdis? Effectiveness in International Environmental Law.” 13 Finnish Yearbook of International Law 129-182; Erkki J. Hollo, Kari Kuusiniemi, Eriika Melkas and Michael Mehling (2002), “Legal Aspects of Climate Change: Instrument Choice and the Kyoto Mechanisms,” in Understanding the Global System: The Finnish Perspective, edited by Jukka Kayhkö and Linda Talve, pp. 177-182. Turku: FIGARE, 2002 | Rejected. Outside the scope of the chapter: topic covered in Chapter 3 |
| 12052 | 15 | | | | | It is not clear how this section relates to the rest of section 15.3. The following sections mainly describe the policy instruments and do not yet evaluate them. With the definition of criteria for assessment at the beginning of the section the reader expects some form of assessment to follow. I would suggest to move this section to 15.5. | Accepted. This section now just describes policy types: criteria and evaluation are in subsequent sections 15.5 |
| 12054 | 15 | | | | | The categories do not mention energy based standards (e.g. standards set in China on energy use per unit of output) | Accepted. Text Modified: minor change in the text to avoid a closed classification |
| 13712 | 15 | | | | | Rename section "Tradeable permits and offset credits" and revise text to cover both cap and trade (allowance-based systems) as well as baseline and credit systems (project-based offsets). | Accepted. Text modified: incorporation of baseline-and-credit trading systems |
| 11089 | 15 | | | | | The vulnerablity of tradable permits to interferences from other policy instruments should be mentioned here. | Taken into account. This section merely describes the different policy alternatives, whose interactions are |
| 5002 | 15 | | | | | The tradable permits may lower compliance costs but not necessarily reduce administration costs. The administration and political cost to sustain EU-ETS is tremendous, if compared with other scheme such as carbon tax. | Taken into account. This section merely describes the different policy alternatives, whose assessment is |
| 5003 | 15 | | | | | It should be mentioned that there is a concern for the accuracy of the data in carbon footprints since there is no perfect data available. Therefore, the usage of eco-labeling and certicication must be carefully implemented not to mis-guide the consumers. | Accepted. Text modified: no reference now to carbon footprints: further explanations of specific topics is beyond |
| 14883 | 15 | | | | | little information, terms are not used in the further analysis in section 15.5; integrate in 15.5 or delete | Noted. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 18735 | 15 | | | | | This section heavily focuses on economic approaches (CGE analysis) as the central way of assessing/evaluating policies and institutions. While the explanation appears balanced as far as economics is concerned (e.g. in terms of challenges faced and approaches used), it is extremely narrow in disciplinary focus and fails to incorporate the valuable (and, in the real world, highly relevant) contributions of other disciplines. One example is law, which is the means by which policies become operational in most cases and, as a discipline, by definition deals with interactions between sets of rules, principles and rights and duties. Accordingly, interactions between policies can only be fully understood when their potential legal conflicts with existing or future procedural and substantive rules are also factored in, as these can either result in the inapplicability or only partial applicability of the policy, or significantly hamper its implementation (or result in other consequences, such as litigation or liability for damages/compensation). By the same token, the success or failure of policies is often strongly affected by how well these harmonize with the existing legal framework, and how conducive that framework is to their effective implementation. For instance, procedural or institutional rules (which body has what power to play which role in the operationalization of a policy) can be decisive for the real-life application of a theoretically superior policy. Unfortunately, there has been very little jurisprudential scholarship specifically on evaluation of climate change policies, and hence it is difficult to pinpoint seminal research (see, e.g., Hollo, Erkki et al. (eds), Climate Change and the Law, Dordrecht: Springer, 2012); rather, it is necessary to understand the legal system in its entirety (and conversely grasp related scholarship very broadly) to fully capture the role of this discipline in evaluating climate policies. The same would apply to other disciplines that can contribute to the assessment of policies, such as e.g. behavioral psychology and its study of the behavioural factors that motivate or hamper change in human behavior e.g. to reduce emissions. | Noted. |
| 12055 | 15 | | | | | Suggested further literature on ex-post evaluation: Forster, Daniel; Falconer, Angela; Buttazoni, Marco; Greenleaf, James; Eichhammer, Wolfgang; Köhler, Jonathan; Toro, Felipe; Schleich, Joachim; Sensfuss, Frank; Ragwitz, Mario; AEA Group (2009): Quantification of the Effects on Greenhouse Gas Emissions of Policies and Measures: Final Report Appendix I: Detailed Policy Methodology and Results Chapters . Oxford: AEA Group, 2009. | Noted. |
| 12056 | 15 | | | | | It would be helpful to the reader to have a clearer rationale why in this context only ex-post evaluation is considered and not ex-ante. | Noted. |
| 3678 | 15 | | | | | Integrate with chapter 3.8. as chapter 3.8. lacks climate change related examples. | Noted. |
| 5752 | 15 | | | | | It is important to mention and refer to the FAO recently agreed guidelines on tenure governance: http://www.fao.org/docrep/016/i2801e/i2801e.pdf | Noted |
| 18751 | 15 | | | | | There is a conclusion (helpful) after 15.6, but not after the much longer and variegated 15.5. It could make sense to consider a conclusion or summary that seeks to condense the main lessons/outcomes. | Rewritten, will be done. |
| 12057 | 15 | | | | | Each sub-section would benefit from a small overview table of the examples that are mentioned in the section, with some key characteristics and an overall finding / evaluation rating (e.g. high/medium/low effectiveness) | Noted, not sure if this is practicable but will try to do something on these lines. |
| 12058 | 15 | | | | | The difference between 'criteria' and 'ex-post evaluations' is not immediately clear from the text. An explanatory sentence would be useful. | Noted,text rewritten |
| 3679 | 15 | | | | | Integrate with chapter 3.8. as chapter 3.8. lacks climate change related examples. | Noted, will discuss w. Ch 3 |
| 14884 | 15 | | | | | covering 'regulation' and 'information' in the same section seems only appropriate when focussing on energy efficeny standards and labels, however regulation with climate change policy incorporate also eg quotas for renewable enrgy or feed-in tariffs; suggest to cover the two items in seperate sections thereby incorportaing quotas and other regulations in the regulation section | Accepted. Regulation and information separeted. RPS and FIT are dealt with at section 15.6 |
| 3680 | 15 | | | | | Integrate with chapter 3.8. as chapter 3.8. lacks climate change related examples. | Accepted. Coordination will be made. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 5905 | 15 | | | | | The text could be shortened considerably if you refrained from listing case studies / examples and changed the text to "statement (source)". For example, p. 30 l. 23 - 31 could be shortened to: "Building code changes can have an effect on energy consumption. For example, an increase in the stringency in Florida's energy code resulted in a decrease in the consumption of electricity by 4% and natural gas by 6%, compared to residences structured before the code came into effect (Jacobsen & Kotchen 2011)." The statement in lines 23 - 25 is pointless and can be deleted completely. | Accepted. Text modified and shortened. |
| 5906 | 15 | | | | | Please concentrate on core statements and avoid listing studies. Please do NOT start sentences with "X conducted …" or "Y found that …". | Accepted. Text modifed and shortened where appropriate. See 104 for different |
| 18739 | 15 | | | | | Suggested table summarizing cost effectiveness calculations for different policies with comparable metrics would be very helpful and should be included | Noted, not sure if this is practicable |
| 11090 | 15 | | | | | I value the style of this section best, because it is objective and science-based; distinguish the grey literature from rigorous published works; distinguish empirical studies from theory or simulation studies. The style of this section should be a benchmark of other sections. | Noted |
| 3681 | 15 | | | | | Integrate with chapter 3.8. as chapter 3.8. lacks climate change related examples. | Noted, will discuss w. Ch 3 |
| 13714 | 15 | | | | | Please also consider the following empirical literature: : Andersen, M. (2004). Vikings and virtues—a decade of CO2 taxation, in: Climate Policy, 4, p. 13-24; Andersen, M. (2010): Europe's experience with carbon-energy taxation, in: S.A.P.I.EN.S, 3.2, URL : http://sapiens.revues.org/1072; Enevoldsen, M., Ryelund, A.; Andersen, M. (2007). Decoupling of industrial energy consumption and CO2-emissions in energy-intensive industries in Scandinavia, in: Energy Economics, 29, p. 665-692; Godal, O.; Holtsmark, B. (2001): Greenhouse gas taxation and the distribution of costs and benefits: the case of Norway, in: Energy Policy, 29, p. 653–662; Zhang, Z.; Baranzini, A. (2004): What do we know about carbon taxes? An inquiry into their impacts on competitiveness and distribution of income, in: Energy Policy, 32, p. 507–518; Ekins, P.; Pollitt, H.; Summerton, P.; Chewpreech, U. (2012): Increasing carbon and material productivity through environmental tax reform, in: Energy Policy, 42, p. 365–376; Agnolucci, P. (2009): The effect of the German and British environmental taxation reforms: A simple assessment, in: Energy Policy, 37, p. 3043–3051. | Noted, text rewritten |
| 18742 | 15 | | | | | The empirically observed effects of the large-scale "Environmental Tax Reform" in Germany between 1999 and 2006, which incurred successive rate hikes on a number of fuel taxes as well as the introduction of a new electricity tax (hence now called the "Energy Tax") are very instructive in terms of distributional impacts, behavioural effects (and ultimately greenhouse gas reductions) as well as employment effects of recycling revenue into a reduction of non-wage labor cost. See e.g. Buehler, Ralph et al. (2011), "How Germany Became Europe's Green Leader: A Look at Four Decades of Sustainable Policymaking" 2 Solutions (2011): 51-63 and Mehling, Michael (forthcoming 2013), "Germany's Ecological Tax Reform: A Retrospective", in Manuela Achilles (ed.), Sustainability in Transatlantic Perspective: Germany and the U.S. (Basingstoke: Palgrave Macmillan). | Noted, text rewritten |
| 13715 | 15 | | | | | Please include: Burniaux, J.; Chateau, J. (2011): Mitigation Potential of Removing Fossil Fuel Subsidies: A General Equilibrium Assessment, OECD Economics Department Working Papers, No. 853, OECD Publishing.doi: 10.1787/5kgdx1jr2plp-en | Noted, text rewritten |
| 11096 | 15 | | | | | This section is one of the most courageous section in this chapter. The message contained here is very important. Keep this as it is, and include the essence in the Executive Summary. | Noted |
| 12061 | 15 | | | | | Aviation and maritime transport does not fit into the logic of section 15.5.3. Since the section as written mainly refers to the absence of taxes for the sectors and not to other policy instruments under consideration for the sectors it would be better suited to include the text as a box in section 15.5.3.3. | Text rewritten |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 18744 | 15 | | | | | The ample evidence on FIT effectiveness in countries like Germany, and the challenges nonetheless faced in setting adequate tariff rates (especially in Spain and Portugal, with an ensuing boom/bust effect) have been discussed in the literature and should be considered - in purely absolute terms, Germany has led renewable energy deployment (at least for certain energy sources such as photovoltaics) for a longer peiod. | Text rewritten |
| 11097 | 15 | | | | | The lessons learned recently in Spain and Germany should be mentioned. | Noted |
| 18745 | 15 | | | | | The assignment of the EU ETS to ch. 14 and national/subnational ETS to ch. 15 may make sense just going by the chapter titles, but that virtually rules our any comparison/side-by-side analysis, as would be useful here. Also, the supranational EU law is considered "domestic plane" in international law. | Noted |
| 11098 | 15 | | | | | This section is one of the most problematic in this chapter. This reads as if it were a gray paper to promote emission trading. Whole section should be rewritten in the style of 15.5.3. What are the issues? What kind of science-based works can be reffered to each argument? Are they grey or rigous published works? Are they empirical studies or theory or simulation? Those questions should be addressed as was the case in 15.5.3. | Text rewritten |
| 13716 | 15 | | | | | Add a section on the Tokyo system, using elements of p. 65, line 27- p 66, line 5, see Nishida, Y.; Hua Y. (2011): Motivating stakeholders to deliver change: Tokyo's Cap-and-Trade Program, in: Building Research & Information, 39, p. 518-533 | Text rewritten |
| 13720 | 15 | | | | | Delete first part of the section, as not referring to greenhouse gas trading, and only retain those parts relating to GHG trading | Text rewritten |
| 12062 | 15 | | | | | The section is unproportionately long compared to the other sections within 15.5.4. Suggest shortening. | Done |
| 3682 | 15 | | | | | Cut chapter by 50% to save space. | Text substantially rewritten and |
| 18747 | 15 | | | | | Two of the helpful lessons coming out from different surveys of the RGGI system include 1. the ability of even a very low-price ETS to influence mitigation in a meaningful way if allowances are auctioned and proceeds used for mitigation acitivities; 2. compliance costs have been minimal, cobenefits significant (see RRGI Inc. and Analysis Group 2011/2012). | Noted |
| 11099 | 15 | | | | | This section is particularly misleading. It sounds as if it deals with ex-post analyses of GHG emission tradings, but it does not. GHG reduction is very different from other polution reductions. This section should be deleted. | Text substantially rewritten |
| 13717 | 15 | | | | | Delete section, as not referring to greenhouse gas trading | Noted |
| 18748 | 15 | | | | | The ample description of criteria pollutant trading systems can probably be abridged if space constraints necessitate doing so, as the value of lessons from conventional pollutant reduction for greenhouse gas mitigation is limited, see e.g. the experiences under the EU ETS. | Yes, done |
| 13718 | 15 | | | | | Delete section, as not referring to greenhouse gas trading | Text substantially rewritten |
| 13719 | 15 | | | | | Delete section, as not referring to greenhouse gas trading | Text substantially rewritten |
| 18749 | 15 | | | | | Not mentioned in this section are two major voluntary agreements on climate mitigation, both of which were only moderately effective or ineffective: the agreements between German inudstry and the government of 1996 and 2000 (Erklärung der Deutschen Wirtschaft zur Klimavorsorge, see http://www.bmu.de/wirtschaft_und_umwelt/selbstverpflichtungen/doc/47777.php; for an independent monitoring report of 2010 by RWI institute, see http://www.rwi-essen.de/media/content/pages/publikationen/rwi-projektberichte/PB_CO2-Monitoring-2010.pdf; largely replaced by the mandatory EU ETS starting in 2005); and the voluntary agreements between European, Japanese and Korean car manufacturers and the European Community (at the time), which were considered ineffective and resulted in adoption of a regulation on CO2 emission limits in 2009. | Accepted. Text modified accordingly. Literature added. |
| 3683 | 15 | | | | | Integrate with chapter 3.8. as chapter 3.8. lacks climate change related examples. | Accepted. Coordination will be made. |
| 12064 | 15 | | | | | The section should be shortened. While Japan is a good example for a functioning voluntary system it would be more useful to discuss the necessary framework that make voluntary agreements more or less successful. | Accepted. Text modified accordingly. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 13722 | 15 | | | | | Replace by "Voluntary agreements have a rather mixed outcome with regards to their environmental effectiveness. They are effective alternatives to mandatory regulations when the target is to achieve small environmental improvements at relatively low cost (Borck and Coglianese 2009). A credible threat of regulation is required in order to achieve stringent targets (Baranzini and Thalmann 2004). Under specific cultural circumstances, such as in Japan, voluntary agreements can also work in the absence of a direct regulatory threat (Wakabayashi 2012) . There, they provide high flexibility and are politically highly feasible." References: Baranzini, A.; Thalmann, P. (2004): Voluntary approaches in climate policy, Edward Elgar, Cheltenham. ; Borck, J; Coglianese, C. (2009): Voluntary Environmental Programs: Assessing Their Effectiveness, in: Annual Review of Environment and Resources, 34, p. 305-324 | Accepted. Literature added. Mixed outcome is mentioned. |
| 2957 | 15 | | | | | you could just cross-reference to the Forestry chapter and delete this section. | Accepted. Section deleted. |
| 3684 | 15 | | | | | Integrate with chapter 3.8. as chapter 3.8. lacks climate change related examples. | Noted, will discuss w. Ch 3 |
| 2958 | 15 | | | | | I would suggest keep the portions of this section that are specific to emission reduction technologies and brutally shortening everything else. | Noted. Section has been shortened. Because of the limited literature on policy impacts on emissions technology, the authors believe that some discussion |
| 5010 | 15 | | | | | Most of the policy measures described in this chapter are the measures for deployment and diffusion of energy efficiency/clean technologies/energies by either incentivatise or mandate them by policies. Assumption behind this is such green technologies/clean energy are expensive and this is basically true. But if clean energy/green technologies become cheper than fossil fuels and ordinerly technologies, such incentives and/or policy measures may not be necessary. Therefore, R&DDD of such cheep clean energy is crucially important for the mitigation. see the following papers: "Climate Pragmatism, Innovation, Resilience, and No Regrets", Bob Atkinson et al., (2011), "The Hartwell Paper, A new direction for climate policy after the crash of 2009", Gwyn Prins et al., Institute for Science, Innovation and Society, University of Oxford and Mackinder Program for the Study of Long Wave Events, London School of Economics, (May 2010) | Noted. |
| 10456 | 15 | | | | | Cut out this section on R&D. This serves no useful purpose, interrupts the flow of the rest of the chapter | Rejected. Theoretical and empirical literature cited in this section demonstrate the importance of |
| 18750 | 15 | | | | | The extensive experience with renewable energy promotion in Germany (feed-in priority and net metering since 1990, feed-in tariff since 2000) and the significant growth in renewable energy technology deployment in the past two years (e.g. >10 GW of new photovoltaic installation in barely a year) might merit more discussion, as they show up a number of second-level/spillover effects (e.g. merit order effect, decentralization of power generation, etc.) while also effectively underscoring how a promotion system, if properly balanced, can function (the "re-balancing" being a challenging and much discussed issue at current). There is substantial gray literature on the topic, as well as some early peer reviewed literature. Instructive also the contrast to the failed policies in Portugal and Spain applying essentially the same mechanism, but with overly generous inventives leading to a "boom and bust" cycle (for the last paragraph "cautionary experience"). | Taken into account. There is additional discussion of these examples in the SOD. |
| 12067 | 15 | | | | | The section very much overlaps with the content of section 15.5 as measures discussed in 15.5. are in most cases (except measures aiming at behavioural changes) finally aimed at accelerating technology deployment. A discussion how far these policies do influence also technology development is useful, but repetition needs to be avoided. Any discussion on the effectiveness of instruments on deployment should be moved to the respective sections under 15.5. | Taken into account. We have better coordinated the discussion of policies that affect deployment between the subsections. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 11101 | 15 | | | | | This is another example of far-from-science-based reports of this chapter. It reads as if it were a piece of anti-IP-protection campaign. Please refer No.15 and rewrite. | Rejected. Different individuals have very different views regarding the effects of IP policy. The conclusions in the chapter regarding the potential consequences of IP protection are supported by the |
| 12068 | 15 | | | | | Are 'environmental policy instruments' as used in the section meant to represent the GHG mitigation policies discussed in earlier chapters? The objective of the section is not clear. It reads like a summary / conclusion section, but the conclusion section comes later. | Noted in part, rejected in part. The text has been expanded to make clear that "environmental policy instruments" in this subsection are, indeed, the kind of generic instruments discussed in the previous subsection. That subsection did not, however, consider the impact of |
| 12069 | 15 | | | | | The content of this section could be moved to the conclusions in section 15.6.8. It does not present any analysis but rather draws lessons from analysis above. | Noted. |
| 18752 | 15 | | | | | There is an inherent tension between the - accurate - affirmation of multiple important objectives of mitigation policy in this section and a) the mention of the Tinbergen rule earlier in the chapter; b) the application of criteria for the assessment of policy instruments (also earlier on in the report) which assume clearly defined, identifiable and uniform policy objectives (whose achievement can be measure in terms of effectiveness, cost effectiveness, etc.). What may be environmentally effective may not achieve any of the other objectives mentioned in 15.7.1; what is successful at accommodating the various priorities listed here may not necessarily be the most environmentally effective; and so on. | Considered. We added a short para at the beginning of this sector to indicate the multiple objetive of mitigation policies. |
| 12070 | 15 | | | | | It is not clear how this section interacts with section 15.3.2. It seems repetitive - consider merging. The second part of the title 'Measures to widen policy goals' is not clear and seemingly unrelated to the first part of the title. | Considered. We have reorganized 7.1-7.3 to a new section which focus on the interaction between policy objectives |
| 18006 | 15 | | | | | The literature and details covered in this paragraph are very interesting, but might or should be covered in the respective sector chapters (particularly Chapter 7). In my eyes, the role of chapter 15 would rather be to provide the link between the framing, the IAM and the sectoral discussions of SD and co-benefits/co-costs with the policy assessment literature and provide an overview of methodological challenges. In contrast to co-benefits and co-costs of individual mitigation options, Chapter 15 could build on these assessments and discuss synergies and trade-offs across different policy goals in different sectors in view of future transformation pathways. | Considered. The linkage with sectoral chapters will be enhanced when related sector chapters are ready. |
| 18753 | 15 | | | | | This section fails to mention some interesting and useful insights from mainstreaming efforts e.g. in Europe at the EU level and that of individual Member States, where substantial institutional restructuring (e.g. formation of Directorate General Climate Action at EU level and appointment of a Commissioner for Climate Action; creation of the Department of Energy and Climate Change in the UK; various national "Climate Laws" or statutes that bring together all relevant climate and energy provisions/rules. There is literature surveying these developments, but I have no concrete citations at hand. | This EU case study has been addressed in 15.2, institution and governance section |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 18756 | 15 | | | | | That other criteria than efficiency may be relevant when discussing interactions or parallel application of two or more instruments is mentioned; what is not mentioned in this section is the discussion about the need to promote specific technologies with long lead time, such as CCS or PV deployment, even if the same sectors are covered by a quantity rationing instrument such as an ETS - this has been the rationale to retain feed-in tariffs in Europe despite the existence of a carbon price in the energy sector (carbon prices in the EU ETS will not be high enough in the foreseeable future to incentivize the higher-cost abatement technologies). There is peer-reviewed literature on this, see Braathens - Interaction between ETS and other instruments (2011); Boehringer et al. - RES and ETS Interactions (2009); Philibert - Interactions of Policies for Renewable Energy and Climate (2011).<br>Also, section 15.7.5.1 lists coinciding application of efficiency standards and carbon pricing as beneficially interacting, when this has been a major discussion in the EU about the introduction of the energy efficiency directive (EED) and its potential to displace allowances under the EU ETS cap, thereby creating unwanted supply in the carbon market and depressing prices, see e.g. Ryan et al. - Energy Efficiency and Carbon Pricing (2011); Lecuyer et al. Combining Climate and Energy Policies- Synergies or Antagonism? Modeling Interactions with Energy Efficiency Instruments (2012). | Noted. Some references added. Several of these issues are now covered in 15.6 |
| 2959 | 15 | | | | | isn't this covered elsewhere in WGIII? | Noted. |
| 18760 | 15 | | | | | What is not mentioned is the highly influential U.S. Conference of Mayors' Climate Protection Agreement, see http://www.usmayors.org/climateprotection/revised/, that now comprises 1054 municipalities around the United States and entails a voluntary commitment to reduce GHGs to 1990 levels. | Noted. |
| 12071 | 15 | | | | | No references provided for the section. Why are the barriers provided in table 15.3 only applicable to the Pacific Islands? They seem rather to apply to a wide range of countries. While it of course needs to be stressed that barriers vary between countries it seems possible to identify a range of generic barriers that apply to a wide range of countries. | The comments is noted and appeciated. The barriers are generic and are not specific to the Pacific Islands Countries only. The Pacific Islands Countries was only mentioned to address the need for developing countries case studies etc in |
| 18761 | 15 | | | | | Repeats or refutes some statements in earlier sections, e.g. "not uncommon ... to ... have a number of different policies" (see above in the chapter, Tinbergen rule and instrument interactions; Definition of policy on p. 70, line 15 somewhat idiosyncratic, what is missing is a definition of capacity building (for which ample literature exists. Also (p. 70, l. 18): policies are the outcome of decisions; they tend to guide (implementing) actions, not decisions (unless one wants to enter the complex discussion of hierarchical planes of regulation, with higher-level policies - e.g. fundamental rights, constitutional doctrines - limiting the range of permissible policies at a lower plane); p. 71, l. 3: instruments alone do not ensure progress on mitigation, as the preceding table already highlighted - a multitude of factors, institutional, technical, economic etc. are determinative. P 71, l. 9 - should read "good" policies (not "food" policies)? | A definition of CB according to the United Nations Conference on Environment and Development, is provided in the SOD. Food vs. Good policis is noted and corrected. |
| 18762 | 15 | | | | | Very short and not much substantial content yet. | Noted. This section is only given 2 pages and can't cover all in that space. |
| 15399 | 15 | | | | | Since most of the comparisons of policy instruments between global, regional and local action involve cost-effectiveness criteria, the discussion of cost-effectiveness needs to be considerably strengthened. | Noted. Will be done wherever feasible given the literature. |

|---|---|---|---|---|---|---|---|
| 15401 | 15 | | | | | The discussion of carbon taxes cannot be confined to a survey of the very limited examples of application of these taxes. There is a large number of published studies, many using CGE models, that show how a carbon taxes or proxies like cap and trade are cost-effective and capable of bringing about emission reductions large enough to meet any feasible temperature goal. This section makes it appear that carbon taxes are nearly irrelevant, despite the many studies showing their advantages over the regulatory and subsidy policies that take up the bulk of the chapter. | Noted. |
| 15402 | 15 | | | | | Discussion of phaseout of fossil subsidies completely ignores the very large subsidies to certain specified renewables now in place in most countries. The notion of technologies competing on a level playing field or cap and trade established by a carbon tax or cap and trade seems entirely missing from the chapter. | Noted. |
| 7560 | 15 | | | | | Eco-point system for housing in Japan has to be mentioned:<br>http://www.env.go.jp/en/wpaper/2011/pdf/22_Chapter4-3.pdf<br>For example, insert the following sentences.<br>Global warming countermeasures in the private sector are an issue that the residential sector should work on, and the government can actively encourage energy-saving in the housing sector, which will create an environmental effect that contributes to the establishment of a low-carbon society, and an economic effect that will stimulate new demand in the domestic market (MOE Japan 2011). | Noted |
| 15403 | 15 | | | | | Discussion of border tax adjustment (BTA) is incomplete in that it does not mention the difficulties of calculating accurate taxes on embodied carbon or WTO obstacles to BTA. On this see Babiker and Rutherford (The Economic Effects of Border Measures in Subglobal Climate Agreements, by Mustafa H. Babiker and Thomas F. Rutherford, 26(4), 2005, 101-128.). and Andrew Greene (Reconciling Trade and Climate: How the WTO Can Help Address Climate Change (with T. Epps) (Cheltenham, UK: Edward Elgar) [forthcoming].; "Trade Rules, Dispute Settlement and Barriers to Regional Cooperation" in Neil Craik, Debora VanNijnatten and Isabel Studor, eds., Designing Integration: Regional Governance in Climate Change in North America. [forthcoming]; "Is There a Role for Trade Sanctions in Addressing Climate Change" (with Tracey Epps) (2008) 15(1) University of California Davis Journal of International Law and Policy 1-30.) | Noted |
| 15406 | 15 | | | | | REDD discussion leaves out perhaps the most important problem with REDD – that the same governance failures that lead to deforestation and are going to be continuing obstacles to reversing REDD. On this see the work of Lee Alston (with Krister P. Andersson, Reducing Greenhouse Gas Emissions by Forest Protection: The Transaction Costs of Redd, February 2011, NBER Working Paper No. w16756) sources they cite. | This section will be deleted. Dealt with in Ch 11. |
| 15407 | 15 | | | | | I do not see any discussion of the literature that would support for the unqualified claim that commercialization needs to be supported by government, and I know that there are many examples of studies that question that claim. See for example: R.G. Newell. (December, 2008). A U.S. Innovation Strategy for Climate Change Mitigation. Hamilton Project Discussion Paper 2008-15 Brookings Institution. | Rejected. First, the claim in the text is not unqualified; we note several issues and concerns regarding government support of technology at the commercialization stage. More important, the claim that there is some appropriate role for government support of commercialization is supported by the literature cited in the section, and additional literature cited in the SPREN |
| 15408 | 15 | | | | | Conclusion 3 on R&D unwarranted – carbon tax would do it, govt purchase a narrow possibility. | Rejected. Theoretical literature, cited in the Chapter, emphasizes that technology markets suffer from distinct market failures that are not addressed by carbon taxes. Empirical and historical literature demonstrate the potential |

|---|---|---|---|---|---|---|---|
| 15409 | 15 | | | | | The list of problematic interactions between policies leaves out the most important cases in which regulations that mandate a more costly technology drives out cheaper technologies that would be chosen under cap and trade. (Bloomberg paper,"The Price of Carbon," in Electric Light & Power Magazine, Volume 87 (August 2009). ) Aside from this good but overly limited interactions section, the chapter implies that every additional policy measure is a good idea – and that more policies are already better than less. Work by Goulder on how regulatory measures increase cost when added to cap and trade or tax policies need to be discussed. For examples, see the following Goulder publications: Goulder, Lawrence H. & Parry, Ian W. H. & Williams III, Roberton C. & Burtraw, Dallas, 1999. "The cost-effectiveness of alternative instruments for environmental protection in a second-best setting," Journal of Public Economics, Elsevier, vol. 72(3), pages 329-360, June. Parry, Ian W. H. & Williams, Roberton III & Goulder, Lawrence H., 1999. "When Can Carbon Abatement Policies Increase Welfare? The Fundamental Role of Distorted Factor Markets," Journal of Environmental Economics and Management, Elsevier, vol. 37(1), pages 52-84, January. Instrument Choice in Environmental Policy Lawrence H. Goulder∗ and Ian W. H. Parry∗∗Review of Environmental Economics and Policy, volume 2, issue 2, summer 2008, pp. 152–174 doi:10.1093/reep/ren005. | Noted |
| 7561 | 15 | | | | | The "environmental concierge system" in Japan has to be mentioned as an excellent example: http://www.env.go.jp/en/wpaper/2011/pdf/22_Chapter4-3.pdf For example, insert the following sentences. In "The New Growth Strategy: Blueprint for Revitalizing Japan," Cabinet decision in June 2010, the "environmental concierge system" was introduced. In order for households to effectively reduce their CO2 emissions, it will be necessary not only to promote the purchase and installation of low-carbon equipment but also to provide appropriate advice on using it to the individuals having high interest.(MOE Japan 2011). | This section is about Capabity to Formulate Policies. This section has been rewritten with more emphasis on the need for sound data and information in order to effectively formulate and review policies. |
| 7429 | 15 | 0 | | | | Add a subsection (15.5.6.6) on the spillover impacts of response measures citing the most recent literature on this issue. | Rejected. This is covered in Chapter 13 section 13.8. . |
| 12929 | 15 | 0 | | | | The chapter is still in a very draft form, e.g. some sentences are missing and many papers are not quoted in the references. However, I found it interesting, informative and original, especially part 15.7 on synergies and tradeoffs among policies (although this part still requires a lot of work). In general there is a lot of material concerning developed countries and relatively few on developing countries, but this reflects the existing literature. Since the TSU mentioned that the chapter is too long, I concentrate my comments on how to shorten it. | Noted. |

|---|---|---|---|---|---|---|---|
| 15547 | 15 | 0 | | | | One key issue that does not seem to be mentioned here or in any of the other chapters is the potential problem of fossil fuel prices falling in response to climate change mitigation policies. This could possibly go in 15.7.5.2. In its most extreme guise, this problem becomes the Green Paradox discussed by H-W Sinn. Emissions pricing to tackle climate change may not have the desired impact on emissions or the development of renewable energy if it drives down the pre-tax price of fossil fuels. Policy-makers need to take into account constraints and general equilibrium feedbacks throughout the economy when designing policy instruments and should not assume that market prices necessarily reflect resource costs in real-world settings (Dreze and Stern, 1990). An important example in the context of climate change and renewables policies is provided by the market prices of fossil fuels. These reflect not only the resource costs of extracting the fuels but also the rents accruing to their owners due to their scarcity value. Carbon pricing may simply push down the price received by the producers of fossil fuels, without affecting the final price to users; the scarcity rents from fossil fuel owners would then just be transferred to the authorities applying a carbon tax or to the owners of carbon emission quotas and the rate of extraction of fossil fuels would not be affected. Indeed, if carbon pricing reduces the producer prices of fossil fuels, that will stimulate demand for them in any jurisdictions not applying carbon pricing. The prospect of policies to combat climate change intensifying and the carbon price rising over time may encourage fossil fuel owners to deplete their exhaustible resources more rapidly, undermining policy-makers' objectives for both the climate and the spread of renewables technology (Sinn, 2008). Insecure property rights – perhaps made more so by the risk of coercive international action to curtail the use of fossil fuels – exacerbate the risk. Hence climate change mitigation policies and renewable energy support policies could undermine each other through their impacts on fossil fuel extraction in the near term.<br><br>This analysis suggests that the optimal trajectory for the carbon price for maximising overall social welfare may not be a steady rise at the rate of interest, or the discount rate plus the rate of decay of greenhouse gases in the atmosphere, as often assumed in models of optimal climate-change mitigation policy (e.g. Paltsev et al., 2009). More attention needs to be given to the economics of exhaustible natural resources. Some analyses have suggested that the optimal trajectory is downward-sloping when there are negligible extraction costs, which is not a bad approximation for the largest OPEC oil producers. Such a trajectory would persuade resource owners at least to delay extraction, which would be beneficial because of discounting (Sinn, 1982; Sinclair, 1992, 1994). If these are correct, then policy-makers risk undermining their objectives, including the large-scale adoption of renewable energy, if they introduce a regime that leads to a rising carbon tax over time. Policies to promote renewables may shift the whole carbon price trajectory downwards, increasing emissions (Hoel, 2009).<br><br>But the availability of cheap fossil fuels need not undermine climate-change policies completely.<br>First, the optimal carbon price is likely to rise for some time, even in models where ultimately all the fossil fuels are extracted (Ulph and Ulph, 1994) Hoel and Kverndokk (1996) show that, if the stabilisation of greenhouse gases in the atmosphere is possible with some residual steady-state greenhouse gas emissions, the carbon price should rise until some moment before stabilisation is reached and then fall, so that fossil fuels are conserved until they can be used cheaply and without harming the environment,alongside renewable energy. | Rejected. The chapter discusses national and sub-national policies. Optimal tax policy at this level must be conditional on other jurisdictions' actions, and this is not taken into account in the literaure cited. In any case, for reasons of space, we do not discuss optimal tax policy. |

|---|---|---|---|---|---|---|---|
| 16957 | 15 | 0 | | | | I have a major dilemma in commenting on this chapter. The topic of assessing policies and (to a lesser extent) institutions has been the prime focus of a book written over the past two and half years: Grubb, Hourcade and Neuhoff, Planetary Economics and the Three Domains of Sustainable Energy Development Taylor & Francis forthcoming (Chapters 1 – 5 submitted, others in draft available on request).<br>Rather than go through in detail, my overall observation is that the chapter could benefit from a clearer consistent structuring of the policies and measures, and an account of how they relate to each other. The key to this would seem to lie in the concluding statement,p.76 lines 3-6, which identifies: "…. Three broad categories of policies for the government to mitigate climate change effectively …"<br>The three broad categories named in this paragraph in fact align almost exactly with the classification of the three domains in our book, and the associated "3 Pillars of Policy", though we do put them in a different order. I think this is no accident: we have converged on a fundamental structural dimension of climate change policy.<br>I would suggest that<br>(a) to the extent possible within the constraints, the chapter is either restructured along these lines, or if this is not possible given the negotiated outline, that the paragraph indicated is moved right up front to inject this basic categorisation into people's minds as they read the rest<br>(b) the accompanying Figure (15.5) is reviewed to see if it can be adapted to align with and reinforce this basic message<br>(c) we share with the Authors of this chapter the full texts of our book, which is structured around these three pillars of policy, seeks to analyse the empirical evidence around them to date, and to then analyse how they interact. Obviously, it would then be up to the authors to decide how useful any of this material is, and to what extent it might be desirable to align terminologies etc.<br>There may be some benefit to swapping the order of the first two categories in the paragraph indicated, so that it leads with regulatory and information measures. This would not only align with the terminology in our book, but more important (for the IPCC) it would align with the theoretical structures of "System 1" and "System 2" decision-making processes introduced in Chapter 2 of the FOD, since these map fairly directly on to (i) regulatory / information, and (ii) price-related, instruments. Note my comments to Chapter 2 also on the fact that many of the other things in chapter 2 that "don't fit" in these two categories are actually manifestations of Third Domain processes, which align with the Policy Pillar of innovation and infrastructure. | Noted. |
| 13753 | 15 | 0 | | | | Overall, the chapter provides a very comprehensive overview over climate policies. It is very relevant and informative. In most instances, the assessment has the right level of detail. It appropriately points to a lot of policies that have been implemented in many countries. However, there are some elements that seem somewhat outdated (e.g. 15.5.4.6-10, which can be replaced by a short summary with a pointer to appropriate references; check with AR4) and in some section, less detail may be sufficient. | Accepted. The sections referred to will be re-written. |
| 13754 | 15 | 0 | | | | There are quite some references that are missing from the reference list. I have not checked all of them and cannot point out, but for example Davis 2010, De Vita et al. 2006, Sterner 2012 are missing. Please check all references. | Accepted. |

| 6710 | 15 | 0 | | | | As a set of policies to reduce energy service demands is one of keys to reduce GHG emissions, it is suggested that such policies should be mentioned separately. For example, insert subsection " emission reduction policies" in Section 15.3<br><br>As an example of policies to reduce energy service demands, Japanese experience after Fukushima nuclear accident could be referred to. For example, "To curtail power demand, in the summer of 2011, the Japanese government launched an extensive power-saving campaign and imposed a cap on power use for large consumers such as factories. As a result, electric energy sales in TEPCO's service area in July and August 2011 posted a year-on-year reduction of about 15% for large and small consumers (Katayama and Onogawa, 2012)."<br><br>Reference: Katayama and Onogawa, 2012, The power saving behavior of the residential sector in the wake of the Great East Japan Disaster, in Lessons Learnt from the Triple Disaster in East Japan, IGES Policy Report No. 2012-01, Institute for Global Environmental Strategies, 71-88, Referred part is in 72, available at: http://enviroscope.iges.or.jp/modules/envirolib/upload/3986/attach/IGES_2012_Policy_Report_for_Disaster_Research.pdf | Rejected. Emission reduction policies include all policy types. |

|---|---|---|---|---|---|---|---|
| 18763 | 15 | 0 | | | | Overall, this chapter represents a solid effort to condense the current scientific consensus on the topics identified during the scoping process. There are, however, some overarching comments that can be made:<br><br>1. Some passages, e.g. the table summarizing national policies, can be omitted to reduce overall length and free up more space for sections that are currently underdeveloped. As the table of national policies in Section 15.2.2.1 shows, any attempt to provide a snapshot of ongoing policy developments will invariably be out of date fairly quickly and selective in what it covers (see separate comments on these specific sections), undermining its added value and suggesting a more analytical, holistic approach instead that seeks to distil general lessons and trends. Likewise, the description of historical experiences with in NOx and SO2 trading in the US in Sections 15.5.4.9 and 15.5.4.10 adds little value because it is both old and applies to a generally different context; lessons from the EU ETS or the Regional Greenhouse Gas Initiative (RGGI), partly covered in other chapters, would seem more useful for climate change mitigation.<br><br>2. By contrast, some other sections are still underdeveloped; e.g. 15.9.3 and 15.9.4, which essentially are expanded headlines and contain very little developed substance.<br><br>3. In some cases, the current division of topics between Chapters 13, 14 and 15 renders it more difficult to reach summary conclusions or compare relevant policies and instruments in a fruitful way; e.g. the ample discussion of quantity rationing instruments (emissions trading) in Section 15.5.4 cannot draw on the wealth of experience reached in the European Union with the EU ETS, because that policy - although clearly relevant for the domestic plane and sharing many of the characteristics of national emissions trading systems, such as centralized administration, enforcement through sanctions etc. that set it apart from traditional international regional cooperation - is assigned to another Chapter.<br><br>4. The increased focus on ex-post analysis is highly welcome, and important in various ways (see also comment on disciplinary bias below). However, it has also resulted in frequent description of situations (policy developments and legislation) that are no longer valid because of political developments since the (often older) source cited. This is particularly apparent e.g. in the description of regional climate initiatives in the U.S. in various sections of the chapter. Greater reliance on authoritative policy documents or official websites seems important to avoid this problem.<br><br>5. There are frequent inconsistencies and tensions throughout the chapter's individual sections. For instance, in Section 15.7.1, the affirmation of multiple important objectives of a single mitigation policy seems to partly contradict the earlier mention of the Tinbergen rule (one policy - one market failure/objective) and the criteria for policy assessment applied earlier in the report, which assume clearly defined, identifiable and uniform policy objectives (whose achievement can be measured in terms of environmental effectiveness, cost effectiveness, etc.). Case in point: what may be environmentally effective may not achieve some of the other objectives mentioned in 15.7.1; what is successful at accommodating the various priorities listed in 15.7.1 may not necessarily be the most environmentally effective; and so on. Such trade-offs between different approaches | 1. Accepted. The table will be deleted. 2. Accepted. These sections will be re-written. 3. Accepted. Chapter 14 will be referred to where needed. 4. Noted. |
| 18674 | 15 | 0 | | | | Too long but the discription of national policies can be taken out (needs to be much longer if useful and will probably never pass) – interesting examples can and should be used as case studies. | Accepted. Will be done. |
| 18675 | 15 | 0 | | | | Isn't there a need to coordinate the dub-national aspect with chapter 12 (in reality about urbanisation and what can be done on the urban level) | Noted. |
| 18678 | 15 | 0 | | | | There is some overlap between 13, 14 (but hard to read out in the present version) and 15 regarding description of policies etc + also overlap in relation to earlier chapters (among them c 3). Perhaps better to sort out the general stuff in chapter 13 and do cross-references. Partly repeating the same stuff is far from ideal + there is a need to stay consistent | Noted. |
| 18679 | 15 | 0 | | | | Rebound effects discussed once again. | Noted. |
| 18680 | 15 | 0 | | | | Boarder tax adjustments discussed one again (at least partly based on new/different material) | Noted. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 18682 | 15 | 0 | | | | (Interestingly enough, patents are thereafter used as a measure regarding innovations.) | Noted. |
| 15560 | 15 | 0 | | | | Overall, the chapter contains very interesting information but could benefit from more structure. Across the chapter and within each section, it would be helpful to clearly state the purpose of the chapter/section and the key points of the chapter/each subsection, the contents of the chapter and subsections as well as clearly defined conclusions, both for the chapter in the executive summary and in the individual sections. Presenting the material in visually easy-to-read formats, such as through the use of bulleted conclusions, will make this more readable. At times it seemed that the content of some sections was disjointed while others were very concise. Developing a clear outline for what each section will say may help to identify what text can be cut or tightened to meet the page limit. Including an overall conclusion or key takeaway messages at the end of the chapter, at the end of each main section, and in the executive summary would significantly improve this chapter. Also, the word "however" is overused. | Accepted. The next draft will attempt to do a better job of this. |
| 18471 | 15 | 0 | | | | The interlinkage with other AR5 policy chapters is extremely limited. (The only clear connection is 15.2.3 discussion on NAMAs). A reader misses a clear connection, e.g. a discussion on the implications of international and regional policies on national policy-making. | Noted. |
| 18472 | 15 | 0 | | | | Chapter misses a synthesis of the policy discussions in the sectoral chapters. Where sectoral policies are currently covered in the chapter, it is in a scattered and inconsistent way. One of the key outputs expected from Chapter 15 for the AR5 would be to bring these inputs together for a concise, overarching message about how national policies address the different sectors. This could be done in e.g. a 3rd level heading in 15.5. | Noted. |
| 18473 | 15 | 0 | | | | Consistency between section 15.3 and 15.5 in terms of policy categorization is lacking in two noticeable places:<br>1) Regulations & Standards and Information policies from 15.3 are combined in 15.5. The reason for this combination that appears in 15.5 is that they are 'often' implemented together. This combination is, however, not always the case. It would be much more useful for the reader to evaluate each of these policies individually (which would also allow consisteny with Section 15.3 as well as Chapter 3), then to discuss synergies in 15.7, which is the logical place for policies that are implemented together.<br>2) 15.3 focuses on land and infrastructure planning (e.g. cities), whereas 15.5 on REDD. Why this differentiation and singled focus on individual sectors, each of which have dedicated policy section in the relevant policy chapters? | 1. Accepted. 2. Noted. |
| 18482 | 15 | 0 | | | | I applaud the focus on ex post analysis as an innovation from the AR4. However, this focus cannot EXCLUDE the theoretical literature. As such, at the very least there should be a discussion of both theoretical and empiracle literature, ideally also comparing the two and explaining discrepancies. This is done in an exemplary way in 15.6, but is largely ignored in 15.5. | Accepted. |
| 18483 | 15 | 0 | | | | The quality and consistency of the chapter text ranges widely, with some sections in a truly excellent state and others that would need to be completely restructured and rewritten. The chapter would benefit greatly from a good, strong edit by a single voice to assure a comprehensive storyline throughout. Substantial effort would be needed to bring the chapter up to a high standard throughout in time for the SOD. | Accepted. |

|---|---|---|---|---|---|---|---|
| 18451 | 15 | 0 | | | | I offer these comments in the spirit of helping the authors achieve the following goals:<br>(a) craft a useful, important contribution to the IPCC report;<br>(b) include recent and relevant research; and,<br>(c) shorten the chapter.<br>The Excel format for offering comments is incredibly clumsy. I have done my best to transpose my comments, which were composed in Word format.<br>I have been a policymaker as recently as 2002 to 2010, when I was member and Vice Chair of the Virginia State Air Pollution Control Board.<br>So I offer comments not only as an academic expert, but also as a former national (EPA) and state air pollution policymaker.<br>One of my current book projects involves climate change policymaking in the US, Germany, and Brazil. | Noted. |
| 18452 | 15 | 0 | | | | 1) To shorten the chapter, I suggest eliminating Table 15.1 and keeping the country descriptions in text. The table provides insufficient detail.<br>Any reader interested in knowing about individual country actions will refer to the text.<br>Careful editing can also shorten this chapter. Many sentences are cluttered with unnecessary words and phrases, and clarity suffers.<br>For example, the following sentence at the top of p. 41 can be shortened, as follows:<br>Current: A problem associated with most carbon pricing systems, but one that is especially significant for RGGI, is that electricity generation and emissions may "leak" outside the cap (Burtraw, Kahn, and Palmer 2005).<br>Shortened: RGGI's design has the potential for "leakage" of electricity generation and emissions (Burtraw, Kahn, and Palmer 2005).<br>It would be useful to describe how Germany's emissions reductions were accomplished by a combination of closing old polluting factories in the former East Germany, implementing the EU ETS, and national energy laws. as should the ways in which those funds have been used to support programs to lower GHG emissions. | Accepted. The table will be deleted. |
| 18454 | 15 | 0 | | | | (4) The US policy descriptions are outdated. The authors should add two or three sentences about EPA's vehicle standards and the Agency's efforts to regulate stationary sources of greenhouse gases under Section 111 of the Clean Air Act.<br>A June 26, 2012 US Circuit Court of Appeals finding wholly supported EPA's claim<br>that greenhouse gases can be regulated under the existing Clean Air Act.<br>The authors should also indicate that plans for new coal-fired power plants in the US have fallen off, because of lower natural gas prices and also because of various EPA regulations for air, water, and waste. See, e.g., Susan Tierney, "Electric Reliability under New EPA Power Plant Regulations: A Field Guide: (www.wri.org/stories/2011/01/electric-reliability-under-new-epa-power-plant-regulations-field-guide). Here is a recent reference for the actions under Section 111 of the Clean Air Act: M. Rhead Enion, "Using Section 111 of the Clean Air Act for Cap and Trade of Greenhouse Gas Emissions: Obstacles and Solutions," UCLA Journal of Environmental Law and Policy 30(1)(2012): 1-50. | Accepted. The material describing US policies will be rewritten. |

|---|---|---|---|---|---|---|---|
| 18456 | 15 | 0 | | | | (6) The first few paragraphs of the chapter indicate that climate change policy effectiveness will be evaluated in some fashion. Yet the chapter skirts that evaluation, which is absolutely critical for policymakers. Readers will want to know, what policies work to reduce greenhouse gas emissions, and in what context?<br>While recognizing the problems with determining cause and effect, the authors should seek studies that indicate how greenhouse gas emissions, emissions per capita, or emissions per GDP have changed in the places that have initiated policies with direct or indirect effects on greenhouse gas emissions. Information on costs and collateral benefits (e.g., jobs, lower solid waste production, reduced emissions of other pollutants) would be helpful, too.<br>This chapter should address these issues head on, rather than skirting them by citing studies on trading programs for other pollutants. In fact, I believe the section on lead emissions trading should be eliminated and the section on the acid rain program should be reduced to a few sentences. The authors should focus on policies and programs that have affected emissions of greenhouse gases, and they should take care to include programs aimed at pollutants other than carbon dioxide. For example, the widespread closure of old landfills around the world and the spread of recycling programs have led to lower methane emissions. Such programs should be described, as should their impacts on methane emissions. | Accepted. Sharper conclusions will be made where warranted. The section on tradable permits will be rewritten. |
| 3183 | 15 | 0 | | | | This chapter serves a crucial function, for it helps people understand what is known about the design and implementation of national policies. It is a difficult chapter to understand, however, because it comes at the end of the WG3 report when many of the key points (such as on policy design and to some degree on political decision-making) have already been made. Moreover, the chapter is nearly devoid of the insights that come from people who study national policy processes professionally—for example, the entire field of comparative politics and most of the field of public policy decision-making. I don't know what to advise in terms of revision, but one strategy would start with key insights from previous chapters concerning policy design and choice (e.g., chapters 2, 3 and 5) and then, with that baseline, add any comments in addition. You might also consider putting sections 15.3 and 15.4 first in the chapter as they set a foundation for understanding policy choices. Throughout, there might be more discussion of different types of governments (e.g., anoncracies and democracies) and how government type affects political decision making as well as industrial organization.In general, attention to adaptation is pretty thin in this chapter. And since WG3, overall, is thin on adaptation the TSU might advise all of us on whether/how this needs to be beefed up. Throughout the chapter I thought regulation is under-played even though it is the main means of national policy related to emissions controls and the importance of markets is over-played. As analysts we might not like that—we prefer flexible markets to regulatory mandates—but the real world has spoken differently. | Noted. Closer integration with other chapters will be done. |
| 12041 | 15 | 0 | | | | Outline of the chapter: I am not sure if the sub-chapter on NAMAs is appropriately positions within section 15.2. As nationally appropriate mitigation actions are a specific construction of the UNFCCC process but in essence represent different types of mitigation actions at various possible levels they represent a specific form of policy instruments. I would therefore suggest to either include the discussion of NAMAs in section 15.3 or to dedicate a specific new sub-section to the discussion of NAMAs. Another alternative would be to include it as a box within section 15.3, as it is not really a policy instrument in itself, but a way of communicating activities at the international (UNFCCC) level. | Noted. This section will be rewritten. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 12042 | 15 | 0 | | | | A general consideration would be whether the chapter only addresses policies that are specifically designed for GHG mitigation or if it also at least mentions measures that are implemented for other purposes but influence GHG emissions. Especially in the section on institutions and governance it would be good to include a discussion how important it is to ensure coordination between different institutions (especially ministries) to ensure mitigation policies are not rendered ineffective by other policies initiated by other departments for a variety of reasons. | Noted. The chapter does aim to address all policies that have major impacts on GHG emission reduction. |
| 12043 | 15 | 0 | | | | The overall logic of the chapter is not made sufficiently clear in the introduction, and the sub-sections lack a clear explanation of the outline of the individual section structure. In many cases the rationale for the choice of sub-sections and their order is not immediately obvious. A very brief introduction to each section would be benefitial for the better understanding of the reader. | Noted. |
| 2346 | 15 | 0 | | | | It is confused the structure of the paper by adding sub conclusions under 15.2.2.3,15.2.5,15.5.2.4. 15.5.5.4Rather having a conclusion in between subsection, this point can be merged into the main part or can be dragged into a main conclusion. Same issue can be raised "sub Introduction". These leads to exceed of length of the paper. | Noted. |
| 10457 | 15 | 0 | 0 | | | Several topics of this chapter are written in an US centric fashion and should be expanded to include the developing world | Noted. Despite the paucity of peer-reviewed studies in developing countries, the SOD will include more |
| 5900 | 15 | 1 | 1 | 92 | | The text could be shortened considerably if you refrained from listing case studies / examples and changed the text to "statement (source)". This might seem just a matter of style but writing "statement (sources), but see also (source)" is less space-consuming than "X wrote ..., Y found ..., but Z indicated that ...". | Noted. |
| 13613 | 15 | 1+ | | | | Just wanted to point out the NBS study we were involved with (a systematic review regarding climate policies and their effectiveness) which may be of interest http://nbs.net/wp-content/uploads/NBS-Systematic-Review-Policy.pdf | Noted. |
| 13620 | 15 | 1+ | | | | Re-reading the request at the beginning, thinking about the audience (which is rather broad), I would suggest deleting some text pertaining to the general debates e.g. the role of IP in hindering or helping technology diffusion at a general level (still covering the key debates but getting into less details to do with the studies. For example, there is a lot of material on the U.S. Clean Air Act and its implications (e.g. appetite and experience of market based instruments, etc). Without negating the importance and significance of this milestone, I would suggest deleting some of the details. | Accepted. |
| 18719 | 15 | 10 | | 16 | | As discussed during the ERM in Washington DC in August, omitting a table is probably preferable to attempting to define compelling boundaries (which countries and why) and seeking to balance depth and detail with available space. Moreover, inclusion of numerous jurisdictions will mean a proportional rise in the number of regulatory changes and additions, consequently resulting in the overview being outdated even sooner. | Table deleted |
| 18676 | 15 | 10 | | 16 | | Table 15.1 Legislation and Policy (pp 10 – 16) –out? To give a complete overview will be very complicated (and demanding) | Table deleted |
| 10227 | 15 | 10 | | 16 | | Landscape format would improve readability of this table | Table deleted |
| 18469 | 15 | 10 | | | | It may be more useful to replace this table with a crisp comparison map, as was done for the IPCC SRREN (see Ch 11.2, p. 875). This will solve the problem of readability (multiple-page tables are typically discouraged in the IPCC) and also country selective bias which has the potential to be politically problematic. This way the messages of the table will be retained and chapter space saved. For comparison in this map, it would be useful to highlight policies that were covered by the AR4, and those that have evolved since that time. | Comparison map has been attempted for SOD |
| 12931 | 15 | 10 | 16 | 16 | 1 | I suggest to delete Table 15.1 and to discuss its main elements in the text of section 15.2.2.2. Prensention of policies in different countries is interesting, but I suggest to to discuss each country with the same structure, in order to facilitate comparison. | Accepted |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 12165 | 15 | 10 | 16 | | | The information in this table seems to provide limited value, especially given its lenght - it is unclear to me what the purpose of all the information provided is other than conveying the fact that indeed quite some countries have adopted climate policy or regulation in recent years. The stated objectives seem to originate directly from the countries own descriptions, which generally do not follow a particular structure. Therefore, the table lacks consistency. Also, notwithstanding its lenght, the information does not provide much on the concrete contents of policies. It might be better to rearrange content following a given structure, or reduce in size drastically. | Table deleted |
| 12166 | 15 | 10 | 16 | | | please provide description for abbreviations AI and NAI and change the colomn header from 'type' to e.g. 'status' | Table deleted |
| 6716 | 15 | 10 | 16 | | | What is the criteria to choose the countries?<br>It is better to add the footnote to the policy of Canada, as Canada withdrew from Kyoto Protocol. | Table deleted |
| 17653 | 15 | 10 | 16 | | | I find the table to be of limited use. Given that it only lists G20 countries, the information is mostly limited to some wealthy or at least increasingly wealthy countries. At the same time the table is incomplete and the categorization between legislation and policy seems unnecessary. | Table deleted |
| 18718 | 15 | 10 | 7 | 10 | 8 | The sentence "Finally, national styles and traditions of governance also shape divergence across approaches" is somewhat unclear, especially when considering the examples that follow (China, USA): how are these two specifically divergent, and divergence across what elements/criteria? Within a single policy, across all national policies, or between policies of different nations? | Re-written |
| 3674 | 15 | 10 | 9 | 10 | 9 | Please add "In its long-term plans until 2020, China aims at a reduction of carbon intensity by 40-45% against 2005, an increase of non-fossil fuel share (in primary energy supply) to 15% by 2020 against 2005, an increase of forest coverage of 40mill. ha and of forest stock volume of 1.3bn $m^3$ by 2020 against 2005 and the promotion of Green Economy, Low Carbon Economy, Circular Economy and technology development". | Section has been re-written. Also, the intent here is not to reproduce all national commitments, as that would make the section too long. |
| 8311 | 15 | 11 | | | | For Canada, suggest to delete example of Kyoto Protocol Implementation Act as it will be repealed. Instead add "Sector by Sector GHG Regulations under Canadian Environmental Protection Act" under legislation/plan name. Under Objectives, delete existing text and add, "Regulations to reduce GHG emissions have been introduced for the transportation and electricity sectors so far. Regulations are forthcoming for other emissions-intensive industry sectors, starting with the oil and gas sector." | Table deleted |
| 5252 | 15 | 11 | Table | | | I thought Canada had walked away from the Kyoto 'Accord'. | Table deleted |
| 13231 | 15 | 12 | | 12 | | China: China issued a "Climate Change White Paper" in 2011. It lists all then current climate policies and plans. It supersedes the 2007 document listed here. | Table deleted |
| 5253 | 15 | 12 | Table | | | The EU's targets exclude 'embedded emissions' in imports, and therefore are a dishonest prospectus. | Table deleted |
| 9917 | 15 | 13 | | | | Germany: the situation presentation in this chapter is outdated | Not applicable now - table removed |
| 13232 | 15 | 13 | | 13 | | Indonesia: Indonesia in 2009 announced a national emissions target, and subsequently announced specific policy measures to help achieve it. The 2007 plan is essentially superseded. More informationa can be found in Jotzo, F. (2012), 'Can Indonesia Lead on Climate Change?' in Reid, A.S. Indonesia Rising: The Repositioning of Asia's Third Giant, ISEAS, Singapore. This paper will be made available to the TSU. | Not applicable now - table removed |
| 5254 | 15 | 13 | Table | | | Germany's position is a shambles. Coal use is rising, fossil fuel subsidies continue until at least 2018, carbon emissions are rising rapidly. This Table is a grossly dishonest reflection of Germany's current and prospective position. | Not applicable now - table removed |
| 3119 | 15 | 15 | | | | re. Turkey - very good overview here:<br>http://www.cgseurope.net/UserFiles/file/Ankara%20workshop_june%202012/presentations/Evren%20Turkmenoglu.pdf | Thank you |
| 3120 | 15 | 15 | | | | it would be useful if there was an additional column on national emission reduction targets. These are mentioned for some countries but not all e.g. Germany has a target for 2020 (40% reduction) and 2050 (80%) | Not applicable now - table removed |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 3117 | 15 | 16 | | | | UK: The Low Carbon Transition Plan was replaced by the Carbon Plan in 2011 (see http://www.decc.gov.uk/en/content/cms/tackling/carbon_plan/carbon_plan.aspx). Also, key features of the 2008 CC Act is that it enshrines the 80% 2050 target in legislation and sets a framework for carbon budgets. | Table been deleted |
| 18677 | 15 | 16 | | 22 | | The same goes for the case studies (pp 16 – 22) | Table been deleted |
| 15562 | 15 | 16 | | | | Under United States of America row - the legislation or plan name is not the Endangerment finding but the Clean Air Act; Recommend that you change the text in the objectives column to be: Based on findings that greenhouse gases endanger public health and that contributions by motor vehicles contribute to greenhouse gas pollution, the CAA has been used to regulate emissions from motor vehicles. | Table been deleted |
| 5000 | 15 | 16 | 10 | 22 | 42 | It is not appropriate to list the specific cases of countries here. | Thanks for this - in the end we have had so many comments about the country case studies that we have decided to go for a descriiption of a particular |
| 13233 | 15 | 16 | 11 | 17 | 5 | Motivations for China's climate policy: The discussion here should be clearer, and it is important to realise that motivations go well beyond fostering energy efficiency. Boyd (2012) identifies as China's motivations (1) energy security, (2) climate change mitigation and (3) technology leadership. One might add reduction in local air pollution to the list. Boyd, O., 2012. “China’s Energy Reform and Climate Policy: The Ideas Motivating Change”, Centre for Climate Economics & Policy, Crawford School of Public Policy, ANU. | Not applicable now - table removed |
| 3675 | 15 | 16 | 11 | 16 | 12 | Please add "One other important impetus of climate change mitigation actions in China is their impact on energy security, especially regarding the reduction of domestic oil demand. As the Chinese government aims at importing crude oil as little as possible, energy security concerns are increasing with growing net-oil imports. Climate change mitigation actions leading to a reduction of domestic oil consumption can reduce the energy security pressure (Oberheitmann, 2009)." Please cite as: Oberheitmann, A. (2009). China’s energy security strategy and the regional environment - Assessment of economic growth and its environmental impact applying a dynamic welfare optimisation approach. Saarbrücken: VDM. | Not applicable now - table removed |
| 12167 | 15 | 16 | 3 | 16 | 4 | In fact I'm wondering if presenting a case study country-wise doesn't make more sense than thematically here, as it makes for a consistent and complete story. I'm not sure whether and which theme would be able to strucure this content with similar value. | Thanks for this - in the end we have had so many comments about the country case studies that we have decided to go for a descriiption of a particular |
| 11083 | 15 | 16 | 3 | 16 | 4 | I prefer keeping the stlye of this section as it is. Present discription on each country is very informative. You may wish to shorten the Table 15.1 rather, by mean of reorganizing themantically here. | Thanks for this - in the end we have had so many comments about the country case studies that we have decided to go for a descriiption of a particular |
| 5255 | 15 | 16 | Table | | | Again, this is a ludicrous and dishonest reflection of the UK position. Delivering cuts of one-third from 1990 levels by 2020? At end 2011, instead of a reduction of over 20% there had been an increase of 20% due to 'embedded emissions'. Sir Robert Watson, Chief Scientific Advisor to UK Department of Environment (former IPCC Chairman) has stressed the need t take embedded emissions into account, and stated this position very clearly in September, 2010, with the then relevant figures. Prof. David MacKay, Chief Scientific Advisor to th UK Dept. of Energy & Climate Change, has said much the same. Meanwhile, the UK's Planning system (e.g. PPS 22, Companion Guide at page 165) makes ludicrously exaggerated claims about capacity factors achieved by UK wind energy developments (see, for example, the actual figures compiled from the operators themselves in the Spring 2012 Bulletin of the International Association of Energy Economics), and UK Planning Inspectors use this 'guidance' to approve schemes which simply burn palm oil from countries like Indonesia despite the figures for associated carbon emissions (and habitat loss) being submitted. | Table has been deleted. Broader discussion of embedded emissions is beyond the scope of this section. |

|---|---|---|---|---|---|---|---|
| 2345 | 15 | 16 | | 22 | | As authors identified, the section with Case studies of national approaches and sub-national implementation has to be curtailed, because they plan to add Germany as a case study. Points can be listed according the form of institutionalization of domestic climate programs in terms of legalization, implementation and co-ordination. | Noted |
| 2314 | 15 | 16 | 1 | 22 | 42 | TSU suggest reduction of the number of pages. Author comments that the sub section must be shortened. In line with the target of the chapter, the section should be presented in a more wide frame and gives the common experiences in developed and in developing countries. Is known that the experiences on developing countries are not enough reflected in the research works and bibliographies as needed, it is, there are a lack of peer-reviewed documents, and this gap must be commented in all the documents. It may be an important conclusion for the further research activities. | Not applicable now - table removed |
| 18720 | 15 | 17 | 14 | 17 | 15 | "creation of provincial carbon markets (Han et al. 2012) will require different forms of justification and possibly access to finance." Jusification vis-a-vis whom? An increasingly difficult issue in this regard is stakeholder outreach and engagement, not only to justify these measures, but also inform and foster understanding, both a prerequisite for acceptance (and hence legitimacy). As for finance, China is a beneficiary of the World Bank $100 Mio. Partnership for Market Readiness, as well as several other initiatives (such as GIZ SIno-German Climate Change Programme) to build capacity and technical preparedness for the adoption of carbon markets. On both issues, see i.a. Mehling, Michael (Ed.), Special Issue: Developing Countries in the Carbon Market: Lessons, Trends and Case Studies. 6 Carbon & Climate Law Review (2012), forthcoming Nov. 2012. | Section re-written to be thematic. |
| 3676 | 15 | 17 | 30 | 17 | 34 | China is also very proactive in climate change mitigation on the city level. In 2010, the National Development and Reform Commission lauched a pilot programme for the development of Low Carbon regions in five provinces (Guangdong, Liaoning, Hubei, Shaanxi and Yunnan) and eight cities (Tianjin, Chongqing, Shenzhen, Xiamen, Hangzhou, Nanchang, Guiyang and Baoding) to develop a Low Carbon Ecomomy and to pilot various other "green lifestyle" policies (Oberheitmann and Ruan, Forthcoming). In addition to this sub-national programme, other cities such as Wuxi City in Jiangsu Province are developing their own Low Carbin City concepts. For 2020, Wuxi even goes beyond the national target as it plans to reduce the CO2-intenbsity of GDP by 50% against 2005 (national target: 40-45%) (Oberheitmann, 2012). Cite as Oberheitmann, A. and Ruan X. (Forthcoming): Low carbon city planning in China. In: Frauke Urban and Johan Nordensvard (Eds.): Low Carbon Development: Key Issues. Text book for Earthscan's Key Issues Series. Oberheitmann, A. (2012). Development of a Low Carbon Economy in Wuxi City. American Journal of Climate Change. Scientific Research Publishing. 1, 64-103 (R). DOI 10.4236/ajcc.2012.12007. | Will refer this material to section on sub-national governance and linkages between levels |
| 2554 | 15 | 18 | 14 | 18 | 14 | São Paulo and Rio are both cities and states. In this case, references are to states. | Thanks. |
| 2553 | 15 | 18 | 16 | 18 | 16 | São Paulo Law (www.sp.gov.br/spcc) has a target to reduce economy-wide CO2 only, but allows for offsets with other GHGs | Thanks |
| 18721 | 15 | 18 | 17 | 18 | 18 | "According to Lucon and Goldemberg(2010a) this represents a rare case of a sub-national entity going beyond national policy": this seems counterintuitive, given how many similar examples are known - both in the developed world (e.g. U.S. cities and progressive states, especially between 2000 and 2008; see in fact next subsection on U.S. on same page, stating precisely that) as well as developing (pilot project and pilot zones in a number of developing countries, e.g. China). The statement would seem a generalization, reflecting a value judgment rather than empirical evidence. | Agreed. Deleted |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 2555 | 15 | 18 | 22 | 18 | 26 | "Brazil represents a case of a non-Annex 1 country passing national legislation, and then going beyond the plan at the regional level. Its approach is based on sectoral absolute GHG targets, adding to a reduction below the expected trajectory of emissions." In fact regions moved beyond the plan independently and, case of Sao Paulo State, precedently (enacted law 4 days prior to Brazilian NAMAs were announced). Brazilian targets are not necessarily absolute, since trendlines are forecasts. More in Lucon and Goldemberg 2010, already cited in the text. Also, remember that the US is another non-Annex I country and California has a similar case. | Agreed. |
| 2559 | 15 | 18 | 22 | 18 | 26 | Brazilian "sectoral absolute" GHG targets conceal an enormous lock-in effect in the Energy sector, as shows the figure in http://lcs-rnet.org/meetings/2011/10/pdf/R1.3_2%20Emilio%20La%20Rovere%20abstract.pdf | We are not seeking to assess the targets in this section. |
| 18722 | 15 | 18 | 27 | 18 | 46 | The section on the US (not unlike the one on China) illustrates the risk of trying to capture policy developments in different countries with any claim to being up-to-date: because much of the cited literature is from 2009/2010, it fails to reflect the fairly far-reaching (and controversial) progress of the US EPA under the Clean Air Act and attendant endangerment finding to regulate GHGs from mobile and stationary sources. Also, there is a factual error in line 46: only 10 US states are currently engaged in cap-and-trade for GHGs (9 in RGGI on the East Coast; 1 in WCI on the West Coast); even in 2010, the number never reached 23, and can only be due to a misunderstanding of the policy plans and commitments under the then still more active Midwestern Greenhouse Gas Reduction Accord and WCI, with the MWGGA never formally agreeing or setting out cap-and-trade for its members. The MWGGA no longer exists. | Case approach no longer used. |
| 14881 | 15 | 18 | 28 | 18 | 28 | 'gravity on climate change' reads 'gravity on climate change policy' | Deleted |
| 15563 | 15 | 18 | 45 | 18 | 46 | Regarding 23 states having cap and trade system, that number is now outdated. More recent numbers (as of July 2012) are available at http://www.c2es.org/us-states-regions/policy-maps/electricity-emissions-caps | Case no longer used |
| 2557 | 15 | 18 | 47 | 19 | 10 | California AB-32 to Proposition 23 is a very important landmark in the US climate law. More at http://www.reuters.com/article/2010/11/03/usa-elections-california-climate-idUSN0227063820101103 | Case approach no longer used. |
| 18724 | 15 | 18 | | 19 | | Although I am aware that the country-focused subsections will eventually be rearranged and a difficult balance has to be struck between being comprehensive and up-to-date while still occupying only limited space, as a close observer of US climate policy and politics I would list additional defining characteristics in addition to those already mentioned in the FOD: these include - the role of the private sector and, to a lesser extent, civil society and philanthropic initiatives, which are far more often the catalysts and originators of mitigation efforts than e.g. in the more public-authority-driven European Union; but also the all-too-apparent political ideologization of climate change in recent years, which has rendered climate change and any policy response an intensely partisan affair. Peer-reviewed literature on this is still scarce, but see inter alia Dunlap, R. E. & McCright. A. M. (2008). A widening gap: Republican and Democratic views on climate change. Environment, 50 (5), 26-35; McCright, A. and Dunlap, R. (2011) The politicization of climate change and polarization in the American public's views of global warming, 2001-2010, The Sociological Quarterly, 52, 155-194 | Good points. The re-written section does not have country details. Consequently it is hard to accommodate these suggestions. |
| 15564 | 15 | 19 | 12 | 19 | 13 | Delete "diffusion across states" | Case approach no longer used. |
| 15565 | 15 | 19 | 14 | 19 | 15 | Delete "with similar efforts in the Western and Midwestern Regions" as they have fallen apart in recent years. | Case approach no longer used. |
| 18723 | 15 | 19 | 15 | 19 | 15 | See previous comment: these initiatives have largely been abandoned following political shifts at state and local level after the 2010 midterm elections; only California remains committed to setting up a cap-and-trade system on the West Coast, and all Midwestern States previously planning to adopt emissions trading have officially abandoned their plans. Hence, while there is little peer-reviewed literature recent enought to account for the latest changes, it would be advisable to omit reference to these outdated trends because the section appears particularly outdated otherwise (and factually wrong, given current policy realities). | Case approach no longer used. |
| 15566 | 15 | 19 | 25 | 19 | 28 | More recently, particularly because of the state of the U.S. economy, many if not most states (except CA and RGGI states) have moved away from climate change as a primary objective and have either minmized their climate work or reframed it based on its cobenefits value. | Case approach no longer used. Danish example not been discussed in text. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 5256 | 15 | 21 | 4 | 21 | 46 | Hasn't anyone mentioned to the authors the weaknesses of the Danish grid system; the resultant need to export large quantities of wind-generated electricity to neighbouring countries (frequently at a loss); and the other result that, instead of supplying 20% of Denmark's needs wind energy struggles to provide half of that. There is a substantial literature on this. Reflect it! | Case approach no longer used. |
| 5257 | 15 | 21 | 47 | 22 | 41 | This section on the UK is a nonsense, due to its complete overlooking of 'embedded emissions'. The transfer of manufacturing capacity from a number of industrialised nations since 1990, and their import of manufactured goods from countries such as China and India, must be analysed and presented in detail. The poor devised subsidy system which (though recently cut by 10%) encourages wind energy developments in locations where there is little wind, or the simple burning of palm oil transported thousands of miles, is ludicrous. The emissions targets are all bogus due to their exclusion of 'embedded emissions'. | No dedicated UK case study |
| 18725 | 15 | 21 | 6 | 21 | 7 | "A Danish Energy Agency was established in 1976, as an agency under the Ministry of Climate, Energy and Buildings": I would advise double-checking that: the agency undoubtedly is now under the Ministry of Climate, but in 1976 I doubt Denmark had a specialized ministry for climate and energy. | Noted. Case approach no longer used. |
| 14307 | 15 | 22 | 12 | 22 | 13 | Note that the Committee on Climate Change was created via the Climate Change Act (unlike DECC - see comment 35 above). It has a legal, statutory, basis and reports to Parliament. | Accepted. But no UK case in revision |
| 3118 | 15 | 22 | 17 | | | there are no 'sectoral carbon budgets'. The UK has set economy-wide carbon budgets but the CCC uses a set of sectoral indicators which it uses to monitor progress. | Accepted. But no UK case in revision |
| 14304 | 15 | 22 | 20 | 22 | 20 | This is incorrect, Great Britain is not made up of 3 devolved administrations. Great Britain refers to England, Scotland and Wales, and the United Kingdom is Great Britain + Northern Ireland. Scotland, Wales and Northern Ireland are devolved administrations of the UK. | Accepted. But no UK case in revision |
| 3116 | 15 | 22 | 20 | | | This should say 'The United Kingdom includes 3 devolved administrations' (not 'made up of' - UK - and indeed GB - also includes England which doesn't have a separate administration). Northern Ireland is not part of Great Britain but part of the UK (i.e. Great Britain = England, Wales, Scotland. United Kingdom = England, Wales, Scotland and Northern Ireland). | Accepted. But no UK case in revision |
| 18726 | 15 | 22 | 20 | | | "Great Britain is made up of 3 devolved administrations" - should read: "Great Britain comprises 3 devolved administrations." Otherwise this creates the impression that Great Britain only is made up of the 3 devolved administrations Northern Ireland, Wales and Scotland | Accepted. But no UK case in revision |
| 2556 | 15 | 22 | 22 | 22 | 22 | How higher are the Scottish targets? Very important to describe | Accepted. But no UK case in revision |
| 14305 | 15 | 22 | 28 | 22 | 30 | This is incorrect. The Office of Renewable Deployment (ORED) and the Energy Efficiency Deployment Office (EEDO) are not separate institutions from DECC. They are simply internal directorates of DECC - the institution is DECC. | Accepted. But no UK case in revision |
| 5258 | 15 | 22 | 42 | 22 | 42 | In the light of the grossly misleading picture given in the forgoing Table of Germany's position, their submission will have to be scrutinised most carefully. | Noted |
| 14303 | 15 | 22 | 8 | 22 | 10 | This is incorrect. Department of Energy and Climate Change (DECC) was not created via the Climate Change Act. DECC was created via a merger of the Energy directorate of the business department (BERR, formerly DTI) and the Climate Change directorate of the Environment department (Defra). The Climate Change Act was a piece of legislation passed after the formation of DECC, and is a policy which DECC is responsible for. | Accepted. But no UK case in revision |
| 3115 | 15 | 22 | 9 | | | the Department of Energy and Climate Change was not created via the Climate Change Act. The Committee on Climate Change (CCC) was but not DECC. It was created by the Prime Minister (Gordon Brown). | Accepted. But no UK case in revision |
| 12002 | 15 | 23 | | | | Please make sure to mention the huge elephant in the room: the CDM has delivered, NAMAs still have not reduced a single tangible, comparable, verifiable ton of CO2 in the way the CDM has delivered one billion. This is not to suggest we do not need NAMAs but it is wrong to present NAMAs as something even remotedly comparable to the achievements of the CDM: It has yet to be proven that NAMAs deliver better than the CDM. Current evidence suggest it does not. | No assessment is made here |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 18727 | 15 | 23 | 1 | 23 | 2 | "For the most part, legislation and policies are directed at enabling change at a sectoral or a sub-sectoral level, rather than through direct enforcement mechanisms." This sentence is unclear; does it suggest that cross-sectoral policies are more likely to be directly enforcing than sectoral and sub-sectoral? That needs to be clarified; as the section argues correctly, the density and scope of national (and subnational) mitigation-related legislation has strongly grown in the past five years, and typically has even stricter enforcement clauses/provisions (as obligations become more specific). What this sentence might have been trying to say is that, with sectoral policies, some of the enforcement prerogatives are transferred to sectoral institutions or bodies, rather than leaving enforcement - as is the default - with the central authority of the state. But this is not so entirely evident at sectoral level, unlike e.g. the subnational level, where indeed provincial or municipal entities often are given exclusive implementation and enforcement rights. | Accepted. |
| 5262 | 15 | 23 | 11 | 23 | | ADD: In the French Territorial Climate and Energy Plans, an adaptation component is compulsory, but obligations of results are not. Experimental but promising approaches to adaptation developed from the bottom are funded directly by the national Energy and environmental Agency (ADEME). | The information was considered but not added. |
| 13756 | 15 | 23 | 13 | 24 | 37 | From what I can gather here, these NAMAs are not really national policies but rather a feature or odd byproduct of international negotiations. If there is litte to write about it, be brief. If this has no results, say so. | Section has been reduced to a box. |
| 11086 | 15 | 23 | 32 | 23 | 38 | This paragraph is particularly problematic or incorrect. It is wrong to compare NAMA with CDM, even under the narrow perspective of politicized debates under the UNFCCC. NAMA is negotiated under the AWGLCA, while CDM is under AWGKP. There is no equivalent of NAMA in the AWGKP. CDM should be compared to Various approaches in the AWGLCA. In principle, IPCC report should be science-based and be independant from politicized debates under the UNFCCC. | The comparison is conceptual, not legal. There are potential conceptual points of comparison between NAMAs and CDM. |
| 13710 | 15 | 23 | 46 | 23 | 46 | Insert after"Tyler et al. 2011": " A NAMA encompassing energy efficiency and renewable energy intervention in the Mexican housing sector is described by Hayashi and Wehner (2012)". Reference: Hayashi, D.; Wehner, S. (2012): Mobilising mitigation policies in the South through a financing mix, in: Michaelowa, A. (ed): Carbon markets or climate finance?, Routledge, Abingdon, p. 168-187 | Section has been reduced, leaving no space for additional examples |
| 18474 | 15 | 23 | | | | This is the only section that clearly discusses the impact of international policy on national policies and the interaction therein. It may be useful to expand this section to embed NAMAs ina broader discussion of international and regional policy impacts. | An editorial deicion was made to shrink this section. |
| 2315 | 15 | 23 | 32 | 23 | 38 | The differences among NAMAs and CDM should be completed, giving a more completed view on those differences. Especially, the NAMAs did not generate tradable CERs and that CDM is a basic market based mitigation instrument to fulfill the reduction targets from Developed Countries and NAMA is not. Should be reflected too the NAMA´s financial mechanism that is different from CDM. | NAMAs section has been shrunk, but some discussion of this difference remains |
| 13711 | 15 | 24 | 28 | 24 | 28 | Insert "Okubo et al. 2011" after "Sterk 2010a", as this paper focuses on MRV of NAMAs. | section has been revised. |
| 13223 | 15 | 24 | 24 | 24 | 32 | The text only mentiones the use of carbon credits to provide international support. However, such support could also involve direct financial support, (through grants, loans etc) in bilateral or multilateral settings. in special issue of climate policy these aspects were discussed - 2009 International Support for Domestic Climate Policies. Climate Policy 9 (5). | The section has been shortened and discussions of financing have been removed. |
| 5001 | 15 | 25 | 11 | 27 | 18 | This part is redundant since similar descriptions are in 15.5 | Taken into account. (This section describes the different policy alternatives, whose assessment is |
| 6137 | 15 | 25 | 12 | 25 | 16 | With regard to policy evaluation criteria, promotion effect of technology innovation/diffusion is missing. However, as touched upon in this section, this is basically decided by Chapter 3. I have raised the issue | Rejected (outside the scope of the chapter: criteria classification |
| 2316 | 15 | 25 | 17 | 27 | 18 | If TSU is suggesting reduction of pages and all the items 15.3.3 to 15.3.8 refers that the analyzed issue will be completed in others 15.5 section. Why will not integrates all these issues in the 15.5?. | Taken into account. (This section now describes the different policy alternatives, whose assessment is |
| 12053 | 15 | 25 | 17 | | | The section heading should not only refer to energy policy objectives but rather more generally to 'other policy objectives' | This issue has now been transferred to 15.2. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 5263 | 15 | 25 | 22 | | | ...the policy targets). ADD: In the French approach to adaptation the policy goals are defined from above and policy instruments are in the hands of local institutions. It is hoped that the policy targets will be developed from this. | Noted. |
| 12168 | 15 | 25 | 43 | 25 | 44 | apart from taxes and charges defined per unit of GHG released, they can also be defined only to apply above a given benchmark | Rejected (Given the limited space, this section only describes the main |
| 13757 | 15 | 25 | 6 | | | What do you mean by "leakage"? Odd to mention the "race to the bottom" here. What about the Porter hypothesis? | Rejected (This section now merely describes different policy alternatives. Border tax adjustments are linked to concerns over leakage, but the |
| 11088 | 15 | 25 | 7 | 25 | 10 | This ia a good summary and deserves to be included in the Executive Summary. | Noted |
| 17654 | 15 | 25 | 11 | 49 | 30 | Criteria in mentioned in 15.3.1 are not used for structuring the assessment in 15.5. If these criteria are to be of use at least some reference to them should be included in the policy assessment section. It would also be helpful if sections 15.3 and 15.5 were based on the same structure. In the current draft, subsection 15.3.3 for example includes regulations and standards while 15.5.2 is on regulation and information measures. Note also that the evaluation issues mentioned in 15.4 are not addressed in 15.5. | Taken into account: This section now describes different policy alternatives, whose assessment is covered in Sections 15.5. and 15.6. |
| 12179 | 15 | 25 | 12 | | | although this section announces various criteria that are used to assess policy instruments, the actual assessment of instruments in 15.5. does not clearly follow those criteria | Noted. |
| 11192 | 15 | 25 | 42 | 26 | 33 | In the section 15.3.4 one should stress the existence of auctioning as well as the (positive) effect on effect of carbon taxation on the public finances: The EU 'Climate and Energy Package' foresees an enhanced use of auctioning in the EU Emission Trading System (EU ETS) from less than 4% in phase 2 (2008–2012) to more than 50% in phase 3 (2013–2020). This implies a substantial generation of public revenues. Auctioning (and taxation) complies better with the 'polluter pays principle' and avoids handing out 'windfall profits' to sectors that can easily pass on the opportunity cost of allowances to their customers. Indeed, full auctioning will be the rule in the power sector from 2013 onwards (Saveyn et al., 2011). Saveyn, B., Van Regemorter, D., and Ciscar, JC. (2011). Economic analysis of the climate pledges of the Copenhagen Accord for the EU and other major countries. Energy Economics 33, S33-S40 | Taken into account. (This section merely describes the different policy alternatives. The assessment of EU policies, and particularly the EUETS, is carried out by Chapter 14) |
| 11385 | 15 | 25 | 42 | 26 | 33 | In the section 15.3.4 one should stress the existence of auctioning as well as the (positive) effect on effect of carbon taxation on the public finances: The EU 'Climate and Energy Package' foresees an enhanced use of auctioning in the EU Emission Trading System (EU ETS) from less than 4% in phase 2 (2008–2012) to more than 50% in phase 3 (2013–2020). This implies a substantial generation of public revenues. Auctioning (and taxation) complies better with the 'polluter pays principle' and avoids handing out 'windfall profits' to sectors that can easily pass on the opportunity cost of allowances to their customers. Indeed, full auctioning will be the rule in the power sector from 2013 onwards (Saveyn et al., 2011). Saveyn, B., Van Regemorter, D., and Ciscar, JC. (2011). Economic analysis of the climate pledges of the Copenhagen Accord for the EU and other major countries. Energy Economics 33, S33-S40 | Taken into account. (This section merely describes the different policy alternatives. The assessment of EU policies, and particularly the EUETS, is carried out by Chapter 14) |
| 12170 | 15 | 26 | 11 | 26 | 12 | this sentence requires explanation | Taken into account: Text modified: assessment of the different instruments is now given in other sections of the |
| 18733 | 15 | 26 | 11 | 26 | 12 | The statement "Overall, taxes on greenhouse gases are a preferred instrument for economists" seems overly bold given the long-standing and still continuing debate over price-based (pigouvian) vs. quantity-based instruments, see e.g. Suzanne Scotchmer, " Cap-and-Trade, Emissions Taxes, and Innovation", Innovation Policy and the Economy Vol. 11, No. 1 (2011), pp. 29-54 | Rejected (Text modified: assessment of the different instruments is given in other sections of the chapter) |
| 15567 | 15 | 26 | 18 | 26 | 22 | It would be helpful to include an example to illustrate the types of subsisides that affect the price of fossil fuels because many in the U.S. public (and perhaps elsewhere) do not believe that there are fossil fuel subsidies. | Noted (Text modified to indicate that fossil fuel subsidies exist in developed and developing countries) |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 6138 | 15 | 26 | 18 | 26 | 22 | Add after "taxes" in line 18, "in that the marginal abatement cost is equalized". Also add explanation that subsidies contradict the OECD's Polluter Pays Porinciple of 1972. | Taken into account (Text modified with no reference to subsidy to pollution |
| 12169 | 15 | 26 | 2 | 26 | 2 | there are various reasons why a tax rate could be geographically variable - stating that 'ideally' this should not be so , requires explanation of the ideal that is sought after (in this case, undisturbed market optimum for emission reductions) | Accepted (Text modified to avoid normative comments: now this section is only descriptive of policy types) |
| 13234 | 15 | 26 | 23 | 26 | 33 | The paragraph on tradable permits here seems to be the only place where permit trading schemes are discussed from a theoretical perspective. In the context of review of other instruments, two to three pages on the basics and practical operation of tradable permit schemes would be needed. It is true that the EU ETS is discussed in another chapter, and that new emerging trading schemes are reviewed in this chapter. Still, what is missing is a discussion of the basic operation, design options and experiences with tradable permit schemes. Otherwise this chapter is lopsided. | Taken into account. (Given space limitation, this section describes the basic policy types, which were already covered by Chapter 3 and whose practical description may be covered in other sectoral and policy chapters. |
| 6139 | 15 | 26 | 26 | 26 | 27 | Change "and a continuous encouragement of cleaner technologies (Stavins 2003)" to "and theoretically a continuous encouragement of cleaner technologies (Stavins 2003)". Then after this sentence, add "However, it is unclear whether EU ETS induced technology innovation or not (Ellerman et al. 2010). This may apply for domestic cap and trade policy especially if permit price fluctuate". | Taken into account. (Text modified: this section now describes the general policy alternatives, whose particular assessment is covered in Sections 15.6) |
| 18734 | 15 | 26 | 31 | | | The claim of "high institutional feasibility" should perhaps be relativized, given the enormous challenges encountered e.g. in the EU ETS regarding data availability and reliability, registry establishment (also the ITL at international level), market oversight and fraud prevention etc.; and this in a developed country context, which gives rise to the expectation that problems might be even more challenging in a developing country context. See e.g. Ruth Greenspan Bell, Choosing Environmental Policy Instruments in the Real World, Paper prepared for the OECD Global Forum on Sustainable Development: Emissions Trading, Concerted Action on Tradeable Emissions Permits Country Forum (Mar. 17-18, 2003), available at http://www.oecd.org/dataoecd/11/9/ 2957706.pdf; Bell, Ruth Greenspan (2002), Are Market-Based Instruments the Right First Choice for Countries in Transition? Resources Issue 146, p. 10-14 | Taken into account. (Text modified: this section now just describes the general policy alternatives, whose particular assessment is covered in Section 15.6) |
| 15568 | 15 | 26 | 32 | 26 | 33 | The part of the sentence beginning with "prices unrelated to…" through the end of the sentence is unclear. What kinds of administrative costs would be lowered? | Taken into account. (Text modified: now this section only describes the main characteristics of the policy types. Experiences with policies are introduced |
| 4286 | 15 | 26 | 34 | | | Please note that Voluntary agreements (VA) may also be referred to as LTA (Long-term agreements). I suggest a footnote here clarifying this. Your ref to Rezessy and Bertoldi 2011 refers to LTAs. Please also include ref to the Swedish Scheme (Stenqvist and Nilsson, 2011 from the Journal Energy Efficiency). | Accepted. Text modified accordingly. Literature added in section 15.5.5 |
| 13713 | 15 | 26 | 44 | 26 | 44 | Insert after "Croci 2005": ":Voluntary agreements are effective alternatives to mandatory regulations for achieving small environmental improvements at relatively low cost (Borck and Coglianese 2009)." Reference: Borck, J; Coglianese, C. (2009): Voluntary Environmental Programs: Assessing Their Effectiveness, in: Annual Review of Environment and Resources, 34, p. 305-324 | Accepted. Text modified accordingly. Literature added in section 15.5.5 |
| 15569 | 15 | 26 | 44 | 26 | 46 | Sentence beginning with "Some authors… " is poorly worded/confusing. | Noted. |
| 2309 | 15 | 26 | 11 | 26 | 12 | It would be helpful to know for your statement "Overall, taxes on greenhouse gases are a preferred instrument for economists" what your referent is. Do you mean preferred to product charges or preferred to all other polices ( including emissions trading, for example)? I suspect you mean the former, but as written the referent is not clear. | Accepted (Text modified: assessment of the different instruments is now given in other sections of the chapter) |
| 2307 | 15 | 26 | 18 | 26 | 18 | The statement that " subsidies are often described as equivalent to taxes" is a at best misleading and at worst simply wrong. Becuase they have different effects on long run average costs, they imply different entry and exit conditions. | Accepted (Text modified with no reference to equivalence between subsidies -to pollution abatement- and |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 2308 | 15 | 26 | 28 | 26 | 28 | The statement that "auctioning, which could allow the use of revenues in a green tax reform fashion" is true, but excessively narrow. In fact the revenues can, and indeed are in operating systems, be used in a variety of manners from incentivizing energy efficiency, to containing costs for heavily impacted industries, to lessening the regressive impact of the program. | Accepted (Text modified: new uses of environmental revenues are contemplated) |
| 2947 | 15 | 27 | | 35 | | is power used in the techncical sense (ability to reject the null hypothesis)? Or do you just mean that the studies are methodologically very difficult and the results aren't very reliable? Clarification would be useful. | Its methodologically weak and it is now clarified. |
| 12178 | 15 | 27 | 14 | 27 | 18 | spatial planning at sea also has important climate change links; both in coastal zones wrt adaptation, and at sea proper wrt renewable energy from wave, offshore wind and tidal. Wrt wind energy onshore, a conection with spatial planning is also obvious. | Rejected (outside the scope of the chapter) |
| 5264 | 15 | 27 | 18 | | | ADD: The French PCET explicitly impose climate objectives in their planning attempting to achieve an equilibrium between density, vegetation and multifonctionality of services. | Rejected (outside the scope of the chapter) |
| 5004 | 15 | 27 | 19 | 28 | 40 | It is not clear what are the points of this 15.4. There seems to be little value added in this subsection. | Now its connected to other subsection |
| 3121 | 15 | 27 | 20 | 27 | 33 | please use wind 'turbines' (or talk about 'windpower') instead of wind 'mills' as 'wind mills' is not really used in relation to modern forms of windpower | Taken into account. |
| 18475 | 15 | 27 | | | | This section is well-written, but misses a link to those criteria outlined in 15.3.1 and Chapter 3.8 as well. Can the methods here be used to provide information on cost effectiveness? Environmental effectiveness? Institutional feasibility? If not, what tools are used to measure those criteria? | Taken into account. |
| 12181 | 15 | 27 | 10 | | | Section could benefit from subheadings to distinguish each of the approaches and tools discussed in the text | Taken into account. |
| 3602 | 15 | 28 | 13 | 28 | 15 | It seems very strange to cite an obscure seemingly unpublished work (Kotani, Tanaka and Managi 2011) to back up a description of the role of experimental economics. It would make much more sense to cite for instance this overview paper by Nobel prize laureate James Heckman in Nature: Falk, A., Heckmann, J.J., 2009. Lab experiments are a major source of knowledge in the social sciences. Nature 326, 535–538. | Noted. |
| 15571 | 15 | 28 | 34 | | | Air pollution and CO2 are not examples of policies. | Noted. |
| 2270 | 15 | 28 | 41 | 49 | 30 | It is strange that the Assessnent of Performance does not include attempts to find out whether greenhouse gases in the atmosphere have changed as a result of these policies. Meaureents over land surfaces are almost completely neglected | Rejected. There is no literature that assesses the effects of policies on GHG concentrations as opposed to GHG |
| 4287 | 15 | 28 | 41 | | | Normally policies may be evaluated ex-post or ex-ante using process or impact evaluation. The latter two types, process or impact, should be explicitly explained. | Rejected. Process evaluations are not prominent in the literature. |
| 15731 | 15 | 28 | 46 | 28 | 46 | "There are fewer ex-post evaluations that provide empirical evidence on the effectiveness of such policies in practice." effectivness and efficiency. And even fewer on the efficacy of such policies… | Noted. |
| 14892 | 15 | 28 | 9 | | | 'cases several polices' Please provide evidence with literature | Noted. |
| 15570 | 15 | 28 | 9 | | | overall paragraph needs editing | Noted. |
| 18481 | 15 | 28 | | | | There is no consistency in the different sub-sections of 15.5 that allows a reader to pull concrete messages. It reads as a mis-match of text pieced together by different authors with very different approaches and emphases. I recommend implementing a common approach/structure to each sub-section that allows a reader to better navigate through them. This could be e.g.:<br>One paragraph listing the countries who have implemented that type of policy<br>Focus on cost effectiveness of that policy-type (including the tools from 15.4 to support the analysis)<br>Focus on environmental effectiveness<br>Focus on institutional feasibility<br>etc. (going through the list of criteria from Ch 3 and 15.3.1)<br>Conclusion | Noted. |
| 18484 | 15 | 28 | | | | It would be useful if every sub-section contained a 'conclusions' section, to bring the main points of the policy instrument together and making the case for the application of uncertainty language. This has been done for Regulations and Voluntary agreements, but no others. | Noted. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 18485 | 15 | 28 | | | | Several sections (Regulations and Voluntary Agreements) contain text that describes a combination of policies. It would be more useful for ther eader to shift these discussions to 15.7.5 and focus 15.5 strictly on evaluating individual policy types. | Noted. Not always practical to do this. |
| 12180 | 15 | 28 | 41 | | | This section could benefit from following a more clear structure, e.g. by discussing each of the criteria mentioned in 15.3.1. one by one for each instrument. | Rejected. There is insufficient literature for this to be practical. |
| 7522 | 15 | 28 | 41 | 33 | 22 | For the efffective assesment of the performance of policies and measures, credible and fit-on purpose data collection with well organized and credible methodology is indispensable. Data confidentiality is also indispensable to collect credible data from industry in tough competition circumstances. These comments is to be added somewhere in this section. | Noted. |
| 7130 | 15 | 29 | 16 | 29 | 18 | It is a fact that consumers place a greater value on the immediate future and heavily discount future saving, but the behavior of consumers is not as free as it seems to appear in a pure market world. Decisions are influenced by the economic capacity, but, what is more important, the drivers of consumers behavior goes beyond prices. That require governments intervention to increasingly considerer attitudes and beliefs of citizens in relation to climate change in order to influencing consumer behavior at an individual level, with a focus on the promotion of sustainable patterns of consumption and lifestyles, and not only on energy uses. | Accepted. Text added in the information section of 15.3 |
| 5265 | 15 | 29 | 26 | | | ADD: Yet, information is not enough: in a qualitative and quantitative study on mobility in Lyon, 81% of interviewed said that CC was the number one challenge of the 21st century, 81% also said tat the best way for an individual to fight CC was to stop using the car, yet, 56% used their car for all activities on a daily basis (96% had a public transport accessible within 400 meters). They were thus well informed but this did not lead to action (Stéphane La Branche. « La gouvernance climatique face à la mobilité quotidienne. Le cas des Lyonnais ». Revue Environnement Urbain/Urban environment. 2011). | Rejected. Not relevant to the context here. |
| 2948 | 15 | 29 | 27 | | 47 | These three paragraphs would be fine in a social science article, but they aren't really needed here and they just take up space. | Accepted. This part is deleted |
| 15404 | 15 | 29 | 27 | | | This is an unsupported assertion – I have seen no analysis that describes an empirically verified and specific market failure and shows that a specific regulation is the least cost method of achieving it – see many Stavins and Jaffe publications (e.g., Robert Stavins, Judson Jaffe, and Todd Schatzki, “Too Good to Be True? An Examination of Three Economic Assessments of California Climate Change Policy.” Washington, D.C.: AEI-Brookings Joint Center for Regulatory Studies, Related Publication 07-01 (January 2007).)– general reference to market failure does not constitute justification for a mandatory efficiency or technology standard. | Accepted. Text modified and literature added. |
| 12171 | 15 | 29 | 8 | 29 | 9 | The purpose and meaning of the sentence "To keep …. Long term." is unclear - please explain 'appropropriate' for what?, and how any given level of energy price would make economic system less GHG intensive. | Accepted. However this section has been reorganized in the second order draft. |
| 12059 | 15 | 29 | 8 | | | To 'keep' the resulting engery price at the appropriate level: the term 'keep' seems not appropriate here as it suggests that prices are already at an appropriate level. | Accepted. However this section has been reorganized in the second order |
| 18476 | 15 | 29 | | | | This section does not seem to follow the overarching structure of the chapter, nor ultimately the broader report. The text seems to focus unnecessarily on energy efficiency policies, and fails to adhere to the sub-categories of regulations presented in 15.3.1 (emissions, technology and product standards). As mentioned in another comment, it would be more useful to address regulations and information policies separately in 15.5, and then in 15.7 to discuss the synergies that result when they are implemented together. | Accepted. Coordination is across chapeters and sections are made. Syntergies are mentioned in information section. |
| 14885 | 15 | 29 | 19 | 29 | 47 | references lacking | Accepted.References added. |
| 15005 | 15 | 29 | 6 | | | This section should include a discussion of fuel-efficiency and vehicle CO2 emissions standards. These are one of the most significant success stories for energy and CO2 reduction, but are not addressed in this chapter, except in passing. | Rejected. The standards for cars are discussed in ch8 (transport). Literature is not availabe for the crosscutting analysis |
| 3184 | 15 | 29 | 6 | | | section 15.5.2 might usefully disentangle "regulation" from "information" policies. They work in quite different ways. | Accepted. Text modified |

|---|---|---|---|---|---|---|---|
| 12182 | 15 | 3 | 8 | 3 | 19 | heading for 15.5.4 does not cover all of the sub headings; subheadings are of unequal type, covering countries, es post analyses, and specific compounds trading programs | Noted. Will be rewritten. |
| 6140 | 15 | 30 | 13 | 30 | 20 | It is not clear whether a whole paragraph are based on Gillingham et al, (2006) or not. If not another literature should be cited for the description of lines 13-20. | Accepted. Literature added. |
| 3123 | 15 | 30 | 16 | | | beginning of sentence missing. Refers to Europe and UK. Do you mean European Union here? If so, UK is part of the EU and appliance standards are EU wide. | Accepted text modified. |
| 2949 | 15 | 30 | 19 | | | "remained the same" compared to what -- the previous status quo, BAU, or what? | Accepted text modified. |
| 15572 | 15 | 30 | 22 | | | Can you put the 10.6 USD/GJ in context? | Accepted. Paragraph separated |
| 3124 | 15 | 30 | 25 | 30 | 37 | too many US examples here - there's plenty of evidence on building standards from other countries as well. | Accepted. They are covered in building section(ch9) and they will be cordinated |
| 12932 | 15 | 30 | 38 | 30 | 47 | The existing literature on the reboud effect is much greater: I suggest to quote results from other papers here, like e.g. Barker, T., Ekins, P. & Foxon, T. (2007): "The Macro-Economic Rebound Effect and the UK Economy", Energy Policy, 35: 4935-4946; or Mizobuchi, K. (2008): "An Empirical Study on the Rebound Effect Considering Capital Costs", Energy Economics, 30: 2486-2516. | Accepted. Text added and literature added. |
| 3125 | 15 | 30 | 38 | | | those rebound effect references are ancient - there are plenty more up-to date studies e.g. http://ec.europa.eu/environment/eussd/pdf/rebound_effect_report.pdf (reports evidence from a range of countries), http://www.nature.com/news/2011/110217/full/news.2011.101.html | Accepted. Text added and literature added. |
| 2950 | 15 | 30 | 38 | | 47 | There is more recent literature on the rebound effect. As a starting point, I suggest: For a concise overview of the leakage literature, see Gabriel Weil, Costs, Contributions, and Climate Change: How Important Are Universally Binding Emissions Commitments?, 23 GEO. INTL. ENV. L. REV. 319 (2011). | Accepted. Text added and literature added. |
| 12172 | 15 | 30 | 38 | 30 | 47 | paragraph starts with statement that much of the gains might be erased by the rebound effect, and ends with arguing that a statement that rebound would lead to net increase is grossly exaggerated. Those two statements are not mtutally incompatible, but the closing statement may falsely convey that rebound effect is of not importance. | Accepted. Text modified. |
| 5005 | 15 | 30 | 38 | 30 | 47 | Rebound is a matter but, as correctly described here, total energy consumption can be saved with energy efficiency improvement. In this regard, energy efficiency improvement is one of the key solution factors for GHG mitigation. | Accepted. Text modified. |
| 3122 | 15 | 30 | 9 | | | which country does the study by Davis refer to? This could well be different elsehwere. | Accepted. Text added. |
| 4230 | 15 | 30 | 1 | 30 | 47 | Attention should be given to sustainability rating systems in providing practices (and sometimes standards) and public recognition for improving sustainability, reducing emissions and adapting to climate change. In U.S. practice these include: LEED ratings for sustainable buildings and sites – www.usgbc.org, Green Globes ratings for sustainable buildings – www.thegbi.org, International Green Construction Code – www.iccsafe.org, and Envision™ ratings for sustainable infrastructure – <www.sustainableinfrastructure.org>. | Accepted. The range of policy instruments for buildings are covered in ch9 (building) |
| 6141 | 15 | 31 | 1 | 31 | 6 | Afrer (Price and Lu 2011), add "Akimoto (2012)" as additional reference. For Reference; Akimoto (2012), Potential for Energy Efficiency Improvement and Barriers. In: Climate Change Mitigation, A Balanced Approach to Climate Change. M. Yamaguchi, (ed.), Springer, London pp. 161-177. | Accepted. Literature added. |
| 12933 | 15 | 31 | 2 | 33 | 14 | This section can be shortened and major results summarised. | Accepted. Text shortened as appropriate |
| 18737 | 15 | 31 | 34 | | | Cited source "Kimura 2009" missing from bibliography | Accepted |
| 4288 | 15 | 31 | 34 | | | You may also want to refer to Thollander and Ottosson (2010) and Backlund et al (2012) and Thollander and Palm (2012), when referring to studies concerning energy management practices. (Backlund, S., Thollander P, Palm, J., Ottosson, M., 2012. Extending the energy efficiency gap. Accepted for publication in Energy Policy. )(Thollander P, Ottosson M, 2010. Energy management practices in Swedish energy-intensive industries. Journal of Cleaner Production 18(12): 1125-1133) (Thollander and Palm (2012) (Improving Energy Efficiency in Industrial Energy Systems - An Interdisciplinary Perspective on Barriers, Energy Audits, Energy Management, Policies, and Programs, Chapter 8 (and chapter 6), ISBN 978-1-4471-4161-7)) | Accepted. Text modififed and literature added. |

|---|---|---|---|---|---|---|---|
| 15574 | 15 | 31 | 36 | | | When the chapter says "it" did not deliver, is "it" the companies or the EM? | Accepted. Text modified. |
| 18477 | 15 | 31 | | | | A lot of this material is likely covered in the sector chapters' policy sections. Where that is the case, it is not necessary to repeat the material again in this overarching chapter. | Accepted. This chapter mosly focus on cross sectoral issues. Coordination will be made across chapters in next draft |
| 15573 | 15 | 31 | 1 | 32 | 44 | A table comparing the costs and savings across programs would be interesting/informative. | Rejected. As number of observation is limited and such table is misleading. |
| 2951 | 15 | 32 | 14 | | 32 | 1-2 sentence summary would be sufficient | Accepted. Text shortened as appropriate |
| 17655 | 15 | 32 | 14 | 32 | 44 | It would be interesting to know more about the drivers of the vast differences in cost-effectiveness across countries. Lines 42-44 discuss that only very briefly and a more extensive discussion would add value to this section | Noted. Very intersting question but current literature does not allow that indepth analysis |
| 15576 | 15 | 32 | 20 | | | Do you have information abut the money saved by the companies? | Noted. It is available in the literature cited, but here the money saved by the |
| 14886 | 15 | 32 | 21 | | | reference Khan 2006 missing in literature list | Accepted |
| 14887 | 15 | 32 | 35 | 32 | 41 | example from developing countries missing | Accepted. Chinese cases are added. |
| 18738 | 15 | 32 | 35 | | | Cited source "Kimura 2010" missing from bibliography | Accepted |
| 15577 | 15 | 32 | 5 | | | When did the facilities implement the 46%? | Noted. Since 2001. as it is obvious the |
| 15575 | 15 | 32 | 7 | 32 | 12 | It was confusing what had been implemented; did the 70% include the 7% mentioned on line 10? Maybe 7% wqs implemented but 70% were in progress or planned? | Accepted . Text modified accordingly |
| 12934 | 15 | 33 | | | | I suggest to discuss more carbon/energy taxes and their possible impacts; you will find a more detailed description of carbon/emissions/energy taxes and and their possible impacts in Baranzini, A., Goldemberg, J. & Speck, S. “A Future for Carbon Taxes” Ecological Economics, 32(3): 395-412, 2000. | Considered |
| 6142 | 15 | 33 | 12 | 33 | 14 | Preparing a table summarizing cost effectiveness of each case not only Section 15.5.2.3 but also Section 15.5.2.2, is high appreciated. Also by doing so, Section 15.5.2.2 can be shortened. | Rejected. As number of observation is limited and such table is misleading. |
| 5006 | 15 | 33 | 15 | 33 | 22 | Even though the cost of energy efficiency improvement is negative, such enegy efficiency improvement has not yet achieved in real world. It is worth mentioning here that there are many barriers (social, political, and technical) . Identifing whare such barriers exists and why, then removing such barriers by appropriate policy instruments is the key for the effective policy measures. | Accepted. Barries are emphasized throughout the chapter. |
| 15405 | 15 | 33 | 17 | | | This is completely unsupported by text. | Accepted. Text modified accordingly |
| 12060 | 15 | 33 | 25 | | | Carbon taxes are a 'theoretically' attractive instrument: the 'theoretically' already indicates a negative evaluation, which is not supported by the following analysis in the paragraph, nor supplied with a 'practical' counter-argument. Suggest removing. | Noted text rewritten |
| 15579 | 15 | 33 | 32 | 33 | 37 | This is confusing.  Is it the fault of the deign or the implementation that these instruments are not more prevalent?Is it better to say that one reason policies that economist believe are sound have not been adopted more widely is because economists have failed to account for political challenges? | Noted text rewritten |
| 11091 | 15 | 33 | 32 | 33 | 37 | This is a very important point to be shared among policy makers. The argument is also applicable to emission tradings, and deserves to be included in the Executive Summary. | Noted |
| 12935 | 15 | 33 | 36 | | | The possible impact of carbon/energy taxes is one of the main arguments of the opponents of this climate policy instrument. I thus suggest adding some elements on this. For instance, the specific impact of carbon taxes on competitiveness are discussed in detail in Zhang, Z.X. & Baranzini A. “What Do We Know About Carbon Taxes? An Inquiry into their Impacts on Competitiveness and Distribution of Income” (avec Z.X. Zhang). Energy Policy, 32(4): 507-518, 2004. | Noted text rewritten |
| 18740 | 15 | 33 | 37 | | | Source "Sterner and Coria 2012" missing in bibliography | Noted |
| 15581 | 15 | 33 | 38 | 33 | 42 | Define grey literature; the tone of this part of the paragraph seems negative or accusatory, especially the "seriously claim..." statement. | Considered |
| 15580 | 15 | 33 | 38 | 34 | 4 | This could be better organized and streamlined. Provide the overall message of this paragraph upfront and then offer the supporting statements. | Text rewritten |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 17656 | 15 | 33 | 4 | 33 | 5 | The explanation of USD/GJ should be included earlier, i.e. on page 3, line 22, where this measures is mentioned for the first time. | Accepted. It is done at chapter 3. |
| 2952 | 15 | 33 | 40 | | | "seriously claim"? ? I assumed everything in the chapter was serious! | Text rewritten |
| 14888 | 15 | 33 | 40 | | | 'seriously claim' delete 'seriously' since it is ambigious | Done |
| 15582 | 15 | 33 | 44 | | | Couldn't find Hammar et al in references | Included |
| 15583 | 15 | 33 | 46 | | | it lacks transition to the sentence "The various nordic…" | Resolved |
| 2953 | 15 | 33 | 5 | | 14 | delete this paragraph | Rejected. The reason to delete is not |
| 15578 | 15 | 33 | 5 | | | It's great that we can say that the programs save .60 cents (US) for every GJ of energy saved; is that net? Can we say something about every program dollar spent achieves X GJ and Y dollar (or financial) savings to consumers? | Accepted there was mistake in the text and it is corrected |
| 5266 | 15 | 33 | | | | SHORTEN This section is much too long especially since this chapter focuses on institutions, not economic tools. Does not another chapter deal with this issue? It could be reduced to a short section on role of institutions setting up taxes and cap and trade but evaluation of these measures as such is best left for an economic's chapter | Noted text rewritten |
| 17657 | 15 | 33 | 24 | | | Subsection could be shortened and made more concise. How can one measure the efficiency of taxes, subsidies, etc.? Then provide brief overview of results. | Noted text rewritten |
| 12936 | 15 | 34 | 14 | 35 | 18 | The impact of carbon/energy taxes on emissions is of course of fundamental importance and thus most recent literature should be quoted. I agree to concentrate on studies based on countries' experiences and thus with real data (opposed to simulations). Baranzini and Carattini (2012) survey the ex-post literature on the impacts of carbon taxes on emissions: see Baranzini, A. & Carattini, S.: "Taxation of Emissions of Greenhouse Gases: The environmental impacts of carbon taxes", In: Freedman B. (Ed.) Global Environmental Change: SpringerReference (www.springerreference.com). | Noted. |
| 2954 | 15 | 34 | 19 | | 35 | delete this paragraph -- not news to policymakers | Text rewritten |
| 15585 | 15 | 34 | 24 | | | What was the value of the Holland tax? It would be helpful to include a table comparing the taxes and values | Considered |
| 3126 | 15 | 34 | 29 | | | The UK CCL is not just levied on manufacturing plants - it applies to all non-residential energy users (i.e. includes offices, supermarkets, public buildings etc). | Noted |
| 15586 | 15 | 34 | 47 | 34 | 48 | What about the C storage technology? Was it successful? | Considered |
| 15584 | 15 | 34 | 5 | 34 | 23 | These two paragraphs are confusing and the wording could be improved. Were all the numbers in the studies prior to line 5 not empirical?Are the studies described in line 14 empirical or not? And are they more or less rigorous than the studies mentioned on line 5? | Rewritten |
| 15587 | 15 | 35 | 10 | 35 | 18 | This is confusing. Can you explain the differences in policy groups more clearly so that the reader undertsands the action called for? | Considered |
| 11092 | 15 | 35 | 10 | 35 | 18 | This paragraph is informative and deserves attention, but is it appropriate to insert this in 15.5.3? According to page 16 line 23, energy prices in China are differenciated based on energy efficiency rather than carbon content. Would it be more appropriately included in 15.5.3.2? | Considered |
| 12173 | 15 | 35 | 25 | 35 | 26 | sentence requires an indication of the geographical scope it relates to. | Noted |
| 11093 | 15 | 35 | 37 | 35 | 39 | I like this sence of humour. | Noted |
| 11094 | 15 | 35 | 42 | 35 | 43 | Please never delete US or USA here! | Noted |
| 15588 | 15 | 35 | 43 | | | Why would they have had as high of taxes and prices as the UK? | Considered. Question is interesting but somewhat beside teh point here. There |
| 4269 | 15 | 35 | | | | There could also be discussion of fat taxes which have been implemented in a number of countries such as Hungary and Denmark and can reduce consumption of animal source saturated fat and thus livestock related emissions | Considered |
| 12174 | 15 | 35 | 19 | | | given the space given to fuel taxes in this section compared to other proxies for carbon, you might consider putting fuel tax in the heading | Considered, text rewritten |
| 15590 | 15 | 36 | 10 | | | What were the other criteria? | Text rewritten |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 5907 | 15 | 36 | 10 | 36 | 16 | Please check the article again. The authors name is Bureau (Benjamin is the christian name) and the results showed - inter alia - that impacts on households differed between type of revenue recycling (some types border on "comparing apples with oranges") and that in a substantial number of cases a welfare transfer from rural to urban areas takes place. It does thus not fully and exclusively support the statement made in the draft. | Noted, thank you |
| 11095 | 15 | 36 | 25 | 36 | 29 | This point is too important to be neglected in the Executive Summary. | Noted, thank you |
| 7426 | 15 | 36 | 31 | 36 | 43 | Note in relation to reduction of subsidies: 1) renewable subsidies are equivalent to fossil fuel taxation, 2) G20 called for the reduction of inefficient fossil fuel subsidies, leaving to countries to decide what subsidy is efficient or inefficient, 3) definition of what portion of the price constitute a subsidy is not standard, particulary when comparing energy producers vs energy importers, and the IEA calculations are inferred from specific interpretation of a subsidy, 4) The extent to which fuel subsides contribute to development and welfare in developing countries. | Noted |
| 15591 | 15 | 36 | 32 | | | On fossil subsidies, give examples;" In 2008 fossil fuel subsidies such as.." | Noted |
| 3601 | 15 | 36 | 4 | 36 | 9 | The discussion on whether consumers correctly internalize the long-run savings from more fuel efficient cars could include a reference to National Research Council (2002. Effectiveness and Impact of Corporate Average Fuel Economy (CAFE) Standards. National<br>Academy Press, Washington, DC) which shows that consumer consider only the first 3 years of fuel savings when considering the value of higher fuel economy, which understates the true economic value of fuel savings by about 60%. | Noted, thank you |
| 15589 | 15 | 36 | 6 | 36 | 9 | Confusing text beginning with "To empirically…". Perhaps better written as: It is difficult to empirically verify how taxes compare to standards, such as the CAFÉ standard, because of reasons already mentioned. Austin and Dinan… , however, used an empiricially based simulation model to find that the tax would be.." | Noted, thank you |
| 18741 | 15 | 36 | 7 | | | "CAFÉ standards" should be explained (and to my knowledge are written without the accent "é", which comes from the real French café - perhaps autocorrect functionality | Noted, thank you |
| 6143 | 15 | 36 | 30 | 37 | 9 | Usually when we take up subsidy as one of policies and measures, it means subsidy for the reduction of pollution. In this sense, subsidy works in the same way as tax does, though this may be against PPP of OECD 1972. What is taken up in Section 15.5.3.3 is a kind of so-called EHS (Environmentally Harmful Subsidy, more strictly saying, Environmentally Harmful Energy Subsidies). This point should be clealy stated at the outset of this section.<br>Second point is that, though G20 or OECD Ministerial Conference support removal of EHS, this is very hard to materialize. The real reason is that those EMSs have their own purposes (eradication of poverty, securing employment, national security). Unless benefit of removal of EMSs exceeds social cost (unemployment etc.) it may not be justified. This issue is now under discussion at the OECD Joint Working Party of Trade and Environment and it will be available before SOD. Suggest to refer to the document and make necessary revision accordingly. | Noted, thank you |
| 18478 | 15 | 37 | | | | Sections 15.5.3.4 and 15.5.3.5 cover topics that are covered in Chapter 8's (Transport's) discussion of policies (See section 8.10 pages 59-65). It is not necessary to repeat the material again in this overarching chapter. | Have read ch 8 and tried to avoid unnnecessary overlap but include cross refs. |
| 8356 | 15 | 37 | 10 | | | I suggest that the title of 15.5.3.4 is rewritten as "Aviation and Maritime transport taxation". | Suggestions noted and considered when |
| 5007 | 15 | 37 | 10 | 37 | 28 | Since Aviation and Maritaime transport are mostly closs national activilies, those issues shoule be handled in Capter 13, rather than Chapter 15. | Suggestions noted and considered when rewriting |
| 14306 | 15 | 37 | 22 | 37 | 23 | This should be updated - aviation is now included in the EU ETS (and has been since January 2012). | Noted, thank you |
| 3127 | 15 | 37 | 22 | | | Aviation entered the EU ETS in 2012. | Noted |
| 17658 | 15 | 37 | 22 | 37 | 23 | The EU includes aviation sector already. | Noted |
| 18743 | 15 | 37 | 23 | | | There is, by now, fairly ample peer-reviewed literature on the inclusion of international aviation in the EU ETS starting in 2012 that might be cited. Some relevant authors include Scott/Rajamani, Bartels, Kulovesi and others. | Noted |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 7427 | 15 | 37 | 24 | 37 | 28 | Note the complications related aviation and maritime emissions taxation with respect to WTO and the UNFCCC principle of common but differentiated responsiblities. | Noted |
| 15122 | 15 | 37 | 24 | 37 | 28 | Similar ICAO work (carbon levy of 25$ per ton of CO2) shows much smaller impact on RTK and fuel use: -1.7% and -1.6% respectively much lower than the -5% to -10% range indicated in this paper. | Noted and included thank you |
| 6717 | 15 | 37 | 28 | | | at least 5-10 percent "compared to what"? | Noted, text rewritten |
| 3128 | 15 | 37 | 32 | 36 | | London example - over which time period did those reductions happen? The source quoted is from 2006 - what's happened since? It says the charge is 'stiff' - would be better to say how much it is (i.e. currently £10 per day), so you can compare this with the Stockholm example. | Done |
| 6145 | 15 | 37 | 39 | 37 | 40 | The text describes as "why taxes cannot be used or cannot be set sufficiently high to match the Pigouvian level (i.e. to correspond to marginal damages)". This is very misleading. If you say so, you must know exact tax level where marginal abatement cost equalizes marginal damage (marginal benefit). If you take Nordhaus calcuration for example, optimal tax rate (Pigouvian tax rate) is not so high. To avoid this kind of discussion, it is better just to say "why taxes cannnot be used of cannnot be set sufficiently high to achieve the intended result". | Noted. |
| 6144 | 15 | 37 | 10 | 37 | 28 | Is this section necessary? Policies for air and maritime transportation are enthusiatically discussed at ICAO and IMO and are touched upon other chapter of AR5. In addition, though the title says aviation and maritime transport, nothing has been described on maritime transport here. | Text rewritten |
| 7131 | 15 | 37 | 11 | 37 | 28 | When assessing the performance of policies related with aviation and maritime transport, it is necessary to take a look at the international debate in which many countries oppose the EU decision and requires aviation and maritime transport emission to be dealt with in the multilateral framework, consistent with UNFCCC. If it is adopted at national (or regional level), which means unilateral from an international perspective, that have counterproductive effects, as shown the reaction to the inclusion of the aviation sector in the EU ETS. So, when considering national and sub - national Policies and Institutions, it is necessary to put this analysis also in the international context. | Noted text rewritten |
| 14889 | 15 | 38 | 11 | 38 | 15 | 'deviates more from the cost difference' In which dirrection were the deviations? Does it mean the set tariffs were too low or too high | Text rewritten |
| 14890 | 15 | 38 | 11 | 38 | 15 | FIT will encourage more supply of electricty (from both brown and green producers)' So under FIT more electricty from dirty brown sources is generated than under a TGC? Will there be more electricty geneartion in total? But why is then the electrcity demand higher when costs= prices will be higher? | Text moved and rewritten |
| 14891 | 15 | 38 | 11 | 38 | 15 | social welfare higher' How this? External costs incorporated? | Removed |
| 6146 | 15 | 38 | 11 | 38 | 11 | Cannot find Tamas et al. (2010) in the reference section. | Will add |
| 12175 | 15 | 38 | 28 | 38 | 38 | This paragraph contains a hotchpotch of issues that lack an introduction and of which the link with subsidies, FIT and Certificates is not explained: it jumps from transaction costs to awareness, TWC, low hanging fruit, ambitious saving targets and additionality. | Rewritten |
| 3129 | 15 | 38 | 39 | 42 | | Developing country example is vague and doesn't really fit under the heading of 'Subsidies, Feed-in tariffs, Certificates' as it doesn't mention any of these | Text removed |
| 12176 | 15 | 38 | 39 | 38 | 42 | where is the link with subsidies, FIT and Certificates? | Text rewritten |
| 12937 | 15 | 38 | 43 | 39 | 5 | Not clear to me why this section is inserted here. Moreover, carbon leakage needs to be associated to climate policies in general, not only specifically to carbon taxes. | Agree, section shortened and rewritten |
| 12177 | 15 | 38 | 44 | 38 | 46 | a bit more introduction to topic required. Also, changing 'committed country' to 'country with emission reduction commisions' may make sentence more clear. | Done |
| 7428 | 15 | 38 | 43 | 39 | 5 | Review and reference the recent literature, particularly the special Energy Economics issue reporting models comparion exercise on border adjustment. | Thank you |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 7132 | 15 | 38 | 43 | 39 | 5 | As with aviation and maritime transport, border adjustment measures, have to be considered in its impact beyond national borders. It is not a matter of doing a political analysis of that issue, but border tax adjustments cannot be seen in a vacuum, while many consider it as a potential threatens to the international framework of climate change negotiations There is also discussions under the Convention, about if such measures are in contravention of this international legally binding instrument, in particular of Article 3.5.There are also divided opinions on whether WTO law permits border tax adjustments for taxable inputs that are not physically incorporated into the final traded product. | Noted |
| 3130 | 15 | 39 | 35 | | | Australian scheme will now be linked to EU ETS and no longer will have a carbon price floor see http://www.climatechange.gov.au/en/minister/greg-combet/2012/media-releases/August/JMR-20120828.aspx | Noted |
| 17659 | 15 | 39 | 38 | 39 | 39 | Mention the plan to link Australian scheme and EU ETS. | Noted |
| 18746 | 15 | 39 | 39 | | | As a result of negotiations between the EU and Australia, the latter decided to repeal the price ceiling stipulation in order to facilitate linking between the EU ETS and the Australian CPM. Unfortunately this has so far only been documented in the press/news services (approx. August 2012) | Noted |
| 12938 | 15 | 39 | 6 | | | Section 15.5.4 (new approaches to emissions trading): I am surprised that in this section there is no space for a discussion about EU ETS and, more important, I would have appreciated an assessment of carbon markets under the Kyoto Protocol's flexibility mechanisms. | Noted, EU ETS discussed somewhere else |
| 15592 | 15 | 39 | 6 | 39 | 7 | Add Northeast and MidAtlantic U.S. to the title | Section rewritten, so no longer relevant. |
| 15732 | 15 | 39 | | | | I wouldn't agree that the "new approaches" are only approaches that include price management. Australia may give up its price floor up again. What is rally new is the design of existing or planned ETS in Asia (Tokyo, Skorea, China…) that these schemes not focus on the traditional sectors of power and heavy industry but may involve entire cities. These systems include smaller facilities, such as buildings, and include indirect emissions from energy consumption. The entire chapter doesnt mention Asian schemes at all. The Tokyo and Saitama schemes are up and running... | Noted |
| 18479 | 15 | 39 | | | | The title of this section would be better as "Tradable Permits" to reflect the structure in 15.3. The detailed case studies presented here could be reduced to provide a simple summary of the innovative design features that were charachteristic in the different countries, and then to provide a clear evaluation in terms of the criteria outlined in 15.3.1. | Noted, section rewritten |
| 6711 | 15 | 39 | 6 | 41 | 4 | What is the criteria to choose the country/sub-country? "Northeast and Mid-Atlantic U.S. " is not included in the title, but it is presented in 15.5.4.5. | Noted, section rewritten |
| 6147 | 15 | 39 | 6 | 44 | 33 | This section can be shortened and improved if, same as Section 15.5.2.2-15.5.2.3, those actual cases can be gathered in a table so that readers can find pros and cons of each scheme at a glance. As a whole this section is a little bit redundant. There is a room for improvement, for example, by omiting certain schemes that is not so important as well as by logically condensing 15.5.4.10 SO2 trading scheme under CAA). | Noted, section rewritten |
| 15593 | 15 | 40 | 13 | | | If allowances will initially be given out for free, what will happen later? | Noted. |
| 15733 | 15 | 40 | 28 | 40 | 29 | International emissions units can be used: can be used unlimited!!! | Noted. |
| 9265 | 15 | 40 | 23 | 40 | 36 | Australia has recently announced it will link with Europe, with no floor price, so NZ's policy might change. NZ's use of global markets means emitters currently enjoy low prices (~$5), but if there is a change of government then a requirement to buy only local credits (eg $25) might apply. The international market means governments have little control over local credits and hence struggle to use credit prices as a tool to reduce emissions. | Noted |
| 15006 | 15 | 40 | 37 | | | This section should note that emissions have fallen significantly in the RGGI region, although it is difficult to ascertain how much of this is due to the RGGI program. While the price is considered non-binding, it may contribute to a decision context that supports shifts toward lower-carbon electricity generation and energy efficiency. | Noted. |
| 2956 | 15 | 41 | | 44 | | This lengthy review of non-GHG trading systems is relevant but tangential. I would suggest summarizing in at most one paragraph. | Done |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 6771 | 15 | 41 | 11 | | 18 | Although the advantage that emissions trading promotes equality of marginal abatement costs across firms, and a large cost saving as described, it is only theorical view. In fact, it is very difficult to allocate initial cap fairly, according to the reviw of Wakabayashi [1].<br><br>[1] Masayo Wakabayasi and Tadashi Sugiyama (A Review on Effectiveness of Emissions Trading Schemes: Empirical Evidences of Their Implementation ) | Noted. |
| 10039 | 15 | 41 | 11 | 41 | 15 | This part should be deleted completely. The introduction of tradable allowance programs for SOx/NOx in the US is based on different background. Conditions of GHG case are different from those of SOx/NOx case, as described in (Wakabayashi, 2007, page40, only Japanse). These literature is listed in the No67 line of this table. | Noted, rewritten |
| 2955 | 15 | 41 | 19 | | 22 | this is too glib -- concentration of CO2 sources might also create hot spots of co-pollutants. This was the basis of a lawsuit in California. | Noted |
| 12939 | 15 | 41 | 23 | 44 | 33 | This material relates to relatively old Emission trading programmes in the USA, which are not ncessarily related to climate policy. I suggest merging sections 15.5.4.7 to 15.5.4.10 in one (short) section only and just describe main results, which could be relevant to emissions trading programmes for climate policy. Otherwise, I suggest to delete all 15.5.4.7 to 15.5.4.10. | Noted, rewritten |
| 5908 | 15 | 41 | 23 | 45 | 11 | These examples are given at greater length than necessary. Please shorten the text. | Done |
| 18480 | 15 | 41 | 29 | 44 | 33 | Sections 15.5.4.8 through 15.5.4.10 could be condensed substantially to save space. It would be useful to the reader to try to pull the main lessons learned from other tradable permits schemes (i.e. those that have not targeted cc mitigation) into one section that is a maximum of a few paragraphs. | Done |
| 5008 | 15 | 41 | 29 | 44 | 33 | Description about lead trading program and SO2 trading program are too much. Those example cases should be either eliminated or condensed to one or two paragraphs at most. | Done |
| 3131 | 15 | 41 | 44 | | | almost 4 pages on US trading programmes that are not about climate change - too much unnecessary detail. Why not analyse the EU ETS instead, after all it is the first large climate trading scheme in the world and has been operating since 2005. Plenty of academic work has been done on it. | Done |
| 6712 | 15 | 41 | 5 | 44 | 33 | The title is of 15.5.4 is "new approaches", but contents from 15.5.4.7 to 15.5.4.10 are not new. They are schemes of reducing air pollutions. It is better to shorten these subsections, especially, 15.5.4.10 (SO2 trading program) and describe the link to CO2 reduction policies. | Noted, rewritten |
| 2310 | 15 | 41 | 1 | 41 | 4 | This is speculation that emissions leakage might occur in RGGI, but now official reports have been published looking at how much leakage has occurred. See "CO2 Emissions from Electricity Generation and Imports in the Regional Greenhouse Gas Initiative: 2010 Monitoring Report" issued by RGGI on August 6th of this year. It found "The monitoring results show there has been no increase in CO2 emissions from non-RGGI electric generation during the first two years of RGGI program operation, 2009 and 2010, compared to an annual average during 2006 to 2008." ( p.6) The report can be downloaded from: http://www.rggi.org/docs/Market/Elec_Monitoring_Report_12_07_30_Final.pdf. | Noted |
| 17660 | 15 | 41 | 29 | | | The source heavily relies on only one source (Ellerman 2003), however, this source is so far not included in the list of references. | Noted. |
| 5267 | 15 | 42 | 31 | 44 | 33 | TAKE SECTION OUT on acid rain - not needed | Done |
| 12940 | 15 | 44 | 34 | 45 | 11 | Laboratory experiments: I am not clear why this section is placed here and what is its aim | Considered |
| 11100 | 15 | 44 | 34 | 44 | 11 | Laboratory experiment is only a part of supporting studies, and it is not fair or misleading just mention one of them. These paragraphs should be shortened and be incorporated in a revised and more science-based report, as mentioned in No. 15 and 23. | Noted. |
| 12941 | 15 | 45 | | | | Section 15.5.4: "Conclusions" are missing | Accepted. Text added. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 12942 | 15 | 45 | 12 | | | Section 15.5.5 (Voluntary agreements). This section needs to add references to the huge literature in this field. For instance, definition of VAs and several contributions surveying impacts on the environment, competitiveness etc., as well as various case studies can be found in the books by Baranzini, A. & Thalmann, P.: "Voluntary Approaches in Climate Policy" Edward Elgar, Cheltenham (UK), 2004; and OECD: Voluntary Approaches for Environmental Policy: Effectiveness, efficiency and usage in policy mixes". Paris: OECD, 2003 and case-studies by OECD. | Accepted. Text modified and literature added. |
| 8010 | 15 | 45 | 12 | 47 | 33 | Fully support. Because the descriptions are based on the scientific facts, although usually only negative aspects of voluntary action plan are highlighted. | Accepted. |
| 5009 | 15 | 45 | 12 | 47 | 33 | Since Voluntary Agreements are widely exercised and well performed in various places in the world, but the details and effectiveness of them are not well recognised, complehensive review of those paragraphs are very important and useful to enhance the understanding of "alternative" approaches. 15.5.5.1, 15.5.5.2, 15.5.5.3, 15.5.5.4 shoule be kept. | Accepted. |
| 5909 | 15 | 45 | 13 | 47 | 20 | This text can be shortened to 1 page. | Accepted, the text is shortened |
| 13721 | 15 | 45 | 18 | 45 | 19 | Delete "USEPA … 2007", as this is a claim from a government institution and not peer-reviewed literature. | Accepted. Text modifed. |
| 6148 | 15 | 45 | 27 | 45 | 27 | After "non-participants" add a new paragraph by inserting "Environmental effectiveness of voluntary agreement varies depending on several factors such as degree of communication between regulators and industries as well as institutional and cultural background. IPCC (2007) describes as 'it must be acknowledged that VAs (voluntary approaches) fit into the cultural traditions of some countries better than others. Japan, for example, has a history of co-operation between government and industry that facilitates the operation of voluntary programmes'. This point is reinforced with ample concrete examples by Yamaguchi (2012)". For references are as follows; IPCC (2007), Climate change 2007: mitigation of climate change. In: Metz B, Davidson OR, Bosch PR, Dave R, Meyer LA (eds) Contribution of working group III to the fourth assessment report of the intergovernmental panel on climate change. Cambridge University Press, Cambridge, and Yamaguchi (2012), Policies and Measures. In: Climate Change Mitigation, A Balanced Approach to Climate Change. M. Yamaguchi, (ed.), Springer, London pp. 129-159. | Accepted. Text modified and literature added. |
| 3132 | 15 | 45 | 30 | | | the discount is for Climate Change Agreements, not Climate Change Programs | Accepted. Text modified. |
| 12063 | 15 | 45 | 33 | 45 | 35 | The Dutch example is not exactly a complementary measure, but in fact replaced mandatory regulation. While the example of the UK constitutes a unique comlementary measure most other voluntary agreements were made under the prospect of further (mandatory) government regulation in the absence of voluntary action. [further literature? e.g. Kornelis Blok] | Accepted. Text modified and wording "complementary" is deleted. |
| 6151 | 15 | 45 | 12 | 47 | 33 | Can not find all literatures in this section in the reference section. Please add in the reference. | Noted |
| 2312 | 15 | 45 | 16 | 4527 | | An additonal possibly useful reference for this section would be: Frans P. de Vries, Andries Nentjes and Neil Odam," Voluntary Environmental Agreements: Lessons on Effectiveness, Efficiency and Spillover Potential" International Review of Environmental and Resource Economics vol. 6, Issue 2 (2012) | Accepted. Literature added. |
| 6772 | 15 | 46 | 23 | | 25 | The Japanese Volantary Action Plan by Keidanren (Japan Business Federation) is a very good example which has shown that the measure of volantary action functions effectively, because their performance in terms of energy and carbon intensity was ranking among the best of the world. And also, Rietbergen et al. [1] analyzed the outcome of long-term volantary agreements on industrial energy efficiency improvement in the Netherland.<br><br>[1] Martijin G. Rietbergen, Jacco C.M. Farla, Kornelis Blok (2002)<br>Do agreements enhance energy efficiency improvement? Analysing the actual outcome of long-term agreements on industrial energy efficiency improvement in The Netherlands<br>Journal of Cleaner Production 10 153-163 | Accepted, but the suggeted literature is not added as they are covered in AR4 and AR4 is reffered. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 6149 | 15 | 46 | 28 | 46 | 28 | Add after Wakabayashi 2012, "Yamaguchi (2012)". For Reference; Yamaguchi (2012), Policies and Measures. In: Climate Change Mitigation, A Balanced Approach to Climate Change. M. Yamaguchi, (ed.), Springer, London pp. 129-159. | Accepted. Literature added. |
| 15483 | 15 | 46 | 37 | 47 | 3 | As the title of this chapter is "voluntary agreements as a "major" policy instrument in government mitigation plan", it seems a bit awkward to include the IW target for appliances here, as this is an action aiming only for one object, rather than industry as a whole, or at least a section. When this whole chapter needs to reduce its size by 76 pages to 60 pages, I would suggest this one may be a candidate to be shortened. | Accepted. Text modified and wording "major" is deleted. Also text is shortened. |
| 12943 | 15 | 46 | 7 | 47 | 33 | I am wondering why this section discusses the Japanese VAP only. There are many examples in other countries: see e.g. chapters in Baranzini and Thalmann (2004) or OECD (2003) quoted above. | Accepted. Text modified. Literature added. |
| 6709 | 15 | 46 | 7 | | | Good section. The Japanese Voluntary Action Plan (VAP) by Keidanren (Japan Business Federation) is a good example of voluntary approach for mitigation. | Accepted. |
| 11797 | 15 | 46 | 7 | 47 | 20 | Reasonable analysis. | Accpeted. |
| 15482 | 15 | 46 | 7 | 47 | 20 | Japanese Voluntary Action Plan is highly evaluated here, but there are different view on this VAP. For example, KIKO Network evaluates VAP as ineffective scheme in reducing CO2 for the following reasons and the data of the report from Japan Environmental Society backs up.<br>1)The target as a whole of VAP was not ambitious enough. Keidanren's VAP set 0% in 2010 compared to 1990 level, whereas the governmen's KP achievement Plan set the industry target for 2010 as -4.6%~-4.3%. This comes from the fact that targets of each industry is set by its own industry's voluntary action rather than set by top down by the government.<br>2) Ensuring compliance is difficult as there is no sanction and targets are not transparent and not comparable, which makes the review difficult. This comes from the fact that each industry can choose the target character as they like, such as CO2 emissions, CO2 intensity, Energy, Energy intensity, and also choose industrial production data for intensity target. Also, there was no clear explanation of how to achieve the total reduction target when most industry association chose intensity target.<br>Due to economic crisis in 2008 and earthquake in 2011, the emissions have fallen since 2008, but this reduction is not the outcome of the VAP. The effectiveness of VAP in the absence of effective policy measures such as Emission Trading scheme/carbon tax is not proven at this point, that it is not a balanced view to regard VAP as a successful mitigation policy measures.<br>Therefore, when reporting on VAP, the chapter needs to mention at least about the ineffectiveness and ambiguity of "setting the targets with voluntary bottom-up approach" to maintain the the balance.<br>citation:<br>KIKO Network.2007. "Keidanren Voluntary Action Plan fact sheet",<br>www.kikonet.org/research/archive/mokutastu/FS-kvap-j.pdf<br>Japan Environmental Society. 2007. "report of GHG emissions evaluation committee",<br>http://jaes.sakura.ne.jp/archives/768 | Accepted. Text modied and literature added. |
| 10672 | 15 | 46 | 7 | 47 | 20 | Good analysis. | Accepted. |
| 15069 | 15 | 46 | 7 | 47 | 20 | This section seems to be excessively too long and redundant, given the content in the present format which only talks about the specific case (VAT) in Japan. With consideration on the balance between the sections, this particular section, if needed, should be much shortened. In addition, when a general conclusion is drawn from this section, more evidence obviously need to be provided, not only for the unique specific country (Japan in this case), but also for other countries in the world, unless otherwise, such conclusion is difficult to be generalized which are less meaningful for the global readers of IPCC AR5. | Accepted. Text shorted, and mixed outcome is mentioned in conclusion. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 10040 | 15 | 46 | 7 | | | This section should be kept in SOD because this section shows as a successful example of "voluntary target scheme". Each industry in Japan has voluntary target and the voluntary target scheme has played a big role, as described in (Yamaguchi, 2012, page35 and 154), (Manuel, 2010, page 6 and 13), and (Yamaguchi, 2010, abstract). In addition, there is also a successful example of "voluntary target scheme" in Netherlands, as shown in (Martijin, 2002, page162). These literatures are listed in the No63 line of this table. | Accepted. |
| 9378 | 15 | 46 | 7 | | | This section provides a good example that voluntary action policy works effectively. | Accepted. |
| 18486 | 15 | 46 | 9 | | | While this is an interesting case, the focus and the detail on the policy of one country seems misplaced and interrupts the flow of the text. I might recommend condensing it to a few paragraphs and including it as a box, rather than a section in itself. | Accepted. Text shortened. |
| 15594 | 15 | 47 | 21 | 47 | 33 | Can be formatted more visually appealing and succinctly - like in bullets. What are the key takeways? | Noted. |
| 11798 | 15 | 47 | 22 | 47 | 33 | Delete last sentense. First sentense says [environmentally effective given a proper institutinal framework], which has already implied the meaning of the last sentense. | Noted. |
| 6773 | 15 | 47 | 31 | | 33 | Although it is described that some voluntary agreements have not brought about significant environmental impacts, there is no evivence. The reference of this description should be indicated. If the reference is not clerar, it should be deleted. | Noted. |
| 10673 | 15 | 47 | 31 | 47 | 33 | This sentence is a reiteration of line 22 and 23. And it looks exaggerating negatively. | Noted. |
| 7793 | 15 | 47 | 9 | | 20 | The same comment as above. | Accepted. Section removed. |
| 6150 | 15 | 47 | 9 | 47 | 9 | Add before (Tanigawa 2004), "Yamaguchi (2012) introduced one study that calculated, by applying the same methodology with which Ellerman et al. used for the evaluation of EU ETS Phase 1, the CO2 emissions reduction effect of Keidanren's Voluntary Action Plan was 34.6 Mt/CO2 or 5.6% from counterfactual BAU during 1998-2008. 1998 was the starting year of the Action Plan". For Reference; Yamaguchi (2012), Policies and Measures. In: Climate Change Mitigation, A Balanced Approach to Climate Change. M. Yamaguchi, (ed.), Springer, London pp. 129-159. | Noted. |
| 18487 | 15 | 47 | | | | In Chapter 11 (section 11.10 pages 64-71) there is already an extensive discussion of REDD policies. There is no need to repeat this discussion in an overarching policy chapter. It also begs the question why this one sector's policies are being singled out above the others. | Accepted. Section removed. |
| 15004 | 15 | 47 | 35 | | | This section should be integrated with chapters 11, 13, 14, and 16. See comment on chapter 11, suggesting establishment of a text box in one of these chapters, detailing history of REDD+. | Section removed. |
| 12944 | 15 | 48 | 22 | 48 | 28 | Please better explain the measure of "land-yield elasticity" and the policy implications of the numbers quoted herein | Section removed. |
| 13614 | 15 | 49 | 45 | | 46 | Just to point back to comment 20 that low carbon technologies are unique in a number of ways vis a vis other technologies and so would suggest that this distinction be made clearer | Noted. |
| 18488 | 15 | 49 | | | | The section is well written with clear conclusions. There seems to be some bias toward US examples and the energy sector. It may be useful to pull more from e.g. buildings or industry as well, ultimately to answer the question "Is technology policy equally important for all sectors? If not, for which is it most important and best suited?" | Accepted. The SOD contains additional non-U.S. and non-energy material. |
| 3185 | 15 | 49 | 1 | | | Section 15.6 is heavy on some factors (e.g., IP) and light on others that are key to actual investment and deployment of new technologies. Those include risk management and allocation policies (e.g., PPAs, loan guarantees, soft budgets, etc). I made a similar comment on chapter 13, which I reproduce here: " sections 13.9.2 and 13.9.3. For my taste these sections are overly focused on IP and not enough on other fundamentals such as protection of property, sanctity of contracts, etc. There's a ton of practical (and to some degree academic—such as in the int' finance, int'l investment law and some of the international political economy literatures) experience with how these kinds of factors actually drive investment outcomes and diffusion of technology. Somewhere WG3 should deal with that—if not here then (better) in the industry chapter (chapter 10, which is devoid of most real world industrial concerns) or the finance chapter (chapter 16, which is a mess). " | Taken into account. Different commenters have different views on the appropriate balance among different factors. SOD contains more discussion of behavioral and institutional issues than the FOD. |

|---|---|---|---|---|---|---|---|
| 3304 | 15 | 49 | 32 | 58 | 36 | Strong section. Keep it. | Noted. Thanks. |
| 6152 | 15 | 50 | | | | It is desirable if a short explanation of why RD&D in 2009 increased so rapidly is added. | Noted. The figure has been revised and this section rewritten. |
| 17661 | 15 | 50 | 4 | 50 | 17 | The paragraph describing Fig. 15.1 is not in line with the facts shown in the graph. For example, the figure only shows expenditures up to 2009 while the text also refers to the year 2010. In addition, the description of the graph states that the “peak investment rate was in 1980” while figure 15.1 implies that this was actually the case in 2009. | Accepted. The Figure has been updated and the accompanying text rewritten. |
| 18489 | 15 | 50 | 3 | 50 | 17 | It would also be useful to know the R&D structures outside of OECD countries. E.g. is there any R&D expenditure in developing countries? How does the situation differ there? | Taken into account. There is limited literature on R&D outside the OECD. We have included brief mention of |
| 5011 | 15 | 51 | 12 | 51 | 22 | Public support for energy technologies R&D is very important and actually brought many important outcomes. See the following paper: "Energy Innovation at the Department of Deffence", Daniel Sareviz et al., Consortiam for Science, Policy, and Outcomes at Arizona State University, March 2012 | Noted. |
| 13615 | 15 | 52 | | | | Same as above (to highlight comment 20) and also to repeat comment 21 (that in addition to 'market failures' alternative approaches take a more systematic view | Unable to understand. There is no figure 15.6.4. The comment does not seem to refer to the figure that does appear on |
| 15461 | 15 | 52 | 1 | 52 | 13 | It may be a good idea to briefly touch upon the ARPA-E project (http://arpa-e.energy.gov) which was driven by the American Recovery and Reinvestment Act. Although DARPA is alluded in the next page, the ARPA-E is directly inspired by the past successes of DARPA. Although the program has been short, it has already spurred $100 million in private investment in its first two years (http://www.sustainablebusiness.com/index.cfm/go/news.display/id/22856). See also: http://theenergycollective.com/cliftonyin/84921/arun-majumdar-made-arpa-e-energy-innovation-leader and http://www.theatlantic.com/technology/archive/2012/09/amid-partisan-bickering-everyone-agrees-arpa-e-is-a-fascinating-experiment/261905/ | Noted. Space limitations, and the need to cover experiences world-wide, preclude a specific discussion of ARPA-E. |
| 5910 | 15 | 52 | 1 | 52 | 6 | Another possibility is that people who are not qualified enter the respective job market and negatively influence research quality. This, in turn, turns up pressure on scientific quality control like review processes and consumes time that could be spend doing research … | Accepted. At a macro level, the consequences for the research process working through this mechanism are the |
| 12066 | 15 | 52 | 15 | | | NIH' as acronym is not explained in the text | Editorial – copyedit to be completed |
| 13617 | 15 | 53 | 3 | | 14 | suggest highlighting the role that the military has played (internet, GPS) (DARPA is referenced but think this distinction is useful). E.g. I am trying to track down studies that I have seen but as the deadline to getting these comments is imminent I can't seem to find it, but there are some that suggest that the military is seriously looking at green technologies as a way to reduce exposure (supply chains in getting fuel / needed energy to their troops) - not only costs but also to reduce casualties | Noted. Space limitations, and the need to cover experiences world-wide, preclude a specific discussion of the military role. |
| 5012 | 15 | 53 | 3 | 53 | 14 | Public support for energy technologies R&D is very important and actually brought many important outcomes. See the following paper: "Energy Innovation at the Department of Deffence", Daniel Sareviz et al., Consortiam for Science, Policy, and Outcomes at Arizona State University, March 2012 | Noted. |
| 6774 | 15 | 53 | 34 | | 35 | The description that FIT has encourged "develoyment of renewable technologies" shoud be corrected to "develoyment of renewable capacity", because FIT has encouraged only renewable capacity as the German case shows in Figure 15.2. □ | Taken into account. The cited text has been reworded. |
| 11799 | 15 | 53 | 35 | 53 | 37 | Delete this sentence. Relationship between [huge expantion] and [cost reductions] is unclear. | Taken into account. The cited text has |
| 6775 | 15 | 53 | 35 | | 37 | Figure 15.3 only suggests that the huge expansion in develoyment appears to have forsterd "economies of scale". In figure 15.3, there is no data that suggests "learning-by-doing" or "incentive for R&D". | Taken into account. The cited text has been reworded. |
| 11800 | 15 | 54 | | | | This figure isn't needed. Refer to No.85. | Accepted. The figure has been deleted. |
| 12945 | 15 | 54 | 7 | 54 | 15 | I suggest moving those 2 paragraphs above, when first discussing FIT | Taken into account. The cited text has |
| 13618 | 15 | 54 | 7 | 55 | 3 | suggest noting that often times these policy levers operate across purposes (e.g. a FIT may have an industrial and innovation goal also at play in addition to reducing GHG emissions) | Taken into account. Interaction of policy goals is discussed in the chapter. |

| 5013 | 15 | 54 | 7 | 54 | 15 | There are many negative/unexpected impact brought by FIT after massive deployment of the policy. Most evident negative of FIT is taht it looks in the existing costly technologies and, as the result, high electricity cost by surcharges for long period, even though new thechnologies may become available and cost may come down in the mean time. See the following book: "The Green Mirage", John Constable, CIVITAS, London, July 2011 | Taken into account. There are diverse studeis of FIT that come to differebnt conclusions. We have tried to represent this literature in the chapter. |
| 18681 | 15 | 55 | | | | IP is discussed on page 55, should be aligned with the same theme in c 13 and perhaps removed from c 15. Refers also to c 16. Messages not aligned? | Accepted in part. The reference to Chapter 16 was an error; the correct cross-reference to Chapter 13 now appears. Chapters 13 focuses on IP policy as an international issue; Chapter |
| 4006 | 15 | 55 | 28 | 56 | 9 | Although I am convinced that strong IP protection supports technological development at least in developed countries and also in developing countries, the discussion here may, as an example, refer to open source software, which is a typical example that the lack of patent protection and the lack of copyright protection (by license agreement of the creators of the software) may produce positive effects on the development of such software. However, I doubt that in fields of cost intensive development of technologies such as in the pharmaceutical sector and also the climate sector (solar industry etc.) IP protection is necessary to allow companies securing their investments and giving them a chance to get a payback on their investments. | Noted. Different individuals have very different views regarding the effects of IP policy. The conclusions in the chapter regarding the potential consequences of IP protection are supported by the published theoretical and empirical literature. |
| 12023 | 15 | 56 | 38 | 57 | 1 | This is an odd statement which is misinterpreted that week IP protection facilitates indigenous technology development. IP protection is important for both domestic technology development and technology transfer. | Noted. Different individuals have very different views regarding the effects of IP policy. The conclusions in the chapter regarding the potential consequences of IP protection are supported by the |
| 13612 | 15 | 56 | 9 | | 18 | I would like to again bring to your attention the work of climate-policy-innovation.org as there are a number of research papers in place to do with climate policy innovation / diffusion (feel free to contact Andy Jordan Andy Jordan (ENV) [A.Jordan@uea.ac.uk] and Dave Huitema Huitema, D. [dave.huitema@vu.nl] for further information about their status (e.g. Auld and I are working on one due imminently) | Noted. |
| 6153 | 15 | 57 | 24 | 57 | 36 | This paragraph descibes situation only in the USA. We need another literature whether the same thing may happen in other part of the world including developing countries. If not, it is necessary to add some caution such as "it is uncertain whether same effect may happen in othe r part of the world". | Accepted. The SOD contains additional non-U.S. material. |

|---|---|---|---|---|---|---|---|
| 15273 | 15 | 57 | 37 | 57 | 39 | Basically, it would be the case that flexible environmental regulations are more effective at inducing technological change, compared with direct regulations which specify a particular technology to achieve regulatory goals. There is a caveat, however, that flexible regulations tend to encourage relatively simple, straightforward technological change, such as end-of-pipe technologies, which will discourage radical, clean innovations, which could be better from a long-term perspective. For example, Yarime (2007) examined the effects of environmental regulation on technological change in the chlor-alkali industry in Europe and Japan. when emission standards introduced were not very stringent, the cost of pollution abatement with end-of-pipe technologies was relatively small, which encouraged companies to focus on this type of technology, rather than clean technologies, as illustrated in the case of Europe. Because the end-of-pipe technologies were effective in reducing emissions to a certain extent, the producers emitting mercury had a strong incentive to continue to use the existing, pullution-laden mercury process, which has functioned to prolong the lifetime of the technologically obsolescent process, leading to technological lock-in. In contrast, stringent regulations worked effectively in creating strong and secure demand for clean technologies such as the ion-exchange membrane process, shifting production companies away from end-of-pipe technologies that would otherwise sustain the trajectory of the pollution-laden mercury process. Such regulations, however, implemented in a very short time period, as was the case in Japan, resulted in inefficient use of resources, as firms were required to make large investments without a clear understanding of emerging technological options. In other words, on the one hand, environmental regulations should be designed to encourage research and development on clean technologies having the possibility of achieving economic and environmental objectives at the same time, rather than end-of-pipe technologies, which only lead to incurring additional costs, except perhaps in cases when immediate actions for eliminating toxic substances are necessary. On the other hand, it is desirable to avoid inducing inappropriate technological choices prematurely in the presence of the uncertainty, diversity, and rigidity inherent in the process of technological change. Therefore, an explicit mandate to phase out the existing pollution-laden technology with a sufficiently long time frame involving a certain degree of flexibility would allow more potential for promoting green innovation, which necessarily requires dedicated efforts on research and development and experimentation.<br>Yarime, Masaru, "Promoting Green Innovation or Prolonging the Existing Technology: Regulation and Technological Change in the Chlor-Alkali Industry in Japan and Europe," Journal of Industrial Ecology, 11 (4), 117-139 (2007). | Accepted. The cited results are now mentioned in the chapter. |
| 15272 | 15 | 57 | 5 | 57 | 6 | For surveys on empirical literature assessing the effects of policy measures on technological change, the following article would also be very useful, with more systemic and integrated views on technological change.<br>del Rio, Pablo, Javier Carrillo-Hermosilla, and Totti Konnola (2010). "Policy Strategies to Promote Eco-Innovation: An Integrated Framework." Journal of Industrial Ecology, 14 (4), 541-557. | Noted. The cited paper is now included in the surveyed literature. |
| 2311 | 15 | 57 | 4 | 58 | 9 | An additonal reference for this section that might be helpful is: Allen S. Bellas and Ian Lange, "Evidence of Innovation and Diffusion Under Tradable Permit Programs' Internationa Review of Environmental and Resource Economics volume 5. Issue 1 (2011) | Noted. |
| 18683 | 15 | 58 | 33 | | | Page 58, line 33 says:<br>“ 4. There is the potential for intellectual property enforcement to impede the diffusion of new GHG technologies, thereby inhibiting both GHG reduction and further improvement of the technologies”<br><br>Highly questionable as a statement! | Rejected. Different individuals have very different views regarding the effects of IP policy. The conclusions in the chapter regarding the potential consequences of IP protection are supported by the published theoretical and empirical |

|---|---|---|---|---|---|---|---|
| 12024 | 15 | 58 | 33 | 58 | 35 | IP protection is necessary for facilitate technology transfer and diffusion in a sustainable way. To much defensive IP management may slow the diffusion but no IP protection intimidates technology holder to transfer its technologies. I disagree with this conclusion as it does not consider sustainability. | Noted. Different individuals have very different views regarding the effects of IP policy. The conclusions in the chapter regarding the potential consequences of IP protection are supported by the |
| 5014 | 15 | 58 | 33 | 58 | 35 | The argument here is not necessarily supported by facts. In fact, from technology owner view points, technology transfer/licence is incentivatised with patents, thus promoted. Without patent protection, technology owners may keep such technologies as trade secrets and hold within the company. | Noted. Different individuals have very different views regarding the effects of IP policy. The conclusions in the chapter regarding the potential consequences of IP protection are supported by the |
| 15595 | 15 | 58 | 41 | | | Is this line meaning//planning to say that social and economic development are big drivers of climate change? I disagree in the sense that they do not have to be and one can have development while minimizing climate impacts if done thoughtfully. | Noted. |
| 15734 | 15 | 58 | | 58 | | Synergies and tradeoffs among policies: among climate policies? Energy policies? | The title is a mandate from IPCC plenary. In this section, we focus on synergies and tradeoffs among climate |
| 18490 | 15 | 58 | | | | The first three sections of 15.7 (15.7.1 - 15.7.3) have a very useful focus on the link between CC mitigation policies and SD policies, highlighting the developing country perspective. However, much of the text is on co-benefits and other topics covered in Chapter 4. It might be most useful to condense these three sub-sections into one, highlighting only what has not already been covered in other chapters. | Considered. We have reorganized 7.1-7.3 to a new section which focus on the interaction between policy objectives |
| 18491 | 15 | 58 | | | | Again, while the section has a useful link to development policies, it misses a link to policies in any other subject areas, e.g. agriculture, to inform the reader where synergies and trade-offs exist with other topic areas, other branches of government. | Considered |
| 15596 | 15 | 58 | 38 | 62 | 48 | This section coul benefit from a tighter structure or outline, especially 15.7.1, 15.7.2and 15.7.3. It seems a bit disjointed at times. The following sections were very well written and could be models - 15.7.5.1, 15.7.5.2 | Considered. We have reorganized 7.1-7.3 to a new section which focus on the |
| 18005 | 15 | 58 | 45 | | | Although the section relates to SD, SD concepts and SD goals, I have found no cross-reference to Chapter 4 although Chapter 4 is supposed to provide the framing for any SD discussion in the WGIII AR5. For this Section, this is particularly relevant, since SD and the related concepts are not sufficiently explicated. The same applies to the discussion of co-benefits/co-costs and the respective framing in chapters 3 and 4 (which has been nascent in the FOD). Please liaise with the relevant chapters in the cross-cutting meeting to determine a viable labor division and synthesis of results with respect to the co-benefits/co-cost assessment and the relation to SD across chapters. | Considered |
| 11102 | 15 | 58 | 33 | 58 | | This conclusion is wrong, or, at least, one sided. The IPCC report should be science-based and be independent from politicized debates under the UNFCCC. | Rejected. Different individuals have very different views regarding the effects of IP policy. The conclusions in the chapter regarding the potential consequences of IP protection are supported by the |
| 6156 | 15 | 59 | | | | As a measures to mainstreaming mitigation for trade and investment, in addition to Energy subsidy reform in page 60, add "removal or reduction of import duties for environmentally friendly goods and services". There are lots of papers from OECD Joint Working Party of Trade and Environment. | Considered. This table has been deleted in SOD |
| 6154 | 15 | 59 | 11 | 59 | 13 | Better to cite United Nation's MDGs (Millenium Development Goals) and/or "The Future We Want " adopted at the Rio + 20 Conference this year (A/CONF.216/L.1). | Considered. This has been added |
| 5268 | 15 | 59 | 13 | | | ADD: But some negative effects can arise: efforts in France to promote diesel in the past have led to increased NOX pollution problems in several cities. | Need reference to this point |
| 15598 | 15 | 59 | 14 | | | Title is wordy/confusing; Perhaps "Capturing (or understanding) Synergies between Climate and NonClimate Policies"? This section could start with a description of the synergies to set the stage for this content which would reinforce the key points. | Considered. We have reorganized 7.1-7.3 to a new section which focus on the interaction between policy objectives |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 7430 | 15 | 59 | 16 | 59 | 21 | Note that there is also a tradeoff between the security of demand for the fossil energy producers and the needed investment to meet actual global demand from these sources. A more integrative and responsible strategy to energy security should allow for all sources of energy in an equal footing suitably corrected for their impacts on GHG emissions. | Need reference to this point |
| 6155 | 15 | 59 | 21 | 59 | 21 | Add "Toichi (2012)" after mitigation. For reference; Toichi (2012), Balance between energy security and mitigation responses: In: Climate Change Mitigation, A Balanced Approach to Climate Change. M. Yamaguchi, (ed.), Springer, London pp. 63-87. | Considered. This has been added. |
| 9271 | 15 | 59 | 29 | 59 | 29 | Spelling mistake "… main raise …" should probably be "… may raise …" | Considered. This has been corrected |
| 6715 | 15 | 59 | 29 | | | It may be "main" should be "may"? "CCS main raise concerns about...". "Main"→ "may"? | Considered. This has been corrected |
| 15599 | 15 | 59 | 30 | | | Why does this raise concerns about energy security? Explain. | CCS may consume more energy then tighten the energy supply |
| 5269 | 15 | 59 | 40 | | | Proposal to add a potential obstacle column: To ENERGY SECURITY add following obstacle column: May lead to<br>- increased coal use<br>- exploration of oil in ecologically sensitive areas<br>-schale gas<br><br>To AIR QUALITY, add following obstacle column:<br>Improving traffic flows decreases pollution in the short term but leads to increased car traffic afterwards;<br>Funding help to replace old but still operational cars reduces pollution but has overall greater ecological footprint;<br>Efforts at increasing diesel motor use in France (less GHG emissions) lead to increased NOx pollution | Considered. This table has been deleted in SOD |
| 2318 | 15 | 59 | 49 | | | The table, should be changed or adequate, The first column should contain the basic target , it is , the mitigation target and the second column may represent the policy options and the last one the synergies. In addition, is a suggested take into account other more synergies. There are more synergies impacts than those that are on the table. | Considered. This table has been deleted in SOD |
| 15597 | 15 | 59 | 5 | 59 | 6 | side impact on climate change" is not very clear. Also, instead of "can widen policy goals…" how about "can achieve multiple policy goals." | We have delted this subtitle in revised text. But widen means to widen the boundary of policy objetives, while |
| 15128 | 15 | 59 | 2 | 59 | 2 | poverty eradication | Considered. We have added pover |
| 15129 | 15 | 59 | 5 | 59 | 5 | many development policies indeed have positive<br>side-impact on climate change | Considered. We have put this into revised SOD text |
| 4270 | 15 | 59 | 12 | | | I couldn't see a discussion of how co-benefits can be incorporated within policy instruments to reduce GHG emissions. Could there be a specific section on this point? | The co-benefit discussion will be addressed mainly by other chapter. This discussion may be more appropriate in |
| 18007 | 15 | 59 | 28 | 59 | 32 | Please provide a cross-reference to and liaise with Chapter 7 to bring the different discussions of CCS impacts across chapters (5, 6, 7, and 11) together. | Considered. However, CCS is only used as an exmaple here to illustrated tradeoff |
| 2317 | 15 | 59 | 33 | 59 | 35 | The use of terms like Green Production, Green Investments and others, should be modified. The AR5 should not use terms and categories that have not a worldwide recognition and a clear understanding for all. I suggest the use of Sustainable Production and Consumption, Investments for Sustainable Development as was recognized in Rio + 20, or, if the author prefers, maintain the Green term, then, must be given a wide explanation for the general understanding on what means all those terms, may be used a references or similar. | Considered. We change to sustainable production and consumption in revised SOD |

|---|---|---|---|---|---|---|---|
| 9311 | 15 | 59 | 14 | 59 | 38 | Toward a sustainable society, the industry shall deal with recycling policies to conserve natural resources but pre-treatment of wastes in the plant requires further additional energy to dry and cut them. Therefore, it is important to recognize that the industry has to challenge incompatible policy/ies as well as climate policy. In order for the industry to diffuse such co-processing technologies, governmental support in developing country is required for a primary driver of the level of local environmental awareness or waste legislation to collect fractionated wastes from industries and public. ( http://www.jcassoc.or.jp/cement/2eng/eh1.html and http://www.jcassoc.or.jp/cement/2eng/eh3.html ) | This institutional and governance discussion will be mainly addressed in section 15.2 |
| 11077 | 15 | 6 | 1 | 7 | 13 | The Executive Summary misses one of the main points of this chapter, i.e. "Subsidy Reduction" mentioned on line 36 of page 36. | Noted. Will be rewritten. |
| 7423 | 15 | 6 | 10 | 6 | 18 | Should mention that the type of policy does matter when assessing efficiency and cost implications including spillover impacts. | Accepted. Will be rewritten. |
| 7704 | 15 | 6 | 13 | 6 | 18 | This (and some of your other statements in the exec summ) are not supported by the fuller discussion, in this case in section 15.5.5. In reading that section, there is little evidence you report to support this conclusions. Furthermore, many of the references you cite in the text are missing from your reference list. | Accepted. The conclusions will be weakened. |
| 13224 | 15 | 6 | 21 | 6 | 39 | The discussion of carbon taxes and emissions trading is entirely disjoint, when it should be strongly connected. Both instruments put a price on emissions, and thereby a market incentive to reduce emissions. Whether this price signal is implemented by way of a tax (or tax-like instrument) or though tradable permits has important implications for the actual policy design, but it is secondary in principle. The question that needs to be answered is "what are the experiences with carbon pricing - does a carbon price (through tax or trading) provide effective incentives for mitigation?". The discussion here and in the body of the chapter should be recast in this light. | Partially accepted. We will use the term economic instruments to bring out the commonality, but it is useful for policy-makers to be made aware of differences as well as commonalities. As Lines 35-37 point out, there are important pertinent differences, especially in a world with very imperfect policy |
| 3598 | 15 | 6 | 21 | 6 | 22 | The claim that there is robust evidence that carbon taxes are effective in reducing emissions does not seem justified by the discussion in section 15.5.3.1, where it is stated for instance that "there is, however, less rigorous published work that is empirical … on the effect of these taxes". See also comments further down on this specific section. | Text rewritten, new published evidence reported |
| 13215 | 15 | 6 | 21 | 6 | 21 | Add the sentence taken from page 26, line 11/12 : "Overall, taxes on greenhouse gases are a preferred instrument for economists", or a sentence conveying the same message, possibly expliciting the reasons for this preference | Noted will do |
| 7424 | 15 | 6 | 22 | 6 | 23 | It is rather strong statement to say that fuel taxion is a cost-effective way for reducing emissions. To the extent that fuels have different carbon contents, the true Pigovian instrument would a tax on emissions and not the fuels consumed regardless of the progressivity or regressivity of the tax. | Text rewritten, I agree but only partially and fuel taxes should be in proportion to carbon (as the carbon taxes on fuel are |
| 7425 | 15 | 6 | 23 | 6 | 26 | Reconcile this statement with that of page 7, lines32-34. There seems to me some contradiction. | No contradiction, will try to make this |
| 7705 | 15 | 6 | 23 | 6 | 29 | These conclusions are just not supported by the text. Most of the evidence you cite in the text regarding incidence is that taxes are regressive, which is the common finding. You report the opposite here. I also did not find support that people are happy to have their fuel taxes raised. | No, taxes on transportfuels are progressive in most countries. (Note that "most countries" here refers mainly to the poor countries. The US is not a |
| 17652 | 15 | 6 | 23 | 6 | 25 | This sentence as well as the sentence starting on p. 7, line 32 state that there is robust evidence that carbon taxation is progressive in developing countries. Neither sentence gives a reference though. On page 36 this argument is mentioned again and one reference is provided (Sterner 2012). However, if there is robust evidence there should be more than one study cited. | More studies will be cited |
| 5901 | 15 | 6 | 23 | 6 | 25 | This is either not in line with economic theory (poor households will have to pay a higher share of their income just to maintain their level of welfare, e. g. transportation) or a sign that poor households forego these expenses and thus also might be restricted in their possibilities and trade e. g. transportation for other amenities / necessities. Please add a link to the relevant section here and / or add sustaining information here. | Rewritten, will be done. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 3599 | 15 | 6 | 29 | 6 | 31 | The claim that hypothecated instruments can make higher fee levels possible is not backed up by any references in secton 5.3 (as indicated it will be). I have, however, added some suggsted references for this further down. | Included |
| 13225 | 15 | 6 | 32 | 6 | 39 | The verdict on emissions trading is unduly negative. Several obstacles to its effectiveness are highlighted prominently and given more space than any positive aspects - which is in complete contrast to the preceding paragraph on emissions taxes which mentions no caveats (many could be mentioned). The discussion of taxes and emissions trading needs to be put on equal footing. I also note here that there is very little substantive discussion of emissions trading in the body of the chapter. This is clearly is an omission in the context of this chapter. Perhaps permit trading is covered in more detail elsewhere, but this chapter really needs to discuss it in-depth, given that many other instruments are discussed in detail. | Rewritten, will be done. |
| 13707 | 15 | 6 | 32 | 6 | 32 | Insert "project-based offsets" behind "emissions trading systems". | Rewritten |
| 11078 | 15 | 6 | 32 | 6 | 34 | Delete the whole sentence from "Economic theory suggests…" to "… medium evidence]! If theory is to be mentioned in the Executive Summary, it should be mentioned in all the paragraph of other policy instruments. "Theoretically" speaking, theories always suggest positive effects of a chosen policy instrument. Otherwise, no governent would have chosen it. Mentioning theories is redundant here. | Will do |
| 13226 | 15 | 6 | 34 | 6 | 35 | Emissions trading "rare and not stringent": the number of schemes in existing is a poor measure of their prevalance, and it is unclear on what the statement of "not stringent" is based on. The EU ETS probably has a much wider coverage of emissions than all the carbon taxes mentioned combined. It has resulted in an average carbon price that has clearly been sufficient to drive some extent of change in industrial practice and investment. Several other countries have implemented ETS or are in the process of doing so. | Rewritten |
| 13701 | 15 | 6 | 34 | 6 | 34 | Replace "medium evidence" by "robust evidence", as there is substantial evidence that emission trading systems have harnessed least-cost reductions, as long as they have not been overallocated. | Considered |
| 13702 | 15 | 6 | 34 | 6 | 35 | Replace "they are so far… high agreement" by "They have spread significantly since 2005, but allocation has initially been relatively loose.  have only been implemented in the last decade. Where combined with stringent caps, they have achieved significant emission reductions; participation has been substantially higher than anticipated [robust evidence, high agreement]. " Reason: With the EU, Australia, New Zealand, several US and Japanese subnational jurisdictions having mandatory emissions trading systems, mandatory ETS cover a majority of industrialized countries. Those systems with scarcity have generated surprisingly high prices and mobilized significant emission reductions. | Rewritten |
| 11079 | 15 | 6 | 34 | 6 | 39 | Shorten and rewrite after revising 15.5.4 completely following the style of 15.5.3. | Done |
| 13227 | 15 | 6 | 35 | 6 | 37 | ETS "cancel the effect of other policies or become redundant": the very same statement applied many other policy mechanisms, under specific conditions. This caveat would be better made with regard to mitigation policy measures more generally, rather than only with regard to ETS. | Do not agree. Will explain better |
| 13703 | 15 | 6 | 35 | 6 | 37 | Delete sentence "When … robust evidence" as it mixes many different issues and redundancy can be argued the other way round (if an ETS exists, other policies may become redundant). | Rewritten |
| 11796 | 15 | 6 | 37 | 6 | 44 | Descriptions should be met with 15.5.5.4 considering No.89. | Considered |
| 13228 | 15 | 6 | 37 | 6 | 38 | Grandfathering of permits may create perverse incentives to increase emissions: it theoretically can do that, but no major emissions trading scheme in existence has resulted in such perverse incentives. This is something of a red herring practice. I suggest re-thinking whether it deserves highlighting in a summary. | Considered |
| 14878 | 15 | 6 | 37 | 6 | 39 | The high costs of grandfathering to final customers needs to be mentioned here as well when stressing the avntage of increasing acceptance i.e. buying acceptance comes at a cost (see eg IEA2010g p8 cited in FOD Chapter 7 p70 ) | Agree, will consider including ref |
| 13704 | 15 | 6 | 39 | 6 | 39 | Add after "medium evidence": "Increasingly, grandfathering has been replaced by auctioning". | Will consider |
| 7706 | 15 | 6 | 40 | 6 | 46 | The discussion of voluntary actions/agreements in the text is that there is little evidence that they are effective, except in Japan.  That is inconsistent with what is said here. | Noted. |
| 13705 | 15 | 6 | 40 | 6 | 40 | Replace "medium" by "limited", and "given" by ", and this requires" | Accepted, mixed outcome is mentioned. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 13706 | 15 | 6 | 45 | 6 | 45 | Replace "some" by "in the majority of". Reason: Outside Japan, voluntary agreements have been rather ineffective. See e.g. evaluation by Baranzini, A.; Thalmann, P. (2004): Voluntary approaches in climate policy, Edward Elgar, Cheltenham; Rezessy, S.; Bertoldi, P. (2011): Voluntary agreements in the field of energy efficiency and emission reduction: Review and analysis of experiences in the European Union, in: Energy Policy, 39, p. 7121-7129 | Accepted. Literature added. Mixed outcome is mentioned. |
| 18714 | 15 | 6 | | 7 | | Executive Summary generally would benefit from editing/rewriting to have a more streamlined narrative; currently it is a somewhatrepetitive list of central takeaway messages from individual subsections, and thus difficult to read and understand in isolation of the main text | Noted. Will be rewritten. |
| 18464 | 15 | 6 | | | | It is very difficult for the reader to pull clear messages from the Executive Summary. There are two overarching reasons for this:<br>1) the presentation of messages is scattered. The building blocks are there (from the assessment in Section 15.5), but there is no structured synthesis that allows a reader easy access. This could be in the form of e.g. a table that highlights policy instruments (vertically) and assessment criteria (horozontally), marking which policies have been considered cost effective, environmentally effective, etc. in the meat of the table.<br>2) The uncertainty language integrated into the sentences interrupts the flow. It would be much more useful to keep sentences crisp, and to use uncertainty language in brackets at the end of the section, as is the typical IPCC standard. | Noted. Will be rewritten. |
| 18465 | 15 | 6 | | | | There are a number of messages missing that a reader would expect. These include:<br>- A synthesis of sector chapter policies relevant at the national level (missing from the entire chapter)<br>- The interplay across different policy levels (national, sub-national, city, etc)<br>- A mention of where synergies may arise with policies targeting other subject areas (missing from the entire chapter)<br>- Regional differentiation to the extent possible in a summary | Noted. Will be rewritten. |
| 18466 | 15 | 6 | 6 | 6 | 7 | The introduction promises lessons from a variety of institutional and governance structures from 15.2 (see p. 7 lines 18 and 19)- what are those lessons and why haven't they been included here? | Noted. Will be rewritten. |
| 15600 | 15 | 60 | 1 | 60 | 20 | It seems that this could be tightened to discuss how these different levels of government need to (1) include climate considerations into existing planning (2) create climate-focused planning efforts that explains the non-climate synergies or (3) promote the synergistic benefits of climate mitigation to increae support for action. It seems a bit confusing as written. | This institution and governance discussion will be addressed in 15.2 |
| 5270 | 15 | 60 | 15 | | | ADD: Institutional culture and structure also raise obstacles: a city's mobility department may not work with the road and infrastructure service or with the urban/land planning one. In France, the urban planning services in cities did not work with building construction actors until 2004. The division of urban services by sectors and areas of judicial and administrative competence is a primary and complex institutional obstacle to mainstreaming. | This institutional obstacles have been mentioned in line 6-7 |
| 18754 | 15 | 60 | 34 | 60 | 35 | "As discussed in the previous section, there are important market failures ...": there are so many subsections in the previous section, further specification is needed. | Noted. |
| 5272 | 15 | 61 | 16 | 61 | 28 | paragraph repetitive with previous sections | Section has been thoroughly redrafted |
| 5015 | 15 | 61 | 19 | | | Carbon tax may help spur innocation, but cap & trade may not necessarily. Once carbon market is established and massive credits are traded, existance and growth of the market itself will become a big concern among traders/market players. Development of cheep clean energy technology will destroy carbon market because it will remove the necessity for carbon pricing as a disincentive for fossil fuels. | Noted. |
| 7431 | 15 | 61 | 29 | 61 | 47 | The second best theory in economics explains that adding one distortion in the presence of multiple distortions does not necessarily improve global welfare. In this case taxing oil increases welfare by reducing emissions but also decreases the welfare by decreasing revenues and consumption of nations depending on the production and exports of oil. | Section has been redrafted to clarify |
| 5273 | 15 | 61 | 29 | 61 | 40 | take out? description of economic tools paragraph probably dealt with in other chapters | Noted. |

|---|---|---|---|---|---|---|---|
| 18755 | 15 | 61 | 3 | | | "in terms of cost-effectiveness": this is symptomatic of the disciplinary bias/excessive focus on economics: when multiple instruments interact, the consequences are manifold and not only relevant in (economic) terms of cost-effectiveness. More often than not, complete failure of a policy instrument (rather than just diminished cost-effectiveness) will follow from outright conflicts between instruments at the legal level, e.g. when one policy has to be cassated because it is found to be legally inconsistent with prior(higher ranking, or long-established and hence vested) instruments. The complete absence of jurisprudential discussion is a significant weakness here and elsewhere. For an overview of instrument interaction from a legal perspective, see Mehling, Michael (2007), "Implementation of the Kyoto Protocol in Germany: Designing an Integrated Management Scheme for Greenhouse Gases." In Tackling Climate Change: An Appraisal of the Kyoto Protocol and Options for the Future, edited by Wybe Douma, Leonardo Massai, and Massimiliano Montini. 111-134. The Hague: T.M.C. Asser Press, 2007. | Noted. Some discussion of this in revised 15.8. |
| 6157 | 15 | 61 | 6 | 61 | 9 | The implication of this paragraph is very important. In this sense it would be better if we can have another literature other than Tinbergen (1952) as, even if Tinbergen is so well-established, this is rather old one. | Noted. Tinbergen (1952) is often considered the key reference. |
| 5271 | 15 | 61 | 9 | | | ADD: Political science and the sociology of organisation tell us that public policy is only as effective as internal competence, responsibility - and public acceptance - go, unless legal obligations and constraints are used. | Noted. |
| 15736 | 15 | 61 | | 61 | | You seem to consider only the interactions between energy policies. Beneficial or problematic interactions however also occur eg between energy policies and biodiversity or water policies. These interactions may significantly influence the performance of energy policies… What about interactions between climate mitigation and adaptation policies? | Noted. |
| 15548 | 15 | 61 | 1 | | | Schmidt and Marschinski (2009) note that new technologies (e.g. mobile telephones) have often reached a stage where economies of scale in production, and the incentive of rising returns to R&D as output rises, have started to reduce costs fast enough to permit very rapid diffusion throughout the economy. Using a model of energy generation in which R&D responds positively to rising returns and there are several market failures, they find that multiple equilibria are possible, and policy instruments have to be used to push the world economy towards an equilibrium with high renewable energy use. The optimal policy mix entails a tax on fossil energy, a R&D subsidy, an investment subsidy and a fee for employing initial public knowledge equal to the patent fee charged for private knowledge. Acemoglu et al. (2012) examine technical change that responds to the relative incentives across industry sectors, in a growth model with environmental constraints and limited resources. Technical change has to be encouraged in 'green' sectors rather than sectors producing greenhouse gas emissions. They show that profit taxes or other instruments are required in addition to a carbon tax, such as taxes on fossil-fuel energy production and innovation. But if renewables and fossil fuels are sufficiently substitutable as inputs to production, fossil-fuel energy production and innovation only has to be taxed temporarily, until the increased incentive for R&D in renewables has reduced their production costs enough to switch the economy on to a low-emissions growth path. Acemoglu, Daron, Philippe Aghion, Leonardo Bursztyn, and David Hemous. 2012. "The Environment and Directed Technical Change." American Economic Review, 102(1), pages 131–66. Schmidt, R.C. and R. Marschinski (2009). "A Model of Technological Breakthrough in the Renewable Energy Sector." Ecological Economics 69 (2), pages 435-444. | Noted. This applies to 15.6. |
| 12025 | 15 | 62 | 11 | 62 | 19 | In reality, there exists variations for a set of products. While marginal abatement costs are not necessarily attributed to each product line. Product standards work as clear signals for the market and facilitate competition. The argument here is too theoretical which works only in a situation that only one non variable good is produced by (a) company(ies). | Noted. |
| 6158 | 15 | 62 | 32 | 62 | 32 | Add after "Overall emissions fall", "However, in this case cost effectiveness is dilluted as MAC is not be equalized amongst players". | Noted. |

|---|---|---|---|---|---|---|---|
| 5274 | 15 | 62 | 33 | 62 | 43 | too economic oriented ! take out and replace with on line 43: One issue in an institution is the 'cost' of learning or having to learn to deal with new issues. Hence, for example, in France local administration have to learn to transform their daily operations into climate friendly objectives and methods while they are also imposed by the central government to develop adaptation strategies without even knowing what type of effects or depth of effects nor when CC will have on their territory. Having to deal with both at the same time appears very difficult. | Noted. |
| 15549 | 15 | 62 | | | | In principle, both carbon pricing and support for renewable energy reduce the cost gap between renewable and conventional electricity generation. But if both are applied simultaneously, their impacts may not be the same as the sum of each implemented separately (De Miera et al., 2008; De Jonghe et al., 2009). The interactions of technology-specific policies – including renewable portfolio standards and feed-in tariffs – with market mechanisms such as a carbon tax, if not properly anticipated by policy-makers, can undermine the efficacy of each individual policy tool, and the suite of climate policies overall (Sorrel and Sijm, 2003; Rathmann, 2007).<br><br>If quantity-based tools (such as quota-based instruments) are used to pursue both climate-change mitigation and renewables objectives, it is possible that the permit price for one scheme will fall to zero (Unger and Ahlgren, 2005; De Jonghe et al., 2009). Conversely, if one price-based and one quantity-based measure are used (e.g. a carbon tax and a renewable portfolio standard), the fixed price imposed by one measure could influence the market price of the quantity-based measure in undesirable ways. Hence coordination of policy instruments and an appreciation of how they will interact are crucial, both at the initial stages of policy formation and later, when circumstances change and uncertainties diminish (or increase) (De Jonghe et al., 2009; Rathmann, 2007; Blyth et al., 2009; Verbruggen and Lauber, 2009).<br><br>One way in which renewables policies may affect the carbon objective is through their indirect impact on the carbon price. By substituting electricity generation away from fossil fuels, renewable mandates reduce the electric sector's overall CO2 emissions. If there is an existing cap on emissions, this reduces the sectoral demand for allowances, and along with it the carbon price. A lower carbon price means that electricity producers' costs decrease, the marginal cost curve shifts, and wholesale electricity prices decrease (Rathmann, 2007; De Jonghe et al., 2009; Stankeviciute and Criqui, 2008). That contributes to a 'rebound' effect, tending to increase energy demand. If the potential impact of renewables policies on emissions is not considered at the time that the emissions cap is set, their impact is likely to be entirely offset by this and other induced increases in demand. Introducing financial support for renewables in addition to a carbon price signal, without adjusting the overall cap on emissions, will tend to lower the carbon price, because it reduces the level of abatement required from emissions sources within the trading scheme. The supply of allowances is fixed by the cap and the price of allowances will fall to bring the demand for allowances back into balance with the supply; the renewables support will just have redistributed the sources of emissions. Policy can therefore fall into a trap in which carbon markets appear more and more insufficient on their own, apparently justifying more and more direct, technology-specific, support (Blyth et al., 2009). The weakened carbon price signal can then point path-dependent technological development and investment away from low-carbon technologies.<br><br>In principle, both carbon pricing and support for renewable energy reduce the cost gap between renewable and conventional electricity generation. But if both are applied simultaneously, their impacts may not be the same as the sum of each implemented separately (De Miera et al., 2008; De Jonghe et al., 2009). The interactions of technology-specific policies – including renewable portfolio standards and feed-in tariffs – with market mechanisms such as a carbon tax, if not properly anticipated by policy-makers, can undermine the efficacy of each individual policy tool, and the suite of climate policies overall (Sorrel and Sijm, 2003; Rathmann, 2007) | Noted. |
| 15735 | 15 | 62 | | 62 | | Policies at the same jurisdictional level also can yield problematic interactions: also at different jurisdictional levels. Eg an EU policy can interact with a national policy… | Accepted - this is now covered in SOD |

|---|---|---|---|---|---|---|---|
| 17662 | 15 | 62 | 1 | | | This subsection should be based on a larger set of references. An example could be:<br>Fankhauser, Samuel and Hepburn, Cameron and Park, Jisung (2011) Combining multiple climate policy instruments: how not to do it. Centre for Climate Change Economics and Policy and Grantham Research Institute on Climate Change and the Environment working papers, 38. Centre for Climate Change Economics and Policy and Grantham Research Institute on Climate Change and the Environment, London, UK | Accepted. Section modified and some references added. |
| 5016 | 15 | 63 | 1 | 63 | 49 | CO2 mitigation action may not be taken without global scale regulation, but energy savings will be a different issue, because energy savings will bring economical and national security benefit even if the action is independent from other countries. Therefore, mitigation should focus on energy savings (efficiency improvement). This is no regret strategy. This argument is further explained in the following paper: "The Hartwell Paper, A new direction for climate policy after the crash of 2009", Gwyn Prins et al., Institute for Science, Innovation and Society, University of Oxford and Mackinder Program for the Study of Long Wave Events, London School of Economics, (May 2010) | No longer applies to revised 15.8 |
| 18757 | 15 | 63 | 24 | | | the benefits of "less hierarchical and collaborative forms of governance" are cited; but earlier on the page, Ostrom is quoted invoking the importance of trust in agreed-upon action. Omitted is any discussion of the value and importance of formal arrangements and law precisely in fostering such trust and channeling expectations with a higher degree of reliablity (due to formal procedures and threat of penalties for non-compliance). It is almost counterintuitive to suggest that informal governance is better able to instil trust when the very justification of law (e.g. a formal contract rather than an informal "gentlemens' agreement") is that it is more predictable and creates greater stability; and when often enough, legally vested rights and procedures are needed to ensure that the less economically or politically powerful stakeholders are engaged and involved through public participation, access to information and other LEGAL rules. Different positions have admittedly been taken on this question, but in this case an entire dicipline's relevance is simply blended out and thereby essentially marginalized. | No longer applies to revised 15.8 |
| 6776 | 15 | 63 | 30 | | 37 | Although it is described that multiple benefits are created by diverse actions such as cost savings and the creation of green jobs, in fact it is very difficult to create multiple benefits. Accorng to Tol (2012) [1], it is wishful thinking that green energy will solve the probrems probrems of sluggish growth, high unemployment, peak oil, energy security and climate change.<br><br>[1] Tol, Richard (2012) Green Growth: Killing Five Birds with One Stone? In Intereconomics. Volume 47, Number 3, 151-154. Springer Berlin / Heidelberg | Noted. |
| 18492 | 15 | 63 | | | | The quality and structure of the subsections in 15.8 varies widely, beginning with a very strong discussion of local and municpal level policies. The discussion of state and perfectural level policies (15.8.2.2 and 15.8.3) could use substantial effort to bring it up to a comparable quality. | Noted. 15.8 has been entirely rewritten. Much of it has been moved to 15.2. what remains is more tightly focused. |
| 8357 | 15 | 64 | 1 | 66 | 8 | How about adding table which shows regional, national and local/state mitigation target. For example, EU/UK/London, USA/California/LA etc. | Noted. |
| 18493 | 15 | 64 | 6 | | | Please compare text with that in Chapter 12 (Section 12.6 pages 36-43). The topic is the same - consistency would need to be assured, and duplications minimized. | Noted. |
| 3133 | 15 | 65 | | | | there is no reference to the figure and the C40 in the text - need to explain what the C40 are | Noted. |
| 5911 | 15 | 65 | | | | Figure is not referenced in the text, can be deleted. | Noted. |
| 15601 | 15 | 65 | 21 | 65 | 26 | Data about state actions can be updated by checking out: http://www.c2es.org/us-states-regions/policy-maps | Noted. |
| 18758 | 15 | 65 | 27 | 65 | 30 | RGGI is no longer an effort to develop a carbon market, it is an existing market that has seen active trading since January 2009; moreover, since 2011, it no longer consists of 10 states given the departure of New Jersey. Here, reliance on older sources resulted in a factual inaccuracy, but the cited website (www.rggi.org) contains sufficient material to update the above statements. | No longer applies to revised 15.8 |

|---|---|---|---|---|---|---|---|
| 3134 | 15 | 65 | 31 | | | surely Tokyo example is municipal, so should be in previous section. Could use other examples here, e.g. German Laender (states) - most of which have climate change targets and policies (see [in German] http://www.umweltdaten.de/publikationen/fpdf-l/4146.pdf) | Noted. |
| 13723 | 15 | 65 | 31 | 66 | 5 | Move text on Tokyo emissions trading system into section 15.5.4 | Noted. |
| 5275 | 15 | 65 | 4 | | | add: It is also a matter of recognising and addressing the ways in which CC impacts the understanding and the cultures of the processes of urban development and infrastructural provision in the urban context. | Noted. |
| 2313 | 15 | 65 | 28 | 65 | 30 | Actually the actual reduction in RGGI emissions has been pretty dramatic. According to official data "CO2 emissions in the RGGI region have declined from approximately 184.4 million tons in 2005 to 123.7 million tons in 2009, or 33 percent." see "Relative Effects of Various Factors on RGGI Electricity Sector CO2 Emissions:2009 Compared to 2005<br>Draft White Paper – 11/2/10" available at: www.rggi.org/docs/Retrospective_Analysis_Draft_White_Paper.pdf | No longer applies to revised 15.8 |
| 2960 | 15 | 66 | 48 | | | I don't understand what ther reference to "24 businesses" means. Is the idea to be able to make more use of baseline power through night operations? Or what? | No longer applies to revised 15.8 |
| 18759 | 15 | 66 | 7 | 66 | 8 | Since the political shift after the midterm elections of 2010 at state and local level, the states mentioned (Arizona, New Mexico, Oregon and Washington) have all abandoned plans to develop emissions trading/cap-and-trade systems. | Noted. |
| 5276 | 15 | 67 | 44 | | | ADD: Several non financial factors play a role in this: perceived political gain and losses, image, and objectives; local definitions and perceptions of quality of life; taking into account poorer people, competition between innovative cities…. | Noted. |
| 3135 | 15 | 67 | | | | too many US examples (except the brief mention of Sao Paulo at the end) | Noted. |
| 13235 | 15 | 68 | 13 | 69 | 25 | The discussion of overlapping policies at national and sub-national level (in particular with a national cap-and-trade scheme) should acknowledge that subnational policies have the effect of shifting the composition of overall abatement under the national cap between regions and sectors, and in many cases this is the desired effecxt. The same goes for sectoral policies (eg renewable energy targets). The overall cap and permit trading price is simply the residual policy action after subordinated policies take their effect. Indeed, this is less efficient than the theoretical ideal of having only a cap and trade scheme; but in reality there will always be specific policies that have an impact on emissions levels. | Accepted; text modified |
| 2961 | 15 | 68 | 20 | | 42 | It seems to me that leakage deserves more discussion than this. It's a significant issue for policymakers. A good starting point would be Joshua Elliott et al., Unilateral Carbon Taxes, Border Tax Adjustments and Carbon Leakage (2012), available at http://ssrn.com/abstract=2072696. | Accepted. Leakage is now covered in other chapters, including chapters 3 and 5 |
| 5018 | 15 | 68 | 13 | 69 | 25 | The leakage issue is a fundamenal flaw in the current mitigation policies, which only focus on process emission (carbon production) and pay no or little attention to carbon consumption. Policy coordination and creative accounting methodology are needed not only amon nations but also between local and central governments. The issue is elaborated in the following paper: "Climate-change policy: why has so little been achieved?", Dieter Helm, Oxford Review of Economic Policy, Volume 24, Number 2, 2008, pp.211-238. | Noted. |
| 3136 | 15 | 69 | 27 | | | the Convention' - first mention needs to spell out that this is the UNFCCC, then can refer to 'the Convention' subsequently. | Noted. The reference to the UNFCCC and the Convention is no longer included |
| 5277 | 15 | 69 | 6 | | | ADD: In France, some adaptation packages in the territorial climate and energy plans serve this purpose of experimentations to see if they are replicable on other territories with different natural and socio economic and political conditions | Noted. |
| 4998 | 15 | 7 | 15 | 8 | 25 | This introduction should be much more concise and simple to be less than two paragraphs. | Noted. |
| 12930 | 15 | 7 | 27 | 8 | 19 | This material can be dramatically shortened: I suggest that it is not necessary to summarise results here: a very short presentation of the chapter content is enough. | Noted. Will be rewritten. |

|---|---|---|---|---|---|---|---|
| 12044 | 15 | 7 | 27 | 7 | 44 | The paragraphs seem to already include main findings (repetitive to the executive summary) instead of providing the background of the analysis and guidance on the logic of the document. Also for the sake of shortening the document it would be advisable to concentrate on providing the framing for the analysis and rationale for the structure of the chapter. Text between lines 27 and 44 could be deleted. | Noted. Will be rewritten. |
| 6133 | 15 | 7 | 28 | 7 | 29 | The text describes as "standards for appliances and buildings to promote energy efficiency". How about adding "automobile" between appliances and buildings. It is proved that introduction of fuel standard for automobile is effective (refer to lines 2-3 of page 30 of this chapter). | Noted. Will be rewritten. |
| 13755 | 15 | 7 | 32 | 8 | 22 | This material presents a summary, not introduction. Please merge with summary. | Noted. Will be rewritten. |
| 13229 | 15 | 7 | 32 | 7 | 36 | Tradeable permits "main advantage cost-effectiveness": the same goes for emissions taxes. In addition, a key advantage of tradable permits in practice is that they allow an emissions price to be formed in markets, which is the strong preference of many governments and many industry stakeholders. | Noted. |
| 13708 | 15 | 7 | 35 | 7 | 36 | Replace by "Emissions trading and project-based offset systems have spread rapidly since the mid-2000s and triggered cost effective reductions. However, allocation of allowances is prone to political influences that can lead to negative redistributionary impacts". | Noted. |
| 6134 | 15 | 7 | 35 | 7 | 35 | what does "increasing in frequency" mean? | Noted. |
| 13709 | 15 | 7 | 37 | 7 | 44 | Replace by "Voluntary agreements require a credible threat of regulation in order to be environmentally effective. A governmental review or consultation process during implementation, as well as accompanying measures such as subsidies for energy audits and equipment can improve their performance. Under these conditions they provide high flexibility and are politically feasible." | Accepted. Regulatory threats are mentioned. |
| 7792 | 15 | 7 | 37 | | 44 | Support the descriptions on the achievements through Voluntary Action Plan in Japan cited as (Tanigawa, 2004) and (Sugino and Arimura 2011). In addition to these documents, Yamaguchi M. (2012) also proved that voluntary approaches “may work well” in various business cultures and traditions.<br>Besides, Chen and Hu (2012) proved that voluntary GHG programs in Taiwan achieved “actual CO2 reductions highly exceed target goals, e.g., 33% more than the target value of 4.02 Mt during the 5 year span for the six industrial sectors”.<br><br>(Chapter 7 of “Climate Change Mitigation – A Balanced Approach to Climate Change-” Mitsutsune Yamaguchi, et al,, Springer (2012))<br>(“Voluntary GHG reduction of industrial sectors in Taiwan” Liang-Tung Chen and Allen H. Hu Chemosphere 88 (2012) | Accepted. Literature added. in section 15.5.5 |
| 15561 | 15 | 7 | 38 | | | Voluntary agreements have (the potential to?) be… | Accepted. Text modified in section |
| 6135 | 15 | 7 | 38 | 7 | 38 | It is empirically true that a voluntary agreement can be environmentally effective in several regions. However, evidence is needed to prove it have been cost effective. MAC will never be equalized. | Noted. Literature suggest mostly low to negative costs opporutnities were addressed by VA, as such costs are not |
| 12022 | 15 | 7 | 39 | 44 | | With regard to VA, fear of lost reputation works very significantly as well. | Accepted. Text modified accordingly in |
| 10038 | 15 | 7 | 41 | 7 | 44 | This part should be deleted completely because there are successful examples of "voluntary target scheme" in the world. Each industry in Japan has voluntary target and the voluntary target scheme has played a big role, as described in (Yamaguchi, 2012, page35 and 154), (Manuel, 2010, page 6 and 13), and (Yamaguchi, 2010, abstract). In addition, there is also a successful example of "voluntary target scheme" in Netherlands, as shown in (Martijin, 2002, page162). These literatures are listed in the No63 line of this table. | Accepted. Text modified accrodingly |
| 18467 | 15 | 7 | | | | The introduction comprises a lot of the same text as the Executive Summary. It would be more useful (and would save space) to shift the results of Ch 15 that currently appear in the intro to the Executive Summary (or simply to remove the duplicated text), and focus the introduction only on drawing a map of the chapter for the reader including e.g. an explanation of how sections 15.5 and 15.6 fit together. (There's already great text on this on p. 49 at the beginning of 15.6.1 - you could use that!) | Accepted. |

|---|---|---|---|---|---|---|---|
| 6160 | 15 | 71 | 30 | 71 | 30 | It seems like the term policies mean policies for adaptation. If so please make it clear. If not also meke it clear. | Done |
| 6713 | 15 | 71 | 9 | | | "Food policies" is important, but it is one of many other important climate policies. It is not adequate to pick up only "food policies" here. | Comment is noted. This is a typo error, should have been "good" policies rather |
| 5280 | 15 | 72 | 12 | | | ADD: it also means, for policy makers a new policy culture that take into account probable and uncertain local and long term/future impacts of CC and integrate this into an ecosocial system vulnerability analysis … | Good comment, but it would be difficult to support an appropriate claim with the |
| 5279 | 15 | 72 | 36 | | | ADD: France has decided to legally oblige communities of 50 000 and over to integrate adaptation as well as clean energy objectives in all planning documents while leaving 'free' the methods by which these will be attained, following a territorially based analysis of both GHG emission quantity and sources and adaptation strategy (following a natural vulnerability analysis). This vulnerability includes in some of the most experimental territories an analysis of the social, institutional and economic activities and vulnerabilities. But adaptation raises a key issue for policy making: profoundly anchored in specific territories, it remains difficult to develop nation wide adaptation strategies that go beyond simple statement of general objectives… | Good comment, but it would be difficult to support an appropriate claim with the relevant literature. Moreover, LAs were instructed not to rely on government documents; everything should come from peer-reviewed academic literature. |
| 12208 | 15 | 73 | 21ff | | | You write that 'particularly the BASIC countries and emerging economies have set up financing schemes'.<br>1.) What are financing schemes? Do you e.g. refer to sources of finance, instututions, facilities or funds? (compare also Table 15.4 - here you say "sources of climate finance";<br>2.) Is your statement ('particular') justified and based on counting countries? What about countries like Bangladesh, Philippines, Ethiopia, Rwanda, countries that establish an NIE under the AF etc.? | Noted. Revised to reflect comment. |
| 5281 | 15 | 73 | 7 | | | COMMENT I entirely disagree: since 2004-2005 almost all UNEP, UNDP, EU and World Bank texts on development and aid integrate CC mitigation and energy (such as in the Millennium development goals). Some national development agencies are following the lead.PNUD. Human Development Report 2007/2008. Oxford University Press, 2008. 399 p.<br>PNUE. Assessment of Impacts and Adaptation to Climate Change Final Report of the AIACC Project. 2007, 250 p.<br>UNEP. CCCC. Kick the habit. A guide to climate neutrality. PNUE. 2008. 202 p.<br>UNEP. Human Development Report, 2007/2008.<br>World Bank. Towards a strategic framework on climate change and development for the World Bank Group. Concept and issues paper consultation draft. 2008. 46 p. | Indeed, development agencies adopted documents to acknowledge the need to support mitigation and adaptation problems. Nevertheless, there is little evidence that these documents resulted in concrete steps analyzed in peer-reviewed literature |
| 6714 | 15 | 74 | 2 | | | It is better to clarify the criteria of picking up these eight funding mechanisms among others. I am afraid that the list is old. Also it is better to write the ending year if it is fixed in "Operational date". Now the start year is only mentioned. For example, Hatoyama initiative is declared at COP15 which says that "As for assistance up to 2012, under this initiative Japan will provide financial assistance to developing countries". | Noted. Already covered in Chapters 13 and 16. Section therefore revised to delete. Subject no more appropriate here. Nevertheless, note that not all the |
| 12209 | 15 | 74 | 8 | | | On your statement "Most low-income...."<br>1. Compare comment 73/line 21ff; your statement is unclear as it is not clear what you mean by 'financing scheme' and the conclusion that these countries rely on multilateral funds e.g. Do you refer to the institutions e.g. or do you refer to the sources of finance? There is a difference between the source of funding and the institutional set-up for distributing it.<br>2. If you refer to financing schemes in the sense of institutions then your sentence is not correct. Every country has institutions and public financial management systems in place, which are i.a. being used to channel funds from development cooperation. | Noted but not necessarily agreeing to your point of view. |

|---|---|---|---|---|---|---|---|
| 12210 | 15 | 74 | 9 | | | a) You make very general statements and suggest conclusions on the state of climate change policies and implementation in developing countries which are not based on arguments and which are not based on scientific findings. ("Besides, the policies.....Such somehow renders their national climate change policies ineffective and susceptible to external risks". (what kind of external risks)<br>b) You implicitly suggest that a dedicated climate change fund is a prerequisite for effectiveness. This is not a scientific finding and evaluations. Many countries are still in the process of setting up dedicated institutional arrangements and it is too premature to draw any conclusion on the quality of operations and impacts e.g. | Noted and corrected. |
| 5282 | 15 | 75 | | | | TAKE OUT figure 15.5 or formalise style | Accepted. Figure deleted |
| 6718 | 15 | 75 | 11 | 75 | 14 | It is often said that "More immediate priorities such as access to water, food security and energy have been the main drivers for climate change agenda." However, it is not clear how "access to water" drives climate change agenda. In Chapter 15, several water issues are discussed. They are irrigation, water-use regulation for ethanol production, ability to raise prices for water, water conservation, water quality and projects to improve water supply to cope with lower and irregular rainfall. No explanation of link "access to water" with climate policy. Please explain how "access to water" drives climate policy. Also please explain what "skill leadership" means to drive climate policy from the points of water, food security and energy. | Noted. However space allowed is too short to provide detailed explanations. |
| 12211 | 15 | 75 | 15 | | | You state that national institutions dedicated to climate change are more successful if such institutions or agencies are coherent with cabinet entities...."<br>Compare my comment on page 74/line 9: I think there is little scientific evidence for such a general statement which suggests that this is the best option for every country. | Note however that there a lot of experiences taking place in developing countries which are not necessarily covered by scientific literature. Such good policies cannot be swept under the carpet under the guise of "not covered |
| 12213 | 15 | 75 | 22 | | | I thought the primary role and function of the IPCC is to synthesize existing scientific literature and debates. Unless the suggestions presented here reflect a scientific debate - if so pls. insert the respective literature - the task of drawing conclusions should be left to political debates. | Accepted. Suggestions deleted. |
| 18495 | 15 | 75 | 22 | 75 | 41 | Please be careful with policy prescriptive language (e.g. wording such as 'should', 'suggestions', 'recommendations'). Note the IPCC assesses literature and is therefore policy relevant, but not policy prescriptive. | Accepted. Suggestions deleted. |
| 12212 | 15 | 75 | 75 | | | On this point: There is a huge body of literature - besides the two you are refering to and which are missing in the list of references- on the topic of aid or development effectiveness or public financial management just to cite two relevant fields. It is not clear why you draw this and not another equally relevant/possible conclusion. | Noted. Some of the literature you are referring had already been covered in Chapter 13 and also quoted by the two references cited in their papers. One |
| 2319 | 15 | 75 | 43 | 75 | 43 | The data gap is a very important issue that must not be forgotten. The current statistic information did not help the analysis of the mitigation and adaptation needs and activities. For this reason the absence of this kind of data sources, and the necessity to face and solve this lack of information, should be an important outcome in all the chapters that must lead with the financial issues in the AR5.This is a very important issue that must not forgotten. | Noted. |

|---|---|---|---|---|---|---|---|
| 13230 | 15 | 8 | 11 | 8 | 12 | Sub-national initiatives "backed by theoretical literature": I doubt that the theoretical literature had much influence in spawning sub-national initiatives. Rather, sub-national initiatives are usually borne out of a political will or impetus for sub-national governments to make some tangible contribution on climate change mitigation. They are often in conflict with national policies, or contribute nothing extra in aggregate, but cater to local preferences. | Noted. |
| 10225 | 15 | 8 | 17 | 8 | 18 | Isn't this leakage? | Noted. |
| 2944 | 15 | 8 | 20 | 8 | 22 | "the link is not obvious" isn't very informative. Even "complex" would be better. | Noted. |
| 10226 | 15 | 8 | 21 | 22 | | There is also a huge potential for conlict/trade-offs in this sector/domain, i.e. bioenergy or food production, reforestation/afforestation or bioenergy/food, urbanization or agroforestry etc. (also relevent for p. 7, l. 11-13) | Noted. |
| 14879 | 15 | 8 | 27 | 9 | 15 | a graph depicting the relation between institution, governance, policy and paradigms would be helpful | Noted. |
| 12045 | 15 | 8 | 4 | 8 | 19 | See comment 2: these paragraphs also already include conclusions and should be moved to the conclusions section or deleted. At this point in the chapter they are not yet sufficiently supported by analysis. | Noted. This is a definition of institutions and governance and an explanation of how governance shapes policy. Will |
| 11081 | 15 | 8 | 9 | 8 | 10 | This is very true. Tradable permit programmes are not only problematic but also very vulnerable when policy cordination is imperfect, which is always the case in the real world. | Noted. Will be rewritten. |
| 6136 | 15 | 8 | 9 | 8 | 10 | Some reasons or evidence may be necessary to probe why tradeable programs are particularly problematic when policy coordination is imperfect. One example I can think of is the case where, in one hand, cap and trade policy is adopted, and on the other hand, renewable obligation or energy efficiency standard are introduced applying to the same players or sectors. | Noted. |
| 18468 | 15 | 8 | | | | A lot of terminology is used in this section that is not clarified, e.g. legislation, plans, policies, strategies. Please clarify their differences up front. Consistent application of these terms throughout the chapter would be ideal. | Accepted |
| 18470 | 15 | 8 | | | | This section is currently 14 pages. A lot of the messages of the sectin get lost in examples which are sometimes unclear how they relate to the rest of the chapter. It may be useful to significantly shorten the section (to e.g. max 6-7 pages) and focus on pulling out the key messages. | Accepted |
| 18716 | 15 | 8 | 42 | 8 | 42 | "how these decisions are made, and whether and" - I would add: "how these decisions are made, HOW WELL THEY WORK, and whether and" | Accepted |
| 18717 | 15 | 9 | 23 | 9 | 25 | "In many (though not all) high-per-capita-emission developed countries, provincial and local governments have been active in autonomously developing the policy framework for climate mitigation." My observation has been that in developed countries, the impetus also often flows from the national/centralized level: I am e.g. thinking of all major renewable energy and energy efficiency legislation as well as energy taxation and emissions trading in Germany, where the federate Länder merely implement the nationally defined objectives; or the comprehensive national climate laws in many countries; or the (albeit failed) Waxman-Markey/Lieberman-Kerry legislative initiatives in the United States, and the current fallback to EPA regulations for emissions from mobile and stationary sources; or indeed throughout Europe the inordinately influential role of the EU in adopting governance frameworks for climate policy that are then manadatory to the (national governments of the) Member States. So while the local and provincial levels are undoubtedly important, I would not contrast their role to that in developing countries so emphatically | Accepted: emphasis changed |
| 12047 | 15 | 9 | 26 | 9 | 28 | The last two sentences of the paragraph don't fit in the logic of the text before and 'drop out of the sky' without clear line of argumentation. In general the paragraph lacks references. | Accepted |
| 12048 | 15 | 9 | 30 | 9 | 30 | The term "proliferation" of policies seems inappropriate at this point, as it indicates a negative, unnecessary or unintended development. If the intention of the authors is to criticise the development of more and more climate policies they need to be more specific and provide argumentation for that. Same applies to the title for section 15.8.2 | Accepted |
| 15730 | 15 | 9 | 37 | 9 | 37 | "EU Directives provide the basis for national actions in several European countries". In all! EU countries. There are almost no national actions in EU 27 that are not based on an EU policy framework… | Not applicable now - table removed |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 5251 | 15 | 9 | 48 | 10 | 2 | The UK's Climate Change Act is based upon a false and dishonest prospectus. The fancy emissions reductions targets completely overlook those emissions 'embedded' in imports. They are therefore ludicrous, as will be seen from further comments below. For this reason the whole section as it relates to industrialised countries is grossly misleading and needs to be rewritten. | The chapter welcomes all comments and will ensure that all data used is references |
| 5260 | 15 | 9 | 8 | 9 | 9 | ADD: Young (2006) shows that an institution's identity and structure can prevent it from reaching environmental objectives (institutional misfit). Important factors playing a role are: spatial and temporal which require institutional culture to adapt to ecological time (long term) and spatial (both local and global but differentiated at the local levels) Young et Ekstrom (2009). | Added selective citations |
| 2816 | 15 | 9 | | 22 | | Catalogue of national legislation excludes notably Israel and Guyana. Climate plans for these countries are summarised in Clapp et al (2010)("Low Emission Development Strategies", OECD/IEA, http://www.oecd.org/env/climatechange/46553489.pdf ), with references to source documents for both countries. see e.g. table on pgs 25-26 of Clapp et al | Not applicable now - table removed |
| 2817 | 15 | 9 | 29 | 10 | 14 | Criteria for evaluating success of national climate plans are proposed in Clapp et al (2010) "Low Emission Development Strategies", OECD/IEA, http://www.oecd.org/env/climatechange/46553489.pdf, which include e.g. linkages to national budget, integration with development and economic strategies (see pg 18 of Clapp et al). | Incorporated into SOD |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 5261 | 15 | 9 | 29 | | | ADD: Some French cities started implemented local climate plans or climate strategies in 2006. But in 2012, the national government established compulsory Territorial Climate and Energy Plans for all public administrations representing at least 50 000 people, including several innovations: 1) the plans include both mitigation and adaptation measures – but more experimental for the last) and 2) an energy component. These plans adopt the EU 20/20/20 objectives. Then, 3) the PCET supersede all other planning documents: mobility, urban planning, transports, land use, construction, non carbon mobility…, must conform to the PCET. The adaptation segment in most cities focuses on water management and urban heat. Low or non carbon energies are strongly promoted, a well as passive forms of energies such as isolation.<br>Adaptation and mitigation are associated in the increased use of parks and vegetation on buildings but debates arise as, for example, the orientation of building. A north-south orientation may be good for heat in the winter but will be too hot in the summer and could increase air conditioning use (most of France is expected to consume more energy for cooling of in the summer than for heating in the winter by 2040-50).<br>The legally binding aspect concerns only administrations. The plans are voluntary for other actors on the territory (industries, other firs, universities…) who are encouraged to sign a charter. No penalty (so far) has been planned for communities who do not reach their targets.<br>While the different PCETs are supervised from far by the National Environment and Energy Agency (ADEME, which also developed a carbon footprint evaluation method), the Agency also funds specific, experimental and promising or ambitious PCETs. Note that little technological innovation is actually used. Rather, the emphasis is on policy innovation through new linkages between services, and efforts at mainstreaming the 20/20/20 climate objectives throughout the sectors, departments and institutions.<br>Main methods are:<br>Urbanism: land use aimed at decreasing $co^2$ (a polycentric approach is recommended in most PCET and some go further by adding the criteria of multifunctionality of services)<br>Mobility: decreasing the status and place of cars in dailylife<br>Building codes: maximum $co^2$ emission standards and energy consumption by $m^2$<br>Education programmes<br>Industries: assistance in reducing energy consumption<br>Administrations: all areas of competences and responsibility plus own activities, buildings, engines…<br>Interestingly, there are only few economic measures and tools. For example, PCET do not include cap and trade or emission exchanges. | Table is no longer being used. This is useful information. But it would be helpful to have peer reviewed publications for citation. |
| 4122 | 16 | | | | | Please review chapter 4 section 4.3.8. If you feel that this section contains redundant and/or inconsistent duplications of chapter 16 discussions, please advice chapter 4 authors on how to revise their section. | Noted. Chpater 4 is a framing chapter and chapter 16 provides details. |
| 4145 | 16 | | | | | Please add an assessment of the literature on fast-start finance, including findings on flows and their effectiveness. | Noted. Will be impleented for SOD. |
| 4147 | 16 | | | | | Overall, the chapter covers many important issues. Most issues are described in qualitative terms by answering the question "what is there?" in terms of finance instruments and insitutions. It would b useful to add a more quantitative assessment of "how much is there and to what effect?". | Noted. Will be impleented for SOD. |
| 4148 | 16 | | | | | It would be useful if you developed a storyline that guides the reader through your chapter and highlights how all these issues relate to each other and why they are treated in this order. At the beginning of each section, it should be stated how this section relates to preceeding ones. | Accepted. Will be implemented for SOD. |
| 4149 | 16 | | | | | If would be useful to synthesize numbers written in the text in more tables and figures. | Taken into account. Will be |
| 4150 | 16 | | | | | Please state at the beginning of your chapter how it relates to preceeding policy chapters (13-15). It would also be useful to highlight the relation of your chapter to the AR4. What has happened since? How was climate finance treated in the AR4 (if at all) and how do you expand on this assessment? | Accepted. Will be implemented for SOD. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 13450 | 16 | | | | 16 | This section is unacceptably weak, with major gaps in coverage and repeated use of overly simplistic concepts. For example, the section does not address the potential for emissions mitigation in the ag sector of Industrializd Countries or the issue of financing measures to achieve this potential. The section does not address the impact of existing tax and subsidy policies on emissions-intensive activities or the financial potential of reducing or redirecting these subsidies, particularly in the cases of industrial agriculture and factory-like facilities for livestock production. | Taken into account. Section will be rewritten. Potential for ag sector is outside of the scope of this chapter - but can be found in chapter 11. |
| 15410 | 16 | | | | | see separate file: "wdavidmontgomery - general comments on chapter 16.doc" | Noted. Comment will be considered in the restructured section on enabling |
| 12839 | 16 | | | | | Check ODA (Abrev. clear to all readers?) | Will be addressed by the glossary |
| 7502 | 16 | | | | | No comments. | Noted. |
| 10614 | 16 | | | | | Comments on Chapter 16 as received from Chapter 8 LA Alan McKinnon <Alan.McKinnon@the-klu.org> follow below. | Comment not clear. No comments follow below. |
| 8744 | 16 | | | | | The public can also rasie money for climate measures through ordinary taxation | Noted. Addressed in SOD. |
| 8745 | 16 | | | | | Effective governance is also for getting those providing the finance (especially in developed countries) to provide more finance/and not cut of the finance stream. | Noted. |
| 16428 | 16 | | | | | All finance figures should be reported in constant USD values (e.g. 2010 USD values) to make them comparable (or at least it should be noted if current USD are used) -> in most of the cases throughout the whole text, it does not become clear whether current or constant USD values are used (notable exception: page 5, line 15) -> why is it important? Take e.g. the USD 100 billion commitment for 2020: will have a very different meaning, if we assume 2020 USD and not 2010 USD... | see comment 12821 |
| 2793 | 16 | | | | | Throughout this chapter there is a confusion between the public sector funding of the gap in cost between clean energy and polluting energy and the private sector providing investment funds to invest against those "subsidy" mechanisms. This is a common and very damaging mistake which I am afraid permeates the whole chapter in this case. I think the distinction between these two very different things needs to be made early and then applied rigourously throughout. I will highlight a number of examples | Noted. Will considered in rewrite of chapter for SOD. |
| 9969 | 16 | | | | | Why in Figure 16.2 the finance developed countries need are even greater than that of developing countries? | Noted. Need to check the scenario and confirm the data for each country group. |
| 9929 | 16 | | | | | Units for the data in the figure should be indicated. | Agreed. |
| 9937 | 16 | | | | | The caption of Figure 16.5 is not appropriate, which should be change into "Types of climate change mitigation activities in transportation sector ….". | Will be addressed if the figure is retained. |
| 15411 | 16 | | | | | The chapter describes second and third best policies and their deficiencies effectively, and appears to imply that there is a way to encourage financing of low carbon investments in the presence of such policies. The chapter should emphasize this point and start out by saying that without a carbon tax, cap and trade there will be no demand pull for low carbon investment other than state subsidies or other regulatory measures, and the efficiency of these instruments (discussed in ch 14) will determine the macro impact of investment. | Noted. Will be clarified in SOD. |
| 17791 | 16 | | | | | the title does not read well | Noted. Will be revised. |
| 8728 | 16 | | | | | Besides the many 2030 estimates, more estimates for 2020 and 2050 could be useful, as they are the years discussed in the negotiations. The section would also benefit form a clearer discussion of nthe difference between top-down and bottom-up modelling. | Noted. Depends on data availability. |
| 7376 | 16 | | | | | From the UNSG High Level Advisory Group on Climate Finance several "innovative sources" could also be included, such as international transaction taxes, taxes on bunkers, and Special Drawing Rights. It is also unclear if "south-south" is innovative, as it represents the model of direct Government contributions. | Agreed. Will be discussed in SOD. |
| 17789 | 16 | | | | | what is the total estimate range and how does it compare with what is needed? | Agreed. Will be discussed in SOD. |
| 8734 | 16 | | | | | Why is waste not addressed? | Chapter structure will be revised. Comment no longer relevant. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 16462 | 16 | | | | | This section (1) is very heterogenic; some determinants are mentioned for some sectors, but not for others, without any reason given for this -> will mention some examples below (2) as it stands now, it is not clear whether the chapter adds additional understanding of the financing problem in each sector -> either you delete this part and refer to the specialized sector chapters of AR5 or you focus much more what the "financing challenges and instruments" are in each sector. (3) the waste sector is missing | Chapter structure will be revised. Comment no longer relevant. |
| 17788 | 16 | | | | | at the end provide some indication of the estimates of "total mitigation potential" | Outside the scope of the chapter |
| 10615 | 16 | | | | | Developed countries:This section makes some strange assertions and is difficult to follow. It claims for example that<br>'The fragmentation of the transport GHG reduction project results in transaction costs that are generally superior to the climate benefits.' (Presumably by superior they mean higher)<br>This is a very negative statement that grossly under-estimates the cost effectiveness of many GHG mitigation measures in the transport sector.<br>Chap 16 goes on to argue that to address this transaction cost issue 'policies for the transportation sector that are integrated to other sectors are crucial. However, the high cost of this "policy packaging" often receives little attention.' (No substantiation of this latter claim is given).<br>While it is often desirable to incorporate transport within more broadly-based carbon mitigation programmes, their importance seems to be exaggerated here. The statements are also highly generalised and need to be illustrated with specific examples and references. The impression is given that few 'free-standing' GHG-reducing initiatives in the transport sector are worth financing. This is too negative and lacks substantiation.<br>The remainder of this section makes vague comments about the role and types of public funding for carbon mitigation in the transport sector. It concludes with a rather cryptic comment that needs clarification and elaboration:<br>'In the absence of a strong evolution of the tax base, the increase in rates will be limited, both for political reasons and often because of the application of ceilings or legal limitations, which are set at the central level, to avoid potential local drifting.' | Taken into account. Will be improved in rewrite for SOD. |
| 10616 | 16 | | | | | Developing countries: This section relating to the developing world is brief but stronger and more consistent with Chap 8. It recognises that funding can support a range of carbon mitigation measures, most of which we discuss. It foresees an ' immense expected rise in transportation demand in developing countries' and argues that ' given that much of the infrastructure is yet to be built, this is a sector with great potential for mitigation finance opportunities.' An accompanying table, from a German government study, gives examples of the measures, though could have been more closely tailored to the situation in developing countries. Missing from the table is any reference to transport investment in developing countries favouring a modal shift to lower carbon modes.<br>The chapter could have made reference to the MAC analysis done in the transport sector and proposals to internalise the environmental costs of transport which, in addition to altering behaviour, would generate new revenue streams to fund GHG abatement schemes. | Taken into account. Will be considered in rewrite for SOD. |
| 8735 | 16 | | | | | One problem with creating credits from REDD+ is that there is a risk of flooding the market with dubious credits. | Outside the scoe of the chapter |
| 8736 | 16 | | | | | Unclear how the differnt kinds of means relate to investment, as they in my eyes would not drive investment. | Noted. Will be addressed in SOD. |
| 8737 | 16 | | | | | Why are susbidies not mentioned here? They can create barriers to effective implementation, e.g. by providing cheap alternatives to the low-carbon technologies. Why purchase EE technologies if energy is heavily subsidised? | Agreed. Will be discussed in SOD. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 18360 | 16 | | | | | Please link this discussion to the relevant sections in Chapter 3 (3.12.6) and 13 (13.9.3) to sharpen chapter specific focus and avoid redundancies. | Agreed |
| 3269 | 16 | | | | | This section called "Transfer" repeats information from earlier in the report and is not relevant to a chapter on finance. Would suggest rewriting to specifically discuss financing needs or mechanisms for climate-friendly technology transfer. | Accepted. |
| 3270 | 16 | | | | | This section on funding approaches dissucsses FDI and the CDM bu these are small in the range of various ways to fund technology transfer. A broader overview should be given. The section on trade also seems to not fit here, and the TRIPS agreement seems to not be relevant to funding TT. | Noted. Chapter will be restructured. |
| 3271 | 16 | | | | | This section only discusses TT in the context of the UNFCCC briefly the GEF, as opposed to the many other ways in which technology transfer occurs and should be broadened. | Noted. Chapter will be restructured. |
| 9060 | 16 | | | | | This section attempts to throw light on the obstacle that ineffective governance presents for "an efficient and effective system of finance for mitigation" but it is too polite to state what problems must be overcome in order to obtain effective governance. In fact, the rest of section, which is not too long, can be read as mirroring the nature of the problem, while avoiding stating directly what the issues are. Let me list some of the phrases which describe these obstacles: inadequate volume of finance, politically dependent access to finance, lack of country ownership, proliferation, fragmentation, conditionality, lack of alignment to development strategies. It would useful to state these problems especially in section 16.6.2.1, the international level, in which issues of duplication, complexity, inadequate scale because of project as opposed to program modality, inconsistency among fund mechanisms and objectives, and proliferation have been identified. There are numerous references where these problems have been identified including: United Nations (2009b). World Economic and Social Survey 2009: Promoting Development, Saving the Planet. Sales No. E.09.II.C.1.; United Nations (2010a). World Economic and Social Survey 2010: Retooling Global Development. Sales No. E.10.II.C.1.; World Bank (2010b). World Development Report 2010: Development and Climate Change. Washington DC: The World Bank. There are many others. The approach embodied in the Convention, based on the Westphalian system of states and consistent with the principles on aid effectiveness discovered in Paris in 2005, is that nation-states must be responsible for climate change actions, with differentiated responsibilities between Annex 1 and non Annex 1 countries. Under this framework, international mechanisms must be support and facilitate state actions. | Noted. Comments will be considered in the restructured chapter as appropriate. |
| 8740 | 16 | | | | | The Standing Committee under the UNFCCC should also be mentioned here. | Agreed. Will be discussed in SOD. |
| 17790 | 16 | | | | | conclusion is somewhat vague, is this intended as an conconclusion | Agreed. Will be addressed in the SOD |
| 4146 | 16 | | | | | You conclude that this "weakness leads to fragmentation, duplication of efforts, and more importantly to misdirected efforts and waste of resources". This is a bold statement which is not a problem as long as it can be grounded in the preceeding text and the literature assessed there. It be would useful if you could provide an assessment of the literature on climate finance effectiveness. | Will reshapte the conclusion to reflect new chapter content |
| 8742 | 16 | | | | | Brings up new issues which have not been discussed before, which is unhelpful in an conclusion. | Will reshapte the conclusion to reflect |
| 9946 | 16 | | | | | Still can't figure out the difference between financing approaches mentioned in this section and the ones mentioned in 16.2.2. | Chapter has be restrcutre to reflect this concern. |
| 7562 | 16 | | | | | Eco-point system for housing in Japan has to be mentioned:<br>http://www.env.go.jp/en/wpaper/2011/pdf/22_Chapter4-3.pdf<br>For example, insert the following sentences.<br>Global warming countermeasures in the private sector are an issue that the residential sector should work on, and the government can actively encourage energy-saving in terms of housing, which will create an environmental effect that contributes to the establishment of a low-carbon society, and an economic effect that will stimulate new demand in the domestic market. | Noted. |

| 7563 | 16 | | | | | Eco-point system for housing in Japan has to be mentioned:<br>http://www.env.go.jp/en/wpaper/2011/pdf/22_Chapter4-3.pdf<br>For example, insert the following sentences.<br>Global warming countermeasures in the private sector are an issue that the residential sector should work on, and the government can actively encourage energy-saving in the housing sector, which will create an environmental effect that contributes to the establishment of a low-carbon society, and an economic effect that will stimulate new demand in the domestic market. | duplicate of previous comment |
| 15413 | 16 | | | | | Planning does not work for development in the poorest countries (see Easterly - The White Man's Burden: Why the West's Efforts to Aid the Rest of the World Have Done So Much Ill and So Little Good, 2006.), and most democratic middle income have avoided reliance on central planning, so how can the conclusion that planning will be either necessary or successful to bring about mitigation investments be supported? | Accepted, will be reworded carefully. |
| 7377 | 16 | | | | | Perhaps this could be re-phrased to consider both a 2C and 1.5C goals, noting the uncertainty, but recognising there would probably be a substantial difference. The answer could also be reformatted to more clearly delineate between "what has been currently directed" and "what is needed." Further, under "what is needed" it would be consistent to quote the numbers from 16.2.1.2 - i.e. "Estimates 26 range from USD 380 to 1,215 billion per year in 2030, at a global level; in developing countries<br>27 incremental investments range between USD 177 and 695 billion per year" | Noted. Chapter will be restructured and comment addressed based on data availability. |
| 7432 | 16 | 0 | | | | In the 4th IPCC assessment spillover impacts of response measures was a cross-cutting issue, but in this version of the assessment there seems to be no mentioning of it, in spite of its vital importance for developing countries and the clear provisions in the UNFCCC for the minimization of its negative impacts through the appropriate design and implementation of policies as well as through funding and transfer of technologies. | Outside the scoe of the chapter |
| 9406 | 16 | 0 | | | | Related to cross cutting issue, the following paper can provide useful information on GHG emissions by region (e.g. Japan, China, India, All Asia, USA, EU27, Russia, Annex I , Non Annex I and world) and by technological mitigation cost (e.g. 0, 25, 50, 75, 100, 125, 150, 175, 200 US$/tCO2) in the year 2020 and 2030, based on bottom-up type analyses. Hanaoka, et al, 2012 also provides technological mitigation potentials by region, by cost and by sector in the year 2020 and 2030. These discussions may be fit into this chapter, but information on this paper is missing. Dr. Hanaoka can help provideing data for this chapter.<br><br>Hanaoka, T., Kainuma, M. (2012) Low-Carbon Transitions in the World Regions: Comparisons of Technological Mitigation Potentials and Costs in 2020 and 2030 by bottom-up analyses. Sustainability Science, 7(2):117-137, DOI:10.1007/s11625-012-0172-6 | Noted, but outside the scope of the chapter. More relevant for sector chapter. |
| 14258 | 16 | 0 | | | | I would expect it to be natural to here discuss the relationship between the negotiated abatement-commitments/quotas and the incentive to develop new/green technology: On the one hand, tough commitments (small emission quotas) makes it necessary for the member-country to invest in new technology. On the other hand, the anticipation of future bargaining rounds can create a fear to be held up then, since today's investments will then be "sunk", and this hold-up problem can reduce the incentive to invest in green technology (such as abatement technology or renewable energy sources). These relationships are analyzed in a recent working paper (Harstad, Bård, 2012, "The dynamics of climate agreements"). | Noted. Also relevant for chapter 13. |
| 16356 | 16 | 0 | | | | Please consider using the following paper in your assessment:<br>The world at a crossroads: Financial scenarios for sustainability<br>Jofre Carnicer and Josep Peñuelas<br>Energy Policy 48, 2012p 611-617 | Noted. |
| 13429 | 16 | 0 | | | | In a number of places, the language in the chapter is vague and inconsistent concerning the definitions of incremental costs | Taken into account: LAs and CLAs will ensure consistent application of |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 18256 | 16 | 0 | | | | In a number of places, the language in the chapter is vague and inconsistent concerning the definitions of incremental costs | see comment 18256 |
| 18286 | 16 | 0 | | | | Although many useful references are cited in this chapter, on balance the chapter is weak and incomplete. The chapter as written is "not ready for prime time." Coverage of activities and institutions related to climate-finance in developing countries are especially poorly covered. In its current form, I do not believe that this chapter measures up to the previous standards of research excellence found in earlier IPCC Assessment Reports. | Taken into account: LAs and CLAs will do deeper research on developing country issues and broaden the range of literature. |
| 9047 | 16 | 0 | | | | The chapter can be clearly improved with greater self-reflection and integration of its substantive content. For example, the listing of the relationship of adaptation to mitigation in pages 38, lines 1 to 26, is simply a listing, without any attempt to relate each of the ideas to each other. There are many instances of incomplete writing, incomplete expressions. For example, in page 32, lines 27 to 28: "Even though the CDM bears weakness, it is one way to facilitate the technology transfer to Developing Countries." "EE" is never defined in the text. Etc. | Taken into account: will be considered in rewrite of chapter towards SOD. |
| 12821 | 16 | 0 | | | | General Remark: It is unclear what the basis for calculating the monetary values is. E.g. does billion dollar in 2050 include an inflation rate and is billion dollar in year X in study Y equal to billion dollar in year X in study Z with regard to the underlying basis for calculation. This is also relevant in the context of required subsidies. | Taken into account. Standard units in accordance with WGIII provisions will be used. |
| 8723 | 16 | 0 | | | | A good chapter but with room for improvement. Generally speaking, the different kinds of costs (incremental costs, incremental investments, total investments) clóuld have been explained better in the beginning, and subsequently used more consistently throughout the chapter. Also the concept of creating a global carbon price could be addressed more explicitly.Discussion of the importance of mainstreaming climate measures into ODA would also be useful. Finally, most of the discussions seem centred on the energy sector, whereas industrial emissions (especially non-CO2 emissions) are a bit overlooked. F | 1. see comment 12821 2. Noted: will be considered in rewrite. 3. Taken into account: Sector coverage and coverage of gases will be enhanced in rewrite for SOD. |
| 14351 | 16 | 0 | | | | In finance, issue on developed countries and those on developing countries are different. Developed countries can be financed with in their won country and/or international market. On the other hand, most of the developing country may be rely on financial assistance from developed countries and multilateral agencies. In this sense, nature of discussion on finance deems different between developed and developing countries. Therefore, this chapter should be devided into two: developed countries part and developing countries part. | We agree that te circumstances of developed and developing countries differ with respect to climate finance. They will be discussed in the chapter. But we do not believe that this is not the mostt effective way to organize the |
| 8075 | 16 | 0 | | | | the incremental cost estimates referred to lack the information from which stabilisation scenario (xx ppm, 2°C etc.) the estimates are derived | Accepted. Will be improved in rewrite. |
| 8083 | 16 | 0 | | | | it is not clear, why in so many cases reference is only made to mitigation finance and not also to adaptation finance, reference on page 13 line 23 does not make this sufficiently clear | Noted. The focus of this chapter is mitigation. The link to adaptation is |
| 3186 | 16 | 0 | | | | This chapter has very little data that helps readers ground the climate investment discussion into broader investment questions—such as total investment levels, flows, the role of MDBs vs private capital, etc. We need an iconic figure on this and serious discussion. (FAQ 16.1 is a notable exception—it does, albeit thinly, discuss such realities.)<br><br>The chapter has almost no discussion of the risk mitigation tools and other factors that have the largest impacts on baseline levels of private finance as well as possible increments in private finance for climate. □ | Taken into account. More emphasis will be given in rewrite for SOD. Risk mitigation will be further considered in SOD. |
| 9930 | 16 | 0 | | | | A section about the influence from financial crisis and the relationship between financial crisis and climate financing should be added, as a response to the chapter 1, in which financial crisis is mentioned as one of the issues learned after AR4. | Accepted. Based on the limited amount of available literature some text will be added to SOD. |
| 9933 | 16 | 0 | | | | When taking USD as the unit for economic numbers, please make sure whether it's in current USD or USD in specific year . Especially when data are from different model, it's important to make all numbers in an uniform unit. | see comment 12821 |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 9935 | 16 | 0 | | | | As one of the innovative sources for climate financing, taxs from international aviation also need to be introduced. | Accepted. |
| 9936 | 16 | 0 | | | | Classification of 16.2.3 is not so reasonable. When talking about current sources and potential sources, I am afraid that there are some overlaps, for example, carbon tax. So maybe it should be reorganized. | Accepted. |
| 9942 | 16 | 0 | | | | In this chapter, if a section about quantitive researches on climate financing and trade-offs between mitigation and adaptation can be supplemented, it would be helpful. Otherwise, this issue should be fully discussed in chapter 6. | Noted. Availability of literature will be examined. |
| 9943 | 16 | 0 | | | | The relationship between this chapter and chapter 6 is unclear. Readers want to know the finace amount in each scenarios mentioned in chapter6. | Noted. A process to improve to consistency between chapters 6 and 16 |
| 9947 | 16 | 0 | | | | Financing approaches are stated repeatedly in this chapter, which even makes readers confused if there is a difference when the same approach is mentioned in different section. | see comment 18256 |
| 9967 | 16 | 0 | | | | Since there has been some financing projects, it would be interesting to assess the influence of climate change from such financial flows based on IAMs. | Noted. We will look for such literature. |
| 9968 | 16 | 0 | | | | Burdening sharing among developed countries is one of the key issues in international financing. And there are some literatures about this. I will submit two papers about the assessment on participations of the US and Australia in the 100 billion commitment pledged in Copenhagen(Houser and Selfe, 2011; Jotzo, et al., 2011). | Rejected. This is outside of the scope of our chapter but treated in other policy chapters. |
| 11054 | 16 | 1 | | 53 | | Chapter16 general comment: The description of the role of public finance (such a Export credit agency with conventional loan, government guarantee etc) is not insufficient. The public finance sector has its catalyze function to mobilize private finance with sensational loan through official dialogue with host country's MOE DOE MOF.These dialogue means capacity building for the host country. see | Accepted. |
| 17237 | 16 | 1 | | | | This chapter is a welcome addition to the work of WGIII – and could play a significant role in 'speaking finance to the climate community' and 'speaking climate to the finance community'. To do this, the chapter needs to have a stronger focus on how the low-carbon transition intersects with capital markets, the barriers to 'climate finance', how financial stakeholders can be incorporated into policy design and how climate risks can be better addressed by finance and investment. | Accepted. The spirit of this comment will be considered in rewrite of the chapter. |
| 17238 | 16 | 1 | | | | At its heart, effective climate finance ensures that the conventional risk:reward in all financial decision-making dynamic is transformed so that mitigation is assured. Historically, the risk:reward balance had weighed against low-carbon options; this has been remedied to some extent through policy intervention to internalize external costs. But high carbon options in nearly all economies are often seen to have a better risk:reward ration than low-carbon options. | Noted. |
| 17239 | 16 | 1 | | | | Global Capital MarketsIt is important to set out the size and structure of global capital markets in terms of key asset classes (equities, bonds, private equity, infrastructure, debt etc). The latest McKinsey Global Institute Report estimated that the total size was USD212trn: it is critical to incorporate this scope as it then places the challenge of 'climate finance' in context – and highlights that the scale of funding required is relatively small (eg 16.2) | Accepted. Quantitative information will be added in rewrite of chapter. |
| 17240 | 16 | 1 | | | | http://www.mckinsey.com/insights/mgi/research/financial_markets/mapping_global_capital_markets_2011 | part of comment 17239 |
| 17241 | 16 | 1 | | | | The relatively low amount is particularly striking if one considers that the share of investment in GDP has been historically low in recent year and will need to rise in coming decades: see Jorgen Randers, 2052 (2012) for some useful estimates. | part of comment 17239 |
| 17242 | 16 | 1 | | | | Key Financial Stakeholders: It is also important – perhaps diagrammatically – to set out the key actors in climate finance, and how they comprise the investment chain from: | part of comment 17239 |
| 17243 | 16 | 1 | | | | - asset owners (pension funds, insurance companies, sovereign wealth funds, foundations, states, private individuals) | part of comment 17239 |
| 17244 | 16 | 1 | | | | - actuaries and consultants which advise asset owners on strategic issues, including climate change See Mercer, Climate Change Scenarios – Implications for Asset Allocation, 2011 | part of comment 17239 |
| 17245 | 16 | 1 | | | | - asset managers, across equity, bonds, private equity etc | part of comment 17239 |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 17246 | 16 | 1 | | | | - banks, who provide investment analysis, raise capital for new assets in the form of equity and debt, provide leveraged finance drawn their own balance sheets and trade existing investment instruments | part of comment 17239 |
| 17247 | 16 | 1 | | | | - corporations, | part of comment 17239 |
| 17248 | 16 | 1 | | | | - ultimate assets and projects | part of comment 17239 |
| 17249 | 16 | 1 | | | | The OECD's Financing Climate Change Action programme also has some useful papers that frame the agenda | Noted. Will be checked for review. |
| 17250 | 16 | 1 | | | | http://www.oecd.org/env/climatechange/financingclimatechangeaction.htm#Papers___pubs | part of comment 17249 |
| 17251 | 16 | 1 | | | | One stakeholder that is omitted from the chapter at the moment is the individual consumer/housbehold as source of finance/investment. CF is not just an institutional issue; HSBC estimates that a third of the spending on low-carbon energy supply and consumption by 2020 will be by households (eg building retrofit; cleaner vehicles – HSBC, Sizing the climate economy, 2010 available at | Acccepted. Will be addressed. |
| 17252 | 16 | 1 | | | | http://www.longfinance.net/programmes/london-accord/392.html). | see 17251 |
| 17253 | 16 | 1 | | | | Climate Finance: It is important to re-examine the concept of 'climate finance'. The Executive Summary (l.33) admits 'there is no agreement on what qualifies as CF', but the chapter perhaps unconsciously assumes in many places that it is in effect public finance. At the heart of the problem lies uncertainty as to what climate finance includes in its orbit. I would suggest the following: ' Climate finance is the allocation of financial assets to activities that enable mitigation and adaptation' The important feature is that this leads to the possibility of measurement around defined investment themes (eg renewables, energy efficiency, public transport etc) and actors along the lines of the CPI report. A secondary issue is the stages of CF in terms of primary finance (eg funding a wind farm) and secondary finance (eg selling on this wind farm to a pension fund). | Taken into account. SOD will provide definition for climate finance. |
| 17254 | 16 | 1 | | | | It is critical to recognize that this definition does not include – and nor does the draft chapter – a discussion on 'climate finance risks', in other words the risks that the transition to a low-carbon, resilient economy pose for finance and investment: I will address this in my final section. I would also suggest that the chapter is more disciplined in defining the elements of CF, breaking it into the following categories. - Type 1: domestic private climate finance; - Type 2: domestic public climate finance; - Type 3: international private climate finance | Noted. Will be refelcetd in the revised draft. |
| 17255 | 16 | 1 | | | | - Type 4: international public climate finance | see comment 17254 |
| 17256 | 16 | 1 | | | | This categorization is perhaps implicit in parts of the chapter – but it would be valuable to have an iron-cast framework that applies throughout. | see comment 17254 |
| 17257 | 16 | 1 | | | | It is also important to clear up some confusion in the language: 'financial flows' refer only to cross-border Type 3 & 4 CF. In addition, in the discussion of innovative sources (16.2.3.2) this is effectively only about innovative sources of public CF. And finally, private finance often funds the public in large measure through public bond issuance, for example, either through sovereign bond issuance and/or issurance from public financial institutions. This is important to recognize as there is growing demand from asset owners for 'climate bonds' (see Climate Bonds Initiative/HSBC, Bonds and climate change - the state of the market in 2012). | see comment 18256 |
| 17258 | 16 | 1 | | | | The key point that needs to be highlighted in the next draft for 16.8 on Gaps in Knowledge is the absence of a common system used by public and private sectors alike for categorizing and monitoring | Taken into account. To be considered in rewrite. |
| 17259 | 16 | 1 | | | | Investment, Costs and Returns: The significant insight in the second paragraph of the Executive Summary of the difference between cost and investment (l.6>) is sadly lost in the rest of the chapter. One structural feature of the low-carbon, green economy is that it substitutes capital for resource use and carbon pollution: the low-carbon economy is thus generally a more capital-intensive economy, with one of the key strategic issues being how to raise this additional upfront capital, which will then deliver a flow of financial returns over the life of the investment. It is critical to communicate to policymakers and financiers/investors that CF investments envisaged yield a positive return, a point that has been emphasized in successive IEA World Energy Outlook's but appears to be omitted in the current section on scale 16.2. | see comment 18256 |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 17260 | 16 | 1 | | | | Barriers to Climate Finance: The chapter lacks a clear analysis of what is preventing finance to flow at sufficient scale and speed to the right places for comprehensive mitigation. I would suggest the following | Taken into account. Will be accomodated in rewrite for SOD. |
| 17261 | 16 | 1 | | | | - structural market failures (eg the externalities identified in previous chapters of AR5, as well as the policy failures such as fossil fuel subsidies) | part of comment 17260 |
| 17262 | 16 | 1 | | | | - financial market failures: these would include short-termism, bounded rationality, regulatory blindness, perverse incentives, obsolete interpretations of fiduciary duty, institutional inflexibility, transparency and path dependency. These are the barriers that this chapter should focus on removing. | part of comment 17260 |
| 17263 | 16 | 1 | | | | To highlight some of these in more detail | part of comment 17260 |
| 17264 | 16 | 1 | | | | Short-termism: This has been highlighted as a structural flaw in financial markets for decades, making it hard for investors to effectively assess and act upon the durational challenge of climate change. Financial myopia was identified by J.M Keynes as a key reason for structural imbalances in Chapter 12 of The General Theory of Money and Employment published in 1936. “It is the long-term investor, he who most promotes the public interest, who will in practice come in for most criticism wherever investment funds are managed by committees or boards or banks. For it is in the essence of his behaviour that he should be eccentric, unconventional and rash in the eyes of public opinion.” This reality has been exacerbated in recent years, and quantitatively analysed by Andrew Haldane, Director of Financial Stability at the Bank of England: the market on its own will not act rationally in a temporal perspective http://www.bankofengland.co.uk/publications/Pages/news/2011/043.aspx | part of comment 17260 |
| 17265 | 16 | 1 | | | | This structural flaw could be addressed by incorporating in financial regulation a requirement on the investment chain for asset owners, managers, banks etc to assess and integrate the long-term challenge of climate change into their routine operations. | part of comment 17260 |
| 17266 | 16 | 1 | | | | Bounded rationality: It would be worth referencing the latest insights of behavioural finance and the explanations these give for inadequate attention to climate change, and the failure of conventional financial theory (such as the efficient markets hypothesis) to root its notions in empirical evidence. James Montier Behavioural Investing is a good reference, and could be cross-referenced with the useful section on behavioural economics in Chapter 3. | part of comment 17260 |
| 17267 | 16 | 1 | | | | Perverse incentives: These are both public and private. Currently, finance and investment receives considerable fiscal support to encourage saving, an important public policy objective: in the UK, this amounts to £30bn p.a.. However, unlike in other policy areas such as energy, there is still little or no integration of environmental or climate factors into how this fiscal support is allocated. One solution to this would be to ensure that to qualify for tax relief savings and investments would need to be managed by funds/institutions which demonstrated an ability to manage climate/sustainability issues and risks. | part of comment 17260 |
| 17268 | 16 | 1 | | | | Regulatory blindness: A similar theme – unlike the agriculture, energy and transport sectors, little or no attention has been given to integrating climate change into core financial regulation. This has led in the case of the banking sector to new rules under Basel III which are discouraging banks from holding long-term project finance debt – a key source of funding for climate mitigation. This is clearly not something that can be dealt with in formal climate negotiations at the UNFCCC and elsewhere – but as with the issue of perverse incentives highlights the need for climate change factors to be integrated into regular financial policy if mitigation and adaptation is to be successful. This insight could be usefully incorporated into 16.6 Institutional arrangements. | part of comment 17260 |
| 17269 | 16 | 1 | | | | Transparency: Without transparency on climate factors, financial markets cannot effectively integrate migitation into decision-making. Considerable progress has been made on a voluntary basis through initiatives such as the Carbon Disclosure Project, and some countries are introducing mandatory climate/sustainability requirements. These need to be universalized so that financial markets can make informed decisions: again worth highlighting in 16.6. | part of comment 17260 |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 17270 | 16 | 1 | | | | Finally, the important point about highlighting financial market barriers is to make clear to policymakers that simply addressing the first order climate externalities will not be sufficient to achieve mitigation; there are many obstacles in financial markets which will obstruct this signal being received. | part of comment 17260 |
| 17271 | 16 | 1 | | | | Incremental Cost: The chapter explores the problematic nature of this term – but it needs to be made clearer the difference between incremental cost and incremental investment, the latter is a classic form of financial deployment from which net benefit is expected. And although carbon externalities are certainly deep and widespread, technological innovation is such that low-carbon mitigation options are increasingly without 'incremental cost' – although there may be incremental upfront investment (but lower operating costs and thus higher net returns). | part of comment 17260 |
| 17272 | 16 | 1 | | | | Institutional Arrangements: The chapter could benefit from recognizing the growing evidence of private finance sophistication and demand for policy in the area of climate change, particularly institutional investors. Hitherto, institutional investors have been the 'missing stakeholder' in climate policy formation and delivery, with policymakers not addressing the barriers that investors face to contribute to climate security. As owners of corporations, investors need to be regarded as a distinct stakeholder that has interests that are not necessarily the same as the interests of corporate management (principal-agent problem/corporate governance). The chapter could usefully highlight the growing investor demand for policy certainty in recent years including:- the 2011 Investor Statement, supported by USD20trn in assets: www.iigcc.org/iigcc-investor-statement and Investment grade climate policy: reports by IIGCC/UNEPFI as well as CMCI (decc.gov.uk) | part of comment 17260 |
| 17273 | 16 | 1 | | | | Climate Risks: The chapter as currently structured focuses on how to mobilize finance behind key thematic investments in the low-carbon landscape. It doesn't, however, examine the flip-side: the risks facing high-carbon finance. One important expression of this is the topic of stranded assets. The absence of credible long-term policy frameworks compounded by financial myopia means that financiers and investors discount the possibility of robust action to hold global warming below 2 degrees celsius. The long-lived nature of key pieces of energy infrastructure in particular means that this has potentially serious implications in terms of locking economies into high-carbon pathways, which makes support for the low-carbon efforts even more difficult. This was an issue addressed in the IEA's 2011 World Energy Outlook. A related issue are the risks for financial stability posed by continued investment in fossil fuel assets which cannot be burnt if the 2 degree threshold is respected. This issue has been usefully examined by the Carbon Tracker Initiative in its report, Unburnable Carbon (2011 http://www.carbontracker.org/carbonbubble). This suggests an important topic for further research and enquiry – to examine the dynamic between climate change and financial stability. | part of comment 17260 |
| 17784 | 16 | 10 | 13 | | | Chapter 1 talks about 2C by 2050 | Noted. We will check the study and make sure we summarize it correctly. |
| 9932 | 16 | 10 | 13 | | 14 | Since only MESSAGE and REMIND are mentioned on line 14, "three integrated assessment models" should be changed into "two…". | Editorial. |
| 13436 | 16 | 10 | 14 | | | The word "annual" is omitted between 'indicate' and 'incremental.' | Noted. |
| 18263 | 16 | 10 | 14 | | | The word "annual" is omitted between 'indicate' and 'incremental.' | See comment 13436. |
| 17785 | 16 | 10 | 17 | 18 | | how much effort needed to do get this done? | Comment not clear. |
| 16427 | 16 | 10 | 7 | 10 | 11 | Would be helpful to have an "overview" table showing the most important differences in assumption within the models | Noted. The SOD will provide greater detail on the cited studies. |
| 13437 | 16 | 11 | 24 | | | The word 'will' should be replaced by "may" or "can." | Comment not clear. Perhaps line 27. |
| 18264 | 16 | 11 | 24 | | | The word 'will' should be replaced by "may" or "can." | See comment 13437. |
| 16429 | 16 | 11 | 46 | 11 | 46 | Explain "t450" | Noted. The SOD will provide greater detail on the cited studies. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 12827 | 16 | 12 | | | | Billion US D calculated with regard to which year? | Noted. All measurement units will be homogeneous (if possible) in the SOD. |
| 16430 | 16 | 12 | | | | Explain abbreviations of the different scenarios | Noted. Will be more precise in the SOD. |
| 13438 | 16 | 12 | 10 | | | The phrase "for power generation" should be inserted after 'consumption' and before 'is expected.' No one expects oil consumption to go to zero in the transport sector in a 2 degree scenario. | Noted. Will be more precise in the SOD. |
| 18265 | 16 | 12 | 10 | | | The phrase "for power generation" should be inserted after 'consumption' and before 'is expected.' No one expects oil consumption to go to zero in the transport sector in a 2 degree scenario. | See comment 13438. |
| 16431 | 16 | 12 | 10 | 12 | 10 | CCS can also be applied to oil but most oil is used in the transport sector where CCS would be too expensive | Noted. Will be more precise in the SOD. |
| 9053 | 16 | 12 | 12 | | | A reference to the empirical complementarity of energy, capital, and labor should be made for this claim. | Noted. Will add references to the empirical literature and to results from |
| 16432 | 16 | 12 | 15 | 12 | 15 | You may add (5) full information on technologies, no transaction costs | Noted. SOD will improve this section as the ful set of scenarios from other chapters will be available. Also the |
| 16433 | 16 | 12 | 29 | 12 | 36 | This paragraph only refers to the 4th assumption (absence of risk and uncertainty) -> explain why you only discuss this point and not the others | Agreed. The text will be revised in the SOD. |
| 13439 | 16 | 12 | 4 | 12 | 8 | It is unclear as written whether this para refers to savings due to higher efficiency or savings due to lower fuel cost resulting from decreased demand or both. | Noted. The paragraph will be rewritten. |
| 18266 | 16 | 12 | 4 | 12 | 8 | It is unclear as written whether this para refers to savings due to higher efficiency or savings due to lower fuel cost resulting from decreased demand or both. | See comment 13439. |
| 19007 | 16 | 13 | | 13 | | Unit is needed | Accepted. |
| 13440 | 16 | 13 | | | | Figure 16.4 claims to represent "current financial flows" of climate finance. However this figure and the accompanying discussion ignores South-North investment flows, e.g., Chinese investment in US advanced battery and electric vehicle companies. These investments in low-emissions technologies should be recognized as a part of the international flow of climate finance. | Noted. More data will be available for the SOD and will be reflected there. |
| 18267 | 16 | 13 | | | | Figure 16.4 claims to represent "current financial flows" of climate finance. However this figure and the accompanying discussion ignores South-North investment flows, e.g., Chinese investment in US advanced battery and electric vehicle companies. These investments in low-emissions technologies should be recognized as a part of the international flow of climate finance. | Noted. More data will be available for the SOD and will be reflected there. |
| 9061 | 16 | 13 | | | | The Chapter will make a distinct contribution if it will distinguish between financing often counted as "climate finance" and which financing flows can be counted as climate finance in the sense that it discharges the developed country obligations under the Convention. In page 13, it reproduces a financing flow diagram from Buchner et al. (2011) in which private financing flows are counted as climate finance. The draft should be commended about the fact that even counting these sources of financing it makes the judgement that the scale of financing so far is insufficient. | Agreed. The SOD will include a definition on climate finance that will clarifiy how it differs from climate finance under UNFCCC. |
| 8729 | 16 | 13 | 1 | 13 | 5 | How closely correlated are the risk premiums on a country's government bonds and on the projects taking place within that country? | Noted. Will be addressed in SOD. |
| 2798 | 16 | 13 | 20 | 13 | 20 | This diagram is very confused. It makes no sense to add tax revenues spent on funding clean energy investments with private capital which is looking for a return to invest against those cash flows. I would recommend that this diagram is removed as it makes no financial sense. | Noted. More data will be available for the SOD and will be reflected there. |
| 16435 | 16 | 13 | 21 | | | Some of these flows are not North-South, (1) a substantial part of the USD 55 billion of private finance will be South-South or domestic (see my comment 8), 20% of Bilateral development banks finance is provided by Southern institutions (Brazil, China, India); (3) some financial payments of MDBs are made possible by developing country shareholder equity (to mobilize debt on the capital market) -> NON-annex-1 countries have e.g. roughly a 35% share in IBRD capital subscriptions | Noted. More data will be available for the SOD and will be reflected there. |
| 13726 | 16 | 13 | 26 | 13 | 26 | Add after "… broad interpretation.": "(for a discussion of possible definitions see Stadelmann et al. 2011)". Reference: Stadelmann, M.; Roberts, T.; Michaelowa, A. (2011): New and additional to what? Assessing options for baselines to assess climate finance pledges, in: Climate and Development, 3, p. 175-192, | Noted. The reference will be checked and used as appropriate in the SOD. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 16434 | 16 | 13 | 3 | 13 | 3 | define "investment-grade" | Noted. Will add a definition |
| 2818 | 16 | 13 | | 19 | | For latest figures in current flows of climate finance, refer to Clapp et al (2011) "Tracking Climate Finance" OECD/IEA, http://www.oecd.org/env/climatechange/50293494.pdf -- see Section 2 pgs 10-12 of paper. This paper builds on previous OECD work by Corfee and Buchner, and offers more recent OECD data that Buchner et al Landscape of Finance. Clapp et al also includes ranges which are more accurate than one average figure for private sector flows. | Noted. Reference will be evaluated and included as appropriate. More data will be included. |
| 8730 | 16 | 14 | 13 | 14 | 14 | Reg the 28 out of 45 billion: does the term "domestic projects" in this context refer to projects within developed countries, or how? This is not clear. | Noted. Data will be checked and text will be clarified. |
| 8061 | 16 | 14 | 18 | 14 | 20 | It is not clear where the definition of international climate finance used here comes from; I do not think that it is undisputed that private finance flows are considered as "international climate finance"; but rather that it is understood as finance that has been mobilised explicitly for climate finance; there should be a discussion on available definitions; I also think this study (number) also includes domestic flows (Buchner et al, 2011, p.8),s o therefore one might need to indicate that the 97 billion are not fully international climate finance | Accepted. The SOD will include a definition on climate finance that will clarifiy how it differs from climate finance under UNFCCC. |
| 16437 | 16 | 14 | 21 | 14 | 22 | As noted before, give not only the point estimate but the range in the Buchner et al. 2011 figures; make clear that they also include some domestic private finance | Noted. SOD will include additional data and will include ranges. |
| 16438 | 16 | 14 | 31 | 14 | 31 | The Stadelmann et al. (2011) figure does not only include international private finance, but also domestic and South-South private finance that is mobilized by industrialized countries | Taken into account. We will check the reference. |
| 16439 | 16 | 14 | 37 | | | You may also refer to the sources that Buchner et al. Cite: OECD rio markers, Atteridge et al. (2009) for bilateral finance institutions | Noted. Will be included as appropriate. |
| 13729 | 16 | 14 | 39 | 14 | 39 | Revise footnote 4 as follows: "Michaelowa and Michaelowa (2011) find severe miscoding of projects and a correlation between overcoding and political variables." | Noted. |
| 16436 | 16 | 14 | 8 | | | The BNEF figure is not only domestic, it includes international investments | Agreed. BNEF includes both domestic |
| 11227 | 16 | 15 | 13 | | | CDM and JI projects have been under criticism for their negative impacts on the environment and on the human rights of affected communities. In 2001, the CDM board decided to launch an internal review into its public participation and consultation policies , following allegations human rights violations related to some CDM projects. | Noted, but chapter 6 deals only with financial aspects. Other aspects of CDM are dealt with in chapter 13. |
| 16440 | 16 | 15 | 13 | 15 | 13 | This figure depends very much on the year and the assumptions (e.g. on carbon credit prices, which are mostly confidential in the primary market; and the share of primary and secondary transactions), e.g. check the way Stadelmann et al. (2011) calculated the USD 1.6-1.8 billion for the CDM; using the same methodology, you would roughly receive USD 5 billion in 2011. | Noted. Data and assumptions will be checked. |
| 16441 | 16 | 15 | 38 | | | You may refer to the literature on stimulus packages, which included funding for clean energy; you may cite Höhne et al. (2009): Economic/climate recovery scorecards: How climate friendly are the economic recovery packages? | Thank you. Reference will be reviewed. |
| 2799 | 16 | 15 | 20 | 16 | 49 | Again this section confuses sources of public funding with private investmnent which are two totally different things. | Taken into account. Section on sources will be restructured in SOD. |
| 12484 | 16 | 15 | 21 | | | This section covers the additional risk currently inherent in low-emission technologies. What the section does not cover in much detail, is the increased financial risk associated with investing in fossil technologies in a scenario where carbon pricing (more fully) reflects the true costs of GHG emissions. The fact that proven hydrocarbon reserves contain much more carbon than we can burn if we want to limit climate change, is not reflected in today's share pricing/financing costs. This "market failure" / hidden financial risk should be pointed out in the financing chapter. It is particularly important that long term investors (e.g. pension funds) also develop tools to deal with this kind of "carbon risk". | Noted. |
| 9940 | 16 | 16 | | | | Since paragraphs on this page is supposed to describe the scale of financing, please pay attention to give some numbers about their potential financing capacity for each finance source. | Agreed. Will be revised in SOD. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 16442 | 16 | 16 | 1 | | | Among "international climate finance", you have - in my view - to A) specifically refer to funds/operational entities under the UNFCCC financial mechanism (GEF, SCCF, LDCF, GCF) and B) clearly distinguihs between climate-specific funds (e.g. CIFs, GEF trust fund, several bilateral initiatives, see Climate Funds Update for an overview), and ODA funds that have climate benefits (e.g. refer to Michaelowa & Michaelowa (2011) "Old Wine in New Bottles?"; where they show that ODA funding for renewables and energy efficiency has already existed in the 1980s and is mainly dependent on the oil price, but does not very much relate to climate change agreements, see http://www.zora.uzh.ch/57335/1/am_old_wine_in_new_bottles11.pdf) | Thank you. Reference will be checked. In the SOD there will be a section on operating entities. |
| 14352 | 16 | 16 | 1 | 16 | 9 | Discussion on international public finance focus on ODA. But, there are another source of international public finance called "other official flows, such as export credit. Therefore, this section should focus on other official flows as well as ODA. | Agreed. OOF are a source of climate finance. |
| 2180 | 16 | 16 | 10 | 16 | 25 | The section on private climate finance seems a bit weak in terms of identifying and analyzing emerging low carbon/sustainable energy investment funds as well as enterprises. Companies like DESI Power in India, for instance, is serving as a model for sustainable energy innovation/development in the developing world and little of this in documented here and/or places in thic chapter. | Noted. Section will be revised and expanded in the SOD. |
| 16444 | 16 | 16 | 10 | 16 | 25 | This paragraph should (a) more refer to specific types of private finance relevant for low-carbon technologies and (b) somewhere make clear that private finance may/will have to provide a substantial part of needed investments but it can not be expected to cover incremental costs of low-carbon technologies (unless it is incentivized via or compensated to do it). | Noted. Will be reflected in SOD. |
| 9934 | 16 | 16 | 10 | | 49 | The third to sixth parapgraphs are supplementary to the second paragraphy in this page. But the starting words in third to sixth paragraphs are all in bold, which seems to me that these paragraphs are parallel to the second paragraph. | Editorial. Will be clarified in SOD. |
| 16445 | 16 | 16 | 26 | 16 | 49 | Structuring unclear; everything form businesses to private philanthropy is potentially part of private climate finance; FDI and retail investors may be part of "business and corporations" (which itself is a relevant type of actor, but not type of funding) | Noted. Will be clarified in SOD. |
| 8062 | 16 | 16 | 26 | 16 | 35 | not clear why business/corporations finance and FDI is in a separate paragraph from private climate finance | Noted. Will be clarified in SOD. |
| 13728 | 16 | 16 | 5 | 16 | 5 | Add after "… action": "However, the share of development assistance channelled into mitigation activities has not been influenced in a statistically significant manner by the international climate policy regime, but essentially been correlated to the level of the oil price (Michaelowa and Michaelowa 2011)." Reference: Michaelowa, A.; Michaelowa, K. (2011): Old Wine in New Bottles? The Shift of Development Aid towards Renewable Energy and Energy Efficiency, in : Carbonier, Gilles (ed.): International Development Policy: Energy and Development, Palgrave Macmillan, London, p. 60-86 | Thank you. Reference will be checked. |
| 16443 | 16 | 16 | 5 | | | Make clear that MDBS/BDBs use both ODA and Other Official Flows (OOF) | Noted. |
| 10458 | 16 | 17 | 0 | | | The section on Carbon taxes on coal and others in India need to be expanded | Noted. |
| 16448 | 16 | 17 | 10 | | | Mention that Germany already uses part of EUA auctioning for international climate finance | Noted. |
| 12485 | 16 | 17 | 15 | 17 | 15 | Please consider to add a sentence about other emission trading systems that are being developed (e.g. Australia, China, California, South Korea). (See section 15.5.4 -New approaches to emission trading) | Noted. Will be considered for the SOD. |
| 8733 | 16 | 17 | 16 | 17 | 19 | The problem with selling AAUs is that it raises the emissions in the country buying them. | Noted. |
| 16449 | 16 | 17 | 17 | | | You may call this "allocation and selling of surplus emission allowances" (more neutral); then you may refer (apart from the eastern EU countries) to the idea of allocating headroom allowances to non-Annex-1 countries in order to give them financial assistance and include them in the global carbon market, see Wagner et al. (2009) Docking into a Global Carbon Budget, published in OUP book (http://www.edf.org/sites/default/files/9410_clean-investment-budget.pdf) | Source will be evaluated. |
| 12828 | 16 | 17 | 22 | 17 | 30 | Can you provide a reference? | We will cite source in SOD. |
| 16450 | 16 | 17 | 22 | | | You may give some numbers on how large these revenues are (e.g. in Europe, more than 50% of the petrol price is due to taxes…) | Noted. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 16446 | 16 | 17 | 3 | | | Define "innovative sources", e.g. "not yet used" would not be appropriate… | Taken into account. "Innovative sources" will be defined in SOD. |
| 16447 | 16 | 17 | 3 | | | Somewhere quote Harmeling et al. 2008 "Funding Sources for International Climate Policy" who reviewed most of these 'innovative' sources | Thank you. Source will be reviewed. |
| 12829 | 16 | 17 | 33 | 17 | 38 | See comment 6 | Comment not clear. |
| 14353 | 16 | 17 | 35 | 17 | 38 | I cannot find how the author estimates the level of subsidy as USD 100 billion. Without reason, it may mislead the reader. | Noted. Amount will be verfied and source cited. |
| 14354 | 16 | 17 | 39 | | | Definition of "South-south cooperation" should be explained. | Accepted. |
| 13442 | 16 | 17 | 4 | 20 | 28 | The discussion of Innovative Sources of Finance and Innovative Instruments is overly simplistic and not credible. It completely ignores recent published work on potential use of a Tobin Tax type mechanism or a user fee on transport fuels used in the international aviation and marine freight sectors as possible sources of Tens of Billions of dollars for climate finance. This represents a glaring and profound weakness in this chapter. | Taken into account. "Innovative sources" will be defined in SOD. |
| 18269 | 16 | 17 | 4 | 20 | 28 | The discussion of Innovative Sources of Finance and Innovative Instruments is overly simplistic and not credible. It completely ignores recent published work on potential use of a Tobin Tax type mechanism or a user fee on transport fuels used in the international aviation and marine freight sectors as possible sources of Tens of Billions of dollars for climate finance. This represents a glaring and profound weakness in this chapter. | Taken into account. "Innovative sources" will be defined in SOD. |
| 8731 | 16 | 17 | 4 | 17 | 15 | It should be mentioned, that carbon taxes also have an impact on emissions in developed countries. | Noted. |
| 8732 | 16 | 17 | 5 | 17 | 6 | Are the mentioned carbon taxes explicit carbon taxes or both explicit and implicit ones. | Under consideration for clarification in |
| 8312 | 16 | 17 | 6 | 17 | 7 | Correction: change sentence to "In Canada, the provinces of Quebec and British Columbia have raised approximately USD 1 billion through carbon taxes". | Noted. |
| 16958 | 16 | 17 | | | | There is at least one potential international funding source not mentioned here, which is to incorporate importers into domestic carbon pricing schemes but make the money raised at the border available for international climate finance. See Michael Grubb (2011): International climate finance from border carbon cost levelling, Climate Policy, 11:3, 1050-1057. | Noted. Reference will be reviewed and considered for the SOD. |
| 12652 | 16 | 17 | 16 | 17 | 21 | Estonia, Czech Republic and Poland are involved in "Green investment scheme" as well.<br>This paragraph should refer to "Emission Trading " as written in Article 17 of Kyoto protocol. | Noted. Text will be clarified in SOD. |
| 7436 | 16 | 17 | 3 | 17 | 43 | Consider debating these questions to better inofrm this subsection: 1) are these sources really innovative? 2) To what extent does funding through the carbon market in developing countries be considered additional rather than a self-financed given the principle of common but differentiated responsiblities? 3) what are the impacts of funding mitigation through the carbon market in developing countries in relation to access and affordability of energy, economic development, and welfare? 4) To what extent does revenues generated through the carbon market in developed countries be used to replace the forgone revenues from fossil fuel taxation in their public budgets and how much will be avialable to finance climate change mitigation and adaptation in developing couuntries? | Noted. Section on sources will be revised to better address these issues in SOD. |
| 12651 | 16 | 17 | 3 | 17 | 43 | Other innovative sources such as Taxes based on globalized activities or Debt swaps have been discussed in Leading Group on Innovative Financing for Development(http://leadinggroup.org/IMG/pdf/Mapping_FIDENG-3.pdf) | Reference will be evaluated for inclusion in SOD. |
| 2800 | 16 | 17 | 3 | 17 | 43 | These are all sources of public funds which can be used to fund subsidies. They are not sources of investment, they are simply ways for governments to raise money. | Noted. Section on sources will be revised in SOD. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 15673 | 16 | 17 | 4 | 17 | 15 | Discussion of innovative financing sources could include explicit reference to revenue generated from schemes to regulate emissions from international transport (bunker fuels), as these have been prominent in both the Report of the High-Level Advisory Group on Climate Change Financing (AGF) and broader policy debates. See also World Bank. 2011. Mobilizing Climate Finance: A Paper Prepared at the Request of G20 Finance Ministers. October 6, 2011. http://www.g20-g8.com/g8-g20/root/bank_objects/G20_Climate_Finance_report.pdf. | Noted. Section on sources will be revised in SOD. |
| 11047 | 16 | 18 | 16 | 18 | 37 | Pubulic export insurance system also contribute to technology transfer of infrastructural goods. For example, china, Korea, France(Coface) , Germany(Euler Hermes) , US(US-EXIM (Overseas Private Investment Corporation)and Japan(NEXI) etc have such a operation to mitigate political and credit risk. | Accepted. Will be reflected in SOD. |
| 7437 | 16 | 18 | 2 | 18 | 9 | It may be argued that concessional rather than competitive financing is needed to foster mitigation in developing countries. The question then whether the suggested sources and institutions of financing will be able to deliver this. | Taken into account in rewrite for SOD. |
| 16454 | 16 | 18 | 33 | 18 | 33 | If you mention FITs, which are essentially a policies, you also have to mention other finance-related policies, e.g. tenders, tax breaks, public investment in electricity infrastructure (important for grid access), check e.g. REN21 | Rejected. AMCs are on contract mechanism to respond to policy mandates; but will clarify in SOD. Other |
| 12830 | 16 | 18 | 34 | 18 | 35 | The abbreviations "EE" and "RE" are introduced without a definition which should be added. | Editorial. |
| 16455 | 16 | 18 | 39 | | | Not all power purchase agreements enable mitigation -> specify which ones (long-term, fixed-rate, rate high enough to cover costs) | Accepted. Will be reflected in SOD. |
| 16456 | 16 | 18 | 39 | | | (1) For the free-rider or additionality problem, you may cite Baumol & Oates (1988) as classic, or the newer literature of the CDM ; -> the free-rider problem actually occurs for any instrument with a subsidy element (so also FITs, concessiona loans, tax exemptions) -> this does not become clear in my view | Noted, but we don't understand the comment in relation to the referenced text. |
| 13441 | 16 | 18 | 53 | | | The acronym "PBI" is never defined. | Editorial. |
| 18268 | 16 | 18 | 53 | | | The acronym "PBI" is never defined. | Editorial. |
| 16453 | 16 | 18 | 7 | 18 | 9 | Write out EPC | Editorial. |
| 16451 | 16 | 18 | | | | The whole section is very much focused on instruments related to energy policy/management; the climate-specific instruments (carbon taxes, emission trading etc.) are MISSING | Accepted. Will be implemented for SOD. |
| 16452 | 16 | 18 | | | | This section mentions many interesting instruments, but also misses many (e.g. public-private equity funds, exchange rate risk-sharing pools, carbon price instruments, mezzanine financing, export risk credits….) -> either you provide a comprehensive overview or you select specific ones because they have advantages according to specific criteria -> mention your selection criteria or refer more to the literature | Accepted. Will be implemented for SOD. |
| 12960 | 16 | 18 | 2 | 18 | 9 | It is worth noting here that different types of investors will have different appetites for risk. Institutional investors may have requirements to conform to certain benchmarks defined by the designated asset class. | Accepted. Will be implemented for SOD. |
| 2801 | 16 | 18 | 38 | 18 | 46 | AMCs are a subsidy mechanism they are not a financial instrument | Rejected. AMCs are on contract mechanism to respond to policy |
| 12961 | 16 | 18 | 45 | 18 | 45 | INSERT AFTER 2009). "However, FITs still present some extrinsic risks to investments, for example the possibility of retroactive changes to FIT levels on existing projects, as was instituted by Spain in 2010, damaged investor confidence in renewable energy projects on a broader scale." CITATION: IIGCC (2010). Shifting Private Capital to Low-Carbon Investment. Available at: http://www.iigcc.org/__data/assets/pdf_file/0016/12247/IIGCC-Position-Paper-on-EU-Climate-and-Energy-Policy.pdf | Accepted. Will be implemented for SOD. |
| 16457 | 16 | 19 | 23 | 19 | 24 | Green bonds: discuss it broader, include Climate Bonds; if you want to focus on the residential sector, then include it the sub-section below | Taken into account. Will be included in SOD as appropriate. |
| 12486 | 16 | 19 | 3 | 19 | 3 | Please consider to add a paragraph about Certificates. "Green" certificates are used to increase the production of renewable energy in Sweden/Norway and "white" certificates are used to promote energy efficiency. For details, see section 15.5.3.7 | Taken into account. Will be included in SOD as appropriate. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 11048 | 16 | 19 | 5 | 19 | 6 | Government involvement (DOE ( Department of Energy ) etc)and garantee is required, see thailand ESCO funds http://www.ecft.org/home/index.php?option=com_content&view=article&id=67%3Aesco-fund&lang=en | Under consideration / evaluating for inclusion in SOD. |
| 12962 | 16 | 19 | 2 | 19 | 2 | INSERT AFTER: ...public benefit funds. “Key features of the sustainability of Germany’s FIT scheme are a clearly stated tariff digression over time to match all reductions in technology costs and an end target of renewable energies achieving grid parity with fossil fuels.” CITATION: IIGCC, INCR, IGCC and UNEP-FI (2011). Investment-grade climate change policy: Financing the transition to the low-carbon economy. Available at: http://www.iigcc.org/__data/assets/pdf_file/0010/15310/2011-Investment-Grade-Policy-Report.pdf | Accepted. Will be reflected in SOD. |
| 2802 | 16 | 19 | 4 | 20 | 28 | The first six mechanims mentioned are ways of providing subsidy for clean energy / efficiency and the last two are forms of financing . Again, they should not be in the same catergory. | Rejected, but classification of instruments will be clarified in SOD. |
| 17781 | 16 | 2 | | | | There should not be a conclusion at section 16.6.3? | Agreed. Section will be revied in SOD. |
| 16459 | 16 | 20 | 17 | 20 | 28 | Pooling: cite the literature (becomes not clear from where you get the information) | Accepted. Will be reflected in SOD. |
| 17787 | 16 | 20 | 25 | | | give one sentence summary | We don't understand the comment in relation to the referenced text. |
| 17786 | 16 | 20 | 29 | | | give a preamble after the section heading | Noted. Section will be largely revised |
| 13443 | 16 | 20 | 31 | 21 | 10 | This discussion of the "Energy and Power Sector" is grievously simplistic and incomplete. There is no discussion at all of the very substantial financial requirements associated with the replacement of frail and aging power sector infrastructure, particularly in Industrialized Countries, as has been well-documented by the IEA. | Taken into account. Section will be largely revised |
| 18270 | 16 | 20 | 31 | 21 | 10 | This discussion of the "Energy and Power Sector" is grievously simplistic and incomplete. There is no discussion at all of the very substantial financial requirements associated with the replacement of frail and aging power sector infrastructure, particularly in Industrialized Countries, as has been well-documented by the IEA. | see comment 13443 |
| 15414 | 16 | 20 | 40 | | | barriers to renewable financing – nonsense, concern about profitability are the only difference from anything else. Need generality about calling something difficult to finance or facing barriers when the plain meaning is “too expensive” | Noted. Text will be calrified in restructred SOD. |
| 16460 | 16 | 20 | 43 | | | Competitive public auctions: add "tenders" (common wording) | Taken into account. Will be considered in restructured SOD as approproate. |
| 16461 | 16 | 20 | 44 | | | "specific percentage of renewable energy" -> this is normally called Renewable Portfolio Standard (RPS) | Agreed. This will be changed |
| 16458 | 16 | 20 | 8 | | | Green bonds: discuss it broader, include Climate Bonds | Noted, per above response to comment |
| 12963 | 16 | 20 | 39 | 20 | 39 | Therefore it is important to understand the asset allocation requirements for institutional investors on infrastructure investments, notably specific liquidity and ownership requirements and leverage ratios. SOURCE: NAPF News (2012) Issue 1 “Pension Funds and Infrastructure.” | Noted, per above response to comment 12960. |
| 12831 | 16 | 21 | 11 | 21 | 17 | You may like to mention policies which explicitly aim at correcting the effect of ENVIRONMENTAL market failures as a third category of policies that contribute to the development and dissemination of green technologies. The subsequently cited emissions trading system constitutes such a policy instrument that aims at environmental market failures (negative externality of THG emissions) and is meant to create incentives for the development (and in consequence also for the dissemination) of greener technologies. | Taken into account. Will be considered in rewrite for SOD. |
| 16464 | 16 | 21 | 12 | 21 | 17 | When discussing technology & innovation, it looks strange that you just cite one World Bank study, while there is a whole strand of literature on these questions, called "science & technology studies" (check for books and papers of Malerba, Lundvall, Dosi, Winter); much of this literature actually looks at mitigation technologies, e.g. Johansson & Bergek, Hekkert, Geels, Unruh... | Taken into account. Will be considered in rewrite for SOD. |
| 16463 | 16 | 21 | 13 | | | "new technologies" -> needed in all sectors | Noted. |
| 16465 | 16 | 21 | 18 | 21 | 18 | The mentioned policy instruments also apply to other sectors | Noted. |
| 11049 | 16 | 21 | 20 | 21 | 20 | The legislation of energy saving is dropped, the low of energy efficiency improvement,energy saving is required to insert in text, please see APEC energy overview http://eneken.ieej.or.jp/data/4431.pdf | Noted. Will be taken into account in rewrite of this section |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 12832 | 16 | 21 | 23 | 21 | 23 | The sections 16.3.2 and 16.3.3 refer to sector specificities in developed and developing countries, respectively. Which criteria are used to differentiate between theses two groups of countries? It would make clear why India, which serves as example in section 16.3.2, is classified as a "developed country", here. | Noted. We will ensure consistency with the glossary (discussed in X-cut meeting) |
| 4529 | 16 | 21 | 25 | 21 | 37 | This paragraph highlights the role of venture capital. However, venture capital is responsible for a tiny fraction of investment, and for the industry sector (e.g. steel, cement and chemicals) the investments that would reduce GHGs largely have to do with improving efficiency of their operations and are not an area for venture capital finance. This paragraph seems more relevant to renewables where it would be interesting to compare VC investment with the pace of investment of for example solar manufacturing in China (and place this in the energy sector section). | Noted. Will be considred in rewrite for SOD |
| 13444 | 16 | 21 | 25 | 21 | 37 | This discussion is outdated and fails to reflect recent developments. The discussion of a contraction in venture capital flows to clean technologies in 2009 is misleading in that it ignores the substantial growth of ventue funding for these technologies in 2010 and 2011. | Noted. Message and data will be updated |
| 18271 | 16 | 21 | 25 | 21 | 37 | This discussion is outdated and fails to reflect recent developments. The discussion of a contraction in venture capital flows to clean technologies in 2009 is misleading in that it ignores the substantial growth of ventue funding for these technologies in 2010 and 2011. | Noted. Message and data will be updated |
| 13445 | 16 | 21 | 40 | 21 | 41 | This sentence is totally incomprehensible. | Agreed. Will be rewriten. |
| 18272 | 16 | 21 | 40 | 21 | 41 | This sentence is totally incomprehensible. | see comment 18272 |
| 9056 | 16 | 21 | 40 | 21 | 43 | This is sentence is incomprehensible to me: "The fragmentation of the transport GHG reduction project results in transaction costs that are generally superior to the climate benefits." Superior? Greater than? | Agreed. Will be rewriten. |
| 16467 | 16 | 21 | 44 | 21 | 44 | The difference between investment and operation costs is relevant for most sectors (e.g. energy, industry, buildings…) | Noted. |
| 9055 | 16 | 21 | 23 | | | The section 16.3.2 is on sector specificities in developed countries but in this line the example is from India, a developing country. | Agreed. This will be corrected |
| 16466 | 16 | 21 | | | | The whole section very much focuses on the public sector; the private sector can play an important role, e.g. in the operation of buses or railway lines, but also owners of air and road transport fleets | Agreed. The section will be largely revised |
| 13446 | 16 | 22 | 1 | 22 | 3 | This section is totally incomprehensible. | Agreed. Will be rewriten. |
| 18273 | 16 | 22 | 1 | 22 | 3 | This section is totally incomprehensible. | see comment 13446 |
| 13447 | 16 | 22 | 10 | 22 | 18 | This discussion incorporates a fundamental misconception in setting the boundaries of an economic problem and assumes a system that privatizes all benefits and socializes all investment losses. | Noted |
| 18274 | 16 | 22 | 10 | 22 | 18 | This discussion incorporates a fundamental misconception in setting the boundaries of an economic problem and assumes a system that privatizes all benefits and socializes all investment losses. | see comment 18447 |
| 9057 | 16 | 22 | 11 | 22 | 11 | The section 16.3.2 is on sector specificities in developed countries but the example cited is from Asia in which only Japan and possibly the Republic of Korea are developed countries. | Agreed. Will be changed in rewrite. |
| 15460 | 16 | 22 | 19 | | | The principal-agent problem is a major stumbling block to building efficiency in China. See http://eec.ucdavis.edu/publications/2010analyzingretrofitinbeijinggov.pdf | Agreed. Will be considered in rewrite of the section. |
| 13448 | 16 | 22 | 39 | 22 | 42 | This statement is incorrect. In many countries (including in the US and the EU), the reason that the emissions-reducing potential of the Ag, Land Use, and Forestry sectors remains untapped is not due to technical problems but rather due to policies that provide incentives for expanding emissions-intensive activities rather than their low-emissions alternatives. | Noted. Will be considered in the rewrite of this section. |
| 18275 | 16 | 22 | 39 | 22 | 42 | This statement is incorrect. In many countries (including in the US and the EU), the reason that the emissions-reducing potential of the Ag, Land Use, and Forestry sectors remains untapped is not due to technical problems but rather due to policies that provide incentives for expanding emissions-intensive activities rather than their low-emissions alternatives. | see comment 13448 |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 12965 | 16 | 22 | 12 | 22 | 18 | According to Ürge-Vorsatz et al, in an appraisal of 20 regulatory instruments, a diverse portfolio of policy instruments is the most effective way to drive CO2 reductions in buildings, with the most cost-effective being appliance standards, demand-side management programmes and mandatory labelling. See, Ürge-Vorsatz, Koeppel and Mirasgedis (2007). Appraisal of policy instruments for reducing buildings' CO2 emissions, in Building Research & Information, 35:4, 458-477. | Noted. Will be considered in the rewrite of this section. |
| 12966 | 16 | 22 | 19 | 22 | 27 | To complete the bullet points in this section, allow me to suggest a recent paper compiled by IIGCC's Property Working Group: IIGCC (2012). Enhancing the real estate sustainability policy framework. Available at: http://www.iigcc.org/__data/assets/pdf_file/0005/15377/IIGCC-enhancing-the-real-estate-sustainability-policy-framework.pdf This paper outlines 7 barriers to scaling up finance in energy efficiency as identified by institutional investors: Policies that inadequately target the relevant practitioner making key management decisions, failure to target opportune stages in a building's lifecycle, tendency to focus on design over operational performance, market signals do not currently value sustainability, lack of strong compliance regimes – to enforce existing regulations, lack of information and skills in green building and failure to consider unintended consequences of policy – for example premature forced obsolescence of buildings. | Noted. Will be consider in rewrite the section.SOD will focus more on investment barriers. |
| 12964 | 16 | 22 | 9 | 22 | 9 | There is also a need to differentiate ownership agreement because renters and owners operate under different incentives in terms of investing in energy improvements, and trends in property ownership vary drastically across markets. | Agreed . Will be taken into account in rewrite of the section. |
| 16468 | 16 | 22 | | | | The whole section is very much written in a "abatement cost" language; a stronger focus on "finance" is needed | Taken into account. The section will be largely rewriten. |
| 11228 | 16 | 23 | 2 | | | As regards tropical forest countries, the land rights of indigenous peoples and local communities are seldom fully recognized in national legal frameworks (RRI, 2012) | Check reference. |
| 11050 | 16 | 23 | 27 | 23 | 40 | There are "immense" opportunities for financing mitigation is not appropriate, a lot of countries face on financial barrier, even in emerging country. According to our study and steel company, India has no any special financial assistance such a tax break, subsidy etc. | Linked to the discussion on complementariness and trade-offs. |
| 16471 | 16 | 23 | 43 | 23 | 43 | write "non-CO2 GHGs" for clarity and mention which ones (HFC?) | The text will be reviewed to be clearer. |
| 16469 | 16 | 23 | | | | Becomes not clear why you discuss all sectors for developing countries again -> many of the mentioned points (e.g. relevance of policies, CCS, digital technologies) also apply for industrialized countries -> would suggest to just focus on the main differences between North and South (e.g. currency risks, political risks, economic risks, many sectors are still dominated by the public sector in many developing countries...) | Accepted. SOD will be largely restructured. |
| 14355 | 16 | 23 | 12 | 23 | 25 | CCS is available at very limited developing countries. I don't think it is appropriate as example of new technology in developing countries. Rather, smark grid must be appropriate. In general, developing countries need to increase their energy supply since many of poor people still have no access to the energy. This means that most of developing countries will be green field of renewable or low carbon energy which could help poor countries to supply energu to poor people. Such potential of low carbon energy supply in developing countries should be focused. | Discussion with the group and with the x-cutting group on adaptation. |
| 9058 | 16 | 23 | | | | Authors might want to consider citing and learning from an important study India on incremental cost on six sectors: Centre for Science and Environment (CSE) (2010). Challenge of the New Balance. New Delhi. | Try to re-structrure the sub-sections. |
| 16470 | 16 | 23 | | | | You may mention that some energy-intensive industries are shifted from developed to developing countries, which leads to additional emissions in developing countries (see e.g. Peters/Hertwich & Edenhofer)and to many investment decisions where low-carbon tech could be applied | Check references. Re-structure the title of sub-section to accommodate a broader perspective. |
| 16472 | 16 | 23 | | | | The whole section only refers to technologies, not to finance | Check with WGII. |
| 16474 | 16 | 24 | | | | Mention in caption that this is about "transport" | Additional data and literature will be |
| 16473 | 16 | 24 | 15 | 24 | 22 | Sections needs rewording: 1) "but there are many…" does not make sense as intro; 2) whole section only refers to technologies, not finance; 3) "with great potential" -> not clear what this means, sounds very unscientific, add details (e.g. % of potential below 20 $/tCO2) | Taken into account. It has already been mentioned that these are only few examples. It can be reinforced in the |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 13449 | 16 | 24 | 4 | 24 | 9 | This discussion is overly simplistic and not correct. In many Industrialized countries, growth in buildings sector demand for energy is strongly driven by increases in "plug load"-related demand for electricity, not just by HVAC demand driven by increased floor space. | It will be re-structured. |
| 18276 | 16 | 24 | 4 | 24 | 9 | This discussion is overly simplistic and not correct. In many Industrialized countries, growth in buildings sector demand for energy is strongly driven by increases in "plug load"-related demand for electricity, not just by HVAC demand driven by increased floor space. | Linked to the discussion on complementariness and trade-offs. |
| 14356 | 16 | 24 | 26 | 25 | 15 | Major source of GHG in agriculture sentor in developing countries include Methan Gas from rice paddy. Many of developing countries rely their economy and employment on agriculture sector. So, agriculture and land use is critical for them in terms of economy and employment, in turn, GHG mitigation. | The text will be reviewed to be clearer. |
| 18277 | 16 | 24 | 27 | 25 | 16 | This section is unacceptably weak, with major gaps in coverage and repeated use of overly simplistic concepts. For example, the section does not address the potential for emissions mitigation in the ag sector of Industrializd Countries or the issue of financing measures to achieve this potential. The section does not address the impact of existing tax and subsidy policies on emissions-intensive activities or the financial potential of reducing or redirecting these subsidies, particularly in the cases of industrial agriculture and factory-like facilities for livestock production. | It is just an introduction to the sub-section. However, a reference can be sought. |
| 11229 | 16 | 25 | 11 | | | Significant challenges still exist as regards full compliance with relevant international human rights and environmental obligations and standards. | Noted. Comments will be reflected in the restructred SOD as appropriate. |
| 16475 | 16 | 25 | 3 | 25 | 5 | Cite literature why public and not private sector is important (in many cases the public sector is responsible for forestry policy but the private sector is the one investing or not…) | Taken into account. The differentiation will be highlighted in the SOD (maybe in |
| 8063 | 16 | 25 | 4 | 25 | 4 | as written here it seems as if international public finance could only be ODA | Comment doesn't make sense in line 4. We assume it refers to line 2. International public finance is not all ODA but "Other official flows" are very |
| 8064 | 16 | 26 | 10 | 26 | 10 | is it really "to enable mitigation finance" and not rather "mitigation action"? And would this not also be applicable to adaptation? | Noted. |
| 16476 | 16 | 26 | 2 | 26 | 2 | Sentence needs re-wording | Rejected. |
| 11231 | 16 | 26 | 21 | | | In addition to facilitating the political, fiscal and educational frameworks, government should also provides modalities for full and effective participation of stakeholders and rightsholders. | Under consideration / evaluating for inclusion in SOD. |
| 16477 | 16 | 26 | 21 | 26 | 27 | Some policies may not be at the right place, e.g. quotas are rather mandating, financial incentives can be seen as facilitating. Difference between facilitating and resourcing does not become clear | Noted. Will clarify in SOD. |
| 11232 | 16 | 26 | 23 | | | Information should be made publicly available to stakeholders and rightsholders as well, not only to the market. | Noted. |
| 18279 | 16 | 26 | 29 | 26 | 10 | This is just a mental error. Line 29 announces that the section will treat "five broad categories" but it covers only FOUR categories. | Editorial. |
| 11230 | 16 | 26 | 4 | | | Proper consideration should also be paid to the, legal and regulatory frameworks and social actors... as key requirements to ensure social and environmental sustainability as well as the attractiveness of financing. Governments should ensure legal reforms aimed at ensuring that climate finance and related activities will do no harm to local communities and indigenous peoples, be participatory and directly accessible - for financing activities based on traditional knowledge and traditional sustainable resource conservation. | Noted. Covered by other sections of WGIII report. |
| 18278 | 16 | 26 | | | | This section is also weak. This where the chapter should treat the topics of removing perverse incentives and subsidies for emissions-increasing activities. Unfortunately, it ignores both important topics. | Under consideration / evaluating for inclusion in SOD. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 12967 | 16 | 26 | 10 | 26 | 14 | To enable mitigation finance, government needs to a) evolve TRANSPARENT policy, fiscal, legal and educational frameworks THAT ARE ALIGNED WITH WIDER POLICY GOALS INCLUDING ECONOMIC, ENERGY, RESOURCES AND TRANSPORT POLICY OBJECTIVES b) build institutional capacity across sectors and at various levels; c) proactively respond to the needs and preferences of ACTORS BY PROVIDING INCENTIVES TO INVEST WHICH RECOGNIZE AND COMPENSATE FOR ANY ADDITIONAL RISK INVOLVED IN THE INVESTMENT d) establish and maintain a range of oversight, accountability , and feedback mechanisms; and e)mobilize and allocate public resources and investments. | Noted. Edits will be included as appropriate in restructured section. |
| 13064 | 16 | 26 | 2 | 26 | 27 | I think it should be appropriate to mention in this section a synthesis work undertaken by WBCSD and published in April 2010 called "Enabling Frameworks for technology diffusion". This work was undertaken at the request of EGTT (Expert Group on Transfer of Technologies) of UNFCCC when consultation of business was framed by this body. This publication, which refernces are below could be accompanied by the following text which summarises the findings : "Business has experienced that five elements are necessary to enhance investments and sales of low carbon technologies : strong signals from governments towards low carbon growth, adequate institutionla frameworks, appropriate absorptive capacity in institutions , business and society, economic and financila incentives, energy efficiency drivers, and business engagement with governements. Specific enablers were indentified in the following sectors :power,cement, road transport, buildings and forests (WBCSD, 2010).". The publication can be quoted as : WBCSD (2010). Enabling Frameworks for technology diffusion. WBCSD, Geneva, 13 Switzerland, 32 pp., (ISBN: 978-3-940388-61-2). Available at: http://www.wbcsd.org/Pages/EDocument/EDocumentDetails.aspx?ID=149&NoSearchContextKey=true | Noted. Reference will be evaulated and included in SOD as approproiate. |
| 12968 | 16 | 26 | 31 | 26 | 31 | ...performance, and facilitating markets." | Editorial. |
| 11051 | 16 | 27 | 35 | 27 | 35 | MEPS for appliance is very populler policy in developing countries as well,thus, several counties should be listed in the text. More comprehensive study is needed. | Noted. Will cite sources that provide more info. |
| 16479 | 16 | 27 | 38 | 27 | 42 | Mention instruments here, e.g. capacity building, information campaigns, labels, knowledge platforms… (the IEA policy database has a good overview) | Rejected, but how facilitation occurs will be included in the SOD. |
| 16480 | 16 | 27 | 43 | 27 | 43 | here you can refer to section 16.3.1. , where a whole range of instruments are discussed to improve access to finance | Noted. |
| 16478 | 16 | 27 | 9 | 27 | 25 | mention carbon price and quantity driven instruments (e.g. ETS or RPS) -> both of them also affect price of consumption -> your distinction btw "affecting price" and "affecting "performance" is not very useful, as both of them can be linke -> a beter distinction may be btw price-based and quantity-based instruments. Among quantity-based instruments, you may distinguish btw. flexible quantity-based instrument (e.g. ETS or RPS) that affect the prices in the market an non-flexible quantity-based instruments (e.g. standards) | Accepted. But will probably not be discussed in this section, but in other section of SOD. |
| 12969 | 16 | 27 | 48 | 27 | 48 | Additionally, private investors may have a difficult time financing energy projects in developing countries because of less developed local banking sectors. | Under consideration / evaluating for inclusion in SOD. |
| 16481 | 16 | 28 | 1 | 28 | 1 | Why are you discussing barriers for policy-makin g and implementation here? Isn't this the finance chapter? | Noted. Will clarify in SOD. |
| 8313 | 16 | 28 | 27 | 28 | 33 | Given that well-designed regulations, which are stringent and flexible, can spur innovation and enhance competitiveness, please add "if poorly designed" before "they can become impediments to innovation and competition". | Will revise in SOD. |
| 8065 | 16 | 28 | 4 | 28 | 7 | it would be interesting to mention shortly the other barriers here | Noted. |
| 18280 | 16 | 28 | 9 | 28 | 25 | The discussion of the fiscal dimension of climate financing omits any discussion of the impacts of fossil fuel subsidies on climate finance. This section needs to compare the impacts of fossil fuel subsidies on future emissions to the impacts of proposed incentives for climate finance and emissions-reducing activities. | Noted. Addressed in other section(s). |
| 16482 | 16 | 28 | | | | Mention import taxes for low-carbon technologies | Noted. |
| 16483 | 16 | 28 | | | | Difference btw regulations and statues does not become clear according to the description; what is the relevance of the distinction for the low-carbon finance context? | Noted. Will consider revision for SOD. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 4530 | 16 | 29 | | | | This figure is at odds with the facts regarding funding of R&D and exaggerates the governmental role. This figure/depiction should be contrasted with the reality who is actually making R&D investments today. Examination of the R&D statistics (reference OECD report on R&D Statistics) shows that for the OECD roughly two thirds (and rising) of R&D is carried out or funded by the private sector, and a third by government. | Noted. Comments will be considered in the restructured chapter as appropriate. |
| 3268 | 16 | 29 | 7 | 29 | 9 | This paragraph states that "A variety of different theoretical and analytical perspectives has been applied to study and understand technology transfer, but no comprehensive theories yet exist." This seems misleading and would be better replaced with a reference to the other sections of AR5 that actually discuss some of these perspectives and definitions. | Accepted. Section will be disolved in SOD. |
| 16484 | 16 | 29 | | | | (1) whole section needs re-writing (english language native should check it), (2) more academic literature needed, does not help too much when just citing UNFCCC; (3) in general, it is not obvious why this section is needed as a) this is the finance and not the technology chapter and (b) almost everything (policies, R&D, financing) is discussed in other sub-chapters of chapter 16; (4) to better integrate this into the whole chapter, this section could focus on the link of finance and technology transfer, e.g. financing tools that promote tech transfer (e.g. CDM) or transfer of "financing technology or know-how" ) tools and knowledge needed for financing low-carbon technology) | Noted. Chapter will be restructured. |
| 6951 | 16 | 29 | 14 | 29 | 15 | Please provide a more specific reference to WGI AR5. | Noted. Reference will be provided if paragraph will be retained. |
| 18281 | 16 | 30 | 13 | 30 | 30 | This para needs a citation for the quoted statistic on the declining share of government research and a footnote on how nuclear R&D is included in the cited calculation (e.g., as energy R&D or as defense spending). | Noted. Appropriate referencing will be used if paragraph will be retained in SOD. |
| 9059 | 16 | 30 | 43 | | 46 | There is a direct quote in this paragraph from a UNEP publication which refers to an "inflection point." But the preceding paragraphs do not describe what the previous situation was to justify characterizing 2008-2009 as a inflection point. The observation of the UNEP study of an inflection point just when the financial crisis erupted can be interpreted as an instance that the private sector will tend to over-finance environmental projects during periods of high financial liquidity in search of high returns through risky projects. This means that the levels of private financing during period of abundant global liquidity in 2000-2008 cannot be directly interpreted as evidence that the private sector can provide climate financing at the scale required except in periods characterized by speculation in search of potentially but unsustainably high returns. This is the same point as my comment no. 20 . Long-term and steady public sector climate policy, not abundant liquidity arising from other flaws in the international financial system, is indispensable to mobilize sutainable private investment and risk-taking in climate change. | Noted. Comments will be considered in the restructured chapter as appropriate. |
| 16485 | 16 | 30 | 7 | 30 | 7 | purchase/trade of CDM credits as "technology transfer" sounds strange, but CDM projects involve tech transfer, cite the extensive literature (e.g. Seres et al., Schneider et al. -> cite them also on page 31, line 40) | Noted. Reference will be reviewed and included in the restructured chapter as |
| 13058 | 16 | 30 | 20 | 30 | 32 | A reference could be attached to this sesction on Research and Development, to the following publication of WBCSD that was done at the request of EGTT in the private sector consultation handled by this body : WBCSD (2010). Innovating for Green Growth, 40pp, ISBN: 978-3-940388-68-1 and can be found at the site : http://www.wbcsd.org/Pages/EDocument/EDocumentDetails.aspx?ID=151&NoSearchContextKey=true | Noted. Reference will be reviewed and included in the restructured chapter as appropriate. |
| 16486 | 16 | 30 | | | | Substantial part of this section is referring to R&D (which is chapter 16.5.1.1) | Noted. Chapter will be restructured. |
| 18253 | 16 | 30 | 33 | 30 | 36 | Similar terms are used referring to “processes of research, development, demonstration, and deployment (RDD&D) is reducing the private spending on climate-smart technology, delaying its diffusion,” | Noted. Chapter will be restructured. |
| 16487 | 16 | 30 | | | | What is difference between "tech diffusion" and "tech transfer" (according to your definition of tech transfer, there should not be any) | Noted. Text will clarified if retained in SOD. |
| 9938 | 16 | 31 | 16 | 20 | | If you can list the detailed technology transfer in energy sector in a table, which can demostrates which technology has been tranfered from which country to which coutry. | Noted. Outside the scope of the chapter. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 18282 | 16 | 31 | 22 | 32 | 17 | This section again ignores the potential use of large-scale mechanisms such as a Tobin Tax or a fee on emissions from international air and marine freight travel as a mechanism for funding climate-related technology transfer. | Accepted. |
| 9939 | 16 | 31 | 22 | 32 | 17 | The funding approaches for technology transfer is almost the same to climate financing in 16.2, so actually funding for tranfer is one part of climate financing. Maybe this chapter should be recomposed, according to the lifecycle of climate financing, which includs the finance sources, instruments, usages, etc. | Noted. Chapter will be restructured. |
| 8066 | 16 | 31 | 31 | 31 | 31 | which sector is being referred to? | Take into account. Text will be revised in restructured chapter. |
| 12003 | 16 | 31 | 36 | 31 | 42 | see my comment above in cell K11: one third is wrong, it is more, difficult to say how much, but definitely more. | Noted. Reference is provided. |
| 11233 | 16 | 31 | 39 | | | In some cases CDM projects have resulted in adverse social and environmental impacts. | Noted. Outside the scope of the chapter. |
| 13724 | 16 | 31 | 39 | 31 | 43 | Replace by cross-reference to Ch. 13.13.1.2 | Noted. Will be incorporated if retained in |
| 16488 | 16 | 31 | | | | You miss two key funding challenges for tech transfer: domestic finance and financial instruments of multilateral development banks | Noted. Comment will be considered in the restructured chapter as appropriate. |
| 14996 | 16 | 31 | 22 | | | The chapter should discuss offsets in cap-and-trade systems as a means of financing developing country mitigation efforts. Beyond the CDM, some programs (e.g., California, Australia) are considering inclusion of international offsets in their trading regimes. Such provisions could drive significant flows of investment from private entities with compliance obligations to mitigation efforts in developing countries. | Noted. Comment will be considered in the restructured chapter as appropriate. |
| 3305 | 16 | 31 | 43 | 32 | 17 | Delete these paragraphs because they overlap with chapter 13, International Cooperation, and they are not strong paragraphs and are understandably not fully developed. | Noted. Chapter will be restructured. |
| 11106 | 16 | 32 | 1 | 32 | 11 | Both Chapter 13 and Chapter 15 deal with issues on IPRs in details. Compared to these chapters, the description of this paragraph is partial, probally because of the limit of space. Thefore, it may be better to refer to these chapters and avoid duplicating similar descriptions in this chapter. My suggestion is "Another sector relevant for technology transfer flows is the international market. There is evidence that those links go through trade on intermediate goods and capital goods. In this regard, IPRs play an important role, and Chapter 13 and 15 deals with IPR-related issues." | Accepted. |
| 11052 | 16 | 32 | 12 | 32 | 17 | The following description is quite misleading. “Over the last years, data show that a .. official export credits flows have “gone to transport and industry sectors, followed by energy projects”. The role of trade financing technology transfer for mitigation “may” not conclusive, however, these mentioned financial share is not directly explain its effect. The citation is not appropriate.<br>Through my working experience at Bilateral Financial Institution, without these export credit, environment efficient technology in industry and transport sector is not realized in developing country. These country face financial and technology barrier to introduce expensive but environmental sound efficient infrastructure with concessional loan □ | Noted. Comment will be considered in the restructured chapter as appropriate. |
| 13725 | 16 | 32 | 25 | 32 | 31 | Replace by cross-reference to Ch. 13.13.1.2 | Noted. Will be incorporated if retained in |
| 12004 | 16 | 32 | 28 | 32 | 31 | you need to explain more the issue with the transaction costs. The transaction costs have been greatly reduced during the last two years. | Noted. Outside the scope of the chapter. CDM will be discussed in more depth in |
| 8738 | 16 | 32 | 28 | 32 | 31 | Why does a price have to be high to generate demand? | Noted. Text will be revised. |
| 7129 | 16 | 32 | 32 | 32 | 37 | Information can be updated on the basis of UNFCCC COP, decision 1/CP.16, establishing a Technology Mechanism, under the guidance and accountable to the COP, which consist of a Technology Executive Committee, and a Climate Technology Centre and Network (CTCN), being one of the priorities areas "Increased public and private investment in technology development, deployment, diffusion and transfer". | Agreed. |
| 16489 | 16 | 32 | | | | This sounds like industrialized countries, CDM and GEF are responsible for tech transfer but you miss some of the key players: companies in Annex-1 countries, governments and companies in non-Annex-1, non-UNFCCC institutions such as MDBs and UN organizations | Noted. Comment will be considered in the restructured chapter as appropriate. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 16491 | 16 | 33 | 10 | | | Define "institutions" for this chapter-> only organizations and funds, or more general: set of rules that shape scocial interaction (if second, refer to North (1990) or other social scientists) | Accepted. Definition will be included. Text refers to a broader defintion of institutions but that include organizations |
| 16492 | 16 | 33 | 21 | 33 | 28 | Many statements, no references, cite literature | Accepted. More references will be cited. |
| 11234 | 16 | 33 | 32 | | | Direct access to financing for adaptation and mitigation actions designed and implemented by local communities and indigenous peoples should also be allowed. (Martone, Rubis, 2012) | Noted. Will make reference to this new modality when referring to GCF and |
| 8739 | 16 | 33 | 42 | 33 | 44 | Two things: Firstly, finance ministries are generally invovled with all public expenditure, i.e. all projects involving public co-financing. Secondly, ministries of energy, planning, etc are also increasingly involved in implementing such activities. | Accepted. Will add a reference to this. |
| 18283 | 16 | 33 | 45 | 34 | 6 | This section needs to expand the reference to national finance channelling entities such as the Indonesia Climate Change Trust Fund as a vehicle for integrated planning and targeting of national, international, and FDI-related investments. This section also needs to cover the role of entities such as the BNDES in Brasil as a national arrangement for managing climate-related investments. | Accepted. A table will be added listing those that have been creating recently. |
| 16490 | 16 | 33 | | | | Wholesub- chapter could be part of the policy sub-chapter; try to focus more on institutions relevant for finance (not for climate policy in general) | Accepted. Text will be revised to focus only on institutions relevant to finance in |
| 14994 | 16 | 33 | 1 | | | This section should be expanded significantly. In particular, the discussion on bilateral finance should be expanded to identify the level and nature of investments that the major donor countries are making. Also, some discussion of the various institutional arrangements and their relative merits or challenges would be appropriate here. | Noted. Section will be revised. |
| 16493 | 16 | 34 | 2 | 34 | 3 | "national implementing entities" -> they are now established as part of the "direct access" window of the Adaptation Fund; as "direct access" is an important development, also for the GCF/GEF, discuss it somewhere (you may cite Horstmann 2011/2 in "Climate Policy" or others) | Accepted. A table listing these and their main characteristics will be added |
| 16495 | 16 | 34 | 25 | 34 | 25 | Replace "Multilateral" with "Global" (else the distinction between multilateral and regional and trilatereal does not make too much sense) | Rejected. Here we refer to multilateral arrengements. |
| 16496 | 16 | 34 | 32 | 34 | 33 | Only Kyoto but not UNFCCC includes "binding emission reductions"; both call for "new and additional finance" | Accepted. Text will be revised. |
| 15675 | 16 | 34 | 33 | | | Financing commitments under the UNFCCC and KP only apply to Annex II, not Annex I countries. | Accepted. Text will be revised. |
| 16497 | 16 | 34 | 35 | 34 | 35 | The voluntary market has not been generated by the UNFCCC/Kyoto | Rejected. Although not directly generated, voluntary markets have been triggered by ETS under the UNFCCC. |
| 16498 | 16 | 34 | 40 | 34 | 40 | Write out SCCF and LDCF | Accepted. Will do. |
| 8067 | 16 | 34 | 44 | 34 | 45 | unclear what is being referred to with this transitional process; where is the 2013 coming from? | Accpeted. Will update the text to reflect new agreements and decisions. |
| 11235 | 16 | 34 | 45 | | | The first meeting of the Board of the Green Climate Fund took place in August 2012. Among te key challenges it will have to face are the need to ensure full and effective participation of stakeholders, ensuring a robust safeguards system and related compliance and accountability mechanisms | Noted. Will make reference to role of stakeolders when speaking of GCF. |
| 16494 | 16 | 34 | | | | Interesting chapters but does not refer to finance | Accepted. Text being revised to focus only on issues of finance in coordination |
| 9421 | 16 | 34 | 36 | | | When discussing institutional arrangements in the international level, do authors only focus on the basket of six GHGs in the Kyoto Protocol? Isn't it also important to take into account non-CO2 GHG emissions, not only six Kyoto gases but also transboundaryair pollutants and Montreal gases that also have a large impacts on climate change? For example, as for Montreal gases such as CFCs and HCFCs, these are long-lived gases with very high global warming potentials that the policy makers were aware of. These gases were excluded from the UNFCCC to avoid any overlap with the Montreal Protocol, however, there will be still large amount of emissions in CO2 equivalent in the next 10 -20 years which are difficult to be reduced even regulated under the Montreal Protocol, because the Montreal Protocol only regulate the phase out schedule of consumption and production of CFCs and HCFCs and still allow production of HCFCs especially in developing countries. | Noted. Reference will be made in SOD where appropriate. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 15674 | 16 | 34 | | | | Either here or in section 13.11 it would be useful to elaborate further on the range of ways in which financing can support international cooperation on climate change. See generally Rübbelke, D.T.G. 2011. International Support of Climate Change Policies in Developing Countries: Strategic, Moral and Fairness Aspects. Ecological Economics 70 (8):1470-80. Either way, it would be useful to cross-reference between these two sections. | Rejected. This belongs more in chapter 13. |
| 14995 | 16 | 34 | 25 | | | The chapter should discuss the World Bank's Forest Carbon Partnership Facility as a key example of multilateral financing that can play a role in capacity building and mitigation. This section could be an appropriate place for that discussion. | There is already a reference to the CIFs administered by WB - will list each separately in SOD. |
| 8068 | 16 | 35 | 23 | 35 | 23 | should be "bilateral climate finance" instead of "bilateral ODA" | Rejected. Some ODA is dedicated to climate finance as defined in the chapter - but will make sure to clarify this in the |
| 8741 | 16 | 35 | 31 | 35 | 35 | Given that it is very much up to the countries to report whether financing deserves the Rio marker or not, it is not certian how precise an instrument the Rio marker is. | Accpeted. Will clarify the shortcomings of this tool, nevertheless as an important but imperfect tool to provide some |
| 16501 | 16 | 35 | 35 | 35 | 35 | Apart from Corfee-Morlot, also cite Michaelowa&Michaelowa(2011) for a more critical view on the markers | Accpeted. More references will be added in the re-write of the chapter. |
| 8069 | 16 | 35 | 35 | 35 | 35 | there is now also an adaptation marker | Accpeted. Will make a reference to this. |
| 17792 | 16 | 35 | 36 | | | plurilateral or multilateral to keep it clear for more non-specialised audience? | Rejected. The two terms refer to different things but accept that a |
| 16499 | 16 | 35 | | | | (1) The EU is an important regional arrangement, also for finance; (2) you may cite the Climate Funds Update webpage for the funds you mention here (also before) | 1) Rejected. The EU is not a financing mechanism though it is true that it manages funds under its purvue and will |
| 16500 | 16 | 35 | | | | This section should be more about the bilateral institutions and not the data collection | Rejected. We include the Rio Markers as an important tool to help track climate finance but agree that the text needs to |
| 16502 | 16 | 35 | | | | (1) Not clear if this section is needed -> are these arrangements relevant? give examples for the case of climate change; (2) instead, you may discuss multi-bi institutions, like the CIFs, this is an important development… | 1) Accepted. Text being revised to focus only on those relevant to finance to climate change 2) CIFs are covered |
| 8070 | 16 | 36 | 1 | 36 | 7 | are there also such plurilateral or triangular arrangements for renewable energies or energy efficiency? | Yes there are and will make reference to this as appropriate in redrafted section. |
| 18284 | 16 | 36 | 12 | 36 | 20 | This concluding section refers to the importance of mitigation activities that are integrated into overall national plans. However, the preceding sections of this Chapter make no mention of any of the most successful of these efforts, including the efforts of the NDRC and the provisions of China's 12th Five Year Plan or the efforts of BAPPENAS in Indonesia that have led to the creation of Indonesia's Sectoral Roadmap for Climate Change and Development or Ethiopia's program of Green Economic Development. The omission of any reference to these and similar activities in other developing countries reinforces the unacceptable "tilt" of this section toward the activities and interests of Annex 1 (i.e., Industrialized) countries. | Accepted. There will be a new table added to these national entities and the important role that they are playing or that will potentially play. |
| 11053 | 16 | 36 | 13 | 36 | 20 | "The overall state of institutions in developing countries is weak." change to "need further capacity building" | Accepted. Will revise text to place focus on need for building the capacities of |
| 16503 | 16 | 36 | 13 | 36 | 14 | This is a very strong statement, and certainly not an obvious "conclusion" of what you discussed before. -> You may cite the work of Winkler on SD PAMs but I am not sure if this is enough to make such a strong statement | Accpeted. Will cite references and efforts of countries to do this and the reasons for doing it. |
| 8071 | 16 | 36 | 18 | 36 | 20 | national implementing entities and national funds have also great potential. If followed by the sentence currently in the text, it sounds like they could also lead to the mentioned weaknesses | Accepted. Will add. |
| 16504 | 16 | 36 | | | | Why are these conclusions only about domestic instutions? Why do you refer to important things in the conclusions like fragmentation and duplication that were, however, not discussed before? | Accepted. Conclusion will be rewritten to cover all the issues of the section. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 12835 | 16 | 37 | 12 | 37 | 13 | This sentence is contradictory. If mitigation and adaptation were complementary, the investment in mitigation would increase the need to invest in adaptation (and not, as mentioned, reduce it). If more mitigation reduces the investment in adaptation, the two strategies are substitutes, and not complements. | Noted. Wording will be clarified. |
| 15415 | 16 | 37 | 23 | | | I know Tol and cant figure out what they are talking about – eg private vs public good aspects of adaptation | Noted. Reference will be double-checked and SOD text clarified. |
| 12836 | 16 | 37 | 24 | 37 | 29 | The message is unclear to me. | The text will be reviewed to be clearer. |
| 12834 | 16 | 37 | 1 | | | In this subsection the notions of complementariness/complement/complementary should be defined to avoid confusion. The economic term "complement" in its strict sense implies that more mitigation leads to an increase in the effectiveness of adaptation and vice versa. According to that, the general relationship of mitigation and adaptation is the following: An increase in mitigation lowers the expected damages of climate change, and so adaptation becomes less effective. In the literature we also find that mitigation and adaptation are economic substitutes, and not complements (see e.g., Ingham, A., J Ma and AM Ulph (2005), Can adaptation and mitigation be complements? Tyndall Centre Working Paper No. 79. Barrett, S (2008) Dikes v. Windmills: Climate Treaties and Adaptation, Discussion Paper, Johns Hopkins University, and Tol, RSJ (2005) Adaptation and mitigation: trade-offs in substance and methods, Environmental Science & Policy 8, pp. 572–578). Also note the short summary concerning this issue in chapter 13.3.1, p.18 ll. 27 to 36. If the notion "complements" is just used to illustrate the fact that it is optimal to apply a mix of both strategies, mitigation and adaptation, (instead of one strategy), then it would be helpful to use another term or to define this notion at the beginning. Nevertheless, in some special sectoral cases there might exist synergies between mitigation and adaptation which could be discussed in detail in section 16.7.2.1 (see Yohe and Strzepek (2007) Adaptation and mitigation as complementary tools for reducing the risk of climate impacts, in Mitigation and Adaptation Strategies for Global Change, Vol 12, 5.). | Noted. Term will be clarified in SOD and discussed with the x-cutting group on adaptation. |
| 16505 | 16 | 37 | | | | Whole section is not very easy to read, consider better structuring: question, elaboration, conclusion (particularly sections 16.7.2.1 to 16.7.2.3 are not very well structured) | Noted. Section will be re-structrur as appropriate. |
| 12833 | 16 | 37 | 9 | | | While the "macro-level perspective" of investments in mitigation and adaptation is described in section 16.7.1, the (expected) "micro-level perspective" is missing as an explicit section in this chapter. Due to the global-public-good character of mitigation in contrast to the private-good property of adaptation, this would lead in a micro-level perspective (without a global agreement to mitigate GHGs) to an underinvestment of mitigation due to free riding (see, e.g. Zehaie, F (2009) The Timing and Strategic Role of Self-Protection, Environmental and Resource Economics 44:337-350, Heuson, C et al. (2012) Which mode of funding developing counrtries' climate policies under the post-Kyoto framework?, RECAP15 Discussion Paper Series 4). | Noted. Reference will be evaluated and included as appropriate. Titel will be reformulated to accommodate a broader perspective. |
| 16506 | 16 | 37 | | | | Check if this is not discussed elsewhere in AR5 | Check with WGII. |
| 12837 | 16 | 37 | 37 | | | Besides the integrated assesment models, there are also theoretical contributions to the issue of timing. You may like to mention that by timing adaptation before mitigation the non-cooperative contributions to mitigation decrease because of strategic actions (see Zehaie, F (2009) The Timing and Strategic Role of Self-Protection, Environmental and Resource Economics 44:337-350). | Check reference. |
| 9941 | 16 | 38 | 1 | | 26 | Literatures in these paragraphs should not just be listed one by one, but the implications and contributions to time dimension should be recomposed. | It will be re-structured. |
| 12838 | 16 | 38 | 20 | 38 | 26 | You may like to check whether your interpretation of the term "complememts" is in line with the authors'. They may refer to their result that "an integrated adaptation and mitigation strategy is more effective" (Wang and McCarl (2011) Inter-Temporal Investment in Climate Change Adaptation and Mitigation. Department of Agricultural Economics, Texas A&M University, Pittsburgh, Pennsylvania, p. 12) which is a different meaning. | Noted. Reference will be double-checked. |
| 9944 | 16 | 38 | 32 | | 35 | You may have to highlight that the followings are just several examples for sectoral financing approaches, which are far more than those mentioned followed. | It has already been mentioned that these are only few examples. It can be |
| 16507 | 16 | 38 | | | | Add a reference to your statement | It is just an introduction to the sub-section. However, a reference can be |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 11236 | 16 | 39 | 19 | | | Social and environmental aspects must also be considered | Comments will be reflected in the text, although I cannot change the message |
| 8743 | 16 | 39 | 22 | 39 | 26 | See commont number 13 above. | Which comment 13? I believe that the number corresponds to the list of comments by Prof. Skovgaard. I do not |
| 11238 | 16 | 39 | 23 | | | REDD+ has generated a significant debate around its potential social and environmental costs and benefits, the positive contribution of and to indigenous peoples and local communities as well as the need to ensure that any REDD+ action, in order to be effective, will have to respect and recognize the rights of indigenous peoples and local communities (Nussbaum and Moss, 2011) | Check reference. |
| 11239 | 16 | 39 | 23 | 39 | 27 | No agreement has been made yet at the UNFCCC on sources of financing for REDD+ , whether public, private or a combination of the two. It is worth noting however, that the last COP in Durban acknowledged that non-carbon benefits of REDD+ (social, livelihoods, and biodiversity among others) should be taken into account for REDD+ related results-based payments). | Noted. Reference to COP acknowledgment will be included as appropriate in restructured text. |
| 16508 | 16 | 39 | 42 | 39 | 43 | What does this section address: adaptation funding or synergies/trade-offs? Would suggest the 2nd, which is more in line with 16.7 overall | Linked to the discussion on complementariness and trade-offs. |
| 11237 | 16 | 39 | 53 | | | Significant challenges still exist as regards legal and governance reforms aimed at ensuring the full and effective participation of stakeholders and compliance with human rights and environmental obligations and standards. (IUCN, 2010) | Check reference. Linked to comment 463. |
| 7316 | 16 | 39 | 6 | 39 | 10 | The text discusses the presumed benefits of diverting waste from a landfill to composting, stating the following: "Waste management projects, especially those who have the dual benefits of producing compost and reducing methane emissions by diverting organic waste from dumping at a landfill to dumping at a composing plant (e.g. CDM project “Composting of Organic Waste in Dhaka”), which is highly suitable to LDCs, can be successful in achieving investment and delivering on sustainable development benefits (Ayers and Huq, 2008)." Waste industry experience indicates that this is an overly simplistic view. Typically, only open windrow composting operations are sustainable and cost-effective for the LDCs. If optimally managed, composting of waste is a highly desirable strategy. However, during rainy seasons or in wetter climates the windrows are seasonally characterized by high water contents, resulting in loss of aeration, the development of anaerobic conditions, and the generation of N2O and CH4, as well as highly objectionable odors from intermediate decomposition products under less than optimum aeration (esp. carboxylic acid generation). I don't know the particulars of the Dhaka project but would just note that, to date, since registration, the Dhaka project has achieved 7131 verified CERs out of an annual projected average of about 89,000 CERs. This plant is semi-enclosed with cells and a "maturing" windrow area according to publically-available information on the CDM website. | Another example and additional literature on the trade-offs with waste sector can be sought. |
| 9945 | 16 | 39 | | | | It's good to introduce the regional financing approaches, but this section seems to be too simple to learn about the issue. Maybe some data or case on this issue can be supplemented to make this section interesting. | Additional data and literature will be sought. |
| 12653 | 16 | 39 | 41 | 40 | 17 | It might be better to describe diference between GEF and CIF (GEF is additional grant,CIF is loan, equity or other instruments) | Taken into account. The differentiation will be highlighted (maybe in a footnote). |
| 17783 | 16 | 4 | | 5 | | The executive summary states "investment and finance inadequate" - how much is needed and how much is the shortfall estimate? | Taken into account. We will provide more information in SOD. |
| 14417 | 16 | 4 | 19 | | | need to translate to percent of (2030) GDP | Unfortunately, it is not possible to translate into a share of 2030 GDP because these estimates are from |
| 2272 | 16 | 4 | 2 | 4 | 2 | The idea that the climate can be "stabilized" merely by controlling greenhouse gas emissions is absolute rubbish and is without a scrap of evidence. It is not only a question as to whether such a "stabilization" is desiteable , there has also to be a realisation that such an objective is completely absurd, as we do not have that degree of control of the many factors influencing the climate and may never have it. | There is ample scientific evidence that shows how growing GHG emissions are altering global climate. It is true that we cannot fully control global climate. However, it is possible to reduce the |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 16400 | 16 | 4 | 20 | 4 | 21 | Incremental investment can already be considered a 'net' figure, so reduced investment in other parts of the economy should already be deducted. | Agree, we cut the sentence |
| 4525 | 16 | 4 | 23 | 4 | 31 | This paragraph gives the impression that incremental cost is a comprehensive metric for viewing investment. However, the cost might not be borne by the investor or a set of investors. In many (most?) cases, different pathways imply investments by different investors with costs borne by those implied by the policy assumed. The idea promoted in this paragraph of using incremental cost as a metric for investment policy is confounded by the fact that the investor is not necessarily the impacted by the macroeconomic cost, and these costs often are not estimated to include transaction and other cost contributors. | Agreed.We will clarify it in the SOD. |
| 16401 | 16 | 4 | 23 | 4 | 31 | Your definition of incremental costs is quite narrow; incremental costs may also include transaction costs (e.g. contracting, enforcement, overcoming information barriers via capacity building, costs of setting up policies etc.), see how the GEF and the Multilateral Fund under the Montreal Protocol use it. | Noted. We will provide a clear definition. |
| 13431 | 16 | 4 | 28 | 4 | 30 | Language used is unclear whether the author is referring to a cost of $100billion per country, $100Billion per technology, or $100Billion in aggregate globally. | This is an aggregate global figure. We rephrased the sentence. |
| 18258 | 16 | 4 | 28 | 4 | 30 | Language used is unclear whether the author is referring to a cost of $100billion per country, $100Billion per technology, or $100Billion in aggregate globally. | see comment 13431 |
| 8076 | 16 | 4 | 28 | 4 | 31 | the incremental cost estimates referred to lack the information from which stabilisation scenario (xx ppm, 2°C etc.) the estimates are derived | see comment 8075 |
| 2399 | 16 | 4 | 3 | 4 | 3 | from activities to technologies. This sentence needs a rewrite. | Agreed. Will be rewritten. |
| 4526 | 16 | 4 | 32 | 4 | 38 | This paragraph is not able to define climate finance, but nevertheless the chapter repeatedly uses the term and tends to limit itself to climate finance rather than investment and finance more generally. Suggest that the chapter clearly define the boundaries it will cover in clearly defined terms. Otherwise, this chapter may give a biased view of what is important for climate change in the areas of investment and finance. | Agreed. We will provide a definition of climate finance in the SOD. |
| 16402 | 16 | 4 | 32 | 4 | 33 | Some authors (e.g. Buchner et al. 2011) include total investments of mitigation technologies (not just the incremental part compared to fossil fuels) in climate finance. | Agreed. Several authors have suggested different definitions of climate finance but there is not a commonly accepted |
| 16403 | 16 | 4 | 32 | 4 | 36 | National climate finance is not only provided by development banks but also by the private sector | Noted. Text will be clarified in SOD. |
| 2794 | 16 | 4 | 32 | 4 | 45 | I think that this is confusing fiannce with aid flows | Noted. We will provide a definition of climate finance in the SOD. |
| 9054 | 16 | 4 | 33 | 4 | 34 | The Convention does not define what "climate finance" is. However, it defines WHAT kind of finance CANNOT be counted as climate finance for purposes of fulfilling developed country obligations in the Convention. In order to claim a comprehensive treatment of the topic, this chapter must recognize the categories of finance that are not countable under the Convention as climate finance. Under Article 4 paragraph 3, climate finance provision for mitigation is a mandatory for developed country signatories. These obligations cannot be met be through ODA which is voluntary, subject to domestic political decisions of aid givers, and bearing of conditionality. Climate finance must be "new" and "additional" and cannot involve redeployment of current aid flows towards climate change purposes. Climate finance under the Convention cannot be provided through loans which must be paid back because under the convention developed countries are responsible for the incremental costs of developing countries' fulfilling their obligations toward mitigation and adaptation. The grant element of loans or the subsidy element in the interest on loans could be climate finance, but not the loan itself. Private foreign investment cannot be counted as climate finance under the Convention because the obligation is that of Annex 2 parties, including the United States. Annex 2 parties can collect funds from the private sector to discharge their climate finance obligations, but voluntary private financing and investment does not qualify as climate finance under the Convention. | Noted. We will provide a definition of climate finance in the SOD and note how it differs from climate finance under the Convention |
| 16404 | 16 | 4 | 39 | 4 | 39 | Most of the flows are not really "meant" to support mitigation/adaptation (particularly private finance but also some ODA/OOF); so to avoid the doubtful interpretation that their is some intention behind it, you may simply write that they "support" mitigation and adaptation | Agreed. Text will be revised. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 16405 | 16 | 4 | 40 | 4 | 40 | "international" means by definition that it comes from "foreign" countries | Agreed. |
| 12822 | 16 | 4 | 41 | 5 | 45 | Executive summary: The results in section 16.7.1.2 are more concise than it is written in the summary ("investments in mitigation should anticipate investments in adaptation" section 16.7.1.2, p. 37, l. 42) ) | Agreed. |
| 18259 | 16 | 4 | 42 | 4 | 45 | Para cites "the only overview available" - but includes no citation. Citation is required. | Agreed. There are now at least 2 estimates that will be summarized. |
| 5242 | 16 | 4 | 42 | 44 | | It is unclear wheather USD 97 billion is an annual amout of money for 2009 or 2010, or wheather it is a cumulative amount of money over several years until 2010? | It is for 1 year, but not for a specific calender year |
| 16406 | 16 | 4 | 43 | 4 | 43 | The estimates of Buchner et al. Are rather "best estimates", so you should give ranges (can be found in their report). | Agreed. We will include ranges. |
| 8059 | 16 | 4 | 43 | 4 | 43 | I think this study also includes domestic flows (Buchner et al, 2011, p.8), therefore one might need to indicate that the 97 billion are not fully international climate finance | Noted. The 2012 report has explicitly included domestic finance and we will |
| 16407 | 16 | 4 | 44 | 4 | 44 | The private finance figure of Buchner includes domestic sources; their figure is the average of USD 37 billion, an estimate of Green FDI flowing into developing countries by UNCTAD (so only international finance here) and USD 72 billion, the BNEF estimate for renewable energy investment in developing countries (of which a substantial part will be domestic); the lower bound seems to be a better proxy for "international private climate finance" in my view, even when the UNCTAD figure does not include all climate-friendly transactions is not based on official corporate reporting but on a dataset from the Financial Times that uses only publicly available data (many FDI transactions may be confidential) | Noted. We will used updated CPI data in the SOD. |
| 7433 | 16 | 4 | 6 | 4 | 10 | Note that 1- The distributional consequences across sectors may have negative macroeconomic impacts if they negatively affect international competitiveness, 2- distributional impacts across sector that has no international competitiveness implications can be dealt with through the domestic polcies but when the distributinal impacts are across regions the fix is difficult. This prevent the movement in allocation to be Pareto optimal and the issue of who gains and who loses can not be ignored. | Agreed, but outside the scope of chapter 16. Should be addressed by chapter 6 and 14. |
| 2400 | 16 | 4 | 6 | 4 | 7 | That is one weird definition of macroeconomic costs. Suggest a rethink. Investments can go into people, institutions or concrete. Not just one. | The sentence is not intended to define macro economic costs |
| 16509 | 16 | 40 | 1 | 40 | 1 | 1) GEF is not a fund, but it manages several funds, e.g. the GEF Trust Funds, LDCF, SCCF; 2) the GEF Trust Fund had a adaptation window even before LDCF/SCCF were created; 3) GEF funds for biodiversity should have had adaptive benefits | Comments will be reflected in the text, probably in a footnote. |
| 15676 | 16 | 40 | 18 | | | The text could refer to the problematic nature of the CDM levy in that it represents a tax on mitigation in order to finance adaptation: see Eisenack, K. 2012. Adaptation Financing in a Global Agreement: Is the Adaptation Levy Appropriate? Climate Policy 12 (4):491-504. | Check reference. |
| 16511 | 16 | 40 | 18 | 40 | 24 | Better separate synergies (CDM as institution initates adaptation funding, AF funding may have mitigation co-benefits) from trade-offs (adaptation levy in CDM reduces finance for mitigation) | Linked to the discussion on complementariness and trade-offs. The |
| 8072 | 16 | 40 | 22 | 40 | 22 | the AF is also financed through pledges of developed countries, hence not only CDM revenues | Comments will be reflected in the text, |
| 18285 | 16 | 40 | 25 | 40 | 29 | This para offers the only passing reference in the entire chapter to some important and innovative approaches to climate finance. It is good that these passing references appear somewhere in this chapter. It would be better if the reference included additional citations and provided some of the associated analysis available in these publications, including some measure of the scale of the possible contribution from each such source of funding. | Coordination with the part on innovative means of finance. Measure of scale will be sought in additional literature. |
| 16512 | 16 | 40 | 26 | 40 | 29 | This rather belongs to 16.2.3 (sources) where it is actually missing | Coordination with the part on innovative means of finance: 16.2.3.2. |
| 8073 | 16 | 40 | 27 | 40 | 27 | a levy on international transport is not only proposed for adaptation, but for both, mitigation and adaptation activities (although of course this specific author might only propose it for adaptation) | Coordination with the part on innovative means of finance: 16.2.3.2. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 16513 | 16 | 40 | 30 | 40 | 36 | Does not belong here -> burden sharing also applies to mitigation, and should rather be discussed in chapter 16.2.3 (sources) | Coordination with the part on innovative means of finance: 16.2.3.2. I believe it belongs here, because this sub-section deals with the synergies and trade-offs between adaptation and mitigation. This |
| 16510 | 16 | 40 | 4 | 40 | 4 | You may have to mention that the SCCF addresses both mitigation and adaptation, while LDCF is for adaptation only | Comments will be reflected in the text, probably in a footnote. |
| 11240 | 16 | 40 | 7 | | | There is already literature on the Green Climate Fund, see lost below FPP and JOAS have produced a report titled “Indigenous Peoples and the Green Climate Fund” that contains a series of recommendations on how to ensure that the GCF activities respect international human rights obligations and standards such as the UN Declaration on the Rights of Indigenous Peoples, ensure full and effective participation of indigenous peoples as active observers and direct access to financing. (Martone and Rubis, 2012) | Noted. Reference will be evaluated and inclueded in restructured SOD as appropriate. Linked to comment 459. |
| 15677 | 16 | 40 | 30 | 40 | 32 | The problem is primarily about who should fund adaptation in poorer countries, given that they don't have sufficient resources - as is, the text implies that the answer is to look to the rich (i.e. capacity to pay), whereas later in the paragraph it rightly suggests that responsibilities to provide adaptation finance should be based on a mix of responsibility and capacity. | This can be reflected in the text, although I cannot change the message of the literature quoted. A reflection on the point raised can be added and |
| 16517 | 16 | 41 | | | | After reading the whole chapter, I am surprised to find no sub-chapter on effectiveness and efficiency of climate finance, given that this is a topic that is both important and more and more discussed! | Noted. The second order headings have been decided by the IPCC plenary in 2009. However, the restructured SOD |
| 16514 | 16 | 41 | 11 | 41 | 13 | Again, better give a range than a point figure for the Buchner et al. estimates | Taken into account. Answers will be |
| 8074 | 16 | 41 | 12 | 41 | 12 | I think this study also includes domestic flows (Buchner et al, 2011, p.8), therefore one might need to indicate that the 97 billion are not fully international climate finance | see comment 8059 |
| 16516 | 16 | 41 | 22 | 41 | 37 | This section does not make clear that substantial governmental policies (ETS, taxes, FITs…) will be needed to reach the needed level of financing; risk-mitigation tools may be an important complement but they will never generate the level of investments needed; generating a high level of public funding will both be very difficult and will also be less inefficient than mobilizing the investment via policies. | Accepted. Role of policies will be clarified. |
| 16515 | 16 | 41 | 6 | 41 | 20 | This section does not clearly distinguish btw. Incremental costs and investment needs. The Buchner etal figure is somehow a mix between the two; -> would be helpful to distinguish the two | Accepted. The SOD will include a definition of incremental cost and |

| 12483 | 16 | 5 | 10 | 5 | 10 | The section referred to (16.2.3.1) covers the additional risk currently inherent in low-emission technologies. What this section does not cover in much detail, is the increased financial risk associated with investing in fossil technologies in a scenario where carbon pricing (more fully) reflects the true costs of GHG emissions. The fact that proven hydrocarbon reserves contain much more carbon than we can burn if we want to limit climate change, is not reflected in today's share pricing/financing costs. This "market failure" / hidden financial risk should be pointed out in the financing chapter. It is particularly important that long term investors (e.g. pension funds) also develop tools to deal with this kind of "carbon risk". | Noted, but outside the scope of chapter 16. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 11044 | 16 | 5 | 11 | 5 | 14 | The role of Public Finance sector should be shed the right on in executive summary, for example "Public finance has significant role to promote technology transfer and leverage new and additional private fund with catalyze function" see OECD. 2008. Richard Doorn Bosch and Eric Knight, Round Table on Sustainable Development, What Role For Public Finance In International Climate Change Mitigation | Noted. The catalytic role of public finance is necessary when there are externalities, as mentioned in the text. This reference will be reviewed. |
| 11222 | 16 | 5 | 14 | | | Proper governance reforms should also be ensured , including – among others - respect of human rights and environmental obligations and instruments, in particular as regards indigenous peoples and local communities. (Johl and Lador 2012) | Noted. But topic is outside the scope of the chapter. |
| 8079 | 16 | 5 | 15 | 5 | 15 | add "inter alia by instruments such as" after revenues; since the following list is not comprehensive and there are no reasons given why the mentioned instruments are preferred | Accepted. Text will be redrafted. |
| 12823 | 16 | 5 | 16 | | | You may like to consider that selling of AAUs leads to emissions elsewhere (the incentive to buy AAUs is not to take mitigation measures). So the money raised by selling AAUs can not fully be attributed as additional money for mitigation, especially not if the money is used for other investment purposes. | Noted. We are simply considering possible financial revenues for governments. We are not making any assumption on how revenues from |
| 9050 | 16 | 5 | 20 | 5 | 23 | The discussion on fossil fuel subsidies applies well to developed countries but must be qualified in the case of developing countries where the contraction of fuel subsidies is circumscribed by the equity impact and objectives of providing access to modern energy to poor populations. See: United Nations (2009). World Economic and Social Survey 2009: Promoting Development, Saving the Planet. Sales No. E.09.II.C.1. | Accepted. Fossil fuel subsidies should be replaced by some form of income support in low-income countries. Therefore the net effect of phasing-out |
| 8080 | 16 | 5 | 20 | 5 | 20 | what is not compatible: the contraction of fossil fuel subsidies, or the fossil fuel subsidies themselves? confusing | Taken into account. We rephrased the sentence. |
| 13433 | 16 | 5 | 22 | 5 | 23 | Para asserts that fossil fuel subsidies will "vanish" in a low-emissions world. This is not necessarily true. No citation is given for this assertion. | Noted. We will check text and amend if necessary. |
| 18260 | 16 | 5 | 22 | 5 | 23 | Para asserts that fossil fuel subsidies will "vanish" in a low-emissions world. This is not necessarily true. No citation is given for this assertion. | see comment 13433 |
| 12824 | 16 | 5 | 23 | | | If the goal is reached there is no problem if sources of funding "vanish in a low-emission world". | Disagree. In several countries, taxation of fossil fuels provide public funds used to finance government activities (i.e. beyond their pigouvian scope). If funds vanish, taxes on income or on other |
| 2795 | 16 | 5 | 24 | 5 | 30 | Some of the tools mentioned are public and some are private. The paragraph implies that there are some which are common which is not the case. | Noted. We separated public and private tools |
| 4799 | 16 | 5 | 26 | 5 | 27 | I think that tradable green certificates (TGC) should also be mentioned, not only FIT has proven its success in the development of renewable energy sources. | Agreed. We will mention TGC. |
| 2402 | 16 | 5 | 31 | 5 | 35 | that para needs a rewrite. Do we need international governance to have good national finance for mitigation? And the second sentence is a run-on. | Agreed. Paragraph will be redrafted. |
| 8060 | 16 | 5 | 32 | 5 | 32 | Why not also for adaptation? | Adaptation will be addressed in Working Group II. We will discuss adaptation |
| 11223 | 16 | 5 | 35 | | | Full and effective participation of stakeholders and right-sholders both in governance and in the design and implementation of projects should also be guaranteed. Experience in various global funds show that direct engagement of communities is a key prerequisite for ownership and effectiveness. (Abbott and Gartner, 2011) | Agreed. Text will be revised. |
| 17782 | 16 | 5 | 36 | | | in certain sectors, for example in PV area - where Australian and US inventions have been commercialised in China | Comment not clear. |
| 16408 | 16 | 5 | 36 | 5 | 40 | The domestic enabling environment is key for tech transfer, see the discussion under the TEC and the IPCC special report on "Methodological and Technological Issues in Technology Transfer" | Agreed. We will review the report. |
| 8081 | 16 | 5 | 44 | 5 | 44 | also the link could be mentioned that lack of funding for mitigation will likely increase the costs for adaptation (and the required finance) and loss and damage | Noted. The chapter incluedes a section on synergies and trade-offs between |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 7434 | 16 | 5 | 6 | 5 | 10 | Taking into account the inhert risks in developing countries together the public good nature of the environmental provision, the type and extent of private funding to climate change may be quite limited. | Noted. We agree with the reviewer. In fact we explicitly say that private finance will play a role only if "the right |
| 2401 | 16 | 5 | 6 | 5 | 6 | that is a poor definition of the private sector. | It is not intended to be a definition, it is a list of major actors in private finance. |
| 9049 | 16 | 5 | 6 | 5 | 8 | "The private sector – e.g. pension funds, insurance companies, banks, mutual funds, and private foundations – has developed tools to finance large and risky projects when there is a clear return on the investment." This statement has to be qualified in light of 2007-2008 financial crisis and the too-big-to-fail phenomena. States have proven to be the ultimate guarantors of the "clear return on the investment" even where there was no explicit guarantee. | Noted. Topic is outside the scope of the chapter. |
| 13727 | 16 | 5 | 9 | 5 | 9 | Add after ".. established.": "However, the target of leveraging a maximum of private funds is unlikely to lead to an effective outcome, as high leverage ratios are likely to mask lack of additionality of the underlying project (Stadelmann et al. 2011)." Reference: Stadelmann, M. Castro, P.; Michaelowa, A. (2011): Is there a leverage paradox in climate finance? Efficiency of the CDM and the GEF in leveraging funds and reducing CO2, Working Paper, Climate Strategies, Cambridge | Noted. |
| 8078 | 16 | 5 | 9 | 5 | 9 | the word "right" incentives in my understanding is quite normative, something like appropriate would be more adequate | Accepted. Text will be redrafted. |
| 16410 | 16 | 6 | 11 | 6 | 14 | This part needs references in the literature, check e.g. Painuly (2001) or refer to other parts of AR5 | Agreed. We will check the reference and change if necessary |
| 2403 | 16 | 6 | 2 | 6 | 16 | careful here. This sounds like a repaet, and a biased one, of the climate negotiations. | Comment is not clear. |
| 16411 | 16 | 6 | 24 | 6 | 26 | Why are innovative sources "crucial"? In theory, you may just use public budgets and regulations (taxes, standards/cap&trade) to mobilize the needed investments. | Noted. Text will be revised. |
| 11224 | 16 | 6 | 26 | | | Any financing from public and private sources will have to be subject to social and environmental safeguards and related compliance and performance evaluation. Respect for safeguards will be key to create an enabling environment for genuine and effective long term mitigation and adaptation action, while recognizing the possible role and contribution of indigenous peoples' and local communities' traditional knowledge and livelihoods. (Johl and Lador, 2012; Global Witness, 2012, Martone and Rubis, 2012) | Noted. Topic is outside the scope of the chapter. |
| 7435 | 16 | 6 | 27 | 6 | 33 | The climate finance in this reference is meant to be additional and predictable. This may impose a constraint on the possible sources. | Noted. This applies to climate finance under the UNFCCC but not to climate |
| 9051 | 16 | 6 | 27 | 6 | 33 | The text claims that: At the Conference of the Parties in Copenhagen 28 2009 (COP 15) and Cancún 2010 (COP 16), developed countries made a concrete commitment, in the context of meaningful mitigation actions and transparency on implementation, to a goal of jointly mobilizing USD 100 billion per year by 2020 to address the needs of developing countries." First of all, the commitment was made in COP 16; the statement from COP 15 is not an actual commitment since the statement was only noted by the Parties. Second,This commitment does not "meaningfully"discharge the obligations of developed countries under the Convention because the Convention does not recognize voluntary financial flows, such as ODA, as fulfilling developed country obligations. To avoid confusion and error, this qualification must be stated in the paragraph. | Noted. The SOD will discuss the USD 100 billion p.a. commitment. |
| 7126 | 16 | 6 | 27 | 6 | 33 | Information can be update to reflect Decision 2/CP 17 (Durban), in particular par.127 which decides to undertake a work programme on long-term finance in 2012... to progress on long-term finance in the context of decision 1/CP.16, paragraphs 97-101. The LTF programme, according to Par.130, is to ""... analyze options for the mobilization of resources from a wide variety of sources, public and private, bilateral and multilateral, including alternative sources and relevant analytical work on the climate-related financing needs of developing countries". | Agreed. SOD will be updated regarding the new developments. |
| 16412 | 16 | 6 | 27 | 6 | 27 | Art 4.3. of the FCCC only refers to "financial resources" provided by Annex-2 countries (Annex-1 w/o former Eastern Bloc) for non-Annex-1 countries; it does not include the full world of climate finance as defined on the same page (domestic, South-South) | SOD will include a definition of climate finance that is broader than climate finance under UNFCCC |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 15672 | 16 | 6 | 31 | | | Text should clarify that the $100 billion is for both mitigation and adaptation. | Agreed. |
| 5226 | 16 | 6 | 39 | | | Please better specify 'green tourism'. In most scientific literature 'sustainable tourism' is translated into eco-tourism and pro-poor tourism, both basically long haul air transport based rich to poor countries tourism, with a very high cabon footprint (and often many associated socio-economic and political issues as well). So this is very much unhelpful within this IPCC report. My suggestion to replace 'green tourism' with 'sustainable transport based, short haul and/or domestic green tourism'. I know, not a nice term, but the general term is not helpful (skip the whole term is another option, may be better; too many problems with tourism to label it a green solution). See further discussions in chapters 8 and 10. | Sustainable tourism will not be covered in the SOD. |
| 16413 | 16 | 6 | 46 | 6 | 47 | for the credible and long-term strucuturing of incentives you may cite Hamiltion (2009) "Unlocking Finance for Clean Energy" and Brunner et al. (2012) "Credible commitment in carbon policy" in Climate Policy | Thanks. We will check these references and cite as appropriate. |
| 16409 | 16 | 6 | 9 | 6 | 9 | Would add "as understood/defined here" after "climate finance", as there is no agreed definition of climate finance | Noted. SOD will include a definition of climate finance. |
| 11225 | 16 | 7 | 15 | | | Public sector should also play a crucial role in setting the REGULATORY framework | Agreed. We also meant the overall |
| 16416 | 16 | 7 | 15 | 7 | 22 | Whole paragraph needs references (can also refer to past IPCC reports or other chapter in this IPCC report) | Agreed. We will look for appropriate |
| 16415 | 16 | 7 | 16 | 7 | 17 | What is difference between "leveraging" and "mobilizing"? (be careful, as particularly the word "leveraging" is understood very differently, see Brown et al. (2011) "[...] a survey of leveraging methodologies". Rather write "mobilizing new and redirecting existing private investment flows" | Agreed. Text will be revised. |
| 11226 | 16 | 7 | 22 | | | Furthermore the public sector has an obligation to ensure that any climate related action complies with international obligations and standards on the environment and human rights. | Noted. Should be addressed in chapter 3. |
| 7127 | 16 | 7 | 23 | 7 | 24 | This affirmation is controversial. Under UNFCCC the main request of developing countries is that finance should come from public sources, as an obligation of developed countries, as reflected in Article 4.7 of the UNFCCC. In addition to the political compromise, public finance is relevant , to support mitigation measures not well addressed by carbon market because they face non-price barriers or more financial support is required than the provided by the market price. That also depends of the country, because carbon market does not operate with the same effectiveness everywhere. Public is also important to finance R&D when private sector not willing to invest due to high risk, long development times or 'public good' character. So public finance is crucial to correct market failures and for leverage private financing. | Agreed. Text will be revised. |
| 16414 | 16 | 7 | 7 | 7 | 7 | "legitimate development needs" is a normative statement, not backed-up by research. Delete or write "development needs, as perceived by stakeholders X, Y and Z " | Noted. Text will be revised. |
| 13430 | 16 | 8 | | | | Language used is vague in separating the concepts of annual vs. aggregate incremental costs | SOD will include a more precise |
| 18257 | 16 | 8 | | | | Language used is vague in separating the concepts of annual vs. aggregate incremental costs | See comment 13430 |
| 4527 | 16 | 8 | 12 | 8 | 27 | Finance largely comes from the private sector and not from governments. Investment flows do not flow only from developed countries to developing countries. Currently, investment is often flowing from countries with strong trade surplus to other counties, regardless of whether the country is developing or not developing. This paragraph is not presenting a description of current investment flows, but rather is stating how many think the flows should work. As such it is expressing a value judgment and should be balanced by a description of the current flows of investment which are being driven largely by economic forces. | Agreed. Text will be revised. |
| 2796 | 16 | 8 | 12 | 8 | 17 | This again confuses aid flows with financing. | Noted. SOD will include a definition of |
| 9052 | 16 | 8 | 15 | 8 | 16 | Text says: "however, countries at the opposite end of the wealth spectrum will be unable to self-finance and 15 will require assistance from the funds committed at COP16." This presumes that the the funds committed in COP16 are the only funds that will be available from now until the future. To be correct, the "16" should be deleted. | True, need to change. |
| 4528 | 16 | 8 | 18 | 8 | 23 | This paragraph seem to advocate greater financing of risky projects, whereas, the added real cost of risk and the principle of minimizing cost would argue for the opposite. Suggest that both sides of such an argument be given here, and since this is only introductory the paragraph should refer forward to sections where both sides are explained with evidence. | Noted. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 13435 | 16 | 8 | 18 | 8 | 23 | Implies that investment risk is lower in Industrialized Countries than in Developing Countries. This not universally true. Investment risks in Spain, Italy, Portugal, Greece and Ireland are likely to be higher, for example than the parallel risks in India, Brasil, Indonesia, and China. | Noted. |
| 18262 | 16 | 8 | 18 | 8 | 23 | Implies that investment risk is lower in Industrialized Countries than in Developing Countries. This not universally true. Investment risks in Spain, Italy, Portugal, Greece and Ireland are likely to be higher, for example than the parallel risks in India, Brasil, Indonesia, and China. | See comment 13435. |
| 16418 | 16 | 8 | 19 | 8 | 19 | rather "risks", not "risk" | Noted. |
| 8726 | 16 | 8 | 20 | 8 | 23 | Prejudice or limited knowledge leading to an inflation of the perceived risks is a similar problem: often investors want a higher risk premium than what can be empirically justified simply because they do not know enough about the country in which the investment is taking place. | Noted. Behavior depends on perceived risk, even if the perception is not accurate. |
| 16419 | 16 | 8 | 20 | 8 | 20 | replace "must flow to" with "must be invested in" -> most investments will be domestic | Noted. |
| 16420 | 16 | 8 | 30 | 8 | 30 | Check for definitions of "incremental costs" under the GEF and Multilateral Fund; the wording "incremental cost" has first been used in the ozone regime, where it was meant to clarify that benefits have to be deducted from costs (see e.g. Benedick 1991) | Taken into account. SOD will include a definition of incremental cost. |
| 9048 | 16 | 8 | 34 | 8 | 41 | The paragraph proposes a definition of incremental cost as lost welfare measured via GDP and derives the implication that incremental cost can only be measured through modeling. Lost welfare through a counterfactual GDP calculation is probably the most direct way to measure incremental cost at the nation-state level. But lost welfare can also be measured at the local, firm, regional, household level and thus incremental cost can also be measured at these levels without the need for economic modeling. So, economic modeling is not the only way. See, for example, Centre for Science and Environment (CSE) (2010). Challenge of the New Balance. New Delhi in the case of 6 high emission sectors in the case of India.<br>Of course, for the purpose of deriving a national estimate it would be necessary to aggregate these estimates but methodologically this alternative method can generate a national incremental cost estimate. | Taken into account. SOD will include a new and broader definition of incremental cost. |
| 8727 | 16 | 8 | 34 | 8 | 41 | If we operate on the national scale, one could argue that the benefits of avoided climate change, or at least co-benefits such as avoided air pollution, also should be included. | Noted. SOD will state more clearly that the analysis deals only with costs and |
| 15285 | 16 | 8 | 34 | 8 | 34 | remove "and" after "from" | Noted. |
| 8724 | 16 | 8 | 6 | 8 | 7 | And vice versa: viable institutions influence how much finace can be raised. | Noted. Text will be revised. |
| 13434 | 16 | 8 | 8 | 8 | 11 | Assumes that Industrialized Countries will necessarily have first priority in allocation of global resources for climate mitigation. This is not necessarily true. Investments in energy efficiency and low emissions technology in China, Brasil, and India are already greater than parallel investments in many Industrialized Countries, including Belgium, Spain, Portugal, Austria, New Zealand, Netherlands, Czech Republic, etc. | Noted. |
| 18261 | 16 | 8 | 8 | 8 | 11 | Assumes that Industrialized Countries will necessarily have first priority in allocation of global resources for climate mitigation. This is not necessarily true. Investments in energy efficiency and low emissions technology in China, Brasil, and India are already greater than parallel investments in many Industrialized Countries, including Belgium, Spain, Portugal, Austria, New Zealand, Netherlands, Czech Republic, etc. | see comment 13434 |
| 8725 | 16 | 8 | 8 | 8 | 11 | I do not think it is a question of not having enough headroom, the global capital markets have plenty of money to meet those needs, the question is how to create incentives to invest in order to meet those needs. | Agreed. Text will revised. |
| 16417 | 16 | 8 | 8 | 8 | 12 | Strange wording in my view: the paragraph gives the impression that capital markets may not be able provide the right amount of capital for CC mitigation, even the right incentives are in place. Can you back up this "risk" or "fear" with any study? If yes, cite them? | Noted. Text will be revised with citations. |
| 16421 | 16 | 9 | 11 | 9 | 12 | "the adequacy of the USD (-> replace 'US$') 100 billion commitment to meet the developing country mitigation and adaptation" needs ->this does not only depend on the level of incremental costs - which is analyzed in this chapter - but also on the own contribution of developing countries you assume; while the UNFCCC 1992 may be interpreted in a way that Annex-2 countries have to pay for all incremental coss in Non-Annex-1 (see e.g. Biermann 1997), this is much less clear under the Copenhagen Accord where the USD 100 billion are provided "in the context of meaningful mitigation actions". | Noted. The SOD will provide context for the 100 $bn commitment. |

| 10944 | AnnexII | 11 | 34 | 11 | 40 | LCA global warming impact category only considers long lived GHG and uses a GWP100. Both of these have been citritiqued in the climate literature. This article discusses some alternatives, and it is worth pointing to somehitng like this Peters, G.P., Aamaas, B., T. Lund, M., Solli, C., Fuglestvedt, J.S., 2011. Alternative “Global Warming” Metrics in Life Cycle Assessment: A Case Study with Existing Transportation Data. Environ Sci Technol 45, 8633-8641. | Following sentence has been added: "LCA traditionally focuses only on GHG emissions, often evaluated over a 100 year time horizon. Radiation-based climate metrics (Peters, Aamaas, et al. 2011) and geophysical effects such as |
| 6382 | AnnexII | 11 | 37 | | 38 | LCAs do not "provide an estimate of the technical emissions reductions offered by these technologies", though (attributional) LCA results are certainly used this way. Attributional LCA merely counts emissions in a production-use-disposal chain and assigns these to the end product, relying on a range of methods and data that can produce substantially different results. Any reduction results from displacement effects outside the supply chain, about which attributional LCA is ignorant: displacement is simply assumed to occur on a 1:1 functional unit basis. | The sentence has been modified and now reads: "LCA is thus used to provide an estimate for the technical emissions reductions offered by these technologies. " |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 6390 | AnnexII | 11 | 44 | | | Given the substantial parametric and epistemic uncertainty in many LCAs, how is can a reliable 'upper bound' be produced? The subsequent sentence acknowledges the possibly large cutoff error, which (in conjunction with the many other limitations of LCA) suggests that no value produced by an LCA can reliably define an upper bound for anything. | The reviewer here seems to misinterpret the sentence. The "upper bound" refers to the maximum potential reduciton of emissions due to the introduction of the technology. It is thereby acknowledged that emission reduction may actually be lower given the part of the life cycle omitted due to system boundary issues. Uncertainties in LCA are acknowledged |
| 10941 | AnnexII | 11 | 6 | 11 | 7 | Are some refereences missing from here? | A reference has been added |
| 10942 | AnnexII | 11 | 9 | | | I have not read the article, but this seems to be an exception to the rule http://onlinelibrary.wiley.com/doi/10.1111/j.1530-9290.2012.00518.x/abstract | Yes, this is a proposal for a marginal rate. Not yet well-established. We have included a sentence here with reference |
| 7651 | AnnexII | 11 | | | | Some developments in LCA are also summarised in: Finnveden, G., Hauschild, M. Z., Ekvall, T., Guinée, J., Heijungs, R., Hellweg, S., Koehler, A., Pennington, D. and Suh, S. (2009) Recent developments in Life Cycle Assessment. Journal of Environmental Management, 91(1), 1-21. http://dx.doi.org/10.1016/j.jenvman.2009.06.018. | included |
| 6383 | AnnexII | 12 | 1 | | 2 | The improved "accuracy" of hybrid LCAs is assumed, but cannot be demonstrated. First of all, accurate for what? Estimating an inventory or estimating GHG reductions? For the prior, perhaps, but not for the latter, since neither method addresses marginal effects. A better wording would be "hybrid LCA can be used to generate a more complete inventory" -- but accuracy is another matter. | The statement has been modified to: "Through their better coverage of the entire product system, hybrid LCAs tend to more accurately represent all inputs to |
| 6384 | AnnexII | 12 | 15 | | 21 | This section is quite dismissive of consequential LCA (CLCA) and implies more accuracy and utility than attributional LCA (ALCA) can deliver. ALCA cannot answer the primary question the Mitigation chapter must ask, which is "Does strategy X mitigate unwanted climate change, and if so, by how much?" This question requires comparison to a baseline and consideration of marginal change, which consequential LCA attempts to do. The difficulty of implementing CLCA does not suggest using instead a method we know does not answer the question! Where ALCA offers false precision with a Type III error (measuring the wrong thing), CLCA offers uncertainty around the correct conceptual answer, which is an appropriate representation of our limited understanding of the actual benefits of some proposed mitigation strategies. Moreover, the "established methods" of ALCA include a variety of approaches to handle co-products that are mostly not representative of environmentally outcomes -- because this cannot be determined in a static analysis -- and which can produce very different results. "Established" doesn't mean correct or accurate. CLCA is presented here as a mere "proposal", yet the US EPA relied on this approach to implement the US Renewable Fuel Standard, and there is a rapidly increasing number of consequential LCAs in the literature. | The section has been amended. A reference has been inserted to a recently published review paper on consequential LCA by some of the method developers, which confirms the statement that CLCA is not yet mature. Note that not all consequential LCAs are about marginal changes and that the role of scenarios in CLCA is increasingly acknowledged by developers of that method, also in the cited review paper. Scenarios are taken up in the subsequent paragraph. |
| 10945 | AnnexII | 12 | 2 | | | "real emissions"? What are they? How do you know? Do you have a reference for this? | See response to review comment 6383 |
| 10946 | AnnexII | 12 | 2 | | | A reference for the cut off issues would be good. Lenzen, JIE? | Several references have been added, including the ones suggested. |
| 6385 | AnnexII | 12 | 27 | | 28 | ALCA does not "show how much impacts per unit are likely to change as part of the scenario" unless marginal effects are approximated by average effects throughout the product system, and there are no price effects. This section oversells LCA and attributional LCA in particular. Offering policy makers false precision is not helpful. | Scenario-based assessments are precisely attempting to do this. Whether they are called attributional or consequential is a question of preference |
| 6392 | AnnexII | 12 | 27 | | 28 | This paragraph seems to imply that examining scenarios makes attributional LCA useful for estimating mitigation capacity. In my view, this is probably incorrect, though what exactly is meant by "scenarios" here is left unsaid. The fundamental issue is that ALCA isn't designed to estimate change. | Please note that references have been added to relevant work. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 6391 | AnnexII | 12 | 3 | | 14 | This section soft-pedals the limitations of LCA, making is sound as though the method is fundamentally accurate, but "some" LCAs are less useful. The example presented about biofuels and animal feed seems incorrect in several ways: (i) it is indeed possible in principle for the implementation of a bioenergy system to result in negative emissions relative to a baseline, (ii) systems that show negative emissions tend NOT to be the ones that produce fodder, but cellulosic ethanol systems that assume high soil C sequestration and displacement of fossil-based electricity by excess electricity co-produced by burning lignin, plus 1:1 replacement of gasoline. (Mind you, all of these assumptions are arguable), (iii) the statement about being more appropriate for a corporate context than for assessment of large-scale transitions is generally true for all attributional LCAs because these assume no scale effects or market effects, nor do they descibe change from a baseline. | The paragraph has been deleted and replaced. It is made clear that most LCAs assess products, not decisions. Market effects are hence less relevant. To what degree market effects should be addressed in LCA is controversial. |
| 6386 | AnnexII | 12 | 37 | | 41 | This section should also address the macro-economic effects of changing supply and demand. If a bioenergy policy reduces global demand for petroleum, price will decline and more petroleum will be used than in the baseline. Put another way, the biofuel doesn't displace its energy equivalent in petroleum, although this is usually assumed in attributional LCA (and the interpretation thereof). This is critically important, as the purpose of this section is to provide information to policymakers about the efficacy of alternative mitigation strategies. Should we really promote so vigorously a method that ignores economics and almost certainly overestimates GHG reduction benefits, including getting the sign wrong in some cases? We need to be more up-front about these limitations and not describe them so glancingly as is done generally in this section. How about saying clearly that ALCA can get the sign wrong (relative to the question noted above), owing to many exclusions and simplifications, and methodological ambiguity? | This section is not specifically about biofuels. Please note that LCA as a research method is not useful to investigate the question of what happens if petroleum is not used for one purpose; if it will be used for another purpose or stay in the ground. In most mitigation scenarios examined in Ch.6, all conventional oil will be produced and burned independent of the amount of energy efficiency or low-C fuels introduced. So this would be an argument that no mitigation measure reduces oil demand. The question examined by LCA is whether a specific |
| 10947 | AnnexII | 12 | 6 | | | A reference to your example is needed. This critique should be mentioned in the appropriate place in the WGIII report. | The section has been replaced so the comment no longer applies. |
| 7652 | AnnexII | 12 | | | | The most recent review on MFA is: Fischer-Kowalski, M., Krausmann, F., Giljum, S., Lutter, S., Mayer, A., Bringezu, S., Moriguchi, Y., Schütz, H., Schandl, H. and Weisz, H. (2011) Methodology and Indicators of Economy-wide Material Flow Accounting. Journal of Industrial Ecology, 15(6), 855-876. http://dx.doi.org/10.1111/j.1530-9290.2011.00366.x. | include |
| 8529 | AnnexII | 25 | 15 | 25 | 16 | Any activity to enhance the sinks of GHGs from the atmosphere should be considered as geo-engineering of CDR-type | Could not be located - this document only has 21 pages. |

|---|---|---|---|---|---|---|---|
| 18462 | AnnexII | 5 | | | | Recognizing that there is an ongoing disucssion on how to compare costs across sector chapters, it is clear that the discussion in this section focuses on energy thus far. Once an agreement has been made, will methodologies for the different sectors also appear here? If so, it would be very useful to clarify which methods are applied in which chapters, and also perhaps to include a brief discussion of the challenges of comparability in this section. | In the process of preparing the SOD, additional cost metrics including levelized costs of conserved energy (LCCE) and macro-economic mitigation costs have been added. The plan is as a next step to also include a discussion of levelized costs of conserved carbon (LCCC) or unit mitigaiton as it is often called if this metric turns out to be useful for comapring costs across several |
| 7505 | AnnexII | 6 | 11 | 6 | 14 | "The International Energy Agency (World Energy Outlook 2010) defines traditional biomass as biomass consumption in the residential sector in developing countries that refers to the use of wood, charcoal, agricultural residues and animal dung for cooking and heating. All other biomass use is defined as modern biomass". This definition is very restrictive and does not make sense. Biomass is used for cooking by the service sector in developing countries and for district heating as well. In developed counties, it is used for household heating and water heating. Industry especially in developing countries, including cottage industries use biomass for heat and stem generation. In my opinion, no distinction should be made between different end uses of biomass. It should all be treated as biomass energy. | This comment relates to the glossary (Annex I). |
| 7506 | AnnexII | 6 | 40 | 6 | 42 | CO2. A naturally occurring gas, also a by-product of burning fossil fuels from fossil carbon deposits, such as oil, gas and coal, of burning biomass, of land use changes and of industrial processes. If the biomass is not burnt, it will rot etc. and revert back to CO2! So the way in is turned back to CO2 (the carbon cycle) is irrelevant. | This comment relates to the glossary (Annex I). |
| 8847 | AnnexII | 7 | 1 | 7 | 17 | While the FOD does state that "there seems to be a clear understanding that LCOE are not intended to be a definitive guide to actual electricity generation investment decisions", Branker et. al (2011) argue that the method "is deceptively straightforward and there is lack of clarity of reporting assumptions, justifications showing understanding of the assumptions and degree of completeness, which produces widely varying results". Branker et al. cite a wide range of LCOEs fo solar from REN21 (2010), Doty et al (2010), Yang (2010), Black and Veatch Corportation (2010), Velosa (2010), REN21 (2008), Bandyopadhyay et al. (2008), Grana(2010), NEB (2006), Walden (2006), and Wiser et al. 2009. [P. Bandyopadhyay, A. Groo, M. Hartley, J. LeBrun, A. Moazed, Renewable Energy for BHP Billiton, University of Michigan, Master's Thesis (2008).] [Black and Veatch Corporation, Renewable Energy Transmission Initiative Phase 2B: Draft Report. Sacramento, CA: RETI Stakeholder Steering Committee, 2010, pp 1-109.] [K . Branker, M. J.M. Pathak, J. M. Pearce, "A Review of Solar Photovoltaic Levelized Cost of Electricity",Renewable & Sustainable Energy Reviews 15, pp.4470-4482 (2011). http://dx.doi.org/10.1016/j.rser.2011.07.104] [G. N. Doty, D. L. McCree, J. M. Doty, F. D. Doty, Deployment Prospects for Proposed Sustainable Energy Alternatives in 2020, ASME Conf. Proc. 2010, 171 (2010), 171-182.] [P. Grana, Demystifying LCOE, RenewableEnergyWorld.com, August 18, 2010,http://www.renewableenergyworld.com/rea/blog/post/2010/08/demystifying-lcoe] [National Energy Board (NEB), Emerging Technologies in Electricity Generation, A Market Assessment Report, March 2006, pp.1-113.] [Renewable Energy Policy network for the 21st century (REN21), Renewables 2007 Global Status Report, Paris, 2008, pp. 1-54] [Renewable Energy Policy Network for the 21st century (REN21), Renewables 2010 Global Status Report, Paris, 2010, pp. 1-80.] [A. Velosa III, What is Inside your LCOE assumptions? SEMI PV Group – The Grid, April 2010, http://www.pvgroup.org/NewsArchive/ctr_036226] [T. Walden, Relative Costs of Electricity Generation Technologies, Canadian Energy Research Institute, for Canadian Nuclear Association, September 2006, pp. 1-8.] [R.Wiser R, G. Barbose, C. Peterman, N. Darghouth, Tracking the Sun – II: Installed costs of PV in the US from 1998–2008, US Department of Energy, Lawrence Livermore Berkley Laboratory, 2009, pp.1-50.] [C. Yang, Reconsidering solar grid parity, Energy Policy 38 (2010) 3270-3273.] | Branker et al. 2011 now is included in the paragraph on the range of LCOE. |

|---|---|---|---|---|---|---|---|
| 8848 | AnnexII | 7 | 1 | 7 | 17 | Darling et al. (2011) suggest that transparency could be improved calculating LCOE as a distribytion, constructed using input pararmeter distributions, rather than a single number. [Darling, S.B., You, F., Veselka, T., Velosa, A., 2011. Assumptions and the levelized cost of energy for photovoltaics. Energy Environ. Sci. 4, 3133–3139.] | Taken into account - citation added. |
| 8849 | AnnexII | 7 | 1 | 7 | 17 | While noting that system and installation costs vary widely, Branker et al (2011) document significant variations in the underlying assumptions that go into calculating LCOE for PV, with many analysts not taking into account recent cost reductions or the technological advancements that means modern panels have a much smaller drop in productivity (now 0.1 to 0.2% annually compared to the 1% used in many cost analyses). [K. Branker, M.J.M Pathak , J.M. Pearce, "A review of photovoltaic levelized cost of electricity", Renenwbale and Sustainable Energy Reviews, Volume 15, Issue 9, December 2011, pp 4470-4482.] | Taken into account - text added. |
| 10938 | AnnexII | 9 | | | | This section is quite useful and relevant. I think it should perhaps appear in Chapter 1? | Chapter 1 does not discuss LCA, carbon footprinting and material flow analysis at present. In any case, the discussion provided in this annex will be far too |
| 18463 | AnnexII | 9 | | | | This section is a very clear deliniation of methods, but the reader is left wondering how exactly these three methods are applied in the AR5, e.g. to which chapters? Which of these methods can and can not be applied to the different sectors? Is there an integrating element across sectors? Recognizing that this process is still ongoing, it may be too early to include this in the FOD, but it could be a useful direction for the next draft. | We now list the chapters but not sections. We do not give an explanation of what appears where. This sentence can be expanded to a paragraph making this identifications, but for that we would need access to the SOD, as most |
