# Expert Review Comments on the IPCC WGIII AR5 First Order Draft – Chapter X

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 12190 | AII AR5 | 1 | | | | Dear authors, thank you for writing the first report. I have comments on selected text passages and sections which concern the interlinkages between mitigation and adaptation.<br>If the task of this IPCC report is to give an overview, synthesise and analyise the content of existing literature:<br>- the analysis on mitigation adaptation interlinkages lacks a systematic approach which is guided by clear analyitical question or a systamitized and explicit description and content analysis of available literature (either from a perspective of IPCC authors and their questions or from a perspective of the authors of the cited publications and their analytical questions<br>- the literature review and accordingly the used literature is not comprehensive, e.g. on adaptive capacity<br>- some text passages are based on the content of non refereed publications | Rejected. WG3 is tasked with analysing the science of climate change mitigation. Adaptation is primarily dealt with in Working Group 2. The synthesis report will focus on interlinkages. |
| 5754 | AII AR5 | 21 | 40 | 22 | 10 | Please include the IPCC RCP regions in the Glossary. They are used intensely in the text but not explained in each chapter. | Noted. The description of regions are provided in Annex II. |
| 4982 | All AR5 | | | | | Although there was something on Issue of gender in the social cobenefit subsection of chapter 7 & 9 ( Energy & buildings), the issue can also be adressed in chapter of FOLU in section of cobenefits | Accepted. We have introduced a consistent treatment of co-benefits and adverse side-effects throughout the report (3,4,5,6,7,8,9,10,11) in economic, |
| 13512 | All AR5 | | | | | Although there was something on Issue of gender in the social cobenefit subsection of chapter 7 & 9 ( Energy & buildings), the issue can also be adressed in chapter of FOLU in section of cobenefits | Accepted. We have introduced a consistent treatment of co-benefits and adverse side-effects throughout the report (3,4,5,6,7,8,9,10,11) in economic, |
| 17314 | All AR5 | | | | | Other recent publications that give an overview on gender and climate change are:<br>Skinner, Emmeline 2011. Gender and Climate Change. Overview Report. Brighton, United Kingdom: BRIDGE, Institute of Development Studies.<br>Dankelman, Irene 2010. Gender and Climate Change: An Introduction. London, United Kingdom: Earthscan. | Taken into consideration by author team. |
| 17315 | All AR5 | | | | | There is evidence for gender differences of indiviuals' carbon footprints, and on gender differences in food/meat consumption, see:<br>Carlsson-Kanyama, Annika & Räty, Riitta 2008. | 11194 | All AR5 | | | | | The report overall makes little reference to the importance of good governance, respect for human rights, and in the context of AFOLU, respect for the rights of indigenous peoples, in achieving successful mitigation activities. Respect for rights is not just essential to make mitigation measures effective (eg putting rights into REDD+ projects) but also an opportunity to put the brakes on major drivers of deforestation and land degradation (eg helping people and communities to resist destructive land grabs). | Rejected. The treatment of justice and ethical issues is covered in more depth than any previous assessment. |
| 11195 | All AR5 | | | | | The report includes dozens of references to the Clean Development Mechanism, but almost all references are positive, with hardly any information about the major problems with the CDM, both in terms of respecting the human rights of affected communities, and in terms of its inability to demonstrate additionality. Indeed, the CDM has been plagued with problems on these fronts, and its future is limited due to withdrawal by the European Trading System, and strong criticism by the US Government's Accounting Office. | Noted. We have made sure that the discussion on the CDM remains balanced. |
| 7395 | All AR5 | | | | | The report is largely missing any assessment of the spillovers related to mitigation, technology, and finance and their impacts on developing countries, which continues to be an important issue for developing countries and crital for future climate change agreements. | Accepted. We have strengthened the draft in chapter 6 and 14 on this issue. |
| 7396 | All AR5 | | | | | The draft provides very little very little attention to the issue of buren sharing and the prinicple of common but differentiated resposibilities in relation to mitigation (future pathways) and the sources and deployment of finance and technologies. | Accepted. We have continued to work on this issue in the context of chapter 6 as well as the summary documents. |
| 8441 | All AR5 | | | | | REVIEW OF AR5 CHAPTER 15 | No action needed. |
| 8442 | All AR5 | | | | | Ian Bailey | No action needed. |
| 8443 | All AR5 | | | | | My research collaborator Hugh Compston and I suggest that Chapter 15 could be made more useful for efforts to strengthen mitigation by incorporating more material on political opportunities for governments that want to take more effective action. Although the introduction to Ch. 15 briefly describes definitions and functions of institutions and governance, the excerpt on governance is restricted to pointing out that governance conceptualizes decision-making as a process involving multiple (governmental and non-governmental) actors. References are made to terms like political barriers and political acceptability at various points throughout the chapter but these are rarely specified and there is very limited discussion of their nature or strategic options available to manage political barriers. | Accepted. We have strenghtened the treatment of literature from political sciences on this issue. |
| 8444 | All AR5 | | | | | Political barriers at the national level have proven to be decisive obstructions to climate mitigation policy in most, if not all, states and have been particularly prominent in key states like the USA, Australia, India and China. Greater analysis is therefore needed within Chapter 15 of the nature of these barriers and how they might be overcome. The types of political barrier falling within this category include problems such as: | Taken into consideration, but limited space is highlighted. |
| 8445 | All AR5 | | | | | · Threats by major corporations to withdraw or delay investments from a country in response to a proposed emissions-reduction measure; the withholding or manipulation of emissions, financial, market or technical information by companies; and non-cooperation with the implementation of manipulation policies within the boundary of national law; | Noted. |
| 8446 | All AR5 | | | | | · Adverse public opinion towards an actual or proposed mitigation policy, as indicated by election results and opinion polls, due to factors such as the costs of mitigating actions. This may be aggravated by unfavourable media coverage and campaigns by opposition political parties; | Noted. |
| 8447 | All AR5 | | | | | · Partisan politics, as Section 15.5.4.1 notes in relation to emissions trading in Australia and which can also be observed in Canadian and US climate politics. | Noted. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 8448 | All AR5 | | | | | It is clear that these and other pressures have constrained national mitigation policies by increasing the risk that governing parties and individual politicians will either be unable to introduce stronger climate policies (policy blocks) or will suffer serious political damage if they do introduce new climate policies (policy penalties). Such pressures particularly affect democratic governments and acts as a strong disincentive for strong mitigation action, but may also be felt by those without representative democracy, through a loss of reputation and legitimacy among citizens and other major actors in society. Passey et al. (2012), for example, present systematic evidence that stakeholder pressure has, in many instances, blocked or weakened emissions trading schemes. | Political difficulty of enacting cap and trade programs noted in 15.5.3 |
| 8449 | All AR5 | | | | | Passey, R., Bailey, I., Twomey, P. and MacGill, I. (2012) The inevitability of 'flotilla policies' as complements or alternatives to flagship emissions trading schemes, Energy Policy, 48, 551-561, http://dx.doi.org/10.1016/j.enpol.2012.05.059. | Noted. |
| 8450 | All AR5 | | | | | These pressures apply in both one-party and multi-party systems, and across a multitude of governance scales. The purpose of including a systematic analysis of political obstacles would not be to advocate particular actions or to make any statements that could be seen as political, since this is beyond the remit of AR5, but simply to describe the nature of political obstacles to mitigation policies and provide an impartial and informative review of the political options available, much as has been done for the sectoral and instruments analyses in earlier chapters of AR5 WGIII. | Noted. Effort made to describe political obstacles and provide impartial and informative review as commenter notes. |
| 8451 | All AR5 | | | | | A wide literature exists on this topic. We recommend the following sources in particular: | Noted. |

| 8462 | All AR5 | | | | | Compston and Bailey (2012) and Bailey and Compston (2012) provide especially detailed theoretical and empirical investigations of political options. These options include: | Noted. |
| 8463 | All AR5 | | | | | · Unilateral action, for example taking small steps on many fronts, and introducing contentious policies early in a term of office to allow opposition to subside and benefits to become clearer before the next election; | Noted. |
| 8464 | All AR5 | | | | | · Using communications to change other actors' policy preferences not only by providing accurate information on climate change and possible policy responses but also through stressing the co-benefits of climate policy for other, such as energy security, employment and regional development, and using metaphors and analogies to make ideas more accessible and appealing to target audiences; | Noted. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 8465 | All AR5 | | | | | · Trading policy amendments for support, either amendments that relate to the climate policy under discussion, such as by providing transitional assistance, or amendments to other types of policies, such as business regulation; | Noted. |
| 8466 | All AR5 | | | | | · Improving the bargaining position of advocates of strong policies by means such as integrating climate and energy ministries, and seeking cross-party consensus on climate change. | Noted. |
| 8467 | All AR5 | | | | | Assuming no change in the structure of the chapter, the most appropriate place to insert material on political barriers and opportunities would appear to be 15.9 Barriers to Mitigation. This is currently focused on developing countries. Among other things a more comprehensive approach would replace Table 15.3 with a table showing constraints for countries whose actions can make a bigger contribution to reducing greenhouse-gas emissions, such as China and/or India (because of their status as major BRICs), Brazil (to illustrate constraints on reducing tropical deforestation); the USA (a major highly fossil-fuel dependent developed nation facing severe constraints on mitigation policy); and Germany or the UK (to illustrate European perspectives where stronger action has been taken). Useful summaries covering all the countries named are included in: | Partially accepted. A summary of mitigation action is included in 15.2, which notes increases in different areas of the world. |
| 8468 | All AR5 | | | | | Bailey, I and Compston, H. (eds) 2012 Feeling the Heat: the politics of climate policy in rapidly industrializing countries, Basingstoke: Palgrave Macmillan. | Taken into consideration by author team. |
| 8469 | All AR5 | | | | | Compston, H. and Bailey, I. (eds) 2008 Turning down the heat: the politics of climate policy in affluent democracies, Basingstoke: Palgrave Macmillan. | Noted. |
| 15264 | All AR5 | | | | | Conflict resolution strategies are essential to resolving international, inter-organisational and cross geopolitical ideological differences. However, current strategies (apparently) follow normative, reductionist paradigms eschewing the human dimension in favour of the sublimely 'objective' allusion. It is time to embrace post-positivist, 'humanistic' methodologies as the subject matter so implores: passion, compassion, empathy - the full gamut of the human (and other creatures and associated systems') condition(s). Isolationary perspectives in terms of obervable phenomena are failing us all. Humanistic complexity perspectives may create a more complete picture of life for planet Earth in the Twenty First Century. Without this viewpoint we are all guilty of delusion of the severist degree. | Noted. |
| 12611 | All AR5 | | | | | The messages from AR5 are very similar to AR4 and all other Ars before. I am concerned that this exercise is not having the desired effect on the international direction of climate change negotiations. In my view this stems from the inability or reluctance to properly consider the costs of climate change adaptation and impacts. As it stands each WG seems to be considering their issue in isolation which avoids the key balance of: Climate Change Mitigation vs. Climate Change Adaptation + Climate Change Impacts. Without trying to understand and if possible quantify this balance I feel AR6 will likely be telling the same story only with less time and more dire consequences at stake. | Rejected. AR5 provides a wealth of new insights in WG3. The structure of the IPCC assessment is that first each WG assesses a well-defined part of the literature. In the synthesis report - all knowledge is brought together. The issue of balancing costs and benefits of |

| 11188 | All AR5 | | | | | Congratulations for the quality of the job. I From my expert viewpoint , I have no comment. | Noted. |
| 14327 | All AR5 | | | | | on Geoengineering: The scientific background to geoengineering concepts is also addressed in WG1 - chapters 6.5 and 7.5. There seems to be at least some repetition, possible redundancy and inconsistencies with the texts on geoengineering in WG3, e.g. in chapter 6.9. | Accepted. We have worked and will continue to work on this - in direct contact with the respective Working |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 14328 | All AR5 | | | | | on Geoengineering: In contrast to the description of the geoengineering science in the FOD of WG1, the FOD of WG3 only contains little text that is scattered over various chapters, e.g. in sections 1.2.1, 1.4.2; 1.4.5, 6.1; page 27; section 9.5.2; and 13.4.2. I I suggest that these various parts on geoengineering in WG3 should be brought together and concentrated under one specific subheading in one of the chapters, e.g. ch.6, with references to this subheading in the other chapters. | Accepted. We continue to deal with different aspects of geoengineering in different chapters of the report, but we moved towards synthesizing our knowledge more and more i chapter 6. |
| 14329 | All AR5 | | | | | on Geoengineering: while the FOD addresses governance and policy questions on a number of other topics, there is virtually no analysis of the literature on the unresolved policy and governance implications of geoengineering, e.g. implications for climate mitigation policies or for the climate negotiations. A number of relevant pieces of literature have been published that have gone through legal peer review and are thus fit for use as IPCC source material. I have submitted some of them as attachments to the e-mail address comments@ipcc-wg3.de, in accordance with the instructions to reviewers. Recent literature that should be included includes:<br>- Bodle, R., with Homan, G., Schiele, S., and E. Tedsen (2012). Regulatory Framework for Climate-Related Geoengineering Relevant to the Convention on Biological Diversity. Part II of: Geoengineering in Relation to the Convention on Biological Diversity: Technical and Regulatory Matters. Secretariat of the Convention on Biological Diversity. Montreal, Technical Series No. 66;<br>- Bodle, Ralph, “Climate and Geoengineering”, in: Hollo, Erkki, Kati Kulovesi and Michael Mehling (eds.), Climate Change and the Law: A Global Perspective, Berlin: Springer, forthcoming 2012 (submitted May 2012);<br>- Bodle, Ralph, Geoengineering and International Law: The search for common legal ground, Tulsa Law Review. Geoengineering Symposium issue, 46 Tulsa Law Review 2 (2010) 305-322;<br>- Bodle, Ralph, “International governance of geoengineering: Rationale, functions and forum”, in: William C.G. Burns and A. Strauss, (eds.), Climate Change Geoengineering: Legal, Political and Philosophical Perspectives, Cambridge: Cambridge University Press (submitted February 2011; in press);<br>- Lin A.C., International Legal Regimes & Principles Relevant to Geoengineering (in press). (2011): Large-Scale Intentional Interventions into the Climate System? Assessing the Climate Engineering Debate. Scoping report conducted on behalf of the German Federal Ministry of Education and Research (BMBF), Kiel Earth Institute, Kiel, available at http://www.fona.de/mediathek/pdf/Climate_Engineering_engl.pdf; | Taken into consideration. |
| 13018 | All AR5 | | | | | This comment is in regard to Annex I - Glossary. Annex I Option in drop down list under the Chapter heading is not available. The term "carbon dioxide capture and storage (CCS)" is defined (page 7, line 3) and the term "sequestration" is defined (page 31, line 32). Under the "sequestration" definition, it refers the reader to the "carbon capture and storage"(page 31, line 38). definition it is recommended that this should be revised to "carbon dioxide capture and storage" to reflect the the formal definition in the Glossary. | Accepted. |
| 13019 | All AR5 | | | | | This comment is in regard to Annex I - Glossary. Annex I Option in drop down list under the Chapter heading is not available. The term "carbon dioxide capture and storage (CCS)" is defined (page 7, line 3) and the term "sequestration" is defined (page 31, line 32). Under the "sequestration" definition, it refers the reader to the CCS definition elsewhere in the Glossary (page 31, line 38). However, under the CCS definition, it does not refer the reader to "sequestration." Since these terms are used interchangebly throughout the document, it is recommended that, under the CCS definition, there should be a reference to the term "sequestration" that redirects the reader. | Accepted. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 13020 | All AR5 | | | | | This comment is in regard to Annex I - Glossary. Annex I Option in drop down list under the Chapter heading is not available. The term "carbon dioxide capture and storage (CCS)" is defined (page 7, line 3). However, throughout the document, the technology is more commonly referred to as "carbon capture and storage." It is recommended that there should be clarification of the various ways CCS can be referred to under the CCS definition in the Glossary (e.g., also referred to as Carbon Capture and Storage and/or Carbon Capture and Sequestration." | Accepted. |
| 13022 | All AR5 | | | | | This comment is in regard to Annex I - Glossary. Annex I Option in drop down list under the Chapter heading is not available. The term "geologic storage" or "geologic sequestration" is absent in the Glossary but identified in areas in the document (Ch 7, page 5, line 49) and alongside "carbon capture" (Ch 13, page 13, line 8) as a stand alone term. It is recommended that the term be included in the Glossary. In the absence of a proper definition, it is reccommended that the reader should be redirected to the terms "carbon dioxide capture and storage (CCS)" (page 7, line 3) and "sequestration" (page 31, line 32) in the Glossary, respectively. | Accepted. |
| 15718 | All AR5 | | | | | None of the chapters make mention of a feature of global urbanization that may have the most far-reaching impact on the climate debate: An urban planet also means more large cities. UN DESA data show that more than a thousand cities now have populations in excess of half a million. These are places large enough to have technical and financial capacity to introduce change by means of planning, design, and local regulation. | Noted. We cover this aspect, but will work to make it more explicit. |
| 15719 | All AR5 | | | | | The discussion in opening and concluding chapters completely misses the potential actions that are now and could be more often taken by subnational governments. Chapters One and Fifteen focus on national and international actors as though they were the sole and most promising agents to effectuate mitigation and adaption. Yet this model since Kyoto has proven elusive and faulty. Copenhagen, Durban and Rio showed a striking inability to get to grips with solutions. At the same time, Chapter Twelve (especially Section 12.4, 12.5, 12.6, and 12.7 contain extensive discussion about mechanisms and incentives which have achieved some progress in specific cities and classes of places, for example, cities in association with one another, suggesting that more could be done at the subnational level. Not a single reference is made to these discussions in Chapter One. | Rejected. This particular aspect does not need to be captured in chapter 1. But it is a point that is made in the report. |
| 15720 | All AR5 | | | | | A further point along these lines is that also deserving of mention is that recent evidence suggests that cities in the 500,000 range are engaged in extensive and effective transfer of knowledge, on the order of thousands to tens of thousands of visits annually, and this horizontal exchange mechanism exhibits the earmarks of risk management by city officials who for reasons of short terms of office have little or no incentive to act on global goods. Identifying and adapting good practice reduces the risk for mayors. Coupled with proper national and international incentives, this subnational mechanism might be able to advance good and better practice where national fiat has failed. | Noted. |
| 13057 | All AR5 | | | | | From Line 3 to 7 of this file I have reproduced the same comment related to the Costs&Potentials X-Cut issues of the chapters, to propose to put them in perspective with market realisation and policy issues | Noted. |
| 12214 | All AR5 | | | | | General comment: Fluorinated greenhouse gases are not very well covered in the report. In particular, an extensive coverage of these relatively important GHGs and their alternatives under mitigation option should be covered in chapters 7 Energy systems (SF6 in high voltage appliances), 8 Transport (mobile air-conditioning), 9 Buildings (air-conditioning, heat pumps) and 10 Industry (commercial refrigeration etc.). The IPCC/TEAP special report "Safeguarding the Ozone Layer and the Global Climate System - Issues Related to Hydrofluorcarbons and Perfluorcarbons", as well as more recent publications, might serve as a basis for this coverage. | Noted. We have continued to work on this aspect. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 4513 | All AR5 | | | | | It is very important that it be made clear when giving the list of expert reviewers that participation in the review process does not indicate agreement with the methodology or conclusions of the Report. This is such a wide-ranging document, with so many topics and arguments fraught with unresolved conflicts and disagreements, that readers of the Report not have the impression that it is somehow a "consensus" document. | Rejected. The IPCC has never implied that reviewers agree with the findings of the report. They are helping to make it better as in any review process. Responsibilities lies with authors and Co- |
| 4514 | All AR5 | | | | | In particular, my comments and suggestions are by no means complete or comprehensive. Other time commitments preclude my reviewing the entire Report in detail. | Noted. |
| 2215 | All AR5 | | | | | Optimally, use consistent quotation for the following report. Recommended: "McKinsey & Company, Pathways to a low-carbon economy - Version 2 of the Global Greenhouse Abatement Cost Curve, January 2009" (McKinsey, 2009), also seen in FOD as "Nauclér and Enkvist" | Noted. |
| 2348 | All AR5 | | | | | Cost definitions and descriptions: 1) Use one consistent cost metric across entire AR5 to compare mitigation options between different sectors and measures (most likely $/tCO2e) 2) for the sectors where other, more sector specific metrics are helpful and possibly better suited, COMPLEMENT this first metric with a second one (e.g. in power/energy $/kWh) | Rejected. This issue has been discussed, but authors agreed that this is not the best away of synthesizing the literature adequately. |
| 2349 | All AR5 | | | | | Explain clearly what types of cost are included, and split those up as far as possible. For example, use "technical project cost (incl. Capex and opex incl. Fuel cost)" and "transaction=program=implementation cost" (not technical, just people capacity) | Noted. We continued to work on transparency. |
| 2350 | All AR5 | | | | | Include cost development over time (e.g. abatement cost) and/or investment development over time, especially for technologies with high expected technological learning (e.g. solar PV (EUR/kW, EUR/kWh), 2nd gen LC ethanol) | Accepted. We have done so in places where appropriate. |
| 2351 | All AR5 | | | | | Include investment needs over time for the measures - upfront financing is a key issue. This way you can also link up the financing needs with the Global Climate Fund of UNFCCC | Accepted. We provide an analysis of investment needs in chapter 16. |
| 2354 | All AR5 | | | | | Currently often the essence/excutive summary of each chapter is in the FAQs at the end, which makes it hard to read Suggestion to have or each chapter two intro paragraphs: 1) Purpose of this chapter (1-3 sentences) 2) Key takeaways (5 bullets) - both should be as much as possible standardized across the sector chapters (energy, transport. etc) | Rejected. We have seriously considered this option, but opted against this. It is not suitable format given the particular remit of IPCC. |
| 2355 | All AR5 | | | | | At least across the sector chapters, standardize the way how information is presented as much as possible. Same thing: Use SAME units for SAME information across chapters: e.g. CO2e (GWP100) rather than CO2e, C, etc. This helps the reader to get easy access to the content. Table formats, graphics. See for example "McKinsey & Company: Pathways to a low-carbon economy" as sample how standardization could look like. This needs to come from the TSU. | Accepted. We worked on these consistency issues. |
| 2366 | All AR5 | | | | | All sector chapters should include a forecast of sectoral emissions, to have a baseline to which abatement potentials are relative to. Absolute abatement potentials without a baseline are unfortunately pretty useless. | Accepted. We have included or are still in the process of collecting such |
| 6809 | All AR5 | | | | | There is a generally complacent tone about conditions, targets and measures in the inroduction and the chapters. It needs to be stated far more clearly that short of aiming at full displacement of fossil fuel combustion with efficiency, sufficiency and renewable generation there is no hope to mitigate climate change effectively. http://pubs.giss.nasa.gov/abs/ha00410c.html | Rejected. This is not consistent with our assessment of the literature. Models show that fossil fuels can still be used, if the CO2 is captured and stored. But the |
| 6818 | All AR5 | | | | | It is clear that the chapter was written by different people with different agenda. There too much political smoothing of hard scientific facts - too much reluctance to name a spade a spade, too much and obvious pandering to the nuclear lobby. | Rejected. IPCC assessment have the merit that they do not reflect the view points of individuals, but of larger, well |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 15550 | All AR5 | | | | | In general, this draft does not, unfortunately, currently adequately address (or even frame) the undeniable starkness of the mitigation challenge that policy makers currently face, internationally, nationally, ot locally. In particular, the disconnect between the scientific basis established by AR's 1-4 (presumably to be even further re-enforced by AR-5 WG's 1&2) is not sufficiently contrasted with the potential mitigation benefits, co-benefits and opportunities described in previous AR's and again here. Too often, language and syntax deployed in this draft tends to frame the mitigation challenge as assessed potential deviation from fossil-fuelled BAU--without addressing the basic fact that BAU is no longer possible if < 2 oC is to be achieved. (See, for instance Box 13.7 in AR-4 WG-3). Additionally (and relatedly) I could not easily locate in this report any further work on, or development of, the vital topic of policy inertia, as previously so tellingly highlighted in the TAR, and referenced again in AR-4. These comments particularly apply to the introduction (since that is the one chapter that will probably be widely read by non-experts), but also apply more deeply and systemically to an undrecurrent throughout the report. | Rejected. The reports makes it very clear that BAU has to be avoided asap to maintain a good chance of staying below 2°C. We are in the process of building in new literature trying to understand how delay in international cooperation and technology constraints make this more challenging. But literature is still coming through. We deal with the iddues of balancing mitigation, adadptation and residual imapcts in the synthesis report. |
| 5753 | All AR5 | | | | | The correct reference is "GBEP. (2011). The Global Bioenergy Partnership Sustainability Indicators for Bioenergy. FAO/GBEP, Rome, Italy." (The word Sustainability is missing in more than one place through the document) | Noted. |
| 10725 | All AR5 | | | | | It is important to ensure consistency across the WG reports. This applies for estimates of current emissions, scenarios, description and and quantification of effects of various components, calculated contributions to climate change, and metrics for comparing effects of emissions. GWP and CO2 equivalents are used throughout the report but often without much explanation. The metric values used should later be made consistent with those given in the report from WGI. | Rejected. We use metric values from SAR consistent with the data available in most global databases. We will work with WG1 colleagues on consistency issues. |
| 10726 | All AR5 | | | | | The authors of the sector chapters could see whether there is useful information in section 8.7.2.4 Metrics and Impacts by Sector in AR5 WGI | Noted. |
| 10727 | All AR5 | | | | | GWP for a 100 year time horizon is often used without any indication that the GWP has been subject to evaluation and critisism in the scientific literature. It could be noted that there are other time horizons than 100 years and that several implicit choices have been made in the application of GWP100 (see WGI Chapter 8 and WGIII chapter 3). It could also be noted that the contributions calulated would look different if a different time horizon was used or if a different metric was used; see figure 8.31 in WGI. Some attention to choice of time horizon could be given - which is a value-based choice that can not be based on science alone. | Accepted. We have included a metric discussion in chapter 3. This is part of the framing of the report and will also be highlighted in the summary documents. |
| 10728 | All AR5 | | | | | Since Life Cycle Assessment is used in several chapters I have a general comment for the whole report on this: When various emissions are aggregated and converted to "CO2 equivalents" the GWP-100 is usually applied. But as several studies over the last 5-10 years have shown, there are limitations related to this metric, and some alternatives have been presented. The use of 100 years time horizon is not an obvious choice and the effect of using different horizons could be given some attention. For example, using a GWP for methane of 25 (from AR4) will give much emphasis to some emissions and sectors relative to using the Global Temperature change Potential (GTP) which has a value of ca 4 for the same time horizon. I think it is important that the authors make the readers aware of this issue, and the potentially significant impact on the results. | Accepted. We have included a metric discussion in chapter 3. This is part of the framing of the report and will also be highlighted in the summary documents. |
| 10729 | All AR5 | | | | | Somewhere in WGIII the various alternatives for design of multi-gas policies (as embedded in the UNFCCC) should be discussed; i.e. whether a gas-by-gas approach, a basket approach (like in the Kyoto Protocol) or a multi-basket approach is chosen. There are some recent papers in the literature on this; e.g.: 1) Smith et al., in Nature Climate Change. 2) Daniel et al. Climatic Change 111 (2): pp. 241-248. (See also brief disussion of this - and references - in section 8.7.1.5 of WGI). | Accepted. We deal with this in chapter 6 and have improved the text. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 12999 | All AR5 | | | | | Much of the report seems to concentrate on, and sometimes simply assume, a rather narrow ethical framing cashed out in terms of contemporary CBA. This perspective is admirably pursued at great length and depth. However, it is (as the first half of chapter 3 and the beginning of chapter 4 suggest) only one of a number of ethical perspectives discussed and canvassed in the peer reviewed literature. It also has its own problems, most of which are either not mentioned at all or else pointed out only very quickly. If the aim of the report is to advise policy makers (and the general public), I respectfully suggest that greater balance would be desirable. | Rejected. The report draws little from CBA. Most of the scenarios, for example, are based on CEA. There are multiple framings and approaches used, which are introduced in chapters 2,3 and 4. |
| 13010 | All AR5 | | | | | Arguments about the relevance of past emissions crop up in a number of places. Other concerns, such as responsibilities to future generations and nonhuman nature, are treated very briefly. Some adjustment would be helpful. | Accepted. We have further elaborated on this in chapter 3. |
| 13012 | All AR5 | | | | | As is perhaps inevitable in a multi-authored first draft, the current treatment remains somewhat uneven and disjointed. For example, different normative approaches are emphasized in chapters 2-4, and chapter 4 seems to assume that a robust analysis of the discounting issue has occured in chapter 3 when in fact it is treated very briefly there. I also doubt the repeated claims that the normative foundations described in the first part of chapter 3 really do underpin the preceeding and subsequent discussions. Some evidence for these claims should be provided. | Accepted. We have worked and continue to work on the linkage between framing chapters (2-4) and the subsequent analysis. This is a challenging task, which takes time. |
| 9781 | All AR5 | | | | | Even if the focus of the report is climate change, some statements could be relativated by addressing climate change as one important environmental issue. In some parts of the report this is well elaborated whereas in other parts, especially when conclusions are drawn, it could be added as the reader might not read the full report. | Noted. |
| 11991 | All AR5 | | | | | I have a comment to Annex I i.e. The Glossary, which for some reason I could not select in this excel sheet's column B: Please add a definition of Cryosphere. | Noted. This is part of our definition of climate system. It is not a central term in WG3, which is used frequently across |
| 4271 | All AR5 | | | | | There does not seem to be a systematic approach to searching for and assessing the quality and validity of specific articles. I think it will be important to have a transparent and defensible approach to deciding which papers to reference and why. Ideally search strategies for relevant articles should be publically available and quality criteria should be published, not necessarily in the main report but somewhere on the IPCC website. | Rejected. The IPCC has a very sophisticated and resource intensive author selection process. They are experts in the area and in the best |
| 14991 | All AR5 | | | | | The decision to exclude discussion of adaptation from the WGIII report is problematic. Although at a theoretical level, it is often convenient to treat mitigation and adaptation as distinct policy responses to climate change, at the level of implementation, these distinctions tend to vanish in certain cases. For example, land-use planning and management, including management of agricultural and forest lands, must consider both mitigation concerns (maintenance of forest stocks, low-carbon agricultural practices) and adaptation concerns (adapting crop selection and agricultural productivity to future climate regimes, siting agricultural lands in the face of future water availability, effect of future climate regimes on forest composition and forest health). To the land manager, many of these concerns must be dealt with together. Indeed, as many countries and local areas go further down the path of grappling with climate change, a key consideration is how best to integrate mitigation and adaptation imperatives within very real budget constraints. Separating adaptation and mitigation policy responses in two distinct volumes written by different working groups leaves little to no opportunity for treatment of this timely and important issue facing policy makers and public managers, and risks the possibility that the AR5 will be largely silent on this topic. | Accepted. Note that adaptation is not excluded, but the main discussion takes place in IPCC WG2. WG3 has worked and will continue to work on strengthening relevant aspects of adaptation recognising the division of labour across WGs. |
| 14992 | All AR5 | | | | | This issue could be addressed in chapter 14 of the WGIII volume, or in a separate chapter or cross-cut section. | It is unclear what the reviewer is referring to. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 14993 | All AR5 | | | | | The decision to exclude discussion of adaptation from the WGIII report is problematic. Although at a theoretical level, it is often convenient to treat mitigation and adaptation as distinct policy responses to climate change, at the level of implementation, these distinctions tend to vanish in certain cases. For example, land-use planning and management, including management of agricultural and forest lands, must consider both mitigation concerns (maintenance of forest stocks, low-carbon agricultural practices) and adaptation concerns (adapting crop selection and agricultural productivity to future climate regimes, siting agricultural lands in the face of future water availability, effect of future climate regimes on forest composition and forest health). To the land manager, many of these concerns must be dealt with together. Indeed, as many countries and local areas go further down the path of grappling with climate change, a key consideration is how best to integrate mitigation and adaptation imperatives within very real budget constraints. Separating adaptation and mitigation policy responses in two distinct volumes written by different working groups leaves little to no opportunity for treatment of this timely and important issue facing policy makers and public managers, and risks the possibility that the AR5 will be largely silent on this topic.<br>This issue could be addressed in chapter 14 of the WGIII volume, or in a separate chapter or cross-cut section. | Accepted. Note that adaptation is not excluded, but the main discussion takes place in IPCC WG2. WG3 has worked and will continue to work on strengthening relevant aspects of adaptation recognising the division of labour across WGs. |
| 12556 | All AR5 | | | | | There is clearly a concerted effort to insert promotional material on geoengineering throughout the draft. This remains a conjectural mitigation strategy or set of measures, in contrast to all other mitigation measures examined throughout the report which have some experiential basis. It seems appropriate to include a generalized discussion of the concepts and approaches that have received serious discussion, e.g. in section 6.9. However, many references are sprinkled throughout the text and the wording leaves the impression that geoengineering is a measure and policy tool available today. For example, Ch. 1, p. 24, line 15, or Ch 6. p. 22, line 35, or Ch. 6, p. 81, line 23 ("SRM role in climate policy is shaped by the fact that it acts quickly" when in fact "it" does not currently exist). These standalone references and many others do not indicate the contingent nature of this strategy nor the very serious ethical and governance questions it raises, questions which are addressed to a at least some degree in section 6.9. | Rejected. The IPCC does an assessment of the literature. There is relevant literature on geoengieering. The IPCC is not promoting any technology. |
| 7606 | All AR5 | | | | | It would be desirable to add the following works of bibliography in the chapter listed:<br>Cap 12.<br>-Olcina, J., 2010: Spatial planning processes, territorial planning law and flood risk in the region of Valencia (Spain), in Risks Challenging. Publics, scientists and governments. [Menoni, S. ed. ] Taylor and Francis Group, 191-204.<br>-Olcina, J., Hernández, M., Rico, A.M., Martínez, E., 2010: Increased risk of flooding on the coast of Alicante (Region of Valencia, Spain), Natural Hazards, 10, nº 11, 2229-2234.<br>-Olcina, J., 2008: Droughts and their economic and territorial effects on the Iberian peninsula, Environmental Economics [Burny, Ph.; Petrescu, D. C. (editors)], Les Presses Agronomiques de Gembloux, ASBL, 173-192.<br>-Sauri, D. Serra, A. Olcina, J., Vera, J.F., 2011: Climate change and Europe's regions: Key findings. Case study Spanish Mediterranean coast. ESPON Climate. Climate Change and Territorial Effects on Regions and Local Economies / Stefan Greiving (Coordinator) / ESPON (European Observation Network for Territorial Development and Cohesion), 30-39.<br>-Rico, A.M., Olcina, J. and Sauri,D. 2009: Tourist land use patterns and water demand: Evidence from the Western Mediterranean, Land Use Policy, 26, nº 2, 493-501. ANNEX I-GLOSARY<br>-Olcina, J., 2007:<br>Research into climate risk in Spain: challenges for the future, in Spanish Climatology. Past, present and future [Cuadrat, J.M. and Martín Vide, J. (coords.)], Prensas Universitarias de Zaragoza, 421-449. | Taken into consideration. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 7608 | All AR5 | | | | | There are details to be made in the treatment of the concept of risk from the geographical point of view. The natural –climate- risk must be understood as an expression of territorial actions carried out by humans in the territory who have not taken into account the natural functioning of the environment where they occur. So if the man does not respect the dynamics of the physical land, infrastructure, economic activities, housing to develop man are deemed to be vulnerable to the development of a climatic event of extraordinary range (Olcina, 2007). | Noted. We deal with concepts of risk extensively in chapter 2. |
| 3058 | All AR5 | | | | | There is an air of unreality about this entire report. Since 1990 IPCC has been discussing and urging reductions in GHG emissions. Despite all the detailed discussions of scenarios, paths, etc., GHG emissions have continued to increase, and (aside from fluctuating with the world economy) there is no indication that even this increase in the rate of GHG emission will slow. The threats of dire consequences may, or may not, be realistic, but the world is not paying attention. | Rejected. IPCC reports have never urged for emission reductions, but assessed the relevant literature on mitigation. |
| 3059 | All AR5 | | | | | China continues to build one major coal-burning power plant a week, making all the talk of reductions of emissions in the US or EU or OECD irrelevant. The various simulations and scenarios have nothing to do with what the world is actually doing. They aren't wrong, in the technical sense, but are only academic exercises: If emissions follow a certain path, then GHG forcing will vary in a certain way, and people and institutions respond in a certain way to incentives and penalties...but on the basis of the last 22 years of experience, it is clear that there will not be (whatever their merit) incentives and penalties sufficient to modify a continuation of the present rate of increase in GHG emissions. | Noted. We are very clear that we try to identify the economic, technological and institutional requirements of alternative stabilization pathways. This is policy-relevant, but non-prescriptive input for policymakers. |
| 3060 | All AR5 | | | | | Why bother? | Authors do not understand this |
| 3065 | All AR5 | | | | | Geoengineering is conspicuous by its near absence from this report. There are two brief mentions in Chapter 1, and two pages in Chapter 6, in comparison to more than 1000 pages on emission reductions. Yet history shows that there is little prospect of reductions in emissions (or even in their rate of growth), while a persuasive case has been made that geoengineering can, at modest cost, reduce the net forcing function to its pre-industrial value, should that be desired. | Accepted. We have worked on the coverage of geoengineering and will continue to do so. It is covered at different places in the report, but material will be focussed in chapter 6. |
| 3068 | All AR5 | | | | | Running through the entire report is the tacit assumption that warming and climate change will be, if not “mitigated” (although that is not standard English usage; the authors mean “reduced”) harmful or even disastrous for humanity. This is an appropriate subject for scientific inquiry, but the question is entirely ignored, and a pessimistic assumption made without examination or inquiry. In order to convince governments and publics to engage in expensive reductions of emissions, they must first be persuaded of their necessity. WGIII ignores this entirely. | Rejected. We identify the economic, technological and institutional requirements of alternative stabilization pathways in Working Group 3. Working Group 2 deals with the consequences of different levels of warming. This is not |
| 3069 | All AR5 | | | | | In many places a 5% annual discount rate is applied to future costs. This has the effect of making future expenditures almost free (the present value of a 2030 $, at this discount rate, is $0.42; a 2050 $ is $0.16; a 2100 $ Is $0.014) at this discount rate. This makes it possible for the authors to propose drastic emission reductions in the distant future, at only slight costs. Unfortunately, 5% is unrealistic. Real per capita wealth grows at About 1—2%, and that is the proper discount rate to use. This gives credibility to such fantasies as 80% emission reductions in 2050; in effect, it postpones any serious cost to the remote future, rather like the alcoholic who promises to stop drinking in some indefinite tomorrow. | Rejected. Discount rates are chosen by each modeling team individually and in some cases are endogenous (e.g. following the Keynes-Ramsey rule in growth models). A 5% discount rate for the calculation of net present value mitigation costs was used ex post to establish comparability between |
| 3074 | All AR5 | | | | | In summary, this extraordinarily detailed report has two gaping omissions: Its detailed scenarios are entirely unlike the actual path the world has taken in IPCC's 22 years, which has been to make a few gestures in the direction of emission reduction, but to continue rapidly increasing emissions, and it never addresses (much less answers) the crucial question of whether warming and climate change are scientific phenomena for us to observe, or problems we must mitigate. The latter is tacitly assumed, without justification. | Rejected. We clearly highlight that current emissions increase despite mitigation policies. Scenarios assess future mitigation pathways with different levels of ambition ranging from likely 2°C |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 18036 | All AR5 | | | | | The terms "low carbon" and "zero carbon" energy technologies must be defined. This is absolutely essential to ensure that statements in the text is precise. Otherwise conclusions and statements will continue to be ambigious and very unclear in many places. In Chapter 7 alone, the term is used more than 50 times, without any attempt to define it. Most would agree that, when it comes to energy sources, renewables are low carbon and nuclear is low carbon. But where is the cut off? at CCS? gas? It must bet the task of the IPCC to provide a reasonable definition of low-carbon energy technologies to avoid that text is wide open to interpretation | Noted. |
| 5938 | All AR5 | | | | | Colour coding of charts, in particular gradations on a particular shade, make them difficult to read | Accepted. We have worked on this, but will need to continuously improve on this. |
| 5259 | All AR5 | | | | | See additional sheet | Noted. |
| 16678 | All AR5 | | | | | There are many references to sustainability or sustainable energy as part of the solution or requirement for effective mitigation. However, "sustainability" is not a well defined field of study or discipline, nor is there a great deal of agreement as to what the terms mean. If the problem is climate, the reports should focus on climate and lowering CO2/GHG emissions. If you ask climate policy to address all the world's problems it is unlikely to succeed on many fronts. (In fact a well crafted climate policy helps address other issues, but if it is shaped specifically to do these, it will likely be suboptimal in addressing anything). Many references assume sustainable energy means renewable energy, but as the terms lacks agreed definition, this may or may not be true. | Accepted. We tried to avoid misleading jargon. |
| 16679 | All AR5 | | | | | At several points in the report, there is the apparent assumption that the best mitigation choice is renewable (or "sustainable") energy, without reference to the economic cost. Relying solely on renewable energy is a much more costly mitigation path -- this is covered in chapter 7, section 7.12.5, lines 16-26 -- this should be highlighted throughout report as countries consider their mitigation strategies and pathways. A "renewables only" policy framing is possible but much more costly -- countries may choose this, but to promote this without discussing costs impacts vs. a policy that includes all mitigation technologies is not helpful to policymakers. Claims that renewables are less costly are not supported by sound analysis. | Rejected. This is clearly not the case. For exampe, chapter 6 highlights the importance of CCS and BECCS. You will find this clearly written down in the first version of the summary documents. |
| 16680 | All AR5 | | | | | Would be helpful if report included more context re the differences in costs of mitigation associated with various technologies and sectors. Not all mitigation options cost the same, nor do they cost the same even w/in same technology -- there is generally an upward sloping supply curve for all -- example, some wind energy installations will be less costly/more productive than others. Help reader understand that some mitigation options will likely deploy before others, and some may not deploy until some decades in the future. Policymakers interested in not wasting resources would do well to understand that not everything should occur in the first decade. They should also understand that a policy that fails to deliver the most costly options in the first decade is not a failure -- rather the policy may simply be driving less costly options first, which should be seen as desirable policy attribute/success. | Noted. We are still working with our authors on finding the best way to represent cost information. The literature is very heterogenous and the task therefore challenging. |
| 16681 | All AR5 | | | | | Market or price based policies have been demonstrated on many occasions to be the least costly approach to controlling pollution -- they incorporate an externality into investment and consumption decisions. This is only touched upon in a few spots within the report. All sections re different sectors (buildings, energy, transport and so on) should demonstrate or explain how such an approach would apply within these sectors. Just describing the possible reduction options or technologies without providing context regarding their relative costs nor how they would likely deploy in a price based regime does not help policymakers understand the primary policy architecture under discussion. If this does not happen, the report is much less useful than it should be. | Noted. We do not necessarily agree that this only touched upon in a few places. It is a fundamental insight of the report. We have tried to make this clear, whilst at the same time recongnizing the plethora of evidence on regulation that has come forward. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 16682 | All AR5 | | | | | This comment DOES NOT apply to the general discussion of chapter 3. However, there are references to "market failures" within the document (chapters 5, Energy efficiency discussion in Chap 10, in the context of "this technology is not deploying as fast as it should and this is evidence of a market failure." This may or may not be true, however, in most cases the fact a preferred action is not happening (even with a CO2 price) does not mean the market is failing -- even if an analysis indicates this is a low cost option. What is more likely is that the analysis fails to include other costs which are all too real to either the consumer or industry that is failing to "be rational" from the point of view of the analyst, or the analyst has failed to incorporate the risks involved in the investment decision, thereby raising the required returns and preventing investment. | Noted. This is part of on-going discussions we are having on issues such as "negative costs" or "co-benefits" |
| 16684 | All AR5 | | | | | When discussing the cost impacts of a climate policy, the frame typically used is lost GDP or lost consumer welfare by a particular date in the future. As the future continues (barring the end of the world) and models almost always show growth continues, it might be more helpful for policymakers to understand how much additional time must pass to achieve the same level of GDP or the same level of consumer welfare in the policy case vs. the non-policy case. This helps place in context the fact that economies continue to grow despite the policy "costs," and helps reinforce the fact this occurs even in developing countries. | Noted. We are having this discussion right now, most importantly in chapter 6. But so far, we concluded not to express consumption or GDP losses in this way. |
| 17635 | All AR5 | | | | | Figures should be systematically reviewed to be sure that : (1) they can be understood effectively when printed in black & white, (2) captions from the original/source graphic are not inappropriate included, (3) acronyms and abbreviations are defined in captions, legends or notes, and (4) captions provide enough guidance that a non-specialist reader can understand the figure without reading the text. ( I suspect many, if not most, readers will read chapters in the IPCC report as PDF documents, i.e., without benefit of color display or reproduction.) | Accepted. We are reviewing figures continuously and will continue to do so until the final version of the report. We have already improved, but will require substantial future progress. All figures in their final version will be reproduced by a |
| 2576 | All AR5 | | | | | What are the levels of fossil fuel subsidies globally? | Accepted. We have included a discussion fo this in chapter 14. |
| 15445 | All AR5 | | | | | There should be more cognizance of the4/ CMP.7 decision by which policy-makers will undertake a review of metrics starting by 2015. Policy-relevant aspects of the discussion on metrics could be brought out more clearly, and this would greatly help policy-makers when they approach their review. | Accepted. We have strengthened the discussion of metrics - particularly in chapter 3. |
| 15714 | All AR5 | | | | | I wonder whether the WG III AR5 makes comparisons between the investments and costs of mitigation, avoided damage and avoided costs of adaptation, The Stern review ( 2006) did a first attempt but I assume there are much better publicationsis today . It is a crosscutting issue but I believe it deserves a prominent place in the WG III report | Noted. IPCC WG3 will not do this as this is a job for the synthesis report, which combines insights from all three WGs. Chapter 3 contains a general |

|---|---|---|---|---|---|---|---|
| 15737 | All AR5 | | | | | An extremely general comment on IPCC:<br>At some time, IPCC should be re-named to something like IPCW (W=Watch) or IPAW (A=Atmosphere). Humanity has now discovered that it can influence, and thus has responsibility for, general climate or atmospheric conditions. This will endure until eternity, even after the current GHG and warming problems have been solved. Moreover, “IPAW” will at some time have to be accompanied by an “IPOW” (O=Oceans plus polar glacier regions and their animals and plants) and an “IPLW” (L=Land including rivers, lakes and groundwater, plants and animals). Reason is that, as human activities become more and more effective and the mass of activities increasing (due to rising population and per capita income), its impact on all parts of the geosphere must be watched by permanent UN-based scientific organizations like IPCC making comprehensive five-years science-based reports with a well-organized review process.<br>I am of course aware that these topics are none to be decided by the authors of AR5.<br><br>Another general comment on AR4 and AR5:<br>I have only access to the AR5 GIII draft. In order to understand the context apart from GIII, I have read several parts from AR4. In the SYR I was missing a table of contents and a complete list of abbreviation or glossary, explaining such basic terms as IPCC, SPM, WG I x.y, Annex I nations… These elements should be included in the Synthesis Report of AR5. | Noted |

|---|---|---|---|---|---|---|---|
| 15738 | All AR5 | | | | | Missing chapter in WGIII: What are the exact motives for mitigating actions?<br>I am dearly missing an assessment of the motives for mitigating GHG emissions.<br>There seems to be unanimity (WG I) that climate conditions are governed by the greenhouse effect (taking sun conditions as given) and in particular that, if humanity can affect climate conditions at all, then by affecting the greenhouse effect. Based on this, there are two largely independent motives for mitigating GHG emissions:<br>Motive 1: If it is believed that there is long-term and persisting global warming and that this poses problems (WG I and II), then GHG emissions have to be reduced. Note that this reasoning is completely independent of the cause of warming. Even if global warming has increased solely due to some sun activity, the only measure to react on it is reduction of anthropogenic GHG emissions (and possibly going further and reduce natural net GHG emissions). In my view, the issue whether global warming has been caused by anthropogenic GHG is given too much emphasis in AR4 WGI and throughout (also in the introduction of AR5 WGIII).<br>Of course, one should always try to find out the cause. But given the uncertainty about the cause and, on the other hand, the certainty about the cure (reducing CO2), it is of secondary importance.<br>One may argue that, if the cause is anthropogenic, then this serves as an indicator that the problem can be solved at all. I.e. the dimension of the problem should then not be too large. Again, this is a second line argument. It is of limited value if, as is often said, the anthropogenic cause can trigger much more powerful chain reactions. Once such a trigger has been pulled, shall we then ignore the warming problem? I think we will then realize that we have to work even harder on GHG emissions.<br>Motive 2 is a precautionary motive: We should mitigate GHG emissions, since these might change climate conditions in the long run. Note that this motive is (not completely but) quite independent of climate forecasts - only if we would witness a prolonged global cooling would this motive be weakened.<br>In contrast to the first motive, this second motive is underscored by an observed and strong anthropogenic effect on GHG concentrations in the atmosphere. Maybe it would be a bit weak without this observation. But with it, it is quite strong: We should stop messing with the greenhouse machine, since this can be expected to change climate conditions in the long run.<br>The two motives are complementary, that is, they add probabilities implying that mitigating GHG emissions is a good idea. This can be expressed as follows: Let p1 be the probability that global warming is already going on, and 1-p1 that climate is still stable (but might change in the future). Let p2 be the independent probability that GHG concentrations are already increasing due to human activities, and 1-p2 the sum of probabilities that GHG concentrations are not yet increasing or that they are increasing, but so far independently of human activities (but this might change in the future). Then mitigating GHG emissions is a good policy goal with probability p1 (first motive) + (1-p1)p2 (second motive) = p2 + (1-p2)p1 = 1- (1-p1)(1-p2).<br>Of course, the reason for political action is strongest if both reasons are given. But this is only the case with probability p1p2, where it holds p1p2 < 1- (1-p1)(1-p2).<br><br>A reasoning like the above is important, but I don't find it in the WGIII AR5 Draft or anywhere in AR4. It should be carried out (more elaborated and refined than I did here) in WGIII and taken up in the Synthesis Report. Instead, Chapter 2 of WGIII repeats textbook stuff on decisions under uncertainty at length without even discussing the uncertainty structure of the climate change problem (see my critical remarks on Chapter 2). I am aware that at | Noted. |

|---|---|---|---|---|---|---|---|
| 15739 | All AR5 | | | | | Missing chapter in WGIII: What are the general economic strategies for mitigating GHG emissions?<br><br>The general economic principle stipulates that abatements should be made efficiently: Either by minimizing the total cost of achieving a given amount of mitigation, or by maximizing the total mitigating effect for a given total cost.<br>In practice, the efficiency principle leads to basically two types of political strategies:<br>Strategy A, the least marginal cost rule: Mitigation measures should ranked by their effectiveness (in CO2equiv reductions) per dollar spent, and those measures with the highest rank carried out first. This principle is taken up, for example, in WGIII AR5 Draft, Chapter 7 (Energy), p.54, line 28 by reference to the marginal abatement cost (MAC). Or in Chapter 6 (Overview), section 6.3.5.1, where the additional costs due to unjustified exclusion of some sectors are highlighted.<br>Strategy B, push-through strategies in selected sectors: Where complementarities prevail (including economies of scale in production, network effects and so on), the marginal cost approach is probably misleading (i.e. not leading to the least cost solution). In that case the optimal policy might entail an orchestrated push-through in order to change the whole setup of the chosen sector.<br>To repeat: the MAC rule is wrong as a general prescription when there are economies of scale or other complementarities (because the second-order condition for a maximum is then not necessarily satisfied).<br>Note also: If a specific sector is (rightly) selected as a push-through target, this implies that other sectors are rightly given less focus and funds to realize abatements. This puts into perspective the view put forth in the above-mentioned Chapter 6 (Overview), section 6.3.5.1.<br>An example of a push-through policy is the endeavor of some countries, like Germany, to change their power generation sectors profoundly. In power generation, complementarities arise from the facts (i) that there are potentially large economies of scale in the production of renewable energy (RE) facilities and (ii) that infrastructure investments are needed to enable a large-scale buildup of RE (compare Chapter 7, section 7.6).<br>Another important economic principle, which stems from the considerable uncertainties associated with mitigation pathways, is the future option value of a current decision. Since both climate conditions and technologies are subject to uncertainties, flexibility of policy paths has value. This may favor some decisions compared to others. For example, investments in science and R & D leave a lot of flexibility in contrast to the implementation of particular abatement measures. Among sectors, it appears that power generation is a multi-purpose sector that might affect other sectors (like transport) in the future by opening up more opportunities. This calls for the power generation sector as a suitable starting point for action. On the other hand, electro-mobility in transport may be complementary to a push-through in power generation, since electric cars might provide the required energy storage.<br>While option value is an important category, the danger of stranded investments is another (and opposed) important determinant of policy choices. For example, in Germany the stock of inherited power generation plants gets old and needs to be replaced by new facilities on a large scale anyways. Thus, it is just time to think about future technology, and it would be great economic risk to choose CO2-intensive technologies that might have to be replaced in the near future, incurring great losses to companies and society.<br>The related issue of co-benefits is very important for any economic analysis and strategy, since co-benefits can | Noted. |
| 15381 | All AR5 | | | | | For general comments on policy chapters 13-16, see "wdavidmontgomery - general comments on policy chapters 13-16.doc" sent separately | Noted. |
| 15416 | All AR5 | | | | | Need a more consistent application of the most common evaluation criteria – cost-effectiveness, predictability of emission reductions, administrative cost, institutional support required – some ignore these completely (14 and 16). No consistent discussion of role of government in large-scale demonstration and commercialization or effects of policy uncertainty on investment | Accepted. We have worked on this aspect for the Second Order Draft and will continue to do so towards the final draft. |

| 10776 | All AR5 | | | | | Use of nuanced collors in graphics is confusing. For instance, lilac blends with red, dark brown with black etc. Please, choose stark collors or graphic dots, lines. | Noted. All figures in their final version will be reproduced by a graphic designer |
| 10777 | All AR5 | | | | | Biased criticism and unfair reporting by newspaper, TVs, pundits are pervading and spoiling public opinion and decision makers. Please add a critical review of the media coverage and advise readers on how to interpret them. | Rejected. This is beyond what IPCC can and should do. But IPCC can assess studies on the influence of media |
| 10778 | All AR5 | | | | | Language tone: sentences in the whole report were written as if for scientists and technical readers only and the often appears as academic style. Indexes display unassuming neutral titles "coal emissions", while it could convincingly say "coal emits most of CO2 to the atmosphere". The best would be to write in simple but scientifically correct English, accessible to decision makers, journalists, and politicians. Here are some senior science/ technical writers that may advise on how to bring AR5 closer to the general reader: Brian Green, Edmond Weiss, the UK´s Plain English Campaign, Elizabeth Kolbert (The New Yorker, climate change). | Noted. Above all, IPCC reports summarize the available science and should do so using the best possible language. |
| 10780 | All AR5 | | | | | the terms "high agreement", "low confidence" "more than probable" etc may be rigorous in science writing, but are confusing and misleading to journalists, politicians, scholars in humanities, pundits, and the general public. They mean totally different things to laypeople. They should be replaced by other terms. Please see my comment on language tone, above. | Rejected. This is IPCC uncertainty language, which is critical for transparent reporting. |
| 10781 | All AR5 | | | | | Worldmapper is a collection of world maps, where countries and territories are re-sized on each map according to the subject of interest, such as population, income, CO2 emissions, or women illiteracy; there are nearly 700 maps. In an outstanding way, they could show climate change issues- energy, beef consumption, emissions, pollution impacts etc. Please contact: http://www.worldmapper.org | Noted. But these may not always be the scientifically best way of transmitting information. |
| 10783 | All AR5 | | | | | if the AR5 text had hyperlinks to definitions of technical words and acronyms, reading will be much easier for decision makers, leaders, non-specialists and so on. The glossary and a list of acronyms will suffice. | Noted. |
| 7854 | All AR5 | | | | | Generally, we see a dominance of the philosophical paradigm of weighed and discounted utilitarianism as well as efficiency oriented CBA in combination with rational choice approaches. This dominance seems to be even stronger than it was in the former ARs. The plurality of of the philosophical, economic and political debate about climate change is not well-represented throughout chapters 1,2 and 3. These chapters do not represent a balanced review of literature (matters seem to be differnt in chapters 4 and 6 though). If the paradigms of discounted utilitarianism, CBA and rational choice are seen as the most plausible/reasonable, criticism of these paradigms must be discussed. This is not the case, rather, the approaches are laregly taken for granted. See comments for deatils and literature. | Accepted. We have worked on a more balanced treatment. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 7855 | All AR5 | | | | | The combination of the key messages of chapter 1 (almost infeasibility assumption regarding 2° goal and affirmation of root cause of climate change - GDP growth; see comments) and these pardigms (see comment 1) implies a remarkable shift from prioritizing mitigation to a portfolio approach entailing mitigation adaptation and climate engineering. | Rejected. IPCC should not be judging feasibility, which is not a purely scientific exercise. We have worked throughout the report to discuss requirements of different levels of mitigation rather than feasibility. But even as the report stands it does not judge on the priority of mitigation and should not do so. Only from the synthesis report, which combines information from all three |

| 10169 | All AR5 | | | | | I lack specificity about whether sustainable CCS methods are available and in use today, and what they are, or whether they are non existent hypothetical technology or technology under development. | Accepted. We have added to the CCS discussions throughout the report, but |
| 10170 | All AR5 | | | | | Table and figure texts are generally poor in information, and may be difficult to interpret without reading the main text thoroughly | Accepted. We have worked a lot on the figures for the SOD and will continue to |
| 10175 | All AR5 | | | | | Figures and tables should be given more space and higher resolution and quality | Accepted. Once the design of all figures is finalized they will be re-produced by a |
| 10195 | All AR5 | | | | | The use of acronyms and/or abbreviations: although this will reduce the legnth of the text, the readablility of the text has to be taken inte account as well. At the moment the number and extent of acronyms used limits the potential to remember their meaning/definition and thereby understanding the text. The readability and ability to understand the text is especially reduced if the meaning/definition of the acronym is not given the first time it is used within a chapter (e.g. chapter 9, p. 4, l. 25 ICT, p. 6, l. 27 CR, p. 6, l. 32 ESCO, EPC, MEP etc but also true for the other chapters). Either limit the use of acronyms (i.e. use them in figures and tables, with accompanied explanations, but to a much lesser degree in the main text) and/or including a list of acronyms/abbreviations for each chapter would be useful (if not necessary). | Accepted. We have reviewed this issue and tried to imrove the balance between brevity and ease of understanding. |
| 10197 | All AR5 | | | | | It is often difficult to understand from the text which mitigation measures are actually available, implemented and working today, and which are under development or only hypothetical/utopical | Noted. We highlight this in most cases clearly, but have continued to be as |
| 10200 | All AR5 | | | | | "Waste" and "Service sector" might merit their own separate chapters | Accepted. We have included a new section on waste at the end of chapter |
| 10201 | All AR5 | | | | | To reduce the length of text: 1. use standard reference style in the text, i.e. use only surnames and one (for one author or three or more authors) or two names (for two authors), e.g. Borg 1997, Borg & Pedersen 2012, Borg et al. 2003; 2. word economy, e.g. more concrete, less verbal models, more specificity and models that can be tested | Noted. |
| 10210 | All AR5 | | | | | When references to empirical and theoretical studies are both given in the same paragraph it becomes more difficutl to entangle what is what unless (in each paragraph)one is dealt with first (e.g. theoretical) and the other thereafter (e.g. empirical) | Rejected. We do this structurally in the report. Chapters 2-4 provide the (theoretical) framing, whilst the later chapters are more dealing with the empirical material. This is more treu so |
| 10911 | All AR5 | | | | | Please make the use of "Life Cycle Assessment" and "Life Cycle Analysis" consistent. | Noted |
| 10913 | All AR5 | | | | | Many chapters seem to give their own summary of GHG emissions and there drivers. Of course, each chapter puts its own spin on it, but I think overall it would be better of GHG emissions and their drivers were discussed in one chapter. In addition, none of the chapters seem to cross reference the similar work in the other chapters. | Rejected. We do both. Chapter 5 is devoted to this question. The subsequent chapters only cover the most relevant aspects for a particular sector at the beginning. We have made |
| 10948 | All AR5 | | | | | The WGIII report is quite different in structure to how the WGI report works. The WGI chapters are very disciplinary. If I am an expert on radiative forcing, there is only really one chapter to read. Someone interested in mitigation, is really interested in the entire WGIII report. I for example, wanted to read about 10 chapters, but only had the time to skim read a few chapters! Even through this, I noticed large areas of overlap. On the one hand, this is hard to avoid is each chapter needs some specific framing of the drivers of GHG emissions, for example. On the other hand, the overlaps makes the report very long and in some cases repetitive. As one example, many chapters discuss GHG emissions, GHG emission drivers, IPAT/Kaya type thinking, etc. As far as possible, it would be good to see some effort in reducing overlap and providing much greater linkage between sections with overlap. This makes it easy for a mitigation person to read more of the report! | Accepted. We have worked hard and will continue to work hard on reducing overlap. This is most challenging. As the reviewer correctly points out, the material from WG1 and 3 is very different. To be useful to policymakers it needs to be structured very differently. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 10949 | All AR5 | | | | | A constant theme in the report is the weighting of GHG emissions. For perhaps obvious reasons, authors fall back to the Global Warming Potential with a 100 year time horizon, even though this has had a strong critique since its inception. The FAR even refers to it as an illustrative approach to demonstrate the difficultuies in comparing GHG! The CLAs and LAs should really be aware of the issues with using a GWP100. A read of the relevant part of Ch8 WGI is important. Using a Global Temperature Potential will greatly change the importance of food for example. It is worth point CLAs and LAs to the paper by Shine on the issue, Shine was a CLA for the IPCC FAR which introduced the GWP and his perspectives on why it is used should be read by anyone just assuming a GWP100 is ok. Shine, K.P., 2009. The global warming potential - the need for an interdisciplinary retrial. Climatic Change 96, 467-472. | Accepted. We have added to the discussions on metrics in different parts of the report - but most prominently in chapter 3. |
| 17274 | All AR5 | | | | | I'd like to put attention that if we use more clean technologies cuting the aerosole emmision the anthropogenic warming increases because of a reduction of aerosole-related cooling. This is clear and quate significant effect. However, I have not found the obvious discussion of this issue (perhaps as a result of lack of time to read carefully all chapters). | Noted. The scenarios presented in chapter 6 almost all tend to account of this issue. Itis therefore well-addressed even though more implicitly. |
| 7827 | All AR5 | | | | | Some language is too prescriptive. The IPCC must not prejudge decisions from policy makers/policy level. Concrete examples are given below. | Noted. We continue to review the language carefully to be policy-relevant, |
| 7828 | All AR5 | | | | | It is suggested that finally all text is reviewed/edited by a native English speaker of high langauge skills in order to improve readability and clarity. E.g. chapters 9 and 10 offer already a very good flow of language. | Noted. There are native English speaker in each chapter. We will carefully check |
| 7841 | All AR5 | | | | | Executive summary need to build on the assessments in the underlying subchapters. Therefore every paragraphs should include references to the underlying subchapters in order to allow the reader to check the original literature that informed any finding. | Accepted. We will make sure that this is the case ultimately. |
| 7842 | All AR5 | | | | | It is noted that many statements in executive summaries do not include qualifications of the level of evidence for specific findings. It is of great importance for the weight of any finding to provide information on the level of uncertainty of each finding using the calibrated IPCC language. The authors should be prepared to explain any such judgements in a transparent manner. | Accepted. We will make sure that this is the case ultimately - unless we are dealing with "statement of facts". |
| 10261 | All AR5 | | | | | In general : Lots of errors in reference names and in references list. | Accepted. We have already reviewed this issue and will continue to do so unitl |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 15071 | All AR5 | | | | | The distinction between 'direct' and 'indirect' policy instruments is an important one and thus made effectively (pp. 33 and 36 of Chapter 3). Indeed, it has often been the 'indirect' policy that has had most consequence (e.g, single largest climate change initiative in Canada was a coal-fired power station closedown, motivated by local air pollution concerns and local economic development aspirations) – see Rowlands (2007, below). This distinction between these two types of policies should be 'maintained' throughout, but they are subsequently 'mixed together'. For example, in Chapter 10 (p. 51), consideration of 'energy management systems' seems to be presented as a 'GHG mitigation policy', but it is the case that such systems are introduced for non-climate reasons; impacts upon net greenhouse emission levels are of secondary importance. Indeed, reference to 'indirect policies' are relatively rare (e.g., p. 21 of Chapter 16), even though – I would argue – much of the discussion is actually about 'indirect policy'. (And at other times, e.g., p. 34 of Chapter 16, line 9, they are bunched together completely – in this case, mention of 'energy and climate change goals').<br>I would have thought, particularly if attention was going to be given to 'indirect policies', more attention would have been given to sub-national approaches, and the 'policy successes' therein. Yes, Chapter 15 (p. 65) and Chapter 16 (p. 34) have some, but more might have been useful. Three sources of mine that might be useful for such a review are listed below:<br>Ian H. Rowlands, 'Encouraging Renewable Electricity to Promote Climate Change Mitigation', in Barry G. Rabe (ed), Greenhouse Governance: Addressing Climate Change in America (Washington, DC: Brookings Institute Press, 2010), pp. 181-203.<br>Ian H. Rowlands, 'Renewable Electricity: The Prospects for Innovation and Integration in Provincial Policies', in Debora L. VanNijnatten and Robert Boardman (eds), Canadian Environmental Policy and Politics: Prospects for Leadership and Innovation, Third Edition (Toronto, ON: Oxford University Press, 2009), pp. 167-82.<br>Ian H. Rowlands, 'The Development of Renewable Electricity Policy in the Province of Ontario: The Influence of Ideas and Timing', Review of Policy Research (Vol. 24, No. 3, 2007), pp. 185-207. | Accepted. We deal with this issue now more comprehensively in the context of the issue of "co-benefits". |
| 8505 | All AR5 | | | | | It would be better to use the term "climate engineering" instead of "geo-engineering" (or "geoengineering") | Rejected. This is a decision that has already been taken across WGs. |
| 17074 | All AR5 | | | | | The comments are made with reference to CHAPTER on EQUITY AND SUSTAINABLE DEVELOPMENT and consequential changes will be needed in the text. A key concern is the use of the term "development path", which implies the reference is to developing countries, and the more neutral term "growth path" should be used as the term applies to both developed and developing countries – for example, we say 'green growth' and not 'green development'. In this context, what is the 'legacy of development'? This is not a commonly used term (title of paragraph 4.3.6); do you mean 'eradication of poverty"? | Noted. |
| 3034 | All AR5 | | | | | This review is limited to the specific topics of energy efficiency and rebound effects. | Rejected. We are dealing with a plethora of issues throughout the report. |
| 3035 | All AR5 | | | | | While it is deeply gratifying to finally see rebound effects addressed in this latest IPCC report, they do not appear to be very well integrated with the model results throughout the report. Rebound effects increase the climate change stakes enormously, because if they are not properly accounted for it means we have less time than we think--less time than our forecasts commonly predict--to devise climate change mitigation (or adaptation) solutions. | Noted. We have continued to work on this aspect in multiple chapters. |
| 11157 | All AR5 | | | | | Overall, the Chapters and Sections layout and sequencing is good. The idea of the FAQs at the end of each Chapter is brilliant. One suggestion on the FAQs sections: Could the FAQs be topical/current with the different chapters rather than FAQs that have been aoound for sometime? Examples of FAQs could include: Chapter 1: WHERE IS THE WORLD AT WITH RESPECT OT CLIMATE CHANGE MITIGATION?; Chapter 7: WHAT IS THE STATE OF THE ART TECHNOLOGIES IN ENENRGY WRT CLIMATE CHANGE MITIGATION? WHO IS EMMITTING THE MOOSTAND THEREFORE WHO IS THE MOST CALPABLE?WHO IS THE VILLAIN? | Noted. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 11545 | All AR5 | | | | | Obviously a lot of hard work has already gone into this draft, and the result is already impressive. However, CLAs will need to spend more time to streamline the chapters and to cross-reference to the right places, otherwise there will be too much shallow repetition, and not enough deep substance where it is due. | Accepted. We have continued to do so throughout the report and will continue streamlining towards the final draft. This is one of the most challenging tasks in |
| 11547 | All AR5 | | | | | To the steering group: it may be worth reiterating to the authors of all chapters the difference between the style of an assessment and a journal article, and to remind them that their target audience are not their scientific peers. | Noted. |
| 10415 | All AR5 | | | | | I suggest to include some works from developing countries, although these works may not be published in Eglish, they could have a great value for the whole assement work. | Noted. Authors are encouraged to do so, if appropriate. This is fully in line with |
| 15443 | All AR5 | | | | | These comments on the FOD of WGIII's contribution to AR5 were drafted by Kathy Jo Wetter, Ph.D., ETC Group, Programme Manager and Pat Mooney, ETC Group, Executive Director. Both Kathy Jo and Pat are registered as Expert Reviewers for IPCC WGIII AR5, FOD. Kathy Jo uploaded the comments. | Noted. |
| 12970 | All AR5 | | | | | Thank you for letting me participate as an expert reviewer for the 5th IPCC draft. Please accept this statement as my position on the document. I do not support the work of the IPCC for the misuse of science including omissions of complex earth system dynamics and for the political insubordination of the free market and personal sovereignty. Hard science is a beautiful craft that reveals both our understandings of our world and the world of learning, critical thought and further understandings of life. Intellectual rigor in our thinking is as valuable as clean water or forests. Our impact on the planet is irrefutable. As is our thinking of our place in it. We are meant to be taking care of the world. Creating a system of centralized control of resources by a few people makes the everyday man, state and nation impotent in thought and action. You strip away mans ability to think, learn, grow and create something other than children, you do get a population problem. It is the only sense of personal control he has left. And then you get a resource problem. Instead, we need open vibrant minds who challenge the status quo. We need diversity in our life strategies that embraces and values talent of the individual and gives them permission to believe in themselves. To take care of themselves and not be dependant on the state to do it for him. A dignified world values the ability of self mastery of the person and their craft. An environmentally healthy world would embrace a science that supports that dignity. A freer political state would enable intellectual competitiveness and leadership. My biggest question is how -if - and when would we ever know these ideas to work unless we try. | Rejected. We appreciate the position, but do not agree with the implication the reviewers draws concerning the report. The IPCC does not advocate a particular way of dealing with the climate externality. It simply summarizes the state of the scientific literature in a policy-relevant, but non-prescriptive way. |
| 8850 | All AR5 | | | | | General comments on the whole report:<br>In general, chapters shall be shortened and sections shall be made more coherent within the chapter. All authors shall try to state facts (findings) and their limitations as well as applications. Besides drawing clear conclusions that are often applicable to certain circumstances/regions/countries, it's very important for authors to acknowledge and state information/knowledge gaps in a consistent way, and to clearly state and enlist recommendations that are appropriate for future work in each chapter that addresses specific sectors/areas/programs. The authors shall strive to minimize ambiguity througout the sections. | Noted. Some chapters are of appropriate length, while others will have to be shorted. We are continuously working on clarifying the language to the degree possible. |
| 4692 | All AR5 | | | | | Annex I definitions can access the Boykoff and Okereke glossary assembled here: http://www.theboulderstand.org/climate-change-glossary/ The full glossary is in 'The Politics of Climate Change: A Survey', Boykoff, M. (ed) (2009) Routledge/Europa. | Noted. |
| 8903 | All AR5 | 0 | | | | There is more interaction needed between chapter teams to unify some (theoretical) positions and avoid repetitions | Accepted.We have worked on this for SOD and will continue this work towards |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 8780 | All AR5 | 0 | | | | Unthinking use of the term 'interests' which implies a utilitarian ethical assumption and framing to questions of mitigation of climate change, similar issues with the unthinking use of the terms 'cost and benefits', 'optimum', 'preferences', 'prosperity' and in places 'consequences' (cf. consequential/utilitarian/economistic ethics). This language is normative and policy prescriptive not neutral. | Working Group 3 has to deal with both facts and values. In fact, they cannot be easily seperated. We aim to provide alternatives and make their ethical implications transparent. For this reasons we have devoted three chapters |
| 8544 | All AR5 | 0 | | | | HAD PROBLEMS WITH THIS CELL. PLEASE START AT #2. Thank you. | Authors do not understand this |
| 16910 | All AR5 | 0 | | | | Based on experience of previous IPCC Assessments, my sense is that AR5 is in relatively good shape for this stage of the process, albeit with some obvious exceptions that it is essentilal to address. Congratulations to the authors who have clearly put in a vast amount work already. However, it still lacks much intellectual integration across the different chapters and at present it is not at all clear what the "big new insights" may be. Nor is there a consistent intellectual structure to help the reader navigate the numerous short (/satisficing), medium (/optimising) and long term (/transformation) issues, even though the decision and economic processes at different timescales involved are quite distinct.<br>There are some issues of intellectual integration across the “framing” chapters (1-6), but the bigger challenge is demonstrating consistency between the more top-down / theoretical structures of these, and the sector-specific insights in the sectoral chapters. My sense is that the “meso-scale” analyses represented in some of Part III – most notably chapters 12 and 14 – might help a lot here to make some of the connections; the interactions between these chapters and the framing chapters deserves particular attention, as I imagine it is otherwise easily lost.<br>As I skimmed the report I was looking for “iconic” figures to summarise really core points that may not be familiar to a governmental audience. There may be several – perhaps the Secretariat could come to the next LA meeting with some suggestions. One “structure” of presentation in particular that caught my eye is Figure 14-12, of per-capita emissions vs per-capita wealth. Being grounded in real data this could have particular impact. However in its current form of aggregation it doesn’t do the job (and the different ways of interpreting it need to be better mapped out). I offer comments in Chapter 5 and 14 on this though it is also relevant to others eg Ch.4.<br>Finally, in presenting data on the implications I think it important that IPCC considers the lessons on the importance of presentation and framing effects. Once they have established “baselines”, the modelling community almost entirely thinks in terms of changes from these baselines. Normal people think in terms of absolute changes. See for example my very brief comments on presentation in Chapter 6.<br>Clearly there is a potential length problem, but reading across ther report there are significant possibilities simply by removing redunancies and getting authors to cross-refer to other chapters that address similar issues. | We accept most of the remarks. In fact, it is one of the key challenges to reconcile sectoral and cross-sectoral evidence. We have made some progress for the SOD, but we need to continue along this road. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 16911 | All AR5 | 0 | | | | The basic intellectual structure that starts to emerge in Chapter 2 (where it refers to System 1 and System 2 processes) could be usefully broadened, extended, and applied as an organising framework across many chapters in AR5. (a) Broadened, so that it is not purely about the psychology of individual decision-making, but about the wider characteristics of decision-making processes at different temporal and institutional scales. (b) Extended to recognise a third level of decision-making in the realm of strategy, security, decision-making under deep uncertainty, innovation and infrastructure, which also speak to the longer-term evolution of systems: broadly these go beyond the realms in which quantified cost-benefit approaches are practiced, or indeed practicable. There are thus three 'domains' of decisionmaking, not two. And (c) these three domains could be applied as a framework to help organise corresponding observations in many chapters of the report. For example, a lot of the material in the Buildings chapter is really grounded in characteristics of the first domain. A lot of transport discussion, with emphasis on infrastructure and innovation, is more about third domain processes. The norms of mainstream energy sector investments tend to be strongly about second domain chacteristics, which corresponds most closely to classical economic assumptions. For sectors and issues dominated by first and third domain processes, however, there is no intrinsic reason to assume that 'business as usual' corresponds at all to optimising behaviour or 'least cost'. At present, too many of the chapters seem to present information which jumbles up these different processes, and leaves the reader somewhat confused about the actual implcations for costs and policy responses. This may also help to provide an classificaiton framework for policy instruments, since the kinds of policy instruments appropriate to the different domains are very different, and have specific roles in relation to the characteristics of those domains. I will submit to the Secretariat the chapter from my book which is focused on defining these 'three domains' and tries to give some sense of their relative significance in relation to energy and CO2 issues. | Noted. |
| 16912 | All AR5 | 0 | | | | It would help enormously if chapters could be more systematic in including an up-front summary of the state of knowledge represented in preivous IPCC reports. In addition, the SPM or Technical Summary should be able to compile estimates of mitigation potentials and costs, in ways analogous to AR4, and to draw any comparison with AR4 in this realm. It is not at all obvious that the chapters yet provide any solid basis for such an effort. | Taken into account. We have encouraged all chapter teams to highlight what has changed since AR4. |
| 9407 | All AR5 | 0 | | | | Especially in Chapter 7, 9, and 10, when it comes to discussing amounts of mitigation potentials by sector (for example, reporting as XX MtCO2 mitigation potentials), it needs to be carefully clarified whether effects of electricity savings in the demand side are included in the demand side or such electricity saving potentials in the demand side are counted in the Power sector. Depending on its definition, results of mitigation potentials by sector will be different. This point was sometimes confusing in the IPCC AR4, thus it should be clearly mentioned or keep it consistent across chapters in the AR5. | Noted. We do not adopt the concept of mitigation potentials as AR4 did. But whenever it is used we should aim to be as transparent about methodology as possible. |
| 14259 | All AR5 | 0 | | | | I would be happy to provide additional comments if I had time (so, please let me know if the deadline is extended or if one can provide comments later/to later revisions). | Rejected. We cannot extend the deadline. |
| 9106 | All AR5 | 0 | | | | I think that two topics would deserve inclusion to the publication, namely agglomeration economies and rebound effect. Cities are shown (as mentioned in the draft) to lead the global economy creating wealth and attracting both affluent consumers and businesses. This leads to cities being consumption centers as well where lifestyles may be much more GHG intensive than in less dense urban/human settlements. This may be a strong opposite effect for GHG mitigation through more dense structures. Related to this is rebound effect. If GHG mititgation leads to monetary savings the savings will be at least partly spent and will cause additional emission. E.g. Turner has demonstrated how the rebound effect may lead to even an overall increase in the emissions (Turner, K. (2009): Negative rebound and disinvestment effects in response to an improvement in energy efficiency in the UK economy, Energy Economics, 31, 648–666.) | Accepted. We have for the first time a chapter on human settlements and infrastructure to better understand the role of spatial structure and urban planning. We have further improved the coverage of the rebound effect in various chapters of the report. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 9125 | All AR5 | 0 | | | | As a suggestion to reduce the amount of pages in the report, to my opinion the sections 12.5-12.8 should be heavily reduced. The level of detail is not in balance with the earlier sections especially consedering the descriptive nature of the sections in general. | Rejected. |
| 13237 | All AR5 | 0 | | | | More integration between chapter 8 (dealing with behavioural aspect of transport) and chapter 12 (dealing with spatial planning) could lead to interesting debate : work by Schaefer or Laterrasse acknowledge that to combine behavioural measures (e.g. energy tax) and planning measures (e.g. densify city centers) can theoretically have greater impact on energy use for transportation. | Accepted. This is an important issue we have worked upon and will continue to work on towards the final draft. |
| 13247 | All AR5 | 0 | | | | More integration between chapters 8 and 12 could potentially reduce in length both chapters. | Generally accepted, but not sure about |
| 4045 | All AR5 | 0 | | | | The issue of whether 2 degrees C can or cannot be achieved by the end of this century needs to be assessed and discussed transparently and robustly. As a member of the U.S. National Climate Assessment Development and Advisory Committee, we were also faced with the same question and have to deal with this head-on. It is clear from all modeling that the kind of policies and actions needed to achieve 2 degrees C would be impossible. What are the options and more realistic scenarios which the world can achieve? | Rejected. We cannot easily make a scientific judgement of feasibility. In fact, since AR4 there is more scenario evidence than ever consistent with a likely 2°C world. Working Group 3 puts an emphasis on discussing the technological, economic and institutional requirements of such a transition |
| 4314 | All AR5 | 0 | | 0 | | My main comment is that, almost without exception, the chapter avoids discussing evidence that casts doubt on the main thesis–that renewable energy can make a large difference to carbon dioxide emissions. This is not unbiased science as I know it. I would also comment that it is extremely wordy and much of what is quoted adds little to the argument. I think it would be easy to reduce the length by 50% and, as a result, the important points would be easier to determine from the mountain of often irrelevant detail. My understanding is that this chapter takes as a given that greenhouse gases cause dangerous global warming and it is all about how to reduce the concentration of greenhouse gases. Therefore, the numerous references to 2° warming and various statements about the dangers of global warming should not be in this chapter. If they're all deleted–as they should be–then the chapter will be more objective and shorter. | Rejected. The report, in fact, stresses the importance of CCS and bioenergy for staying within 2°C. This is highlighted by the latest science trying to understand how difficult individual technologies can be replaced in a mitigation technology portfolio. |

|---|---|---|---|---|---|---|---|
| 18576 | All AR5 | 0 | | | | General comments<br><br>Going through the material I was struck by three points:<br><br>There is no obvious narrative or storyline, just an enormous amount of material.<br><br>The overiding conclusions are unclear.<br><br>How does the material relate to WG I and WG II material?<br><br>Buildning on the three points I think it is really important to try answer three rather general questions.<br><br>Why is the material produced?<br><br>The material is said to be policy relevant but not policy prescriptive, but relevant to whom? To politicians? To policymakers? To scholars and experts?<br><br>The extensiveness and comprehensiveness rule out a majority of politicians and policymakers. The lack of clear conclusions and reader-friendly summaries strengthen the effect.<br><br>It is hard to read out any sort of general message or storyline. What is the intention? What is the consequence? Based on the material as it is presented you can easily draw and underpin very different stories and there is a clear risk that the material is partly “hijacked” by persons wanting to drive their own theses.<br><br>A part of the problem is that the material is more of a mitigation encyclopedia (though not fully developed) but pretending to be a report. There is a choice to be made.<br><br>The bottom-up approach also adds a lot of confusion since the same themes come up again and again in different chapter but partly building on defferent material and often pointing in different directions.<br><br>What is the material trying to cover?<br><br>From what I can read out the intention is to give an overview of existing knowledge form a scientific perspective and thereby give advice to policymakers. Scientific and knowledge is interpreted as peer reviewed material but I would argue that policymaking, even if built on existing knowledge and experiences made, goes far beyond what can said to be proven based on scientific methods.<br>Sometimes I get the impression that the material tries to prove that going a direction has given consequences or try to prove the true consequences of a policy which I am convinced is fundamentally wrong. There is no such thing as correct or false choices purely based on science. Remember, policy relevant but not policy prescriptive | Noted. First drafts of the summary documents are provided with the SOD. They may provide a more concrete idea of the main findings of the report. The report is aimed at an array of policymakers, but the key outlet of IPCC reports are the international climate change negotiations. |
| 11657 | All AR5 | 0 | | | | The issues of HCFCs and CFCs are written in Chapter 1, 5 and 10, however, the banks of HCFCs and CFCs contained in existing equipment, foams and other products are not described. This is very important issue as these emissions from the bank with high GWP are not regulated neither by the Montreal protocol nor the Kyoto Protocol. The IPCC/TEAP special report in 2005 can be referred to present a significance of the reduction and the potential CO2-equivalent emissions when released to the atmosphere. | Noted. |
| 10822 | All AR5 | 0 | | | | In relation to emissions "embodied" in trade, the terms "embedded" and "embodied" are used. I suggest to consistently use "embodied" | Accepted. We have worked and will continue to work on consistency issues. |
| 11322 | All AR5 | 0 | | | | Comments above refer - the chapters are not linked even though the content is. Chapters reviewed (5 and 12) could benefit from reflecting observations in Chapter 13, and vice versa. | Accepted. We have worked and will continue to work on cross-linkage of contents across chapters, but this is |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 12840 | All AR5 | 0 | | | | There are co-benefits but also conflicting items when it comes to measures and solutions. An example of this is the food-feed-fuel-fibre-forest topic as it comes to increasing biofuel and energy crops. As this differs between world regions like Europe with scarcity of land and other continents without scarcity, I propose to discuss this in some detail in Chapter 14. Actually I mean a solution for choice of land use valid for South America is not necessarily valid for Europe when it comes to biofuel production. | Accepted. We have added an bioenergy appendix to chapter 11. The body of the chapter also deals with the issue of land competition. We have added tables on co-benefits and adverse side-effects of |
| 8936 | All AR5 | 0 | | | | I miss in this report an overview of the literature that looks into the implications of different development pathways with respect to urbanization, income distribution or population structure for baseline emissions. This field has made major progress since the last Assessment Report. This literature includes, for instance, the literature that focuses on the future relations between urbanization and emissions, such as B. C. O'Neill et al., Global demographic trends and future carbon emissions. PNAS 107 (2010); V. Krey et al., Urban and rural energy use and carbon dioxide emissions in Asia. Energy Economics in press, (2012) and B. O'Neill, X. Ren, L. Jiang, M. Dalton, The effect of urbanization on energy use in India and China in the iPETS model. Energy Economics, (in press). Also, the relation between income distribution, energy access and baseline emissions is not discussed, as would be available in, for instance, B. J. van Ruijven et al., Model projections for household energy use in India. Energy Policy 39, 7747 (2011). I would expect a discussion of this literature in either Chapter 4 (4.3 or 4.4) or in Chapter 9 (9.2.3 or 9.3.8), or at another place that I might be overlooking | Noted. We discuss this material in chapter 12 and in various other places. |
| 8939 | All AR5 | 0 | | | | Access to electricity is discussed in multiple sections (4.3, 7.9, 9.2, 9.4, 14.2) and with different numbers for current access and using different future projections. Current access is probably best estimated by the IEA or the Global Energy Assessment. There have been multiple future projection produced over the past years (again IEA, GEA, or B. J. van Ruijven, J. Schers, D. P. van Vuuren, Model-based scenarios for rural electrification in developing countries. Energy 38, 386 (2012)), which could be used as a range for future projections of access to electricity, the impact of full-access on emissions and the potential for renewable energy to increase access to electricity | Taken into account. |
| 3273 | All AR5 | 0 | | | | Further coordination across chapters may be needed to reduce overall volume. For example, 2.4.4.3 and 3.11.1.1 make similar argument in some parts, referring to Attari et al. (2010) and Allcott (2011). Most of chapters include behavioural aspects, barriers and opportunities of mitigation. In general, they consist of two parts; common elements to all sectors and sector specific information. Common elements can be described under a chapter of "Framing Issues", such as chapter 3. and other chapter should focus on sector specific information. | Accepted. We have worked on the issue of overlap and will continue to do so. Some chapters have been shortened, but we may not reduce the overall length of the report significantly due to the breadth of literature and issues. |
| 9948 | All AR5 | 0 | | | | Any abbreviation appeared first time in each chapter should be followed by the complete spelling. | Accepted. We have worked and will continue to work on such editorial issues. But this is best done once the |
| 7379 | All AR5 | 0 | 0 | 0 | 0 | Use of calibrated uncertainty language is almost completely absent in many chapters and sections. This is a major failing of the FOD that requires urgent and consistent attention for the next draft. | Accepted. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 7380 | All AR5 | 0 | 0 | 0 | 0 | The treatment of GHG metrics (GWPs etc) is still very patchy in the FOD and does not do justice to the available literature or the policy-relevance of this issue. Metrics are discussed in 3.10.3, but none of the sectoral chapters seem to be aware of this or make any attempt to show how their emissions profile or mitigation potential could change under alternative metrics. This would be crucial for AFOLU, but also industry and transport. Lots of literature on the latter, and it could easily be done. Chapter 5 shows emissions trends only for GWPs, even though this would be a great place to demonstrate how different choices of metric would change the perceived contributions from different sectors. Chapter 6 makes brief reference to the role of metrics in transformation pathways in one small sub-section, even though different metrics could have far more pervasive effects. This is not to say that metrics are crucially important: in contrast, the FOD is missing an opportunity to demonstrate that the closer the policy framework is to a first-best world, the less metrics matter; but the more patchy the policy framework, the more significant could be the regional and sectoral implications of alternative metric choices. | Accepted. We have worked on the metrics section in chapter 3 and chapter 6. |
| 6854 | All AR5 | 0 | 0 | | | These WGI TSU and Co-Chair review comments have been prepared by Thomas Stocker, Gian-Kasper Plattner, Alexander Nauels and Yu Xia. | Noted. |
| 6855 | All AR5 | 0 | 0 | | | The WGI TSU and Co-Chair review comments cover issues identified in the WGIII FOD related to the WGI contribution to the AR5 with regard to consistency, missing references, and sometimes reassessments of WGI-material. We do not attempt to propose alternative text etc. but simply flag the issues. In many cases we feel that providing the physical science basis context by referring to the WGI AR5 rather than doing a separate assessment would already help substantially in avoiding duplication of assessments and ensuring consistency between WGIII and WGI. | Noted. |
| 6856 | All AR5 | 0 | 0 | | | Referencing to IPCC WGI reports (to AR4 and/or AR5 FOD) currently is weak and in the rare cases it's done it's often too unspecific, i.e., lacking information of which Chapter of a specific report is being referred to. Often the entire report, or the SPM-only, is referred to as a whole. We suggest to be as specific as possible and to refer to the Chapters in the underlying report supporting the statements made whenever possible and feasible. | Accepted. |
| 6857 | All AR5 | 0 | 0 | | | As a general comment, we strongly encourage the WGIII authors to avoid reassessing topics concerning the physical science basis in order to reduce redundancies and, more importantly, inconsistencies between the WGIII and WGI contributions to AR5. In case specific mention of physical climate science assessments is needed, please refer to the WGI AR5 and carefully ensure consistency with the assessment provided by the WGI AR5 Chapters. One topic for which this seems particularly relevant is Geoengineering. Geoengineering is mentioned in several of the WGIII FOD Chapters with several instances where a reassessment of the physical science basis of individual Geoengineering Technologies is provided. This clearly needs to be avoided (see also the related Chapter-specific comments ). | Accepted. We have worked hard on the section on geoengineering and will continue to work with WG1 colleagues to ensure consistency. |
| 6858 | All AR5 | 0 | 0 | | | FAQs: We suggest that the FAQs within the WGIII contribution to AR5 carefully stay within the remit of WGIII, i.e., when the Physical Science Basis is mentioned, this should merely serve as a starting point but then the FAQ should focus on mitigation etc.. It is crucially important that the WGI-relevant starting points provided in these WGIII FAQs are consistent with the assessment in WGI. | Noted. |
| 6859 | All AR5 | 0 | 0 | | | FAQs: We note that in contrast to the WGI approach to FAQs, in the WGIII FOD FAQs are mostly short and do thus not allow for detailed answers. This approach, in our view, bears the risk to produce non precise language or gloss over caveats and subtleties. In order to help the reader, we strongly suggest that cross-references for "futher reading" or "detailed information" are provided as an integral part of the short FAQs, and that information on associated uncertainties be added. | Noted. |
| 5421 | All AR5 | 0 | 0 | | | Overall, this report made an excellent summary for the key literature. I just add a few more comments to this report before it can be released. | Noted. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 5422 | All AR5 | 0 | 0 | | | This report mentions the “green growth”, but a definition of “green growth” is missing in the document. What is the essential relationship of “sustainability” and “green growth”. Does the “green growth” belong to the “sustainability” category. | Accepted. We will try to avoid using too many broad concepts like SD and green growth. |
| 5423 | All AR5 | 0 | 0 | | | Many of the citied references are a little bit old. The literature published in recent three years (>2009) was limited citied in this report. In addition, some important policy papers were still missing. | Accepted. We continue to add to the reference lists. Reviewer suggestions are |
| 5424 | All AR5 | 0 | 0 | | | Climate action plans were an emerging new issue since last report. This report did address this important trend. However, the strengths and weaknesses of the current climate action plans were not fully identified. The current climate change action plans well addressed the energy efficiency in building, transportation and built environment; however, they did not appropriate consider other components (such as natural resources, agricultural lands, etc). | Noted. We have strengthened this discussion in chapter 12. |
| 17727 | All AR5 | 1 | | 1555 | | referencing should be correct and uniform across all chapters; such as Sims et al. , rather than R Sims et al. Correct references such as "D Arent and Tol, Forthcoming" | Accepted. We are continuously working on such consistency issues. |
| 7306 | All AR5 | 1 | | | | Comments will be limited to "waste" management strategies, waste sector emissions, and mitigation costs & potentials. | AA: This is not a comment but rather a note |
| 7317 | All AR5 | 1 | | | | This is a long comment related to how emissions & mitigation potential associated with waste management activities were quantified in the AR5.WGIII report to date. Even through "Waste and Wastewater" had the smallest sectoral emissions in the AR4, this sector is, nevertheless, an IPCC reporting sector and, for completeness, it seems that this sector should have been explicitly included as a "sectoral chapter"in the AR5 (as was done for the AR4.WGIII.Chapter 10) or alternatively as a unified discussion in another sectoral chapter (?industry, as was generally the case prior to the AR4). Moreover, there are no clear guidelines for the definition of waste in the various sections of the AR5 draft where is it mentioned (municipal post-consumer waste, agricultural or forestry waste, mining & other industrial processing wastes, wastewater, etc.) Generally, in the current draft for the AR5, there are bits and pieces of discussion pertaining to waste management in several chapters ( esp. 1,5,7,12) with sometimes contradictory numbers and erroneous citations (see other detailed comments). Importantly, in Chapter 1 for the WGIII AR5 FOD, the waste sector is generally missing from figures giving comparative sectoral estimates (Figs.1.4, 1.5 as mentioned above). Chapter 4 mentions waste in the context of sustainable development and consumption "accounting" practices (see 4.4.5.1). Chapter 5 (5.7 esp.) includes figures (FIgs. 5.7.1 through 5.7.5) detailing emissions from waste citing one major reference (Gerlagh and Van der Zwaan, 2012) which has to be erroneous because that reference does not discuss waste (instead, it discusses economic modeling of long-term CO2 leakage from CCS projects). The actual numbers given are similar to AR4.WGIII.Chapter 10 numbers, so perhaps that is the source with respect to the references cited therein? Chapter 7 (Annex) briefly discusses bioenergy from organic waste & residues--see 7.A.3.2. Most discussion of "waste" occurs in Chapter 12 in the context of "urban settlements, infrastructure, and spatial planning." Although one might argue that "urban" waste GENERATION is indeed an important aspect of the urban infrastructure, many activities related to urban waste MANAGEMENT occur at urban fringes or at remote sites far removed from urban/suburban development. Also (as mentioned above with respect to "waste" definitions), it is unclear how emissions from agricultural waste, forestry residues, and industrial waste/byproducts are being considered and quantified (or not being considered) in this report. Clarifications would be welcomed. | AA: Accepted - The main discussion on waste section will be discussed in chapter 10. Coordination with other chapters 5, 7, 11, and 12 will be done to ensure consistency.<br>Also, reference used in chapter 5 figures will not be used and EDGAR data will be used instead. Agricultural waste and forestry residues are discussed in the bioenergy section. MYR (as per Estela's email): a new figure has been done for chapter 5 that shows global emission trends for the<br>four categories in the Waste sector, and their relationships with GDP and population trends normalized at 1970 based on the updated EDGAR database. The figure was made thinking in avoiding any overlap with Chapter 10. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 7321 | All AR5 | 1 | | | | This is a second long comment related to quantification of waste, GHG emissions from waste, and mitigation of GHG emissions from waste. As discussed in the AR4.WGIII report (Chap 10), annual numbers for waste generation from various countries can have high uncertainties and could greatly benefit from improved standardization of terminology and accounting at the national level. Especially, for many developing countries, the role of the "informal sector" for collecting, processing, and recycling waste is largely unquantified. I would highly recommend a 2007 World Bank book by Martin Medina titled "The World's Scavengers: Scavenging for Sustainable Consumption and Production". Although the overall numbers from various cities are not summarized in a table for readers, his specific case studies detailing jobs/livelihoods gained from informal waste recycling, as well as the economic value of those jobs and the materials recycled provides important quantification of the impact of this sector for selected global cities and regions. The challenge is to improve the living conditions for these waste workers and their children. However, recognition of the magnitude of the informal recycling and its economic value is an important point to make in the AR5. | AA: Taken into account - This issue will be included in the co-benefits discussion. |
| 7322 | All AR5 | 1 | | | | This is a third long comment related to quantification of GHG emissions from waste. It's important to get the numbers right, esp. as many studies are beginning to focus on regional and local (urban-scale) emissions to better understand smaller-scale CH4 emissions using innovative tower-based, tracer, and aircraft-based methodologies for specific sources. Historically, the largest % of GHG emissions from waste has been from landfill CH4 (about half/see AR4.WGIII Chapter 10). Also, the IPCC National Inventory Guidelines for Waste (2006) have historically based landfill CH4 emissions on a first order kinetic model (termed FOD, "First Order Decay") which estimates the mass of CH4 produced over decades from waste landfilled in a given year in a given location. However, the existing methodology does not take into consideration the climate and soil microclimate conditions which limit those emissions, specifically: (1) the thickness and physical properties of site-specific cover materials, including seasonal soil moisture changes which limit gaseous transport in the cover materials; (2) the effect of engineered gas recovery on reducing soil gas CH4 concentrations at the base of the cover and thus limiting diffusive transport of CH4 to the atmosphere, and (3) seasonal CH4 oxidation (by methanotrophic microorganisms) in site-specific cover materials which is highly dependent on temporal variations in soil moisture and temperature. [For (3), current methodology allows either zero or 10% CH4 oxidation, the latter based on one of the first studies in the literature, Czepiel et al., 1996, JGR). In recent years, we have developed a freely available site-specific modeling tool which has been field-validated for 5 sites in California and is currently undergoing global validation. This model takes (1) - (3) into consideration through linkages with globally-validated U.S. Dept of Agriculture climate and soil microclimate models, scaling of oxidation to temperature and moisture via extensive supporting laboratory studies, and modeling of a typical annual cycle at 2.5 cm depth increments and 10 min time increments for user-specified site-specific daily, intermediate, and final cover materials (including both soil covers and engineered materials). The model was originally developed and validated for the state of California (and is called CALMIM, for CAlifornia Landfill Methane Inventory Model). The pertinent references are as follows (NB: ref. 1 gives additional background information on field and laboratory research by many groups over the last decade which facilitated the development of CALMIM): (1) Spokas, K., Bogner J., and Chanton, J., A Process-Based Inventory Model for Landfill CH4 Emissions Inclusive of Soil Microclimate and Seasonal Methane Oxidation, J. Geophysical Research-Biogeosciences, 116: paper G04017, 19 p. (2011); (2) Bogner, J., Spokas, K., and Chanton, J., Seasonal Greenhouse Gas Emissions (methane, carbon dioxide, nitrous oxide) from Engineered Landfills: Daily, Intermediate, and Final California Landfill Cover Soils, J. Environ. Quality 40:1010-1020 (2011). (3) Spokas, K., and Bogner, J., Limits and dynamics of methane oxidation in landfill cover soils, Waste Management 31:823-832 (2011). These 3 references have been emailed to the TSU as "authors, year". | AA: Taken into account. The text will address the limitation in emission estimation methodology. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 7323 | All AR5 | 1 | | | | This is a 4th and final long comment related to quantification of GHG emissions from waste. There are a large number of existing CDM (Clean Development Mechanism) projects related to the recovery & utilization of landfill CH4, as well as CDM projects which rely on the "avoidance of landfill CH4 generation" through composting, combustion, or anaerobic digestion. Again, it is important to get the numbers right. The majority of landfill gas CDM projects are under-producing relative to the modeled (FOD model) CH4 generation and recovery predicted in their Project Design Document (PDD). In many cases, the waste composition was poorly known (including the impact of informal recyclers and on-site waste burning to recover metals), overly-optimistic modeling by sometimes-inexperienced developers, and uncertainties regarding the extent (volume) of waste in place. For landfill CH4 projects, however, the PDD projections do not matter so much since the credited CERs are quantified directly and solely on the CH4 collected and destroyed by combustion. However, for the "avoided landfill CH4 generation" projects, the CERs are credited on the modeled (presumed) CH4 that would have been generated, IF the organic waste had been deposited in a local landfill site. Given the variability in landfill CH4 generation at specific sites (as landfills are inefficient anaerobic digesters in the ground), the multiplicity of site management factors which direct affect CH4 generation & recovery, and lack of inputs regarding the factors which actually limit emissions (discussed in previous comment), one might argue that the "avoided CH4" projects' CERs are not always real, quantifiable, and additional. This issue should be re-examined with respect to continuing Kyoto, bilateral, or other mechanisms. | AA: Taken into account. The text will address the limitation in emission estimation methodology and the possible impact on offset estimation which are used as a mechanism to help reach mtigation targets. |
| 2238 | All AR5 | 1 | | | | This whole Report is based on the assumption that emissions of greenhouse gases have a harmful effect on the climate. There is no evidence for this assumption, so the entire Report is unnecessary..This assumption is based on personal opinions of the value of the absurd model of the climate sponsored by the IPCC. These opinions are made by people paid to make them, so the conflict of interest means that they are worthless. | Rejected. We are assessing the science of climate change mitigation in the WG3 contribution. Potentially harmful climate impacts and the physical science foundations are discussed by WGs 1 |
| 2239 | All AR5 | 1 | | | | Annex 1 Should have definitions for CONVECTION and LATENT HEAT which are the most important methods of heat transfer in atmosphere | Noted. |
| 16665 | All AR5 | 1 | | | | I mainly reviewed chapters 3 and 4. There is a lot of both overlap and inconsistency between them, and a great deal of self-reference on the part of some of the authors. This compromises the claim that this report is supposed to provide a snapshot of the state of the art in this field. Some references should be deleted as not central to the climate ethics discussion (or at least multiple references to the same piece), and others added. I feel awkward about the fact that many of the references that I suggest adding are to my work. On the other hand it seems strange that after 24 years of contributing to this field there is no mention of my work in the 24 pages of chapter 3 references. A further point: I have a lingering concern that both chapters are too prescriptive for an IPCC report. | Noted. We have worked on the overlap between chapters 3 and 4 and will continue to do so. We continuously update the references during the drafting process. |
| 6220 | All AR5 | 1 | | 1555 | | Throughout the report the graphs are much too complicated and need considerable simplification and careful consideration needs to be given to the colours used. Complicated graphs impede understanding of the message. | Accepted. The work on figure material has been a key focus during the revisions and will received continued priority. Note once the figure material is |
| 12908 | All AR5 | 1 | | | | The FOD seems to have still value judgements in which should be avoided. | Rejected. Value judgements cannot be avoided, but need to be made transparent. For this very reason, WG3 has provided an array of three framing |
| 15051 | All AR5 | 1 | 1 | 36 | 41 | Annex I - The definition of value capture, walkability, complete streets, automotive dependence, automobility were not considered in the glossary. | Noted. |
| 15052 | All AR5 | 1 | 1 | 36 | 41 | Annex I - The definition black carbon sould be improved to fit Chapter 8. | Noted. |
| 15053 | All AR5 | 1 | 1 | 36 | 41 | The following a anacronysm that are importatn for Chapter 8 were not considered: TOD, BRT, LRT, PRT, HRT, LDV, ICE, CH4, EV, BEV, PHEV, NGV, FCV, V2G, ITS, VKT | Noted. |

| 4689 | All AR5 | 14 | | | | throughout the FOD, particularly noted in Chapter 1 (p. 14), Chapter 6 (p. 15) and Chapter 8 (p. 52) the loose references to 2 degrees Celsius temperature targets detract from the effectiveness of the work. In the 2010 paper by Boykoff, Frame and Randalls ''Discursive stability meets climate instability: A critical exploration of the concept of 'climate stabilization' in contemporary climate policy', Global Environmental Change, 20(1), 53-64, they state the following: An important framing of climate science and policy today revolves around the concept of 'climate stabilization'. While many factors contributed to the rise of this concept in the 1980s, this article reasons that this 'stabilization' discourse is problematic. Drawing upon emerging climate science, the article suggests that the heavy focus on monotonically increasing concentration pathways, stabilization and climate sensitivity have led to insufficient policy inferences relating to the range of uncertainties, the weak relevance of equilibrium for today's policy and the idea that there is a magical threshold of 'dangerous anthropogenic interference'. However, this article argues that the stabilization-based discourse became attractive because stabilization and its ancillary concepts developed from the connected arenas of climate science, environmental economics and energy concerns. That this discourse is tethered to these ways of thinking is unsurprising; but that it has remained relatively free of critical scrutiny can be associated with fears of unsettling often-tenuous political processes taking place at multiple scales. Nonetheless, with this historical trajectory in mind and on the cusp of an agreement in Copenhagen to succeed the Kyoto Protocol, we argue that the time has come to re-assess the concept of stabilization and to explicitly move to more productive ways of framing action to address anthropogenic climate change. The implications of this historical analysis is that stabilization is a problematic way of conceptualizing climate policy and that new approaches need to be found that focus on short- to medium-term decarbonization goals. This needs to be considered when making these claims, and/or parroting comments from UN negotiations between parties. | Noted. |
| 4345 | All AR5 | 4 | 16 | 4 | 22 | "production-side option" and "demand-side potion" are new categories. Detail explanation is necessary in the first place of this section. Figure or table may be helpful for understand. I can see the word of "supply-side" in the text. Is this same as "production side"? | Noted. |
| 4346 | All AR5 | 4 | 1 | 5 | 26 | The authors seem to avoid duplicative discussion in AR4, but important massages to political decision makers should be incooporated. It would be better to address clearly on several options relating to forestry. | Accepted. We continue to focus on "what's new", but restate AR4 finding if |
| 16052 | All AR5 | 5 | | | | The message of AR5 could be more assertive on the remaining possibility or not of sufficient mitigation to attain international goals limiting climate change, either at the technical or political levels. Yes or no is it still possible? If no consensus is here, could the report at least be blunt about the lack of consensus? | Rejected. Feasibility of goals cannot be easily assessed by science. We outline the economic, technological andinstitutional requirements and as such provide a basis for policymakers to |
| 2160 | All AR5 | All | | | | Although the Contribution's recommendations are directed at policy makers, it lacks specific "sectoral" policy recommendations that could drive transformation of engineering practices through regulatory and standard changes. Without setting such policies directed at engineering practices, engineers might be slow to adapt their practices that are necessary prerequisites to any adaptation of the built environment/infrastructure to climate change. It seems to me that the Contribution has the objective of recommending policy changes at sectoral/high level, and does not go to specificity levels that are appropriate for engineers to take hold of something as a basis to transform engineering practices. It might be necessary to have an additional effort by another group to take these policies in the Contribution and establish policy interpretations to bring them to engineering-specific changes in standards and practices. | Rejected. We have a whole serious of sector chapters, which make important conclusions, which are also relevant to engineering. |
| 8358 | All AR5 | all | | | | CO2, Co2, CH4, SO2, N2O and etc. should be revised according to their mocular formula. | Noted. |

|---|---|---|---|---|---|---|---|
| 3485 | All AR5 | all | | | | Throughout the entire report, chemical symbols are written incorrectly, without subscripts and superscripts. For example, the correct symbol for CO2 has the 2 as a subscript [this form does not allow me to format it correctly]. Sometimes you have it right, but in many places it is wrong. This needs to be cleaned up for all chemical symbols throughout the report. | Accepted. We have been revieweing this and will continue to do so. |
| 7653 | All AR5 | Annex I, 7 | | | | Could add 'carbon footprint' to the Glossary, e.g. from; Wiedmann, T. and Minx, J. (2008) A Definition of 'Carbon Footprint'. In: C. C. Pertsova, Ecological Economics Research Trends, 1: Chapter 1, pp. 1-11, Nova Science Publishers, Hauppauge NY, USA. https://www.novapublishers.com/catalog/product_info.php?products_id=5999 | Noted. |
| 9098 | 1 | | | | | Totally appropriate concept | Noted |
| 17119 | 1 | | | | | This chapter does not have any acknowledgement of the global climate advocacy efforts of local governments that has focused through Local Government Climate Roadmap in 2007. A major outcome of the process was the Global Cities Covenant on Climate - the Mexico City Pact which has an international secretariat and regularly monitors progress of signatories. carbonn Cities Climate Registry in an important effort of local governments for measurable, reportable, verifiable climate action, which captures information of more than 170 cities worldwide as of July 2012. Recognition of local governments as governmental stakeholders in para.7 of Cancun Decisions is also important reflection of all these efforts in to UNFCCC processes.This is partciularly important because many of these efforts have been realized or intensified since the relase of AR4. I believe the chapter should also have a bit more reference of theissue of urvanizatuon and global GHG emissions since there are significant number of pages in the whole WGIII Report. | Accepted - Added sentence, "A large array of mitigation actions have also been planned and orchestrated by local governemnts, including cities that are working in concert on climate change issues through parternships such as the C40, and there is some evidence that these efforts are intensifying. " [cite para 7 of Cancun decisions on local action/cities; add cross-reference to chapter 15] |
| 17739 | 1 | | | | | Overall, this chapter should be checked by the authors once again when other chapters have been finalised. At the end, there should be a paragraph on identifying each chapter and what these are about. | Noted |
| 5460 | 1 | | | | | This chapter attempts to summarize changes in emissions, changes in how emissions are viewed (multiple perspectives here) and emissions in a broader context of a paradigm shift in how climate change is considered- here in a much broader context of sustainable development. While the authors present a range of figures- the grouping of figures in 1.7 seems both too complex and too simplistic. (b) in this figure dramatically shows the importance of world trade - this deserves a clearer emphasis and additional discussion- perhaps best to put this in a seperate section. The discussion of sustainable development and the interaction with climate change is critical and is an important part of the chapter- but some type of figure to illustrate what is potential with this interaction would be very helpful for the reader | Rejected, it is not practical to address sustainable development coherently in a figure, and there are lots of ways to organize the material here. |
| 4138 | 1 | | | | | It would be helpful it you could develop section 1.5 and maybe merge it with section 1.4 because it seems that the latter already contains some material on key issues focused on by subsequent chapters. | Taken into account - we will streamline at final |
| 4139 | 1 | | | | | Please review section 1.3 in light of chapter 5 discussions. If you feel that this section contains redundant and/or inconsistent duplications of chapter 5 discussions, please revise your sections. | Accepted - we have redrafted and streamlined |
| 4140 | 1 | | | | | It would be useful if your Introduction to the report also said something about its underlying assessment philosophy and related key issues in the science-policy interface. This discussion should be related to the AR5 roadmap (section 1.5) because one key purpose of the framing chapters is to establish transparency over normative assumptions that are implicit in the concepts and methods used by later chapters to assess transformation pathways. The need to do this arises from our assessment philosophy. Please liaise with the Co-Chairs and chapter 2 authors (section 2.4.5.3) to discuss how to introduce the AR5 assessment philosophy. | Taken into account - we will streamline at final |
| 8910 | 1 | | | | | Please make sure that all abbreviations are explained in the text and that legends to figures include the abbreviations used in a figure. | Editorial – copyedit to be completed prior to publication |
| 4469 | 1 | | | | | In general, the Figures are hard to read, even on a high-resolution computer screen. This will be a problem for those accessing the Report online. | Figures will be re-designed for print and on-screen display for final draft. |
| 2347 | 1 | | | | | <no comment here as cells could not be enlarged to fit the text> | no comment text submitted to database |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 2353 | 1 | | | | | Exclude findings/results from the introduction. Those should go to the "technical summary" and the SPM. I recommend to focus the introduction to "what did we do and how did we do it" in AR5 WGIII. | no action needed--we will have figures and tables in chapter 1 |
| 9782 | 1 | | | | | Environmental impact categories beside Global Warming Potential and trade-offs between them, should be stressed throughout the report | Noted - we already discuss interactions between impacts. No further action |
| 9777 | 1 | | | | | (a)and (b) is not good only to give "change in emissions", suggest to give us as "emission in 1900,1990 and 2008" | Rejected, exactly that information is presented elsewhere in the chapter and |
| 16200 | 1 | | | | | Needs a legend for the abbreviations of the regions | Taken into account - figures will be re-designed for print and on-screen for final |
| 18013 | 1 | | | | | It is general position of the developing world that the principle and provisions of the UNFCCC should not be changed. The current negotiation under the Durban platform does not have the mandate to modify or replace the UNFCCC. So it is important that this section dose not send wrong signals to the UN process. | Noted. |
| 17480 | 1 | | | | | Resolution of 1.7a is so poor as to prevent reading or review | Taken into account - Figures will be re-designed for print and on-screen display |
| 17481 | 1 | | | | | Captioning is quite inadequate. For panel a, there should be some guidance as to interpretation, i.e., helping reader to "read" the graph. Axis labels and legends are so small as to be unreadable even when viewed on screen at 100% size. | Taken into account - Figures will be re-designed for print and on-screen display for final draft. |
| 17795 | 1 | | | | | General: It would be useful to explain in the first pages also - why little focsu has been given to other sectors then energy which had however as of AR4 a significant mitigation potential - e.g. households. I find it interesting that the authors rely a lot on the recent big energy reports e.g. GEA, WEO, IPCC etc - rather then having a slightly less global reports biased approach. If it is really so that in the other areas | Rejected. No action needed. |
| 17796 | 1 | | | | | contl little progress has been done - then there should be a call for more research or analysis. | Noted |
| 17798 | 1 | | | | | contl would explain why these initiatives or not others have been selected | Noted |
| 17799 | 1 | | | | | The reference to the Fukushima accident and the implication for energy choices, e.g. a divided europe - might be elaboated in a way that it includes " the concern for population health of the Fukushima accident - has lead to a diferential approach between and within countries - also time will show how long the fears will prevail | Noted, no action needed. |
| 17802 | 1 | | | | | The style of the chapter in general could be improved - it has initial important developments - but does not outline for example the particular choices done in additional or more in depths analysis in the remaining chapters - it further does not shine - for referrences, and in some parts it appears to be a bit biased and narrow minded. A bit more relying on AR4 - and clearly evolve from some of the key messages - reported from wg 3 in the synthesis report could be important | Taken into account - we will streamline at final |
| 17803 | 1 | | | | | General: It would be useful to explain in the first pages also - why little focsu has been given to other sectors then energy which had however as of AR4 a significant mitigation potential - e.g. households. I find it interesting that the authors rely a l | Taken into account - we will streamline at final |
| 17801 | 1 | | | | | In paticular Figure b - could be better worked out - and with the raw data - of the 1,b,c,d - could not linkages created??? | Rejected, these are already quite complicated; adding more linkages is |
| 15265 | 1 | | | | | I consider the approach of Chapter 1 is very pragmatic, and it is crucial for the real challenge to the global worming. Especially, regarding with the current situation of the world, the realistic description on the hardness to stop warming at +2oC (P22L19), and on climate problem location as one of the wider array of urgent priorities that governments face (P22L44) are plausible. | Noted |
| 17399 | 1 | | | | | In general, I recommend caution with portraying the climate change mitigation challenge as exclusively linked to energy to the exclusion of agriculture, forestry and other land uses. See Ch 1 pp 15-16 for quantitative basis for giving adequate attention to AFOLU. Also, Fig 1.5 illustrates the significance of AFOLU in many regions. Further, changes in land use offer mitigation responses that can both reduce GHG emissions and also sequester atmospheric C. | Accepted - added discussion of land use. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 15455 | 1 | | | | | While the report as a whole deals with gender issues quite substantially, the Introduction does not refer to women specific issues, or problems of gender. Since there is now substantial literature on gender and climate change issues, as well as a vast literature pertaining to feminization of agriculture and pastoral economies, and feminization of poverty - both tangentially and directly implicated with climate change related vulnerability and adaptation - the Introductory chapter MUST introduce the problem of gender, and the need to have a women focus on adaptation strategies. | Noted - no action needed; there is no literature to engage nor other chapters to engage |
| 18124 | 1 | | | | | c) Figures a and b may be a bit too small - I had to blow it up to 300% to see the details. | Figures will be re-designed for print and on-screen for final draft. |
| 5313 | 1 | | | | | is written very well and well balanced, also highlighting the trade-off between investment in green house gas mitigation and other important issues such as poverty reduction and so on. | Noted |
| 5314 | 1 | | | | | Chapter 1 is written very well and well balanced, also highlighting the trade-off between investment in green house gas mitigation and other important issues such as poverty reduction and so on. | Noted |
| 3048 | 1 | | | | | The following comments apply only to the rebound and energy efficiency aspects of the models listed in Table 1.8. Accompanying this submission is a Word document, "Rebound Comparison of Models Listed in Figure 1.8.docx" containing a table comparing all the models across the dimension of rebound-relevant features. These seven features are:<br>- Production function form<br>- Factor substitutability<br>- Factor prices<br>- Efficiency technology method<br>- Multi-factor technology gains considered?<br>- Productive ("embedded") vs End-use energy consumption distinction?<br>- Consumer re-spending effects considered? | Rejected - relevant for another chapter; chapter 1 draws on chapter 6, where the models are discussed in greater detail. |
| 3049 | 1 | | | | | While many of these models are extremely rich in detail, fundamental determinants of energy efficiency rebound, and thus of energy use itself, are perhaps underdeveloped by comparison to other model features. No model considers all the rebound-relevant characteristics listed above. | Rejected - This is not a EMF model intercomparison document. It just reviews what is out there. |
| 3050 | 1 | | | | | A number of the models use some version of a CES production function, sometimes with nestings of Cobb-Douglas or Leontief. It is known that CES functions are fairly "rebound-flexible," but have the disadvantage that energy use in response to price and rebound effects of efficiency gains are determined overwhelmingly by the energy elasticity of substitution. Therefore, these models' energy results are largely determined by modelers' choice of this elasticity's numeric value. This points to modelers needing to be careful in selecting the parametric value and clear in reporting it so comparisons can be made. Ideally, this value will be econometrically measured, not simply assumed. Merely assuming a value is tantamount to pre-determining the results. The simplicity of the CES function also suggests that models would benefit from a less arbitrary choice of production function, more general and more flexible. A rigorous comparison of production functions for uses such as these is given in [H.D. Saunders, "Fuel conserving (and using) production functions," Energy Economics 30 (2008) 2184 2235.]. The importance of the core substitution elasticity in CES production functions is shown there and in [H. Saunders, "The Khazzoom-Brookes postulate and neoclassical growth," The Energy Journal 13(4) (1992) 131 148].<br>There is also the thorny question of how to nest these various production functions, as the nesting scheme matters to the results. Turner and her colleagues [karen.turner@stir.ac.uk] have expended considerable effort looking at this question. | Rejected - relevant for another chapter; chapter 1 draws on chapter 6, where the models are discussed in greater detail. |
| 3051 | 1 | | | | | Models using some form of the Kaya identity face all the problems listed above related to the energy intensity term. | Noted |
| 3052 | 1 | | | | | Since factor substitutability is such a key driver on the production side, the more explicit the model in depicting this, the more credible the result. | Rejected - relevant for another chapter; chapter 1 draws on chapter 6, where the |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 3053 | 1 | | | | | For those models using a production function approach, the manner in which energy efficiency gains are introduced is important. Arguably, a factor-augmenting approach is best, as it fits most closely with engineering concepts and can be econometrically measured. The AEEI concept creates some issues when introduced in the traditional way to a CES function. That is, when translated into an equivalent factor-augmenting expression, the functional form is difficult to interpret in anything resembling a commonsense engineering depiction of the efficiency technology being implemented.<br>The article cited previously shows how factor-augmenting technology terms can be measured econometrically [ref: H.D. Saunders, "Historical evidence for rebound in 30 US sectors, and a toolkit for rebound analysts," (2011, under review) available at http://works.bepress.com/harry_saunders/9/] and another reference shows how such terms can be assessed consistent with engineering principles [for detail on obtaining engineering assessments of energy-augmenting technical change see also H. D. Saunders. "Specifying technology for analyzing rebound" in: Energy efficiency and Sustainable Consumption: Dealing with the rebound effect. Ed. H. Herring and S.Sorrell. Palgrave Macmillan, 2009. link available at: http://works.bepress.com/harry_saunders/12/]. | Rejected - relevant for another chapter; chapter 1 draws on chapter 6, where the models are discussed in greater detail. |
| 3054 | 1 | | | | | No models explicitly incorporate consideration for technology gains that apply to other factors of production, with the exception of WITCH, which introduces a neutral technology gain parameter (TFP), and the possible exception of MESSAGE, if it considers technology gains for other factors via its annual "recalibration" approach. Technology gains for other factors have a huge impact on energy consumption [H. Saunders, "The Khazzoom-Brookes postulate and neoclassical growth," The Energy Journal 13(4) (1992) 131 148] and [H.D. Saunders, "Historical evidence for rebound in 30 US sectors, and a toolkit for rebound analysts," (2011, under review) available at http://works.bepress.com/harry_saunders/9/]. Research is needed to evaluate this effect on energy use more explicitly to improve forecasting. | Rejected - relevant for another chapter; chapter 1 draws on chapter 6, where the models are discussed in greater detail. |
| 3055 | 1 | | | | | None of these models apparently incorporates the ability to partition energy efficiency gains as between productive and end use sectors. Some use a traditional Residential/Commercial/Industrial/Transportation partitioning, but none distinguish efficiency gains in households and for personal transportation (where utility maximization is the driver) from energy efficiency gains in the productive part of the economy (where profit-maximazation is the driver). The productive side of the energy economy (including commercial/industrial/commercial transportation sectors) is where energy becomes "embedded" in the goods and services provided. Efficiency gains are likely to have very different effects in these two components of the energy economy. | Rejected - relevant for another chapter; chapter 1 draws on chapter 6, where the models are discussed in greater detail. |
| 3056 | 1 | | | | | None of these models seems to take advantage of new research on end-use consumer "indirect" or "re-spending" effects. Several researchers have found fairly significant rebounds owing to these effects [Druckman, A., Chitnis, M., Sorrell, S. and Jackson, T., 2011 Missing carbon reductions? Exploring rebound and backfire effects in UK households. Energy Policy, 39, 3572-3581.] and [Thomas, B. A., Azevedo, I. under review, 2012 Direct and Indirect Rebound Effects for the U.S. Household Using a Partial Equilibrium Model. Working paper available at: http://www.andrew.cmu.edu/user/ilimade/Ines_Azevedo/Home.html] and [H.D. Saunders, "An Income-based Analysis of Historical US Energy Consumption" Available at: http://works.bepress.com/harry_saunders/27 (2012, under review)]. Any discussion of rebound should acknowledge direct and indirect effects on both the end use side and the production side of the energy economy. These effects may be strongly additive. | Rejected - relevant for another chapter; chapter 1 draws on chapter 6, where the models are discussed in greater detail. |
| 4368 | 1 | | | | | A general comment on chapter 1: I find it difficult to appreciate the cost of implementing mitigation and adaptation measures. May be it would help to compare estimation of this cost against other expenses such as the cost of the recent economic crisis, the cost of military conflicts around the world, etc | Noted |
| 10460 | 1 | | | | | A good chapter and mostly well written. Need to avoid personal pronouns though throughout. | Taken into account - we will streamline |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 10676 | 1 | | | | | Show 2100 chart from Unger as well, to demonstrate how importance of emissions depends on time horizon? Although this is shown in Figure 8.2.1, I'm not sure that readers of the current draft would go to the transport chapter to find it. | Rejected - figure has been replaced |
| 10374 | 1 | | | | | We suggest to adopt more models from developing countries, so that to convince developing countries taking part in mitigation. Our model also produce the BAU emissin, in which emission in 2100 and 2050 is about 70 GTC and 48GTC respectively. So we may suggest to include some other models from developing countries, especially the IAM which is different with the ones AR5 has selected. | Rejected - relevant for another chapter; chapter 1 draws on chapter 6, where the models are discussed in greater detail. |
| 9923 | 1 | | | | | Resolution is too low to read the data and legend clearly. | Taken into account - figures will be re-designed for print and on-screen for final |
| 9924 | 1 | | | | | Resolution is too low to read. | Taken into account - will be done as part |
| 9925 | 1 | | | | | Assumptions for economic growth, technological change and population growth etc. vary in different models. So BAU emissions from different models are non-comparable only if all the model assumupations are also list as complements. | Rejected - relevant for another chapter; chapter 1 draws on chapter 6, where the models are discussed in greater detail. |
| 18420 | 1 | | | | | main messages and changes since AR4 | No action needed |
| 9928 | 1 | | | | | It's very helpful to highlight issues learned after AR4, but as a response to those issues should be reflected in the following chapters. So that we can see the progress IPCC made after AR4. | Noted |
| 17003 | 1 | | | | | The lack of any discussion on hydro is a glaring omissions. Both large-scale and the potential for micro-hydro, especially in non-grid-connected areas. | Rejected, hydro's potential in mitigation is comparatively limited. |
| 18425 | 1 | | | | | Energy supply<br>Again, the tone is rather optimistic, because it emphasizes the growth of alternative sources of energy (which is true) but does not acknowledge completely the trends in coal, and oil, especially horrible sources like tar sands. Regarding shale gas, the report does not fully recognize the potential problems with this source, in terms of delaying investment in cleaner energy technologies. □ | Accepted - added a declarative statement about coal and more discussion on drivers of emissions |
| 18426 | 1 | | | | | International organizations and agreements<br>It is interesting that the report recognizes the growing of different forms of institutional structures in dealing with climate change, such as G-20 and g-8. But, no surprise here, it fails to acknowledge that the failure of UNFCCC in 2009 is due to structural problems of that kind of negotiating platform.<br>The review of the research agenda of RI and climate change is excessively concentrated in liberal-institutionalism agenda, and does not acknowledge constructivist and especially global governance approaches. □ | Accepted, will add some mention of constructivist work, but if you look at the reference to Hafner-Burton et al (2012) you will see that work cited heavily |
| 3310 | 1 | | | | | I find this section and its graph nearly inscrutible. | Noted - all figures completely redone |
| 10675 | 1 | | | | | Short-lived forcings (especially methane, ozone and black carbon) are a hot policy topic given the recent UNEP report and the formation of the Climate & Clean Air Coalition. I am not sure that this section - plus the reference to a slightly obscure section of the transport chapter - contains sufficient detail and perspective given its policy relevance. For instance, it does not cite Shindell et a. (2012) "Simultaneously Mitigating Near-Term Climate Change and Improving<br>Human Health and Food Security", published in Science, which underpins the UNEP report and is highly relevant. I think at least two points are missing from this discussion. First, these emissions are not limited to the transport sector: they are relevant to biomass burning for energy and larger fossil fuel plants. Second, action on short-lived forcings are not a substitute for mitigation of CO2: peak temperature limits such as 2 degrees can only be met by bringing CO2 emissions to near zero; emission rates of short-lived forcings then add some additional warming to that peak. But the reverse is not true: bringing short-lived emissions to zero cannot limit peak warming under conditions of non-zero CO2 emission rates (this could be demonstrated by reproducing Shindell et al. Figure 1, but critically extending it to beyond the point at which temperature peaks in the 'CO2 measures' scenario, if the data are available). I would like to see these points discussed, perhaps in a more appropriate section of the report such as chapter 5 or section 1.4. | Accepted - cites to Shindell, UNEP on "black carbon", and Victor, Kennel, and Ramanathan (2012) in Foreign Affairs added in section on short-lived climate pollutants |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 18427 | 1 | | | | | Emission trajectory<br>I think this part could be more assertive regarding the path of emission rate, putting numbers and showing how far we are from a stabilization path. | Taken into account - text was rewritten and plans to update the figure showing the gap |
| 12514 | 1 | | | | | Generally, the discussion in Chapter 1 and specifically in this section does not treat energy efficiency and demand side measures generally with the fortitude that they deserve. As important as supply side measures are, this imbalance should be addressed. Numerous studies since the early 1970s have documented the benefits of energy efficiency and indeed its crucial role in mitigation. The draft documents this extensively in later sections. There is no doubt that energy efficiency at scale is an essential strategic approach to reducing emissions and climate risk, and additional discussion to that effect is in order. | Noted, we can add two more sentences on efficiency |
| 10833 | 1 | | | | | I understand what you are trying to do here, to show different perspectives at lookin at emissions, but since you only cover four, you are opening yourself to a critique for what you have missed… The main point is not to miss the most obvious ones. For example, what about annual emissions (the current approach), what about historic emissions (as often debated), etc. I am surprised that these two are not included. Then there are others, such as ability to pay... | Taken into account - we will be adding cumulative emissions |
| 18129 | 1 | | | | | a) Overall it would be good to elaborate if the discussion on perspectives refers to all GHGs or only CO2. For figures 1.7a and b, it is clear that the former refers to all GHGs whilst the latter only to CO2. However for figures 1.7 c and d, elaboration on this is required as ranking and persepctives may vary depending on the GHGs considered and the data sources used (especially for more uncertain sectors like forestry). Transparency here is therefore important.<br>b) The axis marking for the y-axis for 1.7a is very difficult to read - CO2? | Noted - all figures completely redone; rest of text is pretty clear about which ghgs are covered |
| 4472 | 1 | | | | | This section is unduly pessimistic. It should be expanded to include the results of as Stern (2009) and other estimates that place the global effort that would be required to de-carbonize the global economy by 2100 at around 1 to 2 percent of global GDP. This is surely a very large effort, but it is possible. The models are not the same as reality; projections of what is feasible or not over a 100-year horizon need to be much more heavily qualified than they are in this section. | Rejected, section on achievable targets totally rewritten to make conditions clearer |
| 18133 | 1 | | | | | Geoengineering is mentioned several times in this section. What is entails should be briefly described. | Rejected, term will be explained in |
| 12193 | 1 | | | | | General comment for the chapter: Chapter 1 is an introductory chapter. Reading chapter 1.4.5 it is not quite clear to me, what the task/function of the chapter is. Is it to structure the following research on related topics in the report? Is it to provide an overview on past research results in this field since AR4? As it is organized now, it is very general and not comprehensive/balanced, reflecting the literature or possible questions of this topic. The text includes only one reference. What about the related body of literature on “collective action”, for example? | Noted. This wil be clearer when we add a roadmap to other chapters and when the SPM figures out its key messages |
| 4142 | 1 | | | | | You might want to consider additional questions for the FAQs, e.g. "What is new in the AR5?" or "Why and how does the AR5 assess recent findings on climate change mitigation?". | Rejected, a topic like "what is new" is too broad. No action needed |
| 10266 | 1 | 0 | | | | Highly balanced descriptions have been done in this chapter. Excellent. | Noted |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 9093 | 1 | 0 | | | | The analysis not only must be focused in the total rise of the emissions of the greenhouse gases (GHG), but also starting from the real bases of the very high emissions originated in developed countries, and those emissions issued in the developing countries which are in comparison very little.<br><br>The developed countries are responsible for the base emission of GHG that has led to the climate change now threatening humanity due to their historical and systematic policies of excessive consumption of good and the irrational appropriation and exploitation of the countries` natural resources and also the natural wealth of the developing countries.<br>That is the reason, why in the analysis of the mitigation, it is essential to include transparent considerations that lead to the change these policies from developed countries. | Noted. This will be clearer when we add a perspective on cumulative emissions. |
| 13357 | 1 | 0 | | | | This chapter is very fine in many ways. It is well structured, throughly researched, and its overall argument is clearly put. Given this, please forgive the fact that, for brevity's sake, I'll offer corrective comments and criticisms which may make the tone of my response seem unduly negative. | Noted |
| 2151 | 1 | 0 | | | | <no comment here as cells could not be enlarged to fit the text> | no comment text submitted to database |
| 2152 | 1 | 0 | | | | The key messages of the executive summary do not yet come across in a clear manner. Currently the executive summary is to a large extent a (apologies!) collection of key elements of AR5. In my view it needs to be organized around the set of 5-10 key messages which are the essential ones. Those are the ones which you want to bring to policy makers, businesses, and other decision makers. (Former consultant cannot avoid the advice: Take 1 single piece of paper and write down what those 5-10 messages are) | Noted |
| 2153 | 1 | 0 | | | | I recognize that the discussions needed in AR5 on mitigation are broader than in AR4. The main audience of this report are policy makers and businesses who should be motivated to action, as well as the broader public who want to understand what climate change means to the world. Their main questions are still "What can we do to limit global warming? Can we stabilize at 2°C warming? Which measures would need to be pursued and how much reduction contribution do they have? And what will mitigation cost?" Now, the executive summary does not really answer this central set of questions, which should be amended substantially. | Noted. Some of those questions are answered. Executive Summary will be developed further along with chapter. |
| 16913 | 1 | 0 | | | | A well written and professional chapter; however its exact role in relation to the full report and depth of connection to its contents is unclear, and it does have some specific problems. Focusing on the “six arguments” feels a bit unusual for an introductory chapter – but it’s a lot better than anodyne summary so I would incline to keep it. | Noted - No action needed. Our inclination is to keep the 6 arguments as well, but we need to see what comes from the SPM. |
| 16914 | 1 | 0 | | | | The overall “tone” emerging in chapter 1 is pessimistic. This would reflect reasonable judgement – particularly viewed from a North American or ‘current global trends’ perspective - but I think should be more cautious (see some of specific comments below); history is marked by discontinuities. It looks like the language on 2 deg.C has already been quite carefully crafted (“the current trajectory is inconsistent..”), but it is important that the overall message on 2 deg.C is anchored in Chapter 6, and presented with care and consensus. | Taken into account - tone adjusted slightly but message remains the same |
| 4829 | 1 | 0 | | | | With my background in environmental psychology I am happy to see that the WG III report takes findings produced by social science much more into account than previous reports. However, the introduction does not reflect this scope properly as it is strongly dominated by behavioural economy. I would like to see more references to later chapters in the introduction already since this will be read by more people than the whole report. | Noted. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 4315 | 1 | 0 | | 0 | | This figure only goes back to 2000. It therefore gives a misleading impression that recent prices are exceptional. It also uses actual prices rather than correcting them for inflation. This exacerbates the misleading impression. http://inflationdata.com/Inflation/Inflation_Rate/Historical_Oil_Prices_Chart.asp gives a much more accurate message. | Rejected. Quoting nominal prices is fine. Our point is not a long discussion of oil prices but some context. |
| 18401 | 1 | 0 | | | | 1. It would have been very nice to have right here some information in advance (what can be done, what have been not done) about the economic potential for mitigation. | Noted - some of this will be addressed through our discussion of what is achievable and the updating of the EMF |
| 18402 | 1 | 0 | | | | 2. The chapter is not well balanced within countries and groups of countries. Nothing to say also in an elegant way about performance or results of Annex 1 countries with regard to commitments of the Kyoto Protocol. BRICK´s seems to be the bad guys. Remember that the lowering on emissions after 1990 was due to emissions of so called economies in transition due to economic crisis. This is well documented and IPCC cannot ignore it. | Noted. We have four (soon five) different persepctives on mititgation Some make the BRiCs look good; others bad. |
| 18403 | 1 | 0 | | | | 3. Executive Summary | no action needed |
| 18577 | 1 | 0 | | | | As a reader I expect to find an overview of the report, what it itends to do and also of main learnings. | Noted - this will be addressed when we add a roadmap to the report and also the |
| 18578 | 1 | 0 | | | | Ideally the introduction should help the reader to navigate through the extensive material. | Noted - this will be addressed when we add a roadmap to the report and also the |
| 18579 | 1 | 0 | | | | The chapter is at least readable but some sort of declared ambition is lacking. | Noted - some of this will be addressed through our discussion of what is achievable and the updating of the EMF |
| 18580 | 1 | 0 | | | | Addressing CC an important component of SD. Hardly a lesson as such but an important insight/ wider perspective | Noted. |
| 18581 | 1 | 0 | | | | Financial crisis/macroeconomic situation. Figures/date referring to 2009 and 2010. Will be pretty old and partly outdated when published. The interesting (and most sustainable?) part/conclusions:<br>Globl economic growth is shifting to the BRICS<br>Sharp rise in “embedded” emissions<br>Lower turnover in capital stocks in historically industrialized countries. Slow down in practical impact of policies | Noted - we have addressed all these points already in the text; however, financial performance figures might need updating |
| 8989 | 1 | 0 | | | | A fundamental framing issue that Chapter 1 must contend with is whether the assessment report will deal only with flow of current emissions or analyze this in the context of stock of emissions. Ignoring the role of the stock of gases in the framing chapter will make the whole assessment disconnected from reality and risks the presentation of an irrelevant report. | Taken into account - added chart on stock |
| 8990 | 1 | 0 | | | | It is important for the chapter to recognize the macroeconomic and development contrasts between developing and developed countries. The issue of lifestyles and consumption constrasts between developing and developed countries is not analyzed. The contrasting level of industrialization and urbanization is also ignored. It would be useful to discuss the distinction between luxury emissions in the developed countries, part of which is made possible by the exports from develoing countries produced with high emission and the survival emission in developing countries where the majority of populations still do not have access to modern sources of energy. | Noted - Most of these points need to be addressed in later chapters; some of the macro differences are addressed. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 8991 | 1 | 0 | | | | The chapter highlights the global financial crisis but misinterprets its impact and its meaning. The discussion suggests that developing countries growth are decoupled from developed countries, and does not refer to analytical literature that the decoupling is mostly a myth. (For example, see Akyüz, Yilmaz. (2012). "The Staggering Rise of the South?" Research paper no. 44. The South Centre. Geneva and Izquierdo, A., Romero, R., Talvi, E. (2007), "Booms and Busts in Latin America: The Role of External Factors", Working Paper 631, IADB Research Department.) That the developing experienced deep economic downturns at the onset of the crisis in fact demonstrates that the "decoupling" hypothesis does not apply. The recovery in developing countries follows from the economic stimulus measures undertaken in response to the crisis – monetary easing and investment – which also helped in the quick recovery in commodity prices. The chapter mischaracterizes the growth of the BRICS during the crisis, but even in August 2012 the growth rate of all the BRICS has declined, mainly as a result of the slow growth and threatened recurrence of recession in the developed countries. | Taken into account - removed disucssion of causal reasons for the crisis |
| 8992 | 1 | 0 | | | | By emphasizing the recent and future trends emissions, the chapter inaccurately characterizes the climate change issue, shifting the blame to developing countries. This approach de-emphasizes the role of developed countries for the the long-lasting stock of CO2 which conflicts with the global climate change regime which recognizes the responsibility and leadership of developed countries to take action and address the problem. As a matter of accurancy, it is necessary for this chapter to have a comprehensive treatment of the role of the stock of emissions and historical responsibility. | Noted - we will consider expanding point on emissions |
| 8993 | 1 | 0 | | | | The chapter should put the use of the Kaya identity in its proper place. It is a well-known principle in social science that identities by themselves do not generate policy implications. An identity helps to categorize quantitative elemets of a total but ignores the relationship between the parts. For example, many of the arguments in the right side of the identity can be interdependent. The Kaya identity is particularly inaccurate when it is applied on country categories, ignoring levels of per capita income and emissions and irrespective of level of development and economic structure. For example, developed countries already have a larger proportion of GDP in highly technology and in services which have lower emissions. Developing countries still have a large proportion of their economies and their people in low skill, low productivity jobs and will require greater manufacturing activities which are more highly polluting than services industries. | Accepted - Added p.17., line 18: "Within broad groupings of countries—industrialized, and emerging and other developing—patterns are broadly similar, except for the energy intensity per unit of GDP due to shifts in time caused by different stages of industrialisation and subsequent shifts towards a more service-based economy, with related higher and lower levels of emission intensities." And modify p. 17 |
| 7856 | 1 | 0 | | | | Despite the claim to the contrary, the chapter is writtten in a value-laden language and contains many implicit value judgments. These should be made explicit and debated in chapter three. | Noted |
| 10829 | 1 | 0 | | | | Particularly in section 1.3, there is the use of "Annex I", "Annex II", and "Annex B". The first two relate to the UNFCCC and second to the KP, and "Annex I" is different to "Annex B". This is confusing for all but those deeply in the process. I suggest a box/FAQ define what "Annex I", "Annex II", and "Annex B" are and if they refer to the UNFCCC or KP. Following this, make sure the usage in section 1.3 is correct. | Accepted. Annex definitions will be part of the Glossary |
| 18390 | 1 | 0 | | | | This chapter is an overview of this IPCC Report but must contain some general points like: (a) Greenhouse gases are a stock pollutant as opposed to flow.<br>(b) The cause is anthropogenic. (c) Mainly due to industrialization of the advanced countries. | Noted |
| 18391 | 1 | 0 | | | | Mitigation can be over time. Who should bear the responsibility? Cannot be the rich nations alone but also developing countries but the latter must be compensated since they did not create the problem—transfer of technology, carbon permits etc. | No action needed |
| 18392 | 1 | 0 | | | | There is very weak evidence for macroeconomic decoupling, so it should not be<br>taken as an article of faith. Citibank says a one percent decline in US activity lowers the rest of the world's activities by 0.3 per cent or more. | Noted. Text adjusted, evidence is mixed. |
| 18393 | 1 | 0 | | | | So with a global slowdown, industrial activity gets lowered worldwide—good for the environment—but R & D etc also take a hit. | No action needed |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 18394 | 1 | 0 | | | | Some more discussion on uncertainty, fat tails, especially in general equilibrium. | Noted, we have adjusted the text, issues will be discussed in Chapter 2 |
| 18395 | 1 | 0 | | | | Emphasize the point made about linking emissions to consumption rather than production. With international trade not all of China's emissions are for consumption in China. | Accepted - we have made this point and will embellish it with discussions of |
| 5425 | 1 | 0 | | | | I find the text rather biased. Intermittency is flagged as a problem for renewables, but it is not mentioned that there are proven solutions to most such problems. In contract, neither accidents, waste storage or profilation issues are noted for nuclear energy, and the Fukushima accident is mentioned as if it were a public relations issue. | Accepted, need to verify that discussion is balanced with advantages and flaws of all major technologies mentioned/illustrated. |
| 12907 | 1 | 0 | | | | Chapter 15 argues that the subnational governance level is important and that innovation is not just about technology but about situated sociotechnical systems. For example on Chap 15 p64 it is stated that 'Cities have become a critical site for the mobilisation of climate mitigation policy' and that 'new logics and practices for urban development' can realise climate change objectives 'achieving widespread 'transitions' to low carbon urban development' These are extremely important points yet the introductory chapter conspicuously fails to acknowledge them. If Chap 1 is intended to give an overview then it needs to address these issues much more directly and explicitly. | Noted. |
| 18416 | 1 | 0 | | | | There is a sort of tension in this chapter: on one hand, the intention to show that the current GHG emission path, climate modeling, and lack of profound mitigation measures are leading humanity towards a dangerous climate change scenario. On the other, there is some kind of optimism in relation to international arrangements (considering the failures of UNFCCC as temporary setbacks and highlighting actions taken by g-8, g-20 and BRICS) and national actions regarding climate mitigation. For instance, in the same page (22) the 2C target is both considered almost impossible (when talking about climate modeling) and then uncertain (when talking about global political responses).<br>However the tension, I think that the predominant vision in the chapter is the second one, which tries to highlight positive trends in low carbon political economy. Those positive trends exist, but they are by far overpassed by the scientific evidence regarding the degree of the climate problem. In this way, the scenario built in the chapter is inaccurate.<br>There is an unsurprising problem regarding the use of non-scientific UN vocabulary, such as developed and developing world. In my opinion it should be used the much realistic and accurate classification of the World Bank in four groups: High-income countries, Upper- middle-income countrie, Low-middle income countries and Low-income countries.<br>The acknowledgement of growing emissions in the emerging world is always treated with delicacy and moderation, as if the path of emission growth in these countries was not that threatening to climate stability. | Noted - this tension is unavoidable and part of the central tension in the socioeconomic literature, so if the chapter has a tension that is good. But our writing team needs to check if we have the right tension and also if we should shift usage in terminology. |
| 10372 | 1 | 0 | | | | Learn from the financial crisis in 2008, the security of nuclear energy should be reconsidered and should be highlighted in AR5. | Rejected. Nuclear security has no relation to the 2008 financial crisis. |
| 10373 | 1 | 0 | | | | Financial crisis has been mentioned in 1.2.1.2 as one of the issues learned after AR4. But please pay attentions to avoid provoking financial crises in mitigation in the future. If substaintial mitigations are implemented in the US and China, which are the major economic leaders over the world, it would be dangerous for the world economy. So we suggest to take optimal economic growth considered in mitigation actions. Based on our research, an EKC can be obtained with optimal economic growth. I will submit our paper, which is about optimal growth with mitigations, for your reference. | Noted, we reference the discussion of energy modeling under different scenarios and the possibility of higher-than-expected costs as well as lower-than-expected costs. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 2332 | 1 | 0 | | | | In this chapter, there is lack of attention on Least Developed Countries and small islands under climate change scenarios and economic globalization. Climate Change and Economic Globalization are referred in multi dimensional and multi-scale contextual view. However, the analysis is mainly based on the new concept of double exposure to accentuate winners and losers of both processes simultaneously on region, sector, social group and Economical perspectives. Economic globalization signifies uneven development creating many social crises such as poverty, spatial division of labor and unemployment through capital flow and capital accumulation. Ironically, winners of economic advancement would lose dignity i.e. East Asian Crisis in 1997. Conversely, climate change might affect any person or geographical location without concerning socioeconomic status. Climate Change vulnerabilities cause starvation, declining production and economic recessions. Karen O'Brien and Robin Leichenko (2000) distinguish double winners and double losers of both global processes through the concept of double exposure (O'Brien & Leichenko, 2000, 227). In the regional perspective some geographical areas such as Sub Saharan Africa suffer from climate change and economic globalization. Many African countries are exacerbated from lack of advantages of Globalization and devastated climate changes. On the other hand, Agrarian Capitalist class, who captured economic dominant in Mexico gain lot of advantages, makes suppression on rural farmers. This sectoral perspective is applied to realize the rapid climate changes in Mexico in 1998 which alleviate the socioeconomic level of rural farmers declining below poverty line. Thus, I would like to suggest for reconsideration of the bottom line of this arguments while report always dealing with BRICS, emerging economics in developing countries perspective. # Necessary reference for this argument:- O'Brien, Karen L. & Leichenko, Robin M. 2000, "Double Exposure: assessing the impacts of climate change within the context of economic globalization" Global Environmental Change 10, Elsevier Science Ltd. 221-232. | Noted - Ch.1 needs more "granularity" outside Annnex-I and BRICS. |
| 4212 | 1 | 0 | | | | Chapter 1, or an Executive Summary, needs to be clear about the path to mitigation. A possible statement appears in Chapter 6, p5, line 29 "all countries must ultimately bring their emissions toward zero to meet any stabilization goal." However, this statement is too weak and fuzzy. Does "ultimately" mean 2050, 2100, or some, too late, date like 2500? Are "emissions" net emissions after sequestration measures are considered? If not, near zero emissions would be infeasible. Does "toward" mean an easy 10% reduction or a very challenging 90% reduction? | Taken into account - text to be improved |
| 4213 | 1 | 0 | | | | Chapter 1, and the report throughout, should be clear on the key roles of the private sector (businesses and individuals) which needs to understand the needs for, accept its roles in , and act to achieve GHG reduction. Public policies should encourage such actions to be rational economically and desirable socially, but private buy-in and initiative is essential. | Taken into account - text added on businesses |
| 11387 | 1 | 0 | | | | The authors seem to take the view that "green growth" is separate and distinct from "sustainable development" in terms of the conceptual framework and the policy approach. This view reflects the approach that has been pushed largely by the policymakers of developed countries in, for example, the context of the Rio+20 process in relation to the concept of "green economy" as well as through the work of the OECD through its "Green Growth Strategy." However, it should be noted that in the Rio+20 outcome, green economy concepts (which have often been understood as also including green growth concepts) and policies are to be "in the context of sustainable development and poverty eradication as one of the important tools to achieve sustainable development" and that countries that seek to apply and implement green economy policies "can choose an appropriate approach in accordance with national sustainable development plans, strategies and priorities." Politically at the multilateral policy level, therefore, the conceptualization of green growth as distinct from sustainable development is not accepted, particularly by developing countries. Instead, it is merely among the many approaches that various countries can use in order to achieve sustainable development. The Introduction Chapter should reflect this political consensus that was adopted in Rio+20. | Noted |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 11388 | 1 | 0 | | | | The discussion in the section on “International institutions and agreements” does not sufficiently discuss the point that UNFCCC gridlocks may be the result of political differences rather than the result of the policy architecture or the design of the UNFCCC itself. In not doing so, it creates an implication that there is a need to revamp or replace the UNFCCC given the difficulties in obtaining agreement under the UNFCCC. This kind of message, if not adequately corrected, could be used in the future to argue for a shift away from a UNFCCC-based and –centered multilateral policy regime for climate change to a new regime that moves away from the UNFCCC’s principles, provisions, and conceptual approach | Rejected. We have cited a variety of perspectives on this. No further action needed. |
| 11389 | 1 | 0 | | | | There are inconsistencies in the sourcing of references. While most references indicated in the bibliography come from peer-reviewed academic or scientific journals or official publications or reports of international organizations, a non-peer-reviewed speech of the head of an international organization and a news release from the same organization are used in at least two instances to support assertions in the text in relation to the impact of the global economic and financial crisis on global economic relations – assertions that then become part of the argument for stressing that the future responsibility for global emissions will come from “emerging economies”. Given the important role that such assertions play in setting the overall paradigm of the Introduction Chapter with respect to the “emerging economies” and their role in climate change mitigation, such assertions should be more adequately referenced and supported, and should also be balanced by a discussion on the continuing important role of developed countries in the context of their historical responsibility for GHG emissions | Noted, team will check references |
| 11390 | 1 | 0 | | | | There are also inaccurate references to the Copenhagen Accord and its proper context within the UNFCCC framework of decisions. The Introduction Chapter seems to assume that the Copenhagen Accord was an official product of the UNFCCC when in fact it is not. It was merely taken note of by the UNFCCC COP15 in Copenhagen, rather than being adopted as an official UNFCCC COP decision. As such, it is not an official UNFCCC document | Rejected - We wrote delegate "took note" of the Copenhagen Accord. No such expression as adopted. |
| 16078 | 1 | 0 | 0 | | | Whole Chapter : Overall a fairly well designed chapter, good reading, fairly balanced views. Maybe needs more focus on the goal of IPCC WGIII in the present work, such as "can we do it"? "can we do it in our present knowledge"? Can we do it in the present framework of negociations? | Noted - some of this will come from the SPM. That, in turn, will feed into the roadmap that our chapter offers for the |
| 4025 | 1 | 0 | 0 | 0 | 0 | Overall, the chapter is well written, though there is always room for improvement. Thank you. | thank you |
| 4316 | 1 | 0 | 0 | 0 | 0 | It claims that some change in climate is “inevitable". If it means that the climate changes naturally, then it is what everyone knows. If it means that “dangerous man-made global warming" (the redefined meaning of climate change) is inevitable, then it goes against even the P CC who claim that they have no more than a 90% confidence level. I would also point out that this confidence level is unsubstantiated by the data and by the IPCC's own assessment of uncertainties. It needs to be changed. | Rejected. It doesn't mean either of these. It means that because of buildup of gases already (and building that will occur in future) that the climate will change. |
| 3685 | 1 | 1 | | | | The report seems very concise and well written. Congratulations to the entire team | thank you |
| 3686 | 1 | 1 | | | | Executive Summary page 3 line 21 the write up is very good, it accepts the academic work of “how public opinion influences the design and stringency of climate change mitigation policies”. | No action needed |
| 3691 | 1 | 1 | | | | I am not sure the document summarizes the public opinion research, if not it is good two add two or three pages. I am ready to write if needed. | Noted |
| 3692 | 1 | 1 | | | | New References | Noted - no action needed, insufficient |
| 17744 | 1 | 1 | | | | For the executive summary - consider the formats used in chapters 16 and 10 | Noted |
| 4849 | 1 | 1 | | | | Ch.1 Introduction | Rejected, insufficient information |
| 4865 | 1 | 1 | | | | MISPRINTS etc. | Rejected, insufficient information |
| 9188 | 1 | 1 | | | | terminology: geoengineering should be SRM or CDR? Otherwise define geoengineering. | noted - refer to glossary that explains the term "geoengineering" |
| 9189 | 1 | 1 | | | | it should be noted the costs presented here is assuming that the governmental intervention is cost effective - often it is not the case. As such these are minimum cost estimate. | Noted |

|---|---|---|---|---|---|---|---|
| 5755 | 1 | 1 | 1 | 33 | | Please revise all citations, embedding in the text failed in many cases and there are far too many brackets, even in the references' section. | Editorial – copyedit to be completed prior to publication |
| 18404 | 1 | 1 | 2 | | 12 | gives the impression that the mitigation effort has been consistent with the target of important emission reduction and concentration stabilization, but that is not the case. Giving a positive impression is not bad as policy for the report but the chapter need to answer the question if emission continues to increase since AR4. See rows 42 to 46, see also page 13, rows 20-21 and 1.3.1 | Rejected - counterfactual comment. Text is balanced. |
| 18405 | 1 | 1 | 27 | | 27 | I miss the argument that mitigation is not in contradiction with development policies. I´m sure there is literature on that issue. | Rejected - insufficient information |
| 17004 | 1 | 1 | 33 | | | Who are the "G8+5"?; again, these nations should be listed so a complete snapshot of the current situation in the world is given, while also allowing posterity to read this report and assess what each nation has done, what impact it has had, etc. | Accepted - text added to list G8+5 countries |
| 18406 | 1 | 1 | 43 | | 43 | “widely discussed policy goal”, not a scientific one. The chapter continues to quote the target without explicit consideration to science. Later on the chapter there is a sentence related to science “been elusive”. I think scientist do not approve such kind of goals and are no committed to approve that. This goal have never been discussed from the scientific perspective. | Rejected - statement is incorrect. There is massive scientific work analyzing the goal. |
| 12215 | 1 | 1 | 1 | | | This chapter is very well written, it has a good structure, is highly interesting, and the main points are clearly communicated. Congratulations! | thank you |
| 3364 | 1 | 10 | 1 | 10 | 4 | Shale gas has some issues with GHG emissions related to extraction. As currently deployed the GHG footprint could be worse than for coal. There are deep issues with the dynamics of gas deployment, which can make it either good or bad, depending on the context. For an argument on this, see Daniel Schrag: "Is Shale Gas Good for the Climate?". More generally, authors should be careful with examples, because there are always a lot of dependencies, and rarely black/white technologies... | Rejected - this is too much detail for this chapter |
| 16998 | 1 | 10 | 10 | 10 | 11 | Incomplete thought | Taken into account - combined with |
| 9267 | 1 | 10 | 11 | 10 | 20 | Please note that the Global CCS Institute will be publicly releasing its annual Global Status of CCS Projects Report in October 2012 (as it will for its update in 2013 in about October 2013). This report contains the most recent global assessment of the number of large-scale CCS projects segmented by their: location, sectoral application, project lifecycle status and scale of capture capacity (tonnes of CO2-e). It also contains comprehensive project survey analysis on both policy and regulatory matters. | thank you - reference to the report has been added |
| 17734 | 1 | 10 | 12 | | | replace the word "carbon" by "CO2" or "carbon dioxide" - to be consistent with all other chapters | Accepted - word replaced with "carbon dioxide" as suggested by commenter and to maintain consistency with IPCC |
| 13021 | 1 | 10 | 12 | 10 | 12 | This is the first introduction of the term "carbon capture and storage (CCS)." It is recommeded that the term be revised to the formal term "carbon dioxide capture and storage (CCS)" to reflect the Glossary since this is, in fact, the first introduction of the term. | Accepted - word replaced with "carbon dioxide" as suggested by commenter and to maintain consistency with IPCC |
| 10462 | 1 | 10 | 12 | | | Add reference to IPCC Special Report on CCS in 2005 | Rejected - reference is not needed; since 2005 a lot has happened, and most of it relates to issues we discuss--about |
| 3547 | 1 | 10 | 13 | 10 | 13 | "450 ppm" should be "450 ppm CO2-e" | this comment is correct but the paragraph has been revised and relevant |
| 14789 | 1 | 10 | 13 | | 14 | "…450ppm, which roughly corresponds with stopping warming at 2 degrees" This is neither a scientifically accurate nor politically helpful characterization. This concentration corresponds with a roughly 50% chance of EXCEEDING 2 degrees of warming. | Rejected - this is a good point but the paragraph has been revised and that sentence has been removed |
| 9921 | 1 | 10 | 13 | | 14 | A more detailed and convictive statement on the relationship between 450ppm by 2050 and 2degree by 2100 should be given. | this is a good point but the paragraph has been revised and that sentence has been removed. Also this issue is treated |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 16895 | 1 | 10 | 14 | | 20 | Is it possible to reframe this? -- chapters 6 and 7 make very clear that economic modeling shows how important CCS is in terms of a low cost mitigation technology -- the cost of CCS is a large determinant in the likely CO2 price in a tightly constrained cap. | Taken into account - the paragraph has been revised |
| 12612 | 1 | 10 | 15 | 10 | 18 | The GCCSI clasification of a large scale CCS project includes a number of enhanced oil recovery projects that do not monitor or verify their emissions. The IEA CCS Technology Roadmap has a more widely accepted number of five large scale projects which currently store 6.5 million tonnes per year. | Taken into account - CCS project data has been updated, referencing the Global CCS Institute 2012 report |
| 12613 | 1 | 10 | 15 | 10 | 18 | On a per tonne of CO2 basis CCS costs can be as low as $15/tonne which is no more "extensive" than other CO2 mitigation technologies. | Rejected - no scientific evidence/publication provided to support |
| 12655 | 1 | 10 | 15 | 10 | 18 | The GCCSI clasification of a large scale CCS project includes a number of enhanced oil recovery projects that do not monitor or verify their emissions. The IEA CCS Technology Roadmap has a more widely accepted number of five large scale projects which currently store 6.5 million tonnes per year. | Taken into account - combined with other comments |
| 12656 | 1 | 10 | 15 | 10 | 18 | On a per tonne of CO2 basis CCS costs can be as low as $15/tonne which is no more "extensive" than other CO2 mitigation technologies. | identical to previous comment |
| 4092 | 1 | 10 | 15 | 10 | 15 | mid-2011 - update here and elsewhere. | Accepted, we will update |
| 18411 | 1 | 10 | 16 | | 16 | Is correct to say “avoided emissions” with respect to CCS or better “stored emissions”? | Rejected - the word avoided is fine. |
| 7149 | 1 | 10 | 16 | | 18 | The sentence about the savings in CO2 emissions, is positive and maybe even hopeful, but I wonder if it should be placed in context as it represents only about 0.1% savings in the global annual emissions. | Rejected - this may be true but what really matters is marginal cost PLUS |
| 17648 | 1 | 10 | 16 | 10 | 18 | The number 33 million would also be more informative if it were put into perspective, e.g. through a comparison of number of projects and avoided emissions in earlier years. | Rejected - this may be true but what really matters is marginal cost PLUS |
| 16999 | 1 | 10 | 16 | 10 | 18 | Put this number in context - comparable to the emissions of country XX | Rejected - this may be true but what really matters is marginal cost PLUS |
| 16198 | 1 | 10 | 17 | | | Put 33 MtCO2e into context of global annual emissions as a percent (e.g. it is about 0.1% of annual emissions of ca.35 billion t CO2e)) | Rejected - this may be true but what really matters is marginal cost PLUS |
| 9246 | 1 | 10 | 18 | 10 | 20 | "absent" should read "absence", but it's not correct. Things have moved on from the 2010 source cited. Australia has extensive storage regulations, for example. This site gives a more recent overview: http://www.iea.org/newsroomandevents/workshops/name,27053,en.html. Note that the Gorgon project, which will be the largest storage project globally, and at the scale required for climate mitigation (if reproduced!) has regulations in place, and that's in a nature reserve. | Taken into account - the text revised, made more generic and the point about commercial incentives is pulled out into a separate sentence. |
| 14358 | 1 | 10 | 20 | | | Try to say whether CCS can become cost competitive over say a decade, and how much the extra cost is now (50%?1000%?). How much of a carbon tax would it take to make CCS competitive? | Rejected - other chapters do this in some detail |
| 4853 | 1 | 10 | 21 | | 36 | The regulatory framework of the EU on renewables is also an important development since 2007. | Rejected - this is too much detail for here |
| 10417 | 1 | 10 | 21 | 10 | 36 | Enumerate. Where are the percentages? | Rejected - this is too much detail for here |
| 17000 | 1 | 10 | 25 | | | Is this statistic true globally? Or only for specific regions? | Accepted the word "globally" has been |
| 5316 | 1 | 10 | 27 | 10 | 28 | It should be made clear that the rapid growth of renewable energy installations is merely a consequence of high subsidies (Mainly feed- in tariffs, notably for PV) rather than a success of the market. | Rejected - this point is made elsewhere and varies a lot; no further action needed |
| 5317 | 1 | 10 | 27 | 10 | 28 | It should be made clear that the rapid growth of renewable energy installations is merely a consequence of high subsidies (Mainly feed- in tariffs, notably for PV) rather than a success of the market. | identical to 522 |
| 11021 | 1 | 10 | 29 | | | This should recognise the potential for renewably-generated electricity to replace petrol and diesel, via electric vehicle uptake. After ‘transportation through’, insert ‘electric vehicles and’. | Rejected - too much detail for here |
| 16896 | 1 | 10 | 29 | | 36 | It might be interesting to readers to think about wind as a wholesale electricity commodity -- its value depends on the price of other fuels. Rooftop solar on the other hand tends to compete with the price of retail delivered electricity, so in some markets it is likely to be competitive without subsidy in the not distant future. | Rejected - a useful thought, but too much detail for here |
| 3879 | 1 | 10 | 29 | 10 | 30 | "including next generation fuels that have lesser impacts on food security and the environment." - Where are they. Be more careful avoiding creating false expectations to the reader. Be more realistic, describing the huge technical and economic difficulties faced by these technologies after 100 years of unsuccessful trials. | Rejected - this is covered in other chapters; no need for more detail here |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 6433 | 1 | 10 | 32 | 10 | 33 | Since AR4 considerable progress has been made in modelling the integration of renewables and it is demonstrated that this is not 'diffilcult'.. References will be given in the review of Ch 7. I recommend that this progress be reported in the executive summary. I also suggest that 'variable' is more accurate than 'intermittent' in respect of renewables. It should be remembered that nuclear and coal-fired electricity plants regularly have intermittent outputs due to plant failures whereas in a geographically distributed renewables system occurences of complete failure to generate are rare. Finally it should be noted electricity system operators have for decades satisfactorily managed variability in demand; so managing variability on the supply side is not a new phenomenon per se. | Taken into account - revised text says "variable and intermittent". Chapter 7 can deal with this in more detail, but the point that it is not "difficult" strikes me as incorrect. |
| 10463 | 1 | 10 | 32 | | | The term "intermittent" implies on/off which is not correct for wind, solar, wave so the term "variable" is used. Suggest change here and elsewhere. | Taken into account - here and a few other places where there is discussion of "intermittent" renewables is revised to |
| 11022 | 1 | 10 | 33 | | 35 | Treatment of solar is too negative given potential for solar PV prices to reach parity with cost of coal-based electricity within a decade. See U.S. Department of Energy. (2010). $1/W Photovoltaic Systems: White Paper to Explore A Grand Challenge for Electricity from Solar: Advanced Research Projects Agency. | Rejected - outside the scope of the chapter. Topic is covered in chapter 7 |
| 4468 | 1 | 10 | 33 | 10 | 33 | Why single out solar of all the renewables as being particularly in need of feed-in tariffs, etc.? | Taken into account - sentence has been revised so as to not single out solar |
| 6810 | 1 | 10 | 33 | | | The misinformation and anti-solar propaganda is extraordinary in a document that purports to be concerned about climate mitigation: there is no evidence that solar is difficult to integrate into the grid - on the contrary. Also, feed-in tariffs are not subsidies - they are a contractual power purchase guarantee at a fixed price. And there is plenty of evidence that even solar PV is nearing grid parity with coal. There are new coal fired pwer plants likely to come on line soon in the US or Australia. Last year, Australia had - against all odds and without much support at all - the largest renewable electricity increase worldwide. | Rejected - the sentence has been revised per other comments |
| 10464 | 1 | 10 | 33 | | | Better to quote chapter 8 of IPCC 2011 which covers this specific issue of integration. | Accepted - cross reference added to |
| 4093 | 1 | 10 | 35 | 10 | 36 | particular reference could be made to the absurdity (e.g. under UK Planning Guidance PPS 22 and definitions of the UK Planning Inspectorate) of defining palm oil as a renewable source of energy for simply burning in proposed electricity generating plants EVEN WHEN THE ASSOCIATED CARBON DIOXIDE EMISSIONS, HABITAT & SPECIES LOSS ARE POINTED OUT, WITH REFERENCES. | Rejected - too much detail for this chapter |
| 14790 | 1 | 10 | 35 | | 36 | For "fears for fod security" reference recent scholarship on biofuels demand and food price volatility by Tim Wise, Tufts University "The Cost to Mexico of U.S. Ethanol expansion" | thank you; I think the point stands and we already have many references. No |
| 2567 | 1 | 10 | 35 | | | For contested biofuels better refer to SRREN Ch 9 | Accepted - added cross-reference to SSREN (IPCC 2011), chapter 11 |
| 3880 | 1 | 10 | 35 | 10 | 36 | "Some biofuels are contested due to fears for food security and high lifecycle greenhouse gas emissions of some fuel type". Why not present some successful cases like ethanol (Brazil and Thailand) and biodiesel (Argentina). Always preference is for failures? Probably failures call more attention than successes but this report is not a popular newspaper. Only nuclear energy deserve been reported as a success (see next paragraph in the text), even after Fukushima? | Rejected - We talk about the difficulties precisely to be balanced |
| 6434 | 1 | 10 | 37 | 10 | 42 | There is a growing recognition of the down-side of energy efficiency namely the 'rebound effect' which is mentioned in Ch 1. I suggest that the 'rebound effect' is significant enough to rate mention in the executive summary. | Rejected - This is a complicated topic and is extensively covered in the ch 15 . No need to repeat here. "rebounds" are no law of nature or economics and effects are mitigated under current (and |
| 10063 | 1 | 10 | 37 | 10 | 44 | The implementation of vehicle fuel economy standards can be supplemented as an important evidence. | Rejected - we think the text is fine. No |
| 7148 | 1 | 10 | 4 | | 5 | Provide a reference to support the statement (sentence) about the declining US coal use. | Accepted - references to EIA reports |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 16059 | 1 | 10 | 45 | 11 | 8 | One sided paragraph. 60 countries "expressing interest in nuclear" has no meaning (it could be said of CCS or of wave power for instance). Then Page11 line 3 only Germany is quoted when Switzerland, Spain, Belgium are in similar situations. China did slow orders after Fukushima. Line 7 p11 the term "accelerating" is misleading and should be deleted. | Taken into account - replaced phrase about expressing interest with "more than 20 countries currently that have never had commercial reactors have launched national programmes" and |
| 8406 | 1 | 10 | 45 | 10 | 45 | It seems that the statement “Interest in the use of nuclear power has increased significantly since AR4” must be better sustained with data, not based only on IAEA data or some author’s opinion. It seems very difficult to believe, basing on the number of new plants already approved, that “Traditional countries with active nuclear power programmes have been contemplating replacing aging plants with new builds or expanding the share of nuclear power in their electricity mix”: in these countries (i.e., Europe, USA, Japan) the share of nuclear power in the electricity will stay stable or will decrease according to a lot of scenarios made by different researchers. The Fukushima accident is only another driver in this direction. In the IIASA Global energy assessment it is stated that prospects of nuclear energy are particularly uncertain because of unresolved challenges surrounding its further deployment. | Taken into account - the first has been revised. The IIASA assessment may be overly pessimistic; look at china and Korea, notably. |
| 3365 | 1 | 10 | 45 | 11 | 8 | Global aggregate numbers and trends of nuclear power plants don't substantiate the optimism on nuclear power reflected in this paragraph. More balance would be nice. | Taken into account - replaced phrase about expressing interest with "more than 20 countries currently that have never had commercial reactors have launched national programmes" and |
| 12510 | 1 | 10 | 45 | | | Add after “AR4” -- “however, experience has been disappointing.” Even aside from the Fukushima Dai-ichi disaster, so-called Gen III+ or Gen IV reactor designs have been difficult to put through review and approval processes, more expensive than projected, and have encountered long construction delays. Many projects have been cancelled, and the private financial markets have withdrawn most support for new nuclear projects, leaving direct and indirect government finance or guarantees as the remaining financial support for the industry globally. | Rejected - this coment is true mainly in the OECD (and is overly american) -- paragraph on nuclear rewritten |
| 2571 | 1 | 10 | 45 | 11 | 8 | Apparent contradiction here. Has the interest in nuclear power really increased? Are there evidences, such as growth of actual reactor construction and installed capacity? The IAEA is an authoritative but not neutral source. | Taken into account - the evidence points in all directions; the discussion on nuclear is rewritten with more details for |
| 6691 | 1 | 10 | 50 | 11 | 3 | Japanese energy and environmental policies are coming under review now. We can't predict whether nuclear reacters will work or not. So, “and wiii probably leave many reactors shut in that country” should be deleeted. | Accepted - phrase is deleted |
| 11719 | 1 | 10 | 50 | 11 | 3 | [and will probably leave …..difficult to parse.] have to be deleted. IPCC shouldn't predict whether it will happen or not. | Accepted - phrase is deleted |
| 9492 | 1 | 10 | 50 | 11 | 3 | delete this sentence - Ohi Power Station Units 3 and 4 have been operated in Japan from June 2012 | Accepted - phrase is deleted |
| 10635 | 1 | 10 | 50 | 11 | 3 | The statement is made with prejudication. It is still uncertain what patterns in nuclear power investment will be in Japan. There it should be deleted. | Accepted - phrase is deleted |
| 17733 | 1 | 10 | 6 | | | delete "one of the" | Accepted - deleted |
| 4880 | 1 | 10 | 6 | | 7 | {Del} "already is {one of the}one of the | Accepted - deleted |
| 15276 | 1 | 10 | 7 | 10 | 7 | remove "one of the" before "fastest" | Accepted - deleted |
| 11718 | 1 | 10 | 8 | | | It's not clear the meaning of this sentence. Koh et al. shows advanced coal combustion technology will be very competitive and effective in reducing GHG emissions so, this sentence should be amended to [The future of coal hinges, in particular, the defusion of the clean coal technologies].<br>1.Koh et al.:[Potential of Advanced Coal and Gas Combustion Technologies in GHG Emission Reduction in Developing Countries from Technical, Environmental and Economic Perspective. Energy Procedia, Volume 12, 2011], send attachment by another e-mail. | Accepted - Add to the sentence, after 'China and India", 'as well as the diffusion of clean coal technologies.' |
| 3308 | 1 | 10 | 9 | 10 | 11 | This sentence makes no sense. | Taken into account - combined with |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 16058 | 1 | 10 | 9 | 10 | 20 | The paragraph on CCS is well balanced. It could include Zoback M., Gorelick 2012 “Earthquake triggering and large-scale geologic storage of carbon dioxide” PNAS 109:5185–5189 that shows not implausibility of CCS, but the risk that quakes would limit very much the potential. Alas, the paper came too late. | Rejected - this is a good paper, but this is too much detail for an introductory chapter |
| 13251 | 1 | 10 | 28 | 10 | 30 | The use of renewable energy for heating can be included in this sentence. | Rejected - a useful point, but there are lots of such embellishments that might be added and we will exceed our space |
| 8222 | 1 | 10 | 35 | 10 | 35 | example may be given | Rejected - a useful point, but there are lots of such embellishments that might be added and we will exceed our space |
| 13250 | 1 | 10 | 9 | 10 | 11 | The second part of the sentence is no sense. Maybe, there is a lacking verb between "that" and "many", or the word "many" must be replaced with a verb. | Taken into account - this sentence has been revised for clarity |
| 4302 | 1 | 10 | 9 | 10 | 20 | refers to CCS: a note to the emission trading system an its lack to give CO2 a price „good“ enough to invest in CCS would be helpful. In Germany, CCS had two main obstacles: low ETS-prices and public opinion. | Rejected - text is ok. No action needed |
| 3689 | 1 | 11 | | | | Page 11 line 34 onwards reference missing | Taken into account - references added on the engagement of international |
| 6807 | 1 | 11 | 1 | 11 | 8 | There is no evidence for accelerating investment in nuclear power; to the contrary: much are overstated intentions. There is also plenty of evidence for failed investment, and extremely slow progress, practically a failure of that industry. Reference: http://www.worldwatch.org/node/5795 and http://www.worldwatch.org/node/5447, well referenced. See also Page 18, line 15 in this chapter which states this also. | Rejected - this comment is incorrect, and citing a worldwatch report for these points would be inappropriate. Text is balanced |
| 17001 | 1 | 11 | 1 | 11 | 2 | This statement needs to be re-assessed as Japan is beginning to re-activate some of their reactors | Accepted - phrase is deleted |
| 9247 | 1 | 11 | 15 | 11 | 15 | There is no mention that biofuels with CCS offer the only realistic large-scale way of reducing atmospheric CO2. | Rejected - the suggest comment is too extreme. We disagree that it is THE |
| 8708 | 1 | 11 | 15 | | | this sub-section ends without noting the severe problems that siting new CCS facilities have encountered, and the technological uncertainties associated with CCS. It also does not quote the IEA on the peak oil issue, and it does not point out that conventional crude oil production has probably already peaked in the 2006-2008 period. | Rejected - we think the discussion on CCS is balanced. The paragraph has also be revised during editing. |
| 2243 | 1 | 11 | 16 | 14 | 30 | There is no evidence that emissions of greenhouse gases hav any harmful effect on the climate. The whole effort of this report should be changed to the task of dealing with the natural evolutionary c hanges which we face. | Rejected - beyond the mandate of WG III |
| 18012 | 1 | 11 | 17 | 11 | 28 | The discussion in the section of “International institutions and agreements” reflects part of the reason of the slow progress and the deadlock of the UNFCCC process, referring only to the architecture of the treaty frame work, leaving the lack of political unwillingness and non-action of Annex I country parties in silence. Comprehensive evaluation and analysis regarding the effectiveness and ineffectiveness together with the reason behind need to be elaborated more. | Taken into account - paragraph has been revised |
| 4881 | 1 | 11 | 20 | | | {Add} "The first {}session of the Conference of the Parties (COP) | Accepted - added 'session' |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 12511 | 1 | 11 | 22 | 11 | 28 | Replace from "The main regulatory" to the end of the paragraph with the following -- "The main regulatory provisions of the Kyoto treaty concerned quantified emission limitation and reduction commitments for developed countries listed in Annex B of the Protocol. The initial five-year commitment period was set for 2008-2012, with further commitment periods contemplated. At its first meeting in 2005, the Conference of the Parties for the Kyoto Protocol launched an ad-hoc working group to develop emission reduction commitments for a second commitment period commencing in 2013. Subsequently, the UNFCCC Conference of the Parties adopted the Bali Action Plan in 2007, launching a parallel negotiating track to address broader emission reduction efforts incorporating further commitments by developed countries and nationally appropriate mitigation actions in developing countries, with financing, technology and capacity building support to be provided by developed countries. The Bali Action Plan also instituted a broader balanced work programme including the "four pillars" of mitigation, adaptation, financing, and technology transfer, with a view toward adopting a decision in two years. In 2009, the COP continued the two negotiating tracks and noted the separate issuance of the Copenhagen Accord, delineating a broad programme of climate response centered on an agreement to keep increased global average temperatures to 2o C. At Cancun in 2010, the COP launched global climate delivery channels for several of the pillars envisioned in the Bali Action Plan: the Green Climate Fund, Adaptation Committee, Climate Technology Center and Network. In 2011, the COP agreed Durban Platform for Enhanced Action and established a new working group to develop a Protocol, another legal instrument or an agreed outcome with legal force under the Convention applicable to all Parties to be completed no later than 2015 and enter into force by 2020. The COP also agreed to develop a work programme to raise the level of ambition on climate response informed by AR5 and the outcome of a 2013-2015 review of pathways to achieving a maximum of 2o C or 1.5o C warming. This combined, open ended effort will operate alongside the Kyoto Protocol pending a decision for continuation or termination. | Rejected - The suggested change is too long and is too detailed. Also some of the wording is not accurate -- no action needed |
| 14791 | 1 | 11 | 22 | | 25 | "…which meant a successor treaty would be needed…" and "… negotiations on a successor treaty were under way…" The references to "successor treaty" are factually incorrect. With the UNFCCC's Kyoto Protocol's first commitment period coming to a close, its Article 3.9 would determine subsequent commitments under the KP: "Commitments for subsequent periods for Parties included in Annex I shall be established in amendments to Annex B to this Protocol, which shall be adopted...". | Taken into account - text has been revised for clarity. "succssor" has been replaced as suggested by the commenter |
| 18015 | 1 | 11 | 23 | 11 | 24 | the reference to a “successor treaty” in relation to the Kyoto Protocol” is legally inaccurate. The mandate of the AWG-KP needs to be reflected in a accurate way. | Taken into account - text has been revised for clarity. "succssor" has been replaced as suggested by the commenter |
| 7344 | 1 | 11 | 23 | 11 | 24 | It is inaccurate to suggest that "a successor treaty wouldbe needed to cover the period after 2012" when discussing the Kyoto Protocol. The Protocol in its Art 3 (9) makes provision for "subsequent commitment periods" - hence an amendment is needed, not an entirely new treaty. | Taken into account - text has been revised for clarity. "succssor" has been replaced as suggested by the commenter |
| 11397 | 1 | 11 | 23 | 11 | 24 | The reference to a "successor treaty" in relation to the Kyoto Protocol is technically and legally inaccurate. The objective of the negotiations that were launched in 2005 under the Ad-Hoc Working Group on the Kyoto Protocol was to define and establish the period and numerical emission reduction targets for Annex I Parties who are Parties to the Kyoto Protocol for the KP's second commitment period that would commence after the end of the first commitment period in 2012. The AWG-KP negotiations were and are, therefore, NOT about a successor treaty to either the UNFCCC or the Kyoto Protocol. The reference should be "a second commitment period would be needed to cover the period after 2012" | Taken into account - text has been revised for clarity. "succssor" has been replaced as suggested by the commenter |
| 7345 | 1 | 11 | 24 | 11 | 26 | It is inaccurate to describe the negotiations launched at Bali as on a "succesor treaty"; as noted above, the Protocol provides for subsequent commitment periods. In addition the mandate of the negotiations was for an "agreed outcome" which may not have taken the form of a treaty. Negotiations on the second commitment period of the Kyoto Protocol had been continuing since 2005 and were mandated to continue and resolve in 2009 as well. | Taken into account - text has been revised for clarity. "succssor" has been replaced as suggested by the commenter |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 18016 | 1 | 11 | 25 | 11 | 26 | the reference to "negotiation on a successor treaty were just under way" in 2007 is also legally inaccurate. The mandate of the Bali Road Map negotiation needs to be reflected in a accurate way. | Taken into account - text has been revised for clarity. "succssor" has been replaced as suggested by the commenter |
| 11398 | 1 | 11 | 25 | 11 | 26 | The reference to "negotiations on a successor treaty were just under way" in 2007 is also technically inaccurate. The negotiations that were launched in Balic in December 2007 under the Ad-Hoc Working Group on Long-term Cooperative Action (AWG-LCA) launched "a comprehensive process to enable the full, effective and sustained implementation of the Convention through long-term cooperative action, now, up to and beyond 2012, in order to reach an agreed outcome and adopt a decision at its fifteenth session". It did NOT specify the legal form of such agreed outcome as a treaty (e.g. a new protocol). The legal form would be the subject of negotiations in the AWG-LCA. The reference should be accurate in terms of saying that the negotiations should be "on an agreed outcome" rather than "on a successor treaty". | Taken into account - text has been revised for clarity. "succssor" has been replaced as suggested by the commenter |
| 7871 | 1 | 11 | 26 | 11 | 27 | The flowery wording ("wide array of disagreement") is obscuring important issues. There was a lot of disagremment regarding the details of a treaty. However, among many nations was and is a general agreement that more ambitious emission cuts are urgently required and that high emitting countries must take the lead. In essence, the negotations were a complete fail for the US and China blocked each other. This report should acknowledge the lack of political will of some powerful countries. | Rejected - The wording is fine here. Also there is no practicality in blaming the US and china for a failure that has had many sources, not least because there is no scientific way to pin blame. No action |
| 16060 | 1 | 11 | 29 | 11 | 43 | This long paragraph seems to take positively the spreading of climate in many fora, a possible consequence of the limited progress in UNFCCC negociations. Maybe a word of caution is in order. | Noted - the idea is to signal the array of activities not to say if they are good or bad. Chapter 13 (cross referenced |
| 4882 | 1 | 11 | 29 | | | {Add} "on climate {}change mitigation | Accepted - "change" added |
| 4854 | 1 | 11 | 29 | | 43 | It would be worth mentioning also the GEF as an important complementary institution (financing inter alia mitigation projects in developing countries and IETs). | Rejected - text is ok. There are LOTs of unmentioned organizations here |
| 9784 | 1 | 11 | 3 | 11 | 8 | You discuss country policies from a strictly centralized perspective. Both, in industrialized and even more in developing countries decentralized energy systems will play a major role. | Noted - the previous paragraph AND the next paragraph talk about those kinds of |
| 17002 | 1 | 11 | 3 | 11 | 4 | What will this lost (zero-carbon) nuclear, baseload capacity be replcaed by? Coal? | Noted - Japan is looking at lots of actions--some involve restarting some reactors; some are renewables; lots are coal and right now there's a lot more oil and LNG. It is a mix. This kind of detail |
| 2575 | 1 | 11 | 37 | 11 | 37 | Rio+20 needs an update, namely in fossil fuel subsidies | Rejected - no action needed here. The previous sentence talks about fossil fuel subsidies through G20. The G20 reaffirmed that literally days BEFORE |
| 17005 | 1 | 11 | 37 | | | "Rio+20 process" needs to be defined/expnaded upon. | Rejected - text is ok |
| 4883 | 1 | 11 | 40 | | | {Add} "Organization – IMO {}(both focusing on emissions from bunker fuels) | Accepted - text added as suggested by |
| 17797 | 1 | 11 | 40 | | | While mentioning particular initiatives, I would like to see added here the UN family, e.g. WHO initiative of health benefits in the green economy - which in practice analysis those mitigation measures that do have the highest benefit for human health; or the UNECE the PEP programe - working on transport health and the environment - the list could probably be very long - and may even be thought as an Annex - however otherwise the list of new initiatives appears otherwise to be biased. One way out could be choosing a list of crieteria that | Rejected - There too many organizations to name them all. Edits in response to 559 point to a paper that looks at this fuller range in more detail. |
| 16061 | 1 | 11 | 44 | 12 | 12 | The interest of academics in international trade is a fact and a good thing. But the rest of the paragraph takes for granted that WTO could have a positive role for mitigation. The reverse might be true, as shown by recent disputes on carbon quotas levied on aviation by the EC, a mitigation policy contested in the name of free trade. | Noted - it could go either way. Our job here is to report on the science. |
| 12512 | 1 | 11 | 47 | | | Add after "mitigation" -- "and adaptation" | Accepted - words added in text |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 16897 | 1 | 11 | 48 | | 49 | Suggest replace last line with the following: "as well as possible international trade of CO2 emission allowances." | the paragraph has been revised; comment no longer relevant |
| 10465 | 1 | 11 | 5 | | | Add "South" Korea | Accepted - added "South" |
| 15243 | 1 | 11 | 9 | 11 | 15 | what is the temporal scale used here for energy investment? | Rejected - the point is a generic one, not particular to a single temporal period |
| 15533 | 1 | 11 | 9 | | 12 | The benefits of carbon pricing might be mentioned in this context. | Rejected - we mention that a lot |
| 8407 | 1 | 11 | 9 | 11 | 15 | “do not depend on government subsidies”<br>Every energy transition has been based on huge government subsidies, either fossil or nuclear one.<br>The problem is to switch government subsides from fossil to non fossil energy.<br>I believe that this point must be clarified and underlined.<br>As an example, according to IEA (2011, IEA analysis of fossil-fuel subsidies) without further reform, spending on fossil-fuel consumption subsidies is set to reach $660 billion in 2020, or 0.7% of global GDP. Phasing-out fossil-fuel consumptions subsidies by 2020 would slash growth in energy demand by 4.1%, reduce growth in oil demand by 3.7mb/d and cut growth in CO2 emissions by 1.7 Gt | this paragraph has been removed; comment no longer relevant |
| 15289 | 1 | 11 | 9 | 11 | 10 | Describing nuclear power as a promising system is perhaps controversial. Perhaps it should be clearly stated that it is promising from a CO2 mitigation perspective | this paragraph has been removed; comment no longer relevant |
| 7870 | 1 | 11 | 9 | 11 | 15 | This is an implicit value-judgement in favor of nuclear energy and coal plus CCS. If you think that these energies are better overall than renewable energies you should say so and substantiate your claim with arguments. You seem to claim that while renewables will depend on subsidies, nuclear and CCS-coal do not. However, wihtout substantial government subsidies and tax brakes nuclear energy and coal would be more expensive than they are currently and CCS is supposed to raise the cost of generating power from burning coal by one third. If externalities such as damages from CO2 emissions are included, conventional energy gets even more expensive. On the other hand, renewable energies will get cheaper within the next two decades due to learning effects while fossil fuels will get more expensive. A recent German study estimates that by 2030 different forms of wind and solar energies will be as cheap or considerably cheaper than the conventional energy mix (fossil and nuclear) (Kost et al. 2012). | this paragraph has been removed; comment no longer relevant |
| 4303 | 1 | 11 | 1 | 11 | 2 | change: „and will probably leave many reactors shut in that country“ to „and will probably leave most - if not all - reactors shut in that country“. reason: recent activity by the Japanese governement due to continuing high intensity of protests and a new anti-nuke party (Greens). Phase-out is now basically a consensus (only the date is up to debate) | Taken into account - combined with other comments |
| 4304 | 1 | 11 | 9 | 11 | 9 | change: „these promising systems“ to „these systems“, calling CCS and nuclear promising is far from any consensus, especially in the European debate. | this paragraph has been removed; comment no longer relevant |
| 4361 | 1 | 11 | 9 | 11 | 10 | similar comment: presenting energy sources such as nuclear power as «promising» is of dubious meaning and could lead to believe that authors have a biased opinion. Low carbon energy production by no way does equal to desirable, as they can present other drawbacks. | this paragraph has been removed; comment no longer relevant |
| 11023 | 1 | 11 | | | | Around Section 1.2.1.4: There should be some acknowledgment around here of the fact that without a price on carbon dioxide, energy generation is biased away from low- or zero-carbon technologies such as renewables.<br>E.g. Insert around line 15: ‘Another key issue in influencing investment patterns is that, without a price on carbon dioxide, energy generation is biased away from low- or zero-carbon technologies such as renewables.’ | this paragraph has been removed; comment no longer relevant |
| 9248 | 1 | 11 | | 12 | | There should be mention that the UNFCCC recognised CCS as a way of reducing emmisions and provided guidelines for storage:<br>http://unfccc.int/files/meetings/durban_nov_2011/decisions/application/pdf/cmp7_carbon_storage_.pdf | Rejected - the suggested add is not needed |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 14792 | 1 | 11 | | 12 | | There is very little on the UNFCCC regime, and more on the WTO, etc. But, there is much experience with the UNFCCC that could be reviewed here: extent of compliance with UNFCCC (on targets, on finance and technological support), the effectiveness of the CDM, impact of various loopholes, etc. | Rejected - Chapter 13 deals with this in detail. Text is ok |
| 8223 | 1 | 11 | | | | It would be interesting if the authors can shed light on the lessons learned from the fallout of Kyoto by major partners to the initiatives undertaken at G8, G8 +5, G20 and Rio 20 +. What are the successes and failures? Can any conclusions be made on the design of an international institution that could provide effective mechanisms for climate negotiation? | Rejected - We can shed light on this, but not in a way that is concise or fully scientiific. So here we just introduce the issues. See chapter 13 for more |
| 11579 | 1 | 11 | 16 | 11 | 43 | This section is not clear on the emissions being referred to in the first sentenc., Is it to be assumed the authors are referring to all gaseous emissions?Its in the second sentence that it becomes more obvious its the GHGs, as the convention is mentioned. As the chapter seems to cover all agreements related to climate change, there should be a discussion on the vienna Convention and the Montreal Protocol that are good examples and lend credence from the UNFCCC that have universal acceptance. hereThe issue that first needs to be recognised here is that climate change is cross cutting issue hence the reason | Taken into account - added text to mention the Montreal Protocol. "...UN?based process. PROPOSALS EXIST WITHIN THE MONTREAL PROTOCOL ON SUBSTANCES THAT DEPELETE THE OZONE LAYER TO REGULATE SOME OF THE GASES THAT HAVE REPLACED OZONE |
| 18108 | 1 | 11 | 22 | 11 | 28 | With regard to the Kyoto Protocol, the text states that a "successor treaty" was needed after 2012. Suggest framing this according to the language of the Kyoto Protocol which refers to the period of 2008-2012 as the "first commitment period" (eg: Arts 3 (1), (7), Kyoto Protocol) and which envisages the establishment of subsequent commitment periods under the Kyoto Protocol itself rather than negotiating a "successor treaty" (eg: Art 3(4), (9) Kyoto Protocol). The language as it stands could be misinterpreted to suggest that the Kyoto Protocol was only designed for the period of 2008-2012 which was not the case. | Taken into account - text has been revised for clarity. Combined with other comments |
| 5385 | 1 | 11 | 29 | 11 | 29 | climate mitigation ---- shoild be ---- climate change mitigation | Taken into account - combined with |
| 6785 | 1 | 11 | 37 | 11 | 37 | It may be helpful to refer to the following: "Additionally, UN Secretary General Ban Ki-moon is leading a global initiative on Sustainable Energy for All to mobilize action from all sectors of society in support of three interlinked objectives to be achieved by 2030: providing universal access to modern energy services; doubling the global rate of improvement in energy efficiency; and doubling the share of renewable energy in the global energy mix." | Rejected - too much detail for this chapter |
| 11680 | 1 | 11 | 46 | 11 | 47 | Add the following refereed journal article citations before the reference to 'see also Chapter 13':<br>Brewer 2003; 2004; 2010 The full citations are:<br>Brewer, T. (2003). The trade regime and the climate regime: Institutional evolution and adaptation. Climate Policy 3, 329-341.<br>Brewer, T. (2004). The WTO and the Kyoto Protocol: Interaction issues. Climate Policy 4, 3-12.<br>Brewer, T. (2010). Trade policies and climate change policies: a rapidly expanding joint agenda. The World Economy 33, 799-209. | Accepted - added cross reference to ch 13 and to Brewer (2010) since it's the only article is since AR4. |
| 17692 | 1 | 11 | 13 | 11 | 15 | From the second sentence the statement is not clear… The idea is there but ist hard to catch | paragraph has been removed. Comment |
| 7011 | 1 | 11 of 33 | 15 | 11 of 33 | 12 | Add "When energy services come out from solar flux, as is the case for renewables, fuel costs completely (or almost completely) disappear, as well as GHG emissions", after the final period in line 15. | paragraph has been removed. Comment is no longer relevant |
| 15244 | 1 | 12 | 13 | 12 | 38 | of interest but not mention of conflict resolution per se - see Ramsbotham et al (2011) "Contemporary Conflict Resolution", Chapter 12, 2011. Available at http://www.polity.co.uk/ccr/authors/woodhouse.asp accessed 13/9/12. | Rejected - suggested change is not needed here |
| 16062 | 1 | 12 | 13 | 12 | 38 | Too many sources repeated, the paragraph is not focused. Also, Victor is quite relevant here in the discussion, but five quotes in one paragraph may be exagerated… | Taken into account - deleted Hafner-burton et al reference at line 26-27. |
| 13366 | 1 | 12 | 13 | | | Social scientists' rather than 'scientists'. | Rejected - text is fine. These are, in |
| 13367 | 1 | 12 | 13 | 12 | 38 | The referencing here is tendentious. For balance, significant scholarship by Keohane,Oran Young, the Norwegian governance school, and others should beacknowledged and included at this point. | Rejected - this a framing chapter and not the chapter on climate diplomacy and regimes. Excessive references should be avoided and instead only major reviews |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 4474 | 1 | 12 | 13 | 12 | 33 | It would seem appropriate in this paragraph to mention also the recent contributions in game theory as it has been applied to the climate negotiation problem. These may be covered in Chapter 13, but should be noted here also. | Rejected - Game theory remains highly theoretical, and chapter 13 deals with it in some detail. -- no action needed |
| 17800 | 1 | 12 | 13 | 30 | | This whole paragraph could be brought up more to the point and be much more informative - either use a design/figure or bring it to the point - not just the information that three different type of new research has been done - what are the results? | Rejected - our task is to talk about what scientists have done since AR4 |
| 7872 | 1 | 12 | 13 | 12 | 38 | What is the conceptual basis of this paragraph? The literature seems to rest on game theory, rational choice and neo-realistic schools of thought . This is only one - highly contentious - way of analyzing this important issue. One reason is that although it is often presented as value-free or -neutral it contains many normative assumptions. Also, such approaches alone cannot identify what SHOULD be done about climate change. Other perspectives should be included, such as institutionalism (e.g. Young 1999). For a rigorous criticism of (neo-) realism see e.g. Caney (2006). | Rejected - Young and Caney are pre-AR5. What is new that needs to be cited here? In fact, the reason we cite the Hafner-Burton et al piece is because it EXTENSIVELY reviews those varied paradigms. The conceptual basis of this |
| 17007 | 1 | 12 | 15 | 12 | 16 | Cite specificially what section in Chapter 13 the reader can go to to learn about the "body of research… to explain why negotiations on complex topics… are prone to gridlock." | Taken into account - on the topic, added additional references to Murase (2011) |
| 13675 | 1 | 12 | 16 | 12 | 16 | Insert "change mitigation" after "… such as climate". | Taken into account - combined with |
| 7150 | 1 | 12 | 16,22,25,27,29 | | | Remove all unnecessary parantheses. | Editorial – copyedit to be completed |
| 13676 | 1 | 12 | 19 | 12 | 19 | Insert "types of policy mechanisms to achieve mitigation cost reductions" after "… enforcement mechanisms". | Taken into account - edited sentence to say: "...the presence of enforcement mechanisms, SCHEMES TO REDUCE |
| 6458 | 1 | 12 | 2 | 12 | 5 | “Mitigations embodied” should be “carbon embedded”. | Taken into account - sentence has been |
| 17006 | 1 | 12 | 2 | 12 | 5 | Poorly worded sentence / not clear. | Taken into account - sentence has been |
| 3309 | 1 | 12 | 23 | 12 | 25 | I would consider adding a sentence after this one such as this: "However, some scholars believe that the normative structure of political legitimacy severely hinders the possibility of addressing climate change justly (Gardiner 2011)." Citation: Stephen Gardiner (2011). A Perfect Moral Storm: the Ethical Tragedy of Climate Change. New York: Oxford University Press. | Rejected - suggest sentence is not necessary. And adding another reference does not seem vital |
| 8475 | 1 | 12 | 25 | | 29 | A particularly informative text here is Fen Osler Hampson's (edited "Madness in the Multitude: Security and World Order" Oxford University Press 2002 | Rejected - adding another reference does not seem vital |
| 6815 | 1 | 12 | 31 | | 37 | This seems like useful question, since the sources of ozone layer deterioration are equally clearly defined. On the other hand, it is a question that neeeds to be answered here: the fossil enegy system that is the source of much of GHG is so much more fundamental and pervasisve to/in the global economy, and so it is no surprise that a diffusion of respnse results - even distratcions and disinformation. | Rejected - The pieces we cite examine exactly this in great detail. We don't have space to address it further here |
| 17735 | 1 | 12 | 39 | | | In the section title replace the word "beyond" by "other than" | Accepted - change "beyond" to "other |
| 13365 | 1 | 12 | 4 | | | There is asomething awry with this sentnce. The word mitigations' is erroneous. Should the sentence read… '...also allows trade in goods, such as x, y, z, whose production processes are…etc'? | Taken into account - sentence has been revised |
| 15446 | 1 | 12 | 40 | 12 | 46 | A point that could usefully be made more explicit in this introductory section is the fungibility of gases for accounting purposes, through the choice of a basket. | Rejected - Other chapters deal with this, as does WG1. Other comments lead to edits about flexibility of commitments, and that is one of the central reasons for |
| 17008 | 1 | 12 | 40 | | | Might be worth inserting that CO2 from burning fossil fuels accounts for about 60% of global GHG (IPCC WG1, 2007) | Accepted - percentage is added |
| 4884 | 1 | 12 | 41 | | | {Cor} "Kyoto [Treaty] Protocol cover | Accepted - changed Kyoto Treaty to |
| 17736 | 1 | 12 | 42 | | | replace the word "This" by "A" | Rejected - text is fine. No action needed |
| 11349 | 1 | 12 | 42 | 12 | 42 | Nitrogen trifluoride (NF3) is introduced in the second Kyoto compliance period (which can be mentioned in the foot note?). | Accepted - Added to the main text. "NF3 was added as a GHG under the Kyoto Protocol for its second commitment |
| 4885 | 1 | 12 | 44 | | | {Add} "mitigation {}of the emissions of these | Rejected - text is fine. No action needed |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 9785 | 1 | 12 | 5 | 12 | 12 | The crucial issue is the starting point for the comparative assertion, when stating "Article 3 of the UNFCCC requires that "[m]easures taken to combat climate change, including unilateral ones, should not constitute a means of arbitrary or unjustifiable discrimination or a disguised restriction on international trade." You risk to maintain the status quo of pollution havens and environmental dumping (for a comprehensive analysis of theories and empirical studies analyzing the interlinkage between competitiveness and environmental protection on a national scale: GÜNTHER, E.; HOPPE, H.; LAITENBERGER, K.: Competitiveness of nations and environmental protection. In: R. Hahn, H. Janzen, D. Matten (Hrsg.): The social responsibilities of business. Background, Core Issues and Future Perspectives. Stuttgart 2012, p. 467-495. http://papers.ssrn.com/sol3/papers.cfm?abstract_id=2145420 | Taken into account - added sentence "...have been a matter of long standing interest in climate diplomacy AND ARE CLOSELY RELATED TO A LARGER DEBATE ABOUT HOW DIFFERENCES IN ENVIRONMENTAL REGULATION MIGHT AFFECT ECONOMIC COMPETITIVENESS." cited Gunther et al. |
| 10741 | 1 | 12 | 50 | 12 | 50 | In addition to the reference given here to WGIII chapter 8 (on transport) a reference could also be given to WGI Chapter 8 on Anthropogenic and natural forcing, since this chapter gives an overview of the various forcing mechanisms. | Accepted - cross reference added to WG I chapter 8 |
| 10621 | 1 | 12 | 31 | | | For new work on why institutional arrangements vary across issue areas (from regime integration to regime complexes to regime separation), see: [Johnson, T., and J. Urpelainen. 2012. A Strategic Theory of Regime Integration and Separation. International Organization 66(4): 645-677.] The article tests its theory by examining the degree of integration or separation among four environmental regimes: climate, deserts, forests, and ozone. | Accepted - Johnson and Urpelainen (2012) cite added |
| 8224 | 1 | 12 | 13 | 12 | 38 | While this paragraph explains what scholars have focused on, it would be nice if a summary of findings are also made available. This will provide readers a good knowledge of what has been going on. | Rejected - too much detail for the space we have. |
| 5386 | 1 | 12 | 16 | 12 | 16 | such as climate ----- should be --- such as climate change | Accepted - changed to "climate change" |
| 7707 | 1 | 12 | 17 | | | What is a definition of the term 'political scientists'? Is this term used before in AR5 or even in AR4? | Rejected - This is the second largest field of social science. We don't need to |
| 4016 | 1 | 12 | | | | authors might wish to update information on (1) RF of black carbon whose best estimate of the central values is now from 0.0 to 1.3 W/m2. However the total effective forcing from all BC effects is unlikely to be greater than 1 W/m2 (section 3.3.7 of the report ref. to below); and (2) tropospheric ozone. For tropospheric ozone a central estimate is 0.35±0.10 W/m2 (section 3.5). Source: Integrated Assessment of Black Carbon and Tropospheric Ozone, available at http://www.unep.org/dewa/Portals/67/pdf/BlackCarbon_report.pdf | Numbers will be updated according to WGI AR5 |
| 14793 | 1 | 12 | | 13 | | While non-cossil CO2 GHGs are worth a mention, it is not clear why they warrant an entire sub-section as one of the six key observations. | Noted - because the world is focused on CO2 and when you look at the other pollutants they dominate the short-lived |
| 3548 | 1 | 12 | 39 | 13 | 11 | Should mention the climate impacts of the "Montreal gases" | Taken into account - added point on the Montreal Protocol and added citation to Velders et al (2007) which is best study |
| 7811 | 1 | 12 | 39 | 13 | 16 | The different temporal scales of different climate impacts and following implications should be mentioned. | we will discuss |
| 11580 | 1 | 12 | 40 | 12 | 40 | Burning of fossil fuels is the largest contibuting source of GHGs hence the concentration.That countries have been reporting on all the gases, beyond fossil fuel CO2 is an indicator that there is awareness on all gases and the matter of their GWP. | what is the point here? |
| 18109 | 1 | 12 | 41 | 12 | 41 | Suggest referring to the Kyoto Protocol as such rather than as the Ky0t0 Treaty here and troughout the entire document in this and other chapters. | another comment addresses this |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 12085 | 1 | 12 | 44 | 12 | 45 | Current text "Indeed, depending on the region, mitigation of these 45 different pollutants varies enormously in cost." It is worth considering if this statement should be qualified with a statement stating something like "for many countries mitigating non-CO2 gases has been shown to be a cost effective strategy because many of these gases have long lifetimes and global warming potentials much higher than CO2." eg: An MIT study found that focusing on non-CO2 gas mitigation reduced the overall costs of action by two-thirds. Please see at Reilly, J. Jacoby, H. Prinn, R (2008) Multi-Gas Contributors to Global Climate Change: Climate Impacts and Mitigation Costs of Non-CO2 Gases. MIT. Available At http://www.pewclimate.org/global-warming-in-depth/all_reports/multi_gas_contributors | Taken into consideration - added sentence and cites "varies enormously in cost. A VARIETY OF STUDIES HAS SHOWN THAT ALLOWING FOR TRADING ACROSS THESE DIFFERENT GASES WILL REDUCE THE OVERALL COSTS OF ACTION; HOWEVER, MANY STUDIES ALSO POINT TO THE COMPLEXITY IN AGREEING ON THE CORRECT TIME HORIZONS AND STRATEGIES FOR |
| 11581 | 1 | 12 | 47 | 13 | 10 | There is a lot of work that has been carried out by the WHO that could be used to beef up the contribution here if these gases are to be considered. | Taken into account - agreed. Discussion on co-benefits has been beefed up but a detailed assessment of the topic is |
| 4606 | 1 | 13 | | | | AIE is not defined in the graph | Chart has been redrawn. Comment is no |
| 13252 | 1 | 13 | | | | The acronym AIE is not explained | Chart has been redrawn. Comment is no |
| 17011 | 1 | 13 | | | | Where is Forestry? | Chart has been redrawn. Comment is no |
| 17012 | 1 | 13 | | | | "AIE" in the legend should be defined - Aerosol Indrect Effect (I'm assuming) | Chart has been redrawn. Comment is no |
| 10466 | 1 | 13 | | | | Change "Household biofuel" to Household biomass. "Biofuel" is the term used for transport fuels - need to also confirm that in Glossary. Need to cross-check with chapters 7,8,10,11 for consistency with data from this single reference. Put "AIE" in full. Is rail included in "off-road transport" or is that agriculture and construction vehicles? Needs clarifying in caption. | Chart has been redrawn. |
| 6864 | 1 | 13 | | | | Please ensure consistency with WGI AR5 estimates of net radiative forcing -- see Chapter 8 of WGI AR5. | Chart has been redrawn. we have totally redone discussion of GWPs |
| 10742 | 1 | 13 | 1 | 13 | 16 | It is good that the non-CO2 forcings are presented and that the cooling effects are given some attention. But one important aspect is missing, and that is the temporal behaviour of the various mechanisms. Some agents cause strong warming effects on shorttime scales (e.g. black carbon and tropospheric ozone), while some are "medium long lived" like methane, and finally some are very long-lived. CO2 shows a special behaviour due to the very slow removal of excess CO2 (see Box 6.2 in WGI SOD). On the other hand there are some strong short-lived cooling effects. These aspects (time scales and effects of both signs) are illustrated in a recent paper by Aamaas et al. (see http://www.earth-syst-dynam-discuss.net/3/871/2012/esdd-3-871-2012.pdf. Figure 13 shows contributions by sectors and components. (see als fig 11 and 12). While figure 1.3 on page 13 uses RF as indicator the figures in Aamaas et al used temperature. See also WGI, chapter 8; figures 8.32, 8.33 and 8.34. | Taken into account - combined with other comments |
| 17010 | 1 | 13 | 11 | | | Shindell et al. in Science 2012, "Simultaneously Mitigating Near-Term Climate Change and Improving Human Health and Food Security" deserfves to be cited. Also, a mention/discussion of the recently launched (Feb 2012) Climate and Clean Air Coalition is warranted. | Taken into account - combined with other comments |
| 15246 | 1 | 13 | 12 | | | is this meaningful given the complexity of interactions? | Figure has been redone. |
| 12217 | 1 | 13 | 13 | | | Please explain AIE (Aerosol Indirect effects) in caption | Chart has been redrawn. Comment is no |
| 4886 | 1 | 13 | 18 | | 19 | {Add}" totality of {}existing policy efforts do not put the planet on track for meeting the objectives [of Article 2] of the United .. (UNFCCC {}Article 2)<br>That is:<br>" totality of existing policy efforts do not put the planet on track for meeting the objectives of the United .. (UNFCCC Article 2) | Reject - we can't say this. We can say something about 2 degrees (and we have done that, with some revisions to those statements to come). |
| 11025 | 1 | 13 | 24 | | | Suggest adding at the end of the sentence ending with 'deep cuts' the words 'that would be consistent with the precautionary approach suggested by Article 3.3 of the UNFCCC.' | Rejected - the "precautionary approach" has lots of meanings, and article 3.3 doesn't say this precisely. So we can't |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 15247 | 1 | 13 | 28 | | | "adapt naturally" is interesting vis-à-vis 'geo-engineering' | interesting indeed - no action needed |
| 17009 | 1 | 13 | 3 | | | Insert at the end of sentence on aerosols "… i.e., they cool the atmosphere LARGELY THROUGH THEIR ROLE IN CLOUD FORMATION, EXTENT, THICKNESS AND LIFETIME" | Rejected - we don't need to describe mechanisms here. |
| 11399 | 1 | 13 | 30 | 14 | 2 | The reference to Art. 3(3) of the UNFCCC is a truncated reference that selects only a limited part of the provision referred to. In doing so, it creates the potential for suggesting that only the precautionary principle is worthy of highlighting and stressing among the other principles that are included and referred to in Article 3 of the UNFCCC. Considering that Article 3 is a framing article in the UNFCCC in terms of identifying the principles that should guide Parties' actions in implementing the UNFCCC, it should therefore be quoted in full so as to ensure a fair and accurate reflection of the relevant framing principles as provided for in the UNFCCC. | Taken into account - this is a fair point. But if we quote all principles included in Article 3, it may be redundant and consume too much space. Instead the quote has been deleted |
| 11024 | 1 | 13 | 5 | | | The word 'purposely' should be deleted in the sentence 'Interpreting the UNFCCC goals is purposely difficult.' It is ill-judged and inappropriate. | Accepted - deleted 'purposely' |
| 7873 | 1 | 13 | 5 | 13 | 5 | If "optimal" is understood in terms of economic efficiency, this should be stated clearly, for in ordinary language "optimal" means "the best". This is an important difference. | Taken into account - sentence has been removed |
| 11350 | 1 | 13 | 5 | 13 | 6 | I would suggest that the sentense "for optimal radiative forcing reduction policies the integrated total effect should be estimated" be revised or removed because it is not clear why radiative reduction policies are brought up here and also why the integrated total effect (implying the GWP) is important. | Taken into account - sentence has been removed |
| 11351 | 1 | 13 | 6 | 13 | 8 | This statement can be supported by Ramanathan and Carmichael (2008, Nature Geoscience, 10.1038/ngeo156). | Accepted - added cite to Ramanathan and Carmichael (2008) |
| 15245 | 1 | 13 | 7 | 13 | 11 | a little speculative given the state of current research? I.e. 'could' with what degree of certainty? | Taken into account - combined with |
| 12513 | 1 | 13 | 7 | 13 | 8 | The reference should be to "black carbon (soot)" and should not assert that this is simply a positive forcing; refer to WGI for the more mixed role soot plays | Accepted - we will put soot in brackets and add xref to WG1 per comment 664 |
| 10467 | 1 | 13 | 8 | | | "soot" not a good technical term as used here and elsewhere. Suggest use black carbon (as used in Fig 1.3 and 8.2), or particulates or aerosols, as appropriate. | Taken into account - combined with other comment |
| 4362 | 1 | 13 | | 13 | | I cannot make sense of the first phrase from the legend; Numbers within brackets do not seem correct for aviation and shipping; those for biomass burning and industry are surprising (do they contribute to climate cooling?); misses definition of AIE; | Figure has been redone. |
| 6862 | 1 | 13 | 2 | 13 | 3 | You may want to insert reference to WGI AR5 Chapter 7 here. | Taken into account - combined with |
| 8225 | 1 | 13 | 3 | 13 | 3 | Why currently? Can it change in the future? Why? How large are the negative contributions with respect to the total global warming problem? | Rejected - too much detail for this text |
| 6863 | 1 | 13 | 6 | 13 | 8 | Please provide a reference supporting this statement. | Taken into account - combined with |
| 3549 | 1 | 13 | 18 | 13 | 18 | Reference to Chapter 1 in AR4, specify if this is in WG III report (which is likely) | The cite at the end of that sentence (IPCC 2007a) points to WGIII. No action |
| 3550 | 1 | 13 | 31 | 14 | 2 | Format citation | Editorial – copyedit to be completed |
| 3881 | 1 | 14 | | | | What does AIE means?? | Figure has been redrawn |
| 11401 | 1 | 14 | 13 | 14 | 15 | The wording in the Bali Action Plan (decision 1/CP.13) referring to the footnote that cites the work of Working Group 3 of AR4 should be accurately reflect what is contained in the footnote - i.e. "Contribution of Working Group III to the Fourth Assessment Report of the Intergovernmental Panel on Climate Change, Technical Summary, pages 39 and 90, and Chapter 13, page 776." Footnote 1 of decision 1/CP.13 did NOT specifically refer to only "Table SPM5 and Box 13.7" as the current text seems to imply. | Taken into account - The sentence has been revised to point to the Bali Action Plan generally rather than specific boxes and tables, as suggested by the comment |
| 11720 | 1 | 14 | 16 | 14 | 18 | G8 declaretion says [suport] not [agree]. Correct word should be used. | Accepted - changed 'agreed' to |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 9493 | 1 | 14 | 16 | 14 | 18 | revise this sentence to the correct fact - L' Aquila G8 Leaders Declaration says, "we reiterate our willingness to share with all countries the goal of achieving at least a 50% reduction of global emissions by 2050, recognising that this implies that global emissions need to peak as soon as possible and decline thereafter. As part of this, we also support a goal of developed countries reducing emissions of greenhouse gases in aggregate by 80% or more by 2050 compared to 1990 or more recent years."<br>(G8 Leaders Declaration: RESPONSIBLE LEADERSHIP FOR A SUSTAINABLE FUTURE/65. in page 19)(attached on email) | Taken into account - combined with other comment |
| 10636 | 1 | 14 | 16 | 14 | 18 | Yamaguchi et al argued in his essay Climate Change Mitigation  A Balanced Approach to Climate Change that in sipte of the inclusion of the 2 degree target, the leaders remained to recognize the broad scenetific view, and they have not agreed to the view yet. I will send it by email later. | Taken into account - combined with other comment |
| 10677 | 1 | 14 | 16 | 14 | 18 | If the agreement L'Aquila specifically referred to 2 degrees being a "scientific view" then this text should be placed in quotation marks, like the COP15 text. Otherwise these words should not be used, as it sounds like the IPCC authors are endorsing the idea of 2 degrees as the logical scientific interpretation of Article 2. | Accepted -  Reasonable comment. Quotation marks added as suggested by the comment. The phrase was revised to say "recognized the broad scientific view that the increase in global average |
| 17013 | 1 | 14 | 18 | | | "at least 80% by 2050… BELOW WHAT BASELINE?... Any conditions (e.g., domestic legislation, etc.)? | Rejected -  Exact wording is 'compared to 1990 or more recent years'. It doesn't seem necessary here to state this here. |
| 14341 | 1 | 14 | 19 | 14 | 23 | This omits an important addition: At COP16 in Cancun, Parties, for the first time, adopted the 2 degree goal through consensus (paragraph 4 of Decision 1/CP.16). | Accepted - Revised sentence to include mention of Decision 1/CP.16. |
| 11402 | 1 | 14 | 19 | 14 | 19 | In the context of the UN's treaty and mulitlateral negotiations practice, the UN General Asssembly had decided that "the term 'takes note of' or 'notes' are neutral terms that constitute neither approval nor disapproval" (see UNGA decision 55/488 of 7 September 2011, as reproduced in UN Doc. A/56/250 and UN Doc. A/64/250). Hence, when the UNFCCC COP took note of the Copenhagen Accord, it should be read as the COP not approving or disapproving the Copenhagen Accord, but rather simply noting its existence without necessarily endorsing or unendorsing its contents. As such, the 2 degree Celsius goal recognized in the Copenhagen Accord cannot be deemed to have been adopted by the UNFCCC Parties at COP15. It was, in fact, only at COP16 in Cancun that the Parties adopted the 2 degree Celsius goal under paragraph 4 of COP decision 1/CP.16. If the intent of the referenced sentence is to indicate when the COP adopted the 2 degree Celsius goal, then the reference to the Copenhagen Accord would be legally and factually inaccurate. The reference should, instead, be to COP decision 1/CP.16 | Taken into account - combined with other comments |
| 4855 | 1 | 14 | 20 | | 22 | Actually, the goal of limiting warming to 1.5o has also been mentioned already in the Copenhagen Accord (see its para  23). | Taken into account - revised text to say "Ever since the 2009 Copenhagen Conference the goal of 1.5 degrees has |
| 16063 | 1 | 14 | 22 | 14 | 23 | The target in temperature is a political choice of Nations, in particular those most vulnerable, that want to minimize the risk of overshooting tolerable warming. IPCC can say -as righly in Victor 2011- that it is expensive or not attainable through consensus negociations, but its role is not to limit such political ambitions. | Taken into account - we are not trying to limit ambitions but just to lay out the facts.  We think (with edits suggested by |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 13370 | 1 | 14 | 22 | 14 | 23 | The assertion that the scientific foundations for these targets 'has remained elusive', is inaccurate. 'Dangerous' is a value -laden term. However the physical and biological sciences are able to provide reasonably accurate indications of species' and ecosystemic responses to changes in average and extreme temperatures, associated changes in weather, water availability etc. This body of research and observation is hard to summarise and varies signficantly by region. Nevertheless, it is based on a firm and growing volume of biological and physical evidence for impacts - including on ocean acidification and sea levels, glaciers, ice shelves (over time), coral reefs, and a broad range of individual species. These impacts accumulate and amplify substantially as global average temperatures rise above 1.5C. There is also good evidence about the iplications for sea-level rise and the likely fate of coastal settlemnts and biosystems. In terms of compounding effects, the scientific foundations for these targets - read in the contexty of Article 2 - are substantial and not elusive. I suggest the appropriate sentence would be: 'The scientific foundation for establishing these targets - in the light of the broad goals articulated for the UNFCCC - is substantial and compelling'. | Taken into account - We might want to have a substantial base of science, but we don't really know. Some of the sicence says 1 degree is too much. Some says that in some settings 3 degrees is too much. Variations in what different societies mean by "dangerous" and the risks they are willing to endure further amplify that observation. Sentence has been revised to reflect the variation. |
| 13677 | 1 | 14 | 22 | 14 | 23 | Replace "However … Victor 2011" by "Researchers disagree regarding the scientific foundations for setting temperature targets - Schneider and Lane (2006) see them as sufficiently robust, Victor (2011) does not." Source: Schneider, S.; Lane, J. (2006): An overview of dangerous climate change, in: Schellnhuber, H.-J. (ed.): Avoiding dangerous climate change, Cambridge University Press, Cambridge, p. 7-24 | Taken into account - Sentence has been revised per other comment. Added citation to Schneider and Lane (2006) |
| 17737 | 1 | 14 | 23 | | | should be UNFCCC | Sentence has been replaced and word was removed. Comment no longer |
| 15534 | 1 | 14 | 23 | | | Perhaps worth mentioning that the 2degC ceiling was endorsed at Cancun. | Taken into account - combined with |
| 4887 | 1 | 14 | 23 | | | the UNFCCC— | Sentence has been replaced and word was removed. Comment no longer |
| 17014 | 1 | 14 | 23 | | | This paragraph could benefit by reference to the National Academy of Sciences 2011 report, "Climate Stabilization Targets", chaired by Susan Solomon | Accepted - added reference to NAS (2011) |
| 8476 | 1 | 14 | 24 | | 30 | Much of this chapter, and in fact most of AR5, is largely premised in the "deficit model" of knowledge transfer and policymaking, where it is often an a priori assumption that public policy simply needs the "right" data, knowledge or instruments in order to rectify the problem(s). This is a problematic starting point, as (while the emphasis on evidence is important) it tends to ignore or downplay the political, fiscal and path dependent realities of decisionmaking in the public domain. See for example Stone's "Policy Paradox" (1997) or Lawton 2007 (Presidential Address)Ecology, Politics and Policy | Noted - This is an interesting point but too detailed for Ch 1. You might be reading into this more than we are trying to say. We are explictly not doing this. |
| 7874 | 1 | 14 | 24 | 14 | 30 | Any critical literature on geoengineering is missing and should be mentioned here in order to provide a balanced view (Gardiner 2010, 2011b, Goes et al. 2011, Rickels et al. 2011, Robock 2008, Robock et al. 2010, Svoboda et al . 2011, Ott 2012, as well as the contributions in Preston 2012). | Accepted - expanded text to mention the controversy on geoengineering and added cross reference to chapter 6.9 and citation to Rickels et al (2011) and Gardiner (2010) as suggested. More |
| 7347 | 1 | 14 | 24 | 14 | 30 | This paragraph is very clumsy and has poor English usage and grammar ("facing with"; "number of literatures" "from various footings"). It also conflates possible extreme effects and appropriate policy responses - better to break these two ideas apart. Then it would be better not to elevate "geoengineering", as currently it is the only appropriate policy response measure discussed. | Taken into account - paragraph has been revised and the mention of geoengineering expanded to be more balanced |
| 4856 | 1 | 14 | 25 | | | "reference could also be made to the relevant/recent IPCC SP on extremes | Rejected - IPCC SR on extremes does not cover catastrophic losses such as collapse of THC or antarctic ice sheet. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 7875 | 1 | 14 | 25 | 14 | 25 | The observation that emissions are not on track for stabilization let alone deep cuts is correct. But it would substantially improve the analysis of what has happend so far and in identifying current challenges to say something about how "this reality" came about and who created it. One reason that is not mentioned throughout the first chapter is that one of the largest emitter in terms of absolute and per-capita emissions, the US, has refused to implement any meaningful climate policy on a national level until today. See also comment 26. | Rejected - assigning cause is not helpful here. |
| 14794 | 1 | 14 | 26 | | | "Weitzman (2009) raised the concern that standard policy decision tools such as cost-benefit analysis and expected utility theory are not able to deal with climate change decisions, owing to the uncertain probability of high or catastrophic impacts." | Accepted - adopted suggested sentence to replace existing one |
| 13678 | 1 | 14 | 27 | 14 | 30 | Replace "Facing …Society 2009" by "Partly driven by these concerns, the literature on geo-engineering options to remove CO2 from the atmosphere or manage solar radiation has been increasing exponentially (see Chapter 6.9)". | Accepted - adopted suggested sentence |
| 15248 | 1 | 14 | 28 | 14 | 30 | contradicting Article 2 | Noted - insufficient information. No |
| 14331 | 1 | 14 | 28 | 14 | 30 | The brackets in line 28 suggest that their content is a definition of geoengieering. Yet finding a definition, e.g. for scientific or governance purposes, is still a major challenge. On definitions see e.g. Williamson, P., Watson, R.T., Mace, G., Artaxo, P., Bodle, R., Galaz, V., Parker, A., Santillo, D., Vivian, C., Cooper, D., Webbe, J., Cung, A. and E. Woods (2012). Impacts of Climate-Related Geoengineering on Biological Diversity. Part I of: Geoengineering in Relation to the Convention on Biological Diversity: Technical and Regulatory Matters. Secretariat of the Convention on Biological Diversity. Montreal, Technical Series No. 66. | Sentence has been replaced per other comment. Comment no longer relevant |
| 14332 | 1 | 14 | 28 | 14 | 30 | The literature cited does not cover current key aspects of geoengineering governance and ist interrelation with mitigation policy. More recent literature such aspects includes e.g.:<br>- Bodle, R., with Homan, G., Schiele, S., and E. Tedsen (2012). Regulatory Framework for Climate-Related Geoengineering Relevant to the Convention on Biological Diversity. Part II of: Geoengineering in Relation to the Convention on Biological Diversity: Technical and Regulatory Matters. Secretariat of the Convention on Biological Diversity. Montreal, Technical Series No. 66;<br>- Bodle, Ralph, "International governance of geoengineering: Rationale, functions and forum", in: William C.G. Burns and A. Strauss, (eds.), Climate Change Geoengineering: Legal, Political and Philosophical Perspectives, Cambridge: Cambridge University Press (submitted February 2011; in press);<br>- Lin A.C., International Legal Regimes & Principles Relevant to Geoengineering (in press). Cambridge: Cambridge University Press, Cambridge (submitted 2011, in press);<br>- Rickels, W.; Klepper, G.; Dovern, J.; Betz, G.; Brachatzek, N.; Cacean, S.; G ssow, K.; Heintzenberg J.; Hiller, S.; Hoose, C.; Leisner, T.; Oschlies, A.; Platt, U.; Proelß, A.; Renn, O.; Sch fer,S.; Z rn M. (2011): Large-Scale Intentional Interventions into the Climate System? Assessing the Climate Engineering Debate. Scoping report conducted on behalf of the German Federal Ministry of Education and Research (BMBF), Kiel Earth Institute, Kiel, available at http://www.fona.de/mediathek/pdf/Climate_Engineering_engl.pdf | Taken into account - We don't' have a lot of space here on this topic, added the Rickels et al cite. |
| 9786 | 1 | 14 | 28 | | | When political decision makers read such paragraphs, they might tend to draw the conclusion that geo-engineering might save it all. | Taken into account - sentence has been replaced per other comments |
| 14795 | 1 | 14 | 28 | | | Add: "...literature on risks and potential of geo-engineering..." | Taken into account - sentence has been replaced and discussion expanded per |
| 5459 | 1 | 14 | 3 | | | this paragraph describes different summits and their respective goals- they all seem well intentioned but it is not clear what the point of the paragraph is. It seems that the point is integrating the scientific basis and knowledge on climate change into political goals- but a sentence or two to direct the reader would be helpful | Noted - The purpose is to show how ultimate objective or 2 degree target has been treated. The idea of this paragraph is to convey the role of these parallel processes. Paragraph has been revised |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 7346 | 1 | 14 | 3 | 14 | 23 | It does not seem appropriate to cite political declarations of the G8 as evidence for a global interpretation of Article 2 of the Convention. If political statements are to be referred to then the range of submission by country groupings to the UNFCCC (usually consisting of more than eight members) could be referred to here. As the African Group, the Least Developed Countries gorup, the Alliance of Small Island States and the Bolivarian Alliance of the Americas (ALBA), representing over 100 countries collectively, have suggested a 1.5C target. The material as presented suggests the G8 declarations are more relevant to determining what constitutes "safe" or "dangerous" interference than submissions from more sizeable and more representative groups of countries. It would be preferable to perhaps remove the discussion of political considerations if the conclusion that no scientific foundation for establishing the targets is to be maintained. Otherwise reference to the Cancun Agreements, with reference to below 2C with the intention to review and consider a 1.5C target, may be more appropriate. | Taken into account - Cancun has been added though it was touched upon in more general way. The reasons why G8 declaration is included here are 1) leaders have first agreed to explore halving global emissions by 2050 (in 2007 at Heiligendam), and 2) they supported to cut their emissions at least 80% by 2050. There are many G8 Summit statements, but only important two among them from the standpoint of mitigation target are cited here. The |
| 3311 | 1 | 14 | 30 | 14 | 30 | I would add a reference to an ethical skeptic: Gardiner (2010). "Is 'arming the future' with geoengineering really the lesser evil? Some doubts about the ethics of intentionally manipulating the climate system" in Gardiner, Caney, Jamieson, and Shue (2010). Climate Ethics: Essential Readings. New York: Oxford University Press | Taken into account - combined with other comments |
| 3062 | 1 | 14 | 30 | | | Also cite the Novim report http://www.arxiv.org/abs/0907.5140 (2009) | Rejected - several citations already added per other comments. I think we |
| 8506 | 1 | 14 | 30 | 14 | 30 | It would be appropriate to mention that in the framework of the G8+5 summit (Tokyo, 2008) the meeting of leading academies of science stated in its resolution that “there is also an opportunity to promote research on approaches which may contribute towards maintaining a stable climate (including so-called geo-engineering technologies and reforestation), which would complement our greenhouse gas reduction strategy”. | Rejected - too much detail for this chapter |
| 9787 | 1 | 14 | 31 | 14 | 47 | Multidimensional optimization will gain importance, time issues as later on stressed in chapter 2 as well. I would add a sentence that both decision dimensions and the time-frame are specific and thus different for different decision makers and must be dealt with accordingly. There is no "one size fits all" | Taken into account - other edits to the text will emphasize this point--about article 2, about time horizons for |
| 3312 | 1 | 14 | 32 | 14 | 36 | I don't understand, precisely, what this sentence is referring to. Why are the costs harder to make precise? | Taken into account - sentence has been |
| 7876 | 1 | 14 | 32 | 14 | 43 | This view is based on a portfolio perspective as it is adopted in the Royal Society report on climate engineering (Shepherd et al. 2009). However, such a perspective seems implausible to assess the triangular affair of mitigation, adaptation and geoengineering. It supposes that one can choose between any combination of the measures and thereby ignores possible trade-offs. For instances, if employment of measure A undermines measure B it does not make much sense to speak of a portfolio. In addition, the portfolio perspective obscures conflicts of interests and, hence, justice for a different mix of measures will affect different people (differently). For further criticism of the portfolio pespective see Gardiner (2011). | Taken into account - text has been revised |
| 15249 | 1 | 14 | 37 | 14 | 38 | see point 7 | Noted - insufficient information. No |
| 12218 | 1 | 14 | 40 | 14 | 40 | Please use consistent language. Here soot is used, earlier balck carbon is used e.g. on page 12, line 49. The term Black Carbon is preferred. | Accepted - changed "soot" to "black carbon" |
| 14796 | 1 | 14 | 41 | | | It is not the case the because the world is not on track for 2C that analysts have had to look at higher temp goals; the higher temperature goals (3C, 4C, 5C, etc.) have always been among the scenario runs. What would be correct would be to state... "And the evidence that the world is not on track to stop warming at 2 degrees Celsius means that analysist have had to explore solutoins that compensate for this slow progress, through more rapid emission declines later and/or negative emission options." | Taken into account - sentence has been revised. The term "slow progress" suggested is too emotive. And I think when you look at the history the number of STABILIZATION runs at these higher |
| 7348 | 1 | 14 | 41 | 14 | 43 | Firstly this sentence accepts or suggests that 2C is an accepted global goal, which should be stated in the context of the review of that goal, as that is how many countries agreed to it. Secondly, it is unclear why a failure to reach a goal determined to be "safe", should then result in the need for "another goal." Surely 1C, 1.5C or 2C can all continue to serve as goals and the science can continue to inform policy-makers how far they are from those goals. | Taken into account - combined with other comments. There is extensive discussion elswehere in the text about the origins of 1, 1.5 and 2 degrees. No further action needed |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 11026 | 1 | 14 | 42 | | | The phrase 'analysts have had to devise a larger number of alternative goals' is poorly expressed and should be amended to 'analysts have had to consider a number of alternative goals, and the costs of inaction relative to the costs of accelerated policy action.' | Accepted - phrase has been adopted to replace the original, as suggested |
| 13679 | 1 | 14 | 42 | 14 | 43 | Replace "… have had to devise… goals" by "have to assess new policy instruments that could achieve substantial mitigation or assess the costs and benefits of alternative goals". Reason: The fact of not being on track could mobilize higher political will to get back on track. | Taken into account - combined with other comment |
| 2244 | 1 | 14 | 44 | 14 | 47 | We need scientific evidence. Scentific "understanding" is insufficient | Rejected - Science is a combination of evidence and understanding. This is off topic for this chapter. No action needed |
| 13368 | 1 | 14 | 5 | | | It is unclear what 'purposely difficult' is intended to mean. Written to be obscure? I suggest it is clearer to write simply 'Interpreting the UNFCCC's goals is sometimes difficult'. | Taken into account - combined with other comment. We are removing |
| 11400 | 1 | 14 | 5 | 14 | 5 | The sentence "Interpretiing the UNFCCC goals is purposely difficult" injects a subjective opinion as a scientific truth, implying that the treaty framers intended to make the UNFCCC's provisions to be unclear and ambiguous. The word "purposely" should be deleted. | Taken into account - combined with other comment. We are removing "purposely" |
| 13369 | 1 | 14 | 7 | 14 | 9 | 'The second part of Article 2...etc.' This sentence's assertion about the second part of Article 2 is inaccurate. It is scientifically possible to indicate when species and ecosystems are/were adapting naturally rather at a point when such adaptation is breaking down or impossible, in relation to climate-driven pressures (temperatures, patterns of species reproduction, water avaialbility, and so on). Similarly it is possible to indicate when human-engendered and climate-related threats are affecting food systems and sustainable economic development. | Rejected - This isn't really the point we are making--we are making a point about the ability to nail down precisely what is "dangerous". Other edits (suggesting a variety of points of view, see comment 686) address this |
| 4607 | 1 | 14 | 9 | 14 | 9 | Do you mean "natural science analysis"? | No--we mean the totality of scientific assessment. No action needed. |
| 6507 | 1 | 14 | 18 | | | Replace "agreed to cut their emissions" with e.g. "supported a goal of developed countries reducing emission of greenhouse gases in aggregate" according to the text of L'Aquila G8 Summit. | Taken into account - combined with other comments. Text has been revised |
| 3552 | 1 | 14 | 27 | 14 | 27 | "Facing with the increasing…", delete "with" | This sentence has been removed per an previous comment. Comment no longer |
| 6865 | 1 | 14 | 27 | 14 | 28 | Suggest to refer to both WGI and WGII AR5 as the basis for such statements. | This sentence has been removed per an previous comment. Comment no longer |
| 3551 | 1 | 14 | 7 | 14 | 7 | Reference to Chapter 1 in AR4, specify if this is in WG III report (which is likely) | Taken into account - text has been |
| 6866 | 1 | 14 | 41 | 14 | 42 | Supporting evidence for this statement needed. Suggest to add reference to relevant sections of WGI AR5, Chapter 12. | Taken into account - addressed through responses to other comments such as |
| 4018 | 1 | 15 | 10 | | | after "Shindell et al., 2012" add "Anenberg et al., 2012". The full reference: Anenberg, S.C., J. Schwartz, D. Shindell, M. Amann, G. Faluvegi, Z. Klimont, G. Janssens-Maenhout, L. Pozzoli, R. Van Dingenen, E. Vignati, L. Emberson, N.Z. Muller, J. Jason West, M. Williams, V. Demkine, K. Hicks, J.C.I. Kuylenstierna, F. Raes, and V. Ramanathan. Global Air Quality and Health Co-Benefits of Mitigating Near-Term Climate Change through Methane and Black Carbon Emission Controls. Environ Health Perspect 120:831–839 (2012). http://dx.doi.org/10.1289/ehp.1104301. | Rejected - we are already overloaded with refs. |
| 2245 | 1 | 15 | 11 | 22 | 35 | Your theory seems to believe that the climate is influenced by CONCENTRATIONS of greenhouse gases in the atmosphere. Why do you place so much attention on EMISSIONS?. What evidence is there that they have any effect on atmospheric concentrations? | Noted - Emissions lead to concentrations. See WG1. No action needed |
| 10823 | 1 | 15 | 11 | 15 | 18 | Given the use of Figure 1.3, and the previous reference to Shindell et al 2012 and UNEP 2011, you seem to be expanded GHGs to be more than just the long-lived (wel-mixed) GHGs as in the Kyoto Protocol. I think this is good and overdue. Yet, in section 1.3.1 you focus on the long-lived greenhouse gases. I think you should justify why you focus on these. | Taken into account - The first two paragraphs have been revised to explain. |
| 14359 | 1 | 15 | 12 | | | Try to say something about likely emissions after 2008. There was a temporary slowdown (decline?) because of global recession, but I believe there was an especially large increase in 2010. The point could usefully be made that despite the recession the medium-term path is still about what was expected before. | Accepted - data will be updated as they become available |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 10837 | 1 | 15 | 12 | 15 | 12 | Footnote 1. If it fine to use EDGAR. Why did you stop at 2008? When I believe EDGAR has numbers to 2011 now? And it is probably worth referencing what you write, e.g., http://www.biogeosciences-discuss.net/9/1299/2012/bgd-9-1299-2012.html | Accepted - data will be updated as they become available. Cite added to WGIII Annex II |
| 10679 | 1 | 15 | 12 | 15 | 12 | Given the importance of global GHG emissions data, it would be helpful if the authors provided pointers to some of the other sources out there (e.g. WRI CAIT, UNFCCC). There could even be a box listing these sources and comparing their different characteristics (sectoral coverage, temporal coverage, estimated uncertainties, etc.) | Taken into account - cross reference added here. |
| 9922 | 1 | 15 | 12 | | | A url should be given in the footnoot to the EDGAR dataset. | footnote has been removed. Full citation to the database in the reference list |
| 12219 | 1 | 15 | 17 | 15 | 18 | Does the explanation in paranthesis mean that the EDGAR database does not include BC, or is it another explanation to exclude BC? | Taken into account - text has been revised |
| 10743 | 1 | 15 | 19 | 15 | 21 | It should be specified that it is the IPCC reports FAR to AR4 that presented GWPs for transforming emissions of different components to a common scale. And I think it is important to mention here that the GWP concept has been subject to critisism and that several alternatives have been presented. (See AR5 WG1 SOD as well as Report from IPCC Expert meeting on Metrics (Plattner et al., 2009)). | Taken into account - Revise sentence to say: "Starting with the first assessment report, the IPCC has calculated global warming potentials (GWPs) to convert these gases with different properties into common units over 20, 100 and 500 year time horizons (chapter 2, IPCC First Assessment Report, 1990). In the Kyoto Treaty diplomats chose the middle value--100 years--despite any published conclusive basis for that choice (Shine, 2009). The GWP concept has been subject to criticism, including as more experts focus on the potentials for mitigation of pollutants with short atmospheric lifetimes whose radiative impacts are relatively under-counted |
| 10744 | 1 | 15 | 19 | 15 | 21 | Regarding footnote 2: Very good. | Noted |
| 10745 | 1 | 15 | 19 | 15 | 30 | Somewhere in this para (or in a footnote) it should be made clear that IPCC did not choose 100 years time horizon, but presented GWPs for 20, 100 and 500 years. And that it was for the Kyoto Protocol that 100 years was chosen (without any published conclusive basis for this; see e.g. editorial by Keith Shine in Climatic Change, 2009). | Taken into account - combined with other comment |
| 18017 | 1 | 15 | 19 | 15 | 30 | could more reason be given on why to select 1970 to 2008 as the timeframe for reviewing historical GHG emission? | Accepted, data will be updated as they become available |
| 10824 | 1 | 15 | 19 | 15 | 21 | I release the "footnote 2" keeps a door open, but as the WGI text clearly explains is that the use of GWP100 is a value based choice that has no real justification. I know it is used broadly, but I think a stronger link to the actuall WGI text. For example, the use of "the IPCC has long used" implies that there is broad agreement on using the GWP100, which is not the case. Perhaps word something like "we use the GWP100 as in the Kyoto Protocol, but we recognise that other equally valid choices exist (ref WGI)". | Taken into account - combined with other comment |
| 11352 | 1 | 15 | 19 | 15 | 21 | Although the GWP100 is the most commonly used metric for research and policy purposes, emission conversions using the GWP100 have drawn various criticisms (Fuglestvedt et al., 2003, Climatic Change, 10.1023/a:1023905326842; Fuglestvedt et al., 2010, Atmospheric Environment, 10.1016/j.atmosenv.2009.04.044). To avoid promoting the use of GWP100, it can be stated that the GWP100 is used only to illustrate the change in greenhouse gas emissions on a common scale and to faciliate comparison. Issues related to the GWP and other metrics are summarized in Tanaka et al. (2010, Carbon Management, doi:10.4155/cmt.10.28). | Taken into account - combined with other comment |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 11403 | 1 | 15 | 19 | 15 | 30 | There should be an explanation of why the timeframe 1970 to 2008 was used for purposes of reviewing historical GHG emissions. Why should not the historical range be extended back to at least 1900 or 1850? Starting from 1970 would essentially discount pre-1970 historical emissions as a factor in calculating future emissions responsibility. | Accepted, we will be adding a figure on cumulative emissions. |
| 4019 | 1 | 15 | 26 | 30 | | Please check the percentage. As all non-CO2 GHG have GWP higher then CO2 total emissions of all greenhouse gases - weighted by their global warming potential (GWP) with 100 year time horizon should have increased by more than 80% since 1970, even though some of them have shorter life times compared to CO2 | Rejected - non-CO2 weigh only 1/4 altogether and they increased less than 80%. No action needed |
| 16064 | 1 | 15 | 28 | 15 | 18 | The "collection" of flunorinated gas is probably inaccurate. "Net emissions" or "production" may be correct. | Rejected - collection is OK. No action |
| 18412 | 1 | 15 | 3 | | 4 | Such country or group of countries related statements do not need to be repeated within the chapter. That's a bad policy. | Rejected - this shift is correct and important for the assessment. No action |
| 10825 | 1 | 15 | 31 | 15 | 31 | "warming gases" would be better to be "GHG", as Figure 1.3 shows some are cooling | Accepted - changed "warming gases" to |
| 10826 | 1 | 15 | 31 | 15 | 32 | This could be confusing to some people. State more clearly, that "by weighting the GHG with a GWP100, CO2 contributes…". | Accepted - Changed sentence to "Looking at the total source of warming gases AND WEIGHTING WITH 100- |
| 10827 | 1 | 15 | 31 | 15 | 32 | Do the percentages refer to a single year, and average of all years, etc? State. | Taken into account - combined with |
| 7349 | 1 | 15 | 31 | 15 | 36 | Why is some detail of the country of origin provided for some of these statistics (e.g. China's contribution to CO2 from cement) but not others? Particularly as no such information is present in the figure referred to it may be better to remove the references. | Rejected - we are just illustrating so that people get a sense of how the activities are allocated |
| 17016 | 1 | 15 | 31 | | | Are these %'s for a 100-yr time-span, as well? | Taken into account - combined with |
| 17017 | 1 | 15 | 33 | | | Does "agriculture" here include all aspects of LULUCF / AFOLU? What about forests? Are these numbers consistent with those coming out of WG1? It is critical that numbers like these are cross-referenced for consistency. | Taken into account - All categories of emissions are listed in Annex II. See Annex II for emissions included in |
| 9778 | 1 | 15 | 36 | 15 | 36 | Emphasizing "originated in China" is not fit. Suggest to delete "of which half originated in China" | Rejected - we are just illustrating so that people get a sense of how the activities |
| 17015 | 1 | 15 | 5 | | | Insert , "… to encourage shifts TO LOWER GHG EMISSIONS in the energy system, …" | Accepted - adopted wording as |
| 17406 | 1 | 15 | 6 | | | Here or somewhere else that biofuels are referenced, it is important to discuss the potential negative effects of large-scale deployment of biofuel approaches for land use (eg, under growing conditions of inadequate global food supply, diverting existing cropland to biofuel production risks exacerbating conversion of natural systems to agriculture with large resulting release of C to the atmosphere). | Rejected - other edits create this balance; there is a whole chapter on these issues too. No action needed |
| 10678 | 1 | 15 | 7 | 15 | 10 | Little evidence is given here or in the rest of the chapter to support the claim that there has been substantially more effort to mitigate soot and methane (the Shindell Science paper does not discuss past trends, only future mitigation; the full UNEP report has a brief discussion of trends but only ozone precursors show much decline in the charts there). | Accepted: edited sentence to say: "...there ARE SUBSTANTIALLY STRONGER INENCITVES TO LIMIT SHORT-LIVED POLLUTANTS LIKE BLACK CARBON (SOOT) and methane—in part because these other pollutants are also linked to many local environmental ills AND THUS THE |
| 4017 | 1 | 15 | 9 | | | suggested wording: "many local environmental ills and human respiratory diseases" | Taken into account - combined with |
| 18428 | 1 | 15 | | | | historical and future trends<br>When the report presents the trend (pag 15 paragraph 1) it should say that emissions are growing horribly, and not only "shifting". | Rejected - but they are shifting, and using the word "horribly" is sure to earn ire from others. No action needed |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 17018 | 1 | 15 | | | | It's unfortunate that the data used only goes through 2008 - just at the height of the recession. Some very interesting trends have emerged in the 4 years since the deepest part of the recession and it may come across as tone-deaf for a report that is to be published in 2014 to be based on 2008 data, esp when databases such as IEA, NEAA and EIA have more up-to-date emissions data. AR4 came out in 2007 and used 2004-05 emissions data, so it should follow that AR5 which comes out in 2013-14 should use 2011 data, FF CO2 data of which will be available by IEA later this year. Does the TaskForce on National Greenhouse Gas Inventories have anything to add to this data? | Accepted, data will be updated as they become available |
| 11892 | 1 | 15 | 11 | 17 | 34 | This section is too long and not easy to catch the point. Suggest to add a table to summarize the changes in GHG (in %) and the major driven factors for these changes. | Taken into account - section has been revised |
| 18113 | 1 | 15 | 19 | 15 | 30 | There is reference to 2008 emissions in this paragraph. However Fig 1.4 shows data only till 2006. This paragraph also discusses % rise in emissions between 1970 - 2008. Either the text or the figure (1.4) needs to be changed. | Accepted, data will be updated as they become available |
| 6867 | 1 | 15 | 20 | 15 | 21 | Please add reference to WGI AR5 Chapter 8. | Taken into account - combined with |
| 3553 | 1 | 15 | 31 | 15 | 36 | Mention contribution from transport in thsi paragraph. | Rejected - the paragraph is just illustration. Each sector does not need |
| 6508 | 1 | 15 | 31 | | 36 | Quote the year, for which contributions of gases are calculated. | Taken into account - combined with |
| 18111 | 1 | 15 | 31 | 15 | 36 | The sector categorisation in this paragraph does not match that shown in Figure 1.4 (right). Suggest harmonising them for ease of understanding. | Accepted - edited line 34 to say: "Other sources of greenhouse gases INCLUDE CO2 from biomass burning (11%, mostly forest and peat fires and post?burn decay in non?Annex I countries), and INDUSTRIAL |
| 6868 | 1 | 15 | 31 | 15 | 36 | Please ensure consistency in numbers with WGI AR5, Chapters 2, 6, 8, ....; this also applies to the quantitative results provided in the subsequent sections. | Accepted - will double check for consistency |
| 17694 | 1 | 15 | 9 | 15 | 10 | Must be better explained why countries create policies to limit the emission of some pollutants. Their budget is limited and they can obtain more percibable results in the reduction of these contaminants with less money. | Taken into account - combined with other comments |
| 9249 | 1 | 16 | | 16 | | Are biofuels incorporated here under Energy? Too small a component to split out? | Figure has been redrawn. Modern biofuels production are in the energy sector, consumption in transport sector (only non-CO2). Traditional biofuels and |
| 14797 | 1 | 16 | | | | "2% in Ax1 and 87% in non-Ax1" < 100% ? | it is a percentage of a percentage (first derivative), not absolute. No action |
| 3063 | 1 | 16 | | | | Figures show that IPCC is essentially wasting its advocacy effort---emissions have steadily increased WGI and II are performing a useful function in collecting and summarizing the science, but the discussions of “mitigation” of emissions (that is not proper English usage; effects may be mitigated, but emissions are reduced, or not) are wishful thinking. It hasn't happened, and there is nothing to indicate it will. | Noted - no action needed |
| 11891 | 1 | 16 | | | | The legends and captions are too small. | Figures will be re-designed for print and on-screen for final draft. |
| 7447 | 1 | 16 | | | | The GHG emissions for ALFOU seem high. Most biomass used for energy is from sustainable sources. It seems that some is assumed to be non-sustainable. I have discussed this in detail in chapters 7 & 11. | Taken into account - Added cross-reference to chapters and beefed up the |
| 7308 | 1 | 16 | 1 | | | Waste sector is missing from sectoral estimates in this figure. | Taken into account - waste sector will be |
| 7307 | 1 | 16 | 10 | | | "landfills and wastewater (together an increase of 90%, with 20% since 1990)" No citation given. | The figure has been redrawn and corresponding text removed. Comment |
| 14360 | 1 | 16 | 11 | | | Explain why rice emissions declining | The figure has been redrawn and corresponding text removed. Comment |

|---|---|---|---|---|---|---|---|
| 14361 | 1 | 16 | 11 | | | Lumping livestock and other agriculture emissions together with land use is a problem. Should separate out deforestation. Is agriculture (including livestock) a large source of emissions once deforestation is removed? (I think not.) | The figure has been redrawn and corresponding text removed. Comment no longer relevant |
| 10468 | 1 | 16 | 17 | | | Delete "gases" | The figure has been redrawn and corresponding text removed. Comment |
| 15535 | 1 | 16 | 19 | | 29 | How are the regions defined? | Taken into account - this paragraph has been removed but descriptions of the categorization of countries can be found |
| 9094 | 1 | 16 | 19 | 16 | 29 | The reducing the emissions of the greenhouse gases (GHG) requires the inclusion in the analysis of real quantities of emissions originated in developed countries, because their historical and actual emissions are very very high in comparison with the developing countries emissions. | Taken into account - we are adding a cumulative emissions charts and the whole purpose of the discussion here is |
| 18413 | 1 | 16 | 19 | | 35 | From an ethical and policy perspective the use of the basis year 1990 is controversial and misleading. Is the purpose of the text to focus on the “bad guys” again? Assessing long term changes in trends is more reasonable. | Noted - 1990 was chosen by UNFCCC and Kyoto so we are following that. No action needed |
| 11582 | 1 | 16 | 19 | 16 | 29 | There is need to interrogate these figures and references be provided. | Noted - The paragraph discusses figure 1.4. No action needed |
| 4888 | 1 | 16 | 20 | | | [Del] generally used terminology w/o "highly":: ["highly] industrialized | Taken into account - "highly" has been |
| 3555 | 1 | 16 | 21 | 26 | 24 | References to Annex I, Annex II and Annex B countries mixed up. If retained, each should be defined clearly. | Taken into account - edited sentence to sy "Since 1990 CO2 emissions from electricity and heat production increased by 27% for the group of OECD countries; the rest of the world has risen |
| 17019 | 1 | 16 | 21, 35 | | | In l21, it cites that 87% of the rise in FF CO2 emissions sicne 1990 is from NA1 nations. In l35, it states that the rise in CO2 emissions from energy from non-A2 nations since 1990 is 64%. How can these nubemrs be reconciled? This is a significant difference for seemingly similar metrics with similar baselines. | Taken into account - combined with other comments, edits (see 781) remove the annex II distinction and simplify. |
| 17020 | 1 | 16 | 23 | | | "newly industrialized countries"; again, these nations should be listed so a complete snapshot of the current situation in the world is given, while also allowing posterity to read this report and assess what each nation has done, what impact it has had, etc. | this paragraph has been revised. The discussion on newly industrialized countries has been removed. Comment |
| 7151 | 1 | 16 | 24 | | | The word 'in' should be struck. Otherwise the sentence does not make sense. | this paragraph has been revised. The sentence has been removed. Comment |
| 17021 | 1 | 16 | 24 | | | "other developing countries"; again, these nations should be listed so a complete snapshot of the current situation in the world is given, while also allowing posterity to read this report and assess what each nation has done, what impact it has had, etc. - does this refer to Least Devleoped Nations (LDCs)? | this paragraph has been revised. The sentence has been removed. Comment is no longer relevant. |
| 4889 | 1 | 16 | 26 | | 27 | many readers may not know these abbreviations (esp. the case of Mexico and S-Korea): "OECD North America .. OECD Europe .. OECD Pacific | this paragraph has been revised. The sentence has been removed. Comment |
| 12220 | 1 | 16 | 27 | 16 | 28 | The description explaning EIT in page 17, line 31-33, could better be introduced here where it is mentioned the first time. It should also be in the Glossary naming the countries that are included in the EIT group. | this paragraph has been revised. The sentence has been removed. Comment |
| 17022 | 1 | 16 | 27 | | | "Economies-in-transition" ; again, these nations should be listed so a complete snapshot of the current situation in the world is given, while also allowing posterity to read this report and assess what each nation has done, what impact it has had, etc. | this paragraph has been revised. The sentence has been removed. Comment is no longer relevant. |
| 17023 | 1 | 16 | 28 | | | Emissions from EIT declined in the 1990s and have since levelled… IN LARGE PART BECAUSE OF THE BEAK UP OF THE SOVIET UNION (and wahtever inefficient centralized industrial policies may have | this paragraph has been revised. The sentence has been removed. Comment |
| 10470 | 1 | 16 | 28 | 16 | 33 | Sentence "Emissions …… to 1970." is out of place. Move to line 33 after "doubled." | Accepted - sentence moved |
| 10469 | 1 | 16 | 30 | | | Think this should be "Fig 1.5" not 1.6 | Figures have been changed and renumbered. Text is updated accordingly. |
| 10680 | 1 | 16 | 30 | 16 | 30 | There is a reference to a Figure 1.6 here that is not the actual Figure 1.6 in the draft (properly referenced on p17 line 8). I suspect there is a missing chart... | Figures have been changed and renumbered. Text is updated accordingly. |

|---|---|---|---|---|---|---|---|
| 17024 | 1 | 16 | 32 | | | "CO2 EMISSIONS FROM the energy ssytem have nearly tripled…" (The ernegy system itself has not tripled since 1970, ahs it? If so, fine, but it sounds like the intent of this statement is in regard to emissions, not the energy system itself. | Accepted - edited to say "EMISSIONS FROM THE energy system…" |
| 17025 | 1 | 16 | 33 | | | Simialr to previous comment - Has transport doubled since 1970? Or have CO2 emissions from transportation doubled? | Taken into account - text has been revised for clarity |
| 4890 | 1 | 16 | 34 | | 35 | [Del and Cor] "[highly] industrialized (so-called “Annex II” countries) .. in Annex II (I guess: Annex I) | Taken into account - combined with |
| 16199 | 1 | 16 | 7 | | 18 | Using %s to describe change within a gas limits ability to compare across gases--perhaps add actual values in parentheses (drawn from the charts--and/or refer reader to charts) | Rejected - chapter 1 is just an overview. For more detail you can go to sectoral chapters or to WG1 where there is a lot |
| 11404 | 1 | 16 | 7 | 17 | 26 | The effect of choosing 1970 as the starting year for looking at historical emissions becomes clear in these paragraphs - these highlight the point that emissions growth in the post-1970 period come from developing countries rather than developed countries, which could create the implication that future responsibility for emissions will then lie largely with developing countries and that, therefore, the focus for mitigation actions will have to be on developing countries rather than on developed countries. Choosing 1970 as the starting year allows the analysis to disregard the fact that the vast majority of anthropogenic GHGs currently in the atmosphere was contributed by developed countries if historical emissions between 1850 or 1900 up to the present were taken into account. | Accepted, we will be adding a figure on cumulative emissions. |
| 10828 | 1 | 16 | 8 | 16 | 8 | "higher emissions from livestock". Is this a per unit increase or do you really mean "increase in the number of livestock" | this paragraph has been revised. The sentence has been removed. Comment |
| 3882 | 1 | 16 | 9 | 16 | 9 | "oil and gas production and transmission"". What does it means transmission in this context? | this paragraph has been revised. The sentence has been removed. Comment |
| 14798 | 1 | 16 | | | | Format for reporting emission rises is inconsistent. Generally, if the Ax1 and nonAx1 breakdown is probably more informative if given as "X% of the rise has been in Ax1 and Y% has been in nonAx1" rather than "Ax1 has risen by X% and nonAx1 has risen by Y%" since the latter requires the reader to know the relative proportions of Ax1 and nonAx1 base year emissions in order to understand the implications of the reported rises in emissions. | Taken into account - these are really broad trends and the point is just to illustrate them generally. Text is revised and added a pie chart for further illustration |
| 18110 | 1 | 16 | | 16 | | The caption states that the figures show the long term trend from 1970-2009, however the figure only contains data till 2006. Caption needs to be amended to 2006. Also, is "buildings" an economic sector? Does this refer to the construction industry or something else (direct energy use in buildings?) This may need further explanation. Finally, under which category would methane emissions from landfills be captured? | the sectors reflect the breakdown in the rest of WG3. figures will be updated later |
| 4363 | 1 | 16 | | 16 | | time period (1970-2009) does not matches that of fig 5.2.3, although it is the same graph | Accepted - figures to be updated |
| 13656 | 1 | 16 | 19 | 16 | 27 | Comparison of the contribution to emissions increase by Annex-I and non-Annex-I countries has been done from 1990 even though it has been mentioned earlier that data is available in almost all databases from 1850 onwards. It is unclear why the comparison is only for the period after 1990 then. It should begin from an earlier period.(CAIT, EDGAR) | the comparisons are illustrative; we are adding a cumulative emissions chart which will help address this. |
| 18114 | 1 | 16 | 19 | 16 | 29 | a) For consistency, the increase in CO2 from 1970 should be mentioned again here as it was in lines 7-18 for the other GHGs (which reinterated the information in pg 15, lines 26 and 27).<br>b) The text write-up cannot be easily matched with the information presented in Fig 1.6. For example t is not apparent which are the "newly industrialised countries", "other developing countries", "OECD NOrth America", "OECD Europe", OECD Pacific", "Economies in Transition".<br>c) Where is the information about international transport reflected in Fig 1.6? The transport sector should arguably include domestic transport emissions as well. Also, why is international transport as a sector suddenly singled out in a paragrapgh discussing emissions from regions? More explanation on this is required in this paragraph. Is it linking it to embodied emissions, in which case this is not very clear.<br>d) Caption under Fig 1.6 should explain what OECD, REF, LAM, MAF and ASIA stand for. | Taken into account - text is revised, figure redrawn and caption expanded |

| 6509 | 1 | 16 | 30 | | 31 | Modify the description , as "Figure 1.6" dose not "look at global emission by sector". | Figures have been changed and renumbered. Text is updated accordingly. |
| 18115 | 1 | 16 | 30 | 16 | 33 | This part does not appear to be related to Fig 1.6 which it refers to and seems to be more relevant as an introduction to Fig 1.4. | Figures have been changed and renumbered. Text is updated accordingly. |
| 4364 | 1 | 16 | 30 | 16 | 17 | I assume link is to fig 1.5, not 1.6 | Figures have been changed and renumbered. Text is updated accordingly. |
| 18116 | 1 | 16 | 33 | 17 | 1 | This needs supporting data/figures or reference. | Rejected - the reference is in the figture. The text has been revised and the |
| 18112 | 1 | 16 | 7 | 16 | 18 | This paragraph discusses the source of increase of all GHGs except CO2, It can therefore be enhanced by including a discussion of the source of increase of CO2. | Rejected - the next two paragraphs discuss CO2 in detail |
| 3554 | 1 | 16 | 8 | 16 | 8 | "mainly to higher", insert "due", i.e. "mainly due to higher" | Sentence has been removed. Comment |
| 10746 | 1 | 17 | | | | Since"CO2 equivalents" is the unit used, it should be explained in the figure caption how these are calualted; e.g. emissions weighted by GWP-100. (And whether the GWPs are from AR4 or those used by the Kyoto Protocol (i.e. SAR). This applies also to figure 1.4 | Taken into account - other edits address this point in detail, which is a good point |
| 11893 | 1 | 17 | | | | The legends and captions are too small. | Figures will be re-designed for print and on-screen display for final draft. |
| 3883 | 1 | 17 | | | | Difficult to read both figures. | Figures will be re-designed for print and on-screen display for final draft. |
| 17407 | 1 | 17 | | | | Figure too small to read easily. | Figures will be re-designed for print and on-screen display for final draft. |
| 17027 | 1 | 17 | | | | The regions at the tope of each panel need to be defined on the plots themelves or in the caption | Taken into account - combined with |
| 5756 | 1 | 17 | | | | These figures are too small. Regions need to be explained prior to using the abbreviations, too. | Figures will be re-designed for print and on-screen display for final draft. |
| 10471 | 1 | 17 | | | | Text (P 16, l 35) talks of only "road transport". Is that the case for Fig 1.5? Change legend accordingly if so. Both figures mention "Energy" in their legends BUT I suspect right hand figure " CO2 energy" includes transport emissions whereas "Energy" in left figure excludes transport. Needs clarifying by changing legend terms. | Taken into account - figure covers all transport; text focuses on road transport. Text has been modified and a note added |
| 16007 | 1 | 17 | | | | text of figure not readabel | Figures will be re-designed for print and on-screen display for final draft. |
| 17026 | 1 | 17 | 1 | 17 | 2 | Should "from fuel combustion" be deleted from this last sentence? Otherwise it implies that 60% of CO2 emissions are from fuel combustion from electricity production and transportation - this sems to low to leave 40% of CO2 emissions from fuel combustion to other non-electricity and non-transportation sectors?? | Accepted - sentence revised and phrase deleted. Text added on the largest sectors comprising this share. |
| 6511 | 1 | 17 | 10 | | | Replace "The sum" with e.g. "the function" to make it correct. | Accepted, changed "sum" to "product. |
| 4608 | 1 | 17 | 12 | 17 | 12 | E is not defined | Accepted - replace C/E with C/TPES |
| 18117 | 1 | 17 | 12 | | | C/E should be C/TPES. | Accepted - replace C/E with C/TPES |
| 15250 | 1 | 17 | 15 | | | it is worth pointing out that reduced growth (the "credit crunch") is proportional to lower emissions - see point 5 | Rejected - suggested change is not needed |
| 17028 | 1 | 17 | 15 | 17 | 16 | The recession was due to more than "the credit crunch", so it is suggested that "due to the credit crunch" be deleted. | Accepted - edited to "when the global recession BEGAN TO HAVE ITS |
| 14362 | 1 | 17 | 18 | 17 | 22 | See Cline (2011, pp. 10-11) for decomposition analysis for 1990-2006 by major country. William R. Cline, Carbon Abatement Costs and Climate Change Finance (Washington: Peterson Institute for International Economics, 2011) | Accepted - cite to Cline added and text revised |
| 17738 | 1 | 17 | 19 | | | While discussing CO2/TPES - the rate of CO2 growth actually slowing, see recent IEA reports on CO2 emission. | Taken into account - the section was rewritten |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 7877 | 1 | 17 | 22 | 17 | 24 | We highly agree with this analysis ("most important driver of emissions is economic growth"). This is an important point. However, throughout the first chapter traditional DGP-growth is (more or less implicitly) affirmed by a value-laden language (growth is "sluggish" or "robust", "slow performance" in terms of growth etc.) and by statements in which GDP-growth is deemed "necessary" or investment in exploitation of fossil fuels is deemd "insufficient". If so, Working Group III affirms the main driver of emissions. Then, reaching the 2° goal is indeed not viable anymore and other options such as Solar Radiation Management become more attractive. Unfortunately, the chapter does neither mention the many well-known problems associated with and critiques of economic growth in terms of GDP (instead of many: Jänicke 2012a) nor does it mention proposals to generate/maintain prosperity without relying on tradinional growth patterns (WBGU 2011, 2012, SRU 2011). | Taken into account - this section has been revised and added cross reference to ch 5 which discusses the kaya identity more in depth |
| 15251 | 1 | 17 | 23 | 17 | 24 | see point 13 | Noted - insufficient information. No |
| 17029 | 1 | 17 | 25 | 17 | 26 | Reword after the semicolon to be more clear: "while in the last few years, emissions in emerging economies have grown much more rapidly." | Accepted - text edited |
| 14363 | 1 | 17 | 27 | | | Edit for clarity (“decreased” … “twice as much” - ??) | Taken into account - text has been |
| 16201 | 1 | 17 | 27 | | 34 | when describing a decrease that is 'good' (e.g. from negative=uptake of 1.4 to a negative=uptake of 2.7), might want to describe it as 'improving' even though the trend is increasingly negative. Readers will think negative means bad when in some cases, it represents an improvement. | Taken into account - text has been rewritten for clarity |
| 7309 | 1 | 17 | 3 | | | Waste sector is missing from sectoral estimates in this figure. | Rejected - waste is not a sector in the WG3 macro sector scheme |
| 4891 | 1 | 17 | 31 | | 32 | {Cor} in generally used terminology those are EiTs to a market economy: "underwent transition from [Soviet-style] central planning {to a market economy} [(the so-called economies in transition, or] “EIT” countries) and<br>That is:<br>"underwent transition from central planning to a market economy (“EIT” countries) | Taken into account - text has been rewritten for clarity |
| 15252 | 1 | 17 | 32 | | | not quite seeing the point here - does central planning result in fewer emissions or vice versa? | Taken into account - text has been |
| 15536 | 1 | 17 | 33 | | 34 | Why 'ultimately to the same level'? I would expect differing natural endowments to mean that there are always likely to be differences. | Taken into account - text has been rewritten for clarity |
| 14799 | 1 | 17 | 33 | | | "Slowly the … same level." This may be a premature or simplistic extrapolation, since the ultimate carbon intensity is certainly a function of domestic energy resource endowment, not merely technological "catch-up". | Taken into account - text has been rewritten for clarity |
| 12221 | 1 | 17 | 4 | | | Region names should be explained in the caption. Colour codes for different sectors and pollutants should be kept the same throughout the chapter. | Figure will be revised. |
| 9788 | 1 | 17 | 7 | 17 | 11 | Here you should make a reference to COMMONER, B. (1972): The Environmental Cost of Economic Growth. In: Ridker, R. G. (Hrsg.): Population, Resources and the Environment. Washington, DC 1972, S. 339-363, who published on this topic earlier. | Rejected - suggested change is not needed for our purposes here |
| 17408 | 1 | 17 | 8 | 17 | 26 | This analysis seems too narrowly focused for this section which addresses more than just energy systems (see categories in Fig 1.5). | Taken into account - text has been rewritten for clarity |
| 3556 | 1 | 17 | 10 | 17 | 10 | "Total emissions are the sum of…" should be "Total emissions are the product of…" | Accepted, changed "sum" to "product. |
| 13657 | 1 | 17 | 10 | 17 | 12 | Kaya identity is used for factor analysis which privileges population over all other indicators. If numbers are compared between 1850 or 1970 and 2000 however, it is seen that a high share of emissions is from countries which have had small very small shares in the total global population increase (Sattherwaite et al.) | Taken into account - text has been rewritten for clarity |
| 18118 | 1 | 17 | 10 | 17 | 11 | The Kaya Identity is Impact (CO2) = Population X income per capita X energy intensity of GDP x carbon intensity of energy OR Population x GDP/capita x Energy/GDP x CO2/energy. (Kaya 1990, Raupach 2007) The statement that total emissions is the sum of the individual forces (population, GDP and TPES) needs to be improved. | Taken into account - combined with other comment |
| 13253 | 1 | 17 | 12 | 17 | 12 | What is "E" in the ratio C/E? not explained | Taken into account - combined with |

|---|---|---|---|---|---|---|---|
| 18119 | 1 | 17 | 16 | 17 | 26 | a) Figure 1.6 does not support the information provided here which further decomposes the drivers of global emissions between industrialised and emerging countries.<br>b) Standardise reference of carbon intensity of energy throughout the document. In lines 19 and 34 for example, it is referred to as CO2/TPES while on line 10, carbon intensity is C and in line 12, it is C/E. | Taken into account - both points are combined with other edits. Text has been rewritten |
| 3557 | 1 | 17 | 27 | 17 | 28 | "…decreased to about 2%, about twice as much.." Missing minus sign, and unclear language. | Taken into account - combined with |
| 18120 | 1 | 17 | 27 | 17 | 34 | a) It is not clear how the percentage figures mentioned in this paragraph are derived from Fig 1.6 (which is indexed to 1970).<br>b) EIT has already been defined earlier.<br>C) Reference for the last sentence is required. | Taken into account - combined with other comment |
| 6510 | 1 | 17 | 8 | | 34 | Make the abbreviated symbols (e.g. (P), (G), etc.) consistent, including those used in Figure 1.6. | Figure will be revised. |
| 10831 | 1 | 18 | | | | A regional breakdown, like in Raupach et al (2007) would be good, particularly considering you discuss it in the text. | Rejected - I don't think we have the space for this, but added references to others who have done regional |
| 5757 | 1 | 18 | | | | What does "cap" mean (in "GDP/cap")? | Accepted, cap stands for capita, figure |
| 4020 | 1 | 18 | 11 | 18 | 18 | facts and figures provided in this paragraph need to be referred to relevant sources | Taken into account - will update to IEA, 2012 and provide clarification on the |
| 6816 | 1 | 18 | 11 | | 14 | These unreferenced share data are misleading and false, since they are not comparing comparable quantities (example: the primary energy of nuclear is the uranium potential, while that of renewables is - the sun? These comparisons typically look at the primary energy of nuclear power and compare it with the end-energy of renewables. Such methods / figures are used to falsely inflate nuclear and statistically lower the share of renewable energy. Using the substitution method of primary/end energy content place nuclear energy closer to 2.5 % of global supply, whole renewables as a whole stand at 18%. For a much better and comparable final-energy consumption comparison for 2009 see page 17 of REN21's Global Status Report: http://germanwatch.org/klima/gsr2011.pdf. See also http://www.europeanvoice.com/article/2012/march/blowing-away-nuclear-power/73977.aspx and http://www.eia.gov/todayinenergy/detail.cfm?id=5750 | Taken into account - text has been revised for clarity and cite added to IEA 2012 |
| 10472 | 1 | 18 | 11 | | | Assume this is global "primary" energy supply. | Accepted - edited to say global |
| 10473 | 1 | 18 | 12 | | | Change 'biofuels" to "biomass" | Rejected - suggested change is not |
| 4984 | 1 | 18 | 16 | 18 | 18 | Sentence: decline in overall share of fossil fuels from 88 % in 1990 to about 86 % . the lowest in decades. Indicate which year decline was 86 % ? | Taken into account - combined with other comments |
| 13514 | 1 | 18 | 16 | 18 | 18 | Sentence: decline in overall share of fossil fuels from 88 % in 1990 to about 86 % . the lowest in decades. Indicate which year decline was 86 % ? | Taken into account - combined with other comments |
| 5758 | 1 | 18 | 16 | 18 | 18 | Neither "renewables" nor nuclear power are zero emission electricity sources! There is no such thing as a "zero emission energy source", just the timing of the emissions is different (see LCAs of energy sources). | Accepted - edit to say "…two largest sources of ESSENTIALLY zero GREENHOUSE GAS emission |
| 10475 | 1 | 18 | 16 | | | For nuclear reduction by 0.5% need to state what accounting method used. Also lack of references in this whole section to supprt data quoted. | Taken into account - combined with other comments |
| 12515 | 1 | 18 | 17 | | | Change “zero emission” to “low emission.” “Zero emission” is a misnomer; as discussed extensively later in the draft, all generating sources have some life cycle emissions. | Taken into account - combined with other comments |
| 10832 | 1 | 18 | 17 | 18 | 17 | "zero emission electricity" does not, as far as I know, exist. You probably mean zero emissions at the power plant, but there are plenty of emissions elsewhere in mining, construction, etc. I would reword and refer to the WGIII chapter that deals with this | Taken into account - combined with other comments |
| 7879 | 1 | 18 | 19 | 18 | 20 | Please be more explicit about the relation of costs and benefits. In economic terms, if an activity is highly beneficial, the costs are outghweiged by the benefits. Then, an activity cannot be both, beneficial and costly, at the same time. Or are you referring to upfront investments? Or are you suggesting that renewable energies are more expensive than conventional energy sources? This is not correct (see comment 18). | Taken into account - edited to say "(and OVER THE LONG TERM, IF IMPLEMENTED WELL, highly beneficiaL)". |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 7350 | 1 | 18 | 19 | 18 | 24 | It is not clear that it is the potential cost of transformation that causes "many different perspectives"- where and how is this established? It would seem that diverse concepts of responsiblity and justice are large drivers of differing perspectives. Also it is not clear what it means to say that something is "costly (and highly beneficial)" - is that referring to the "benefit" of mitigating climate change or of some co-benefit? This should be elaborated further. | Rejected - this is a very controversial topic because there are many ways to view the underlying facts and options. Text is properly balanced. No action needed |
| 17031 | 1 | 18 | 19 | 18 | 24 | This paragraph gets into very murky "science" and is no longer an objective presentation of scientific findings, but rather an introduction of value judgements - which IPCC should probably stay away from. | Rejected - we disagree. See 861 |
| 10681 | 1 | 18 | 19 | 18 | 20 | Something being both costly and highly beneficial needs a bit more explaining! | Taken into account - combined with |
| 12222 | 1 | 18 | 2 | | | Consider to use colours that makes it easier to distinguish between the different indicators. Please consider to indicate the purpose of this figure in the caption (driving forces). Further PPP, TPES, cap should be explained or written out in legend. | Figure will be revised. |
| 7152 | 1 | 18 | 20 | | | Rather than use 'costly (and hightly beneficial)', maybe use 'costly, but nevertheless highly beneficial,' would be better. Nonetheless, even if the cost is high, it could also prove to be cost-effective in the long term. If so, it is a point worth making in the text I think. | Taken into account - combined with other comment |
| 15277 | 1 | 18 | 20 | 18 | 20 | "peoples" to be "people"? | Rejected - plural was intentional. No |
| 7878 | 1 | 18 | 3 | | | Of course, the energy system is slow to change. Rather than mentioning this well-known fact, the report should address that already there have been two decades of inaction and eventually discuss the reasons why this is so (lack of political will, successful lobbying of powerful stakeholders (Oreskes/Conway 2011), etc.). | Rejected - the report addresses the consequences of inaction in more detail elsewhere. No action needed |
| 9250 | 1 | 18 | 5 | 18 | 6 | But there has been rapid fuel switching in the USA - coal to gas - thus reducing emissions at some point sources? Not necessarily slow to change. And China seems to be making changes rather quickly. I think the paradigm is changing slightly; we should not be wholy pessimistic, as there is some cause for hope, even though overall emssions are rising. | Rejected - the overall system is in fact quite slow to change. Look at the data on the US which is the only place on the planet where this gas revolution is happening. IN the last 13 months we have seen a big shift in the switchable power supply (coal to gas, from 42% coal to about 33%) - but it could easily |
| 16243 | 1 | 18 | 5 | 18 | 6 | The challenge of slow change is not limited to the energy system, but includes also long-living buildings and infrastructures that create energy demand and often create lock-ins. | Rejected - that is why we use the term "energy system" rather than energy |
| 17409 | 1 | 18 | 5 | | | Again, it's unclear why focus is given only to energy systems -- this seems at odds with data presented in the chapter and also with one of the six core arguments that multiple mitigation approaches will need to be pursued simultaneously. Also, later in the page, it seems that "world emissions" are being conflated with emissions from energy systems. Greater precision seems important. | Taken into account - the paragraph has been revised for clarity |
| 10830 | 1 | 18 | 5 | 18 | 6 | A good reference here is http://www.sciencemag.org/content/329/5997/1330 | Accepted - added this cite to the end of the sentence referred to here; also, added cite to World Economic Forum Global Agenda Council White paper on |
| 10474 | 1 | 18 | 5 | 18 | 18 | This paragraph confuses "energy" with "electricity".Suggest start new para at line 13 and change "renewable energy"in line 16 to "renewable electricity". | Taken into account - The paragraph has been edited for clarity. |
| 18121 | 1 | 18 | | | | PPP (Purchasing Power Parity) should be defined in the caption. Source of data for GDP and Population should be added. | Figure will be revised |
| 8226 | 1 | 18 | | 18 | | In this section 4 perspectives (mitigation obligation, trade, per capita emissions and efficiency of the economy) are discussed. Another perspective may be added is the resource endowments or country circumstances. For example, countries in early stage of development and those are rich in natural resources tend to have more per capita emissions. Also other factors such as location (arctic vs. temperate) have significant influence on emissions. | Rejected - there are lots of perspectives. We don't have space for this. No action needed |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 17030 | 1 | 18 | | | | These are NOT perspectives on mitigation, but rather perspectives on emissions trends and they are entirely arbitrary. Why not look at emissions per km^2 or emissions per capita per kim^2 or plots of wealth transfers / trade deficits assocaited with emissions? Like earlier, this is an interesting academic exercise, but this section adds little value to the objective, policy-relevant discussion due to its arbitrary, selective frmaing. Its deletion is suggested. | Rejected - we disagree completely with this comment and have documented extensively that these different perspecitves DRIVE the starting point for diplomacy on mitigation and on policy |
| 18122 | 1 | 18 | 11 | 18 | 18 | Reference required for the information on the changes in renewable, nuclear and fossil fuel energy in total energy mix over time. | Taken into account - combined with other comments |
| 3558 | 1 | 18 | 16 | 18 | 16 | "by half a per cent." should be "by half a percentage point." | Accepted - text changed as suggested |
| 6786 | 1 | 18 | 16 | 18 | 18 | New data / evidence available: "Taken together nuclear and renewable energy sources-the two largest sources of zero emission electricity-have led to a decline in overall share from 88% to about 83.3%". Reference: REN21. 2012. Renewables 2012, Global Status Report, Page 21, Figure 1<br><br>Delete text from the above sentence: "of fossil fuels" | Rejected - cited IEA 2012. Sentence has been revised |
| 3446 | 1 | 18 | 17 | | | The assertion: nuclear and renewable energy are the two largest sources of zero emission electricity, could be relative if it is consider the CH4 emitted from dams constructed in Amazonas. See Brazil experience in accounting these emissions. | Rejected - there's a couple dams for this we know this is true (e.g., Balbina). Generalizing this globally is much |
| 13254 | 1 | 18 | 17 | 18 | 17 | Strictly speaking, nuclear and renewable are note zero emission (taking in account the whole life cycle or direct emissions, example, nuclear installation and decomission, solar PV panel making, some amount in geothermal), so it would be better to say "the two largest sources of near zero emission electricity" | Taken into account - combined with other comment |
| 13255 | 1 | 18 | 18 | 18 | 18 | It is not clear for the context, if the percentages of 88% and 86% are referred to primary energy or only electricity. | Taken into account - combined with other comment |
| 3559 | 1 | 18 | 24 | 18 | 24 | "-illustrated on four…" should be "-illustrated in four…" | Rejected - we have added a fifth and will fix grammar when we insert that extra |
| 15450 | 1 | 18 | 4 | | | Although all the four perspectives described here are useful, the rationale for the selection is not really clear. For example, the first case (AI and NAI under the Kyoto Protocol) deals with emission reduction of the whole economy in absolute terms based on country groupings (and production-based in contrast to the second case). Technically, there could be other country groupings other than the Kyoto-way and there are some other proposals (e.g. South-North Dialogue). But there is no mentioning of that. The first category seems to be about "country-, production- and historical responsibility-based emission and mitigation"; the second is "emobodied, consumption-based" emission; the third is "per capita (population-based)"; the forth is "intensity-based." It might be better categorize them by either "what emissions" or "based on what". | Rejected - the perspectives are perspectives on the strategy of mitigation, not groupings. no action needed |
| 17695 | 1 | 18 | 12 | 18 | 23 | Why not use the data for 2011 on Renewables? Also in line 23 Scientific analysis not only can help frame but must be taken into acount. | Accepted - data will be updated as it becomes available |
| 16065 | 1 | 19 | | | | Complex, too small prints, and mysterious. Even in the large IPCC report, this is not very useful. | Figures will be re-designed for print and on-screen display for final draft. |
| 8911 | 1 | 19 | | 19 | | In Figure 1.7, panel (b) the direction is not clear; i.e., what is the source (producing) region and what is the receiving region (to which commodities are exported). | All figures have been redrawn and captions revised |
| 13371 | 1 | 19 | | | | This figure is extremely hard to follow. It should be broken into its components, with each presented and discussed separately. | All figures have been redrawn and captions revised |
| 4021 | 1 | 19 | | | | this figure might require a thorough review: for example how come that all non-Annex B oil&gas exporting countries transfer less emissions than Russia? | All figures have been redrawn and captions revised |
| 11894 | 1 | 19 | | | | The legends and captions are too small. | Figures will be re-designed for print and on-screen display for final draft. |
| 17410 | 1 | 19 | | | | Figures too small to read. | Figures will be re-designed for print and on-screen display for final draft. |
| 17649 | 1 | 19 | | | | Figure - in particular country names - is hardly legible. | Figures will be re-designed for print and on-screen display for final draft. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 7351 | 1 | 19 | | | | The heading "perspectives on mitigation" is misleading - this figure merely shows emission levels using a variety of metrics, it does not suggest any mitigation levels or indication of mitigation "burden sharing." If the authors intend for this to be a presentation of ways in which to determine who should have greater mitigation responsiblity, they should also include a representation of a historical emissions, and of historical emissions per capita, and of contribution to current warming/or atmospheric concentrations. | All figures have been redrawn and captions revised |
| 17034 | 1 | 19 | | | | This data is outdated. Data throguh 2011 exists from the recent (2012) report from PBL-NEAA :Trends in Global CO2 Emissions". As stated in an earlier comment, It's unfortunate that the data used only goes through 2008 - just at the height of the recession. Some very interesting trends have emerged in the 4 years since the deepest part of the recession and it may come across as tone-deaf for a report that is to be published in 2014 to be based on 2008 data, esp when databases such as IEA, NEAA and EIA have more up-to-date emissions data. AR4 came out in 2007 and used 2004-05 emissions data, so it should follow that AR5 which comes out in 2013-14 should use 2011 data, FF CO2 data of which will be available by IEA later this year. Does the TaskForce on National Greenhouse Gas Inventories have anything to add to this data? | Accepted, data will be updated as they become available |
| 17032 | 1 | 19 | | | | Showing emissions reductions from former Soviet nations (e.g., Ukraine and Russia) from 1990 levels is misleading as broader pattersn caused the decline. If you were to start from say 1992 or 1994, you would see starkly different results that more accurately reflect the current world reality. | All figures have been redrawn and captions revised |
| 5759 | 1 | 19 | | | | I suggest to split the panels appart and divert this figure into 3 or 4. Panels a and b are too small and have no stringent, inherent connection to panels c and d. | Rejected - We are mindful that figure 1.7 is hard to read, and other comments have led us to need to create still more panels for figure 1.7. Thus we have redrawn all the figures to make them easier to read and will consider splitting |
| 11108 | 1 | 19 | | 19 | | The sub-figures are too small to read. This applies to many other figures in the draft, too. | Figures will be re-designed for print and on-screen display for final draft. |
| 16008 | 1 | 19 | | | | text of figure not readabel | Figures will be re-designed for print and on-screen display for final draft. |
| 15469 | 1 | 19 | 1 | | | Having four graphs on one figure makes it too busy. The impt points made with this figure may get lost. Suggest breaking it into 2 or 3 figures, esp as there is a long discussion of the graphs in the section. | Rejected - We are mindful that figure 1.7 is hard to read, and other comments have led us to need to create still more panels for figure 1.7. Thus we have redrawn all the figures to make them easier to read and will consider splitting |
| 7352 | 1 | 19 | 16 | 19 | 20 | Needs to clarify that "Annex I" is a list under the Convention, and the Kyoto Protocol provided for parties included in Annex I to join its Annex B with a QELRO. Currently reads as if Annex I is a category of the Kyoto Protocol alone. | Taken into consideration - edits earlier in the chapter make it clear where Annex I came from. Text here is accurate and helpful for nonexpert reader who will get |
| 10834 | 1 | 19 | 17 | 19 | 18 | Well, not all Annex I countries have targets, so this sentence is factually incorrect. | Rejected - text says "…Annex I countries that agreed to targets.." where "that" is a |
| 12223 | 1 | 19 | 2 | | | The caption is very long. Please consider to give seperate captions for the different Panels. Caption for Panel A) page 19, line 6-7. The description of the 4 colours in the caption do not match the 3 colours in the figure. Panel B is a very omportant figure, but should have been describes better, e.g. to indicate in the figure what is increase in "import"/"export". Panel C and D, region names are not fully visible. Also: please consider to give each panel a heading indicating its purpose, such as "Panel A) Trends in GHG emission" etc. | Rejected - a long caption here is needed to explain the figure. We are mindful that figure 1.7 is hard to read, and other comments have led us to need to create still more panels for figure 1.7. Thus we have redrawn all the figures to make them easier to read and will |
| 3560 | 1 | 19 | 6 | 19 | 6 | "Kyoto" should be "Kyoto protocol" | Accepted - text will be changed |

| 17033 | 1 | 19 | 6 | 19 | 7 | There are no blue bars in this panel (a), so this statement should be deleted, "Blue bars show non-Annex I countries." | Accepted - figures to be updated |
| 3561 | 1 | 19 | 7 | 19 | 7 | "non-Annex I" should be "non-Annex B". Ref. Comment no 11 above. | Taken into consideration - text has been |
| 4365 | 1 | 19 | | 19 | | fig has too many components that are printed too small, I recommend spliting | Rejected - We are mindful that figure 1.7 is hard to read, and other comments have led us to need to create still more panels for figure 1.7. Thus we have redrawn all the figures to make them easier to read and will consider splitting |
| 6513 | 1 | 19 | 16 | | 17 | Modify the description, as "mitigation obligations under Kyoto Protocol" do not appear on the panel. | Rejected - we think the sentence is correct. By dividing countries into color-coded groups based on whether they are members of Annex B under the Kyoto Protocol, we show whether they have mitigation obligations under the Protocol |
| 3562 | 1 | 19 | 17 | 19 | 17 | "Annex I" should be "Annex B". Ref. Comment no 11 above. | Taken into account - combined with |
| 18125 | 1 | 19 | 17 | 19 | 20 | Fig 1.7a shows Annex B and non-Annex B as per the Kyoto Protocol listing of countries with and without obligations. While the characterisation in terms of Annex 1 and non-Annex 1 is not incorrect (as per the UNFCCC), to avoid confusion for the reader, it may be best to refer to these groups of countries consistent with how it appears in the figure. | Figure will be revised. |
| 6512 | 1 | 19 | 6 | | 7 | Modify the description, as "Blue bars" do not "show non-Annex I countries". | Taken into consideration - text has been |
| 18123 | 1 | 19 | 6 | 19 | 7 | a) Reference to Blue bar showing non-Annex 1 countries to be deleted as line 5 says non-Ammex B countries are shown in red.<br>b)The names of the countries in Figures 1.7c and d are not clear - they can either be presented at an angle to fit the entire name, or a key should be provided with the full names. | Accepted, figure and caption will be revised. |
| 18418 | 1 | 2 | | | | It is right when it says that climate mitigation is bigger than climate policies. I have two objections though (pag 2 paragraph 5): first, sustainable development (SD) and green economy (GE) are clearly convergent with mitigation, but energy security it is not: that difference is not clear. Second, how many national governments are actually investing in green economy and SD?<br>I think the tone of the summary is excessively optimistic, and does not accurately acknowledge the gap between science and policy. □ | Taken into account - portions of the text has been rewritten for more balance |
| 18407 | 1 | 2 | 12 | | 12 | The concept of sustainable development arose 1980/ 81 , not with the Bruntland Report. See AR4 WGIII, Chapter 12 Sustainable Development and Mitigation | Taken into consideration - there were LOTS of ideas related to this for decades prior, but Brundtland crystallized it. The |
| 17794 | 1 | 2 | 13 | 15 | | And possibly have multiple benefits simultaneously (economy, social, environmental, health, ect) | Taken into account - combined with other comments. No further action |
| 7153 | 1 | 20 | 1 | | | Replace 'an' by 'a'. | Accepted - text changed |
| 3605 | 1 | 20 | 1 | 20 | 1 | Please add in brackets "(including Canada and the US, the total emission reduction target was 5.2%)." | Rejected - this is too much detail for here |
| 10835 | 1 | 20 | 1 | 20 | 1 | Where did the 4.2% come from? Article 3 of the KP states "with a view to reducing their overall emissions of such gases by at least 5 per cent below 1990 levels in the commitment period 2008 to 2012" | Taken into account - If we exclude USA, Canada and Turkey (Turkey has no numerical target under the Kyoto Procotol), base year emissions are 12,055,187 tCO2e and target emissions |
| 17035 | 1 | 20 | 1 | 20 | 5 | It might be worth discussing how the EU cut their emissions between 1990-2005 (and have since stabilized), whereas others - like the U.S. - have cut their emissions post-2005. | Rejected - this is too much detail here |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 4022 | 1 | 20 | 11 | 20 | 13 | suggested wording: "The big decline in Ukraine's and Russia's emissions, for example, reflect the collapse of their economies in the early 1990s in the aftermath of the desintegration of the Soviet Union in 1991." (Reason for correction: In fact, there has been no major "restructiring" since then. Unless the authors imply almost total elimination of some high-tech industries with marginal emissions.) | Rejected - Getting into this level of detail may create problems about getting the exact details of which sectors changed when and we don't have space for that level of detail here. Also, getting into those details takes the topic away from the purpose of our chapter. There is no doubt that some of this is economic collapse, but a lot is restructuring, there |
| 14801 | 1 | 20 | 12 | | | "Russia, Ukraine, EU+12, and part of EU15 (former East Germany)." | Taken into consideration - text edited to say " The big decline in Ukraine, Russia, the 12 new members of the EU (EU+12) and one of the original EU members |
| 7880 | 1 | 20 | 13 | 20 | 16 | These lines seem to be based on the stage model of economic development from W.W. Rostow (1960). If such a model is presumed here, it should be stated explicitly. | Rejected - they aren't fully based on the model, so adding a Rostow cite here would not be fully appropriate for what |
| 4470 | 1 | 20 | 17 | 20 | 28 | This paragraph is incoherent and internally inconsistent. Many of the countries that have ratified Kyoto are not meeting their Kyoto obligations, and others have not ratified Kyoto. Countries can't both be "selective" and compliant at the same time. | Noted - in fact, that is exactly the point. Countries select which obligations to join and then they "comply." That's the key insight of Downs et al (which we cite) |
| 4857 | 1 | 20 | 17 | | 28 | The purpose of the lamentation on various interpretations is unclear; it would be better to avoid .. | Noted - suggested action by commentor is not clear. We simply offer that there are many ways to interpret the trends in |
| 7353 | 1 | 20 | 17 | 20 | 28 | It is not clear that this is "the message" of that panel. Nor is the importance of CBDR an "intepretation" in the same sense that "countries have complied with their targets" is an observation, and it is not clear why they are described as "alternate" interpretations, when they could easliy be complementary. | Taken into account - when we add a cummulative perspective then CBDR will be beefed up. No further action is |
| 14802 | 1 | 20 | 18 | | | eliminate "big" | Accepted - changed "big" to "some" |
| 11896 | 1 | 20 | 18 | 20 | 18 | Harmonize the use of "Kyoto treaty", "Kyoto" as "Kyoto Protocol". | Accepted - text changed as suggested |
| 11895 | 1 | 20 | 2 | 20 | 4 | Move this statement to the caption of Figure 1.7. | Rejected - our view is that this point is so important to accurate understanding of what kyoto does (see for example the Peters comment about where the 4.2% |
| 14804 | 1 | 20 | 20 | | 24 | It is not clear how this is a fitting illustration of common but differentiated responsibilities ("and respective capabilities"). This inference would require comparing the magnitude of the action required of a Party to its responsibility and capability, which is not reflected in this chart. This inference is further blurred by the fact that other effects played large roles: UK dash to gas, soviet collapse, and recession/financial crisis in particular. | Taken into account - We think the allocation of QELROs to developed countries is a fitting illustration to that point. Also, we are adding a fifth perspective on historical emissions. No |
| 14803 | 1 | 20 | 25 | | | eliminate "strict" | Accepted - removed "strict" |
| 17036 | 1 | 20 | 25 | 20 | 28 | This statement may cause offense to some nations whose domestic circumstances preclude comprehensive actions desired by certain branches / entities wiithin their governments. Everything after the semicolon on l25 should be deleted as it is not a constructive addition to the text. | Rejected - we are mindful that this statement may cause offense but it is correct and scientific. Other topics may cause offense to other countries but we |
| 15253 | 1 | 20 | 26 | 20 | 28 | this seems most obvious? | Noted - lots of other comments point in the oppposite direction. Insufficient |
| 16066 | 1 | 20 | 29 | 20 | 37 | True, linking trade and emissions is key. Maybe link this paragraph with parts of the report relevant to (1) indirect and sectoral emissions (2) international negociations | Noted - insufficient information. No action needed |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 12224 | 1 | 20 | 29 | 20 | 31 | Is it always the case that are allocated to the country where they occur, one example is international transport. | Taken into account - text in the paragraph has been revised. Also, revised second sentence to say "nearly all of the statistics presented in this |
| 9463 | 1 | 20 | 29 | | 37 | Indeed! Chapter Eleven would benefit from explicit discussion of this priority. It mentions the challenge, but does little to examine frameworks that seek to internalize emissions from trade (i.e. the California LCFS and the US RFS). | Noted |
| 17038 | 1 | 20 | 29 | 20 | 37 | Unusual weight is given to a single study throughout this section (the Peters et al 2011 study). It is merely one framing and one that has not gaiend traction in the practical world of international negotiations. As a result, it's unusual influence, persistence and recurrence throughout this Chapter is inappropriate. For example, there is also the Chakravarty article in PNAS (2009) on sharing glboal CO2 emission reductions among 1B highest emitters. Neither paper deserves to be the source of a single framing | Taken into account - The Peters et al study is about trade. The Chakravarty et al study is about per-capita assignments (largely ignoring trade but indexing on economic prosperity and explicitly avoiding national accounting). But adding the other per-capita perspective is important. Two points here: First, on trade, we are illustrating this with one study because we can only use one figure. Second, on per-capita we add a sentence at end of paragraph: "Other |
| 4858 | 1 | 20 | 32 | | 33 | Avoid one-sided evaluation. There is another side of the coin, too: the fundamental demand by China to maintain econ. growth (for higher living standards for its people) and the partially export-oriented national steel industry is part of meeting that demand. So: common (coupled) but differentiated demands .. | Taken into account - cross reference to section 1.2.1.2 on macroeconomic situation discussion on embedded |
| 17037 | 1 | 20 | 32 | | | While the emissions are "embodied" in products that are exported, the economic benefit of those emissions go to the producing nation. This very important aspect cannot and should not be overlooked/glossed over. In theory, producing nations *could* increase prices to produce consumer goods via clean energy. | Noted - This is true to some degree, but so do the local externalities. Our point is not to get into those weeds here. |
| 7155 | 1 | 20 | 34 | | | Remove unnecessary paranthesis. | Accepted - deleted parenthesis |
| 17039 | 1 | 20 | 35 | 20 | 37 | This final statement of the paragraph is a total value judgement and IPCC should NOT be in the business of making value judgements. This is a pervasive problem in this Chapter. Calling for the incorporation of trade into a process that is already gridlocked (as stated earlier in the Chapter) would NOT be a productive policy-relevant recommendation. | Noted - it is not total value judgment, but is a direct logical extension of the argument. This sentence has since been deleted in editing. |
| 14805 | 1 | 20 | 37 | | | "… trade rules, and the consideration of embedded carbon when assessing possible meanings of "common but differentiated responsibilities and respective capabilities". | Rejected - too much detail that obscures the main point here |
| 4859 | 1 | 20 | 38 | | 47 | Besides consideration of per capita emissions another essential factor is the consideration of the "historical emissions" – which is not illustrated on the panels, however, these are also of key importance for scientific and political assessments of the mitigation. | Taken into account - we are adding this perspective. |
| 7882 | 1 | 20 | 38 | 20 | 47 | The paragraph fails to mention the significant differences in per-capita emissions within the group of developed countries. This difference should not go unmentioned because it highlights at least to important points: first, a high level of prosperity can be reached with substantially lower per-capita emissions than in countries such as Australia or the US; second, it points to different responsibilities for the impacts of climate change (see chapter 3.3). | Rejected - there are LOTS of things this paragraph doesn't mention. But the data are in the figure so we don't need to do this. We need to be careful in adding more text, for example, on per capita emissions as this might overly endorse |
| 7354 | 1 | 20 | 38 | 20 | 47 | It is noted with "interest" the diversity within categories (i.e. between countries in A1 or NA1) but the difference between Annex I and Non-Annex I is not commented on; it appears remarkable that the highest per capita emissions by country of non-Annex I are not much more than the highest per capita emissions of Annex I. Further, the highest per capita emissions come from Korea, a country that is particularly unique within the Annex distinction, due to its membership of the OECD. | Noted - no clear action suggested |
| 7881 | 1 | 20 | 39 | 20 | 40 | Again, the stage model seems to be presumed. | Taken into account - combined with |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 3884 | 1 | 20 | 4 | 20 | 6 | I understand a few words about the EU economic crises should be mentioned here, as a driver for CO2 mitigation success | Rejected - It is hard to comment on that right now it is still playing out. Solid literature on this is still missing so we |
| 4471 | 1 | 20 | 41 | 20 | 42 | This sentence is unwarranted. Quantitative information by itself cannot provide a justification for any particular scheme for allocating emissions reduction obligations or emissions rights. Any such allocation has to be the result of negotiations, and may take account of various criteria such as historical emissions, capacity, the possibility for "leapfrogging" over carbon-intensive technologies in the course of rapid development, and most importantly, national interests. Allocation along lines of population (does this mean per capita allocation?) is one possibility, but can hardly be considered either a scientific or consensus position. | Rejected - this is not what we are saying. We are saying if you take this perspective THEN that's the logical implication. -- the text has been revised for clarity |
| 7883 | 1 | 20 | 41 | 20 | 41 | Here might be a minor mistake. Do you mean "emission reduction obligations" instead of "emission obligations"? | Taken into account - edited to say: "emission CONTROL obligations" |
| 17040 | 1 | 20 | 41 | 20 | 42 | This third perspective does NOT suggest that emissions obligations be allocated along lines of population! It's tone deaf to the reality ofg moving people and goods within sovereign border of vastly differing sizes and across vastly different landscapes. Again, these perspectives - this section - is nota constructive contribution to the report and should be deleted. | Rejected - See 945. We disagree. The literature and concepts need to be reviewed. |
| 17650 | 1 | 20 | 43 | 20 | 44 | In Figure 1.7, there is explicit example of one of the least developed countries, thus the figure also does not show differences among them. | Accepted. Figure and discussion will be revised. |
| 14806 | 1 | 20 | 44 | | | replace "state of the economy" with "income per capita" | Rejected - text is ok as is. No action |
| 14364 | 1 | 20 | 48 | | | Need to clarify whether using purchasing power parity GDP or market exchange rate. | Taken into account - clarified text in the caption to figture 1.7, panel D. |
| 14807 | 1 | 20 | 48 | | | "efficiency" is an inappropriate term here. It is clearly more than simply efficiency, as subsequently stated in the same para. It is also a measure of resource endowment, economic structure (agri/industry/service), state of development (which determines rate of investmentin infrastructure), etc. | Rejected - it is a measure of lots of things, including prices. The overall crude indicator, though, is efficiency-- |
| 14800 | 1 | 20 | 5 | | | The phrase "exceed their target" is ambiguous. (Emissions exceed their targeted emissions, or reductions exceed their targetted reductions?) | Taken into account - edited sentence to say: "FOR 2008-2012, THE COUNTRIES THAT JOINED THE KYOTO PROTOCOL AND ADOPTED |
| 7154 | 1 | 20 | 5 | | | The antecedent of 'they' is unclear. Do you mean 'Canada and the US' or the 'other Annex I countries'? | Taken into account - combined with |
| 13372 | 1 | 20 | 7 | 20 | 8 | The comment is made that countries will be unable to meet their emissions targets without also engaging in a degree of emissions trading and purchasing credits internationally. Given the faith in these markets and mechanisms, it is hard to see this as problematic without a further explanation why this might be so. | Noted - The point is really just about collective effort and dealing with shortfalls. See edits per 952 |
| 11721 | 1 | 20 | 9 | 20 | 11 | Everyone can understand the meaning without this sentence and all anex I countries are making efforts to meet their target by using Kyoto mechanism. So,there is no need to pick-up the indivisual country's case. | Accepted - deleted the sentence. But it is important to note that power companies that cannot comply with their own target do not have extra money to |
| 9494 | 1 | 20 | 9 | 20 | 11 | delete this sentence - Japan is making effort to meet 6% cut and CDM credits is acceptable system by Uns | Taken into account - combined with |
| 9357 | 1 | 20 | 9 | 20 | 11 | The example of Japan should be deleted because Japan contributes to the reduction of CO2 through the CDM project, from which Japan get the credit. | Taken into account - combined with other comment |
| 18429 | 1 | 20 | | | | perspectives on mitigation<br>The interpretation done regarding KP is far too optimistic (pag 20 paragraph 2) | Rejected - other comments say the opposite. I think balance is ok here |
| 18126 | 1 | 20 | 40 | | | The perspective on how per capita emissions depicts differences in stages of development requires elaboration. Alternatively, this perspective can be limited to the difference in sizes of populations in countries. | Rejected - this is an overview chapter-- we don't have space for this. But, sentence is edited for clarity: |
| 6514 | 1 | 20 | 42 | | 44 | Modify the description, as "the least developed countries" do not appear on the panel. | All figures have been redrawn and descriptions and captions revised |

| 17044 | 1 | 21 | | | | This plot should NOT be replaced with a chart showing mitigation gaps. Such a plot cannot capture the ineherent, vast uncertainties of such an analysis. A detailed explanation of why such a presentation is unwarranted follow: • Even before you look at scientific uncertainties, the political uncertainties leave a range of 18 Gt CO2e (i.e., 3 Gt gap in case 4 vs. 21 Gt gap in BAU).<br> Note, these numbers were updated in the Bridging the Emissions Gap report to be 4-16 Gt, showing how fluid our knowledge is of this science<br><br>• Even if the political realities could be confined to a single “case”, you’re left with a range of close to 5 Gt – or more than 10% of current global emissions.<br><br>• But let’s accept that we could confine the pledges to a single case. Where would the science leave us?<br><br>• 2°C is a very nebulous goal given the propagation of uncertainties that occurs when going from emissions to atmospheric concentrations to transient / equilibrium temperature change.<br><br>• Many studies have made informed predictions, but it remains an awfully challenging parameter to quantify accurately. As a result, the level of emissions reductions called for under a “2°C scenario” may actually only limit warming to 3°C… or – there’s an equal possibility that that same amount of emission reduction would limit warming to only 1°C.<br><br>• In general there are three critical scientific / objective / analytical aspects to the 2°C goal and the idea of an “emissions gap” that really make it unworkable from an operational standpoint.<br><br> Uncertainties in quantifying emissions.<br> Uncertainties in the carbon cycle (i.e., translating emissions to concentrations)<br> Uncertainties in Earth’s climate sensitivity (i.e., translating atmospheric concentrations to a temperature change)<br><br>• As a recent study by Chinese scientists published in Nature Climate Change demonstrates, we are still woefully inaccurate in our ability to consistently and accurately report emissions.<br><br>• The Guan et al. study found that in China alone, an emissions gap of 1.4 Gt existed in 2010 between the nationally-reported emissions and the aggregation of provincial level data – an uncertainty of 1.4 billion tons of CO2 – roughly equivalent to half the 3 Gt gap in case 4.<br><br>• In other words, more accurate reporting from one nation could close the emissions gap by 50%(!).<br><br>• Along these lines, estimates for cumulative carbon emitted to date, globally, range from about 400 to 700 Gt. | Figure will be redrawn. -- we are going to defer to IPCC WG3 chapter on modeling and look at gaps related to many different goals. |
| 14365 | 1 | 21 | 1 | 21 | 5 | What about the question of whether energy subsidies are causing excessive use of energy per unit of GDP that cannot be justified by high ratio of goods (and manufacturing) to services sector associated with lower per capita income? | Taken into account - a good point. Sentence at line 1 edited to say: "primary processing using energy intensive methods OFTEN REINFORCED WITH SUBSIDIES |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 15537 | 1 | 21 | 10 | | 22 | An important issue that should be mentioned here is that national planning aspirations often envisage more rapid growth than do the BAU modelling assumptions. If the planners are right, then the outlook is more difficult still. As the Blanford et al piece in EMF22 suggests, it is not clear that BAU projections have taken on board the rapid growth of Asia since the 1990s. | Rejected - The Blanford et al (2009) paper is clear. However the paper was published in 2009 and global economy, including China and India, are still struggling. If we adopt this comment, that may invite many comments arguing the paper was writen more than 3 years |
| 17043 | 1 | 21 | 13 | 21 | 15 | The EMF22 is NOT the most recent study. IEA's World Energy Outlook 2012 (due out in Nov) has 3 scenarios and will be the most recent effort. Even last year's WEO2011 is more recent than the EMF22 effort. | Rejected - IEA is a single model study. EMF's strength is multimodel comparison. Edited the sentence to say: |
| 12910 | 1 | 21 | 13 | 21 | 21 | the results of EMF22 are the latest published right now. However, EMF27 is about to be published and some of the draft numbers even are used in this FOD in other chapters. EMF27 gives a much more optimistic picture with repect to achievability of low emission targets. Chpter 1 should reflect this saying that EM22 shows that is difficult , meanwhile we are more optimistic (albeit the task still being a difficult one). If emf27 is not mentioned in chapter 1 we run into inconsistencies because it will be used in other chapters! | Accepted, data will be updated as they become available |
| 7156 | 1 | 21 | 14 | | | Remove unnecessary paranthesis. | Editorial – copyedit to be completed |
| 2154 | 1 | 21 | 16 | 21 | 18 | This is the sentence which will become the press headline (linked to my comment above on the central question is "can we achieve 2°C?"). The press will state "IPCC says 2°C is not achievable". If the IPCC really comes to this harsh conclusion, you need to triple think about it. I do not think so. Yes, the chances are small, but not impossible - in my view a neutral picture should be drawn which shows hope, as well as the need to act. Specifically, my suggestion is to consider a picture with a RANGE of BAU trajectories on the top, and a RANGE of maximum possible mitigation pathways at the bottom. In a separate exhibit you can then compare the "mitigation range with the 1.5 / 2.0./ 2.5 etc RANGES of temperature stabilization | Taken into consideration - the whole section has been rewritten to be more clear about our intentions that achieving the goal will be challenging but not impossible |
| 17046 | 1 | 21 | 18 | footnote | | The footnote should specify that this is "above pre-industrial levels". | Taken into account - This paragraph has been rewritten for clarity and the footnote |
| 16067 | 1 | 21 | 2 | 21 | 8 | Not very helpful. Is it something that will be precised by research ? By improved international accounting and date collection? Or just not knowable? | Noted - There are various perspectives and we simply offer a few. Here we discuss the typical stages of development and offer the logical |
| 7885 | 1 | 21 | 21 | 21 | 22 | The statement "a Herculean task" is value-laden and misleading. With the technologies available today Germany can genrate 100% of its electricity with renewable energy sources by 2050 (SRU 2011). Thus, the taks is not so much Herculean in any technical meaning although it might be so in terms of political feasibility (see comment s19 and 26). This, however, is an important difference. This difference is brought out well in chapter 6. A reference to and eventually some key messages of chapter 6 should be included. | Taken into account - a good point. Section has been rewritten to more accurately reflect our message |
| 12909 | 1 | 21 | 21 | 21 | 21 | value judgement: "Herculean" should be avoided! | Taken into account - combined with |
| 12225 | 1 | 21 | 24 | | | Y-axix should read Gt CO2/yr not Gt/CO2. It should be included in the caption that this figure picture the BAU emissions, and is without further measures. | figure will be replaced |
| 4860 | 1 | 21 | 29 | 22 | 22 | Some clarity would be needed since the EMF scenarios are on fossil and ind. CO2 while references to the pledges (gaps) and to the ppm-ranges (for 2C) are for CO2e | EMF 22 is based on CO2e. Fig. 1.8 focuses on Energy related CO2 only to make it consistent to Table TS2 cited in Bali Action Plan. Figure will be redrawn. |
| 7355 | 1 | 21 | 29 | 21 | 30 | This says "at least in half" when above it says "most of those scenarios were based on emission controls that envisioned a 60% reduction" these are quite different and it does not seem appropriate to "downplay" the depth of cuts necessary later in the section. | Rejected - This comment is incorrect. Here we are talking about what IPCC AR4 showed. The previous paragraph describes about EMF 22. The figure will |

|---|---|---|---|---|---|---|---|
| 17045 | 1 | 21 | 29 | | | There's a more recent body of literature than AR4 on this topic. See the work of Rogelj, Meinshausen, etc. | Rejected - Of course--but one of the purposes of AR5 is to comment on what was said in AR4 and what has changed; so this statement MUST STAY so that |
| 15452 | 1 | 21 | 29 | 22 | 12 | For the purpose of being comprehensive, it would be better to have a reference to UNEP study on the "gap" (UNEP (2011) Bridging the Emissions Gap. UNEP) because the study is a synthesis report of existing studies. | Taken into account - combined with other comment |
| 15254 | 1 | 21 | 3 | 21 | 5 | this too seems good policy! | Noted - no action needed |
| 17041 | 1 | 21 | 3 | 21 | 5 | Allocation Emissions obligations is not the business of the IPCC. Making value judgement statements like this may have a detrimental effect on the integrity of the IPCC. These concluding statements in each of these paragraphs ought to be deleted, if the entire section is not deleteed altogether. | Taken into account - combined with other comment |
| 11897 | 1 | 21 | 4 | 21 | 4 | Avoid to use "should". | Rejected - "should" is ok because the beginning of the sentence says "From |
| 7884 | 1 | 21 | 5 | | | We do in not oppose improvements in energy intensity. Still, what matters with repsect to mitigating climate change are absolute and per capita emissions. Low intensity goals alone will not lead to any meaningful reduction in emissions as is well demonstrated by figure 1.6. | Noted -- no specified action suggested |
| 8912 | 1 | 21 | 6 | 21 | 7 | There is something wrong with this sentence, too many "interpretations". | Accepted - edited sentence to say: "well, WITH VARIED IMPLICATIONS FOR POLICY STRATEGIES AND THE ALLOCATION OF BURDENS AND |
| 3885 | 1 | 21 | 6 | 21 | 7 | "Still other interpretations are possible as well, and the exact interpretation of what explains these interpretations has large implications for policy".. Please improve wordings to express your view. | Taken into account - combined with other comment |
| 17042 | 1 | 21 | 6 | 21 | 8 | This statement more or less implies that this entire section is all relative, subjective and attempting to be prescriptive. As a result, this section should be deleted. | Rejected - this comment is incorrect. Sentence has been revised per previous |
| 9216 | 1 | 21 | 9 | 22 | 35 | It should be notd that the "concentration stabilization" is not a likely future and this has implication on the scale of emission reductions. In (T. Matsuno, K. Maruyama and J. Tsutsui “Stabilization of atmospheric carbon dioxide via zero emissions-----An alternative way to stable global environment”. Part 1 and 2 In Proceedings of Japan Academy Ser. B, Vol. 88, No.7 (July, 2012),p 368-395.), the authors critically examine the traditional “stabilization” concept in which the atmospheric CO2 concentration and corresponding temperature are held constant for many centuries to a millennium. They claim that such long-term constancy of concentration and temperature is not a likely future state. Instead they propose “zero-emissions stabilization” in which emissions will be diminished close to zero, and after that the concentration will decrease approaching the final equilibrium state for which the temperature rise can be made much lower to avoid the risk of sea level rise. Another advantage of the zero-emissions stabilization strategy is that emissions in the near future can be made larger compared with ordinary stabilization pathways under the same temperature rise constraint. This would be beneficial to respond to current socio-economic needs. These points are shown by simple model calculations for illustrative cases. | Rejected - This comment should be addressed to WG1or to WG3/Ch. 6. This paper raises the important issue whether the world can tolerate to delay the timing of stabilization, for example at 450 ppmCO2e level, for another century or centuries in comparison to generally anticipated. This is beyond chapter one's mandate. |
| 3447 | 1 | 21 | 1 | 21 | 2 | An additional argument justifying that emissions of greenhouse gases are higher in emerging economies, is due to the relocation of highly polluting firms from developed countries into developing countries. Maybe a comment on this issue should be mentioned in the document. | Rejected - this is exactly why we added the "embodied emissions" perspective. No action needed |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 4366 | 1 | 21 | 2 | 21 | 8 | Pannel B of Fig 1.7 suggest that «mature» economies have seen part of their industry related emmissions transfered to developping economies, so how much more carbon efficient economies really become as they mature when emission transfers are accounted for. What is the contribution of those emission transfers to meeting the Kyoto objectives, compared to “real” emission reductions ? | Rejected - the piece we cite (Peters et al) deals with this in detail, and one implication is that OECD countries haven't made much progress. UK emissions are down 20% but embodied emissions pretty much offset that cmopletely. That's the implication. If we go too far down the road of spelling this out in the text then some reviewers |
| 6515 | 1 | 21 | 4 | | 5 | Modify the description after "and", taking into consideration that a rapid transition of a developed country to low emissions can lead to importing more GHG emissions embedded in trades from developing countries and promote GHG leakage to such developing countries, as suggested in section 5.5.4. | Rejected - this edit not needed because exactly this general point (if not the details) is in our treatment of embodied |
| 3563 | 1 | 21 | 6 | 21 | 7 | "…exact interpretation of what explains these interpretations…" unclear and bad language. | Taken into account - combined with |
| 18130 | 1 | 21 | 6 | 21 | 7 | Needs rewording. For example, the word interpretation appears thrice in this sentence. | Taken into account - combined with |
| 14808 | 1 | 21 | | | | This section is quite difficult to follow. The text seems to confound BAUs with mitigation scenarios. It does not make sense to show a set of 11 BAUs shown and state "BAU projections such as in Figure 1.8 are wildly at odds with those ambitions and global emissions continue to ncrease" ... is this not true simply by virtue of the fact that these are BAUs, not mitigation scenarios? | The commentator misunderstood the text and the figure. The text and figure has been revised |
| 14810 | 1 | 21 | | | | This section is focused on making the case that meeting the 2C target would be exceedingly challenging, which is undoubtedly true as has been evident for quite some time. However, as presented, this section appears to be presenting a case for relaxing this exceedingly challenging target. What is not discussed, but is equally relevant to such a decision, is whether it would also be exceedingly challenging to MISS the 2C target? That is, what demands and pressures would be put on societies to bear the impacts of a higher level or warming? Not only is there no basis provided in this section to suggest that meeting the 2C target would be less challenging than missing the 2C target, but the text does not even raise this as the relevant comparison to make. | Noted - WG3 is about mitigation centrally, and the exact role for adaptation (and bearing impacts) is unclear to us. Thus we have added a discussion of adaptation near the end of the chapter. Talking about the cost of 2 degrees on societies is more of a WG2 topic but we have added a sentence highlighting the challenges of missing |
| 4367 | 1 | 21 | | 21 | | A figure model outputs showing that targets are not achievable would be more interesting | Noted - that is exactly what we are doing. Figures will be redone. |
| 13658 | 1 | 21 | 10 | 22 | 12 | The entire section draws from projection of emission trajectories for the future, which are based on business as usual scenarios. This is a high uncertainty methodology as the nature of the the BAU trajectories is counter-factual and mitigation efforts are highly sensitive to the assumption of a BAU trajectory. Why have other approaches (budget approach – Meinshausen et al) not been used to measure the scale of the mitigation effort required, as it provides a more concrete basis to gauge total available carbon for the future. □ | Taken into account - The budget approach isn't any more helpful--there is no way to escape the need to look at BAU-like projections and the "gap" between likely and desired trajectories. This section has been rewritten for clarity |
| 8227 | 1 | 21 | 16 | 21 | 18 | It is not clear if the targets are not achievable even with mitigation actions? Please clarify. | |
| 6869 | 1 | 21 | 16 | 21 | 18 | Please check definition of Climate Sensitivity in the Glossary. We suggest to stick very closely to this Glossary definition. E.g., here the equilibrium component of the formal defintion is missing. The Glossary definiton reads: "In IPCC reports, equilibrium climate sensitivity refers to the equilibrium change in the annual mean global surface temperature following a doubling of the atmospheric equivalent carbon dioxide concentration." | This section has been rewritten for clarity. No further action needed |
| 13256 | 1 | 21 | 19 | 21 | 20 | the expression "small majority" is contradictory. What it is intended to be said? That a small portion of scenarios will find the target achievable, or that a majority of scenarios will find the target achievable? | Taken into account - This section has been rewritten for clarity. we will add text '8 among 14 scenarios', and also add 'in case of delayed participation, 2 out of 14 |
| 17728 | 1 | 21 | 21 | | | replace the phrase "a Herculean task" by "an increasingly difficult task as actions are delayed" | Taken into account - this section has |
| 6870 | 1 | 21 | 29 | 21 | 29 | Which part of AR4? Need to provide specific references to previous IPCC reports. | Taken into account - figure and discussion on the figure has been |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 15451 | 1 | 21 | 9 | | | It would be useful to view the challenge from the perspective of cumulative emissions up to 2050, too, as described in Meinshausen et al. (2009) Greenhouse-gas emission targets for limiting global warming to 2 ºC. Nature. 458: 1158-1163 (doi:10.1038/nature08017). For example, the paper says having emissions by 2050 results in 12-45% probablity of exceeding 2 ºC (assuming 1990 level as the base year, though). To keep the probability below 25%, the cummulative emissions must be less than 1,000 Gt CO2. This way of thinking would add another useful insight to the discussion and it is worth mentioning. | Taken into account - Here discussions are based on the best estimate of climate sensitivity of 3 degree C. Meinshausen's paper deals with the broad range of climate sensitivity (2-4.5 degree) and this point has been dealt with separately in our text. See page 22, lines 13-17. This description will be |
| 10779 | 1 | 21 | 9 | 22 | 12 | This statement is so strong that it should be part of the summary of the report. It says, in simple English, that warming control is nearly hopeless. The author, though, softens the writing with the weak word "challenging..." | Noted - section has been rewritten |
| 4861 | 1 | 22 | | | | 1.4.1 It could also be mentioned, that many of these priorities, goals (MDGs and climate change mitigation and adaptation related goals), and the means to achieve those are interrelated to some extent.( Such interrelations should be taken into account with reconciling the priorities.) | Noted - This is what we wrote in this section. Also for interaction between mitigation and adaptation, refer to 1.4.5. |
| 14366 | 1 | 22 | 10 | | | Cline (2011) sees mitigation capable of staying within the 2 degree limit as cutting per capita emissions to 1.4 GtC02 b 2050, not 1.1. | Taken into account - Section has been rewritten. Added cite to Cline and Yamaguchi et al (see comment 1008) |
| 11722 | 1 | 22 | 11 | 22 | 12 | Yamaguchi et al says [the feasibility of the 2 degree target is too slim, if not possible]. So [1 degree or 1.5 degrees would be extremely challenging] is more apropriate expression.<br>1.Yamaguchi et al.:[Climate change mitigation,P23], send attachment by another e-mail. | Taken into account - combined with other comment |
| 10637 | 1 | 22 | 11 | 22 | 12 | Yamaguchi et al says that "the feasibility of the 2 degree target is too slim, if not possible". So it is better to express that "1 degree or 1.5 degrees would be extremely challenging".<br>Yamaguchi et al Climate change mitigation will be sent be email later. | Taken into account - combined with other comment |
| 17048 | 1 | 22 | 11 | 22 | 12 | Reword this setence to be more clear: "By logical extension, limiting warming to 1 degree or 1.5 degrees is even more challenging [and prehaps even impossible given emissions lock-in, etc.]" | Accepted - text changed as suggested |
| 9971 | 1 | 22 | 11 | 22 | 12 | This part should be revised into "is extremely challenging". The 1.5 ℃ target is not realistic and even 2℃ target is extremely difficult to attain, as described in (Höhne, 2011, conclusion) and (Rogelj, 2011, abstract). These literatures are listed in the No10 line of this table. | Taken into account - Rogeli et al. discussed the gap (see 981). Added after 'target' in line 4, p. 22, '(den Elsen |
| 16068 | 1 | 22 | 12 | 22 | 12 | Noun missing | Taken into account - combined with |
| 16202 | 1 | 22 | 13 | | 17 | uncertainty bit is not clear. What is the point? Point is not made; be more direct. | Taken into account - text has been revised for clarity but basic concept remain unchanged. Meaning is quite |
| 9926 | 1 | 22 | 14 | | 18 | The Unit for concentration is inconsistent in the context. Ppm and Ppm CO2e are all used, but the difference is not stated. | Rejected - We use the unit accurately. Only when we indicate concentration of CO2 only, we use ppmCO2. When it |
| 16069 | 1 | 22 | 18 | 22 | 22 | "Exceptionally difficult if nor impossible" is not acceptable without a qualification such as "in the present state of play" or "with the policy instruments presently on the table". If the political goal of Nations is indeed 2°C, then other instruments should come in play such as banning most plane transport or limiting drastically the use of individual cars. Thus the construction of this paragraph is misleading. In particular, even consensual policy (e.g. universal pricing of carbon) is presently not given serious consideration. Also, no technological barrier exist to implement technology based changes (see other chapters). Only political proposals, instruments and consensus are lacking. You should say so, for example "technology and economic policy proposals, sufficient to limit GHG emissions, do exist but are presently excluded from serious policy consideration, making the 2°C goal nearly impossible". | Taken into account - The text has been rewritten. Though we soften the language, this comment is a political statement. Our role is to provide policymakers policy relevant information based on scientific literatures. |

|---|---|---|---|---|---|---|---|
| 14367 | 1 | 22 | 18 | 22 | 22 | This comes close to throwing in the towel. In general it seems to me there is a risk that the chapter essentially implies it will be extremely costly and almost impossible to stay within the 2 degree limit. Cline (2012, p. 4; p. 81) calculates that by 2030 the path needed would only impose economic costs of about 2/3 of one percent of GDP or less annually on both industrial and emerging market economies, with the cost reaching 1 to 2 percent by 2050. It would be unfortunate to imply instead that the 450 ppm target is simply impossible, thereby discouraging efforts to meet it. | Taken into account - That is what we are saying, to some degree. But we will qualify this. In this particular point, we need to know the condition that enable achieving 450ppm (CO2e?) target at the cost of 1-2% of global GDP. We are looking forward to see several modeling studies (EMF 27, RoSE, AMPERE |
| 9251 | 1 | 22 | 18 | 22 | 18 | 350 ppm is an old figure - was it that low at the AR5 cut-off date? Now locally 400 ppm. | Accepted - change 350 to 390 |
| 7886 | 1 | 22 | 18 | 22 | 22 | You write that to stop warming at 2° will be exceptionally difficult if not impossible. It is not clear though in what sense it is deemd impossible: scientifically/technologically or economoically or politically (in terms of political will)? If you have the first or second meaning in mind, you should critically discuss those studies and politcal plans that suggest otherwise. See also comment 33. | Taken into account - Good suggestion. Our discussions are based on literatures that are based on analysis of technology, cost, speed of energy system transformation etc. and not on political will. Political will stems from |
| 17049 | 1 | 22 | 18 | 22 | 22 | There is a body of literature that would be very informative to this discussion: Many studies have addressed the question of feasibility from different angles, but with remarkably concordant conclusions: for normative climate sensitivity, limiting warming to 1.5 deg C is no longer possible because the mitigation rates required (c. 20% per annum – Raupach, Tellus, 2011) are not technically feasible. Large-scale energy technologies require 50 years for full-scale penetration (Smil, V., Energy. Myths and Realities, American Enterprise Institute, 2010; Victor, D., Global Warming Gridlock, Cambridge Press, 2011); for the penetration of zero-emission technology, this timescale is equivalent to a mitigation rate of ~5% per year. Limiting warming to 2 deg C is still feasible in principle, but would require an immediate start to mitigation at rates exceeding 5% per annum. Alternatively, one can use estimates of the emission gap for year 2020, which are 3 to 9 Gt CO2-eq per year, compared to the required level to meet the 2 deg C target of 44-46 Gt CO2-eq per year (UNEP, Emissions Gap Report, 2010, and IEA, World Energy Outlook, 2010).<br>The prognosis for limiting warming to 3 deg C is more optimistic. Raupach (Tellus, 2011) demonstrate that a 3 deg C limit could be achieved for mitigation start times from 2011 to 2030 with decarbonization rates of 2 to 3.5% per year, respectively. These rates fall within realistic energy technology turnover rates and have been met by some nations in the last decade; e.g., Denmark, Germany and Spain decarbonized by 1.9, 2.2 and 3.6% per year, respectively, from 2005-2010, although some of these declines likely reflect recessionary effects. | Taken into account - Thanks for useful information. On this point, our idea is to mainly rely on large model comparison projects now on-going. But we will cite some of those in our text. |
| 11405 | 1 | 22 | 2 | 22 | 12 | The reference to "pledges" should be with respect to the Cancun outcome under decision 1/CP.16 rather than to the Copenhagen Accord, as only the former is the multilaterally agreed instrument under the UNFCCC for such pledges. | Rejected - Legally speaking this comment is correct. However the pledge is generally known as the Copenhagen Pledge and exactly this language is used in chapter 6 (ref. to Fig. 6.34). What we do is to add the following after 'Copenhagen Conference' in p. 22, line |
| 14811 | 1 | 22 | 20 | | | eliminate "…if not impossible…" This is is presented as if it is an analytical scientific result. It is not. It is a conclusoin based on a set of assumptions regarding whether society is capable of rallying the political will to achieve a appropriately ambitious mitigation pathway. | Taken into consideration - the text has been rewritten |
| 16071 | 1 | 22 | 23 | 22 | 27 | Scenario consideration is too complicated in the paragraph. Why not a graph? | Rejected - other chapters will address |
| 16070 | 1 | 22 | 23 | 22 | 35 | Same remark on the paragraph. Only fairly "mild" conditions are tested in the scenario, and not rather more radical options such as ban in some coal trade, drastic limitation of plane travel, quotas in the use of cement… So the implausibility of the 2°C scenario should be qualified e.g. "with policy already on the table". | Rejected - this comment is much too extreme and not linked to the scientific research. No action needed |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 14812 | 1 | 22 | 23 | | 35 | Again, this is reporting modeling results as scientific results, without acknowledging the sensitivity to assumptoins. Most importantly, the claim that emissions must peak around 2020 is based on optimal path assuming earnest reductions started today. That does not mean that meeting the 2c target *requires* emissions to peak by 2020 and is impossible otherwise. If earnest reductions do not start in the next few years, then the peaking year of the optimal path would be pushed out later than 2020, (with subsequent reductions greater than 4% and/or negative emissions to compensate for the delay). Please see section 6.2.3 "Interpretation of model infeasibility" | Taken into account - All figures will be redone. The new approach to figure 1.8 will focus exactly on the conditions. We will cite cumulative emissions from WG1/SPM as follows; 'The 2°C temperature target implies cumulative carbon emissions by 2100 to be below about 1000–1300 PgC in the set of scenarios considered, of which about 545 [460 to 630] PgC were already emitted by 2011 (AR5/WG1/SPM)'. If SPM will not be ready we can cite similar wordings from |
| 7887 | 1 | 22 | 23 | 22 | 35 | The message seems to be that the 2° goal is (almost) out of reach. If this is the case, will (should?) mitigation still have priority? Please be more explicit about this point. | Rejected - we can't make that statement |
| 17050 | 1 | 22 | 29 | 22 | 30 | "… reduction of annual emissions by 4% per year THROUGH WHAT YEAR?" | Taken into account - Exact wordings are 'around 4% of 2000 emissions annually over a period of decades' p. 111. |
| 6817 | 1 | 22 | 31 | | | Drop 'nuclear' from this line. It is not possible to power up nuclear in time to meet these timeframes - see above. Furthermore, any signicant investment in nuclear acts as a wasteed financial resource sink lowering the potential for faster methods, ie renewables. | Rejected - The idea is to expand all near-zero sources, including nuclear |
| 11898 | 1 | 22 | 31 | 22 | 32 | For "nuclear power", consider to mention the Fukushima accident may affect the policy of the use of nuclear power; as it has been mentioned in page 10, line 50. | Rejected - not needed here--too much detail. We discuss that earlier |
| 12614 | 1 | 22 | 32 | 22 | 32 | Bioenergy and CCS is a very valid technology but may be constrained by the availability of sustainable biomass. This must be taken into account when estimating the infultration of bio CCS into any overshoot scenario. | Taken into account - The comment is correct. What the literature and the text shows, however, is that without all technologies including BECS, 2.6W/m2 |
| 12657 | 1 | 22 | 32 | 22 | 32 | Bioenergy and CCS is a very valid technology but may be constrained by the availability of sustainable biomass. This must be taken into account when estimating the infultration of bio CCS into any overshoot scenario. | Taken into account - combined with other comment. No action needed |
| 11027 | 1 | 22 | 32 | | | 'It is uncertain at this stage whether all those conditions could be met. For example, in view of the Decision at COP 17 that "a protocol, a legal instrument or agreed outcome with legal force" applicable to all parties to take effect from 2020—the very year that global emissions would need to peak.'<br>This is an understatement, i.e. the words should be strengthened to state: 'it is almost impossible at this stage that those conditions would be met, in view of the Decision that ….parties is to take effect from 2020—the very year that global emissions would need to peak. An assessment of risks and the need for policy strengthening will need to take into account likely implementation lags and the likely shortfall from full global participation, and the possibility that stronger top-down policy pressure may discourage participation.' | Taken into account - We have other comments (notably from USG) arguing that we strip out all interesting content related to such points. The text in this section has been rewritten |
| 17051 | 1 | 22 | 34 | | | It might be worth explainging why the year 2020 was chosen - some 8-9 yers after the agreement in Durban. | Rejected - we can offer no scientific explanation for this, only political ones, |
| 11899 | 1 | 22 | 37 | 22 | 40 | Consider to make this paragraph more simple and clear. | Noted - paragraph seems simple enough. No specific action suggested |
| 18414 | 1 | 22 | 39 | | 39 | Please which ones? | Noted - insufficient information. No |
| 17047 | 1 | 22 | 4 | 22 | 7 | See detailed comment on emissions gap presented in comment 84 | Taken into account - combined with |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 3888 | 1 | 22 | 42 | 22 | 42 | Can the authority for the assertion that this is 'one of the most serious challenges' be cited and the reasons given for rejecting differing expert assessments (eg Lomborg's Copenhagen Consenus http://en.wikipedia.org/wiki/Copenhagen_Consensus)? Otherwise this looks like a statement of personal bias by the authors. | Rejected - this is the authors' assessment of a vast literautre, which is exactly what the authors were asked by ipcc to do |
| 3891 | 1 | 22 | 44 | 22 | 47 | This sentence confuses the humanitarian MDG goals with the urgent priorities of actual governments. The urgent priority for the Syrian government right now is to retain power. Once again the problem here is the absence in the chapter of a positive theory of the incentives that governments actually face. Where there is an inadequate understanding of the reasons for government failure, otherwise unjustified disappointment with political outcomes can lead to unreasonable disillusionment with democracy itself. | Accepted - line 43 edited to say: "only challenge. FOR EXAMPLE, a survey…" |
| 18430 | 1 | 22 | | | | mitigation challenge<br>Here the report is more realistic since considers almost impossible to avoid a 2C raise in global temperature. However, when it leaves hard data and enters in international politics it says that the adoption of measures consistent with a 2C scenario is uncertain (pag 22), when is clear that is also almost impossible. This happens in the same page: 22 paragraphs 3 and 4. | Rejected - We have lots of comments urging us to do the opposite--to talk about the feasiblity of 2 degrees. And some models (albeit with wacky assumptions) can reach 2 degrees |
| 3565 | 1 | 22 | 12 | 22 | 12 | Substitute "require" with "be" | This sentence was reworded in 1010. Comment no longer relevant |
| 6871 | 1 | 22 | 13 | 22 | 17 | Suggest to base this statement on (and refer to) the assessment provided by WGI Chapter 12, which is based on a number of peer-reviewed studies and different line of evidence, rather than relying on a single study only. | Taken into account - In WG1/CH.12, Climate Sensitivity remain unchanged, though pdf of CS shown in Box 12.1, Fig.1 shown in Ch. 12 of WG1 may be different from that in AR4. Also, at this moment no such study like Meinshause's has been published based on new pdf. Therefore we keep this as is. In addition, we add after the end of line 17, p. 22 the following; 'Meinshausen (2009) also calculated |
| 3566 | 1 | 22 | 14 | 22 | 14 | Insert "the" before "probability" | Accepted - adopted suggested text |
| 6872 | 1 | 22 | 18 | 22 | 18 | Add reference to the relevant Chapters in WGI AR5 showing the past, present, and future projected evolution of GHG/aerosol concentrations: e.g., Chapters 2, 6, 11, 12. | Accepted - it should be noted that IPCC WG1 has no real insight into future evolution of concentrations, which is mainly a social science issue. Added to |
| 18131 | 1 | 22 | 2 | 22 | 6 | Reference is made to the "Copenhagen conference" in line 2 and COP 15 in line 6. For ease of reading suggest changing the reference in line 2 to COP 15 in Copenhagen (2009). | Taken into account - combined with other comment. Sentence has been |
| 6516 | 1 | 22 | 21 | | 22 | Add a conditional clause, e.g.. ", if governments want to limit warming to about 2 degrees." to make it clear. | Accepted: edited line 22: "...must be AGGRESSIVELY EXPANDED if DIFFICULT GOALS SUCH AS |
| 6873 | 1 | 22 | 24 | 22 | 24 | This should probably say "Integrated Assessment Modelling Community" rather than "Climate Modelling Community". | Accepted: edited to say "integrated assessment and energy and emissions |
| 6874 | 1 | 22 | 26 | 22 | 28 | Need to base this statement regarding the 2°C climate target on WGI AR5, see Chapter 12 WGI AR5. | Rejected - The statement will be based on what the IAM work, which we review, |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 3890 | 1 | 22 | 37 | 23 | 21 | This section ends with a paragraph that suggests that the Mitigation challenges and strategies problem is to use CBA to assess trade-offs, difficult though this is. This means that the section omits consideration of the problem of political processes and incentives. For example, what arrangements would incentivise a governing elite to put mitigation ahead of retaining power? To help readers understand why it is so hard to get politicians to 'do the right thing' in the light of the best available CBA the chapter needs needs to undertake a positive analysis of the actual incentives of bureaucrats and politicians. Arelated need is to explain how the efficacy of government action is limited by inadequate information. | Rejected - politics, where it is assessed scientificially, is suffused throughout the chapter--to the degree that lots of other comments urge us to pull back. We can't do a full blown positive political economy of policy choices here. |
| 15453 | 1 | 22 | 41 | | | The descrption here is not fair because it fails to mention there could also be interaction between climate change and those sustianble development issues and they are not limited to "tradoffs." Climate change can worsen some of the SD issues mentioned here by making conditions hard. For example, extreme poverty can be worsened by droughts and some other extreme weather events due to climate change. It is generally agreed that climate change can have negative impacts on efforts to prevent malaria. Hence, only stressing "trade offs" would miss an important point. This point should be mentioned even if the section is mainly about "challenges" and the authors want to focus on the aspect of challgenges. | Rejected - there's a LOT of discussion of interaction of priorities. No more needed. Text around co-benefits redone and text revised |
| 18132 | 1 | 22 | 44 | 22 | 47 | It would be good to list all 8 MDGs or say that those given are examples. | Rejected - beyond the scope of our chapter. No action needed |
| 11028 | 1 | 23 | | | | The text states: 'MDGs are unquestionably the urgent issues human beings should cope with immediately and globally. Achieving such goals along with an even broader array of human aspirations is what many governments mean by "sustainable development"…'. The first part of this is a value judgment, and could be better phrased as: 'MDGs represent an important and widely supported crystallisation of the priorities for human welfare, immediately and globally.' The second part needs to acknowledge that SD encompasses environmental goals. The following is preferred: 'Achieving such goals along with an even broader array of human aspirations including protection of the environment is what many governments mean by "sustainable development"…' | Rejected - I think our text is ok. No action needed. |
| 15255 | 1 | 23 | 11 | | | compare with 'growth' | Noted - insufficient information. No |
| 8408 | 1 | 23 | 14 | 23 | 14 | I suggest to avoid defining such kind of exercises "essential". Maybe they could be of some methodological interest, but it's hard to believe that could really be of some interest for policymakers. Different problems have different temporal and spatial scales, and it does not make much sense to assume that it is possible to address only one problem at the time, and that there is just one actor. Furthermore, one of the references quoted (Lomborg 2004) is not peer reviewed and a lot of analysis made by the author and used in such exercises have been identified as very weak, if not completely biased (i.e., Realclimate 11/8/2009: A biased economic analysis of geoengineering). The major part of the work of the Copenhagen Consensus doesn't involve much science and it is not peer reviewed. I suggest you delete this reference that only generates confusion. | Taken into account - deleted this phrase and the two cites: "...worthy—such endeavors are both essential and highly controversial (e.g., Lomborg (2004); Sachs (2004)." |
| 14813 | 1 | 23 | 14 | | | It is probably not advisable to cite authors whose writings have been roundly discredited by climate scientists. | Taken into account - combined with other comment |
| 10064 | 1 | 23 | 14 | 23 | 21 | Are there any more recent references to cite? | Taken into account - combined with |
| 7157 | 1 | 23 | 14, 21, 44 | | | Remove all unnecessary parantheses. | Accepted – copyedit to be completed |
| 15538 | 1 | 23 | 15 | | 17 | The difficulties are well illustrated in the discussion of US CBA guidelines in Dietz, S (2012). 'The Treatment of Risk and Uncertainty in the US Social Cost of Carbon for Regulatory Impact Analysis' Economics The Open-Access Open-Assessment E Journal Vol. 6, 2012-18. http://dx.doi.org/10.5018/economics-ejournal.ja.2012-18 | Rejected - text is fine--it already makes these points. No action needed |
| 14814 | 1 | 23 | 16 | | 17 | CBA is not a good example here, given its problems when applied to issues such as climate with intergenerational considerations, value-laden tradeoffs, and profound uncertainties of possibly catastrophic magnitude (a la Weitzman). | Accepted - deleted citation to "Azar" cited at line 21 and added citation also to Weitzman (2009) and to Nussbaum |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 17052 | 1 | 23 | 16 | 23 | 17 | Explain why applying such techniques for making tradeoffs is extremely difficult difficult in such settings - due to unknwon discount rates, etc.? | Rejected - we already provide several examples (e.g. monetization), low probabilities, extreme impacts. We deal |
| 17053 | 1 | 23 | 18 | | | Inserting "such as equity" is unncesary. "Equity" is a laoded term in the UNFCCC context - and as previous AR's have shown, it has over a dozen definitions. Therefore, it should be avoided, unless it is made crystal clear what it refers to. Here, the conversation is about the Millenium Development Goalds and one ough to check to see if "equity" is one of them. | Rejected - the MDG is an illustration of the kinds of tradeoffs involved. And so is equity--a term we choose because it has many definitions-- an illustration. Other |
| 11406 | 1 | 23 | 18 | 23 | 19 | The reference to "important goals such as equity" should be further expanded with a more substantial and balanced discussion of the concept and the application of equity in the context of climate change policy and actions (see e.g. Martin Khor, The Equitable Sharing of Atmospheric and Development Space: Some Critical Aspects (Research Paper 33, South Centre, November 2010) | Rejected - other comments (1059) urge us to do opposite. I think we are fine here |
| 15256 | 1 | 23 | 19 | | | why is 'equity' difficult? | Taken into account - combined with |
| 3313 | 1 | 23 | 19 | 23 | 19 | After "monetized," I'd add two citations to theoretical sources challenging the coherence of CBA for climate change equity: Gardiner (2011) (cited above) and Martha Nussbaum (2000) “The Costs of Tragedy: Some Moral Limits of Cost-Benefit Analysis.” Journal of Legal Studies, 29: 1005-36 | Taken into account - combined with other comments |
| 17054 | 1 | 23 | 21 | | | This last sentence could stand to have this addition, " market damages, TO SAY NOTHING OF COUNTING EMISSIONS ACCURATELY TO BEGIN WITH." | Rejected - there are LOTS of embellishments possible. Text is fine |
| 8781 | 1 | 23 | 22 | 24 | 34 | Little consideration of the implications for (mitigation) policy of the uncertainties and difficulties of prediction of the consequences of climate change. Charlesworth M & Okereke C (2010, Policy responses to rapid climate change: An epistemological critique of dominant approaches, Global Environ. Change, 20:121-129, doi:10.1016/j.gloenvcha.2009.09.001) provides some pointers, the most obvious being precaution. | Rejected - we don't' have space to cover everything here. This is a very short paragraph and points to chapter 2. |
| 15257 | 1 | 23 | 23 | | | please highlight "risk management under uncertainty" (its crucial) | Rejected - that's why we have a whole section on it -- no action needed |
| 3892 | 1 | 23 | 23 | 23 | 23 | Can the authors cite an authority for asserting that the policy challenge is one of risk management under uncertainty? Perhaps it is the policy elite's key challenge, but is it decision-makers's key challenge? Is it not a greater problem that politicians want to get re-elected and that they fear that if they go very far down the mitigation path they will get thrown out of office? | Rejected - our task is the decision-maker's challenge related to mitigation - no action needed |
| 8409 | 1 | 23 | 24 | 23 | 24 | The control of emissions will impose costs on national economies, but the exact amount is uncertain.<br>I would add that the control of emissions will impose also benefits on national economies, and also their exact amount is uncertain.<br>So I suggest to write: “The control of emissions will impose either costs or benefits on national economies, but the exact amount is uncertain. | Taken into account - we have an edit much earlier in the chapter that makes that point; no need to make it again. |
| 17055 | 1 | 23 | 25 | 23 | 26 | This sentence could stand to have this addition, "to allow for flexibility, OR IF EARTH'S CLIMATE SENSITIVITY IS NOT WHAT WE THINK IT IS." | Rejected - this sentence is an illustration that is brief for clarity. Adding lots of |
| 11353 | 1 | 23 | 25 | 23 | 26 | This statement can be supported by literature (for example, Stavins (1995, Journal of Environmental Economics and Management, doi:10.1006/jeem.1995.1036)?). | Rejected - there's a LOT of literature on this topic; point here is just an illustration and then to set up this topic being |
| 8478 | 1 | 23 | 27 | | 29 | Policy design has a specific meaning an context in policy analysis that is not apparent here. See the 1987 text by Bobrow and Dryzek (Policy Analysis by Design) which speaks to the importance of values and critical theory to policy. | Rejected - Our intention for the word "design' is basic and we don't think we need a citation here to make this point. |
| 13682 | 1 | 23 | 27 | 23 | 27 | Insert after "... energy systems.": "or policy instruments are more efficient than predicted. In this context, market mechanisms have shown in the last decade that they can mobilize cheap reductions (see Michaelowa 2012)." Reference: Michaelowa, A. (2012): Manoeuvring climate finance around the pitfalls, in: Michaelowa, A. (ed.): Carbon markets or climate finance?, Routledge, Abingdon, p. 255-265 | Taken into account - added a sentence at line 27: " "... energy systems.": "or policy instruments are more efficient than predicted. In this context, the experience with market mechanisms |
| 11900 | 1 | 23 | 29 | | | Is this "Metcalf, 2009" an available peer-review reference? | Noted - yes--see reference list. No action |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 14815 | 1 | 23 | 30 | | | delete "Perhaps". The potential consequences are unquestionably more uncertain. | Rejected - actually I don't think anyone really knows this--hence we are more cautious in our language. No action |
| 15258 | 1 | 23 | 31 | | | essential to factor in understanding of feedbacks in forecasts! | Noted - yes. No action needed |
| 17056 | 1 | 23 | 31 | 23 | 34 | if there is not yet a source for this proclamation, do NOT include the statement as fact. | Rejected - this is in fact exactly where the science is headed. But when we wrote the draft we didn't have WG2 |
| 4023 | 1 | 23 | 33 | 24 | 2 | the authors might wish to base the discussion on UNEP 2011, where the most recent scientific knowledge on black carbon has been assessed in a comprehensive manner. The level of uncertainty is now much lower. Clearly, mitigating black carbon emissions would very likely reduce the anthropogenic radiative forcing in spite of side effects, which have been rightly pointed out by Chen and other researhers. | Rejected - we cite this elswhere and extensively. No action needed |
| 11354 | 1 | 23 | 33 | 23 | 34 | Sea level rise and ecosystem impact mentioned after "for example" are not exactly examples of climate feedbacks. | Rejected - that's why we have the phrase "along with…" on line 32 |
| 14816 | 1 | 23 | 35 | | | "…and may also lessen uncertainty". It is not clear what this refers to. | Taken into account - edited sentence to say: "may also lessen uncertainty IN THE ASSESSMENT OF POSSIBLE |
| 14817 | 1 | 23 | 36 | | | Not clear that the para starting "Risk management…" is useful here. | Rejected - it is very useful because it is added the temporal dimension. No |
| 17411 | 1 | 23 | 38 | | | This would be a good place to refer to the potential of AFOLU mitigation strategies. | Taken into account - afolu added in |
| 10476 | 1 | 23 | 38 | | | Maybe a footnote to define short-lived and long-lived for the reader. | Taken into account - From revisions, there is now a more careful discussion of GWPs and time horizons earlier in the chapter. That should be sufficient. Also, |
| 17740 | 1 | 23 | 39 | | | give reference to the chapters when you write "elsewhere" | Accepted - at line 39: added cite to |
| 16339 | 1 | 23 | 4 | 23 | 7 | This section mentions the MDGs and refers to the recent Rio+20 agreement. My comment is that it was agreed at Rio+20 (paragraphs 245-251) that a set of "Sustainable Development Goals" will be developed. I think that this should be mentioned in WGIII report, as I think this will be an important way that nations will be delivering truly sustainable development and so mitigation strategies post 2015. The document says that the SDG's should be "action oriented, concise and easy to communicate, limited in number, aspirational, global in nature and universally applicable to all countries while taking into account different national realities, capacities and levels of development and respecting national policies and priorities. (...) Governments should drive implementation with the active involvement of all relevant stakeholders (.....) progress towards the achievement of the goals needs to be assessed and accompanied by targets and indicators (....) The document states that a working group will be set up of experts to report to the 68th session of the UN. There is a process where stakeholders will be able to input to this expert panel and to the UN. IPCC and readers of the IPCC report should be making sure that they have the right science to base the goals on. The UN will be looking for this. The SDG's are expected to be the mainstay of the post 2015 development agenda | Rejected - At this stage I don't think we need to do this. There remains lots of uncertainty about whether/how the SDGs will actually be developed and whether they will be useful. If we are writing for the year 2014 and beyond who knows if this will be consquential. But the MDGs (which we use here JUST as an illustration for tradeoffs (see comment 1059) have proven to be relevant |
| 11355 | 1 | 23 | 41 | 23 | 45 | Here the could state explicitly the importance to strike a balance between the abatement of short-lived climate forcers (e.g. black carbon) and that of long-lived climate forcers (e.g. CO2) (Berntsen, 2010, Climatic Change Letters, 10.1007/s10584-010-9941-3). | Rejected - our cites here (e.g. Ramanthan and Xu and the UNEP report) make exactly that point. No |
| 4473 | 1 | 23 | 44 | 23 | 45 | The other side of the coin is that any of the large nations or blocs (e.g., the U.S., China, the EU) can by itself cause dangerous interference with the climate if its emissions grow unchecked. Thus, each of the largest nations has some individual incentive to reduce emissions and to press for coordinated action. | Rejected - we agree and we make that point elsewhere (citing to Victor et al 2012 in Foreign Affairs). no action |
| 17057 | 1 | 23 | 44 | | | The Shindell et al. paper in Sciecne (2012) ought to be cited here. | Rejected - we cite that a lot elswhere. We don't need to cite it every time we |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 12226 | 1 | 23 | 45 | 23 | 47 | The finding from Chen et al deserves an explanation. Also, a judgement of what the majority of studies find should be included. As this sentence stands now, I read that it is as likely as not that BC warms the atmosphere. Also, the snow and ice effect of BC should be mentioned to give the reader an idea of the total climate effect of mitigating BC. | Taken into account - this text is an illustration and is getting already too long and off point. Text shortened -- delete p.23 line 45 ("It should be noted…") through p.24, line 2. Replaced with: "A climate change mitigation strategy that places emphasis on short-lived climate pollutants also has implicaitons for the choice of GWPs and could favor GWPs |
| 17058 | 1 | 23 | 45 | 23 | 47 | This statement regardign BC effect on clouds is not necessarily a scientific consensus by any means and therefore it is misleading to include it. What is a scientific consensus is that sulfate aerosol is a far superior cloud condensation nucleus than BC aerosol. | Rejected - see 1087. Just because eveyone doesn't agree 100% doesn't mean we shouldn't mention this-- |
| 11356 | 1 | 23 | 45 | 23 | 47 | One could add the point here that removing sulfate aerosols may result in a short-term warming (e.g. Andreae et al., 2005, Nature, 10.1038/nature03671; Armour and Roe, 2011, Geophysical Research Letters, 10.1029/2010gl045850; Tanaka and Raddatz, 2012, Climatic Change Letters, 10.1007/s10584-011-0323-2). | Rejected - this point is addressed in WG1 and not essential for us here. No action needed |
| 10477 | 1 | 23 | 48 | | | For short-lived, cross reference Section 8.2 | Sentence has been removed. Comment |
| 8477 | 1 | 23 | 8 | | 11 | This presents sustainable development as an outcome, rather than as a process. SD may never be attainable. | Rejected - language throughout is very process and balancing and evaluation. That is process, not just outcome. No |
| 17651 | 1 | 23 | 8 | 23 | 21 | This paragraph could list some more and more recent references, e.g. more recent literature concerning low probability but high risk events. | Taken into account - combined with other comment. We have referred risk management and fat tail issues to |
| 7888 | 1 | 23 | 8 | 23 | 21 | Lomborg's work is genreally regarded as poor science and contains many obvious flaws (e.g. see the many critical comments in Nature and Science on his book "The Skeptical Environmentalist"). It comes at a great surpise that Lomborgs ill-founded "message" resurfaces in this report. In addition, we doubt that CBA is of much use in identifying justifiable climate policies. All CBAs provided so far (most notably those of Nordhaus, Tol, Weitzmann) are vulnerable to serious challenges raised in the literature (e.g. Hampicke 2011, Betz 2006, Randall 2002, Broome 1992, Ott/Baatz 2012, Baum 2009). The many problems of using CBA to clalculate "optimal" policies were already discussed in the 90s (at least in Germany, see for example Rohner/Edenhofer 1996). Rather than pointing out the importance of CBA you should refer to chapter 3 where some of its merits and drawbacks are discussed. See also comment 44. | Taken into account - combined with other comment. At end of this paragraph in addition to new cites suggested above also add crossref to IPCC WG3 chapter 3. |
| 10264 | 1 | 23 | 8 | | | Fresh reference:Routa, J., Kellomäki, S., Kilpeläinen, A., Peltola, H. and Strandman, H. 2011. Effects of forest management on the CO2 emissions of wood energy in integrated production of timber and energy biomass. GCB Bioenergy 3: 483–497. Citation from the article: "In general, forest bioenergy supply chains seem to be effective; i.e. the energy consumption was 2–3% of produced energy and the CO2 emissions are 4–7 kgCO2 eqMWhpa 1 (Wihersaari & Palosuo, 2000). This held also for this study, with the energy consumption varying in the range 2.2–2.8% of that produced in the energy supply chain." | Rejected - thank you for the cite, but it doesn't fit here at all. This is about mitigation potential of forestry programs, which belongs in the chapter that deals with that. No action needed |
| 3889 | 1 | 23 | 8 | 23 | 8 | The statement that "all" countries seek sustainable development flies in the face of the sober reality of oppressive authoritarian regimes that demonstrate, when the need arises, their willingness to kill as many of 'their' people as is necessary in order to retain power. Again there is a need to distinguish between pious statements of good intent, and the real priorities of despotic (and other) regimes. | Rejected - hence we have the phrase "in different ways" on that very same line. It depends on the objective function. This comment takes us far from our team's |

|---|---|---|---|---|---|---|---|
| 18431 | 1 | 23 | | | | Reconciling priorities and SD<br>There is again a remarkable optimism regarding the adoption of SD path by “all countries” (pag 23, paragraph 2). This is inaccurate; most societies live within short-term scenarios. Most of them have economic growth concerns, fewer might have equality concerns, but this does not mean that they are acting considering the long-run or future generations. Those are exceptions, not the rule. | Rejected - it depends on the relative weight that countries give to such varied factors. This comment relates to 1095. No action needed |
| 4251 | 1 | 23 | 1 | 23 | 2 | The threshold of $1 per day has been revised by the World Bank to $1.25 per day for the definition of absolute poverty | Accepted - Although the MDG refers to USD 1 per day as the threshold all statistics reported after 2005 considers |
| 3568 | 1 | 23 | 21 | 23 | 21 | Strange with only one reference to a really huge literature. | Taken into account - combined with other comments. see comment 1057 |
| 3567 | 1 | 23 | 8 | 23 | 8 | Replace "places" with "puts" | Accepted - text revised |
| 16072 | 1 | 23 | 23 | 24 | 18 | This section describes chapter 2, why not insist on the new body of knowledge in this chapter compared with AR4? | Rejected - because this is an introduction to WG3 and our purpose is to introduce other chapters, issues and |
| 6875 | 1 | 23 | 31 | 23 | 34 | Suggest to refer here to the relevant Chapters of WGI AR5, e.g., Chapters 11, 12, 13, 14, Annex I: Atlas of Global and Regional Climate Projections. | Accepted - at lines 33-34 cite: "(later add citation to relevant parts of IPCC WG2; SEE ALSO IPCC WG1, |
| 11583 | 1 | 23 | 36 | 24 | 2 | There is a considerable body of work on short lived climate pollutants. Its also clear what technologies are required to deal with them. This work should not be confused with the requirements and the commitments to bring down the GHG concentrations in the atmosphere. | Rejected - text is fine and accurate as is. Other edits will shorten and focus, for example see comment 1087. no action |
| 6876 | 1 | 23 | 39 | 23 | 39 | Please refer to WGI AR5 Chapters, e.g., 2, 6, and/or 8. | Taken into account - another edit above adds xref to chapter 8--thanks. No |
| 6877 | 1 | 23 | 45 | 23 | 47 | Please refer to WGI AR5 Chapter 7. | Sentence has been removed. Comment |
| 6878 | 1 | 23 | 47 | 24 | 2 | It seems crucial here to refer to WGI AR5 when discussing an assessment of atmospheric perturbation life time etc.. The atmospheric lifetimes of perturbations of different GHGs and aerosols are discussed in detail in WGI AR5 Chapters: Chapters 2, 6, and/or 8. | we have deleted this text and added other xrefs to WG1. Comment no longer relevant |
| 17696 | 1 | 23 | 8 | 24 | 18 | Why is the Precautionary principle not mentioned? | Rejected - because there are lots of things that could be mentioned; our purpose is to illustrate the tradeoffs. No |
| 17059 | 1 | 24 | 1 | 24 | 2 | this statement demands expansion and quantification. See, for example, the Guan et al study in Nature Climate Change (2012) on China's Gigaton emissions gap | text is deleted. Comment no longer relevant |
| 17061 | 1 | 24 | 10 | 24 | 14 | These examples are not "extremes" in the common understanding like cyclones, droughts, floods. Rather, these are abrupt climate changes and/or tipping points/thresholds. This is a very important difference to make. Refer to WG1 colleagues for further clarification. | Rejected - this comment is incorrect. These are "extreme climate impacts" which is our phrasing, and the pieces we |
| 14333 | 1 | 24 | 14 | 24 | 16 | This sentence suggests that geoengineering may be a "risk managment approach" that could reduce uncertainties or crudely offset impacts of climate change. Yet all recent studies emphaisze (i) the uncertainties around the potential impacts of geoengineering and (ii) the time it would take to makes geoengineering techniques work, cf for instance Williamson, P., Watson, R.T., Mace, G., Artaxo, P., Bodle, R., Galaz, V., Parker, A., Santillo, D., Vivian, C., Cooper, D., Webbe, J., Cung, A. and E. Woods (2012). Impacts of Climate-Related Geoengineering on Biological Diversity. Part I of: Geoengineering in Relation to the Convention on Biological Diversity: Technical and Regulatory Matters. Secretariat of the Convention on Biological Diversity. Montreal, Technical Series No. 66 | Rejected - this is a massive mis-statement of the literature. Almost all recent studies have, in fact, looked at risks and benefits and tried to develop some frameworks. And it is that balance that we are telegraphing here. No action needed |
| 16075 | 1 | 24 | 14 | 24 | 15 | "radical innovation" suggests that we invent from scratch new processes. In most cases, the scientific base does exist. Isn't our problem is more "development and implementation of best technology"? | Rejected - this comment doesn't apply to text cited. No action needed |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 16073 | 1 | 24 | 14 | 24 | 18 | On Geoengineering, "a growing number of studies" is misleading. Many of these studies emphasis extra risk, and anything resembling a real life experiments is forbiddent (e.g. recent UK episodes) or at least very controversial. The paragraph should mention that risk is unknown, and that all notion of geo-engineering is (still) controversial. | Rejected - the text says exactly that and so do the pieces we cite. No further action needed |
| 7158 | 1 | 24 | 14 | | | Remove unnecessary paranthesis. | Editorial – copyedit to be completed |
| 7889 | 1 | 24 | 14 | 24 | 18 | Again, crititcal literature on geoengineering is missing (see comment 22). | Taken into account - combined with |
| 15420 | 1 | 24 | 14 | | 16 | It is dangerous and misleading to suggest geongineering is a “risk management approach” when geoengineering technologies are largely speculative, with unknown short- and long-term impacts on climate, environment and biodiversity. Reference to geoengineering as an element of a risk management approach should be DELETED. | Rejected - This is not what we say and we disagree that the effects are "unkonwn". They may be uncertain and involve balancing of risks--which is exactly what we say. Geoengineering is |
| 16076 | 1 | 24 | 15 | 24 | 15 | The sentence implies that change is mainly technology. In many cases, especially in the industrialized world, there is now a dimension of limiting uses ("la sobriété") that should be also proposed. | Rejected - this point is not relevant here--we are talking about risk management and geoegineering, not "limiting uses". |
| 14368 | 1 | 24 | 15 | | | Unfortunate to give a boost to geoengineering, given the risks. | Rejected - we are not giving a boost. We are adding it to the discussion. No |
| 14818 | 1 | 24 | 15 | | | add "…. may be able crudely to offset the impacts of some climate change while imposing other risks." | Taken into account - I like this edit, but it makes for a complicated sentence. Let's add the idea in the next sentence. line 17 to say "…technology, possible IMPACTS AND RISKS OF TESTING AND DEPLOYING |
| 15259 | 1 | 24 | 16 | 24 | 18 | fools gold? | Noted - insufficient information. No |
| 14334 | 1 | 24 | 16 | 24 | 18 | see comment to p. 14 line 28-30: The literature cited does not cover current key aspects of geoengineering governance and ist interrelation with mitigation policy. More recent literature such aspects includes e.g.:<br>- Bodle, R., with Homan, G., Schiele, S., and E. Tedsen (2012). Regulatory Framework for Climate-Related Geoengineering Relevant to the Convention on Biological Diversity. Part II of: Geoengineering in Relation to the Convention on Biological Diversity: Technical and Regulatory Matters. Secretariat of the Convention on Biological Diversity. Montreal, Technical Series No. 66;<br>- Bodle, Ralph, “International governance of geoengineering: Rationale, functions and forum”, in: William C.G. Burns and A. Strauss, (eds.), Climate Change Geoengineering: Legal, Political and Philosophical Perspectives, Cambridge: Cambridge University Press (submitted February 2011; in press);<br>- Lin A.C., International Legal Regimes & Principles Relevant to Geoengineering (in press). In: W.C.G. Burns and A. Strauss, (eds.), Climate Change Geoengineering: Legal, Political and Philosophical Perspectives. Cambridge: Cambridge University Press, Cambridge (submitted 2011, in press);<br>- Rickels, W.; Klepper, G.; Dovern, J.; Betz, G.; Brachatzek, N.; Cacean, S.; G ssow, K.; Heintzenberg J.; Hiller, S.; Hoose, C.; Leisner, T.; Oschlies, A.; Platt, U.; Proelß, A.; Renn, O.; Sch fer, S.; Z rn M. (2011): Large-Scale Intentional Interventions into the Climate System? Assessing the Climate Engineering Debate. Scoping report conducted on behalf of the German Federal Ministry of Education and Research (BMBF), Kiel Earth Institute, Kiel, available at http://www.fona.de/mediathek/pdf/Climate_Engineering_engl.pd | we cover the landscape, including with a new cross ref to chapter 6.9. |
| 11029 | 1 | 24 | 16 | | | Geoengineering needs to be represented in a balanced way if it is to be introduced here at all. Its perverse effects should be noted. For example, after Cicerone 2006, insert the words: ‘The perverse effects of geoengineering will need to be considered in policy analysis – in particular, the likelihood that ‘successful’ application of a geoengineering solution to reduce temperatures may induce complacency about emission control, and that apparent ‘success’ may distract from failure in areas such as ocean acidification.’ | our text says pretty much exactly that. And so do the things we cite. No further action needed |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 8969 | 1 | 24 | 16 | | 18 | These studies indicate there really is no coherent "pland B" so that geoengineering is not a real option and its governance is quite speculative. | Rejected - text is balanced about risks and context -- no action needed |
| 13680 | 1 | 24 | 16 | 24 | 18 | Replace "Cicerone , 2006). Since AR 4 … Society 2009" by "(see Chapter 6.9)". | Accepted - added a cross reference to IPCC WG3, section 6.9. |
| 15421 | 1 | 24 | 16 | | | DELETE: "growing" | Rejected - bilbiometric analysis shows they are growing exponentially |
| 12227 | 1 | 24 | 18 | 24 | 18 | It might be worth to include the IPCC meeting report from the Workshop on geoengineering here. | we leave that to chapter 6. we have added xref to chapter 6.9 |
| 3064 | 1 | 24 | 18 | | | For geoengineering, also cite the Novim report http://www.arxiv.org/abs/0907.5140 (2009) | Taken into account - combined with |
| 10478 | 1 | 24 | 18 | | | Cross-reference to geoengineering section in main report. | we have done that now |
| 15422 | 1 | 24 | 18 | | | INSERT A NEW SENTENCE: However, geoengineering remains highly controversial, largely due to unknown and unintended impacts and the inability to contain effects within boundaries (i.e., geoengineering's effects will be transboundary) or to reverse unintended, negative effects of geoengineering; a global de facto moratorium on geoengineering techniques was agreed at the United Nations Convention on Biological Diversity (CBD) in 2010, preceded by a moratorium on ocean fertilization (one geoengineering technique) in 2008. (CBD decisions IX/16 C and X/33 paragraph 8w; see ETC Group, "The Geoengineering Moratorium under the UN Convention on Biological Diversity," 10 November 2010 [online] http://www.etcgroup.org/es/content/what-does-un-moratorium-geoengineering-mean) | Rejected - way too much detail. We have written 4 balanced lines and your edit proposes to more than double that text with a highly selective set of references. There is a lot of literature out there, we can't cite them all. |
| 16074 | 1 | 24 | 21 | 24 | 21 | Black carbon (soot) has recently been in the spotlight as important GHG without a global presence. | Noted - agreed, but no action needed |
| 14819 | 1 | 24 | 25 | | | Finl sentence: "As this is a global commons problem, an effective solution is possible only with international collective action." | Rejected - The suggested sentence says pretty much same thing as our sentence but with twice as many words. No action |
| 17062 | 1 | 24 | 26 | | | Rather than "unavoidable", perhaps use "essential if dangerous anthropogenic interfernece in the Earth system is to be avoided." | Rejected - I don't think we can say "essential" since there is a small chance that self-interest, low costs of abatement or tacit cooperation (a la Shelling and |
| 4862 | 1 | 24 | 28 | | 29 | {Add} Techn. development is discussed in the next section, but it should also be mentioned here: "coordination is also needed to share information about best practices {and technologies} in many areas | Rejected - we are severely space constrained. It is mentioned in next |
| 8782 | 1 | 24 | 29 | 25 | 15 | Logical tension between discussion of 'promising options for reducing emissions involve changes in behaviour' and 'without radical technology innovation deep reductions are not possible by 2050' should be clear; however, to illustrate - if changes in behaviour mean radical reduction in consumption of fossil fuels are achieved without technological change then innovation, though potentially welcome, is not essential. The history of technological innovations such as CFCs suggests that relying on technology is not a robust policy assumption. The second statement suggests a trenchant ideological position and a distinct lack of imagination. | Rejected - The CFC example in fact shows EXACTLY what we say--that changes in technology allowed (and accelerated) deep cuts in emissions. Changes in behavior may play a role; maybe not. But absent massive changes in behavior (which has not really been witnessed in most of |
| 11148 | 1 | 24 | 3 | | 8 | States that scientific uncertainties involve investments across many intellectual disciplines and activities, such as engineering and the many fields of climate science (related to understanding the risks of climate change). But apart from understanding, what about the acceptability of those risks? Risks can never be quantified and explained with 100% rationality. there's always an emotional/ethical component involved, e.g. in assumptions underlying risk assessment models. I would therefore recommend that references are included to the scientific fields that study acceptability of risk as an ethical issue. | Taken into account - combined with other comments. We talk about risk management; we are adding a cite to Nussbaum's related work; and we point to chapters 2 and 3 that deal with these issues in depth. No further action |
| 17060 | 1 | 24 | 3 | 24 | 18 | this paragraph could benefit by reference to the National Academy of Sciences 2011 report, "Informing an Effective Response to Climate Change" in which iterative risk management and adapative governance were stressed as being critical to successful response to climate change. | Taken into account - combined with other comment. in response to another comment we have added an NAS |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 16077 | 1 | 24 | 37 | 24 | 40 | The two mentions of geoengineering are too much. One could be enough mentioning "as an insurance". This is an introduction, not an editorial. | Rejected - the text is balanced and ok and brief. No action needed |
| 7890 | 1 | 24 | 38 | 24 | 39 | Even modest objectives such as delinking emissions from growth (which has already occurred in some countries) are portrayed as highly difficult to reach. Under this non-neutral and perhaps even prescriptive point of view more ambitious goals are to be regarded as utopian. | Rejected - but this is difficult and that's what most of the modeling shows. And some of the countries that supposedly are delinked have, in fact, not delinked because they have outsourced |
| 17063 | 1 | 24 | 38 | 24 | 39 | One could point to the results in the U.S. from 2011: Emissions declined by 2.4% while GDP grew by 1.8%. See http://www.eia.gov/todayinenergy/detail.cfm?id=7890&src=email | Rejected - this would be a dangerous fact to use since single year estimates are notorously unreliable signals of long |
| 11030 | 1 | 24 | 39 | | | The text states: 'Delinking GHG emissions from GDP growth will probably require massive changes in technology.' The emphasis on technology should be balanced by reference to changes in patterns of human behaviour, either here or elsewhere. I suggest 'Delinking GHG emissions from GDP growth will probably require large changes in technology and significant changes in human behaviour [see, for example, ….]''. | Rejected - In the most simple matter delinking emissions from GDP will require different technologies and also different ways how we use technologies. Having a statement to emphasize this hardware-software dichotomy would be quite useful in ch.1 especially in view of |
| 17412 | 1 | 24 | 40 | | | Discussion of technology innovation would be more appropriate if complemented by discussion of innovation in practices / behavior (eg, household energy use, transport choices, land use management alternatives, etc). | Taken into account - combined with other comments |
| 4305 | 1 | 24 | 14 | 24 | 18 | change „may" to „might"; add „and to some degree systems that might be needed to govern geoengineering" because none of the mentioned authors has provided a suitable, practical and much quoted model of governance. | Taken into account - combined with other comments |
| 6880 | 1 | 24 | 16 | 24 | 18 | Ensure consistency with and reference to WGI Chapters 6 and 7 which do thoroughly assess the physical science basis of proposed geoengineering methods covered by CDR and SRM. Avoid reassessing the physical science basis component in WGIII. We suggest to also consider the cross-WG IPCC Expert Meeting Report on Geoengineering held in June 2011 (IPCC, 2012: Meeting Report of the Intergovernmental Panel on Climate Change Expert Meeting on Geoengineering [O. Edenhofer, R. Pichs-Madruga, Y. Sokona, C. Field, V. Barros, T.F. Stocker, Q. Dahe, J. Minx, K. Mach, G.-K. Plattner, S. Schlömer, G. Hansen, M. Mastrandrea (eds.)]. IPCC Working Group III Technical Support Unit, Potsdam Institute for Climate Impact Research, Potsdam, Germany, pp. 99. ). | Rejected - we are not reassessing the physical science basis. What we are doing is pointing to the physcial science issues that relate to risk management-- and here WG3 needs to address the topic. Added cross-reference after Cicerone citation to IPCC WG1, chapter 6 |
| 3569 | 1 | 24 | 2 | 24 | 2 | "…that are particularly not well understood." replace with "…that are not always well understood." | Sentence was removed from previous edits. Comment no longer relevant |
| 3570 | 1 | 24 | 5 | 24 | 5 | "In climate these…" Replace with "In relation to climate change these…" | Accepted - adopted suggested changes |
| 6879 | 1 | 24 | 7 | 24 | 7 | Reference to WGI AR5 needed. | Taken into account - cross ref already added per previous comments. No |
| 5387 | 1 | 24 | 20 | 24 | 20 | climate issue --- should be --- climate change issue | Taken into account - combined with |
| 15715 | 1 | 24 | 20 | 24 | 34 | This section contains language that could easily be perceived as being 'Policy Prescriptive', something the IPCC should stay away from, for instance: 'Collective action is needed at many fronts', or: 'Coordination is also essential on matters of finance since many international goals seek action by countries that are unwilling or unable to pay the cost fully themselves'. Better to phrase statements where some action is 'needed' in a conditional "if.. then" manner: "if certain objectives A and B are to be met, then actions X and Y are needed'). In addition, I suggest not to use expressions like "countries that are unwilling or unable to pay...", better to more neutral wording "countries that are not in a position to pay…'. | Rejected - we don't think our text is how is policy prescriptive. While we don't phrase this as IF, THEN when you read the paragraph in totality that is exactly what it says. No action needed |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 8410 | 1 | 24 | | 25 | | I suggest to add in this section the importance of reshaping energy subsidies. Many analysis highlights that the price signal from subsidy phase-out would provide an incentive to use energy more efficiently, and trigger switching from fossil fuels to other fuels that emit less GHGs.<br>Eliminating environmentally harmful subsidies must play a central role in national efforts to achieve a long-term transition to a truly sustainable and secure energy system. | Taken into account - combined with other comments. Subsidies are discussed earlier in the report and other edits add a phrase to underscore impact of subsidies (in response to a comment |
| 12086 | 1 | 24 | 38 | 24 | 39 | The text states that "Delinking GHG emissions from GDP growth will<br>probably require massive changes in technology." This incorrectly implies that Delinking GDP from GHG emissions has not been achieved yet anywhere with existing low carbon technologies. This text could be read by some "nontechnical" decision makers as implying that "delinking" is not technically possible yet until we have "new technical innovations". Yet "relative" Delinking of GDP from GHG emissions has been achieved in many counties including China from 1980-2000 (Please see Comment #3 above) and Absolute delinking of GDP from GHG emissions has been achieved by a few countries. These countries have achieved this using currently available technologies. Please see OECD (2011) Towards Green Growth: Monitoring Progress. OECD - the subsection on Decoupling GDP from greenhouse gas emission indicators. | Taken into account - combined with other comments |
| 6301 | 1 | 24 | 38 | 24 | 39 | "Delinking GHG emissions from GDP growth will probably require massive changes in technology." Consider adding "as well as changes in behavior." The report deals with this issue in an important way, so acknowledge it here. | Taken into account - combined with other comments |
| 3571 | 1 | 24 | 40 | 24 | 40 | "…vary in any ways…" should be "…vary in many ways…" | Accepted - text changed as suggested |
| 3572 | 1 | 24 | 41 | 24 | 41 | Replace ";" with " | Accepted - text changed as suggested |
| 18248 | 1 | 24 | 45 | 24 | 47 | To stimulate investment in appropriate technologies at the right time and place,<br>The term “appropriate technologies” could be substituted by “opportunity technologies”. This because appropriate technology can be confused with the already coined term in the sense to be appropriate with the factors´ endowment. So I propose:<br>To stimulate investment in opportunity technologies, that is at the right time and place, and to the right people, | Rejected - it could be confused, but "opportunity" is even worse--it has no obvious plain English meaning |
| 15716 | 1 | 24 | 45 | 24 | 47 | Again, policy prescriptive language: suggest to replace by "To stimulate investment in appropriate technologies at the right time and place, it will help if countries would consider the full life cycle… | Accepted - text changed as suggested |
| 17697 | 1 | 24 | 20 | 24 | 34 | Mitigating CC is providing a public good, some government will freeride | Noted - that's why we are talking about |
| 4863 | 1 | 25 | | | | 1.4.5 In some areas the mitigation and the adaptation measures are closely interlinked (e.g. urban planning, construction, certain agricultural activities, forest management).. | Noted |
| 17064 | 1 | 25 | 1 | 25 | 2 | A discussion of David et al in Science (2010): "Future CO2 Emissions and Cliamte Change from Existing Energy Infrasutrcture" is warranted here. | Taken into account - per another comment we have added the Davis et al |
| 15260 | 1 | 25 | 13 | 25 | 15 | current Intellectual Property system is a deterrent. | Noted - actually folks tend to over-state this. The mantra against IP is mostly political rhetoric (see GEA chapter 24 for |
| 11031 | 1 | 25 | 15 | | | The text states: ‘They also agree that without radical technology innovation deep reductions are not possible by 2050’ - this is again a judgment. It may be that extremely rapid and wide deployment of currently emerging technologies such as solar PV and electric vehicles, combined with behaviour change, would generate deep emission reductions – the case is not proven. I suggest ‘A combination of wide deployment of emerging technologies, and radical technology innovation will increase the likelihood of deep emission reductions by 2050 being achieved.’ | Taken into account - sentence has been removed |
| 17065 | 1 | 25 | 15 | | | Insert, "radical technology innovation, SUCH AS COST-EFFECTIVE CCS, deep reductions…" | Rejected - given all the complaints about CCS by other reviewers calling out CCS here--when we already have discussion of CCS in more detail elswhere in the |

|---|---|---|---|---|---|---|---|
| 15539 | 1 | 25 | 16 | | 30 | Should also mention changes in consumption patterns. That is a potentially important margin of adjustment. | Taken into account - discussion now mentions behavior and consumption |
| 5318 | 1 | 25 | 16 | 25 | 19 | “decreasing vulnerability to energy price volatility”: If volatility of energy prices around a mean price are significantly lower than the cost of providing energy by renewable energy sources, it will still be better for consumers than to cope with some volatility than accept high costs for sure. Volatility is not per se bad! | Rejected - that is true in some settings but not others; and when you read the sentence in totality we are pointing to a wide array of factors that people cite as |
| 3036 | 1 | 25 | 16 | | 30 | This paragraph seems to imply adherence to the common misconception that rebound effects apply only or mostly to final consumers. Globally, only one-third of energy is consumed by households and for personal transportation, while two-thirds is consumed in the productive part of the economy ("embedded" energy), which provides goods and services [ref: ExxonMobil, The outlook for energy: a view to 2030, (2009) available at http://www.exxonmobil.com/Corporate/energy_o_view.aspx. ].<br>Rebound effects may be quite large in the productive part of the economy (including industrial plus commercial plus commercial transportation sectors) [ref: H.D. Saunders, "Historical evidence for rebound in 30 US sectors, and a toolkit for rebound analysts," (2011, under review) available at http://works.bepress.com/harry_saunders/9/, showing historical magnitudes of direct effects alone at around 50% in the US productive economy]. Energy use responses to efficiency gains in this productive realm are driven by producers maximizing profits, not end-use consumer behavior that is susceptible to "education." | Taken into account - this paragraph is about efficiency, with just a passing mention of rebound effects. It is about the big picture. But we'll edit to clarify that. This sentence at line 28 replaced with : "While many policy efforts focus on end-use efficiency, improvements in efficiency are relevant across the entire value chain from primary energy supplies to final users." |
| 17066 | 1 | 25 | 21 | | | Perhaps cite California rolling brown-outs from several years ago and recent blackouts in India that left something like 10% of the world' population without power. | Rejected - too much detail for here |
| 12228 | 1 | 25 | 22 | 25 | 22 | It would be useful if some examples of barriers are given. | Taken into account - edit lines 22-23: "However, energy efficiency faces barriers when it comes to implementation—FOR EXAMPLE, THE DIFFICULTY IN OBTAINING RELIABLY INFORMATION ABOUT THE COST AND PERFORMANCE OF |
| 15261 | 1 | 25 | 23 | | | see point 23 | Noted - insufficient information. No |
| 12229 | 1 | 25 | 24 | 25 | 26 | It would be useful if some examples of rebound effect are given. | Taken into account - in light of comment 1162 I think we will just keep it simple |
| 4094 | 1 | 25 | 25 | 25 | 26 | why not reference Jevons to the rebound effect? | Rejected - The relevant chapter in the main body of the report addresses this. Jevons and company are prone to |
| 6435 | 1 | 25 | 25 | 25 | 26 | Additional references for the rebound effect: Gifford, R., 2011. The dragons of inaction: psychological barriers that limit climate change mitigation and adaptation. American Psychologist 66 (4), 290-302; Druckman, A., Chitnis, M., Sorrell, S. and Jackson, T., Missing carbon reductions? Exploring rebound and backfire effects in UK households. Energy Policy 39 (6), 3572-3581; Freire-Gonzalez, J., Methods to empirically estimate direct and indirect rebound effect of energy-saving technological changes in households. Ecological Modelling 223 (1), 32-40; Ouyang, J.L., Long, E.S. and Hokao, K., Rebound effect in Chinese household energy efficiency and solution for mitigating it. Energy 35 (12), 5269-5276. | Rejected - this level of detail is too much for the introduction chapter. Rebound effects are discussed in Chapter 5. Comment has been redirected to ch 5 and ch 9 accordingly. |
| 11149 | 1 | 25 | 26 | | 30 | States that there is a need to educate consumers about the financial and environmental benefits of rational energy use and the rebound effect, which will support effective consumer decisions. However throughout the document this statement is defied directly (on p 389 lines 8-9) as well as indirectly by explaining that consumers are not rational decision-makers and/or not primarily driven by environmental benefits, e.g. P38 lines 5-8; p45 lines 37-44; paragraph 2.3.1; p73 lines 21-24; p169 lines 4-13; 3.11.1.2. I suggest that not only cross-references to these sections are added but that the statement itself is adjusted or removed. | Rejected - This level of detail is too for one paragraph here. Edits (such as in response to 1164) will address this |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 17645 | 1 | 25 | 26 | 25 | 28 | "Socail benefit" is also neseccisty of education for consumers in order to decide effective choices. | Rejected - in light of edits (see 1164) this sentence was deleted |
| 4830 | 1 | 25 | 26 | 25 | 28 | The notion that consumers need to be educated about financial and environmental benefits to induce behavioural change is much too simplified. Psychological research has shown (see also the following chapters) that education alone is not sufficient to induce change. Knowledge is a necessary but not sufficient to make people change their behaviour. See for example the literature review in Abrahamse, W., Steg, L., Vlek, C., & Rothengatter, T., (2005). A review of intervention studies aimed at household energy conservation. Journal of Environmental Psychology, 25, 273-291. | see comment 1170--Sentence will be deleted. But the point here is REALLY important and will be passed along to the chapter that addresses energy efficiency |
| 17413 | 1 | 25 | 27 | | | "educate consumers" is a fairly unsophisticated representation of the opportunity for mitigation through behavior changes -- this is an area of only emerging understanding, but it has become clear that simply "educating" members of the public is not sufficient and that economic, policy and social incentives often need adjustment if large-scale behavior change is to result. This comment applies to Ch 5, p 71, ln 22-26. | Taken into account - combined with other comments |
| 15262 | 1 | 25 | 29 | | | see point 23 | Noted |
| 17067 | 1 | 25 | 29 | | | As stated, it is a weird and abrupt way to end the paragraph - and section. It would be improved if this section stated the barriers and examples of how those barriers have been overcome. | Rejected - this is implicit in all that is said earlier in the paragraph; see also |
| 7891 | 1 | 25 | 31 | 40 | | It is correct that climate policies are a triangular affair between mitigation, adaptation, and geoengineering. According to you, how the priorities are set depends on expectations ("if it is to be expected"). To make priorities dependent on the behavior of others, rather than on normative reasoning, is an ethical claim that should be debated in chapter 3. | Rejected - dependence on the behavior of others is the essence of strategic interaction. And it is core to essentially ALL research in international relations (and broadly now in cooperative theory in economics, going back to game |
| 15278 | 1 | 25 | 31 | 25 | 31 | "adaption" to be "adaptation"? | Accepted - spelling fixed |
| 11901 | 1 | 25 | 33 | 25 | 34 | "More countries…" please give examples; If possible, provide a reference. | Taken into account - edited: "…there has been a shift in emphasis to |
| 10682 | 1 | 25 | 33 | 25 | 34 | "More countries are rightly focussing on adaptation" sounds policy prescriptive | Taken into account - combined with |
| 15263 | 1 | 25 | 34 | | | but there is a danger that adaptation is at the cost of mitigation - is this a message we wish to be communicating - think of the implications! | Noted - maybe or maybe not. But if adaptation is reality shouldn't we be |
| 15423 | 1 | 25 | 34 | | 38 | DELETE: "rightly" SENTENCE SHOULD READ: "More countries have been forced to focus on adaptation." (Countries affected by climate change must focus on adaptation, but it is not a choice.) | Taken into account - combined with other comments |
| 14683 | 1 | 25 | 36 | 25 | 40 | The two references in this sentence to geoengineering sit rather uneasily without further explanation and qualification; it reads very much as though they have been added in parentheses as place holders. If reference to geoengineering is to remain in this section, then it would be important to qualify that its full implications and effectiveness as a social-policy alternative or addition to mitigation or adaptation is not known | Rejected - we have expanded the discussion in this chapter to mention the controversy on geoengineering in a balanced manner. This is an important |
| 11109 | 1 | 25 | 36 | 25 | 37 | "If it is expected that global mitigation efforts will be limited, then adaptation (and perhaps also geoengineering) will play a larger role in overall policy strategy." - "will" should be replaced by "must". My personal belief is that we are too late to mitigate climate change, so a more important task will, and must, be to adapt as much as possible. While the report reflects this approach, I think all possible means should be exploited to emphasize the need for adaptation. | Reject - "must" is an inappropriate value judgement |
| 15424 | 1 | 25 | 37 | | 40 | DELETE BOTH INSTANCES OF: "(and perhaps also prepare geoengineering)" -- one instance in line 37 and one in lines 39-40. Only a few scientists in a few countries are proposing geoengineering as a climate change response. It is premature (and radical) for the IPCC to suggest here that geoengineering will play a role, perhaps a large one, in overall policy strategy, on par with mitigation and adaptation. | Rejected - we have expanded the discussion in this chapter to mention the controversy on geoengineering in a balanced manner. This is an important |
| 17741 | 1 | 25 | 38 | | | list few adaptation measures here | Text has been rebalanced |
| 17742 | 1 | 25 | 39 | | | delete the words "and perhaps also prepare geoengineering" | Rejected - we have expanded the discussion in this chapter to mention the controversy on geoengineering in a |

|---|---|---|---|---|---|---|---|
| 8970 | 1 | 25 | 39 | | 40 | Please omit the word "should" when referring to Geoengineering. The IPCC whole cloth approach should not be an endorsement of this. | Rejected - we have expanded the discussion in this chapter to mention the controversy on geoengineering in a |
| 7356 | 1 | 25 | 40 | 25 | 47 | An international element of "adaptiation" that is relevant here is the responsibility for emissions that have caused the impacts for which adaptiation is required. Coordination on providing just compensation to affected communities is an essential part of international cooperation, as agreed under the UNFCCC and should be referred to here. | Rejected - yes, but there isn't really any science on this. So for now we are just focusing on the shift in underlying realitis and what that means for social science |
| 10480 | 1 | 25 | 41 | 25 | 47 | Repetition of 1.4.3. Suggest merge | good point; for now we will leave it in place and look at overall flow after the |
| 7892 | 1 | 25 | 43 | 25 | 44 | This sentence could be read as downplaying the responsibility of high emitting nations. It should be rephrased or made explicit that this is not the intention. | Rejected - the statement is just a fact. It is what motivates collective action and the central political challenge of the last |
| 17068 | 1 | 25 | 43 | | | "Even the biggest nations…"; again, these nations should be listed so a complete snapshot of the current situation in the world is given, while also allowing posterity to read this report and assess what each nation has done, what impact it has had, etc. | Rejected - not needed; other figures offer that information, and our point here is a larger one about strategy. |
| 13681 | 1 | 25 | 44 | 25 | 44 | Replace "most" by "a significant share of". Reason: Many adaptation options are global, such as research on drought-resistant crops or early warning systems for large-scale meteorological diturbances such as El Nino. | Rejected - we don't agree |
| 4864 | 1 | 25 | 46 | | 47 | The outcomes of the recent political negotiations on adaptation related cooperation contradict to this statement: "The need for (and difficulty of) achieving international collective action is less daunting". | Rejected the statement is correct. The international negotiations on this topic have been dealing with just a very small |
| 7160 | 1 | 25 | 47 | | | Use the expression "international collective mitigative action", rather than "international collective action". Add the word "mitigative" to describe the kind of action that is needed. | Taken into account - edited line 47: "...is PERHAPS less daunting THAN |
| 7161 | 1 | 25 | 49 | 26 | 3 | The two sentences contained within these four lines (the first beginning with 'In general' and the second beginning with 'That insight') express what might be considered conventional wisdom. But I for one am not comfortable with them or the sentiment they express, principally because I find that they extend a false hope or false sense of optimism that somehow mature ecomomies are less sensitive to the weather than less developed economies. Yet currently, the US (an archetype for a mature economy) is suffering one of the worst droughts and heat spells in recored history. If these conditions persist for the next year or two (which is no longer a remote possibility) and crop production in the US falls by 1/3 to 1/2, it seems to me that the maturity of the economy is no guarantee that the US won't suffer as much or more than any less mature (or agrarian) economy. Especially if one considers that in the US most people have never really had to deal with hunger and famine, whereas many of the less mature economies have (at least to some level). I personally am no longer convinced that mature economies are less sensitive to shocks produced by the weather than any other economy, especially when allowing for how humans may react when sufficiently stressed and feeling misled by (and angry at) their political leaders. But countries encompassing large areas or more climatic regions may have more buffering capacity (and larger areas under cultivation) than smaller countries. But if the weather induced damage is sufficiently wide spread no economy is going to fare very well. I would recommend that these two sentences of the text be rewritten to empahsize that the climate situation is pressing (but clearly not hopeless, of course). But please do not give the impression that there are some ecomonies (meaning societies) that are more likely to suffer than others. In the long run (and maybe less than 1/2 century) all economies are going to suffer. And the situation is likely to become progressively worse with each passing year. | Rejected - but they are correct--pretty much all the impacts work shows that the impacts on people (and as a fraction of economic output) are higher for societies that depend more on the "outdoors" for livelihood. Thus lower income places (where dependence on agriuclture is high) are quite vulnerabilithy. And lower incomre usually narrows options. That result has been known for 30 years, was confirmed in the MINK studies among a zillion others, and is highly robust |
| 9252 | 1 | 25 | 5 | 25 | 29 | Mention could be made of the cross-technology ability to bank green energy, eg using excess solar, wind or hydro to pump compressed air underground for later use, instead of peak-supply fossil fuel plant. Also of the comination of biofuels and CCS, to take CO2 out of the atmosphere. | Rejected - This level of detail is too much here |
| 3573 | 1 | 25 | 10 | 25 | 10 | Replace "creating" with "creation" | Accepted - text changed |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 12087 | 1 | 25 | 14 | 25 | 15 | This statement "They also agree that without radical technology innovation deep reductions are not possible by 2050 (IEA, 2010b)" is incorrect. There is a wealth of economic/technical "deep cuts" literature since the mid 1990s which shows that deep cuts to greenhouse gas emissions can be achieved with existing low carbon technologies by 2050.[See Comment #1 above] A full list of this literature can be provided if interested. Also, in the last 5 years, there is a new literature showing how nation's can meet 100% of their electricity needs with combinations of energy efficiency and renewable energy. Please see Elliston B, Diesendorf M, MacGill I, 2012, 'Simulations of Scenarios with 100% Renewable Electricity in the Australian National Electricity Market'. Energy Policy 45:606-613. http://www.ies.unsw.edu.au/docs/diesendorf-simulations.pdf This paper provides an overview of the literature here - 15 studies for different countries, regions of the world and also global studies on how nations, regions and the world can meet 80-100% of its energy needs through renewable energy. | Sentence has been deleted in the revisions. |
| 12089 | 1 | 25 | 16 | 25 | 20 | Energy efficiency/energy conservation AND demand management strategies AND technologies are important because they can be implemented quickly between now and 2020. And the IEA's Energy and Green Growth report states that energy efficiency measures will achieve the majority of GHG mitigation by 2020. Gert Jan Kramer and Martin Haigh (2009) No quick switch to low carbon energy. Nature 462, 568-569 found that "Energy efficiency is the only strategy that has a chance ofenabling the achievement of greenhouse gas stabilization at 450ppm. This is because historically,<br>- It takes 30 years to span the 1000-fold growth needed to get from low carbon energy supply pilot-plant scale up to 1-2% of the world's total primary energy supply -- a sustained growth rate of 26% pa.<br>- After this, historically the deployment rises more linearly to its ultimate share in the energy mix, which depends on direct economic competitiveness at scale.<br>As the authors explained<br>"Our best chance of beating these deployment laws requires efforts on multiple fronts…One implication of the deployment laws is that more action is required on the demand side to increase efficiency and curtail consumption. The good news is that demand-side solutions are subject to different laws. In principle, everyone in the developed world could use less energy tomorrow." | Taken into account - see 1164 and 1170. Gert Jan Kramer and Martin Haigh (2009) is quite different from RCP 2.6. There is no description as 'Energy efficiency is the only strategy that has a chance of enabling the achievement of GHG stabilization at 450ppm'. Therefore, we will keep the text as is. |
| 12088 | 1 | 25 | 25 | 25 | 26 | The text currently states that "Efficiency improvements that<br>lower service costs may directly or indirectly induce additional demand (rebound effect) for energy services, thus partly offset the efficiency gains (Sorrell et al., 2009; Lee and Wagner, 2012".....This should be qualified with a statement that "this risk of negative rebound effects can be significantly reduced through the implementation of effective policies....and reference the IPCC AR5 WGIII policy chapter" Please see European Commission (2011) Addressing Rebound Effects. EU Commission at http://ec.europa.eu/environment/eussd/pdf/rebound_effect_report.pdf | Taken into account - combined with other comments |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 5319 | 1 | 25 | 26 | 25 | 30 | "There is need to educate consumers about the financial and environmental benefits of rational energy use and the rebound effect, which will support effective consumer choices." Here and in other chapters, the authors seem to make the assumption that consumers are systematically bounded rational and poorly informed. There may, however, be considerable hidden consumers switching cost, which are ignored. For example the new energy saving bulbs partially have a different light spectrum, which some consumers seem to find disturbing. Such preferences are not just irrational. There are also other environmental external costs through such bulbs, such as the emissions of quicksilver. Three comments about the rebound effect. 1) Rebound means that some new more energy efficient technology will be used more extensively than the old, less efficient technology . In this sense, some rebound is even socially optimal, because the high use rate may outweigh the social cost of additional use. (See the excellen book by Franz Wirl: "The economics of energy conservation programs," Kluwer, 1997 and articles cited in there.<br>2) Empirically observed rebound effects are often larger than optimal due to ill-defined incentives. Command and control, such as the EU-directive on light bulbs, induces a higher rebound rate than optimal regulation through prices would induce. So the rebound is not the consumers' fault in the first place, but the regulators' ill defined rules. This complex is actually well understood by energy economists. (See also Wirl, 1997).<br>3) To avoid rebound by education is an illusion (and probably highly costly) | Taken into account - combined with other comments |
| 3575 | 1 | 25 | 28 | 25 | 29 | Delete last sentence (repetition from line 22) | Taken into account - in response to other comments we have done that and |
| 4252 | 1 | 25 | 28 | | | The rebound effect is unlikely to be affected much by education - surely a better approach is likely to be a carbon tax or similar mechanism | Taken into account - combined with other comments |
| 3287 | 1 | 25 | 3 | 25 | 4 | Add reference to chapter 13, International Cooperation, at the end of the sentence. | Accepted - added xref |
| 11584 | 1 | 25 | 3 | 25 | 4 | The word finance should be added | Accepted - edited to say: "…international cooperation, FINANCE, |
| 3574 | 1 | 25 | 23 | 25 | 23 | Replace "The same time…" with "At the same time …" | Accepted - Thanks! Text updated |
| 4253 | 1 | 25 | | | | There should be discussion of policies which combine both mitigation and adaptation e.g. Land use policies which can reduce the adverse impacts of climate change and greenhouse gas emissions or housing policies which combine both perspectives | Rejected - This is beyond the scope of our chapter. The urban planning chapter does this |
| 14820 | 1 | 25 | | | | It is not at all clear that "Interactions bteween mitigation and adaptation" qualifies as one of the six "particularly notable challenges" worth including in sec 1.4. The notion of "balance" between the two is somewhat flawed, as the balance is actually occuring among the multitudinous objectives considered by policy makers (and choices made by consumers and citizens). | Taken into account - change section heading for 1.4.5 to "Rising Attention to Adaptation" |
| 10479 | 1 | 25 | | | | Reference to WG II | Taken into account - will add cross |
| 15096 | 1 | 25 | 31 | 25 | 31 | Change:¨ Interactions between mitigation and ADAPTATION¨ | Taken into account - combined with other comments. Title is changed |
| 11585 | 1 | 25 | 32 | 26 | 6 | This section needs to recognise that the heavy burden of adaptation is being forced on the vulnerable and poor countries who have not contributed to the climate change problem. These are the countries which are required to undertake mitigation actions and provide adaptation support. | Taken into account - combined with other comments. |
| 12090 | 1 | 25 | 32 | 25 | 40 | This paragraph and entire sub-section completely ignores mitigation and adaptation synergies. Please see IPCC AR4 WGIII Adaptation and Mitigation synergies for the Forestry Sector at http://www.ipcc.ch/publications_and_data/ar4/wg3/en/ch9s9-5-2.html More examples of mitigation/adaptation synergies can be provided. | Taken into consideration -we will consider rephrasing |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 12091 | 1 | 25 | 32 | 25 | 40 | This paragraph and entire sub-section suggests that it is ok for nations to focus less on mitigation whilst focusing more on adaptation or vica versa. This ignores the fact that there is a scientific literature showing that there is a) a limitation to adaptation strategies for the worst case long term climate change scenarios for many countries [[Please see IPCC AR4 WGII on "Limits to Adaptation at http://www.ipcc.ch/publications_and_data/ar4/wg2/en/ch17s17-4-2.html" and b) therefore mitigation is essential to avoid these worst case climate change scenario's which risk pushing the socio-enviro-economic systems past points which they can adapt c) Finally, it is worth noting that developing countries will bear a high percentage of negative impacts from climate change. Developing countries have a relative lack of adaptive capacity and financial and other resources to apply all cost effective adaptation measures. See World Bank (2009 World Development Report. World Bank at http://siteresources.worldbank.org/INTWDRS/Resources/477365-1327504426766/8389626-1327510418796/Overview.pdfTherefore, based on these scientific and economic facts, and given the evidence in the literature [see Comment 1] significant mitigation is feasible technically and economically,.....the text could legitimately find that there is significant scientific and economic evidence to support nations choosing to prioritise both mitigation and adaptation simultaneously. This appears to a more scientifically sound approach rather than urging nations to choose either focus on mitigation or adaptation, as the current text appears to be implying. | Rejected - we don't say this at all. We say that adaptation is rising in importance. And we talk about some of the macro issues. The stuff about relative impacts on developing countries gets us even further afield. |
| 15097 | 1 | 25 | 37 | 25 | 37 | Eliminate:( AND PERHAPS ALSO GEOENGINEERING) | Rejected - we have expanded the discussion in this chapter to mention the controversy on geoengineering in a |
| 4306 | 1 | 25 | 37 | 25 | 40 | delete text on geoengineering in brackets (line 37 and line 39/40) or mark it as „highly contested“ | Rejected - we have expanded the discussion in this chapter to mention the controversy on geoengineering in a |
| 15098 | 1 | 25 | 39 | 25 | 40 | Eliminate: ( AND PERHAPS ALSO PREPARE GEOENGINEERING) | Rejected - we have expanded the discussion in this chapter to mention the controversy on geoengineering in a |
| 17698 | 1 | 25 | 16 | 25 | 30 | Business case for Energy efficiency can be related to Energy Security | Rejected - too vague |
| 17699 | 1 | 25 | 48 | 26 | 6 | Even if it will be addressed later the tradeoff between adaptation and mitigation should be explained. Also the fact that the countries that will need to adapt more are the least responsible for CC. | Taken into account - Discussion on co-benefits has been beefed up but a detailed assessment of the topic is |
| 17743 | 1 | 26 | | | | There should be a FAQ "What is climate change adaptation" | Taken into account - we will consider this |
| 10836 | 1 | 26 | | | | I am not sure of the definition of mitigation. It is very broad. The way it is worded, world war, global recisions, etc, all seem to qualify as mitigation? I would have thought of mitigation as more of a deliberate act to reduce emissions. Consider changing | Taken into account - Replace 'occurs when any activity that results in' with 'is an activity with the purpose to reduce'. |
| 9927 | 1 | 26 | | | | What's the implication of uncertainty in the report? Because uncertainties can be found not only in mitigation costs, technological change and cliamte change but also in modeling and analyzing. To make it clear, please make it clear what uncertainty is in AR5. | Rejected - we have addressed this extensively throughout, and chapters 2 and 3 do that as well. No action needed |
| 7893 | 1 | 26 | 1 | 26 | 3 | The stage model seems to re-emerge here ("mature"), see comment 28. | Rejected - see our responses to your many other comments on the stage |
| 17069 | 1 | 26 | 1 | | | "… those that are least responsible for emissions" ; island states? much of Africa? ; again, these nations should be listed so a complete snapshot of the current situation in the world is given, while also allowing posterity to read this report and assess what each nation has done, what impact it has had, etc. | Rejected - we are making a macro point here--adding lots of country names will make it harder to read and understand |
| 13196 | 1 | 26 | 12 | 26 | 15 | IPCC has always been very cautious not to retrict its analysis to anthropenic climate change and has always stressed the difference between the meaning of climate change, when used in an IPCC report oas opposed to the meaning in the UNFCCC framework where the climate change is the anthropgenic climate change only. This sentence should be deleted or rewritten to avoid contradiction with the WG I approach. | Accepted - definition will be revised |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 18415 | 1 | 26 | 16 | | | Is a population policy that aims to reduce population growth and reduce emissions also mitigation? In that case you have to quote Chinas effort to control population. Emissions reduction from economic crisis? “any activity that results in emissions of greenhouse gases (GHG) in the atmosphere at levels lower than would otherwise occur”. This is misleading. Please use definition from AR4 until an assessment report changes the definition. | Rejected - we don't need to quote china in a FAQ. No action needed |
| 5760 | 1 | 26 | 21 | 26 | 24 | Please rephrase, e. g. "Anthropogenic GHGs mostly come from (…). A substantial fraction also … ." | Rejected - text is ok |
| 17070 | 1 | 26 | 23 | 26 | 24 | This should reference WG1 #'s and be quantified, such as "While msot GHG come from FF conversion (~60%), a substantial fraction also comes from other activities like agriculture (~20%), industrial processes (XX%) and municipal waste (~XX%)." | Taken into consideration - we were asked to write FAQs that were very short and simple. We will considering |
| 12192 | 1 | 26 | 5 | | 6 | The term “more recently” is a) very vague and b) not correct. It is not correct with regard to 2 aspects: 1. already in the first decade there was a scientific and political debate on the trade-offs of between adaptation and mitigation and what the best policy strategy would be. 2. It is unclear what exactly you mean with “policy strategies”, but if you refer to the global level, the debate is an “older” rather than a “recent” one. Discourse on 'strategies' on adaptation started at least at the beginning of the second decade of UN climate negotiations leading to the Marrakesh Accords. | Rejected - edit at 1230 may be sufficient |
| 7357 | 1 | 26 | 5 | 26 | 6 | The international climate negotiations have always included an element focused on adaptation, including for example the "share of proceeds" agreement for the CDM under the Kyoto Protocol. It is true that the focus has increased significantly in the last five years but the "twenty years" characterisation is an overstatement and does not adequately reflect the detail of UNFCCC negotiations. | Rejected - edit at 1230 may be sufficient |
| 12516 | 1 | 26 | 6 | | | Change “contemplate” to “progress” -- work in adaptation has long since gone beyond “contemplation” | Accepted - edit to line 6: "…more recently begun EXTENSIVE |
| 12230 | 1 | 26 | 9 | 26 | 24 | While the two FAQs included are important, more work should be considered in order to add FAQs on e.g. What do we need to do in order to meet the 2 deg target?, what is the difference between emissions reported to UNFCCC and emissions estimated form life cycle analysis or those including trade?, etc. etc. | Noted. |
| 4040 | 1 | 26 | 3 | 26 | 6 | Perhaps the debate or case for links between adaptation and mitigation should be more centred on the valued outcome. Both mitigation and adaptation are means to an end, the end being reducing losses to what is valued. Instead, the sentence (and indeed the whole section 1.4.5) seems to be framed in terms of adapation and mitigation as ends in themselves. However, for AR5, this framing of the probem should be updated to reflect the fact that we have now moved on from such framing (see Lynch, A. H.; Tryhorn, L.; & Abramson, R. (2008). Working at the Boundary: Facilitating Interdisciplinarity in Climate Change Adaptation Research. Bulletin of the American Meteorological Society, 89(2): 169-179). | Rejected - the extra cite is not needed here. The overall tone in the report is about goals--not mitigation and adaptation for their own sake. |
| 11110 | 1 | 26 | | | | I don't think this FAQ is necessary. It does not say anything, and terms and definitions are usually parts of reports under the heading "Glossary". However, a compendium on climate change, including mitigation and adaptation, has been missing from the webpage of IPCC (many other organizations maintain such a website, or parts of their website is dedicated to climate change or its several aspects) - why IPCC could not develop and maintain such a website, based on its reports e.g., which could then be THE official scientific webpage of climate change for anyone in the world? | Noted. |
| 6881 | 1 | 26 | 12 | 26 | 15 | The UNFCCC definition of climate change differs from the IPCC definition of climate change! The IPCC definition includes both natural and anthropogenic causes of climate change. Thus this FAQ, in our view, will be very misleading if it's meant to explain what in IPCC is meant with climate change mitigation, but starting off with a non-IPCC definition for climate change. | Noted. |
| 7708 | 1 | 26 | 9 | | | Only two FAQ in Chapter 1? For exmaple, the significance of Kyoto Protocol from the scientific and technological view point would be frequently asked by the general public. | Noted. |
| 13257 | 1 | 26 | 23 | 26 | 24 | Add deforestation in the following sentence: "While most GHGs come from fossil fuel conversion, a substantial part also come from other activities like agriculture, deforestation, industrial processes and municipal waste." | Taken into account - replace sentence at 23-24 with commentor's suggested sentence |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 18134 | 1 | 26 | 23 | 26 | 24 | Deforestation as another source of emissions should be included here. | Taken into account - combined with |
| 16666 | 1 | 27 | | | | The chapter "makes arguments." This sounds prescriptive to me. | Taken into account - combined with |
| 15425 | 1 | 27 | 8 | | 10 | Geoengineering cannot claim “reducing economic loses due to productivity shocks” when geoengineering is largely speculative and its impacts are unknown; adverse impacts on the climate and economy, at least the climate and economy in some parts of the world, are as likely. | Rejected - in fact, in emergency mode this is exactly what people think geoengineering will do. Text ok. |
| 16915 | 1 | 3 | | 4 | | Six interesting points, unfortunate that the main chapter then quickly dives into “six major changes” (in section 1.2.1); this could be confusing for readers. I think there could be additions to either list. Regarding the “six arguments” in Exec Sum could consider a seventh, an observation along the following lines:<br>This Fifth Assessment – and the more recent literature it draws upon – has been compiled during a period of unprecedented transition in global affairs spanning economics, geopolitics, international energy markets and the climate change negotiations themselves. This makes it exceptionally difficult to make robust predictions. The most obvious evidence from these trends lead to a pessimistic assessment of the prospects for rapid progress in tackling climate change, but in a time of major global transition, surprises leading to a rapid turnaround in the global trend of emissions cannot be ruled out. | Rejected -- The essential parts of the suggested 7th pointed are already covered. |
| 9379 | 1 | 3 | | 4 | | Even though a broad approach on diverse contributors to mitigation might be necessary to reach the goals, something more needs to be said about the role of governments, because they are still the most powerful institutions in terms of drafting laws and implementing regulations. | Rejected - text is balanced |
| 4141 | 1 | 3 | 1 | 4 | 22 | Please do not use probabilistic qualifiers ("is is likely", "it is very likely", "it is certain") with statements that you cannot underpin with data. I assume that you used these terms in a more colloqial sense but there is the risk to create confusion with regard to the IPCC calibrated uncertainty language. | Taken into account - text revised to use probalistic qualifiers more precisely |
| 7438 | 1 | 3 | 1 | 26 | 21 | This is a general comment on the whole report. At times it reads like a PhD thesis. It tries to cover every angle of ‘sustainable development’ and in my opinion gives far too many references. | Noted |
| 7439 | 1 | 3 | 1 | 26 | 21 | There is a distinct bias against so-called ‘traditional biomass’, which is defined as biomass, both processed and unprocessed used for cooking and heating by households in developing countries. It assumes that these households cook indoors with ‘green’ biomass on inefficient stoves. | Rejected - text is balanced in treatment of traditional biomass |
| 7440 | 1 | 3 | 1 | 26 | 21 | Their number has been put at 2.7 billion and is forecast to grow to 2.8 billion by 2020. Yet the only solution offered is to wean them away from biomass with electricity and/or liquid and gaseous fossil fuels. | Rejected - outside scope of this chapter |
| 7441 | 1 | 3 | 1 | 26 | 21 | Many households cook outside and about 10% cook with charcoal, which is a smokeless fuel with an energy value higher than most coals! Incidentally, nothing is said about people cooking with coal, which is more polluting than most biomass. | Rejected - too detailed for the purpose of this chapter |
| 7442 | 1 | 3 | 1 | 26 | 21 | There are simple and cheap ways to reduce indoor air pollution: namely, better ventilation, using dry biomass, improved stoves with chimneys, improved kitchen practices etc. | Rejected - outside scope of this chapter |
| 7443 | 1 | 3 | 1 | 26 | 21 | The paper also assumes that collecting fuelwood and residues places an undue burden on women and children, when they could be undertaking more productive tasks or going to school. | Rejected - outside scope of this chapter |
| 7444 | 1 | 3 | 1 | 26 | 21 | . However, these collectors also sell fuelwood and charcoal. An estimated 30 million people are employed in its production transport and trade. | Rejected - outside scope of this chapter |
| 7445 | 1 | 3 | 1 | 26 | 21 | It helps with poverty alleviation and promoting other forms of energy in its place, may increase poverty and accelerate deforestation to grow subsistence and cash crops. | Rejected - outside scope of this chapter |
| 7446 | 1 | 3 | 1 | 26 | 21 | The various chapters are full of acronyms. Each acronym is usually defined only once, and some not at all. In my opinion, acronyms should be constantly spelled out, otherwise readers like myself will be mystified as to what is being said. | Taken into account - will be checked in final edits |
| 2325 | 1 | 3 | 1 | 3 | 12 | In the discussion of the market-based approaches, the signed commitment declaration called "Corporate Sustainability Forum Joint Commitment for Climate Transparency and Disclosure in Rio+20" would be recent remarkable step in mitigation of GHGs. More details<br>http://www.unglobalcompact.org/docs/issues_doc/Environment/climate/Joint_Commitment_Statement.pdf | Rejected - Our purpose is to discuss macro trends |
| 4868 | 1 | 3 | 10 | | | "United Nations Framework Conventional on Climate Change | Taken into account - text revised |
| 4587 | 1 | 3 | 18 | 3 | 18 | Given that "capabilities" is a technical term, I would not use it here; why not use again "policies"? | Taken into accont - text revised |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 4588 | 1 | 3 | 21 | 3 | 21 | "understanding" rather than "information" | Rejected - text is fine |
| 8470 | 1 | 3 | 21 | | 22 | Public opinion influences design, but design, politics and media also play a significant role in affecting or shaping the framing or content of public opinion (see for example the work of Doris Graber, Rosalee Clawson or Jonathon Morris) | Noted |
| 3604 | 1 | 3 | 22 | 3 | 22 | Please specify or give examples for "events in the world" . | Rejected - the paragraph already discusses the economic recession. No |
| 4589 | 1 | 3 | 24 | 3 | 24 | "diplomatic outcomes"; do you mean there is a gap between the scale of the mitigation challenge and the "diplomatic outcomes" actually obtained; please, clarify | Noted - that's exactly what we mean. |
| 15551 | 1 | 3 | 24-26 | | | The global economic set-back "beginning around 2008" is not (as far as I am aware) formally classifiable as a "worldwide" recession. In the OECD, perhaps, yes. If I am wrong, and it is in fact, formally classifiable as a "worldwide recession", I suggest the insertion of the words "largely concentrated in industrialised countries" after the word "recession" and before the word"beginning" | Rejected - worldwide is ok. Discussion on post 2008 global economic situation not core theme of Ch.1 |
| 4590 | 1 | 3 | 27 | 3 | 27 | arguments about what. Please, clarify | Noted |
| 14782 | 1 | 3 | 27 | 4 | 22 | The choice of these six arguments as the most important to highlight in this ES is not at all clear. It is also not clear how they related to the remainder of the chapter, which should presumably probide the substantiation for these arguments. (It is also not clear how these related to the six main messages presented in 1.2.1.1 - 1.2.1.6) Many other possibilities for key arguments come to mind, which are perhaps better supported by the text. For example the chapter could elaborate and highlight statements relating to the following points<br>-- "the scale of the mitigaiton challenge has grown enormously since 2007" and discussion of why the level of ambition thus far has been so low.<br>-- "large new supplies of unconventional resources", which seems to be dominating near (medium?) term trends in energy use around the world. | Noted - We map the rest of the text pretty closely on the arguments. And the first of the proposed alternative arguments is, in fact, what we say. The second is incorrect--the flood of unconventional resources is still pretty isolated. |
| 7857 | 1 | 3 | 27 | 4 | 22 | What is the claim that is to be substantiated by the six arguments, or are just matters of facts stated? All six "arguments" are well known and rather trivial. What is the point of stating them? | Noted |
| 7831 | 1 | 3 | 27 | | | The sentence might better read: The present chapter identifies six conclusions. | Taken into account - text revised |
| 6811 | 1 | 3 | 28 | | 29 | this sentence has the wrong oder and emphasis: 'Those include population, the structure of the economy, behaviour, and the state of energy technology.' Infact, fossil energy systems are to blame for 75% of the anhropogenic atmospheric emissions - and should be listed here first, and named, not 'state of energy technology' but 'fossil fel combustion'. | Noted - our language here is meant to map directly on the Kaya/IPAT kind of analysis--that's why we use it that way. |
| 16242 | 1 | 3 | 28 | 3 | 29 | Replace "energy technology" with "technology" to avoid impression of a narrow energy supply perspective. | Accepted - text revised |
| 15525 | 1 | 3 | 29 | | 30 | Should add 'patterns of consumption.' | Accepted - text added |
| 4591 | 1 | 3 | 29 | 3 | 29 | individual or societal behavior? | Accepted - text added |
| 15552 | 1 | 3 | 29 | | | Insert the words "investment decisions" between the word "behaviour" and the words "and the state of…[etc]" | Accepted - text added |
| 12506 | 1 | 3 | 29 | | | Add after "technology" -- "and induced effects, e.g. anthropogenic land use conversion, forest, peat and other land emissions in changing climatic conditions." The following sentence refers to the choice of fuels and the efficiency of the energy system, but does not address land-based emissions that are also a consequence of the four factors affecting GHG emission levels. | Accepted - text added |
| 13672 | 1 | 3 | 29 | 3 | 29 | Add after …"technology": "and availability of energy resources". A country with high renewable energy resources has a different mitigation potential than a country where such resources are absent. | Accepted - text added |
| 17398 | 1 | 3 | 29 | | | "the state of energy technology" is likely too narrow as it excludes other important technologies / practices in the land use sector. | Taken into account - combined with other comments |
| 2326 | 1 | 3 | 29 | | | the term "behaviour" is unclear. It should be social behaviour or Individual behaviour or Institutional behaviour. | Taken into account - combined with |
| 4011 | 1 | 3 | 30 | | | suggested wording: "the choice of production and consumption patterns as well as fuels and the overall efficiency of the energy system" | Taken into account - combined with other comments |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 14777 | 1 | 3 | 30 | | 33 | "In nearly all countries… " This statement is a retrospective statement that pertains to countries and a time period during which there were minimal or zero deliberate attempts at achieving emission reductions. If this conclusion were applied to the future period, it follows that suggest that the most plausible route to lowered emissions would be economic decline. Is this the intended message? It is reinforced by the statement "In *addition*, for *some* countries it is *likely* that...", which suggests that actual deliberate measures to induce mitigation are secondary to economic decline as a mitigation policy. | Taken into account - text revised to clarify. Deleted "in addition, for some countries" in line 32 |
| 6812 | 1 | 3 | 31 | | 33 | This is non-sequitur, makes little sense. There is absolut no evidence that 'market based policies' have been successsful in lowering GHG emission - but there is evidence to the contrary. Also, what does 'the state of the economy' have to do with 'polciies'? It is of course a truism that in a fossil fuel economy a lowering of industrial output will lower emissions, but this is not what is likely meant here. Also important to refer to the Rebound Effect, or Jevons Paradox, when calling for efficiency improvements - these can only have the desired effect when combined with renewable energy based energy systems replacement and sufficiency (lifestyle based consumption pattern) improvements. | Taken into account - The state of the economy has a lot to do with emission policy potentials, and the experience with market based politics is mixed. But text has been revised to clarify meaning |
| 11016 | 1 | 3 | 32 | | | The text states: 'In addition, for some countries it is likely that there is a large role for regulatory and market policies focused on controlling emissions. [1.3; high agreement, robust evidence]'. Comment: This is a judgment, but I would substitute "for most countries" in place of " for some countries" and insert "a mix of" after "large role for". | Taken into account - combined with other comments |
| 4592 | 1 | 3 | 35 | 3 | 35 | there are other national priorities which are more common and more realistic such as economics growth, poverty alleviation, millenium goals, military power; sustainbale development often does not go beyond the rhetoric for diplomatic consumption | Noted |
| 12507 | 1 | 3 | 35 | | | Add after "green growth," -- "terms of trade." The draft extensively documents the impact that trade has on emissions and rightly focuses on emerging study and documentation of consumption-based life-cycle emissions analysis. | Taken into account - text revised |
| 11107 | 1 | 3 | 35 | 3 | 37 | The mere fact that governments have to address different but related policies at the same time does not automatically guarantee<br>"that actual progress in controlling emissions is larger than it may seem when analysts focus just on policies that g overnments have identified as "climate change. | Noted - we agree with this point, but our point here is slightly different, which is to emphasize that the total mitigation effort is hard to observe accurately. |
| 13673 | 1 | 3 | 37 | 3 | 37 | Add "-related" after "climate change"". | Accepted - word added |
| 4866 | 1 | 3 | 4 | | | {Add} "adopt climate {change} mitigation | Accepted - word added |
| 2327 | 1 | 3 | 4 | | | "National governments" would be national governments with simple "n"?? | Accepted - text revised |
| 7832 | 1 | 3 | 40 | 3 | 41 | the following language is sugegsted: … improvements to climate mitigation programs need to address these broader national priorities. | Rejected - we can't make that value judgement. |
| 9185 | 1 | 3 | 40 | 3 | 40 | replace "mitigation" by "mitigation and adaptation" (or "mitigation and adaptation and SRM") | Accepted: text revised to say "mitigation and adaptation as well as other possible |
| 13358 | 1 | 3 | 42 | | | This understates the situation somewhat. All relevant scientific assessments agree that the 2 degrees C goal cannot be achieved given the current trajectory of aggregated global emissions, even given variations in modelled sensitivities. I suggest the word 'likely' be replaced by 'clear'. | Taken into account - text revised to conform to IPCC standard definitions |
| 14778 | 1 | 3 | 42 | | 43 | "It is likely that the current trajectory…" This is a statement that embeds an unstated long-term extrapolation of our present emission path, without which it is not possible to make a statement about long-term temperature rise. What is actually implied is a statement about the likely temperature rise if we do not increase the level of mitigation ambition beyond what has been evidenced so far. This should be made claer, otherwise this statement is easily misinterpretted to mean that we have already committed the climate to a likely chance of exceeding 2C, which is incorrect. | Taken into account - paragraph text revised for clarity |
| 17793 | 1 | 3 | 42 | 46 | | This is probably the most important statement - however it would be nice to add a sentence on the consequences for the assessment itself | Noted |

# Expert Review Comments on the IPCC WGIII AR5 First Order Draft – Chapter X

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 17400 | 1 | 3 | 42 | | | Recommend moving this 'argument' to be the first argument mentioned as it seems to be of much greater significance than then others. | Rejected - the order of our arguments is ok for now. |
| 16961 | 1 | 3 | 42 | | | Is the term "likely" used consistently throughout the WG3 report? … and across WG reports? You might consider a different word given the use of "likely" in quantifiable uncertainty terms elsewhere | Taken into account - text revised to conform to IPCC standard definitions |
| 4869 | 1 | 3 | 43 | | | in order to avoid the negative accent: "more aggressive goals >> more ambitious goals | Rejected - "aggressive" is what we |
| 4593 | 1 | 3 | 44 | 3 | 46 | It the two degrees Celsisus target is unlikely to be met, why single out the 1.5 degree target, especially in an Introduction? This whole sentence seems to be superfluous | Noted - 1.5 is a reality in diplomacy. It needs to be discussed even if it is |
| 14779 | 1 | 3 | 44 | | 46 | "It is extremely unlikely…" This statement seems wholly unjustified given the evidence presented. Is this a statement about the science, claiming that no future emissino path can be described that keeps warming below 1.5C? Is it a statement about the availability of technologies to enable such a path? Is it a statement about the economic viability of acheiving such a path? Is it a statement about the political plausibility of implementing measures necessary for such a path? This categorical statement is extremely ill-defined, and should either be heavily qualified or eliminated. | Rejected - This is a statement about the plausible achievability of this path. But qualifying phrase has been revised to conform to IPCC standard definitions |
| 8702 | 1 | 3 | 44 | | | This is an extremely important and potentially controversial statement. Please add all appropriate qualifying conditions under which it is true. For example, do you mean it is politically infeasible? Certainly, it is not physically infeasible. Also, compared to the previous statement regarding meeting a 2 degrees target, which is only 0.5 degrees higher, the statements are too dramatically different for such a small temperature difference. The careful reader will likely be puzzled. | Noted - qualifying phrase has been revised to conform to IPCC standard definitions. But it should be noted that 0.5 degrees difference between the two targets is not a small difference in reality. |
| 13359 | 1 | 3 | 45 | | | I suggest adding 'given current mitigation efforts' to this sentence. | Rejected - our statement is actually stronger--not just current mitigation |
| 15526 | 1 | 3 | 47 | 4 | 2 | Should also mention the demand side - energy efficiency and changes in consumption patterns are also important. | Taken into account - we address this elsewhere. |
| 15553 | 1 | 3 | 48 | | | Insert the words "capable of substantially mitigating emissions" between the word "trajectories" and the words "bit it is…[etc.]" | Accepted - text revised |
| 17681 | 1 | 3 | 48 | 3 | 48 | the word "here" seems to be there | Accepted - text revised |
| 4009 | 1 | 3 | 5 | | | suggested wording: "Those policies have been local, national and international as well as sectoral in scope" | Taken into account - combined with |
| 4010 | 1 | 3 | 6 | | | suggested wording: "market-based approaches such as emission trading systems along with regulation and voluntary initiatives" | Accepted - text revised |
| 4867 | 1 | 3 | 6 | | 7 | {Add} "market-based approaches such as emission trading systems{, energy or carbon taxes} along with regulation; they encompass many diverse “green growth”{, eco-efficiency} strategies | Taken into account - combined with other comments |
| 7829 | 1 | 3 | 6 | | | It is suggested to speak of "regulatory approaches" instead of "regulation". | Taken into account - combined with |
| 4585 | 1 | 3 | 7 | 3 | 7 | add "and voluntary measures" after mitigation | Taken into account - combined with |
| 7830 | 1 | 3 | 7 | | | It is suggested to substitute "nations" by "countries" as the latter is the more apprpopriate term usually in the IPCC context.. | Accepted - text revised |
| 4586 | 1 | 3 | 8 | 3 | 8 | "economic" unduly restricts welfare; welfare may include happiness | Accepted - text revised |
| 6860 | 1 | 3 | 13 | 3 | 14 | WGIII, II or I or SYR? Please Clarify. | Taken into account - citation in text |
| 6861 | 1 | 3 | 42 | 3 | 46 | The topic of climate targets (and climate change commitments, allowable emissions etc.) is thoroughly assessed in the WGI AR5 contribution. We strongly suggest to ensure consistency in the underlying assessment with the careful assessment provided in WGI AR5, primarily Chapter 12. Reference to Chapter 12 needs to be added. As a general comment, we strongly suggest to avoid reassessing topics concerning the physical science basis in order to reduce duplication and inconsistencies between the WGIII and WGI contributions to AR5. | Taken into account - This is a topic that requires an analysis of the physical and the socioeconomic basis. But if necessary, the outcome of WG1 will be reflected in social science (including economics) literatures, which will be |
| 2928 | 1 | 3 | 11 | | | delete "also" which is not necessary | Accepted - text revised |
| 2927 | 1 | 3 | 4 | | | "have seen active efforts" to be replaced by "have seen relatively active efforts" in order to be more nuanced | Accepted - text revised |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 3893 | 1 | 3 | 27 | 4 | 22 | The six arguments referred to in the executive summary appear to be based on the premise that governments can force their citizens to incur the proposed costs, without losing office in the process. No evidence is put forward in support of the proposition that what is being advocated is politically feasible. An analytical problem here is the absence in the chapter of a positive theory of state and bureaucratic action. Yet disappointing policy outcomes are likely when there is no mature and well-developed understanding of current incentive structures. On a more encouraging note, there is less reason to be pessimistic about voluntary, spontaneous responses to the issues. A great many citizens and organisations will be more motivated to consider the future than the corrupt and venal administrations that are so prevalent according to Transparency International, and others. Would not the chapter be better organised if it distinguished between mitigation approaches that depend on government force and mitigation processes that make use of voluntary initiatives? Any implicit notion that if governments fail, all is lost must be resisted. | Rejected - this goes beyond what we can say as scientists, even if we have a political economy theory of action in mind. |
| 15080 | 1 | 3 | 10 | 3 | 10 | It is incorrent the name of UNFCCC not is Conventional is Convention | Accepted - text revised |
| 13654 | 1 | 3 | 27 | 3 | 30 | Factors affecting cc mitigation said to be population, structure of the economy, behaviour, and state of energy technology. This draws from the Kaya identity approach (Sathe Jayant et al), which is flawed in that it considers population as the main driver of emissions. However data shows otherwise (Sattherwaite etc al.) | Noted - elsewhere in the chapter we make it clear that economic drivers and technoogical drivers are more important. Following team discussion, this section |
| 15081 | 1 | 3 | 28 | 3 | 29 | I propose to include in the factor the governments will and the availability of financial resources at national and international level in order to solve the main sources od GHG emissions, mainly in developing countries. | Taken into account - we already include this. |
| 13655 | 1 | 3 | 42 | 3 | 43 | Emphasis on emission trajectories which are subject to higher uncertainties (are counterfactual) than more robust indicators of temperature increase such as carbon budgets (cumulative emissions) (Allen et al., Meinshausen et al.) | Taken into account - Emission trajectory also implies levels of cumulative emissions. Text added. |
| 15079 | 1 | 3 | 5 | 3 | 9 | I propose delete this part or improve ¨ They have included market-based approaches such as emission trading systems along with regulation; they encompass many diverse “green growth” strategies that nations have adopted with the goal of promoting human economic welfare and jobs while also cutting an array of environmental impacts including emissions of carbon dioxide (CO2) and other greenhouse gases (GHGs). Because market-based approaches neither is the best example nor the main lines in cutting GHG emissions, and ¨green growth¨ is very controvertible and didn´t reach consensus in High Level Meeting of Rio+20 and I propose to omit here and in all text | Rejected - Our language is broad here and points to lots of different strategies. |
| 17680 | 1 | 3 | 42 | 3 | 43 | The term "likely" migth suggest the evidence is not "robust". I line 44 for robust evidence the term extremely is used. | Taken into account - qualifying phrases revised to conform to IPCC standard |
| 17693 | 1 | 3 | x | 33 | y | Usage of words that can be hard to understand for the non native english speaker,prone, parse, germane, halving, Reapeted words in the same sentence | Noted |
| 4024 | 1 | 31 | 30 | 31 | 43 | the correct reference is: Shindell, D., J.C.I. Kuylenstierna, E. Vignati, R. van Dingenen, M. Amann, Z. Klimont, S.C. Anenberg, N. Muller, G. Janssens-Maenhout, F. Raes, J. Schwartz, G. Faluvegi, L. Pozzoli, K. Kupiainen, L. Höglund-Isaksson, L. Emberson, D. Streets, V. Ramanathan, K. Hicks, Kim Oanh N. T., G. Milly, M. Williams, V. Demkine, and D. Fowler. Simultaneously mitigating near-term climate change and improving human health and food security. Science, 13 January 2012: Vol. 335 no. 6065 pp. 183-189 DOI: 10.1126/science.1210026. | Taken into account - citation added |
| 7159 | 1 | 325 | 33 | | | The parenthetical expression, '(and a lot more likely)' is a bit confusing. I suggest "with some change in climate inevitable, 'and significant change looking increasingly likely,' " . | Rejected - text seems fine |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 18255 | 1 | 4 | | | | 3. Adaptation to climate change impacts<br>“In that context it is very likely that adaptation to climate change should be viewed as a complement to mitigation policies, not a substitute.”<br>Yes adaptation and mitigation are complemented each other, but both are related with development (“economic development is perhaps the best hope for adaptation to climate change”, Economics of adaptation to climate change: Synthesis Report, World Bank, 2010). Then innovation policies could be either specific, or attending both, or even overlapping adaptation and mitigation policies and actions. | Taken into account - cite to World Bank report |
| 9380 | 1 | 4 | | | | A seventh significant change can be seen in the grown emphasis on ethical issues; climate change is discussed in terms of "justice", "the most vulnerable persons", "environmental rights", "sustainability" etc. | Rejected - langauge recalibrated a bit, but mostly this is not a topic for our |
| 14357 | 1 | 4 | 1 | | | Cryptic. What technologies? Sounds like a plea for geoengineering. If this is the case, be explicit. | Rejected - This is a discussion on deep cuts, therefore geoengineering is out of |
| 8703 | 1 | 4 | 1 | | | I think you mean "climate change targets" not "trajectories" in this sentence. | Rejected - "climate change trajectories" phrase not found in text. Insufficient |
| 14781 | 1 | 4 | 16 | | 22 | It is not at all evident that "sohpisticated techniques" have in fact yet been developed that have been usefully applied to assessing geoengineering. | Taken into account - following team discussion, text revised for clarity. Geoengineering is not the only, nor most |
| 7858 | 1 | 4 | 16 | 4 | 19 | What are the "more sophisticated techniques" you mention? At least in chapter two only conventional economic wisdom can be found. | Noted - In this context, the words mean such as CCS, BECS (bio with CCS), Hydrogen etc. and not including |
| 14330 | 1 | 4 | 18 | 4 | 19 | The text refers to research on risk management strategies and mentions "emergency geoengineering" as one policy response. The brackets at the end of this sentence to refer chapter 2. However, chapter 2 does not mention geoengieering. There is no in-depth research or literature on risk managment specifically of of geoengineering. Thus mentioning geoengineering as one example before the brackets appears slightly misleading. | Accepted - chapter 2 is about tail risks and management. Team will liase with ch 2 to consider whether/how geoengineering is useful for managing tail risks and to discuss including the |
| 15417 | 1 | 4 | 18 | | 19 | DELETE: "and emergency geoengineering [chapter 2; low agreement, medium evidence]". It is not clear what "emergency geoengineering" means, though the phrase implies that there is another category of geoengineering that is for non-emergency purposes. Geoengineering itself is neither mitigation nor adaptation according to IPCC definitions of both concepts in AR4. (IPCC, 2007:84 and IPCC, 2007:76). This point was also discussed in the Joint Expert Meeting on geoengineering held in Lima in June 2011, and there was NO agreement among workshop participants to define geoengineering as either mitigation or adaptation, although some participants proposed that the definitions of mitigation and adaptation could be revised to accommodate geoengineering techniques. The definitions of adaptation and mitigation do NOT accommodate geoengineering, but it should not be implied, therefore, that geoengineering can be considered another (equally valid), "third" option.<br>Geoengineering is highly controversial and speculative and this should be made clear in AR5, at the first mention of geoengineering. | Taken into account - 'emergency geoengineering' phrase changed to 'possible deployment of geoengineering technologies as a last resort in case the dangers of extreme climate change appear quickly' |
| 4594 | 1 | 4 | 19 | 4 | 19 | why limit to geo-engineering and not simply to technology to be more general? | Noted - because there is a special role |
| 15418 | 1 | 4 | 19 | | 21 | DELETE: "In that context it is very likely that adaptation to climate change should be viewed as a complement to mitigation policies, not a substitute [1.4; high agreement, limited evidence]." REPLACE WITH: Adaptation to climate change is an unavoidable and necessary measure for countries affected by climate change, but should never be seen as a substitute for mitigation. Adaptation always has and always will play a larger role in the overall policy strategy of developing countries than mitigation has played or will play. | Rejected - text is ok as is; proposed revision has language "always and always will play a larger role" that may not be true, in fact. |
| 15554 | 1 | 4 | 2 | | | Insert new third sentence to this para (after the one ending "….excessive emphasis") as follows: "On the other hand, there is a recognised linkage between path dependency and technology choices, particularly in the cases of (e.g.) large-scale infrastructure and building stock" | Accepted - sentence added but paragraph has been revised |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 15419 | 1 | 4 | 21 | | 22 | DELETE: "There is rising scholarly attention to the role of adaptation in light of the GHGs already loaded into the atmosphere and likely emitted in the future." The "scholarly attention" would need to be referenced along with noting the level of agreement for the assertion (that scholarly attention to adaptation is rising). If the implication is that focus is shifting to adaptation because of failures to mitigate, this is a dangerous message to send to Northern countries that should retain or concentrate focus on emissions reductions. If the implication is that the "scholarly attention" to adaptation includes attention to geoengineering, this is flawed, as there is no justification for considering geoeningineering a form of adaptation. | Rejected - We don't need to cite in the executive summary. And the confidence statements we put after each paragraph apply to the whole paragraph; we don't need them for every sentence. |
| 16963 | 1 | 4 | 24 | | | WG3 is charged with "assessing scientific research", but this report is framed in terms of 6 somewhat arbitrary arguments. Is this really the most objective way to present the state of science as it relates to mitigation? | Rejected - The arguments are neither arbitrary nor unscientific. |
| 15274 | 1 | 4 | 24 | 4 | 24 | "Working Group 3" to be "Working Group III", keep consistence. | Editorial – copyedit to be completed |
| 4595 | 1 | 4 | 25 | 4 | 25 | add "and their cumulative impacts" | Accepted - text revised |
| 4596 | 1 | 4 | 26 | 4 | 27 | delete last sentence of this paragraph (see rationale on next line) | Taken into account - combined with |
| 2240 | 1 | 4 | 26 | 4 | 26 | There is no energy balance at any place on the the earth's surface and there is no overall "energy balance". Every geologiust knows that the earth's energy fluctuates over every time scale | Rejected - the reference here is to planetary balance. |
| 4597 | 1 | 4 | 28 | 4 | 28 | add "after this one" "- the fifth IPCC comprehensive assessment-" | Rejected - text is ok. |
| 4850 | 1 | 4 | 28 | | 37 | This text is common for all the AR5 | no action needed, insufficient information |
| 2328 | 1 | 4 | 28 | 4 | 37 | In this paragraph, "such assessments" is used repeatedly. It would be better to note at least one place the specific name of assessment. Otherwise, readers may be confused. | Taken into account - combined with other comments |
| 8704 | 1 | 4 | 32 | | | the important word "consistent" is not defined here - please state what is meant | Taken into account - text revised |
| 15238 | 1 | 4 | 35 | 4 | 36 | Good! | Noted |
| 15528 | 1 | 4 | 35 | | | Could also mention World Bank (2012). 'Inclusive Green Growth: The Pathway to Sustainable Development' World Bank, Washington DC. | Accepted - cite added to text where we talk about "green growth". But text has |
| 7859 | 1 | 4 | 35 | 4 | 37 | What is ment by "neutral language"? Please be more precise. Are you referring to value-neutral language? This claerly is not the case. Throughout the chapter we see many implicit assumptions which are value-laden or even prescriptive. Questions of viability, for instance, are never completely neutral. To address the challenge of anthropogenic climate change value judgments and judgments of different courses of actions are inevtiable, but they must be made explicit as well as comprehensible. | Taken into account - paragraph has been deleted |
| 16964 | 1 | 4 | 36 | | | This report is MANDATED to be policy-relevant, not INTENDED. The language should be strengthened to cement the fact that IPCC reports are - by intergovernmental decision - to be objective and not policy-presriptive | Taken into account - paragraph has been deleted |
| 4598 | 1 | 4 | 38 | 4 | 39 | delete the entire line after "This chapter" and continue with the next line "focuses first on the main messages.." | Accepted - text revised |
| 13674 | 1 | 4 | 4 | 4 | 4 | Add sentence "However, some policies such as market mechanisms and emission taxes have shown their ability to mitigate greenhouse gas emissions under widely varying circumstances". See evidence in Chapters 15 and 13. | Rejected - sentence is not really needed. In Chapter 15, there are descriptions that other policies are effective as well. |
| 14783 | 1 | 4 | 41 | | 42 | "… raising questions about the viability…2 degrees" Again, without elaboration and explanation about whether this is a scientific, technological, economic, or political assessement, this statement is easily misinterpretted. | Taken into account - we will consider this |
| 6808 | 1 | 4 | 42 | | | There is sufficient evidence that 2 degrees are too high, and that 450 ppm carry a massive risk of overshooting that target. http://pubs.giss.nasa.gov/abs/ha00410c.html, many other sources | Rejected - outside scope of this chapter. This is to be treated in WGI |
| 17643 | 1 | 4 | 43 | 4 | 45 | Is this sentence added the norm "adaptation"? (In section 1.4, "adaptation" was introduced, and was mentioned the intractions between mitigation and adaptation.) | Rejected - text is ok. Here we discuss about conceptual issues. Mitigation is a |
| 18009 | 1 | 4 | 43 | 4 | 43 | “green economy” is one of the key concept in the introduction. In order to introduce this concept in a comprehensive way, the recent international consensus regarding this concept, namely the language agreed in Rio+20 need to be reflected. | Rejected - We cite the concept and some of the literature and explain. This is a mitigation report and not an |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 11391 | 1 | 4 | 43 | 5 | 10 | The separated references to sustainable development and green growth creates the impression that these are two different concepts. However, as pointed out above in the general comments, the multilateral consensus coming out of Rio+20 is that green growth (as part of the concept of green economy) is simply among the tools that can be used to achieve sustainable development, rather than a replacement concept for sustainable development itself. In this regard, all references to green growth should be deleted or at least be indicated as “green growth in the context of sustainable development” | Taken into account - text revised |
| 15240 | 1 | 4 | 47 | | | mention of nuclear may be contentious? | Noted - Whether it is contentious or not is not the issue in IPCC. We address |
| 4870 | 1 | 4 | 5 | | | [Del] consistent use of the term: "participate in climate [change] policy | Accepted - text revised |
| 12508 | 1 | 4 | 6 | | | Add after “including” -- “subnational governments and” The role of municipalities and other subnational entities is well covered in the draft and deserves recognition here in the summary. | Taken into account - combined with other comments |
| 4871 | 1 | 4 | 7 | | | {Add} "different environmental, {social,} business and | Accepted - text revised |
| 15527 | 1 | 4 | 9 | | 15 | Should also add 'economic growth.' | Rejected - text is ok as is. |
| 8471 | 1 | 4 | 9 | | 15 | Uncertainty is important, but so is complexity and variability as part of that equation. Simply focusing on uncertainty implies that a greater degree of certainty can be generated (through science, for example) and that may not be true. It may be helpful to refer to climate change as a "wicked problem" (See the recent work of Val Brown) and in particular the interaction effects that occur between policies and policy instruments across domains (work in eco-health, for example, helps illustrate this) | Taken into account - text expanded and revised to include complexity, but not variability |
| 14780 | 1 | 4 | 9 | | 15 | This fifth main argument about uncertainty unhelpfully confounds and equates many different types of uncertainty, all of which are relevant to some extent, but this statement de-emphasizes the fundamental, profound *downside* risk associated with disruption of the climate system. Other types of uncertainty (such as in future economic growth rates, technological progress, policy effectiveness) are certainly relevant, but in an important way they are secondary to the uncertainty associated with the magnitude of the potential climate damages. Neglecting this point leads to an attenuation of the meaning of a "robust," "adaptive" strategy, underemphasizing the necessity for a precautionary response. | Rejected - different types of uncertainty should be illustrated but disentangling the many kinds of uncertainty here in the executive summary isn't really hepful (and the illustration of climate uncertainties being more important isn't always true). Note that chapter 2 does this in detail |
| 16962 | 1 | 4 | 9 | 4 | 15 | In this discussion of uncertainties, no mention is given to one of the biggest uncertainties of all - actually measuring the emissions themselves. As the recent Guan et al (2012) paper showed in Nature Climate Change, emissions ucnertainties in China can be on the order of 1 Gt(!) | Taken into account - Text added to address all main sources of uncertainty, not only in the emissions. For efficient and effective mitigation policies the |
| 18419 | 1 | 4 | | | | The idea that the mitigation challenge has grown enormously since 2007 should be stressed in the introduction (pag 4 last paragraph). | Rejected - team discussed this; stressing this point is not necessary |
| 8842 | 1 | 4 | 25 | 4 | 25 | It currently defines Mitigation as "the effort to control the fundamental sources of climate change". Perhaps it should be emphasised that the primary focus of mitigation is to control the fundamental anthropogenic sources of climate change, with geo-engineering of naturall climate drivers a last resort (which is not to say that there shouldn't be geo-engineering research in preparation). | Taken into account - text edited to clarify meaning of 'mitigation' |
| 15084 | 1 | 4 | 26 | 4 | 26 | To add in line 26 : ….notably the emission of GHG AND pollutants that can affect the planet’s energy balance | Rejected - sentence ok as is |
| 6299 | 1 | 4 | 35 | 4 | 35 | What is meant by "neutral" language? Re-word, avoiding "value neutral" but perhaps "non-partisan." | Taken into account - combined with other comments. Text has been revised |
| 4245 | 1 | 4 | 14 | 4 | 15 | There should be mention of co-benefits of mitigation strategies at this point particularly health co-benefits. See for example Haines A, McMichael AJ, Smith KR, Roberts I, Woodcock J, Markandya A, Armstrong BG, Campbell-Lendrum D, Dangour AD, Davies M, Bruce N, Tonne C, Barrett M, Wilkinson P. Public Health benefits of strategies to reduce greenhouse gas emissions: overview and implications for policy makers. Lancet 2009; 374:2104-14. Also the WHO series of papers on health in the green economy http://www.who.int/hia/green_economy/en/ | Taken into account - Discussion on co-benefits has been beefed up but a detailed assessment of the topic is addressed elsewhere in the report. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 15082 | 1 | 4 | 19 | 4 | 21 | Not is real the asseveration ¨ In that context it is very likely that adaptation to climate change should be viewed as a complement to mitigation policies, not a substitute¨. The adaptation policies not can be seen as a complement of mitigation policies, each with their personality and objectives, in many developing countries the adaptation is the main way and measures because their GHG emissions are very low | Noted - no action needed |
| 15083 | 1 | 4 | 21 | 4 | 22 | To add in : ¨There is rising scholarly attention to the role of adaptation in light of the GHGs already loaded into the atmosphere and likely emitted in the future AND THE CLIMATE CHANGES THAT IS OCCURRING AND THOSE PROGNOSTICATED | Rejected - no changes needed-- proposed changes here don't add further meaning to exisiting sentence |
| 17682 | 1 | 4 | 1 | 4 | 2 | If no specific set of technologies is outlined a technology can be removed it there are no technical or economic capabilities to implement it | Noted - insufficient information. No action needed |
| 17683 | 1 | 4 | 25 | 4 | 26 | The planets energy balance? Maybe it could be more specific regarding the green house effect of GHGs because action is towards reducing them not sending energy into space | Noted - no action needed |
| 7002 | 1 | 4 of 33 | 25 | 4 of 33 | 26 | Add "and enhancing GHG sinks also", after "to control the fundamental sources of climate change". | Accepted - text revised |
| 7003 | 1 | 4 of 33 | 29 | 4 of 33 | 29 | Add "man-induced", besides "global climate change". | Taken into account - text has been |
| 7004 | 1 | 4 of 33 | 36 | 4 of 33 | 37 | The last phrase in this paragraph has been included systematically in PCC Assessments since the first one, but the results have been worsening day after day and year after year, and thast is also policy relevant!!!! Maybe it's time to find another way for obtaining appropriate results with another phrase or another steps more effective. | Taken into account - sentence has been deleted |
| 6813 | 1 | 5 | | | | Changes since AR 4: should one not also mention, above all, that emissions and GHG concentrations are growing unabatedly, and that the natural global carbon mechanism shows serious signs of getting out of control - reference ice melt rates and discovery of large and sustained methane streams from thawing permafrost areas? Much of this section isn't really very well focused on the topic at hand, stretches are even superfluous. This seems a bit incongruous with what is daid ion pages 14 and 15. | Rejected - text needs to stay focused on what we actually do in chapter 1. other revisions will address this point somewhat |
| 12216 | 1 | 5 | 10 | 6 | 39 | The focus of this section is on development in developing countries. While appreciating that, please consider to include efforts done to mitigate climate change also in the developed world. Both initiatives that developed countries have taken in order to assist developing countries (e.g. REDD+) and initiatives to mitigate national emissions in developed countries, e.g. in Europe. | Rejected - there is extensive discussion of this in the main text. No further action needed. Text will be added in next section on green growth in response to |
| 2241 | 1 | 5 | 10 | 5 | 19 | Sustainable development is impossible. There are only two directions, forward and backward. The climate and everythingh in it evolves and we should try totake advantage of its course. To try and stop is leads to disaster. | Noted - no action needed |
| 8472 | 1 | 5 | 10 | | 19 | Important to note the difficulties of implementation, and the often-ignored gap between strategy, planning, policy and then implementation. It is typically assumed (see Wildavsky 1973) that implementation is an automatic step - this is often not true, and is impact by both political and bureaucratic structures. It is also important to note that equity issues also include social, health and political equity at the individual levels, all of which factor into climate change "policy" | Noted - the main text addresses this adequately. No action required |
| 18010 | 1 | 5 | 10 | 5 | 10 | “green economy” is one of the key concept in the introduction. In order to introduce this concept in a comprehensive way, the recent international consensus regarding this concept, namely the language agreed in Rio+20 need to be reflected. | Taken into account - combined with other comments that suggest using sustainable development or green |
| 17401 | 1 | 5 | 10 | | | It's not clear to me that "green growth" is a term that is of comparable importance and longevity as "sustainable development" -- perhaps consider de-emphasizing its prominence in the document. | Taken into account - combined with other comments |
| 17646 | 1 | 5 | 10 | 9 | 11 | After reading subsections 1.2.1.1 and 1.2.1.2 are well, the reader might get the impression that since the publication of AR4, only developing and emerging countries have taken strong action against climate change while the industrialized world only has a deep financial crisis on its track record since AR4. An overview section on policies within industrialized countries might mend to this issue. | Taken into account - text has been revised to include paragraph on industrialized countries' actions |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 4012 | 1 | 5 | 11 | 5 | 19 | suggested wording: "Since the paradigme of sustainable development was advanced through international processes such as the Brundtland report (World Commission on Environment and Development, 1987) it gradually has been accepted and popularized as a framework to harmonize economic development and environmental protection . This approach, which emphasizes the integration of selected policy goals, is particularly important for climate change as it intersects with many development and environmental goals—including challenges of establishing fairness between country regional groupings and generations of peoples. In many respects, climate change is becoming the key environmental challenge of sustainable development (see chapter 4)." | Taken into account - there are lots of comments that point in all different directions on the language here. Other comments and responses will address this topic. |
| 9107 | 1 | 5 | 11 | 5 | 13 | I think that the generalization only applies when production-based inventories are concerned. There is a lot of evidence that with production-based perspective cities may cause more emissions as well. | Noted -- No further action needed |
| 4873 | 1 | 5 | 13 | | 14 | [Del] "as one of basic [principles] approaches | Taken into account - text has been revised so suggested change is no |
| 15239 | 1 | 5 | 14 | 5 | 15 | together with achieving social equity (e.g. see UNESCO) | Rejected - suggested change is not necessary. No further action needed |
| 4600 | 1 | 5 | 15 | | 15 | I would add as a reference:(…; Agenda-21, 1992) since the latter is the first major international policy document in which the exprtession Sustainble Development appears | Rejected - statement may not really be true. No furthre action needed |
| 4874 | 1 | 5 | 17 | | | {Add} "economic{, social} and environmental goals | Accepted - but paragraph has been |
| 16965 | 1 | 5 | 17 | | | Introducing terms like "fairness", which have many definitions and are (by definition) subjectively interpreted, would steer this report away from its mandate to remain objective and not cast value judgements. | Rejected - The report needs to reflect the literature. There is a huge literature on justice and fairness, and this is a big issue for lots of countries so the chapter |
| 6442 | 1 | 5 | 18 | 5 | 19 | "Fossil fuels resources are...cost-competitve with other energy forms." This statement needs to be qualified in terms of the economic framework in which it is made. For example, the externalities associated with fossil fuel combustion are not fully paid for by the fossil fuel industry or use (despite the existence of various emissions trading schemes). Fossil fuels are only cost competitive today because they do not pay their way for the environmental damage caused. | Taken into account - the quoted sentence is not found anywhere in the chapter text, but reference added to chapter 3 that discusses externalities in more details |
| 17685 | 1 | 5 | 18 | 5 | 18 | aspects instead of respects… | Rejected - respects is the correct word |
| 4599 | 1 | 5 | 2 | | 2 | add at the end of the line "as well as in the science related…" | Rejected - suggested change is not necessary. No further action needed |
| 12509 | 1 | 5 | 20 | | | Add after "including" -- "sovereignty, domestic order, and international relations especially terms of trade and security,..,." | Taken into account - suggested changes are too complicated. Other edits will fix |
| 13360 | 1 | 5 | 22 | | | It is an overstatement to suggest that the goals and interests framed by developing countries are 'paramount'... in other words, 'more important than all others' goals and interests'. While the future growth in emissions from major emerging emitters is highly significant, the actions of developed countries in both reducing domestic consumption and emissions and providing effective funding to assist in mitigation and adaptation remain powerful dialogic influences shaping developing country actions, goals and interests. I suggest replacing 'paramount' with 'critical'. | Accepted change- but paragraph has been revised |
| 16966 | 1 | 5 | 23 | | | Here, and elsewhere, it could be quite beneficial to list the actual countries the text is referring to. Not only does it give a complete snapshot of the current situation in the world, but it will allow posterity to read this report and assess what each nation has done, what impact it has had, etc. | Taken into account - combined with other comments |
| 7861 | 1 | 5 | 24 | 5 | 25 | What do you mean by "necessary industrialization and urbanization in a traditional growth pattern"? Are you suggesting that conventional growth patterns are inevitable or desirable? If so, this is problematic for at least two reasons: first, there are well know possibilities to create properity without conventional growth; second, you would be implicitly suggesting that the main cause of rising GHG emissions - conventional growth - can/should be addressed to a limited extend only. See comment 25. | Taken into account - paragraph has been rewritten |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 16889 | 1 | 5 | 28 | | 35 | Policies that try to do too many things or meet multiple objectives frequently don't do anything well -- multiple objectives raise cost and decrease effectiveness. (Sorry, I don't have much to cite here, so probably not that helpful.) | Rejected - topic of "policy effectiveness" is beyond scope of the chapter. |
| 16967 | 1 | 5 | 29 | | | This should be CHANGES IN extreme weather events (extreme weather events would happen without climate change - it is how their magnitude, frequency and location change with a changing cliamte that is of most interest) | Accepted change- but paragraph has been revised |
| 4013 | 1 | 5 | 30 | 5 | 31 | suggested wording: "Mindful of these impacts, these countries have acknowledged that climate change should be acoounted for prominently in sustainable development strategies." | Accepted change- but paragraph has been revised |
| 13361 | 1 | 5 | 31 | | | It is more accurate to claim that 'many of these countries have acknowledged that climate change is 'an increasingly important component of sustainable development'. | Taken into account - combined with other comments |
| 18011 | 1 | 5 | 31 | 5 | 35 | “green economy” is one of the key concept in the introduction. In order to introduce this concept in a comprehensive way, the recent international consensus regarding this concept, namely the language agreed in Rio+20 need to be reflected. | Taken into account - combined with other comments |
| 16968 | 1 | 5 | 31 | | | Where is it cited that climate change is THE important component to sustainable development. This probvlem presents itself elsewhere and can be fixed simply by replacing THE with AN. | Taken into account - combined with other comments |
| 8705 | 1 | 5 | 31 | | | do you mean "most" important component? | Taken into account - combined with |
| 11392 | 1 | 5 | 31 | 5 | 35 | The reference to green growth here should be “in the context of sustainable development” so as to link it to the multilateral consensus from Rio+20. | Taken into account - combined with other comments |
| 6814 | 1 | 5 | 33 | | | The use of unconventional sources is a sign that the peak is behind us, not ahead. I would quote the IEA's Chief Economist on that who consistely asserts since 2009, that the 'peak' - ie sustained conventional supplies - occurred in 2006. The fact that the world economy is now fossicking for remnant, risky, dangerous and increasingly expensive fossil sources should be cause for alarm, not complacency (as here implied). | Rejected - discussion and statements (ahead, behind,…) on "peak" is beyond scope of chapter. |
| 9108 | 1 | 5 | 33 | 5 | 43 | I'd like to ad that cities may also be promoters of consumption intensive lifestyles leading to high GHG loads. This seems evident and a bigger problem than it is often credited if kept in mind that cities generate 90% of global economy. | Rejected - we talk about cities elswhere. no action needed |
| 13362 | 1 | 5 | 36 | | | This opening sentence overstates current realities and does not clarify what 'this approach' is. I suggest 'Many developing countries have made considerable efforts to address both sustainable development and climate change. Their collective efforts include all major mitigation measures...etc' | Taken into account - combined with other comments |
| 11715 | 1 | 5 | 36 | 5 | 37 | Efforts are not only for developing countries. [Developing countries] shoud be amended to [Developed and developing countries]. | Taken into account - paragraph has been revised |
| 6455 | 1 | 5 | 36 | 6 | 2 | Make it shorter. To delete the sentence after "For example". | Taken into account - section has been |
| 16890 | 1 | 5 | 36 | | 47 | There is a common myth that lowering emissions from the BAU pathway halts growth -- it is untrue. Please make sure people understand this. | Noted - comment is very general; team will address this generaly |
| 17402 | 1 | 5 | 36 | 5 | 40 | Strongly recommend adding agriculture to this set of mitigation arenas, both related to GHG reduction and C sequestration. | Taken into account - section has been revised |
| 7862 | 1 | 5 | 36 | 5 | 36 | On which concept of Susatainbable Development relies this statement? In addition, the following lines are very China-friendly. We should not downplay Chinese efforts to mitigate GHG emissions (especially with respect to inaction by some developed countries), but the message in this paragraph is one-sided given rapidly rising emissions and other enviromental problems in China. | Taken into account - section has been revised |
| 10062 | 1 | 5 | 36 | 6 | 2 | This passage is mainly about China's effort to maintain sustainable development. Currently, China's four big cities have implemented vehicle purchase restriction. This kind of policy instrument is unique, convincing and has seldom been used in western countries. I suggest adding a piece of text describing this effort. | Rejected - this level of detail is not included in the exectuive summary. Such policies are discussed in some |
| 16969 | 1 | 5 | 36 | | | Claiming that developing nations have "made great efforts" is a bit of a subjective statement, particualrly with emissions trends and projections do not necessarily support "great efforts" by some people's interpretation. | Taken into account - text has been revised. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 2329 | 1 | 5 | 37 | 6 | 15 | Their efforts cover all major mitigation measures- here, the term "all" so optimistic. It cannot be noted that all major mitigation measures have been adapted in all developing countries equally. The critical economic argument here is how BRICS examples comparable with generalization of developing countries. These are common mistakes in this high level assessment report or policy report. Here, I would like to quote the WHITE PAPER (5 September 2011) of Bloomberg" However, developing world officials and non-governmental organisations are accusing developed parties of failing to deliver on their pledges. And that only a small proportion of the promised funds are 'new and additional', with the rest diverted from other aid budgets or previously announced –according to a report by the Institute of Policy Studies, endorsed by Pakistan, Bangladesh and Solomon Islands. In addition to the financial implications, a failure to deliver the $30bn could exacerbate the resentments between developed and developing parties, which have already hindered progress towards a new global climate agreement" Citation:- www.bnef.com/WhitePapers/download/47 | Rejected - these are poltical arguments beyond scope of our chapter. Bloomberg's White Paper is not relevant for the IPCC report. |
| 8706 | 1 | 5 | 39 | | | This sub-section should probably discuss the debates over economic growth, and whether growth is sustainable in the long run. | Rejected - the debate over economic growth is not central to this chapter. Economic growth is discussed in section |
| 11716 | 1 | 5 | 40 | 6 | 2 | Many countries are playing leading role so that it is not natural to cite the example of only China. [For example, China has……(Xie, 2009; Guo, 2011; Ye, 2011)] should be deleted. | Taken into account - India was also an example. Added examples from |
| 11890 | 1 | 5 | 40 | 5 | 45 | Provide a refence for this statement. | Accepted - references added |
| 16970 | 1 | 5 | 40 | 5 | 45 | It might be worth stating how uncertain the economic and emissions data coming out of China are. Again, see the Guan et al. (2012) paper in Nature Climate Change as an example. With so many people and disparate sources, it is inevitable that the economic and emissions data would be alden with uncertainties, but explainging what they are, how they arise, and even how they might be reduced would be a huge benefit. | Rejected - generally countries with fast changes in the economy (e.g. REF in early 90s and China in 2000s) have larger uncertainties in compiling complete statistics. The discussion on |
| 3061 | 1 | 5 | 42 | 5 | 43 | Energy intensity values are meaningless because the values of GDP used are affected by inflation and variations in exchange rates. The increase in the yuan exchange rate and inflation in China make meaningless the advertised reductions of energy intensity. | Rejected - These variations are well known and the measures are still useful. The issue of exchange rate is not |
| 15275 | 1 | 5 | 42 | 5 | 44 | The report described the energy/carbon intensity target of China, should we mention "eleventh five year plan" and "twelfth five year plan" of China?, instead of just tell readers the range of the year. Because it is very useful to mention this by telling pelple China has its specific phase plan. | Rejected - This level of detail is not appropriate for this chapter. No action needed. |
| 4014 | 1 | 5 | 45 | | | should be "policy targets" not "policy goals". | Rejected - text is fine. No action needed |
| 6443 | 1 | 5 | 46 | 5 | 46 | The word 'dramatically' should be replaced with potentially, since CCS has never been demonstrated on a full-scale electric power plant. Similarly the next sentence should begin "Possible applications include…" | Taken into account - however, unable to find the word 'dramatically' anywhere in the text. Unable to locate for suggested |
| 16971 | 1 | 5 | 46 | | | The statistics on China's INSTALLED wind capacity can be a bit misleading because there are vast amounts of capacity that is not grid-connected and, therefore, does not produce any useable zero-carbon energy (yet). This speaks to larger issues of industrial policy that the report may not want to delve into, but it might be worth highlighting this aspect. | Noted - this is an important point, but we address it elswhere (and really needs to be addressed in the chapter on electricity/industry). As the comment |
| 16972 | 1 | 5 | 47 | 6 | 2 | Is this statement still true, post-Fukushima? | Taken into account - Statement is correct. We have not seen a significant retraction globally in nuclear |
| 4872 | 1 | 5 | 7 | | | [Del] "within which [governments] various actors have tried | Accepted - text revised |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 12082 | 1 | 5 | 40 | 6 | 50 | The current text about China's climate change mitigation refer to efforts from the last few years and commitments for the next 5-10 years. I recommend noting also that China achieved significant decoupling of GDP from energy usage and greenhouse gas emissions from 1980-2000. Very few people are aware of that between 1980 and 2000 GDP grew over 6 fold whilst energy use only grew 2 fold in China. Please see Figure 3b and discussion in Levine, M. Zhou, N., Price, L. (2009) The Greening of the Middle Kingdom: The Story of Energy Efficiency in China. Lawrence Berkeley National Laboratories and US DOE. http://china.lbl.gov/sites/china.lbl.gov/files/LBNL-2413E.Story_of_EE_in_China.pdf | Rejected - this is too much focus on China, especially as other comments suggest we be less China-centric. |
| 7860 | 1 | 5 | 1 | | | Neither throughout nor at the end of section 1.2 did we find any explicit message. Is the key message that the 2° goal is not viable any more? Please be more explicit. | Rejected - The message seems clear enough based on other comments |
| 15085 | 1 | 5 | 2 | 5 | 3 | I propose to change: ¨Since AR4 there have been many developments in the world economy, emissions and policies related to climate change¨ by ¨Since AR4 there have been many CHANGES in the world economy AND SOCIETIES, COUNTRY emissions and policies related to climate change¨ | Rejected - proposed text is too complicated. No action needed |
| 15086 | 1 | 5 | 6 | 5 | 7 | I propose to include:¨ First, there have been large changes in the economic, SOCIAL, ENVIRONMENTAL and political context within which governments have tried to address the climate issue¨. Because the governments have taken different measures in order to preservate the communities, natural resources, among many others. | Rejected - proposed text is too complicated. No action needed |
| 12080 | 1 | 5 | 8 | 5 | 9 | General Comment - In both IPCC AR4 WGII Mitigation Report and again here in this draft there is a failure to recognise the fact that now many governments and research bodies have developed important economic/technical/policy studies on how to achieve, for nation X, deep cuts to GHG emissions by 2020 and 2050. These detailed "deep cuts by 2050" studies for each nation did not exist before 2000. The fact that these dtailed studies exist is very important as these studies provide national governments with studies relevant to their specific nation's conditions and stage of development. Such "national deep cut" studies/models compliment the IPCC WGIII Mitigation report work, and provide national government's with evidence to justify adopting the IPCC's recommended 2050 GHG targets. A sample of just some of the many "deep cut" studies includes; Interlaboratory Working Group (2000) Scenarios for a Clean Energy Future for the USA, Oak Ridge National Laboratory, Berkeley, CA, Lawrence Berkeley Laboratories, CA and National Renewable Energy Laboratory, CO. Department of Trade and Industry (2003) Our Energy Future – Creating a Low Carbon Economy, Energy White Paper, UK Department of Trade and Industry, Version 11.Saddler, H., Diesendorf, M. and Denniss, R. (2004) A Clean Energy Future for Australia: Energy Strategies, WWF, Canberra. National Institute for Environmental Studies (2005) Japan: Low Carbon Society Scenarios toward 2050, National Institute for Environmental Studies, Japan . Department of Trade and Industry (2007) Meeting the Energy Challenge: A White Paper on Energy, Department of Trade and Industry, UK. von Weizsäcker, E., Hargroves, K., Smith, M., Desha, C. and Stasinopoulos, P. (2009) Factor Five: Transforming the Global Economy through 80% Improvements Improvements in Resource Productivity, Earthscan, London. More such "deep cut" studies can be provided, if interested. | Taken into account - This is a good point. Examples of emission programs in other countries added. But to clarify, IPCC did not make this recommendation. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 12081 | 1 | 5 | 8 | 5 | 9 | General Comment - Since the last IPCC AR4 WGIII Mitigation Report, there is one more key fact that "has been learnt" - namely that the co-benefits of action on climate change are significant (greater oil independance, reduced exposure to oil price rises, air pollution reductions, energy/water efficiency nexus opportunities, materials/energy efficiency nexus opportunities, healthier populations from active sustainable transport, biodiversity improvements, soil productivity improvements, national security co-benefits and poverty reduction co-benefits etc) . When these co-benefits are included in economic cost/benefit analysis it significantly reduces the overall net cost of action on climate change mitigation. This economic fact justifies andmotivates greater policy integration across government department's to enable a more integrated approach for action on climate change mitigation. Once these co-benefits are taken into account, then this strengthes the economic case for government's adopting a integrated "green growth" policy approach to climate change mitigation policy reform. see OECD (2012) Environmental Outlook to 2050: The Consequences of Inaction. OECD athttp://www.oecd.org/env/environmentalindicatorsmodellingandoutlooks/oecdenvironmentaloutlookto2050theconsequencesofinaction.htm and Smith, M. Hargroves, K. Desha, C (2010) Cents and Sustainability. Securing Our Common Future through Decoupling Economic Growth from Environmental Pressures. Earthscan.London. | Taken into account - This is a good point and we will add co-benefits into our discussion of the scale of the mitigation challenge |
| 3362 | 1 | 5 | | | | This section choses to rely on "green growth" for framing, a fair choice. However, a broad discourse is criticial of this concept, perceiving "green growth" as a greenwashing of "economic growth", camouflaging large scale projects with regressive distributive properties, which are in many cases still environmental harmful because of their scale, even if efficiency gains are substantial. Such discourses might reasonably reflected in the text. | Taken into account - combined with other comments |
| 4851 | 1 | 5 | | | | 1.2.1.1 This text is too "political": (i) important references to the efforts and positions of the developing countries, however, it is unclear why there is no word on the relevant activities and problems of the developed countries; (ii) it is also missing as a key message that all the good efforts taken together are not enough to achieve global s.d. and halt the global ghg-emissions. | Taken into account - other comments address this in other places of the text |
| 4250 | 1 | 5 | | | | I think that the increased recognition of climate change co-benefits including to health is an additional development since AR4 and should be added at this stage to the other 6 climate change mitigation strategies | Taken into account - we added more explicit discussion of co-benefits |
| 18421 | 1 | 5 | | 6 | | Sustainable development and green growth (pag 5 y 6) | Taken into account - combined with |
| 18422 | 1 | 5 | | 6 | | Again, an exaggerated optimism regarding the SD agenda in emerging countries and the “great efforts” they have done on SD and climate change (pag 5 last paragraph). Especially India, China and Brazil. BRICS meeting is anything else than rhetorical (pag 6 paragraph 3) | Taken into account - we will review text carefully after redraft to ensure balance and accuracy |
| 11017 | 1 | 5 | 10 | | | The title of the section is ‘Sustainable development and green growth’.<br>Comment: This presumes a consensus about growth as a goal. However, this is increasingly questioned. I suggest that the words ‘Sustainable development and a green economy’ are substituted.<br>Section 1.2.1.1 should also acknowledge the growing trend among developed countries to question whether ongoing economic growth is a desirable goal for developed countries. A suggested insertion, at the end of section 1.2.1.1, is: ‘There is also a nascent movement among some in developed countries to question the desirability and feasibility of ongoing economic growth for developed countries, if sufficient ‘space’ is to be provided for developing countries to raise their living standards.’ Ref: Schneider, F., Kallis, G., & Martínez-Alier, J. (2010). Crisis or opportunity? Economic degrowth for social equity and ecological sustainability. Introduction to this special issue. Journal of Cleaner Production, 18(6), 511-518 http://www.cemus.uu.se/dokument/msd2010-2011/article%20for%2024th.pdf. | Taken into account - there are lots of comments that point in different directions. Text has been revised to reflect multiplicity of goals and discussion on green growth is shortened. Suggested insertion was not added. |
| 17647 | 1 | 5 | 10 | | | This section lists several examples of sustainable development policies, yet these examples contain mostly absolute numbers that are of limited value if one does not know the initial levels or is given the relative change (e.g. p. 6, line 9 onwards: these numbers contain limited information without a relative comparison) | Noted - these examples are intended to be illustrations, not detailed treatment. No further action needed |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 15087 | 1 | 5 | 11 | 5 | 11 | I propose change: ¨Addressing climate change has become IN ONE OF THE MOST important component of sustainable development. | Taken into account - text has been revised |
| 15088 | 1 | 5 | 14 | 5 | 14 | To add: ¨ …..principles to harmonize economic AND SOCIAL development and environment protection¨ | Taken into account - combined with |
| 13248 | 1 | 5 | 14 | 5 | 14 | Sustainable development includes social equity, so I suggest to state: "(…) principles to harmonize economic development, social equity and environmental protection." | Taken into account - combined with other comments |
| 6300 | 1 | 5 | 14 | 5 | 14 | Add social development here. The Brundtland report supported the notion of sustainable development as including social, environmental and economic… | Taken into account - combined with other comments |
| 15089 | 1 | 5 | 17 | 5 | 17 | To add: ¨ …..economic, SOCIAL and environmental goals¨. Because for example the fight against the poverty and hunger are social aspects, and sustainable development includes the three aspects. | Taken into account - combined with other comments |
| 8218 | 1 | 5 | 17 | 5 | 17 | Authors should include “social goal” as well, along with “economic and environmental goals”. Sustainable development encompasses the three pillars: environmental, economic and social dimensions. | Taken into account - combined with other comments |
| 15090 | 1 | 5 | 18 | 5 | 19 | To change: ¨……climate change is becoming IN ONE OF THE MOST key environmental challenge of sustainable development AT THE PRESENT AND IN THE FUTURE ¨. Because the anthropic overexploitation and degradation of natural resources is in this moment the most important environmental challenge. | Taken into account - combined with other comments |
| 15091 | 1 | 5 | 20 | 5 | 21 | To include: ¨Governments have many different goals, including economic development, ENVIRONMENTAL PROTECTION, poverty alleviation and living standard improvement.¨ | Taken into account - combined with other comments |
| 15092 | 1 | 5 | 22 | 5 | 24 | To change in the following form: ¨Of paramount importance are the goals and interests framed in DEVELOPED COUNTRIES, MAIN CONTRIBUTORS TO THE ACTUAL SITUATION, AND IN developing countries, especially the emerging economies, whose economies are expanding rapidly. ¨ | Rejected - suggested text is too complicated |
| 15093 | 1 | 5 | 30 | 5 | 32 | To change: ¨Mindful of these impacts, these countries have acknowledged that climate change should be tackled as ONE important component of sustainable development—such as through “green growth” strategies | Taken into account - combined with other comments. Overall, the section |
| 8219 | 1 | 5 | 30 | 5 | 30 | “mindful of these impacts, these countries have acknowledge that climate change should be tackled as the important component of sustainable development – such as “green growth”..<br>Comments: Some references on this for different country context would be helpful | Taken into account - combined with other comments, we will beef this up a bit. Overall, the section has been revised |
| 4246 | 1 | 5 | 33 | 5 | 33 | Not just health care improvement but more broadly health improvement since many determinants of health lie outside the healthcare system | Taken into account - combined with other comments, we are beefing up |
| 5383 | 1 | 5 | 34 | 5 | 34 | adapt to climate impacts --- should be -- adapt to climate change impact | Accepted - text changed, but overall section has been revised |
| 15094 | 1 | 5 | 36 | 5 | 37 | Add: ¨ Through this approach, developing countries have made great efforts on sustainable development and addressing climate change WITHOUT COUNT IN MANY TIMES WITH THE ALL NECESARRY FINANCIAL RESOURCES AND TECHNOLOGIES ¨ | Rejected - suggested text is too compliated; also, combined with other comments |
| 10975 | 1 | 5 | 36 | 6 | 2 | It is stated that only developing countries tried hard in mitigation; however, developed countries also contributed to take measures to global warming through CDM. Therefore, the paragraph around here should be amended. | Taken into account - paragraph added in section 1.2.1.1 discussing efforts by industrialized countries, though |
| 4359 | 1 | 5 | 45 | 6 | 2 | presenting all low carbon energy sources, such as hydro-power or nuclear power, as sustainable is questionable | Noted - there is a wide range of reviews; our text reflects that |
| 11348 | 1 | 5 | | 6 | | It might make sense to introduce the situations surrounding developed countries (not just developing countries). If it is discussed elsewhere in the report, that can be cited. | Taken into account - paragraph added in section 1.2.1.1 discussing efforts by industrialized countries. Combined with |

|---|---|---|---|---|---|---|---|
| 3886 | 1 | 5 | 20 | 5 | 35 | This section is written as if all countries are either democracies or governed by benevolent despots. However, according to a report by the Economist Intelligence unit (http://graphics.eiu.com/PDF/Democracy_Index_2010_web.pdf) around a 3rd of the world's countries are led by authoritarian regimes. As is all too evident some of them commonly put things like the maintenance of power, subjegation of women and/or the elimination of rival tribes ahead of professed goals whose main purpose might be to impress the democratic world. Should not the text distinguish more clearly between what regimes profess to do and what they actually do? Formally what is needed is a positive theory of the exercise of state power. (For literature on this see Buchanan, Tulloch and Mancur Olsen) | Rejected - this takes us somewhat beyond our mandated. |
| 17684 | 1 | 5 | 11 | 5 | 11 | "has becomed the important component" for "the most important" unless al the others are in the same | Taken into account - combined with |
| 17686 | 1 | 5 | 33 | 5 | 33 | these countries have acknowledged "in greater or lesser extent" that climate change… | Taken into account - section has been |
| 17687 | 1 | 5 | 36 | 5 | 36 | Probably the BRICS but not all developing countries have made "a great" effort on sustainable development | Taken into account - section has been |
| 7005 | 1 | 5 of 33 | 21 | 5 of 33 | 21 | Add "in equity conditions" after the word "improvement". | Rejected - edit is not needed |
| 7006 | 1 | 5 of 33 | 38 | 5 of 33 | 38 | Add "and renewable" after "low carbon". | Rejected - edit is not needed |
| 7007 | 1 | 5 of 33 | 41 | 5 of 33 | 41 | Add "renewables," after "advance", and before "green". | Rejected - edit is not needed |
| 16053 | 1 | 6 | 12 | 6 | 19 | This paragraph paints a too rosy picture of BRICS, a group which has recently decreased its carbon efficiency and been very reluctant on international negociations. Their important political role is to be recongnized with more balance | Taken into account - combined with other comments. Text has been revised, discussion on BRICS has been removed |
| 6457 | 1 | 6 | 12 | 6 | 28 | Redundent. To delete these two paragraphs. | Taken into account - the paragraphs have been shortened and revised |
| 16891 | 1 | 6 | 12 | | 19 | This demonstrates the myth -- if we only lower CO2 emissions by halting use of energy, this could indeed cap growth -- but in fact there are many technologies that are only somewhat more expensive. Economic and energy system modeling demonstrates that growth is only slightly reduced but does not in fact reverse. See Bossetti and Frankel. | Taken into account - the paragraph has been removed |
| 10416 | 1 | 6 | 12 | 6 | 19 | This has to be enumerate rather than wordy. Targets envisoned should be provided | Noted - comment not pertinent in this |
| 4602 | 1 | 6 | 13 | 6 | 13 | "this area"; which one are you talking about? Energy technologies? Please, clarify. | This paragraph has been removed. Comment is no longer relevant. |
| 16975 | 1 | 6 | 16 | | | It might be worth expanding how "sustainable and inclusive growth" differs from "cappin development" | This paragraph has been removed. Comment is no longer relevant. |
| 4603 | 1 | 6 | 19 | 6 | 19 | I would use Rio+20 as a reference as well | The paragraph has been removed. Comment is no longer relevant |
| 16054 | 1 | 6 | 20 | 6 | 28 | This paragraph paints a too rosy picture of two nations that have a blurred record for deforestation. Could the paragraph quote a "best case" country that have at least stopped cutting its forests? | Taken into account - there are countries that have made a lot of progress, and in the industrialized world there is net growth. But to caution that an overall situation is difficult to assess, added sentence "It remains difficult, however, |

|---|---|---|---|---|---|---|---|
| 8709 | 1 | 6 | 20 | 6 | 28 | The Amazon is the region of the Brazil with the largest number of protected areas. Over a third of its territory falls into one protection regime, whether in the form of conservation units, indigenous lands, either in military areas. Between 2003 and 2009, 70 federal conservation units were created with a total area of 26.4 million hectares. In all, the country has with 310 of these areas, the equivalent of 76.5 million hectares (Brazilian Ministry of Environment http://www.mma.gov.br/). This fact is one of the reasons to explain the decrease in deforestation by the constitution of a blocking barrier formed by the conservation unities.<br>Another strong reason to the deforestation decrease is related to economic strategies adopted by the government with the intent of discourage the agriculture in illegal areas. Among the main agreements signed is the Soy Moratorium, which prohibits the export of soybeans produced in illegal areas, and the pact with the loggers, which determines that the private sector does not buy timber from deforested areas.<br>However, the deforestation problem in Amazon is strongly related to social problems, where people don't have options to deal with the absence of development and are driven to use the land in the wrong way. In this sense, the success implementation of the Nagoya protocol can take this region to a different overview by the appreciation of the natural products of the forest instead the substitution of natural vegetation by monocultures. | Taken into account - this is a helpful comment, but action item is unclear. This paragraph was removed in latest edit |
| 16976 | 1 | 6 | 20 | 6 | 28 | As Indoensia accoutns for some 25% of the global GHG emissions from LULUCF, it's a glaring omission not to say something about what they are doing (or not doing) with respect to mitigation of their LULUCF emissions | The last few sentences of the paragraph have been removed. Comment is no |
| 9462 | 1 | 6 | 23 | | 25 | It remains inconclusive whether this reduction in deforestation was due to prices or policies. For more see - Assunção, J., e Gandour, C. C., & Rocha, R. (2012). Deforestation Slowdown in the Legal Amazon: Prices or Policies? Rio de Janeiro, Brazil: Climate Policy Initiative. | Accepted - added text "It remains difficult to disentangle the role of policies from other factors that affect incentives |
| 7863 | 1 | 6 | 23 | 6 | 25 | Clear-cutting of rain forests is not simply forestry; this is a euphemism and an example of the non-neutral language. | Rejected - we think the language is ok here; we clearly signal the variety of |
| 16892 | 1 | 6 | 29 | | 39 | Low carbon emitting energy technologies will likely remain more costly than conventional techs for the foreseeable future. The question is how can developing countries justify paying the premium in the face of other development needs. There really is not a big tradeoff here, but it looks like it at first glance, especially if one does not really understand how trade, especially emissions trading, fits into this picture. | Taken into account - This is an important point, i.e. whether changing accounting system can encourage the realization of low carbon development or not. This may lead to the shrinkage of international trade itself. Paragraph has been revised. The discussion on |
| 11717 | 1 | 6 | 3 | | | With regard to No.2, [other] is not needed. | Rejected - text is fine. No action needed |
| 6456 | 1 | 6 | 3 | 6 | 11 | Make it shorter. To delete the sentence after "For example". | Taken into account - combined with other comments, the paragraph has |
| 16977 | 1 | 6 | 30 | 6 | 32 | You must insert SOME between OF and DEVELOPING, as the 2012 PBL-NEAA report, "Trends in Global CO2 Emissions" clearly showed that per capita emissions in China, Iran and South Africa are on par with those of developed EU nations | Accepted - text inserted |
| 11018 | 1 | 6 | 32 | | | "Low carbon technologies available today are not sufficient to offset the emission increase driven by the economy growth." This is unclear and should be replaced by "Low carbon technologies available today by themselves are unlikely to be sufficient to offset the emissions increase driven by economic growth, but other emissions drivers besides technological progress need to be taken into account." | Taken into account - sentence replaced with:" Current investment in low carbon technologies is insufficient to offset the emissions increases associated with projected economic growth in both |
| 11019 | 1 | 6 | 32 | | | 'Low carbon technologies available today are not sufficient to offset the emission increase driven by the economy growth'. This is unclear and should be replaced by "Low carbon technologies available today by themselves are unlikely to be sufficient to offset the emissions increase driven by economic growth, but other emissions drivers besides technological progress need to be taken into account." | Taken into account - combined with other comment |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 13363 | 1 | 6 | 32 | | | This sentence is potentially inaccurate. It confuses policy intent and constructed capacity with technological capabilities. 'The range of low carbon technologies available today' refers ambiguously to what has been installed to date, and to the technical abilities of existing technologies. It is correct if the former and incorrect if the latter, as a smorgasbord of low carbon technologies could provide for all needs (with a range of economic caveats). I suggest 'Current investment in low carbon technologies is insufficient to offset the emissions increases associated with projected economic growth in both developed and developing countries'. | Taken into account - combined with other comment |
| 14784 | 1 | 6 | 32 | | 33 | "Low carbon technologies available today… growth" sounds like a statement about technologies, when it is fact a statement about costs and affordability. | Taken into account - combined with other comment |
| 7864 | 1 | 6 | 32 | 6 | 33 | In our opinion, the claim that "low carbon technologies available today are not sufficient to offset the emission increase […]" is false (e.g. SRU 2011, Jacobson/Archer 2012). In any case, rather than portraying this as a well-known fact you should discuss the evidence supporting and challenging your claim and link this with the discussion in chapter 6. | Taken into account - combined with other comment |
| 16978 | 1 | 6 | 32 | 6 | 33 | The statement about low carbon technologies avaialble today not being sufficient to offset the emissions increase driven by economoci growth seems odd. Certainly, solar, wind and nuclear are sufficient zero-carbon technologies - it's economics more than anytihng that precludes these from advancign faster than economic growth, no? | Taken into account - combined with other comment |
| 16979 | 1 | 6 | 33 | 6 | 39 | In a world with sovereign boundaries and international trade, the idea of "traded carbon" is inevitable. Counting physical emissions within a given nation's boundaries is challenging enough, framing such a large piece of this report around 1 or two recent studies - while an interesting academic exercise - does not seem to be a valuable, practical contribution to the policy-relevant discussion currently given all the uncertainties in accounting. | Taken into account - In fact, the Waxman-Markey bill in the US envisioned doing just that. And there are varied studies by WTO lawyers looking at legal feasiblity of this. France is making moves in this diretion; ditto EU more generally. This is important. See, for example, the next comment |
| 16055 | 1 | 6 | 34 | 6 | 39 | It is very helpful to recognize the role of indirect emissions. Can it be noted that it is not yet discussed in the international negociation? | Rejected - our job is to stick to the science here, so we won't make this |
| 7865 | 1 | 6 | 34 | 6 | 39 | Embodied emissions clearly is an important topic, especially for developing countries. We whish to ask, though, how the problem of embodied emsissions can be integrated into negotiations given the complexities of world trade. There is a realitic fear/possibility that this will only exaggerate disagreement and hamper successful negotiations. | Rejected - how this should be done is not our task, but see responses to comments at line 366 |
| 17729 | 1 | 6 | 37 | | | the phrase "much improved technology" in the sentence "Without much improved technology, accounting systems and other arrangements the international economy system doesn't yet support and encourage the realization of low carbon development" does not make sense | The sentence has been removed. Comment is no longer relevant |
| 14785 | 1 | 6 | 37 | | 39 | "Without much improved…" make the inability to shift to low carbon development paths appear to be the result of inadequate technologies or accounting systems, which are not the ultimate reasons. It would be much more helpful if this chapter actually discussed the reasons that mitigation has not been undertaken at a scale consistent with climate goals. | Noted - much of that discussion is in the realm of political choices and not the subject of scientific analysis. No action needed |
| 3363 | 1 | 6 | 4 | 6 | 7 | "driven by sustainable development strategies that emphasize the interconnection of many different policy goals such as energy and food security, local pollution control and climate change. For example, Brazil is one of the leading countries of bio-ethanol production." Does this example imply, that Brazil consciously designed a bioethanol policy to balance all these policy goals? Given the contention, the various calculation done on this issue, and the uncertainty of outcomes as induced by present and future Brazilian bioethanol it is a courageous move to take Brazilian ethanol as an example. Just to scrap on the surface of the discussion, here is an interesting study on the climate effects, and the interaction with livestock markets, of Brazilian bioethanol: Lapola, D. M. et al., Indirect land-use changes can overcome carbon savings from biofuels in Brazil. PNAS 107 (8), 3388 (2010). | Taken into account - No, the sentence means just what it says and does not imply anything. The example of Brazil in this paragraph was removed during editing. |

|---|---|---|---|---|---|---|---|
| 4604 | 1 | 6 | 40 | 9 | 11 | Section 1.2.1.2 is a very good introductory section | thank you |
| 2242 | 1 | 6 | 40 | 11 | 16 | The SRES Scenarios need to be completely changed to take into account this material | Rejected - No reference to SRES is made in text. In AR5 in Ch.6 the new RCP scemarios are discussed and compared with present emissions. |
| 7866 | 1 | 6 | 40 | 9 | 11 | What is the the purpose of the descriptive anaylsis of the crisis? This section can be read as a complete affirmation of traditional GDP growth (see comment 25). | Rejected - Comment refers to motivation and not to text. No action needed. |
| 11268 | 1 | 6 | 41 | 6 | 42 | China, India, etc. are named explicitly everywhere in the report. Why do not say that the crisis started in poorly regulated financial speculation in the USA (“subprime crisis”). As matter of fact, Mexico and Turkey are also members of the OCDE. | Rejected - we have some discussion of the origins, but much detail and opinion on that matter is beyond scope of this |
| 3887 | 1 | 6 | 41 | 6 | 42 | The emphasis this sentence/citation puts on poorly-regulated financial speculation as a cause does not seem to be a mainstream view. The US federal inquiry into the causes might be a more authoritative source to cite (there is a link here http://www.nytimes.com/2011/01/26/business/economy/26inquiry.html). Note that the Wikipedia discussion of the causes here (http://en.wikipedia.org/wiki/2007%E2%80%932012_global_financial_crisis) identifies the bursting of the US housing bubble and the lack of provenance of the pervasive CDOs as major issues, and does not refer to financial speculation. Note too the central role in US housing finance by Fannie Mae and Freddie Mac. | Taken into account - phrase on the cause of the financial crisis has been removed |
| 4875 | 1 | 6 | 42 | | | {Add} [Del] "concentrated in [the] {some} OECD countries | Taken into account - combined with |
| 4876 | 1 | 6 | 44 | | | {Add} "largest financial institutions in the US, {Western} Europe | Taken into account - combined with |
| 4601 | 1 | 6 | 6 | 6 | 6 | I am not sure I would use bio-ethanol as the leading example of sustainble development policy in an introduction as bio-ethanol is controversial in some ways it is produced (e.g. corn but not sugar canes nor cellulose) | Taken into account - combined with other comments |
| 16973 | 1 | 6 | 6 | | | The statement on Brazil's bio-ethanol production needs to be expanded because there are many ways in which bio-ethanol production could NOT be sustainably developed. If Brazil is doing it in a sustainable way, it deserves to be elabvaorated upon just how they are achieving that so other nations can follow suit if desired. | Taken into account - combined with other comments |
| 16974 | 1 | 6 | 8 | 6 | 11 | When was this Solar Initiative in India launched? What has been committed in terms of resources and has anything been achieved yet? | Taken into account - Sentence has been added at the end of paragraph to include |
| 18423 | 1 | 6 | | | | There are inaccurate generalization regarding developing countries and climate mitigation, for example regarding carbon sinks (pag 6 par 4).<br>Problem with the concept of energy intensity (pag 5 last paragraph) and with Brazilian data regarding deforestation rates (pag 6 paragraph 4). □ | Taken into account - combined with other comments. No action needed |
| 3958 | 1 | 6 | 3 | 6 | 11 | Information about India is missing so it may be included."In India, thermal power plants constitute 65% of the installed capacity, hydroelectric about 21% and rest being a combination of wind, small hydro, bio-mass, waste-to-electricity, and nuclear. Moreover, India is rich in biomass and has a potential of 16,881MW (agro-residues and plantations), 5000MW (bagasse cogeneration) and 2700MW (energy recovery from waste). Biomass power generation in India is an industry that attracts investments of over Rs 600 crores every year, generating more than 5000 million units of electricity and yearly employment of more than 10 million man-days in the rural areas.This traditional biomass fuel – fuel wood, crop waste and animal dung is a potential raw material for the application of biomass technologies for the recovery of cleaner fuel, fertilizers and electricity with significantly lower pollution. During 2011, some 45000 small scale biogas plants were installed. Cumulatively, India has installed 4.44 million small scale biogas plants. " | Rejected - this is way too much detail for our chapter |
| 15095 | 1 | 6 | 37 | 6 | 39 | Add: ¨Without much improved technology, accounting systems,FIANCIAL ASISTANCE FOR DEVELOPING COUNTRIES, and other arrangements the international economy system doesn’t yet support and encourage the realization of low carbon development. | this paragraph has been revised. The discussion on accounting has been removed. |
| 4360 | 1 | 6 | 6 | 6 | 6 | same comment for bio-ethanol | Taken into account - combined with |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 4852 | 1 | 6 | | | | 1.2.1.2 It is a fair, however, a too detailed economic analysis of the world macroecon. situation in terms of its relevance for the changing c.c. policies. Concerning the implications (pages 8-9), an essential one is not mentioned, namely the drop of the ghg-emissions due the decrease of econ. growth rate in many developed countries. | Noted - our assessment is balanced |
| 15524 | 1 | 6 | 40 | | | The macroeconomic narrative makes sense to me but covers some potentially controversial topics. There are, for example, differing views on the relative importance of financial system factors (such as poor regulation) and of saving behaviour (e.g. excessively low saving rates in rhe USA, excessively high ones in China). I would suggest shortening this section substantially and keeping away from discussing the causes of the macroeconomic crisis. This is not the place to try to fashion a consensus view of those causes. | the first three paragraphs in this section have been condensed and causes of the crisis have been removed. |
| 15468 | 1 | 6 | 40 | | | It should be mention that the 2007 Finanical Crisis caused a significant decrease in emission rates in the first couple of years, due to a major decline in economic activity in many countries (as shown in Fig 1.1). This would highlight the importance of global economic activity on emissions from the current mix of energy sources. Although it is briefly mention in section 1.3.1, it should be also mention in the earlier section | Taken into account - we mention this already in this section but have expanded it a bit. |
| 13249 | 1 | 6 | 43 | 6 | 43 | "The crisis spread rapidly in the fall of 2008 (…)". The reference to a season is biased according to the (northern or southern) hemisphere. It should be better to reference a month. | Rejected - 'fall' is fine |
| 4090 | 1 | 6 | 43 | 6 | 43 | Delete reference to Sornette & Woodward - too obvious a fact, large body of literature. | Rejected - reference is fine as is |
| 17688 | 1 | 6 | 33 | 6 | 34 | low carbon technologies are not sufficient? In what way? New energy sistems arnt influenced so much by the technological locl in | Taken into account - combined with other comments |
| 7008 | 1 | 6 of 33 | 32 | 6 of 33 | 32-33 | Add "if BAU development is considered to be the only alternative; a very different outcome would be attained in the case that more efficient final use technologies could be accessible to those countries", before the period. | Rejected - suggestion is too complicated - no action needed |
| 7009 | 1 | 6 of 33 | 39 | 6 of 33 | 39 | Add "or zero" before "carbon development". | Rejected - edit is not necessary. no |
| 3687 | 1 | 7 | | | | Page seven figure needs explanation | Taken into account - explanation seems sufficient, but we will recheck with final |
| 17730 | 1 | 7 | | | | If possible, include the the data for 2011. By the time this report is published, latest data in this figure 1.1 will be four years old; this will make it consistent with the sentence in line 23 - "….since then..." Also include South African data in this figure. | Figure will be revised to show available data for world regions. |
| 16984 | 1 | 7 | | | | This is a really valuable and interesting figure. Mexico should be included. Perhaps use the Major Economies Forum (MEF) nations (which account for some 75-80% of global GHG emissions) as a guide for this framing. | Figure has been redone. Countries are now grouped so comment is no longer |
| 9109 | 1 | 7 | 11 | 7 | 12 | To my knowledge assessments exist where cities in general seem to cause higher GHG loads than the rest of the country on per capita basis, e.g. Heinonen and Junnila (2011c). | Rejected - this work is misleading because it needs to control for income and trade; too much depth for our |
| 16983 | 1 | 7 | 12 | 7 | 14 | This statement / theme ought to be connected back to the earlier discussion/framing on transboundary carbon emissions (incurred via trade) - if that framework persists. This rgowth in trade has facilitated poverty alleviation, economic growth and an increased standard of living in many developing economies. | Rejected - we have the right balance here. No action needed |
| 9110 | 1 | 7 | 14 | 7 | 16 | I don't understand the sentence. If this refers to cities having lower per capita footprints, the comment above apply. | Rejected - we don't see the relevance of the comment to the text. No action |
| 15241 | 1 | 7 | 16 | | | Euro area is large compared with, for example, the UK, is is a fair comparison? | Rejected - figure has been redone. Countries are now grouped so comment |
| 15529 | 1 | 7 | 16 | | | No African or Middle Eastern country mentioned? | Rejected - figure has been redone. Countries are now grouped so comment |
| 14786 | 1 | 7 | 19 | | 20 | Some scholars would argue that it is premature to claim that growth has been decoupled (as is indeed acknowledge in the parenthetical statement at line 23). | Rejected - this is about macroeconomic growth patterns. Such details is outside the scope of this chapter. No action |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 11393 | 1 | 7 | 19 | 7 | 26 | There is currently no consensus among economists about the decoupling of growth rates between developed and developing countries. The theory of decoupling should not be extended. The unprecedented acceleration of growth in the developing world in the new millennium in comparison with developed economies is due not so much to improvements in underlying fundamentals as to exceptionally favourable global economic conditions, shaped mainly by unsustainable policies in advanced economies. The only developing economy which has had a major impact on global conditions, notably on commodity prices, is China. However, growth in China has been driven first by a rapid expansion of exports to developed economies and more recently, after the global crisis, by an investment boom, neither of which is replicable or sustainable over the longer term. To maintain a rapid growth, export-led Asian economies need to reduce their dependence on foreign markets. For Latin American and African commodity exporters, gaining greater autonomy and achieving rapid and stable growth depend on their success in reducing reliance on capital flows and commodity earnings – the two key determinants of their growth which are largely beyond national control. See for example Yilmaz Akyuz, The Staggering Rise of the South? (Research Paper 44, South Centre, March 2012) | Rejected - this is about macroeconomic growth patterns. Such details is outside the scope of this chapter. No action needed. |
| 9111 | 1 | 7 | 20 | 7 | 28 | There is also evidence that the spatial form affects all other consumption choices and thus the emissions on a much wider scale than often taken into account. | Rejected - This level of detail is outside the scope for this chapter |
| 14787 | 1 | 7 | 27 | | 28 | "especially in LDCs" is not necessary | Rejected - other comments suggest the opposite. no action needed |
| 3306 | 1 | 7 | 3 | 7 | 3 | I don't understand this sentence. Is there a missing noun? | Accepted - text has been revised |
| 16056 | 1 | 7 | 3 | 7 | 10 | "Developping countries were generally not affected" is an euphemism | Rejected - At the time of this writing, develping countries ARE being affected, |
| 16057 | 1 | 7 | 3 | 9 | 11 | two pages of development on the economic crisis is too much. Page 8 until page 9 line 11 is more relevant to show shipting patterns of the internation economy. | Taken into account - this section has be revised to be more concise |
| 7144 | 1 | 7 | 3 | | 4 | The sentence seems to have an extra word, 'with', near the end of the sentence. | Taken into account - combined with |
| 16980 | 1 | 7 | 3 | 7 | 4 | Incomplete sentence | Taken into account - combined with |
| 16981 | 1 | 7 | 5 | 7 | 9 | If this is true, it definitely needs a citation | Taken into account - text has been revised and shortened. Eliminated need |
| 16893 | 1 | 7 | 9 | | | Suggest the following changes -- delete "small, open and export oriented" and at end of sentence add "closely linked through trade with countries which were more directly impacted by the financial crisis." Trade helps countries grow and develop -- it is not helpful to developing countries or to climate policy to suggest that trade is a bad thing. | Rejected - Trade also exposes countries to the fortunes of their trading partners. The text here does not suggest that trade is a bad thing but points to the |
| 16982 | 1 | 7 | 9 | 7 | 10 | This statement ought to be quantified - has the recession led to a significant and persistent delcine in FDI and ODA? | Rejected - we think the language is ok here |
| 18424 | 1 | 7 | | 9 | | World macroeconomic situation<br>There is very positive vision of the role of developing countries in the 2008 financial crisis and its aftermath (pag 7, 2 y 3 paragraph).<br>Saying that technological innovation “has shifted” to large emergent economies is an exaggeration (pag 9 1 paragraph) | Accepted - the sentence has been revised and no longer says specifically a shift to emerging economies but more generally "has accelerated shifts in the global landscape for innovation" with a cite |
| 5384 | 1 | 7 | 16 | 7 | 16 | This figure should include: South Africa (as BRICS country) and also should include example from Africa and Example from Gulf oil rich countries….. | Rejected - figure has been redone. Countries are now grouped so comment |
| 4247 | 1 | 7 | 28 | 7 | 29 | Where climate change mitigations have been linked to... | Accepted - word added |

|---|---|---|---|---|---|---|---|
| 12083 | 1 | 7 | 3 | 7 | 4 | The current text is not entirely correct where it says that "The financial crisis ended a seven-year period of substantial expansion of the global economy and with it a period of steadily rising and volatile with material and resource prices." Since the GFC started in late 2008, after a fall in material and resource commodity prices in 2009, resource commodity prices have continued to rise in 2010, 2011 and 2012. In 10 years, from 2001-2011, commodity price rises have eliminated the entire resource commodity price falls from the previous 100 years. Please see "Exhibit 6" in McKinsey Global Institute (2012) The Resource Revolution - Full Report. McKinsey Global Institute. pp30 at http://www.mckinsey.com/insights/mgi/research/natural_resources/resource_revolution | Taken into account - sentence has been revised |
| 3545 | 1 | 7 | 4 | 7 | 4 | 'volatile with material…' - delete "with" | Accepted - sentence has been revised |
| 3688 | 1 | 8 | | | | Page 8, the source of bullet points statement (whose statements are these?) | Noted - these are our assessments |
| 10461 | 1 | 8 | | | | Not clear exactly what "energy" relates to since oil is decoupled. The web site graph gives only "fuel (energy) index". Which specific oil commodity is "oil"? May need a footnote to the caption to explain. But oil and energy are basically the same curve. Why have oil at all? Also put "Agr. Raw.mat." in full. | Taken into account - this figure to be redrawn and simplified in parallel with SOD |
| 15531 | 1 | 8 | 12 | | 13 | Asian countries' policies with respect to building up foreign exchange reserves were also important. If global imbalances are to be discussed, they should not be ignored. But perhaps the whole issue could be put aside. | Taken into account - the discussion has largely been put aside. |
| 11394 | 1 | 8 | 12 | 8 | 12 | Perhaps another reference could be found in addition to the Lamy speech. Furthermore, additional references and discussion should also be provided for the argument that such a shift to emerging economies might also not take place given the extent to which they have still not decoupled from developed economies. | the paragraph is revised and the sentence has been removed. Comment is no longer relevant. |
| 15530 | 1 | 8 | 13 | | 14 | This is an example of a potentially controversial statement that is not necessary in this context. For a different view, see Bowen, A, and K Mayhew (2008). 'Globalisation, import prices and inflation: How reliable are the 'tailwinds'?' Bank of England Quarterly Bulletin, Q3, London. | the paragraph is revised and the sentence has been removed. Comment is no longer relevant. |
| 16988 | 1 | 8 | 13 | 8 | 17 | Citations are needed | the paragraph is revised and the sentence has been removed. Comment |
| 4466 | 1 | 8 | 17 | 8 | 19 | This sentence seems out of place and is incomplete. There were several causes of the financial crash other than "lax regulation," and the rest of the paragraph pertains to the current macroeconomic situation, not that which prevailed prior to the crash. | the paragraph is revised and the sentence has been removed. Comment is no longer relevant. |
| 16989 | 1 | 8 | 19 | | | we didn't know the bust was going to be "inevitable", so suggest dropping the term. | good point but the paragraph is revised and the sentence has been removed. |
| 2330 | 1 | 8 | 19 | 8 | 21 | Obviously,it is clear the connection between financial crisis and extreme weather. But in report like IPCC, it should be elaborated logically this double exposure on countries rather than just one sentence. | Rejected - The commenter may have misunderstood the text as we do not say |
| 4467 | 1 | 8 | 24 | 8 | 27 | It is premature to assert that "the momentum in global economic growth has shifted to the BRICS". They have been doing well in recent years, but future growth is notoriously difficult to predict. "Momentum" is not a concept that applies to economic growth. | Taken into account - text is revised |
| 11395 | 1 | 8 | 24 | 8 | 27 | There should also be a discussion here to highlight the possibility that such shift in momentum of grlobal economic growth, and hence a shift in future responsibility for global emissions, might not take place as expected or forecast due to the impacts of the current and future economic crisis as well as the potential impacts of climate change on emerging economies' growth and development. | Taken into account - text is revised to provide more clarity |
| 18408 | 1 | 8 | 25 | | 25 | Are the BRIC´S guilty?. Emissions are growing without BRIC´s?, bullet is not clear. There also no statements about the finally results of the Kyoto Protocol. | Taken into account - other edits to this line will address this point to provide |
| 9783 | 1 | 8 | 28 | 8 | 30 | Embedded emissions should be stressed throughout the report; when reduction targets are discussed for international agreements, the point of consumption of the final good should be taken into consideration when setting country-specific reduction targets; there is a whole body of literature on virtual emissions and national footprints that could be considered here. | Taken into account - we address embedded emissions a lot |

|---|---|---|---|---|---|---|---|
| 16894 | 1 | 8 | 28 | | 30 | Suggest adding additional sentence at end of this bullet point: "Consumption of imported goods is driving emissions growth in countries which have gained more share of global manufacturing." | Accepted - added phrase "suggesting the need for additional or complementary accounting systems that reflect the ultimate consumption of manufacturing goods that cause emissions rather than just the geographical place where |
| 3307 | 1 | 8 | 31 | 9 | 2 | This bullet point is unintelligible. | Taken into account - paragraph has |
| 7145 | 1 | 8 | 31 | | 33 | The direction in the 'shift in priorities' is not clear. The sentence might make more sense if the clause read: 'among them has been a shift,at least within the countries where economic growth remains sluggish, away from adopting climate policies on the own.' | Taken into account - paragraph has been revised for clarity |
| 16985 | 1 | 8 | 5 | 8 | 6 | "a wave of anxiety driven by public debt threatens the world economy" deseres a citation | paragraph has been removed. Comment |
| 16986 | 1 | 8 | 6 | | | "Several highly indebted OECD countries in Europe…"; again, these nations should be listed so a complete snapshot of the current situation in the world is given, while also allowing posterity to read this report and assess what each nation has done, what impact it has had, etc. | Rejected - This level of detail is beyond the scope of the chapter. No action needed |
| 8404 | 1 | 8 | 8 | 8 | | It is worth noting that the economic crisis doesn't concern energy companies, the revenues and profits of biggest fossil-energy companies in the last years have been enormous, and often increasing substantially from the previous years.<br>See http://money.cnn.com/magazines/fortune/global500/2011/full_list/ | Rejected - no scientific evidence/publication provided to support changes suggested by the reviewer. No action needed |
| 8473 | 1 | 8 | 9 | | 21 | It may be helpful to note here that comparative advantage does often translate into significant disparities at the population and individual level, which may exacerbate the impacts of climate variability | Rejected - This is a good point but is too much detail here |
| 17403 | 1 | 8 | 9 | 8 | 12 | This point may not be relevant for food production for a number of reasons such as finite amount of arable / grazeable land (and fishable waters) and the large inefficiency of further clearing of tropical forests for food production. Consider including a footnote for this caveat. | Rejected - this point is not correct. No action needed |
| 16987 | 1 | 8 | 9 | 8 | 11 | Many economists would argue that this is not what has driven the shift in productivity so much as cheap labor and booming markets in emerging economies. | Rejected - there are mixed views on this. This paragraph has largely been revised. |
| 12084 | 1 | 8 | 3 | 8 | 4 | The current text simply says "Governments responded to the crisis in many different ways, often with fiscal stimulus packages as well as support to ailing banks." It is relevant for the IPCC to note very briefly in one sentance that "many national and state government's focused significant percentages of their "stimulus packages" on initiatives which were designed to simultaneously achieve climate change mitigation whilst creating jobs and boosting the economy. This is because many climate change mitigation strategies have a relatively good economic multiplier." This futher evidences the fact that there has been an historic shift amongst decision makers globally to now view climate change mitigation as an activity that stimulates the economy. Please see OECD (2011). Towards Green Growth. OECD, Paris, France. Please see HSBC Global Research (2009) Building a green recovery Governments allocate USD470bn and Counting. HSBC Global Research at http://www.hsbc.com/1/PA_esf-ca-app-content/content/assets/sustainability/090522_green_recovery.pdf | Rejected - there are mixed views on this, and other comments suggest we shorten this section. So no edits will be taken on this point, but we will add the OECD green growth citation elsewhere. |
| 8220 | 1 | 8 | 9 | 8 | 12 | While talking about the impact of financial crisis, particularly in the OECD countries, the author states that, "The net effect of these crises has further shifted production, investment and technology to emerging economies—a phenomenon that is consistent with the expectation that in a globalized world economy capital resources will shift to emerging economies that can make most productive use of investment (Lamy, 2011)."<br>Comment: I wonder if there are other references that may be cited. The current reference (Lamy 2011) is a talk given in the 2011 Panglaykim Memorial Lecture on "Harnessing Global Diversity" at the Centre for Strategic and International Studies in Jakarta on 14 June 2011. | Accepted - added reference to Zhu (2011) "Emerging Challenges" in Finance & Development |
| 17690 | 1 | 8 | 28 | 8 | 30 | The qotation marks are wrong. The consecuences of embeded emissions can be briefly pointed out "that dificult the measure of GHG emissions between manufacturing and cosuming countries". | Taken into account - other edits address embedded emissions, which is really important. Combined with other |

| 5458 | 1 | 9 | 27 | 9 | 32 | Discussion of peak oil with differing opinions- no indication of consensus is provided here and would be helpful | Rejected - Discussion of peak oil is beyond scope of chapter 1. A simple reference to GEA chapter 7 will suffice |
| 8474 | 1 | 9 | 28 | | 30 | Important to note that "peak water" is also a factor, particularly in areas not often considered in this light, including Alberta, Canada | Rejected - The suggestion inclusion of "peak water" is beyond scope of chapter |
| 18250 | 1 | 9 | 3 | 9 | 8 | shifting) to these emerging economies… . (See also chapters 5 and 16)". | Noted - cross reference is already in the text. No action needed |
| 18251 | 1 | 9 | 3 | 9 | 8 | All along Chapter 1 the concept is technological innovation, but in Chapter 5 is used technological change, and in chapter 16 is used technology development and transfer, as well Transfer and diffusion. So a definition is needed to grasp the interrelationship between Science, Technology, Innovation and Diffusion and then using the concepts properly in the whole text. | Rejected - beyond the scope of this chapter. Other chapters deal with this. Chapter 1 is an overview |
| 18252 | 1 | 9 | 3 | 9 | 8 | Another aspect is that innovation is not only technological but also non-technological ( organization, marketing, services). | Rejected - this is a good point but other chapters that deal directly with |
| 18014 | 1 | 9 | 3 | 9 | 8 | is there evidence to show that " technological innovation…has shifted( and is shifting ) to these emerging economies". | Taken into account - the sentence has been removed and the paragraph |
| 16992 | 1 | 9 | 3 | 9 | 8 | This bullet is not substantiated in the preceding discussion and should be deleted | Taken into account - combined with |
| 11396 | 1 | 9 | 3 | 9 | 8 | More basis should be provided for the assertion that "technological innovation … has shifted (and is shifting) to these emerging economies" considering that there continues to be many barriers and difficulties that are in place which prevent full and effective technology transfer to developing countries. | Taken into account - combined with other comments |
| 18410 | 1 | 9 | 30 | | 30 | Concerns about availability of resources, not scarcity. Resources are not scarce by definition. Within technical properties of resource there is no consideration for scarcity. | Noted - unclear on suggested action. No further action needed |
| 11020 | 1 | 9 | 31 | | | In regard to peak oil, suggest add the following reference:<br>Murray, J., & King, D. (2012). Oil's tipping point passed. Nature, 481, 433-435 | Rejected - the existing cite is fine. A discussion on any "peak" theory is outside the scope of this chapter -- no |
| 8405 | 1 | 9 | 33 | 9 | 33 | I suggest to add that it is a fact that from 2005 onwards, conventional crude-oil production has not risen to match increasing demand. Production is now 'inelastic', unable to respond to rising demand, and this is leading to wild price swings (See Murray J., King D., 2012, Oil's tipping point has passed. Nature, 481-433).<br>This is an important change since AR4, because production of crude oil increased along with demand from 1988 to 2005. | Rejected - the existing cite is fine. A discussion on any "peak" theory is outside the scope of this chapter -- no action needed |
| 13364 | 1 | 9 | 33 | | | The term 'inadequate investment' seems strange choice of words in the context of this report. Perhaps 'low investment' would be better. | Accepted - wording changed to "low investment" |
| 4605 | 1 | 9 | 33 | 9 | 33 | After "unit": "and is more efficient than coal" | Rejected - text is fine as existing. No |
| 4015 | 1 | 9 | 33 | | | suggested wording: "fossil resource and uranium endowment" | Rejected - suggested text is too |
| 7869 | 1 | 9 | 33 | 9 | 35 | This sentence seems to suggest that much more conventionl (and unconventional) fossil fuels should be exploited. It, again, indicates the affirmation of traditional growth patterns, see comment 25. | Rejected - We do not agree with the commenter's suggested implication of the text. We think the text is fine. No |
| 16997 | 1 | 9 | 33 | 9 | 35 | Is this global or region-specific? Also need a citation | Rejected - this is a global statement thus |
| 14788 | 1 | 9 | 4 | | 8 | "The largest…" This is overstated and should be put in context of the generaly global distribution of technological innovatoin capacity, which still resides overwhelmingly in the North, with pockets in the South being limited and constrainted to certain technological domains. | Rejected - no scientific evidence/publication provided to support changes suggested by the reviewer |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 16990 | 1 | 9 | 4 | | | "The largest emerging economies"; again, these nations should be listed so a complete snapshot of the current situation in the world is given, while also allowing posterity to read this report and assess what each nation has done, what impact it has had, etc. | Rejected - this is too much detail for the chapter |
| 17732 | 1 | 9 | 40 | | | This sentence is too long | Accepted - sentence has been |
| 4879 | 1 | 9 | 41 | | | "high energy intensity (~ of the extraction?) | Rejected - no, of the fuel itself. We think this is clear enough in the text. No action |
| 7147 | 1 | 9 | 41 | | | Remove both parentheses. | Editorial - copyedit to be completed prior |
| 2572 | 1 | 9 | 45 | 9 | 46 | I would expect that a large number of contrasting views would have a large number of references | Accepted - additional references added |
| 2573 | 1 | 9 | 47 | 10 | 8 | Very important the mention to the infrastructure lock-in by the use of shale gas, World Energy Outlook 2011 | Rejected - this is too much detail for |
| 16991 | 1 | 9 | 5 | | | "innovation and deployment of new technologies" - worth noting that many "effective systems" are also very controversial internationally in terms of tariffs, dumping, etc. | Rejected - this is too much detail for here. |
| 17404 | 1 | 9 | 9 | 9 | 11 | This is an important point, but it is phrased unclearly. Can the implications be more clearly articulated? | Taken into account - paragraph has |
| 18249 | 1 | 9 | 3 | 9 | 8 | “Fourth, technological innovation that is an essential part of cutting emissions has shifted (and is | Noted - unclear on suggested action. No further action needed |
| 18409 | 1 | 9 | 13 | | 20 | Paragraph says nothing new, space may be saved. | Rejected - we think text is ok. No action |
| 4248 | 1 | 9 | 33 | 9 | 34 | Has there really been inadequate investment in exploration and extraction capacity for conventional sources of gas and oil? Isn't the increased exploitation of unconventional sources an indicator that these are more productive in conventional terms than conventional sources? Surely the main lack of investments is in low carbon sources of energy? | Taken into account - combined with other comments. The word "inadequate" was changed to "low" per another comment |
| 5315 | 1 | 9 | 33 | 9 | 35 | The authors talk about inadequate investment in exploration and extraction capacity. At the same time they talk about unexpected surges in demand. Ex post, investment may not have been inadequate. But what is the benchmark for adequate? From a global warming perspective, the too low investment into oil exploration may be considered positive since it slows down CO2 emissions. The point in global warming is not carbon scarcity but (compared to the social cost) its oversupply. I therefore do not understand the concerns about underinvestment in fossil fuel extraction and exploration. | Taken into account - combined with other comments. The word "inadequate" was changed to "low" per another comment |
| 3445 | 1 | 9 | 37 | | | It should mentioned as well, among the new supplies from unconventional: tight gas and tight oil | Rejected - our text is ok. It is trying to signal the broad issues only |
| 8221 | 1 | 9 | 3 | 9 | 4 | Distinction must be made between innovation and deployment – I think there are more deployment and technology transfers than innovation in the emerging economies. Some clarification may be helpful. Have there been any studies that evaluate how technological innovations and the possibility of large new supplies from unconventional resources (e.g., oil sands, shale oil, extra-heavy oil, deep gas, coal bed methane (CBM), shale gas, gas hydrates) will affect the emission and environment. | Taken into account - the first sentence in that paragraph has been revised. Further differentiation, as suggested by commenter, would be beyond the space allocation of the chapter. |
| 4091 | 1 | 9 | 44 | 9 | 44 | unconventional oil and gas. | Rejected - this is a good point that gas be included. Per other comments, this sentence has been shortened and the portion of the sentence referred to by this |
| 17691 | 1 | 9 | 47 | 9 | 47 | Why use "warming gases" instead of GHG? | Noted - to avoid repetition. No action |
| 7010 | 1 | 9 of 33 | 20 | 9 of 33 | 21 | Add "But whatever the costs are, the current world energy system is unsustainable because it's based mainly on fossil fuels, which are finite and pollute the environment", after the final period in line 20. | Rejected - we can't scientifically make that judgement here. It is probably true and that is the spirit of the whole ipcc |

|---|---|---|---|---|---|---|---|
| 11578 | 1 | o | | | | In general what the chapter captures are the BRICs and the developed countrie(OECD and North America).The rest of the countries, the world, are not dealt with. It is to be noted that there are different categories of developing countries who all have the aspiration of improving the lives of their citizenry and develop. As they develop, they will emit GHGs.They need to be supported to move along green trajectories. Currently they are struggling in their efforts to sustainably develop and address the adverse effects of climate change. They are however doing a lot of work that is contributing to the objectives of the UNFCCC that can be provided as examples in this chapter such as work on energy conservation and efficiency improvements in industry, increasing the widespread use of renewables,development of low carbon energy sources and afforestation etc | Accepted, some more discussion on LDCs added; new categories agreed by DTG will address LDCs (and other categories of countries) systematically |
| 12191 | 1 | Page 25 | Line 32ff | | | You say that there has been a shift in emphasis from mitigation to adaptation and that more countries are rightly focusing on adaptation? Why? What are the arguments, indicators and information you base this statement on? Has there really been a shift? At the global or at national levels (the latter would imply that there had been a focus on mitiation before)? And why do countries “rightly” focus on adaptation? | Taken into account - context is accurate. See response to 1177 |
| 14521 | 2 | | | | | | Noted.<br>Commenting files will be amended |
| 3319 | 2 | | | | | I find it odd that the chapter does not include the policy directive of expanding public education around risk and uncertainly in climate change. Especially given the last sections of the chapter which focus on public perceptions and openness to climate policies, the issue of what people in general think and feel becomes crucial. These are affected by education in the broadest sense, and governments or NGOs looking to deal with risk and uncertainty bias should consider education as a deep response to the problem, indeed, as an adaptive response. | Informational deficits are one barrier to public action on CC mitigation, as the chapter now acknowledges in the introduction to Section 2.2, and a widely known one, but by no means the only impediment. Section 2.2 therefore focuses more on two other barriers to |
| 4114 | 2 | | | | | Who is the audience and what can this audience learn from this chapter? Large parts of the chapter address 'the decision-maker', an apparently uniform entity. Climate change as a global collective action problem involves a large group of heterogenous decision-makers. What is the nature of uncertainty arising from social systems (e.g. politics) and how do they relate to the natural system uncertainties (e.g. climate sensitivity)? It could be useful to frame your discussion from a political decision-making perspective because that would move many targeted end-users centre stage. | Accepted. In our view the realms of natural system and social system uncertainties are not nested. This chapter is more focused on the latter. In this regard a new table (Table 2.1) develops a taxonomy of different types of |
| 4115 | 2 | | | | | There are gaps and inconsistencies between chapter 2 and other framing chapters and between framing chapters and subsequent chapters. As the first of all chapters (after the Introduction), chapter 2 is encouraged to play a pro-active role in mainstreaming its framing into the remainder of the report and seek support from the TSU for doing so. | Table 2.1 provides a link to the other framing chapters |
| 4116 | 2 | | | | | It would be useful to prioritize more and carve out key insights. Some sections seem almost encyclopedic, some sections are skin, not all pieces of information seem relevant. | Sect. 2.1 now provides more key insights. Other sections will address this |
| 4117 | 2 | | | | | It might be useful to add a discussion on insurance. Which types of risk are insurable and what types are not, and what happens if people become insurable, how does that alter behavior, on the individual level and on the level of the group? | The SOD will incorporate material on insurance and how insurance can affect behavior |
| 4118 | 2 | | | | | When is uncertainty a reason to wait and learn, and when is it a reason to act and learn later? You assess this question but it would be helpful to parsen your answers more clearly because they seem very important. Perhaps you could even provide case-specific answers related to the risks that matter on the UNFCCC level. | We highlighted the effects of climate and technology response uncertainty in the section on IAMs. However in the SOD we will also mention it in the introduction and the summary. We will |
| 4120 | 2 | | | | | Please review chapter 4 section 4.7.1. If you feel that this section contains redundant and/or inconsistent duplications of chapter 2 discussions, please advice chapter 4 authors on how to revise their section. | Done. |
| 4128 | 2 | | | | | It would be useful to highlight the relation of your chapter to the AR4. What has happened since? How was uncertainty treated in the AR4 (if at all) and how do you extend on this assessment? | We will highlight this in the introduction. |

| 4133 | 2 | | | | | Please review chapter 3 section 3.11.1.4 on "Human ability to understand climate change" and, if needed, discuss this section with its authors. | We have reviewed Sect. 3.11.1.4 and discussed this section with some co- |
| 8915 | 2 | | | | | risk and uncertainty' are often used as one entity that is followed by a verb in singular. Uncertainty is an inherent part of risk, but the two concepts are still distinct. There is more to risk than uncertainty and there are uncertain situations that do not entail risk. | Thank you for this comment. Throughout the chapter, and in the Glossary, we are clarifying the distinction between risk and uncertainty. At the same time, "risk and uncertainty" is often treated in the literature as a single issue (because the two concepts, while different, are closely related). It is in this sense, as a single |
| 8917 | 2 | | | | | One main argument in the chapter is that people are myopic, that is, focus on short-term consequences and overly discount delayed future outcomes (e.g., element ' Risk perception and behavioral responses ...' of the framework on page 5 and page 8; Sections 2.2.3, 2.2.4.1, 2.2.4.2). It is true that this is a reliable finding, but mainly in the domain of financial and health risks. In the domain of environmental risks, it has been found that people do not discount long-term future environmental consequences (Böhm & Pfister, 2005; Gattig & Hendrickx, 2007). Thus, it might be that climate change consequences are much less discounted or that the discount rate varies substantially depending on the domain that is affected (finance, health natural environment, etc.).<br>Böhm, G., & Pfister, H.-R. (2005). Consequences, morality, and time in environmental risk evaluation. Journal of Risk Research, 8, 461-479.<br>Gattig, A., & Hendrickx, L. (2007). Judgmental discounting and environmental risk perception. Journal of Social Issues, 63, 21-39. | Thank you for the two references. It may well be that time delay does not play as much of a role in fairly general, nonpersonal environmental decisions of the kind used in the Boehm & Pfister paper, where subjective perceptions of temporal distance of the adverse consequences were significantly different but still very similar(from 1.96 to 2.92 on a scale from 1 to 7. And even there, greater perceived distance WAS correlated with less perceived risk and less tendency to help. Other studies, triggered in part by the Gattig & Hendricks paper did find evidence that both American and Chinese respondents discount future environmental accounts very similarly to financial outcomes and also far more than normative economic discount rates would suggest (Hardisty, D. H., & Weber, E.U. (2009). |

|---|---|---|---|---|---|---|---|
| 14821 | 2 | | | | | The chapter presents a great amount of important information. It would, however, much more illuminating and useful if be organized and structured in a more systematic framework. Specifically, the chapter currently reviews a range of different types of climate-related decisions, types of uncertainty, and types of tools. It should go on to provide guidance as to which types of decisions reflect which types of uncertainty and are thus amenable to which tools. To be more explicit...<br><br>The types of uncertainty should be distinguished by their key features. Some types of uncertaintly are of fundamental importance and define the very nature of the climate problem: the deep epistemological uncertainties within the natural system and the enormous downside risk associated with climate change is this kind of uncertainty. We have no probability density functions or damage functions that can be employed with any confidence. We have no historical precedent, no capacity to do experiments with a "test planet earth". Another type of uncertainty is that associated with, say, the rate at which cost of a given technological option will decline, or its efficiency will improve. It has fairly well-defined bounds and reasonable historical precedent to make justifiable estimates of probability densities. One can imagine a fairly neatly charted spectrum of types of uncertainty, from the most profound and poorly characterized, to the mere techno-economic and well-bounded and confidently characterized. The types of uncertainties discussed in the chapter could be placed on this spectrum. Another type of uncertainty has to do with human volition: our own (unpredictable) choices will determine certain outcomes.<br><br>Similarly, the tools should be distinguished by type, and placed on a corresponding spectrum, ranging from tools approrpiate for the most profound and poorly characterized types of uncertainty to those appopriate for more manageable and well-characterized types. CBA and E(U) Theory are appropriate for well-characterized uncertainties. SEJ and RDM, on the other hand, are more suitable for situations of profound uncertainty, when there is not sufficient information to use tools that rely on a probability density function. Scenario analysis would be most suitable for issues where uncertainty is determined by human volition, such as the choices of future development paths.<br><br>And finally, the chapter could help the policy maker by explicitly discussion which kind of decisions entail which kinds or uncertainty, and are thus amenable to which tools. For example, the choice of a global climate goal (e.g., 1.5C? 2C? more than 2C?) cannot be determined by doing a CBA or E(U) optimization. It involves uncertainties that are ill-characterized and profound. It also involves value decisions (relating to treatment of other individuals and generations who may pay the cost of our decisions, and the worth of non-monetizable values), and is intrinsicially a process relying on democratic involvement. SEJ and participatory process could provide the process by which an objective is determined, and the objective is used subsequently in CEA processes to identify the most efficient path. A choice between different regulatory optoins for meeting this goal could then be amenable to a constrained CBA or E(U), accounting for uncertainties in, say, techno-economic parameters. (This process has been identified by climate policy analyists as being far more viable than CBA or E(U) for identifying a cliamte goal). | We will elaborate on the link between precaution, RDM and CEA more carefully. However to our understanding the literature on decision-making under deep uncertainty does provide only little guidance how to decide under multiple sources of deep uncertainty. In that sense we regard it as premature to develop an iconic figure of the type the reviewer suggests. Instead we will be very explicit on the research needs along those lines. |
| 14833 | 2 | | | | | The observation "an important exception..." is not particularly compelling given the caveats (no catastrophic/threshold damage, no cobenefits), which renders the observation virtually irrelevant. The exception should probably be removed, and the primary conclusino should be elaborated further. | Text has been edited accordingly |

|---|---|---|---|---|---|---|---|
| 11490 | 2 | | | | | The charge that local decision makers tend to be "myopic" appears throughout the text. This should be reexamined on two grounds: first, that decisions based on short-term considerations rather than long-term possibilities are often entirely rational. Second, that it is extremely difficult for policy makers to consider the complex challenges and numerous factors faced by individuals who are forced to adapt to climate change. One can argue that the models employed by policy analysts often contain simplifed heuristics and hyperopia (the approximate opposite of myopia), by which critical context-specific factors affecting adaptation are obscured. | These are all excellent points and this and other comments by you are a good reminder to be cognizant of unintended connotations of expressions like "myopia" or "myopic". The term is used to contrast observed behavior from the rational-economic assumptions about human goals and processing ability currently used in the models on which policy prescriptions are based. The arguments you provide for why such behavior is observed are, of course |
| 11521 | 2 | | | | | This chapter is much improved from the previous draft in terms of clarity and order. However, it is still lacking the incorporation of indigenous perspectives on/reactions to climate change. Such perspectives could be added to the chapter through specific examples, and also through acknowledgement of pluralistic perspectives on risk and uncertainty, as well as interpretation of scientific knowledge. | We are well aware of this deficiency and are working on correcting it, by additional efforts of existing chapter authors and by adding expertise on such |
| 11518 | 2 | | | | | This figure lacks a caption and is not discussed in the text itself. It is confusing and unnecessarily dichotomizes between natural and social systems. If it is not critical to the chapter, it should be removed. | It is removed. |
| 15740 | 2 | | | | | General remark on Chapter 2:<br>In my opinion, this chapter is misplaced in the Assessment Report. It does not address the relevant questions: How should uncertainties affect our policy motives and decisions? (See my general remarks on the WGIII Draft.) Instead, section 2.1 deals with something like the psychology of behavior under risk. This is of minor interest, unless there are hypotheses about how it affects the questions whether and what should be done about climate change (the topic of the Assessment Report). Section 2.3 is a description of different evaluation methods of uncertain events. It is kind of incomplete textbook with critical remarks. Almost no applied study on climate change issues is summarized or even mentioned! (For example, section 2.3.2 discusses the Cost-Benefit Analysis method, but no such study on climate change is referred to.) Neither are the methods tentatively applied by discussing a relevant question of climate policy. If the AR contains such general treatment in WGIII it should also have a physics textbook in WGI – I think both are / would be misplaced in the AR. Similar holds for section 2.4. The exception is section 2.4.4 which is very interesting to read, addressing some real issues of mitigation policies under uncertainty. | We believe the psychology of decision-making as it relates to risk perception and behavior (Sect. 2.2) is central to developing climate change policies in combination with decision tools for improving behavior (Sect. 2.3). The SOD will clarify why it is important to have descriptive and normative analyses for developing climate change policies. |
| 18442 | 2 | | | | | view,it is the decisions made which are short term for expedience. | Comment is unclear - no response |

| 15456 | 2 | | | | | Sociological and anthropological perspective are missing. There has been quite an explosion of theoretical work on risk, and except for a brief mention of the work of Ulrich Beck, many of the other studies (Anthony Giddens, Scott Lash, other studies by Beck) - these need to be added. For a critique of these theoretical / conceptual approaches from a developing country perspective, please also include - D.Parthasarathy,15. "Social and Environmental Insecurities in Mumbai: Towards a sociological perspective on vulnerability", South African Review of Sociology, 40, 1, 2009. | Thank you for providing us with this paper (there is a strong shortage of work in developing countries!) and for pointing out that sociological and anthropological perspectives are missing. We now cite the paper in our section 2.2.1.3. We agree that a broader range of social science disciplines than just economics needs to be represented in the IPCC |
| 10161 | 2 | | | | | To me it is a bit counterintuitive that the decision to be made affects the uncertainties in themselves (as the figure seems to say) rather than which uncertainties that need to/should be considered. This needs to be clarified in the figure so that a reader intuitively understands what is meant. | Figure 2.1 has been revised in the SOD so the first box is Problem Formulation |
| 6366 | 2 | | | | | Unclear what this figure portrays. It resembles a flowchart, but the boxes all identify concepts rather than actions. The meaning of the arrows is unclear, and in any case, they create an endless loop. Bottom line: this does not seem to be a very helpful figure. | Fig. 2.1 has been revised in the SOD so that readers will understand the importance of descriptive and normative |
| 17138 | 2 | | | | | See Adger, N., Barnett, J., Chapin, F., Ellemor, H., (2011) This Must be the Place: Underrepresentation of Identity and Meaning in Climate Change Decision-Making. In Global Environmental Politics 11 (2): 1-25. | Thank you for alerting us to this publication. It argues for a response to climate change based on methods other than economic cost-benefit analysis, based on the fact that some places of immense cultural yet non-market value (areas in the Arctic, Pacific islands) will be lost entirely as a result of climate change. While space is limited, the |
| 10481 | 2 | | | | | General comments below on this chapter are from Dan Sperling - LA Chapter 8 <dsperling@ucdavis.edu> | Thank you. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 10482 | 2 | | | | | Chapter 2 is well written and a good overview of the literature on risk and uncertainty. It would be an excellent resource for a graduate seminar course. But, in the end, the chapter is too theoretical and too abstract to be of much value to decisonmakers in government or business. Even discussions that are a bit more grounded—for instance on price caps and feed-in tariffs—are far too general and insensitive to situational considerations to be useful to decisionmakers. In the end, assessments of risk and uncertainty and related decisionmaking are based on situational considerations specific to that decision. This chapter seems to show no appreciation of that fact, focusing on general theories, concepts and considerations.<br>Some other concerns:<br>• I was as surprised to find almost no insight or attention to business decisionmakers. The chapter is almost totally devoted to individual behavior, and a bit to government agencies. Almost nothing is said about business decisionmaking. In the energy areas, for instance, it did not address decisionmaking by oil, natural gas, electricity, and biofuels companies. It did not address car and truck manufacturing companies. It did not address infrastructure companies. And so on.<br>• The chapter provided minimal insight for government decisionmakers. The design of cap and trade programs entails a large number of decisions about allocating allowances; social, regional, and economic equity; financial integrity; international and national trade laws; trading robustness; and much more. I saw little or no insight into risk and uncertainty for these issues.<br>• The chapter does not address in any way a vast swath of decisions and policies under consideration. In my area of transportation and fuels, I did not see anything on land use changes (a huge issue with biofuels), regulations of vehicles and fuels, urban land use, and much more.<br>• Another citation regarding loss aversion, with respect to purchase of more efficient cars, is: David L. Greene, John German and Mark A. Delucchi, “Fuel Economy: The Case for Market Failure,” Chapter 11 in Daniel Sperling and James Cannon, eds,, Reducing Climate Impacts in the Transportation Sector, Springer, 2009. (I believe there were follow-up journal articles) | We agree that the discussion of the effects of risk and uncertainty on climate change response policies provided by Chapter 2 is general, as Chapter 2 is one of the framework chapters. Situational refinements and qualifications of these more general points are provided by the sectoral chapters later on in the report.<br><br>?We have now added mention and discussion of a much broader range of levels of decision makers, including business decision makers, as seen for example in Table 2.1, and at various other parts of the chapter.<br><br>?We now also spell out in much more detail the different types of decisions that need to be made (see again Table 2.1) and comment on different sources of uncertainty for those and different implications of how to deal with them as a function of decision maker level and type of decision.<br>Thank you for the Greene & Delucchi reference, it is a nice application of loss |
| 7217 | 2 | | | | | It is not clear to me to whom this report is addressed. Judged from the writing style, it seems to be by scientists for scientists. | The report is written for everyone. We have rewritten several sections of the report to clearly explain technical terms in simple language. We have also |
| 6784 | 2 | | | | | Add content about the risk of adaptation or mitigation policy choice in different sectors,because the risk or uncertainty of adaptation or mitigation policy choice for different sectors may be very different . | Accepted. The text will be modified accordingly. |
| 4611 | 2 | | 15 | | 17 | The meaning of this sentence is not clear as well; what does "greater sensitivity" illustrate: system 1 or system 2 ? | Thanks, Text has changed in SOD |
| 8115 | 2 | | | | | The summary sounds quite similar to the introduction. It should be focused on the main insights. | The Executive Summary in the SOD will provide the main insights of the chapter. |
| 4832 | 2 | | | | | The introduction section is in long parts a repetition of the summary (same examples, same arguments). Given that the space is so limited, I strongly advice to reduce this overlap. It is also tiring for the reader. | The introduction has been rewritten. |
| 3314 | 2 | | | | | I find the use of the category of "decision tools" narrow and potentially misleading, implying technocratic quick fixes to the considerable issues raised in this chapter. What is at stake, often, are not only "tools," but education, which takes time and more investment, and social or organizational processes, which are not simply tools, but ways of structuring information and decision-making based on information. I understand that you want a relatively streamlined language for policy-makers, but would urge some sort of caveat, at least in a footnote. It is worth flagging the depth of the challenge here, not inadvertantly making the challenge seem superficial simply by the way one frame the kind of response available. | A wise caveat, which we have incorporated into our introduction section 2.1. |
| 8914 | 2 | | | | | Section 2.1.1 is virtually identical to the Executive Summary. This is quite tiring - why the redundancy? | The Executive Summary in the SOD will provide the main insights of the chapter. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 11481 | 2 | | | | | After each of the subheadings in this section, it would be useful to indicate where these topics are discussed in more detail later in the chapter by giving the page number. | The Sect. 2.1.1 would be too long and cumbersome if it specified page numbers for each of the topics in the |
| 8233 | 2 | | | | 1 | Most of Section 2.1.1 is a copy paste of the executive summary. Comments made on the executive summary also apply to this section. | The Executive Summary in the SOD will provide the main insights of the chapter |
| 8124 | 2 | | | | | The two modes of thinking are quite reasonable at first glance. However, for further analytical and empirical clarification, this concept is too simplistic. | We agree. In moving towards the Second Order Draft, we are clarifying that the two modes are applicable to thinking about individual decision makers operating in the abstract, and yet the ways in which decision-making |
| 13825 | 2 | | | | | If this report is accepting whole-cloth the hypothesis of Kahneman (2011) with no modification or caveat, that point should be made clear up front. This entire section seems like a review of that one contribution. The remaining references predate Kahneman (2011) and there is no reference to any critical literature citing his work. | The introduction to Section 2.2 which introduces the System 1 and 2 distinction has been rewritten to make it clear that this distinction predates Kahneman (2003 and 2011), and that he only provides the most recent synthesis. |
| 13826 | 2 | | | | | Many statements and claims are not substantiated by reference to literature. It is not clear if these are opinions of the author(s) or conclusions based on actual scientific analysis that has been peer-reviewed. An example is the paragraph beginning on line 30. But this is a common problem. | We tried to provide references to all specific claims. |
| 13827 | 2 | | | | | In general, I see no reference to confidence metrics related to any statements. | Confidence metrics are mandatory only for the key findings in the Executive Summary. We comply with this rule in |
| 11514 | 2 | | | | | This section needs a subsection on indigenous people's behavior and responses under risk and uncertainty because they are already experiencing the impacts of climate change. | We now discuss indigenous people's responses and indigenous knowledge |
| 8919 | 2 | | | | | One aspect that is not discussed in this chapter and that I think should be addressed in Section 2.2 is that people see climate change also as a very moral issue (e.g., Lorenzoni & Pidgeon, 2006). While morality is a different dimension than risk and uncertainty, it is an important aspect of how people perceive the consequences of climate change. Issues of justice, fairness, and responsibility are important in environmental risk perception (e.g., Böhm & Tanner, 2012), they also trigger emotional reactions which then guide behavior such as cooperation (Fehr & Gächter, 2002; Pfister & Böhm, 2008, 2012).<br>Böhm, G., & Tanner, C. (2012). Risk perception. In L. Steg, A. E. van den Berg, & J. I. M. de Groot (Eds.), Environmental psychology: An introduction. New York: Wiley-Blackwell.<br><br>Pfister, H.-R., & Böhm, G. (2008). The multiplicity of emotions: A framework of emotional functions in decision making. Judgment and Decision Making, 3, 5-17.<br><br>Pfister, H.-R., & Böhm, G. (2012). Responder feelings in a three-player three-option ultimatum game: Affective determinants of rejection behavior. Games, 3, 1-29.<br><br>Fehr, E., & Gächter, S. (2002). Altruistic punishment in humans. Nature, 415, 137–140. | We refer to this now in the introduction to Section 2.2, but can do so only in passing, because of space restrictions. The role of ethics and ethical concepts in climate change policy is the topic of Chapter 3. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 12520 | 2 | | | | | Much of the analysis in this and following sections asserts a variety of phenomena as related to the proposition of “System 1” and “System 2” modes of human cognition. While this may merit a brief discussion, it is a far too simplistic and conjectural application of this particular cognitive model. Among other things, this and similar models ignore communication, interaction and group effects. This section should be rewritten to review a broader range of theories on human cognition, choice and decision-making. | A good point and we tried to do that. |
| 11505 | 2 | | | | | This section would benefit from an example from a part of the world where the effects of climate change are more apparent, such as in the Arctic or many mountainous regions. The relationships between expectations and perceptions are quite different in areas where climate change impacts have been acutely observed and adaptation is already occurin. | Some examples of this kind are now provided in Section 2.2.1 |
| 8483 | 2 | | | | | Again, much of this is framed assuming a deficit model of policy and knowledge transfer, as well as downplaying the relationship(s) between science and politics. Maasen and Weingart "Democratization of Expertise? Exploring Novel Forms of Scientific Advice in Political Decision-Making" (2005) provides some insight/content in this direction | Some of these suggested dynamics are described in Section 2.4. |
| 4835 | 2 | | | | | Another factor which might play a role is that climate change is confused with "local warming". So the effect that the global climate system warms is taken for a sign that also local climate should warm. Together with the climate/weather confusion exceptionally cold winters as experienced in the northern hemisphere in 2010 for example can make people disbelieve in climate change (phrased as "global WARMING"). Unfortunately, I do not have any studies available analysing this effect, only my personal experience reading the letters to the editor in a Norwegian newspaper during winter 2010. Hopefully, there are studies showing this effect. There is however, a reference in the report on page 42, lines 7-9 which seems to go into the same direction. | We report a study that established exactly the phenomenon you describe (Li et al., 2011) in Section 2.2. |
| 4836 | 2 | | | | | Social amplification of risk is one possible outcome of constant exposure to climate change communication. Another alternative outcome is that the perceived risk is reduced because of a higher familiarity. | Constant exposure is not a trigger of social amplification and I don't think that |
| 10269 | 2 | | | | | This section will be valuable, but more descriptions higher relevant to climate policy implications will be expected. | We tried to provide more examples and illustrations from a climate policy context |
| 4043 | 2 | | | | | This section is very comprehensive and clear in its aim, to list methods and discuss their merits and shortcomings. However, this may not be enough for the purposes of decision making under uncertainty. A useful addition to this section, and the whole concept of methods more generally, would be a procedural illustration of how to evaluate and assess the tool against the purpose and aim for application. In other words, how do we measure and account for the choice of decision-making approach under undertainty? from an accountability and governance perspective, this would be imperative. Standards and criteria for the evaluation of decision making processes do exist, and this discussion should form of this chapter. For example, Lasswell (1971) validation of decision-making pocesses in policy sciences is a very pertinent source that has been cited in a few climate change adaptation works, and no doubt have applicability in the mitigation context as well. See: Lasswell, H. D. (1971). A Pre-View of Policy Sciences: Elsevier Publishing Company. | Thank you, we have now modified the chapter in order to better link methods to actual examples and in order to contextualize methods under different choices types |
| 3318 | 2 | | | | | This entire section suffers from a deficit of attention to deep responses to uncertainty and risk bias. At the deepest level, public education is crucial, yet the section focuses on technocratic tools. This is a serious oversight. In a world where voter and consumer behavior makes a lot of decisions, we need to address deep, underlying ignorance and bias. You should find a way to include this consideration in your report. Allocating funds to climate risk education is very important in the long run, not simply using one of the tools you've described. | We have now made an extensive effort to link the section on behavioral issues and risk perception with the section on economic tools |

|---|---|---|---|---|---|---|---|
| 13859 | 2 | | | | | This section fails to discuss 'scenario planning' . An example is Title: Climate change and future energy consumption in UK housing stock<br>Author(s): Collins, Lisa; Natarajan, Sukumar; Levermore, Geoff<br>Source: BUILDING SERVICES ENGINEERING RESEARCH & TECHNOLOGY Volume: 31 Issue: 1 Pages: 75-90 DOI: 10.1177/0143624409354972 Published: FEB 2010 --- OR --- Title: Climate change scenarios and citizen-participation: Mitigation and adaptation perspectives in constructing sustainable futures<br>Author(s): Larsen, Katarina; Gunnarsson-Ostling, Ulrika<br>Source: HABITAT INTERNATIONAL Volume: 33 Issue: 3 Pages: 260-266 DOI: 10.1016/j.habitatint.2008.10.007 Published: JUL 2009 --- OR --- Title: Use of participatory scenario modelling as platforms in stakeholder dialogues<br>Author(s): Andersson, Lotta; Olsson, Johanna Alkan; Arheimer, Berit; et al.<br>Source: WATER SA Volume: 34 Issue: 4 Pages: 439-447 Published: 2008 | The two reference do not deal with uncertainty, which is the chief objectinve of this chapter. |
| 11515 | 2 | | | | | The organization of this section is reader-friendly. Each tool is explained, its relevance to climate policy is discussed and advantages as well as limitations are stated. This is a notable improvement from Zero Order Draft. | Thank you |
| 3317 | 2 | | | | | You should discuss Gardiner (2011)'s critique of CBA with respect to climate equity. | A larger discussion of CBA and issues related to inequality, representative agent, interteporal equity is undertaken |
| 12996 | 2 | | | | | The claim that the precautionary principle is a version of maximin might be disputed. Although some authors suggest this, it is not clear that all versions of the PP demand it (e.g., the Rio version). Also, theoretical discussion of the foundations of the precautionary principle would be helpful (e.g., Sunstein 2005, Gardiner 2006). This is a topic on which chapter 3 might also touch. | Agreed, Delete text |
| 12523 | 2 | | | | | The precautionary principle does not lead only to a worst-case/minimax analysis. Modern approaches can use dynamical models selecting employing stepwise (e.g. annual for a 20-year planning horizon) assessments across multi-dimensional scenarios at each step, and converge on a 2-factor “efficient frontier” analysis using, for example, cost and risk. Northwest Power and Conservation Council, 2011. An Overview of the Council's Power Planning Methods, www.nwcouncil.org/library/2011/2011-02.pdf | Text has been changed |
| 13864 | 2 | | | | | Section 2.4 is a marked change in character from earlier sections. It is more literature review of the type typical of AR4 and less text-like teaching a subject noted previously for earlier sections. This change is jarring and suggests that the earlier sections need considerable improvement in style and mode of presentation. | To a large extent the change in style reflects the different functions this chapter is meant to serve, according to the Plenary Approved Outline. On the one hand it is meant to bring the reader up to speed on many of the technical and scientific issues surrounding risk and uncertainty; sections 2.2. and 2.3 do this, and for this reason they can read a bit textbooky, presenting some basic concepts and theories, rather than reviewing specific scientific studies of the past 7 years. On the other hand the chapter is meant to synthesize findings |

M., 2008. Germanys solar cell promotion: Dark clouds on the horizon. Energy Policy 36:4198-4204.<br>Frondel, M., Ritter, N., Schmidt, C. M., Vance, C., 2010. Economic impacts from the promotion of renewable energy technologies: The German experience. Energy Policy 38:4048-4056.<br><br>Reichenbach, J. and T. Requate 2011. Subsidies for Renewable Energies in the Presence of Learning Effects and Market Power, Resource and Energy Economics 34 (2012), 236-254. | Thank you very much for these references. As for the insight that, of course, policy instruments that succeed in stimulating investment in intermittent renewables do generate risks associated with supply interuptions, and higher costs associated with the additional average costs compared to existing power sources: we have included this into the introduction for section 4.4, with many of the references that you have suggested here. With respect to the latter, I believe that the sectoral chapter on Energy Systems and the governance chapter on the national scale(Ch 15) are both dealing with these issues. As to the former issue, we will include it. |

|---|---|---|---|---|---|---|---|
| 5322 | 2 | | | | | As mentioned already in the remarks to chapter 1: The authors seem to be preoccupied by the concept of systematically bounded rational consumers and ignore switching cost and other hidden cost incurred by the consumers through adopting new technology. (See by contrast chapter 4, where switching cost are addressed, e.g. Farrell and Klemperer (2007), Chapter 31, Coordination and Lock-in: Competition with Switching Costs and Network Effects. Handbook of Industrial Organization). | Noted. Introduction clarified. |
| 3037 | 2 | | | | | It is not clear that promoting energy efficiency and removing barriers to its implementation for final consumers will always have the intended effect of reducing energy consumption, owing to rebound effects. For instance, consider compact fluorescent bulbs, which are mentioned here. Despite the seemingly commonsense appeal of such technology for restraining energy use, a Journal of Physics analysis of lighting technologies covering three centuries, six continents, and five technologies shows both very large gains in energy efficiency and essentially 100% rebound [Tsao, J.Y., Saunders, H.D., Creighton, J.R., Coltrin, M.E., Simmons, J.A., 2010. "Solid state lighting: an energy-economics perspective." Journal of Physics D: Applied Physics 43 (35), 354001; also Saunders, H.D. and Tsao, J.Y. "Rebound effects for lighting," Energy Policy, 49(2012): 477-478]. Importantly, note that such efficiency gains increase economic welfare even if they don't reduce energy use. Consumers benefit from efficiency gains, but their behavioral response may be surprising and counter to "one-for-one" energy reduction expectations in the long run. | The literature on the rebound effect is very important, and needs to be taken into account in all discussions of efforts to Improve energy efficiency. It is, however, somewhat tangential to the issue of risk and uncertainty in the area of energy efficiency. Rather, it has to do with the effectiveness of various policies, which are covered in the sectoral chapters on buildings and transportation. |
| 8918 | 2 | | | | | The section paints a picture of people being irrational creatures that are driven by emotions and by identity-based aspects such as cultural values. Emotions are an important, maybe the most important, determinant of behavior. But emotions have a cognitive basis and thus reflect a person's understanding of the situation. For example, a factor that has been shown to guide people's support for climate change policies apart from emotions is their understanding of the causes of climate change and which policy measures they judge to be effective (O'Connor et al., 1999, 2002; Bostrom et al., 2012), which is a cognitive and deliberative judgment.<br>Bostrom, A., O'Connor, R. E., Böhm, B., Hanss, D., Bodi, O., Ekström, F., Halder, P., Jeschke, S., Mack, B., Qu, M., Rosentrater, L., Sandve, A., & Sælensminde, I. (2012). Causal thinking and support for climate change policies: International survey findings. Global and Environmental Change: Human and Policy Dimensions, 22, 210-222.<br><br>O'Connor, R.E., Bord, R.J., Fisher, A. (1999). Risk perceptions, general environmental beliefs, and willingness to address climate change. Risk Analysis 19, 461–471.<br><br>O'Connor, R.E., Bord, R.J., Yarnal, B., Wiefek, N. (2002). Who wants to reduce greenhouse gas emissions? Social Science Quarterly 83, 1–17. | A useful observation, and one that we have tried to address in the introduction to section 2.2, describing in more detail the wisdom and contributions made by System 1 processes. |
| 16092 | 2 | | | | | No clear message in that section | The message -- that perceptions of risks associated with particular technologies, in particular nuclear and CCS, is a major obstacle to development -- could be brought out more strongly in the opening |
| 16093 | 2 | | | | | It is not clear in this section what knowledge is posterior to AR4 | This comment raises a fundamental problem with this section, namely that, unlike the rest of Section 2.4, this sub-section fails to focus on the empirical |
| 12991 | 2 | | | | | The fact that EU theory involves a distinct normative perspective, and indeed is only one way of operationalizing that perspective, is owrth emphasizing and should be addressed in chapter 3. | We agree that E(U) is only one way of highlighting a normative perspective. It |

|---|---|---|---|---|---|---|---|
| 10267 | 2 | 0 | | | | Throughout this chapter, there are many general explanations about risk and uncertainty. You should focus on them regarding climate change. Please do not forget that this report is an assessment report on climate change. | Thank you for this comment. The risks and uncertainties associated with climate change are one of the elements that we consider in this chapter. It is important to recognize, however, that this chapter is not about risks and uncertainties in climate change per se, however, but about risks and uncertainties that are relevant to climate change policy responses. We are thus deliberately not focusing on risks and uncertainties associated with climate, but rather seeing these risks and |
| 8783 | 2 | 0 | | | | The approach is normative in focusing on utility rather than alternative ethical schemes such as rights/ deontological ethical approaches (e.g. right to life) or virtue ethic and epistemological approaches - e.g. (precaution/wisdom and seeing moderation of consumption as good for individuals, societies and the Earth System). One example is the focus of where people act as 'consumers' and have shorter term aims that some economic analysis suggests is wise, ignoring where people act as citizens and would take a longer term view than economics typically does in practice. Charlesworth M & Okereke C (2010, Policy responses to rapid climate change: An epistemological critique of dominant approaches, Global Environ. Change, 20:121-129, doi:10.1016/j.gloenvcha.2009.09.001) suggests that conventional economics cannot respond to the demonstrated level of difficulties in prediction of the climate. It also suggests that the utilitarian ethics of economics may not be K10the starting point of the majority of the global population. That is, economics is both an irrational and undemocratic response to climate change as described by climate science. | This is a very good point, thanks also for the reference, and we make this point now in an expanded introduction to Section 2.2. |
| 12231 | 2 | 0 | | | | General comment: It seems like most of the litterature and examples in this Chapter is from North America and some from Europe. Please consider some more regional balance, as there might be relative differences between nations and regions. | Has been changed, see specially section 2.1.5 from SOD and FAQ 2.2. |
| 4893 | 2 | 0 | | | | Excellent arguments, examples, language, however, less attention could be devoted throughout the chapter (actually, in sections 1 and 2) to the heuristic, intuitive or "System 1" approach (its analyses and examples) since the main purpose is to explain the importance and methods of the comprehensive analytic approach to deal with risks and uncertainties in decision-making in relation to climate change (except, e.g., the relation mentioned inter alia on p.16: "These behavioral and cognitive science insights highlight some of the challenges facing scientists and policymakers in their efforts to develop effective climate change risk communication strategies and raise important questions about whether efforts to guide System 1 learning might be used to stimulate System 2 behavior.". | System 1 is important for developing climate change policy along with System 2 tools as noted in Fig. 2.1 and the introduction to Sect. 2.2 |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 8114 | 2 | 0 | | | | The chapter attempts to integrate a broad field of disciplines, schools and research perspectives. Furthermore, it attempts to integrate a broad field of implementation (decision) situations. However, the concept used to structure the field seems to be too simplistic for this challenge. I am sorry to sound so harsh, but the chapter reads occasionally as a potpourri of thinkable decision situations and loosely linked tools. I strongly recommend to (1.) reduce the scope of this chapter, (2.) be more precise about what kind of decision situation at what kind of decision-phase is actually addressed (and what not), and (3.) assess the tools more carefully and balance the options and threats more clearly.<br>In my perspective, the work of the International Risk Governance Council (IRGC) is most instructive for this challenge. It structures the problem-situation threefold in complexity, scientific uncertainty and ambiguity. Since climate change impact is a combination of all three, this structure helps to characterize which tool or procedure has its strengths in which problem-situation challenge. Furthermore, the IRGC has developed a Risk Governance procedure structuring the risk assessment process. They distinguish five phases: pre-assessment, appraisal, characterization/evaluation, management and communication. In each phase the handling of risk and uncertainty needs a specific strategy. Evidence of the usefulness of this IRGC approach is published in several peer-review journals.<br>Some sources: www.irgc.org.<br>Van Asselt, M. B. A.; Renn, O. (2011): Risk governance, in Journal of Risk Research, 14 (4), S. 431-449.<br>Atkinson, R.; Klausen, J. E. (2011): Understanding sustainability policy: governance, knowledge and the search for integration, in Journal of Environmental Policy & Planning, 13 (3), S. 231-251.<br>Aven, T.; Renn, O. (2010): Risk Management and Governance, Technology, Risk, and Society, Berlin Heidelberg, Springer.<br>Cope, S.; Frewer, L. J.; Renn, O.; Dreyer, M. |---|---|---|---|---|---|---|---|
| 16916 | 2 | 0 | | | | This is a good chapter and has potential to be extremely valuable, but to do so I think it needs to be clearer in structural approach towards different types of decisionmakers, and needs further development in two main directions:<br>• The concepts of risk and uncertainty are applied almost entirely to climate impacts ("the nature of the problem") rather than aspects of mitigation – which is rather odd for a report on Mitigation: in more than 40 pages, for example, there is less than a page on energy efficiency despite the fact that the energy efficiency is central and the literature identifies perceptions of uncertainty, risk aversion and other behavioural dimensions as crucial to understanding;<br>• Whilst the chapter gives intellectual clarity over "System 1 behaviour", and its distinction between that and "System 2", it then addresses a range of other issues with implication that they are hard to fit into "System 2" decision framework, but without this ever really pinned down. I think the chapter would be far clearer if it acknowledged the existence of "System 3" processes around strategic risks and deep uncertainty, including the role of security, strategic judgement, innovation and systems transformation. It would then help to clarify the boundary between these, and System 2 processes which generally aspire to quantification and work best under conditions of limited uncertainty and trade-offs at the margin.<br>I would also suggest value in trying to find another term, since the word "System" is hugely used through the Mitigation report for many different purposes (Energy System, Economic system, Systems Transformation, Innovation Systems, etc etc). The term I have found most useful is "domain".<br>The chapter also needs at minimum to say a bit more about the role of inertia at many levels of decisionmaking and the (physical and social) systems involved. Inertia in its broadest sense is what renders "wait and see" untenable in the face of uncertainties. □ | We will respond to the reviewer's two bullets separately. Bullet 1: In its revision, Chapter 2 now offers far more coverage on uncertainty in climate change mitigation, starting with a list of multiple sources of uncertainty, of which climate impacts are only one among many. Bullet 2: chapter 2 has been extensively revised and now mentions many of the aspects the reviewer found missing. However, we did not add a "System 3" as Systems 1 and 2 refer to two different processing systems, rather than types of uncertainty. We also did not switch to a different terminology for System 1 and 2, because this is the way in which both academic publications and the more popular press refer to those types of psychological processes, but now frequently define what these "systems" stand for, as in "intuitive System 1 processes," or "analytic |
| 7300 | 2 | 0 | | | | Chapter 2 concentrates on qualitative (textual) description of risks and uncertainties relevant to climate change response policies. The quantitative assessments are almost missing. It would help, if the quatitative assessments of the relevanr risks and uncertainties are included in the chapter, wherever possible. | Thanks for this comment, I assume you want inclusion of quaNtitative assessments?:-). There is much experience with (quantitative uncertainty analysis (QNUA) in engineering and science based policy, but not much yet in climate change. An overview for integrasted assessment models is appearing in Cooke, Roger. M. (2012) "Uncertainty Analysis Comes to Integrated Assessment Models for Climate Change…and Conversely Climatic Change. DOI: 10.1007/s10584- |
| 4255 | 2 | 0 | | | | The current draft of chapter 2 ends rather inconclusively and its difficult to see the practical implications of the various approaches to decision making. It would benefit from a few illustrative examples. I wasn't convinced that devoting the second chapter to this topic was appropriate - it might be better to give the reader a better idea of mitigation options first. There is no discussion of the use of macroeconomic modelling including the co-benefits of mitigation strategies eg.CGE models | Regarding the sequence and scope of the chapter this is as decided by IPCC at its plenary session October 26-29, 2009 (please see approved chapter outline on WG III site). Co-benefits at the sectoral level are addressed in sector-specific chapters such as those on energy, transport, buildings, industry and agriculture (Chapters 7 to 11). Macroeconomic models (including CGE |
| 13793 | 2 | 0 | | | | This chapter is relevant to both WGIII and WGII. Integration, consistency, and cross-referencing will be challenging. | In the SOD we will devote particular effort in improving on the aspects that |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 13871 | 2 | 0 | | | | This chapter fails to identify any 'key findings' and fails to assign any metrics of confidence or uncertainty to statements. This is not appropriate. There are many places where useful ideas are made that rise close to the level of a recommendation and that should be presented as a key finding. These would be particularly valuable to a policy maker who wishes to draw from the useful material in this chapter. | Summary and Executive Summary will be augmented accordingly. |
| 4515 | 2 | 0 | | | | The discussion of risk in this chapter seems inconsistent with the glossary definition of risk which focuses only on hazards (presumably associated with changing climate). It should be made clear that/if risk is being considered more broadly. For example, there are a wide risks to investments that are not caused by climate hazards but are relevant to climate policy. Suggest that the glossary definition be changed to be consistent with this chapter. | The mutual relation of definitions of risk in the Glossary and in our Chapter will be made clear in the SOD. Ideally, both can be made identical. |
| 4831 | 2 | 0 | | | | In general a nice and interesting chapter covering the necessary basics in risk psychology. However, parts of the summary and introduction overlap massivly (even down to paragraphs that have just been copied and pasted). | This comment is absolutely right. We are completely revising the introduction and the executive summary, among |
| 9139 | 2 | 0 | | | | Biases of perception might be explained by biological evolution. It might be a good idea to employ this viewpoint in the discussion part. (cf. Haselton, M. G., Nettle, D. & Andrews, P.W. ( 2005 ) . The evolution of cognitive bias. In D. M. Buss ( Ed. ) , Handbook of Evolutionary Psychology, (pp. 724-746). ) Slovic has started this kind of discussion too. (cf. Slovic, P. (2007) If I look at the mass I will never act: Psychic numbing and genocide. Judgment and Decision Making, 2, 1-17. Retrieved April 24, 2007 from http://journal.sjdm.org/vol2.2.htm) | Because of space constraints, we don't think that such a discussion can be included, even though it would be interesting. |
| 14522 | 2 | 0 | | | | This draft offers an excellent survey of how individuals interpret and deal with risk and uncertainty. But it could benefit from placing these discussions in a broader context. For instance, the chapter never makes the argument, or even a statement, that addressing climate change in a challenge of risk management. The chapter largely focuses on individual decision making, and could benefit from placing its discussions in a risk governance (Orwin Renn) and/or decision support framework that would capture some of the important institutional and social contexts, and associated decision processes, in which these individuals reside. This chapter's current themese are clearly vital to understanding climate change as a risk management challenge, but it is at least as important to situate these ideas in the broader contexts since most important climate-related decisions (and the associated formation of risk perceptions) will be made by individuals acting within society, rather than as individuals acting along. These contexts will have an important influence on how people perceive and manage risk, and how they can best interact with the information provided in the rest of this IPCC WGIII report. | Excellent points. The SOD highlight the issues of risk governance as discussed by Ortwin Renn and indicate climate policy is an exercise in risk management. |
| 4693 | 2 | 0 | | | | Surprising that you discuss climate change communication but then don't follow up with strategies for doing it well and having it contribute to improved responses | Good point, and in good part because of space constraints, as the chapter is charged to do so much with such a small page allocation. We do, however, provide at least a brief discussion and a |
| 4701 | 2 | 0 | | | | Somewhere in this chapter, the problems of moral hazard from risk reduction should be addressed. For example, the US helped people rebuild in New Orleans, directly in the path of more frequent hurricanes. | The issues of rebuilding New Orleans falls more in the domain of WGII on Adaptation. The SOD will discuss insurance and note the importance of |
| 4709 | 2 | 0 | | | | For the whole chapter, I would suggest more use of Nudge-theory policies which suggest the best approach to the obstacles posed by System 1 thinking is to accept those as "givens" and design decision architectures that lead to the "socially desired" outcomes while allowing people to make System 1 "cognitive errors." Much more could be made of this. | Yes, thank you, we tried to do that. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 18582 | 2 | 0 | | | | What is the intention? To give advice on how to handle risk and uncertainty? If so, to whom? To explain behavioural aspects? To discuss/inform about apropriate decision tools and their capability to cope with uncertainty? To present some sort of general reasoning on risk/cost strategy seen from a mankind/society perspective? | The intention of Chap 2 is to indicate why climate change is a challenge for risk management and suggest how to address this issue |
| 18583 | 2 | 0 | | | | Gives an overview but no/little advise. Relevance for policymaking? Directly, no or highly questionable. Indirectly, maybe but I guess the audience is limited. | (See response to Comment 49) |
| 18584 | 2 | 0 | | | | The chapter is incomplete. | Thank you, we have extensively worked on improving the status of the chapter |
| 18585 | 2 | 0 | | | | More of an annex? | Comment is unclear - no response |
| 8994 | 2 | 0 | | | | To be comprehensive and accurate treatment of the subject, it will be important for the chapter to recognize that different societies can have different ways of managing and sharing risk. Individuals reduce their vulnerabilities to rsk by having broader social networks, for example. The chapter places too much emphasis on price-based, insurance market approaches. | Yes, an excellent point that we now make in a new Section 2.2.4.5 on Risk diversification by formal and informal institution, with social networks that |
| 8995 | 2 | 0 | | | | It is important to recognize that what is involved in climate change choices is that it is collective, not individual, decisions that are the most important. It is more important to highlight how people make collective choices under uncertainty than how individuals make these decisions under uncertainty. Because of this, ten pages of treatment of micro-based approaches, which applies most directly to choices made by individuals, raises the question of emphasis. The tools emphasized by the chapter, such as cost-benefit analysis, are mainly applicable to "bounded" problems. Climate change, which is a cumulative process, is by nature an unbounded problem for which prices and costs are often not well defined. For these kind of problems, other methods, such as expert assessment, might be more appropriate. | We have refocused the emphasis of the chapter, and now acknowledge the wide range of levels of decision making, from the individual to collectives and to policy makers at different levels, as shown in Table 2.1. We also point out the connections between responses to uncertainty at these different levels far |
| 8996 | 2 | 0 | | | | The Chapter privileges the Kahnemann System 1 and System 2 approaches to characterizing decision-making under incomplete information. Care should be taken to emphasize that what is at stake are effective and timely decisions. In the case of climate change, these decisions are made in a highly charged political context, with large gaps in power and capability among the parties involved. If the question is one of arriving at effective collective political decisions – whose appropriateness cannot be fully judged at decision-time, the System 1 approach, associated with intuition, perception, less analysis, and more myopic, is not necessarily an inferior one. | We are now more careful to point out that System 1 responses are not necessarily inferior to System 2 responses, but that good judgment involves knowing when to supplement System 1 rapid responses with more effortful and analytic System 2 |
| 5426 | 2 | 0 | | | | The Chapter promotes the view, that perceived risks are always inferiour to "expert judgement", presumable meaning risk=probability times damage, but there are many examples that the perceived risk can be more realistic. In any case, the literature is full of much deeper discussions of the different tisk concepts (for example my book, Sørensen: Life-cycle analysis of energy systems, RSC Press, Cambridge) | We certainly do not want to say that perceived risks are always inferior. We will describe the model of social planner/ behavioral interaction that we have in mind more carefully. In fact, acording to our interpretation, both levels of |
| 18396 | 2 | 0 | | | | Chapter 2 is well written and a good overview of the literature on risk and uncertainty. It would be an excellent resource for a graduate seminar course. But, in the end, the chapter is too theoretical and too abstract to be of much value to decisonmakers in government or business. Even discussions that are a bit more grounded—for instance on price caps and feed-in tariffs—are far too general and insensitive to situational considerations to be useful to decisionmakers. In the end, assessments of risk and uncertainty and related decisionmaking are based on situational considerations specific to that decision. This chapter seems to show no appreciation of that fact, focusing on general theories, concepts and considerations. | In the SOD we will make a severe attempt to better link concepts and applications. |
| 18397 | 2 | 0 | | | | I was as surprised to find almost no insight or attention to business decisionmakers. The chapter is almost totally devoted to individual behavior, and a bit to government agencies. Almost nothing is said about business decisionmaking. In the energy areas, for instance, it did not address decisionmaking by oil, natural gas, electricity, and biofuels companies. It did not address car and truck manufacturing companies. It did not address infrastructure companies. And so on. | Good point. The SOD will examine the impact of risk and uncertainty on business and organizational decision making |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 18398 | 2 | 0 | | | | The chapter provided minimal insight for government decisionmakers. The design of cap and trade programs entails a large number of decisions about allocating allowances; social, regional, and economic equity; financial integrity; international and national trade laws; trading robustness; and much more. I saw little or no insight into risk and uncertainty for these issues. | This is a very important comment, and one that we are trying to address. What we are doing in the Second Order Draft is being much clearer about the diversity of choice types and actor levels, and doing our best to identify the most important risks and uncertainties across these types and levels. In so doing we hope to make it clearer for government decision-makers which risks and uncertainties matter for them. But we are constrained in two ways. First, we are constrained by the existence (or lack) of peer reviewed literature specifically addressing the impacts of |
| 18399 | 2 | 0 | | | | The chapter does not address in any way a vast swath of decisions and policies under consideration. In my area of transportation and fuels, I did not see anything on land use changes (a huge issue with biofuels), regulations of vehicles and fuels, urban land use, and much more. | Thank you for this comment. We are doing our best in the Second Order Draft to be more specific about the impacts of particular risks and uncertainties in particular contexts. But to some extent a full treatment of, say transportation |
| 18400 | 2 | 0 | | | | Another citation regarding loss aversion, with respect to purchase of more efficient cars, is: David L. Greene, John German and Mark A. Delucchi, “Fuel Economy: The Case for Market Failure,” Chapter 11 in Daniel Sperling and James Cannon, eds,, Reducing Climate Impacts in the Transportation Sector, Springer, 2009. (I believe there were follow-up journal articles) | Yes, we now mention it in Section 2.2.3 |
| 9218 | 2 | 0 | | | | Through the chapter, the technical terms "system 1" and "system 2" are used very frequently. Although they are concisely explained on Page 11 based on Kahneman (2011), many readers may not read the paragraph and move on to other parts of the chapter. In such a case, the concept of "dual process thoery" and the meaning of "system 1/2" might not be understood properly by general readers of the chapter, who are not an expert of psychology (like me).<br>Furthermore, I am concerned that specific decision-making styles/processes which the chapter authors don't valuate highly (i.e. subjective expert view) are possible to be classified into "system 1" in an arbitrary or ambiguous manner.<br>From the reasons above, though I like the concept of system 1/2 is mentioned in the chapter, I think it should not be used too intensively as a backbone concept of the chapter. | The role of Systems 1 and 2 for climate change policy will be more clearly defined in the SOD |
| 14231 | 2 | 0 | | | | The chapter is a well-organized, clearly structured, and ties the conceptual approaches in risk and uncertainty analysis nicely to the relevant climate change applications. It performs well in covering a wide array of approaches, and trading-off between comprehensiveness, relevance, and length. | Thank you! Positive comments are very helpful in achieving balance. |

|---|---|---|---|---|---|---|---|
| 3137 | 2 | 0 | | | | This chapter has improved massively since the ZOD. This chapter has a very different feel from WG1 and WG2 chapters and much of WG3. there is little/no discussion of "what's happened since AR4." I don't have a problem with that, but perhaps it is useful to have some text at the outset indicating that the kinds of issues addressed here haven't in past had much attention in IPCC. Thus most of this is "new." Some of the most interesting parts of this chapter relate to risk perception. Shouldn't that be in the title? At present, the title refers to "integrated" yet much of the chapter is actually about how risk analysis isn't integrated. This chapter is really about "Uncertainty, Risk Perception and Implications for Climate Change Response Policies." This chapter needs cross references to other chapters. For example, the discussion of uncertainty and risk has big implications for policy design and choice. That's taken up in lots of other chapters. It would be helpful if the executive summary indicated more of the key substance of what the chapter finds and argues—such as on risk perception; social planner vs other decision making perspectives; evaluation frameworks; etc. | We will relate our Chapter to AR4 in our new Intro. |
| 10375 | 2 | 0 | | | | There are several kinds of risks, including risks with definite distributions, random risks and chaos risks. Maybe researches about risks should be focused on in the future. | Thanks. These issues are bound up with the representation of uncertainty (2.3), but the emphasis on the future pervades |
| 2333 | 2 | 0 | | | | The risk and uncertainty are main technical terms in this chapter. Having baseline on these terms, comprehensive definitions on “Risk” and “Uncertainty” cannot be notified in the chapter. By quoting, UN World Water Assessment Report Volume 1, Managing Water under Uncertainty and Risk,<br>“Risk commonly refers to an adverse event or the con-sequence of a decision. (see Section 8.1.2; see also Aven, 2003; Bedfore and Cooke, 2001; Cooke, 2009; Covello and Mumpower, 2001; Kaplan and Garrick, 1981; Kasperson et al., 1988; Mays, 1996; Slovic, 1992; Yoe, 1996).<br>Uncertainty is often used in connection with the term risk (sometimes even interchangeably). The most widely held meaning of uncertainty refers to a state of mind characterized by doubt, based on a lack of knowledge about what currently exists or what will or will not happen in the future. It is the opposite of cer-tainty, which is a conviction about a particular situation (Bogardi and Kundzewicz, 2002; Morgan and Henrion, 1990; Pindyk, 2007).” Thus, I would like to suggest above UN World Water Assessment Report Volume 1, Managing Water under Uncertainty and Risk and inter quotation as main sources for this chapter when 2nd revision. | Thanks for pointing us to this reference. However, we rely on the definitions of risk and uncertainty as spelled out in the IPCC-AR5's uncertainty guidance notes. The link to those as well as the definitions we are using will be explained clearer in the SOD. |
| 6056 | 2 | 0 | | | | Thorughout this chapter, there are so many textbook style explanation about risk and uncertainty especially 2.1, 2.2 and 2.3. What really matters with respcet to climate policy and uncertainties are, for example, how to manage the risk and uncertainty of fat tail issue of catastrophic damages when deciding/agreeing global target concentration, how to evaluate the role of bio-CCS and food security, how to invite all the countries to an international framework (immediate participation) in order that mitigation effort will not become too late. In contrast, concrete examples in this chapter very often start with uncertainty with farmers or carbon tax. I think these uncertainties are so well known and not appropriate to be cited so frequently. These may make the chapter feel rather redundant. Another point on this chapter is that cited concrete examples are heavily biased to US and European examples. Examples from other regions will add value to this chapter. The last point is that there are certain duplication among chapter 2 and 3. Chapter 2 should focus on risks and uncertainty aspect. | Thanks for the comment. The initial sections review standard material and are by their nature more text book style. Refracting risk as you suggest now plays a large role in Ch. 2 and the polity of risk management has become a unifying theme. |
| 16079 | 2 | 0 | 0 | | | In the whole chapter -otherwise very interesting and pedagogic- it is difficult to distinguish between existing knowledge and new science. There could be also a benefit in mentioning more where this knowledge has been improved through climate policy (UNFCC bodies, spectific programs or policies...). | Thank you, we will stress more the difference between new science and existing knowledge |
| 18448 | 2 | 0 | | | | A clearly structured content, balanced discussion with case scenario analysis, however, there is | Thank you, unfortunately the last part of the comment was truncated |

|---|---|---|---|---|---|---|---|
| 7894 | 2 | 0 | | | | If it is true that different agents can choose different tools for risk assessment the questions occurs what combination of tools the benevolent social planner should choose. In fig. 2.2 it looks as if the identification of stabilization targets using CBA in combination with adaptation planning is the most reasonable tool for the social planner. This judgment, however, does not follow from the reasoning in section 2.3. If our observation is correct, the chapter adopts Nordhaus' approach that faces massive criticism. Subsequent comments are related to this general remark. | The social planner's choice of assessment method should be the result of a society's debate, as it is a deeply normative issue. CBA is just one option. We will modify Fig2.2 to further reduce the risk of mis-interpretation. |
| 3366 | 2 | 1 | | | | This is an excellent chapter. Others chapters should learn from it, such that uncertainty discussion within all chapters is put on a high level. | Thank you! Positive comments are very helpful in achieving balance. |
| 4892 | 2 | 1 | | | | Ch.2 Integrated Risk and Uncertainty Assessment .. | Comment is unclear - no response |
| 13828 | 2 | 1 | | end | | In general, use of the term myopic (implying myopia) is not advisable. It has a specific scientific meaning that is not intended here. What is implied by its use is a perjorative (i.e. ascientific judgemental statement unfounded by citation of literature). Sometimes the use of system 1 leads to survival. This is not a myopic choice. Use a term from the scientific literature that conveys the point of interest and we may find better success reaching the intended audience. Page 18, line 7 is an appropriate use of the term as it refers to a professionally-defined concept (cognitive myopia). | We did not intend to use the term in a pejorative way, but instead as describing an attentional focus on objects and concerns closer by that are therefore getting privileged by actions taken. We have tried to be more careful in any unintended connotations throughout the paper and also emphasize much more the adaptive function of such a focus |
| 2593 | 2 | 1 | 1 | 74 | 21 | This chapter is very knowledgeable, like a textbook. If possible, lots of examples or study cases might enrich its content, and would be attractive. | Table 2.1 provides an opportunity for Chapter 2 and other chapters to provide |
| 11476 | 2 | 1 | 74 | | | While there is an improvement over the previous daft, overall the whole chapter is not tightly integrated among different sections, resulting in some sections being well developed while others are not. In addition, there is some overlap, making the whole chapter a little repetitive. | We will address these issues in the SOD. Our aim is a qualitative improvement of the level of integration |
| 4902 | 2 | 1- | | | | MISPRINTS etc. | This comment is ambiguous. However, the entire section has been edited. |
| 6065 | 2 | 10 | 1 | 10 | 2 | Please explain why the investment that may result in a small loss to investors be justified. | Such investments may be justified on account of risk aversion or risk loving. The rank ordering of expected utilities associated with different options may differ from the rank ordering of their |
| 7693 | 2 | 10 | 10 | | | Please clarify: "[…] the right-hand tail the distribution of climate never diminishes to zero[…]". Assuming that the distribution refers to damages, could this be rephrased as "there is a non-zero possibility that climate damages can be infinitely large", or some other expression that does not explicitly mention distributions. The text would be then be more accessible. | Thank you. Correction has been made. |
| 11495 | 2 | 10 | 10 | 10 | 10 | Grammar: "the right-hand tail the distribution" - needs correction. | Thank you. Correction has been made. |
| 7227 | 2 | 10 | 10 | | | tail the distribution -> tail of the distribution | Thank you. Correction has been made. |
| 7228 | 2 | 10 | 10 | | | It is not clear what is intended to say with this? What is a climate distribution? What does "right hand" mean in this context? | Point taken. We have changed the phrase to "the right-hand tail the probability distribution of climate |
| 3189 | 2 | 10 | 10 | | | "distribution of climate only slowly changes" | Thanks. We have changed the text as suggested in the working draft. |
| 7229 | 2 | 10 | 14 | | 16 | the sentence does not parse. Maybe "adapting" -> "be adapted" | Thanks. We have changed to "guide the targets for greenhouse gas emissions, and suggest the need to adapt to a wider possible range of climate impacts than |
| 13802 | 2 | 10 | 15 | | | Remove first 'possible' from this sentence | Done! Thanks. |
| 13803 | 2 | 10 | 16 | | | Remove 'may not have been' | Done. Thanks. |

|---|---|---|---|---|---|---|---|
| 6369 | 2 | 10 | 17 | | 26 | The uncertain GHG mitigation effect of some proposed mitigation measures creates a risk of increasing GHG emissions in the name of reducing them. More broadly, our methods for assessing these reductions (e.g., life cycle assessment, approved CDM methodologies) include many data, model, and scenario uncertainties. This is most famously the case for biofuels, but is true even for fuel switching from coal to natural gas, given uncertainty about NG leakage rates and the increasing trade in coal. It's important to compare both the mean and variance/uncertainty of the GHG reduction benefits of different strategies so these risks can enter into the discussion. | The point raised here is absolutely valid, but is tangential to this particular paragraph, which was written mainly to clarify the types of systems and unceratinties that matter for policy development. Hopefully the issues that the reviewer raises will be addressed in |
| 9114 | 2 | 10 | 18 | 10 | 20 | Do the figures include embodied energy in the goods that are importetd? In developed countries cities tend to outsource heavy industries but import a large proportion all the utilized goods. | I don't understand the comment, because we do not provide any figures at |
| 13804 | 2 | 10 | 19 | | | Change 'can' to 'might' | Thanks, but we will stick with "can." Both words work. Levies can protect people. Levies might protect people. The former word is a bit more theoretical and abstract, the latter a bit more practical. This paragraph is written at the more |
| 11723 | 2 | 10 | 20 | 20 | 24 | Already established technologies like energy transmission in Japan, USC for power generation have great potential to reduce CO2 in the world. Original sentences could make readers misunderstand that available technologies doesn't have much potential. It would be apropriate [...technologies for energy transmission, storge, and greater energy efficiency which are new or in stages of rapid improvement can reduce furtehr carbon emissions. It is however ....]. | Good point. We have changed "Many of these technologies" to "Some of these technologies," which carries less of a connotation about relative numbers. |
| 13805 | 2 | 10 | 20 | | | Change 'can' to 'might' | Thanks, but we will stick with "can." Both words work. "Can" is a bit more theoretical and abstract, "might" a bit more practical. This paragraph is written at the more theoretical and abstract |
| 13806 | 2 | 10 | 21 | | | Change 'can' to 'might' | Thanks, but we will stick with "can." Both words work. "Can" is a bit more theoretical and abstract, "might" a bit more practical. This paragraph is written at the more theoretical and abstract |
| 4908 | 2 | 10 | 27 | | 38 | some hint on the uncertainties related to the new SSPs would also be in line with the purpose of this listing | As far as we are aware the SSPs are in too preliminary a stage of development for the uncertainties to have become |
| 13807 | 2 | 10 | 28 | | | Make it clear that you mean AR3 and AR4. Right now it reads as if there have only been two previous assessment reports. | Thanks. We have changed it to "The most recent two assessment reports…" |
| 12233 | 2 | 10 | 29 | 10 | 29 | SRES should be explained, as it is introduced for the first time in WGIII report. | If the SRES scenarios were to be discussed at length in this report, we would do so. But they now belong to the dustbin of history, and so given space limitations we will allow interested |
| 8123 | 2 | 10 | 4 | 10 | 5 | The kind of policy choices and the phase during the policy cycle (or risk assessment) should be characterized. | We agree. We are revising the introduction substantially in order to do |

| 9791 | 2 | 10 | 4 | 11 | 13 | The five distinct areas can be referred to as PESTE(L) or STEEP-analysis (political, ecological, social, technological, economic and legal environment) and thus build on a framework widely used in organizations. | Thank you for bringing this analysis (known variously as PEST, PESTEL, PESTLE, STEEPLE, and STEEPLED) to our attention. We believe that the ideas we present here match that quite closely. We do not suplicate the PESTLE format, because as far as we understand that format is one designed primarily for use by private sector firms, across a wide range of choices or |
| 13801 | 2 | 10 | 4 | | | Change 'policy choices' to 'policy choices concerning climate change' | Good suggestion. We have incorporated it in the working draft. |
| 9115 | 2 | 10 | 42 | 10 | 43 | A reference would be needed here in my opinion. I would anticipate that in these cities especially the differences between a consumption-based and a production-based assessment results would be very different. | Thank you. The text has been revised accordingly. |
| 10268 | 2 | 10 | 43 | 10 | 47 | Keynesian models are minor for analyses of global warming mitigation. The limitations of the assessments by Keynesian models particularly for long-term analyses of global warming mitigations should be discussed. The explanations regarding these points are required. | The point is well taken. Our point in this chapter is not to appraise the relative merits of the two models, but rather to suggest the fact that their presence introduces an aspect of uncertainty. What we have done is to change the sentence to make it clear that the Keynesian approach is the minority view: "As Knopf and Edenhofer (2010) report, for example, the majority of energy models, based on a Ramsey (1926) full employment growth model of the economy, predict net reductions in global economic activity as a result of |
| 4702 | 2 | 10 | 43 | 10 | 48 | Environmental Kuznets curves might also be mentioned here. | We don't understand what environmental kuznets curves have to do with uncertainties associated with future regulations and their effects, if the line |
| 3190 | 2 | 10 | 43 | | | "Ramsey(1926) full-employment growth model" | Done. Thanks. |
| 14369 | 2 | 10 | 45 | | | It is misguided to give the impression that abatement will be cost-free because of Keynesian considerations. Keynesian unemployment is a temporary issue, not a persistent phenomenon for half a century. | The point is well taken. Our point in this chapter is not to appraise the relative merits of the two models, but rather to suggest the fact that their presence introduces an aspect of uncertainty. What we have done is to change the sentence to make it clear that the Keynesian approach is the minority view: "As Knopf and Edenhofer (2010) report, for example, the majority of energy models, based on a Ramsey (1926) full employment growth model of the economy, predict net reductions in global economic activity as a result of |

|---|---|---|---|---|---|---|---|
| 5320 | 2 | 10 | 45 | 10 | 47 | There is no reference in the chapter proving that in Keynesian models the increase of mitigation increases economic activity. This claim is also not quite true in general. A Keynesian model based on production functions and a budget constraints on inputs, say capital, does not make this prediction. Even if investment in abatement is treated as a "normal investment", there is the concept of "crowding out" in Keynesian models which can be up to 100%. Third, a Keynesian model may predict increase of economic activity in the short run. However, a deficit financed increase without productivity investment may have contracting effects in the long run, also in a dynamic Keynesian model. In my view Keynesian model are often abused to prove that abatement investment (which may be well justified by environmental reasons) has a second dividend, which it usually does not have. | The point is well taken. Our point in this chapter is not to appraise the relative merits of the two models, but rather to suggest the fact that their presence introduces an aspect of uncertainty. What we have done is to change the sentence to make it clear that the Keynesian approach is the minority view: "As Knopf and Edenhofer (2010) report, for example, the majority of energy models, based on a Ramsey (1926) full employment growth model of the economy, predict net reductions in global economic activity as a result of |
| 6066 | 2 | 10 | 45 | 10 | 47 | Need citation for net increases in global economic activity | The result appears in Knopf and Edenhofer (2010), which as been cited. |
| 3191 | 2 | 10 | 46 | | | "Keynesian model of an unemplooyment economy" | I put in the "full employment" part before the Ramsey model. But as far as I know the Keyensian model differs in that it does not assume full employment. Hence, it could be full employment, or could be partial employment. So I will |
| 9116 | 2 | 10 | 48 | 10 | 49 | One potential density effect is an increase in overall consumption leading to higher emissions. This perspective should not be totally omitted. | This is a good point, and I trust that it will be covered in another chapter. Here |
| 13808 | 2 | 10 | 48 | | | Change 'actor' to 'actors' | Done. Thanks. |
| 13809 | 2 | 10 | 49 | 11 | 1 | Change 'as to what future climate policy will be' to 'about what climate policies will be adopted in the future' | I am going to leave it as it stands. The version you suggest implies that climate policies are things that need formally to be adopted. The more expansive definition of policy, which we use in this |
| 3188 | 2 | 10 | 5 | | | "five broad areas" ["distinct" too strong] | Good suggestion. We have incorporated it in the working draft. |
| 8234 | 2 | 10 | 6 | 10 | 16 | Another aspect of low-probability high-impact events and tipping points raised by Weitzman (2009b) is that they may also be irreversible, which strenghtens the argument for including a precautionary effect in climate change decision-making. | Thank you for this reference. It has been inserted in the text. |
| 11494 | 2 | 10 | 9 | 10 | 10 | The description of "fat tails" is misleading. Both tails can be fat, depending on the climate variable under consideration - not just the right-hand tail, as indicated in the text. This is important because in many cases, communities need to simultaneously prepare for precisely opposite extreme events , e.g. both floods and droughts. | Thank you. The sentence is not a description of 'fat tails,' rather, it is just an instance of the tails as you have correctly highlighted. |
| 10163 | 2 | 10 | 9 | 10 | 12 | This sentence is unclear. First an explanation/definition of "fat tail" is needed, secondly it is not clear what is not diminishing to zero. | Thank you. We have included a description/definition of fat tails. The |
| 6883 | 2 | 10 | 7 | 10 | 7 | Proper reference needed to WGI AR5. | Ultimately yes. I don't think we know what that reference is yet, in terms of |
| 13810 | 2 | 11 | 1 | | | Change 'as to' to 'about' | Thank you. Correction has been made. |
| 13813 | 2 | 11 | 10 | | | Clarify 'they' and 'them' | Thank you. Correction has been made. |

|---|---|---|---|---|---|---|---|
| 9117 | 2 | 11 | 14 | 11 | 18 | There is relatively little research on how the lifestyles change in overall when coming from e.g. dense downtown area or other dense agglomeration and moving towards the outskirts. The assessments tend to concentrate on changes in transport related emissions and housing, but omit the possibility that other consumption may change significantly as well. | yes, a good point. |
| 11496 | 2 | 11 | 14 | 11 | 21 | What is the definition of "social systems" in this paragraph? What does it include/exclude? Is it the same or different from "human systems" (see Ellis, 2009 "Earth science in the Anthropocene") | the term is used in contrast to natural systems, so is meant to be very broad and inclusive. To be more precise, we |
| 6067 | 2 | 11 | 14 | 11 | 15 | "Social system" should be changed to "socio economic system". | Thank you. Correction has been made. |
| 13814 | 2 | 11 | 17 | | 18 | You are mixing ideas. I think the parallel issue is the impact of uncertainty in social system dynamics upon decision making. | thanks, we reworded this statement. |
| 6068 | 2 | 11 | 20 | 11 | 20 | "Social system" should be changed to "socio economic system". | Thank you. Correction has been made. |
| 7231 | 2 | 11 | 22ff | | | Put the storyline at the beginning of each subsection? Write more in a newspaper style: Important information at the beginning, fillers towards the end. | Will consider this point in writing the SOD |
| 11497 | 2 | 11 | 24 | 11 | 26 | What does 'natural system' refer to? Is there on system or are there many? Is it the same as or different from "Earth system" (see Ellis, 2009 "Earth sciences in the Anthropocene") | Thank you. We have replaced 'natural' with 'earth' |
| 4910 | 2 | 11 | 25 | | | {Add} associated with {}the changes of the natural system | Thank you. Correction has been made. |
| 13815 | 2 | 11 | 25 | | | Strike 'and need to be made given'. This is opinion, not science and is not needed to make the point. The point is stronger without it. Instead say 'and that are affected by' | Thank you. Correction has been made. |
| 14529 | 2 | 11 | 27 | | 28 | The chapter should be careful with phrases such as “misperceive the risks.” Sometimes expert and lay perceptions of risk differ because the experts have better information and are thinking more carefully. But sometimes expert and lay perceptions differ because the two groups value different things. Chapter 1 of the IPCC SREX report tried to use language that captured the full range of possibilities. Language along those lines might be useful here. | yes, thank you, we have tried to be more careful. |
| 13811 | 2 | 11 | 3 | | | Change 'to' to 'of' | Thank you. Correction has been made. |
| 13816 | 2 | 11 | 32 | | | Change 'influences' to 'influence' | Thank you. Correction has been made. |
| 13817 | 2 | 11 | 34 | | | Strike 'key' - an evaluation best left for the reader | Thank you. Correction has been made. |
| 8125 | 2 | 11 | 37 | 11 | 41 | The two modes of thinking are quite reasonable at first glance. However, for further analytical and empirical clarification, this concept is too simplistic. Furthermore, it should not only focus on the limitation of the decision maker but in the same extent, on the limitation of the decisions' support tools. | We discuss the distinction in a more critical fashion now. Section 2.3 is explicitly addressing your second |
| 13818 | 2 | 11 | 37 | | | Strike 'key' - an evaluation best left for the reader | done. |
| 16080 | 2 | 11 | 39 | | | Extensive quote could be simplified | The bullets are not a quote but a |
| 13819 | 2 | 11 | 39 | 11 | 40 | Reference to Kahneman (2011) seems inappropriate. This is not peer-reviewed literature. Dr. Kahneman has published multiple peer-reviewed articles containing his ideas that would be more appropriate to cite. | thank you and we now also quote his nobel address in a peer reviewed econ |
| 16920 | 2 | 11 | 4 | | 21 | Probably should note that perceptions (I assume) is partly with reference to perceptions of climate change; and that extreme weather events may have disproportionate impact on these.<br>Its hard to be definitive about a list of uncertainties but I’d make a case for at least one more than the five listed: the state of international negotiations and of international relations more broadly, and the role of governments vis-à-vis other actors within this. The social science literature seems to have retreated somewhat from proclaiming either the death of the nation-state as dominant actor, or the demise of an international order – but there are quite major uncertainties, associated not least with the shift in centre of gravity to the emerging economies. | Thank you, we have added a section on "International Relations and Negotiations". |
| 8235 | 2 | 11 | 4 | 11 | 21 | An example of how people's preferences impact decisions when facing risk could be given using two agents with different profiles for risk aversion. | good point, though risk aversion is not the only and perhaps not even the most important difference in preference when it comes to climate-related decisions. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 4909 | 2 | 11 | 6 | | | The anticipated impacts and costs of climate change | done, thanks. |
| 12234 | 2 | 11 | 8 | 11 | 10 | It's not clear what the reference is for this statement. We'd expect the negotiators to rely on their mandate from the government they represent, rather than depending on their perception of the preferences of the parties across the table. | We have added a reference to what Plous had labelled "perceptual dilemmas". In addition to following instructions on preferred actions from their government, international negotiators also need to infer what the preferences of the other parties are, a task on which there is uncertainty and |
| 13812 | 2 | 11 | 8 | | | Change 'outcome' to 'outcomes' | Thank you. Correction has been made. |
| 7230 | 2 | 11 | 8 | | | depend -> depends | Thank you. Once we change 'outcome' to 'outcomes,' then 'depend' is just |
| 8784 | 2 | 11 | 36 | 20 | 22 | Section 2.2 is insightful and helpful; however, much of the broad thrust of the analysis and more concrete discussions of how to address the issues raised are implicit in Aristotle's Nicomachean Ethics and subsequent virtue epistemology and ethics literature. I have completed an unpublished book manuscript that applies these insights directly to sustainable development and climate change. This includes questioning needing control for happiness - important given that humans cannot control the Earth System. It also includes discussion of how 'System 1 behaviour impacts on particular policy instruments [and] on ways to encourage System 2 behaviour.' the latter being more direct. | thank you. We now discuss the antecedents of the System 1 and 2 distinction in as much detail as space constraints allow. |
| 7694 | 2 | 11 | 36 | | | Can "System 1" and "System 2" have more descriptive names, although these would not be from Kahneman's book? "System X" can mean virtually anything, and the terms are used often in later subsection without reference to the source. (Not a big issue, but would improve readability.) | We are probably stuck with these labels, given that they have been popularized by Kahneman. We tried to add clarifying |
| 4704 | 2 | 11 | 36 | | | Section 2.2 could benefit by a summary at the end of the overall view that there is a significant disconnect between homo economicus and real people and that this disconnect creates a clear set of specific obstacles to understanding risk AND responding to it. | Excellent point which we have implemented, both for Section 2.2 and especially for the Executive Summary. |
| 6069 | 2 | 11 | 36 | | | Although the classification of two models of thinking is meaningful in dealing with behavioral responses, real problem with respect of uncertainties and risks exists in the field of System 2. It is better if this kind of explanation will be added here. | Good point, and many of the discussions of tools in Section 2.3 address this. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 16921 | 2 | 12 | | 13 | | This is, or should be, the intellectual heart of the chapter. My sense is it needs attention to a few things to play this role well:<br>* It is hard to follow – having mentioned associative and affective processes, one assumes they have some link to the material that follows but its not obvious; cant eg the subsection titles that follow reflect these processes?<br>* I think the System 1 and System 2 are defined too narrowly at the outset broadly in terms of cognitive processes. The concepts are of far wider application. The First really could usefully span the realm of instinctive or embedded psychology and behavioural characteristics of both individual and organisational short-term responses. The latter is concerned with considered, "rational" evaluation generally based on attempts to quantify and trade-off costs and benefits. To an important degree – and highly relevant in a chapter of this nature - this is the domain of most economic theory.<br>* As indicated, I just don't think these two actually capture the span of issues. I think this section needs to introduce a third 'Strategic' decision-system/domain approaches in the face of deep uncertainty, objectives of security, and analytic traditions around innovation and transformation. This should include reference to the importance of "Black Swan" (Taleb, 2008) events in real-world developments, and might also include learnings from the financial crises (eg. Rajan, 2010). For an analysis of "Third Domain" issues in relation to energy and climate see Grubb, Hourcade and Neuhoff (Chapter 2 (completed) and Chapters 9-11 (in preparation).<br>This would then provide an intellectual framework within which, for example, the later Precautionary / "Robust Decision-making" discussion can be located by readers.N.N. Taleb (2007), The Black Swan: the Impact of the Highly Improbable, Pearson, 2007.<br>F.G.Rajan (2010), Fault Lines: how hidden fractures still threaten the world economy, Princeton University Press, 2010.<br>Somewhere in this section, I'd suggest reference also to herd behaviour (including corporates, as in stock and financial markets). These systems can create strong tendencies to "self-fulfilling prophesies" for a duration, and also boom-and-bust cycles. | Thank you for the useful feedback. We do frame the System 1 and 2 distinction more broadly now, though not as far you suggest. We don't quite see it as Psychology vs. Economics. We also think that the third strategic system you propose can be thought of as a System 2 response. Finally, we do now talk far more broadly about decisions at different levels, including organizational decision makers, see for example the new Table 2.1. |
| 7233 | 2 | 12 | | | | Talking about myopic: It might be better to demonstrate everyone's myopicity by an example policy makers can relate to. When reading about myopic views, one is quick to apply this label to others, but not to one self. Hence the need to drive home this point to EVERYONE. | A really nice point, which we have implemented in Section 2.2, using the example that policy makers who are focusing too much on political feasibility |
| 7234 | 2 | 12 | | | | try to phrase things in a way that makes use of modern psychology: people are much more afraid of losing something they have than of not getting something (or the other way around, I'm not sure). If one phrases key aspects of this report appropriately, this might influence decision makers | done, thanks. |
| 13822 | 2 | 12 | 10 | | | Change 'not only … choices by' to 'found in decision-making by the general public," [The problem is endemic!] | done, thanks. |
| 4610 | 2 | 12 | 11 | 12 | 14 | This is supposed to illustrate how exports also use System 2; however, I do not understand how the use of frequent and timely feedbacks illustrate System 2 use | We changed that statement to better describe what it was meant to show, namely that experts only make good predictions using System 1 processes when their evidence base matches |
| 13823 | 2 | 12 | 11 | | | Refeences seem dated given the objective of AR5 | that may be true, but these are classic references. We made an effort to also add references to more recent work, though there has not been a lot of either |
| 13824 | 2 | 12 | 13 | | | Change 'namely' to 'such as' | done, thanks. |
| 8482 | 2 | 12 | 15 | | 17 | Note the concept of "intuitive toxicology" here, and the variation of expert and lay assessments of risk | good point, thanks, done. |

|---|---|---|---|---|---|---|---|
| 11498 | 2 | 12 | 27 | 12 | 29 | The implication that social planners are inherently more thoughtful than individual decision makers appears unfounded. | We changed "can" to "may be" to make this an aspiration rather than description. |
| 8126 | 2 | 12 | 3 | 12 | 7 | In contrast to this statement, the two modes of thinking are used in this chapter as analytical, clear reasoning for behavior. In my perspective, the use of the two modes of thinking in this chapter is not in line with the work and evidence of Kahnemann, 2011. See also: p. 13, line 4-7. | We are using the two modes of thinking as a useful organizing principle, and in a necessarily simplifying fashion that does not always do justice to all qualifications and complexities that a detailed psychological analysis of specific |
| 14530 | 2 | 12 | 3 | | 7 | I very much like organizing this discussion around System 1 and System 2. But this chapter needs to do more to put its discussions of individual decision making into the context of the group decisions that will be crucial in addressing climate change. Towards the end of his wonderful "Think Fast, Think Slow" book, Kahneman notes "organizations are better than individuals when it comes to avoiding errors, because they think more slowly and have the power to impose orderly procedures….Whatever else it produces, an organization is a factory that manufactures judgments and decisions…The corresponding stages in the production of decisions are the framing of the problem that is to be solved, the collection of relevant information leading up to the decision, and reflection and review." Given its topic is climate change, the chapter could do much more to place its discussions in a broader institutional and organizational context, because organizations such as businesses, governments, NGOs,churches, and political groups will be the focus of many if not virtually all impactful climate decisions. In this vein, the chapter should really draw more heavily on concepts such as risk governance (Renn) and the concepts of decision support. Both these frameworks emphasize just the steps laid out by Kahneman, in particular processes that organizations use to frame problems and use in the generation, transmission, and interpretation of information about risk. | We now address decisions across the whole spectrum of decision makers, including the organizational and policy levels, much more explicitly, see the new Table 2.1. |
| 9792 | 2 | 12 | 30 | 12 | 36 | Moreover planning horizons in companies are short-term, family businesses think more long-term. The literature on incentive systems, e.g. Ibrahim, S.; Lloyd, S. The association between non-financial performance measures in executive compensation contracts and earnings management. In: J. Account. Public Policy 30 (2011) 256–274 might add additional value. | An interesting reference, thank you. |
| 13829 | 2 | 12 | 30 | | | delete "and be myopic." It is redundant here at the least. | done, thanks. |
| 11499 | 2 | 12 | 30 | 12 | 36 | What does 'System 1' say about 'strategic behavior'? When people make choices about future their behavior can be strategic on the time frame that they choose. This paragraph, however, makes a case for 'human tendency to be myopic' that can mean it is a human condition. Is it really? | Research suggests that System 2 processes are required for strategic thinking and planning, which involves abstractions at multiple levels and processes. This is not to say that |
| 8127 | 2 | 12 | 39 | 12 | 39 | The author should be careful to claim an 'objective reality'. At least it should be clarified to whom 'objective reality' is meant. | Thank you, a loaded term, we changed it to "external" reality. |
| 11500 | 2 | 12 | 39 | 12 | 39 | What is "objective reality"? This term is contentious. | Thank you, a loaded term, we changed it |
| 13830 | 2 | 12 | 45 | | | why it is 'relevant' here is not explained. | now explained better |
| 8128 | 2 | 12 | 47 | 12 | 48 | Quite a few terms have to be defined. Here, as an example: what is 'second-order' uncertainty? | The sentence has been reworded. |
| 13831 | 2 | 12 | 48 | 13 | 2 | This sentence is convoluted and may be hard for a reader to decipher unambiguously. | The sentence has been reworded. |
| 13820 | 2 | 12 | 5 | | | Strike 'convincingly' - an evaluation best left for the reader | done. |
| 10164 | 2 | 12 | 8 | 12 | 23 | References that possibly can illustrate the outcomes/effects of using system 1 vs system 2 in decision making: Shenhav, Rand & Greene (2011) Divine Intuition: Cognitive Style Influences Belief in God. Journal of Experimental Phsychology: General, 141: 423-428; Gervais & Norenzayan (2012) Analytic Thinking Promotes Religious Disbelief. Science, 336: 493-496. | We added the second reference, thank you. |
| 4911 | 2 | 12 | 9 | | | {Add: t} reflect the more | done, thanks. |
| 13821 | 2 | 12 | 9 | | | Change 'he' to 'the' | done, thanks. |
| 7232 | 2 | 12 | 9 | | | he -> the | done, thanks. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 6302 | 2 | 13 | | 41 | | The chapter as a whole is sound, persuasive and well documented. It raises issues of critical importance and it does so well, on the whole. However, I have some concerns about the way in which System 1 and System 2 thinking guide the discussion. System 1 thinking is described as somewhat simplistic, uninformed, affective and biased thinking, with System 2 thinking described as analytical and informed. However, it is vital to recognize that often, pre-thematic (what the IPCC authors recognize as System 1 thinking) can also be extremely well-informed. For instance, I quote from my recent article to provide an example, which reads: "In an incident during Operation Desert Storm, when American Marines were to liberate Kuwait from Iraqi invaders, a fleet of coalition aircraft carriers were stationed twenty miles off the coast as backup for the ground troops. They were also thereby positioned in close proximity to potential Iraqi missile fire.<br>Lieutenant Commander Michael Riley was responsible for protecting the Allied fleet by monitoring the radar screens onboard a British destroyer. He came on duty at midnight. In the early morning, one blip on the screen began to cause him consternation even though, from all available evidence, there was no reason to doubt that the blip was simply another American A-6 fighter jet. However, Riley became increasingly concerned that it could be a Silkworm missile headed for the USS Missouri. If that ship were hit, hundreds of U.S. sailors could die. There was no clear way to figure out from the radar screen what the blip was, and because the object was moving quickly, a decision had to be made right away.<br>Riley gave the order to fire even though he had no rational evidence for his concern and despite the fact that if the blip really was an allied fighter jet, two innocent American pilots would die. Four hours later, the results were reported: the blip was indeed a Silkworm missile, and Riley had saved hundreds of American lives.<br>Why did Riley experience this reaction to a blip on a radar screen that was indistinguishable from the other blips that indicated American jets? Riley himself could not explain his anxiety, and others concluded that his decision had simply been a lucky guess. However, a cognitive psychologist decided to investigate Riley's decision-making process and revealed that the answer lay in the timing of the appearance of the radar blip on the screen. It had appeared eight seconds earlier than the average A-6 fighter jet. Somehow, Riley had picked up on this minimal, almost unnoticeable time discrepancy.<br>The point of the story for me is that lived experience teaches us in ways that we are often unaware of. Sometimes, we are able to know and to understand without explicitly recognizing and following a set of rational rules and procedures. Riley himself was unable to give a logical explanation of his fears, even though he had intuitively recognized that something was wrong.<br>In fact, knowledge and reason do not consist only of explicitly acknowledged facts and values. Often, we operate with a non-calculative, pre-thematic understanding of the world. The notion of a sense of place, for instance, often is formed pre-linguistically and pre-reflectively."<br>See Stefanovic, Ingrid Leman (2012), Honoring the Landscape through Thoughtful Decision Making", Minding Nature, May 2012, Vol. 5, Issue 1, 12-18. | This is a beautiful example of the wisdom of intuition, which we now describe far better in Section 2.2. |
| 8129 | 2 | 13 | 12 | 13 | 14 | Imprecise language. This sentence clarifies a general critique I have to the overall chapter. Of course, there are much more than two psychological risk dimensions! Especially Solvic would agree to that. What might be meant by the text is: there are two _most relevant_ psychological risk dimensions. This kind of imprecise language makes is difficult to grasp the right conclusion of the chapter. | wording has been changed. |
| 8130 | 2 | 13 | 28 | 13 | 28 | What is the meaning and relevance in this context of this paragraph? | this paragraph has been deleted to make room for other material |
| 4833 | 2 | 13 | 35 | 13 | 44 | Another factor which might play in here is that the manifestations of climate change are all known events to humans (humans have seen storms, floodings, draughts, etc. before). Following the psychometric paradigm, this should lead to lower risk perception. This possible effect is discussed in Klöckner, C. A. (2011). Towards a Psychology of Climate Change. In W. Leal Filho (ed). The Economic, Social and Political Elements of Climate Change. Climate Change Management (pp. 153-173). Berlin: Springer Verlag. | thank you, we added this reference. |

|---|---|---|---|---|---|---|---|
| 11501 | 2 | 13 | 36 | 13 | 38 | In some cases, isn't it possible that if a hazard is not observed over a long period of time, we can conclude that the likelihood of that hazard is reduced? | When there is evidence that the probability might have changed/decreased, increased periods of time without any incident do provide Bayesian evidence about a potential |
| 11502 | 2 | 13 | 40 | 13 | 43 | It seems that options such as moving to a different part of the country are written with mid to higher socioeconomic classes in mind. People with lower incomes may not find this to be an option, even if they have several years notice. Perhaps suggest that the non-immediate nature of the change allows time for planning of alternatives and strategies. | Yes, thank you, that is a better illustration. |
| 8131 | 2 | 14 | 1 | 14 | 48 | On this page there are quite a lot of repetitions. The relevance of some paragraphs remains unclear (line 13-21). Again, imprecise language: The statement from line 10 remains in contrast to line 13/14. People are almost always exposed to weather since climate change is a phenomenon over decades. A few local storms and flooding are not 'physical evidence of climate change'. | This section has been revised and shortened, thanks. |
| 11504 | 2 | 14 | 13 | 14 | 13 | The claim that "most people consider themselves expert on the weather" is unfounded and highly unlikely in many cultural contexts where weather is regarded as highly unpredictable. | This section has been revised. |
| 7235 | 2 | 14 | 13 | | | define climate vs. weather | This section has been revised. |
| 14232 | 2 | 14 | 14 | | | I think "Loss Aversion" should be formatted non-italic bold | This section has been revised. |
| 11503 | 2 | 14 | 3 | 14 | 4 | It is important to acknowledge that statistical analysis are not the only way to engage in System 2 processes. Many societies without a tradition of statistical description nevertheless maintain nuanced and highly-effective decision-making systems. | It would be very helpful to have specific examples of what these decision making systems entail. Please provide us with |
| 4912 | 2 | 14 | 30 | | | {Add} A recent study of a representative sample {Add}of the in Britain .. | This section has been revised. |
| 11506 | 2 | 14 | 30 | 14 | 30 | There seems to be a word missing between 'the' and 'in' | This section has been revised. |
| 7236 | 2 | 14 | 30 | | | sample of the in Britain public | This section has been revised. |
| 13832 | 2 | 14 | 36 | 14 | 39 | This statement is not substantiated by reference to literature. It is not clear if these are opinions of the author(s) or conclusions based on actual scientific analysis that has been peer-reviewed. | Statement has been taken out |
| 16081 | 2 | 14 | 40 | 15 | 6 | Paragraph made of too long sentences with alternate propositions. It could gain by shorter sentences (i.e. less that two lines) with references at the end. | Paragraph has been revised accordingly. |
| 3192 | 2 | 14 | 6 | | 9 | confusing sentence: "highly unlikely"[?] | This section has been revised. |
| 8236 | 2 | 14 | 17 | 14 | 21 | It is not necessarily true that the colonist continued to clung to their expectation based on latitude, I think it was because the benefits of settling overrode the expected loss or damage from colder temperature. I do not think this is good example. There are better examples given later in the chapter. | These two explanations are not mutually exclusive. In the interest of space for other content, we eliminated the |
| 6884 | 2 | 14 | 22 | 14 | 23 | A reference from 1997 is not a "recent example". Suggest to rephrase. | done, thanks. |
| 16922 | 2 | 15 | | | | "Other factors". Is the chapter too polite to mention lobbying? It is estimated that US industry spent $500m on lobbying on climate change in 2010 and presumably much of this was targeted a public opinion. | We now discuss such vested interest campaigns in Section 2.2.1.3. |
| 16923 | 2 | 15 | | | | Section 2.2 overall might benefit from cross-check against literature in the most recent (June 2012) Special Issue of Risk Assessment which is on climate change (eg. Spence et al., 2012). | Good suggestion, thanks. |
| 7237 | 2 | 15 | | | | talk only about "people's" reluctance to deal with climate change. Maybe explicitly mention politicians as well? Or will this antagonize too much? rewrite it less abstractly. Say that people don't like to deal with negative things or things that they are not in control of as the first sentence. | Nice suggestion, done. |
| 8132 | 2 | 15 | 1 | 15 | 16 | What are the conclusions from these findings? | This section will be revised with better content and conclusions. |
| 11507 | 2 | 15 | 1 | 15 | 6 | The distinction between weather and climate is more subjective than one might think, particularly as the rate and magnitude of changes increase. Climate is described by long-term trends and parameters, but extreme events are increasingly likely (i.e. fat tails). As abnormalities (as described here) are observed more frequently, so-called extreme weather may be increasingly indicative of climate. Furthermore, many people have acquired transgenerational knowledge of climate that enables them to be keenly aware of long-term climate changes, so the claim that people are generally unfamiliar with climate rings false. | All valid points. We have toned down our statements on this issue. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 10165 | 2 | 15 | 14 | 15 | 16 | It is unclear what "similar results" refer to here. Is it that there is higher concern amongst scientists than non-scientist? But the levels of concern in both groups are higher than in the US. | it refers to similar variability in concern over time, which we now say more |
| 14370 | 2 | 15 | 17 | | | Sad that a chapter would have to be written explaining climate change denial | yes, indeed. |
| 4834 | 2 | 15 | 19 | 15 | 20 | "people with finite processing capacity" is an unfortunate phrase since all humans have finite processing capacity. | fixed, thanks. |
| 16082 | 2 | 15 | 29 | 15 | 35 | Paragraph short and to the point, focused on knowledge useful for policymakers, not too many references. | thank you. |
| 8133 | 2 | 15 | 31 | 15 | 31 | Definition: systemic uncertainty?; what is meant by: expert disagreement about many forecasts? | both have been reworded |
| 13833 | 2 | 15 | 36 | 15 | 38 | Please provide a reference for this sentence. It is not demonstrated by the reference given on line 41. | This is not an empirical statement, but a simple logical fact. Any mitigation or adaptation policy intervention may solve a climate problem but in doing so will |
| 12519 | 2 | 15 | 42 | | | The sentence is: “The cognitive demand of a calculated response to climate risks normally loses out to behavior that satisfies emotional needs and minimizes tradeoffs.” Is there a citation for this assertion, and are there other views? | We took this statement out, since it was a conjecture. |
| 4629 | 2 | 15 | 44 | 15 | 47 | “Motivated reasoning, as 44 exhibited by the confirmation bias (i.e., a tendency to attend to evidence confirming favored beliefs) 45 tends to steer individuals to System 1 behavior. More specifically, wishful thinking and motivated 46 cognition in the face of growing evidence of climate risks helps explain increased polarization in 47 attitudes and beliefs about climate change over the past two decades . . .” Even scientists who know the theories of Karl Popper still focus on confirming evidence for a theory, when they should of course look for disconfirming evidence. I think these sentences are speculative and unsupported – you might say an example of motivated reasoning. Is there increased polarization, or is there, as in most things, a distribution of beliefs? Is there more polarization or just more awareness among the general public of the issue? | Yes, there is increased polarization, now documented with a reference, Pew (2010). |
| 13834 | 2 | 15 | 47 | 15 | 48 | Please document this 'increased polarization' | Done, Pew (2010). |
| 4256 | 2 | 15 | 35 | | | This discussion does not place enough emphasis on the role of organised climate change denialism see for example 'The Merchants of Doubt' by Naomi Oreskes which shows how powerful interests are funding denialist activities in the USA | We discuss the book and argument in Section 2.4.3.5, but have also added a reference to it here. |
| 4249 | 2 | 15 | 47 | 15 | 48 | This discussion does not place enough emphasis on the role of organised climate change denialism see for example 'The Merchants of Doubt' by Naomi Oreskes which shows how powerful interests are funding denialist activities in the USA | We discuss the book and argument in Section 2.4.3.5, but have also added a reference to it here. |
| 17326 | 2 | 15 | 7 | 15 | 16 | This session brings about the question "how does concern over climate change relates to specific individual/collective action? In this session and the previous one the discussion makes no allusion to what if anything happens after raising "concern" about an issue such as climate. The specific example here used considering the study made after people who had seen the movie "The Day After Tomorrow" seems very particular singular to stand as the marker of this session on its own. Is it possible to find studies that inform on the effects of how climate is discussed in the media and its effects? | This is a very good question and we will try and find such studies for the SOD. |
| 8134 | 2 | 16 | 1 | 16 | 40 | Again, repetitions and unclear conclusions. | Section has been revised. |
| 13837 | 2 | 16 | 10 | | | The inference ("therefore") is not clearly based on a logical syllogism. I am not convinced it follows from the evidence cited. | Has been reworded. |
| 7238 | 2 | 16 | 10 | | | are -> is | done. |
| 13838 | 2 | 16 | 12 | 16 | 17 | The first sentence refers to a different point than the remaining sentences in the paragraph. | This section has been revised. |
| 13839 | 2 | 16 | 15 | 16 | 17 | The example is not appropriate for the preceeding sentence. | This section has been revised. |
| 11508 | 2 | 16 | 18 | 16 | 24 | This paragraph is miselading because it does not address the many regions of the world where people are already observing and responding to climate change, and therefore recognize climate change as both local and immediate. | This section has been revised. |
| 16083 | 2 | 16 | 19 | 16 | 22 | Odd sentence (lacking a verb?), too long | This section has been revised. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |

| 13840 | 2 | 16 | 21 | | | "to that" … missing a word? "to conclude that" ?? | This section has been revised. |
| 11509 | 2 | 16 | 21 | 16 | 22 | This part of the sentense is not clear. Perhaps a missing word: "Americans to … that" | This section has been revised. |
| 7239 | 2 | 16 | 21 | | | a verb is missing in the sentence, maybe "believe"? | This section has been revised. |
| 13835 | 2 | 16 | 4 | | | Delete "with respect to the future." It is redundant. | done, thanks. |
| 3193 | 2 | 16 | 4 | | 6 | sentence unclear, convoluted | Has been reworded. |
| 16925 | 2 | 16 | 41 | | | Shouldn't the title be something like "Social amplification and attention of risk perception"? It seems to cut both ways, particularly if industry spends $500m convincing publics that there is not a problem | Section has been revised. |
| 11510 | 2 | 16 | 41 | | | Why is there is only one subheading 2.2.2.1, what sense does such subtitle make? | We added another subsection on Individual differences in numeracy. |
| 16084 | 2 | 16 | 47 | 17 | 6 | The example given is probably specific to North America (?), maybe too local. | This section has been revised and made |
| 11511 | 2 | 16 | 47 | 17 | 6 | The purpose of this example is not clear, and needs to be elaborated. The implication seems to be that most people quickly forget their concerns about climate change, but this is not particularly strong evidence. Why not look at examples from indigenous communites? | This example has been removed and the section made more general. |
| 13836 | 2 | 16 | 6 | 16 | 9 | This sentence seems out of place here. The idea is not clearly related to the preceeding or following sentence. | Section has been revised. |
| 4042 | 2 | 16 | | | | This section should also include a discussion on values-based approaches to the characterisation of climate change cognition. In the field of adaptation, that has largely been discussed in terms of (non-monetary) values associated with preferred outcomes. However, this is just as pertinent for mitigation as well. Suggested published literature includes: O'Brien, K. (2009). Do values subjectively define the limits to climate change adaptation? In W. N. Adger, I. Lorenzoni & K. O'Brien (Eds.), Adapting to climate change: Thresholds, values, governance: Cambridge University Press. and O'Brien, K. L., & Wolf, J. (2010). A values-based approach to vulnerability and adaptation to climate change. Wiley Interdisciplinary Reviews: Climate Change, doi: 10.1002/wcc.30. | This is more of a topic for Chapter 3, and space constraints prevent us from addressing it in Chapter 2. |
| 6885 | 2 | 16 | 29 | 16 | 29 | Refer to Mastrandrea et al. 2011, IPCC AR5 Guidance Note on the treatment of Uncertainty. | done. |
| 4631 | 2 | 17 | | | | , time discounting. There is a large literature on the apparently large discount rate used by most people in making decisions about future events, e.g., not investing in insulation or fluorescent light bulbs despite their clear economic benefits. It's either that or a budget constraint (possible for some investments, especially by local government decision-makers) or inertia in the face of too many competing decisions (otherwise known as procrastination). (There is a substantial section in chapter 3 on this topic which should be referenced.) | We now refer to Chapter 3 for its treatment of discounting. |
| 8135 | 2 | 17 | 1 | 17 | 6 | What is the conclusion of this statement? | This section has been revised. |
| 11512 | 2 | 17 | 14 | 17 | 33 | The concepts of loss aversion and status quo bias appear to be interrelated. It is not clear how they can be considered separately. | yes, correct, and the sections have now been combined |
| 7240 | 2 | 17 | 14 | | | loss aversion: Say one clear sentence, e.g. "People are more afraid of losses than they are keen on winnings." | a better definition has been provided. |
| 7241 | 2 | 17 | 15 | | 16 | Too abstract. People who read this probably won't know what a slope is! | a clearer definition of loss aversion has |
| 3194 | 2 | 17 | 15 | | | define or describe "expected utility theory" first time term is used. | It is defined in Section 2.3, to which we |
| 4630 | 2 | 17 | 26 | 17 | 28 | "The crop 26 allocation decision will also be influenced by degree of risk aversion and the magnitude of loss 27 aversion." This throwaway sentence ("also be influenced") is the entire behavioral side of the decision under uncertainty. | We are not quite sure what you mean by this comment. All of Section 2.2 and large parts of Section 2.4 address the behavioral side of decisions under uncertainty, and the Behavioral X-cut of |
| 8136 | 2 | 17 | 29 | 17 | 33 | What is the conclusion? | A better take away has been added. |
| 16085 | 2 | 17 | 34 | 17 | 48 | Interesting example and quote, but is it so new? Could you precise? | We are not sure what example and quote you refer to in this section on |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 9793 | 2 | 17 | 34 | 17 | 48 | Please sound this paragraph with the corresponding deliberations in chapter 3. | All the x-cuts are designed to connect themes across chapters. We also now refer to Chapter 3 for its treatment on |
| 4837 | 2 | 17 | 34 | 17 | 48 | The comparison between the hurricane on the next day and the potential flooding 5-20 years from now is a bit confound because it does not only vary the time perspective but also the certainty. Whereas the forcast of a hurricane coming through the next day is relatively certain, is the forcast of flood some day in 5-20 years necessarily uncertain. | We are not sure what comparison on p. 17 you are referring to or anywhere else in that vicinity. Though much of that discussion has been revised and your concern hopefully addressed. We agree |
| 7242 | 2 | 17 | 35 | | | Scientists know what "exponential" means and have certain connotations. Policy makers don't! | We now define exponential and hyperbolic discounting in accessible |
| 4703 | 2 | 17 | 7 | | | This section should be a comprehensive list of these factors but does not appear to be. Alternatively, ensure these are the "most important" factors and note that this was the basis for inclusion here. Loss aversion should be the same run-in format as the other headings as well, of course. | thanks, we added the fact that this is not an exhaustie list and fixed the formatting. |
| 6070 | 2 | 17 | 7 | | | This subsection seems to discuss phenomena in "people's decisions" under risk and uncertainty. What I am wondering is where we can find discussions of phenomiena in "policy-makers' decision"? The latter is more relevant to policy makers. | We now address decisions made at all levels, from individuals and households to company and policy maker decisions |
| 3067 | 2 | 18 | | 20 | | 2.2.4 has a strong undertone of political advocacy, as if the task of IPCC is to change the political choices people and society make. That is not a proper role of IPCC, which is to review and evaluate the science, and discredits IPCC in the eyes of much of the public. It is possible that continuing to increase emissions is a rational decision. | The purpose of Sect. 2.2.4 is to document the biases and heuristics that characterize behavior with respect to risk and uncertainty as it affects climate change decisions. To the extent research reveals there are ways of improving individual and societal |
| 4913 | 2 | 18 | 10 | | | {Add} consider themselves to {}be experts in | done, thanks. |
| 13841 | 2 | 18 | 10 | | | "to experts" … missing a word? "to be experts" ?? | done, thanks. |
| 7243 | 2 | 18 | 14 | | | Section heading 2.2.4 should be renamed: maybe "Improving decision making: counteracting the prevalence of system 1" | Sect. 2.2.4 is not about improving decision making but the biases and |
| 12235 | 2 | 18 | 27 | 18 | 27 | In which country was the Program - or was it an international Program? | the United States (have added in the |
| 11513 | 2 | 18 | 27 | 18 | 30 | The discussion of NFIP needs to recognize the issue of 'moral hazard' as well, i.e. those who have insurance and are compensated frequently because they live in flood zones, and they are reluctant to relocate because of incentives inherent in the insurance schemes, e.g. almost every year they upgrade their furniture. In addition, post-disaster relief grants by the federal government creates further incentives not to buy insurance and not to relocate. | The new NFIP legislation stresses the importance of risk-based rates so this will incentivize individuals to invest in adaptation measures. There is little empirical evidence that individuals are |
| 16924 | 2 | 18 | 31 | 34 | | This is almost the first mention of energy-related decisions (notably energy efficiency) in the chapter, and it is not a strong one – I note, with no reference. It reads as a theoretical assumption, not evidence-based: actually over most of the range, efficient fridges are not more expensive than less efficient ones, and the evidence is that labelling has had a huge effect - though probably because of branding concerns of manufacturers as well as actual rational choice by customers. See the Buildings chapter of this (AR5 FOD) report, and also Grubb, Hourcade and Neuhoff, Chapters 4 and 5. Grubb M., Hourcade J.C., Neuhoff K, Planetary Economics and the Three Domains of Sustainable Energy Development, Taylor & Francis, forthcoming (chapters 1-5 submitted and available on request. Chapter 4: "Why so wasteful"; Chapter 5 "Tried and tested: three decades of energy efficiency policy"). | we changed the example to lighting technology, and are now referring to Chapter 5, as well as providing a reference. |

| 6071 | 2 | 19 | 43 | | | Several theories are explained here, including prisoners' dillemma. What is really policy relevant is not just the explanation of theories but assessment of literatures. Especially in 2.2.4.5, impact of coordination and cooperation is the main theme. In this respect, what policy makers wish to know is the analysis of impact of uncertainty on coordination and coopration. If this subsection include the assessment of literatures discussing barriers to cooperate under uncertainty and any idea to overcome these barriers, this chapter will add value. | The purpose of this section is to discuss research that examine how uncertainty impacts on cooperation and coordination |
| 16926 | 2 | 20 | | | | end of section 2.2<br>The section could do with a conclusion. In relation to energy-related decisions, there is a clear implication about the non-optimality of energy decisions which is backed strongly by empirical data. Since most choices on energy consumption are taken by private decision-makers strongly influenced by “System 1” processes, whereas most supply investments are by big companies using “System 2” processes, there is an intrinsic bias towards supply-side investments in the energy system. Within supply-side (at least for electricity), the influence of risk aversion and uncertainty in energy markets further biases investments towards established fossil fuels rather than the more capital intensive low carbon options. See Grubb, Hourcade and Neuhoff (2012), Chapters 4 and 7. | Text has been changed |

| 12521 | 2 | 20 | 5 | | | Add after "2009" -- "Building on work by Perlo-Freeman (2006) and others, DeCanio and Fremstad examine the entire 2x2 possibility space and informally assess elements of climate policy and negotiations dynamics, concluding that no single game fully describes the state of play and suggesting that assessment of alternative game outcomes can shape evolution of an effective policy regime for climate response." Stephen J. DeCanio and Anders Fremstad, 2010. Game Theory and Climate Diplomacy, www.e3network.org/papers/Basic_Game_Anlaysis.pdf | Will consider adding the proposed sentence related to the De Canio-Fremsted paper in the SOD |
| 4612 | 2 | 20 | | 30 | | Generally, irreversibility, especially the one for climate change, has been given short shrift in this chapter; a good source on irreversibility is Ch. Perrings and W. Brock, Irreversibility in Economics, Annu.Rev. Res.Econ. 2009, 1: 219-38 | Noted. Option values are mentioned in 2.4.2.1 (p26 l12) and the main result on irreversibility effects summarized in |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 14830 | 2 | 20 | | | | The phrase "political and societal negotiation processes" is used (p. 24 line 17). It should be elaborated as one way of making decisions under uncertainty. Negotiated decisions (especially when characterized by procedural equity) can be an important way of dealing with decision-making under uncertainty, especially deep uncertainty involving value judgements. Another subsection should be added to include negotiated decisions as one tool for decisino-making under uncertainty. | Noted, agreed. New material on risk and society will be added. |
| 14238 | 2 | 20 | | | | The authors might want to consider a brief dicussion of robust control theory and ambiguity theory as well. While, e.g., the less wide-spread approach of RDM is discussed at some extent, the more common economic decision theories of robust control theory, and decision making under ambiguity are not discussed. | Text has been modified |
| 4705 | 2 | 20 | 23 | | | This is a well-structured delineation of ECONOMIC strategies for improving risk perception and decision-making but appears to be written in complete isolation from the insights of the prior section. If many of the obstacles to people understanding and responding to climate change are psychological in nature (as per section 2.2), then the strategies in section 2.3 all suggest that if people will just become homo economicus, it will all work out just fine. Put differently, if the problems laid out in section 2.2 really ARE the problems (and I think they are), then these solutions are irrelevant to addressing those problems. This is a crucial part of this chapter that should be addressed. This surely reflects that psychologists wrote 2.2 and economists wrote 2.3 but, now, those two groups have to sit down and make a coherent argument to each other. More broadly, this also suggests that there may be some important economic obstacles to decision-making and responses to climate change that could be better addressed in section 2.2 (e.g., the economic argument involved in my moral hazard point above -- if you take away the costs/risks of something, then people will rationally do more of it). | We have now made an extensive effort to link the section on behavioral issues and risk perception with the section on economic tools |
| 4706 | 2 | 20 | 23 | | | Structurally, this section has relatively parallel headings -- they should be identical if you are going to go that way, not halfway similar. | We have made an effort to cover in a symmetric way different tools, but only |
| 9219 | 2 | 20 | 23 | 30 | 11 | I appreciate that tools (thories) for improving decisions related to uncertainty and risk in climate change are summarized efficiently in Section 2.3. However, it is rather textbookish and lacking in concrete examples of climate risk analyses which applied those tools and theories. | We have now made an extensive effort to link this section with that on behavioral issues and risk perception. In addition we are working with other |
| 6304 | 2 | 20 | 34 | 20 | 37 | Once again, in describing expected utility theory, anyone wisely employing that decision making model should recognize that before one "defines a possible set of alternatives," the problem has to be explicitly defined, scoped and justified. | Thanks. That's true; much effort goes into the formulation of alternative courses of action. The same also holds for 'quantifying uncertainties…' and |
| 18445 | 2 | 20-30 | | | | Simple, clear and thoroughly discussed tools with illustrative scenario analysis, pros and cons.Good. | Thank you! Positive comments are very helpful in achieving balance. |

|---|---|---|---|---|---|---|---|
| 4632 | 2 | 21 | | | | . In the section on the expected utility hypothesis, I am surprised that no mention is made of the method of certainty equivalents, in fact CE are not mentioned anywhere in the chapter. | CE's play a role in the operationalization of partial belief as subjective probability, esp in von Neumann and Morgenstgern (1944), who (unwittingly) follow Ramsey (1926). However, it is not essential in the more modern account of Savage. To recall, event A is qualitatively more probable than event B for a subject if (s)he prefers a lottery giving a Good consequence if A and a Bad consequence if not-A to a similar lottery involving event B. Under (mild) restrictions, this qualitative ordering is necessary and sufficient to determine a unique probability measure. The idea is that we can construct 'almost uniform partitions' of arbitrary size in which no partition element is qualitatively more likely than the union of any two elements, and then compare events to unions of partition elements. The strongest restriction (the sure thing principle) says that if "Good if A, Bad else" is preferred to "Good if B, Bad else", and if event C is disjunct from A and from B, then "Good if A or C, Bad |

| 14233 | 2 | 21 | 13 | 21 | 19 | The paragraph on "Subjective versus objective probability" does not contain a definition or discussion of objective probabilities. The usual objective probability definition is based on the relative frequencies referred to in the pragraph (e.g. van Mises R. von Mises [1928 German](1954 English translation), Probability, Statistics and Truth. New York: Macmillan), or symmetry arguments (or Popper's (1959) [The propensity interpretation of probability, British Journal for the Philosophy of Science, Vol. 10, p.25-42.] notion of propensity). Two secondary sources discussion objective versus subjective probabilities are Kyburg, Henry E. Jr. und Howard E. Smokler (1964), Studies in Subjective Probability, John Wiley & Sons: New York. and Eisenführ, Franz und Martin Weber (2010), Rational Decision Making, Springer: Heidelberg. It might be worthwhile to explicitly address the issue prevalent in climatic change evaluation that objective probabilities are rarely given and purely subjective probabilities only help for individual decision making, but not for guiding institutional analysis. This problem naturally leads to the discussion in the chapter's appendix on trying to find different, partly new wordings to describe uncertainty in the IPCC process. | Thanks for this comment, which is spot on. The literature on the objectivist interpretation is well known to us. The best modern renderings (IMO) of the frequentist interpretion are based on the definition of a random sequence as those which pass all 'recursive tests', i.e. avoids recursive null sets (as in Martin Lof and Schnorr). The discussion is rather technical, but it does enter the vernacular through the notions of probabilistic explanation in Hempel and others. In climate change, this is related to the problem of deciding what is 'natural variability' and testing that all 'secular trends' have been accounted for. Earlier drafts contained some text on this. I would be happy to (re-) include this discussion but the decision to allocate space is above my pay grade.<br>(1)Schnorr, C.P. (1971) Zufa”llighekt und Wahrscheinlichkeit Lecture notes in Mathematics, 281, Springer?Verlag.<br>(2) Schnorr, C.P.(1973) “Process complexity and effective random tests” J. Comp. Syst. Sc. 7, 376?388.<br>(3) Martin?Lof, P. (1970) On the notion of randomness, in A. Kino, J. Myhilol, R.E. Vesley (eds) Intuitionism and Proof Theory, North Holland 73?78.<br>(4) Martin?Lof, P. | 2156 | 2 | 22 | | | | The section on cost-benefit analysis and uncertainty (Section 2.3.2) provides an appropriate coverage for the purposes of the report once expanded to clarify how uncertainty is accounted for in cost-benefit computations. Ayyub (2003) offers a fundamental and simple model based on the moments of underlying random variables to compute the probability of not realizing benefits, i.e., P(B<C) where B=benefit and C=cost. Such an approach enables users to account for both B/C ratio and the uncertainties in B and C.<br>Reference: Ayyub, B. M., Risk Analysis in Engineering and Economics, Chapman and Hall/CRC, 2003. | Thank you |
| 14534 | 2 | 22 | 1 | | 11 | This box on the Condorcet voting paradox is interesting, but from what little I understand about social choice theory (which largely comes from Amartya Sen's The Idea of Justice) most of these voting paradoxes depend on assumptions about well-characterized uncertainties and stable individual rankings, and thus aren't particularly relevant for vast societal issues such as climate change. Such issues involve large groups of individuals grappling with complex ethical considerations and economic tradeoffs where the consequences of actions are poorly understood; the fit with existing moral traditions is still unsettled; and debates are subject to strong filtering by existing values, information networks, and economic interests. The space used by this box might be better spent on topics more relevant to these issues. | Thanks, its all true. However the discussion in ch 2 focuses on foundational issues, and shows that the concepts of subjective probabiity and utility are meaningful for individual choice, but there is no straightforward way to generalize them to social choice. The factors you mention reinforce this conclusion, but on the abstract level of |
| 14535 | 2 | 22 | 14 | | | It might be useful to say how cost-benefit analysis relates to expected utility theory. | Thank you, text has been revised |
| 7252 | 2 | 22 | 14 | | | Cost Benefit Analysis -> Cost Benefit Analysis (CBA) | Thank you, text has been revised |
| 6072 | 2 | 22 | 15 | 22 | 17 | The text says "CBA does not address the challenges in achieving agreement across countries with respect to strategies for mitigating the impacts of climate change". It is difficult to understand why. Citation please. In page 24 line 14, there is description that the target can be defined through a CBA, through the application of a principle. Those two sentences are not consistent each other. | Text has been modified |
| 16086 | 2 | 22 | 17 | 22 | 22 | Does it mean a treaty or a global policy cannot be assessed by CBA? Whant about global equilibrium modelling by economists? Does it mean it is worthless in assessing possible path of policy? Maybe it is contradictory with the next paragraphs. | Text has been clarified |
| 12992 | 2 | 22 | 17 | 22 | 18 | The claim that CBA should be used only at the national or subnational level is interesting, but seems out of step with much work in contemporary climate economics, which is focused at the global level. More explanation or defense would be helpful. | Text has been clarified |
| 7253 | 2 | 22 | 17 | | | to utilize -> to be utilized | Thank you, text has been revised |
| 14824 | 2 | 22 | 21 | | | I don't it is justified to claim that "CBA can still provide useful insights when applied to the global problem of climate mitigation". A strong case can be made that it is not suited to the problem. Please see Ch 6, where, among other observations, they state<br>"no cost-benefit study finds an optimal level of mitigation that stabilizes atmospheric concentrations. Instead, conc entrations continue to rise throughout the modeling period. " (p.26) | Text has been clarified |
| 4633 | 2 | 22 | 23 | | | Why the highest social net present value? Referring to the levee example in the previous paragraph, what would be the social benefits? Lower government payments to owners of previously flooded land? It seems to me that a lot of the benefits are captured by individuals, not society in general, while the costs of flood control are almost always borne by taxpayers, or society in general. | Thank you, text has been modified |
| 6073 | 2 | 22 | 25 | 22 | 25 | In CBA applied to climate change issues, private and social cost are compared with benefits (refer to, for example, many literatures by William Nordhaus and other schelars. | A more complete discussion on social versus individual costs and benefits is reported in Chapter 3. We are only |

|---|---|---|---|---|---|---|---|
| 7257 | 2 | 23 | 16 | | | funded -> founded | Done. |
| 9140 | 2 | 23 | 26 | 23 | 30 | Of course I agree that CBA is a useful tool for decision making process. However, many researches dealing with biases of perception suggest humans are not good at understanding the concept of probability correctly, meanwhile CBA highly relys on System 2 process. Thus I don't think CBA plays a "critical" role to overcome System 1 of all humans. I would suggest that you would soften the tone of the words. | Yes, good point, done. |
| 7258 | 2 | 23 | 29 | | | want -> wants | Done. |
| 7259 | 2 | 23 | 30 | | | greenhouse gas emissions know -> ..greenhouse gas emissions. It knows there | Done. |
| 12993 | 2 | 23 | 32 | 23 | 33 | This claim about the status of CBA may mislead. Many normative perspectives are internally coherent and claim to be either based on or consistent with rational norms. Moreover, the norms associated with CBA are often claimed to be very weak, and so to do little in themselves to guide action (e.g., without stronger and more contentious value assumptions). See, e.g., Daniel Hausman and Michael McPherson, Economic Analysis and Moral Philosophy (Cambridge, 2006). | Text revised to acknowledge the scope of the debates on CBA, focus on risk and uncertainty and refer to 3.5.2 for more detailed discussion. |
| 13850 | 2 | 23 | 32 | | | Is this the advantage over all other methods? Over system one methods? This does little to recommend CBA. Is not an advantage that it has a record of success? Success in comparable situations? | See reply to #12993 |
| 8237 | 2 | 23 | 36 | 23 | 37 | While it is noted that some impacts are hard to measure in monetary terms which may lead to their omission, it should also be noted that there are tools available in environmental economics to value these impacts such as the contingent valuation and the avoided cost methods. | Text added. |
| 16087 | 2 | 23 | 41 | 23 | 46 | Excellent paragraph, but maybe you fail to remark that many events described with IPCC vocabulary as "low probability" would be highly probable by your local insurer if compared with his trade made of grave injuries or fires. This gap shows that what laks is not a "new psychological frame" in the decisionmakers, but often just a fair description of the risk. | Noted. |
| 12994 | 2 | 23 | 41 | 23 | 43 | This may be the most prominent objection amongst economists, but I doubt that it is the most common more generally. More importantly, other major objections should at least be mentioned, and especially the ethical ones. See, for example, Mark Sagoff, The Economy of the Earth (Cambridge, 2008) and Stephen Gardiner, 'Cost-Benefit Paralysis', chapter 8 in A Perfect Moral Storm (Oxford, 2011). | See reply to #12993 |
| 7895 | 2 | 23 | 41 | 23 | 43 | You write: "The strongest and recurrent argument against CBA (Azar and Lindgren, 2003; Tol, 2003; Weitzman, 2009b, 2011; Nordhaus, 2011) is related to its failure to deal with low probability, catastrophic events that might lead to unbounded measures of either costs and/or benefits." This is not the strongest argument against CBA. One oof the main challenges is that CBA entails several normative and empirical assumptions (the rate of discount, the curving of the damage function, aggregation of impacts in a single welfare function, the marginal value of future consumption units, the assumed value of a statistical life, technological innovation as either exogenous or endogenous to climate change, monetary value of environmental change and loss of biodiversity, shifts in transaction costs, control costs, and search costs, etc.) that are not dealt with appropriatly by existing CBAs on climate change - and that are hard to deal with in general. The argument mentioned in the quote only deals with one of these many aspects, namely with how the damage function is curved. It is somewhat funny that only proponents of CBA are quoted at this point. See also comment 36. | Thank you, we now have emphasized more other challenged to CBA |
| 4512 | 2 | 23 | 43 | 23 | 45 | Here and perhaps elsewhere, reference should be made here to the work of Chichilnisky on the incorporation of catastrophic possibilities into expected utility analysis. A recent example is her paper with Chanel in the forthcoming special issue of Ecological Economics. | Thanks for the suggestion. Reference added in 2.3.1.1 when discussing research on EU theory alternatives. |
| 9141 | 2 | 23 | 43 | 23 | 45 | As well, I think it's more important to consider how we human systematically fail to estimate fat tails events from the viewpoint of biological evolution than just constructing robust techniques. Such a viewpoint might consequently provide countermearures to systematic failures of our decision making. The countermeasures might be simply how calculation results should be shown or something, rather than novel methods of calculation. | Thanks, good point. Its true that fat tails can frustrate standard statistical methods. A discussion of fat tails is submitted to the Glossary. Space constraints have kept it out of our chapter |

| 2964 | 2 | 23 | 46 | | 23 | leaving off extremes seems irrational and likely to lead to disaster -- consider the decision of planners to consider only the past century of experience with tsunamis in designng the Fukushima facility, excluding earlier more severe events. | see response to comment 9141 |
| 8238 | 2 | 23 | 47 | 24 | 10 | The paragraph notes that one way to get around the fat tail issue in a CBA is to "leave off extremes when the consequences from these 47 outcomes do not demand serious consideration now". The text should specify under which circumstances extremes do not demand serious consideration and how this may relate to the degree of risk aversion of decision makers. | We have now specified this better |
| 14826 | 2 | 23 | 48 | | | "to leave off extremes…" This sentence is unclear. | We have now specified this better |
| 14234 | 2 | 23 | 8 | 23 | 9 | "In either case the decision maker is assumed to be maximizing expected utility". The formulation is unfortunate because what is usually referred to as Monte-Carlo analysis in the integrated assessment literature only averages deterministic paths. The generated results usually do not reflect the response to uncertainty that an expected utility maximizer would reveal. | Thank you for the comment, we are actually referring to cases where the expected utility framework is actually adopted here. We have now specified |
| 7256 | 2 | 23 | 9 | | | how is CBA different from E(U) if both maximize expected utility? Maybe add a table comparing E(U), CBA, CEA? | CBA can be used to maximize net benefit, without uncertainty or utility function. More detailed discussion of decision making belong to chapter 3, |
| 13851 | 2 | 24 | 16 | | | Change 'funded' to 'founded' | Done. |
| 6371 | 2 | 24 | 29 | | 30 | Grammatically muddled sentence. | Paragraph rewritten |
| 3196 | 2 | 24 | 29 | | 35 | Opaque. Rewrite more clearly. | Paragraph rewritten |
| 6074 | 2 | 24 | 32 | 24 | 33 | Pleae explain why CEA could enable the government to assess the "optimal" mitigation policy. In my understandings, CEA could enable governments to assess the cost effective mitigation policy, but not optimal mitigation policy where marginal cost equalizes marginal damage. | Text rephrased without « optimality ». |
| 3197 | 2 | 24 | 42 | | | Here and elsewhere, use "discount rate" for "pure rate of time preference" | We eliminated the whole discussion as it seemed that it belonged more to |
| 12995 | 2 | 24 | 44 | 24 | 46 | This claim should be more balanced. Particular CBAs are not immune to politics, and are often thought to be hostage to the particular ethical assumptions and other preferences of the analyst. The latter is one of the major objections to CBA in public policy. | Text rephrased. |
| 12522 | 2 | 24 | 44 | 25 | 2 | With over 30 years of experience in cost-effectiveness analysis (CEA) applied to integrated resource planning of power systems at the utility and region level, I presume perhaps the literal wording of this paragraph does not convey the author's intention clearly. But given that experience, it is simply incorrect to say “A drawback of CEA relative to CBA is that it does not enable one to undertake an integrated valuation and comparison of benefits and costs.” The following sentences basically read as non sequitur. | Text rephrased. |
| 14827 | 2 | 24 | 44 | | | This would make more sense: "An advantage of CEA relative to CBA is that it does not force one to undertake an integrated valuation and comparison of benefits and costs. The choice of the target could instead be addressed by a political decision reflecting people's preferences." | Text rephrased. |
| 14235 | 2 | 24 | 11 | | | It might be useful to point out that CEA is a special case of CBA that replaces benefits from emissions and optimization over the emission level with an exogenously emission trajectory, but keeps the optimization over costs. Making part of the policy analyzed in CBA exogenous directly implies the discussed advantages and disadvantages. Similarly, CCP and CRA (methods the reviewer is less familiar with) seem to be special cases of CBA that replace the emission benefits with some exogenously defined objective instead. | Thanks. Text added. |

|---|---|---|---|---|---|---|---|
| 8239 | 2 | 24 | | 24 | | The explanation around when and how to conduct cost-effectiveness analysis should be explained more clearly. "Cost-effectiveness analysis is useful when benefits cannot be expressed in monetary values in a meaningful way. In this case, it can ensure technical efficiency in the process of achieving a desired outcome. A CEA calculates cost-effectiveness ratios of different alternative policy options and then compares the resulting ratios so that the most efficient option is chosen. The pure cost-effectiveness of a policy option is calculated by dividing the present value of total costs of the option by the present value of a non-monetary quantitative measure of the benefits it generates. The ratio is an estimate of the amount of costs incurred to achieve a unit of the outcome from a policy option. The cost-effectiveness analysis does not evaluate benefits in monetized terms but is an attempt to find the least-cost option to achieve a desired quantitative outcome". (Canadian Cost-Benefit Analysis Guide, p. 29, retrieved at www.tbs-sct.gc.ca/ri-qr/documents/gl-ld/analys/analys-eng.pdf ) | Thanks. The 2.3.3.2 has been rewritten. In part, we quoted the definition of CEA as to be found in the Canadian CBA-Guide. However we do not follow the definition to the point where ratios are to be taken. So far the climate community has avoided taking ratios and left the assessment of how to balance mitigation costs and avoided non-monetary damages to society. |
| 8240 | 2 | 24 | | 24 | | The section should add that another drawback of CEA is that it usually does not account for the timing of emission reductions compared to the CBA framework. CEA assists in determining the most effective way of reducing emissions but does not account for when reductions will occur over time. The CBA framework will capture when emissions are reduced and their associated benefits (discounted), while the CEA framework informs of the reductions achieved (in physical units) and their associated costs achieved without specifying when they occur. | This is not correct. Indeed CEA has been extensively performed using a cap on temperature or radiative forcing allowing for full flexibility in the timing of the emission abatement |
| 14236 | 2 | 25 | 16 | | | Might the authors have intended to write "CEA" instead of "CRA"? | Thanks. Text corrected. |
| 7260 | 2 | 25 | 29 | | | What is EUmax? | Clarified. |
| 7695 | 2 | 25 | 3 | | 8 | The text should be clarified on what "target can only be observed probabilistically" refers to. I assume that it means that the temperature response resulting from an emission pathway is not known with certainty ex-ante. This does not yet necessitate CCP if the prevailing temperature can be observed. The emission pathway doesn't have to be decided at one instant. We can observe the realization of temperature increase later during the century, and adjust the emission pathway recurrently so that the temperature target will be ultimately met (with certainty, if the amount of emission reductions are sufficiently large). Scenarios with a temperature target and risk-hedging through sequential decision making include:<br>* Syri, S., Lehtilä, A., Ekholm, T., Savolainen, I., Holttinen, H. & Peltola, E. (2008), 'Global energy and emissions scenarios for effective climate change mitigation - deterministic and stochastic scenarios with the TIAM model', International Journal of Greenhouse Gas Control 2(2), 274–285.<br>* Webster, M., Jakobovits, L. & Norton, J. (2008), 'Learning about climate change and implications for near-term policy', Climatic Change 89(1-2), 67–85.<br>* Johansson, D. J. A., Persson, U. M. & Azar, C. (2008), 'Uncertainty and learning: Implications for the trade-off between short-lived and long-lived greenhouse gases', Climatic Change 88(3-4), 293–308.<br>* Ekholm, T. (submitted), Hedging the climate sensitivity risks of a temperature target. Submitted to Resource and Energy Economics in Feb. 2012. | We agree with the referee that decisions can be corrected for in the course of time. This is what we refer to as 'learning'. We introduce our terminology more carefully in the SOD. However we disagree with the referee that learning opens the ex ante perception to be able to observe the target with certainty. An infinity-tailed climate sensitivity distribution opens the chance that the target cannot be observed any more, no matter when and how much we learn, simply because of the stock of carbon already in the atmosphere and limited carbon sinks. |
| 14828 | 2 | 25 | 3 | | 21 | These three paragraphs are not clear. It is in particular not clear what is said here that is not also a drawback of CBA. | Thank you, we have now changed the text. |
| 6372 | 2 | 25 | 32 | | | Should say "likelihood .. is ", not "likelihood … are" | Done. |
| 14237 | 2 | 25 | 32 | | | check use of noun versus adjective | Thank you, text has been edited |

| 12997 | 2 | 25 | 41 | 25 | 43 | Not all versions of the PP give discretion to the decision-maker. For example, Soule 2003 contrasts strong and weak versions of the PP, and calls the discretionary ones "weak". (See Gardiner 2006.) | A more critical discussion of PP has now been introduced |
| 3198 | 2 | 25 | 41 | | 46 | Point out that PP is highly subjective and pays ZERO attention to probabilities | A more critical discussion of PP has |
| 18450 | 2 | 25 | 22 | 26 | 32 | As part of the robust decision making approach specific approaches deserve a much broader discussion. This concerns especially the rich literature on the "tolerable windows approach" (guard rail approach) or the safe landing approach. For the probabilistic extension of the guard-rail approach please refer to "T. Bruckner, K. Zickfeld: Inverse Integrated Assessment of Climate Change: the Guard-rail Approach, International Conference on Policy Modeling (EcoMod2008), July 2-4, 2008, Berlin" and the references therein. The deterministic version is described in "T. Bruckner, K. Zickfeld: Emissions Corridors for Reducing the Risk of a Collapse of the Atlantic Thermohaline Circulation, in: Mitigation and Adaptation Strategies for Global Change 14, 61-83, 2008". | Thanks for the references. Forwarded to chapter 3 where this literature is reviewed (3.9.2.1). Furthermore we add a hint in our PP-section. |
| 14536 | 2 | 26 | 1 | | 7 | RDM can use an objective function that interpolates between a minimize maximum regret criteria and an expected utility criteria. In these contexts, RDM provides decision makers tradeoff curves that allow them to debate how much expected performance they are willing to sacrifice in order to improve performance in worst cases. This is offered as a more systematic means of capturing the spirit of the precautionary principle in a way that illuminates the tradeoffs being made. That said, it is important to regard various decision support methodologies as more than just decision criteria. In a recent paper, we used three criteria to compare alternative robust decision approaches: 1) their decision criteria, 2) their representation of uncertainty, and 3) the information presented to decision makers. (See Hall, J. M., R. Lempert, K. Keller, A. Hackbarth, C. Mijere and D. McInerney (2012). "Robust Climate Policies under uncertainty: A comparison of Info-Gap and RDM methods." Risk Analysis. Another article offers a related set of criteria for comparing decision support methodologies: Lempert, R. J. and S. C. McKay (2011). "Some thoughts on the role of robust control theory in climate-related decision support." Climatic Change.) You might find such a set of criteria useful for your comparisons here. | We will discuss RDMs tools more explicitly in the SOD, in particular the role of trade-off curves. |
| 6373 | 2 | 26 | 1 | | 3 | Cite Lempert et al. 2006. | Thank you, we have improved the text |
| 4613 | 2 | 26 | 12 | 26 | 13 | There is here an allusion to irreversibility through real options theory; this is the only place where the fundamental irreversibility result is indirectly mentionned: in general, the irreversibility effect does not exist. | This issue is actually discussed in details in 2.4.2, from page 32 line 19 onwards. Text updated to this end. We have weakened our statement here and left this discussion for the more |
| 10683 | 2 | 26 | 12 | 26 | 13 | "cannot" is a very strong term - surely the point is that the precautionary effect/principle does not automatically dictate a reduction in greenhouse gas emissions solely on the basis of uncertainty in climate projections. | We have weakened our statement here and left this discussion for the more general overview on numerical results in |
| 17137 | 2 | 26 | 15 | | | There are documented cases in the literature of adaptive management to climate change - see for example: Berkes, F., Colding, J., and Folke, C. (2000) Rediscovery of Traditional Ecological Knowledge as Adaptive Management. In Ecological Applications 19: 1251-1262. See also Berkes, F. and Armitage, D. (2010) Co Management institutions, knowledge and learning: adapting to change int he Arctic. In Inuit Studies 24(1) 109-131 | Thank you for for these references, especially the latter one with special reference to climate adaptation in the arctic. We have included them in the text as examples of passive adaptive |
| 7261 | 2 | 26 | 33 | | | Mention problems due to local differences (in culture, circumstances, values) that make AAM somewhat challenging on global scales. | I don't think that we are making any argument that adaptive management could possibly be implemented on a |

|---|---|---|---|---|---|---|---|
| 3199 | 2 | 26 | 33 | | | Section 2.3.5 on adaptive management is perhaps tangential. Maybe omit? | I am puzzled as to why it would be viewed as tangiential. Adaptive management is an approach to governance, coming out of the ecological research community, that precisely deals with uncertainties and the potential for learning, and hence fits squarely with the remit of this chapter. Of course it is not an approach that has |
| 17394 | 2 | 26 | 34 | 26 | 35 | The definition of AM is a bit awkward since AM rests on the recognition that knowledge will never be adequate. Given inadequate knowledge and continued uncertainty, perhaps the greatest strength of AM is that it specifically aims to increase the resilience of the system involved. This could be added, e.g., "Adaptive management is an approach to governance that explicitly incorporates mechanisms for reducing uncertainty over time and increasing system resilience, growing out of the field of conservation ecology in the 1970's…" | I am not sure that I agree with this interpretation of AM. My understanding of AM is not that it is intended, per se, to increase system resilience. Rather, it is intended to generate the datathat will lead to needed learning, which in turn will support improved management practices in the future. In applying adaptive management, it is important to understand the existing system resilience, so as not to cause permanent |
| 6374 | 2 | 26 | 8 | | 18 | This paragraph is a non-sequitur that breaks the flow of discussion about RDM. | This § is indeed not about RDM but about another notion of the precautionary |
| 6375 | 2 | 26 | | | | The paragraph/section structure here could be improved. Section 2.3.4.2 starts by describing how RDM can help, but the rest of the paragraph describes a decision not based on RDM. The RDM part is split out into 2.3.4.3. These two sections should be combined, and the text reworked to flow better, and to better describe RDM (e.g., the minimax regret approach). Indeed, this whole section talks more "around" the idea of RDM and never really gets to defining it well. See Lempert et al. 2006 for a concise definition. | Thank you, we have improved the text |
| 17395 | 2 | 26 | 33 | | | A key strength of AM is that it enhances the resilience of socio-ecological systems and strengthens social and ecological capital e.g., by enhancing linkages between system components, building awareness etc. This is perhaps as pertinent to the climate change problem as the other features of AM mentioned here. | To my knowledge this strength has not been demonstrated empirically, and so we will omit it. |
| 2157 | 2 | 27 | | | | The coverage of uncertainty types and models is somewhat brief making look deficient – this might be intentional by the authors. I recommend directing readers to an expanded meaning of uncertainty (including evidential reasoning) based on the work of Ayyub and Klir (2006), Klir (2005) and other similar books and papers. Reference: Ayyub, B. M., and Klir, G. J., Uncertainty Modeling and Analysis for Engineers and Scientists, Chapman & Hall/CRC, Press Boca Raton, FL, 2006. | Thanks, these references are known to us, as are the concomitant problems, see Cooke, R.M.,Book Review Elicitaton of expert opinions for uncertainty and risks Elsevier, Fuzzy Sets and Systems 133 (2003), page 267-268, ISBN 0-8493-1087-3. The paradoxes in interpreting "and" and "or" as intersections and unions of fuzzy sets are not discussed in these references. However they lead to conclusions like: IF the uncertainty that Qunicy is a man is 1/2, and the uncertainty that Quincy is a woman is 1/2, THEN the uncertainty that Qunicy is a man AND a woman is also 1/2. This is |

|---|---|---|---|---|---|---|---|
| 4690 | 2 | 27 | | | | in Chapter 2 (p. 27, Box 2.2) treatment of uncertainty needs to be expanded and nuanced a bit further. In particular, targeted use of work from Science and Technology Studies (STS) can help here. For example, in 1992, STS scholar Brian Wynne wrote about the importance of disaggregating these broad-brush considerations of risk and uncertainty in order to more capably consider open and more complex human-environment actions. Wynne unpacked these considerations in the context of what Silvio Funtawicz and Jerry Ravetz characterized during this time as the spaces of 'post-normal science', where "facts are uncertain, values in dispute, stakes high and decisions urgent" (1993, 739). Wynne described 'four kinds of uncertainty' in this way:<br>(1) 'risk' – where we know the odds, system behavior, and outcomes can be defined as well as quantified through probabilities<br>(2) 'uncertainty' – where system parameters are known, but not the odds or probability distributions<br>(3) 'ignorance' – risks that escape recognition<br>(4) 'indeterminacy' – this intersects with the previous three kinds, and captures elements of the conditionality of knowledge and other contextual scientific, social, political factors<br><br>Considering the well-known utterance from former US Secretary of Defence Donald Rumsfeld can help to make these distinctions (and the importance of doing so) more concrete. In February 2002 – regarding US military risk and uncertainty – Rumsfeld commented, "As we know, there are known knowns. There are things we know we know. We also know there are known unknowns. That is to say there are some things we do not know. But there are also unknown unknowns, the one's we don't know we don't know". These Rumsfeldian distinctions break down quite usefully along the categories defined by Brian Wynne.<br><br>Funtowicz, Silvio O. and Ravetz, Jerome R. 1993. "Science for the post-normal age," Futures 25: 739-755.<br>Wynne, Brian 1992. "Uncertainty and environmental learning," Global Environmental Change June: 111-127. | Wynne's 4 categories map on our definitions as follows. #1-#2 are in-line with the original definitions as developed within statistics and economics. However in the climate community as somewhat different use of these terms has manifested itself as documented in the IPCC-Uncertainty Guidance Notes Mastrandrea et al., 2011. There, 'uncertainty' is equivalent with a cognitive lack of knowledge that might or might not be expressed by a precise probability measure. Pairing 'uncertainty' with an undesirable outcome then gives 'risk'. Ignorance can in part be captured within subjective uncertainty, or it cannot scientifically be captured at all to our understanding – hence we cannot represent it. Finally the abovementioned conditionality is captured by conditional modeling that IAMs try to mimic, in that sense we do already represent it. |
| 8486 | 2 | 27 | 11 | | 14 | This is a particularly illustrative case study in terms of challenges to adaptive policy, and sustainability action more generally. Particularly for smaller communities or political units where resources (ie, capital and capacity) are limited, short term barriers or goals will typically over-ride longer-term goals, objectives and values. See for example Sayer and Campbell 2004 re: Sustainable Development | Thank you for this comment. We will search for the paper you suggest and add as appropriate. |
| 12524 | 2 | 27 | 11 | 27 | 14 | "Replace sentence "As Lee..." as follows -- "As Lee (1993) documented, policy-makers on the Columbia River employed multiple perspectives to improve protection and recovery of federally listed fish stocks. While progress has been slow, adaptive management based measures slowly gained acceptance and are resulting in improved smolt-to-adult returns. However, current measures remain well short of the levels required for long term viability (Fish Passage Center 2011)." Fish Passage Center, Final 2011 Comparative Survival Study Annual Report, http://www.fpc.org/documents/CSS/2011%20CSS%20Annual%20Report—Final.pdf | This important. Obviously it puts a much more positive spin on the case that Lee documents. My sense is that Lee documented that adaptive management had not been particularly successful at the time, but as you point out, it is a matter of degree. I have revised the sentence accordingly to suggest that AAM had not altogether failed to take |
| 11517 | 2 | 27 | 12 | 27 | 13 | In the example about attempts to conduct experiments on salmon in adjacent tributaries, local people are implicated as selfish. It is important to consider whether they were acting to protect their own longer-term interests, ie important local food sources. Ironically, the authors seem to dismiss the risks and uncertainties associated with experimentation on salmon populations. | I am not sure that I understand this comment, but I think that the spirit of it can be captured by deleting the word "immediate." |

| 17396 | 2 | 27 | 15 | 27 | 17 | AAM is in fact being applied to the area of climate change (although this is of course a work in progress), and some of the relevant studies should be cited, e.g., Lawler, J.J., Tear, T.H., Pyke, C., Shaw, M.R., Gonzales, P., Kareiva, P., Hansen, L., Hannah, L., Klausmeyer, K., Aldous, A., Bienz, C., Pearsall, S., 2010. Resource management in a changing and uncertain climate. Front Ecol Environ 8 (1): 35-43. Littell, J.S., Peterson, D.L., Millar, C.I., O'Halloran, K.A., 2011. US National forests adapt to climate change through science-management partnerships. Climatic change, DOI 10.1007/s10584-011-0066-0. | Thank you for these references. We have included them, and the points they make. |
| 14537 | 2 | 27 | 15 | | | Are energy technology R&D programs an example of AAM? The government invests in a wide range of early-stage technologies, with the explicit expectation that some will be dropped and others move on to latter stages of funding. | That seems right. Adaptive management involves trying out a diversity of approaches, with the explicit expectation that some approaches will work better than others; the successful ones will be retained and improved upon, and the |
| 7262 | 2 | 27 | 16 | | | What is UNFCC? | United Nations Framework Convention on Climate Change. We trust it will be in |
| 4634 | 2 | 27 | 40 | 27 | 41 | , I do not understand "If five logically independent statements each hold with probability 0.8, the probability 40 that all of them hold can be anything from 0.8 to 0." Why is the answer not (0.8)5? | Logically independent' means that none of the statements logically implies any of the others. However, they may be probabilistically dependent. The answer 0.8^0.5 holds if the probabilities in question are independent. It can happen that each of five events has probabiity 0.8 but their intersection has probability zero. In this case it is impossible that they all hold. It can also happen that |
| 13852 | 2 | 27 | 40 | 27 | 45 | Sentence beginning with 'If five …" through line 45 seems out of place in this box. It would be more appropriate to let the box stand for itself and have this material in the text, referring to the box as needed. | I would disagree. It is essential to understand that attaching probability qualifiers to statements can conceal the problem of propagating uncertainty through a chain of reasoning. This is an |
| 14240 | 2 | 27 | 40 | 27 | 41 | The example seems to be at least easily misunderstood, if not wrong. Given independence, the joint probability should be easility calculated and unique. I think the authors have in mind that the formulation would not contain the information whether these events are independent or not. Then indeed the given range seems right. | See response to comment 13852. If 'logically independent' causes confusion, we could just leave it out, the statement in the text remains true. |
| 8391 | 2 | 27 | 46 | | | It is not clear what "uncertainty analysis" is as distinct from everything else in section 2.3. This section seems to be a repository for things that didn't fit in well above. I suggest thinking very carefully about what "uncert analysis" might mean, and how to organize the entire section 2.3 given this. | Thanks for the opportunity to expand on this. Definitions are given, and the meaning of 'uncertainty analysis' is anchored in a long tradition within technical risk analysis. Quantitative uncertainty analysis (QNUA) requires a mathematical model, qualitative uncertainty analysis is a structured narrative. The former has not yet played a large role in the climate debate, which explains its subordinate role in this chapter. See however Cooke, Roger. M. (2012) "Uncertainty Analysis Comes to |

|---|---|---|---|---|---|---|---|
| 8392 | 2 | 28 | 9 | | | Structured expert judgement is a tool that can be used to populate probabilty distributuions for all the other tools in the chapter, and so it is confusing to have it presented in a parallel manner. Expert judgment should not be used on its own (it is not a good idea to just ask experts what they think we should do), but rather as a way of creating probability distributions. This should be made more clear, both in the writing, and also by the structure of the sections. | Thanks, see response to comment 8786. Note also the distinction between 'expert judgment' and 'structured expert judgment'. Expert judgment tout court can mean anything from blue ribbon |
| 14829 | 2 | 28 | | | | This is a very helpful section, and could even be usefully expanded. It is arguably more useful | Thanks , I agree. Talk to the Page |
| 8786 | 2 | 28 | 9 | 29 | 24 | Again generally good discussion of the approach but no discussion of the fundamental difficulties in using expert opinion in this manner when it is difficult to gauge the impact of the experts ideological and religious positions, ethical, ontological and epistemological assumptions, expertise in philosophy of science, etc. | Thanks, this comment invites a long discussion. Here's a short reply. All experts, like most of us, have biases, predlictions proclivities etc. This is why it is essential to guage expert performance ( in terms of statistical accuracy and informativeness) with objective measures - to treat them as statistical hypotheses. Most EJ methods attempt to sensitize experts to biases etc. However, the proof of the pudding is in the eating. The credibility of an EJ study depends on these objective measures, and not on a narrative claiming bias removal. Indeed, 'unbiased' experts can still return poor performance. Many studies have tried to relate expert |
| 7264 | 2 | 29 | 10 | | 12 | How does this number compare with the forecast? | We do not know to which number you |
| 12525 | 2 | 29 | 20 | | | It is implausible to say that structured expert judgment is “just opinions and not hard facts.” Peer review, to name one salient example, is not “just” opinions. | "just…' is in quotes. Studies have shown that eg citation indices do not predict expert performance. Eg Cooke, R.M., ElSaadany, S., Xinzheng Huang, X. (2008) On the Performance of Social Network and Likelihood Based Expert Weighting Schemes, Special issue on expert judgment Reliability Engineering & System Safety , 93 , 745-756 |
| 13856 | 2 | 29 | 31 | 29 | 34 | Recommend updating this part to reflect the new 'Representative Concentration Pathways' of WG I | Good idea, will do |
| 7265 | 2 | 29 | 31 | | | May not be the first occurence, but define "emission pathway" | see response t comment 13856 |
| 14538 | 2 | 29 | 35 | 30 | 11 | Schoemaker (1993) writes “the multiple scenario method thus differs from traditional planning and risk analysis in its psychological basis,” referring to scenarios attempted role in addressing over-confidence and allowing groups to reach consensus on the need to consider potential risks without first agreeing on their magnitude or precise form. This chapter’s discussion takes a much narrower view of scenarios, essentially focusing on their use in laying out a range of plausible future climate conditions. But the climate community has a much richer view of scenarios, as described, for instance in Parson, E. A., V. Burkett, K. Fischer-Vanden, D. Keith, L. O. Mearns, H. Pitcher, C. Rosenweig and M. Webster (2007). Global-Change Scenarios: Their Development and Use, Synthesis and Assessment Product 2.1b, US Climate Change Science Program and a special issue of Environmental Research Letters (see O'Neill, B. C., S. Pulver, S. D. VanDeveer and Y. Garb (2008). "Editorial - Where next with global environmental scenarios?" Environ. Res. Lett. 3: 1-4.) | This is a very good point, but since Chapter 2 addresses uncertainty and risk, we refer to the aspects of scenario methods related to that. This does not preclude other uses. |
| 7266 | 2 | 29 | 41 | | | What is SRES? | Thank you. SRES is an acronym for Special Report on Emissions Scenarios. |
| 6076 | 2 | 29 | 41 | 29 | 41 | Examples of SERES can be replaced by the most recent ones including EMF 27. | see response t comment 13856 |

|---|---|---|---|---|---|---|---|
| 13857 | 2 | 29 | 43 | 29 | 44 | Suggest relating this sentence to previous sentences by noting that the Meehl at al (2007) study involved multiple runs of multiple models. | see response t comment 13856 |
| 3897 | 2 | 29 | 47 | 29 | 48 | Sentence difficult to read and understand -recommend redrafting it. | The last line is number 43?? |
| 12526 | 2 | 29 | 48 | | | Add after “change” -- “estimating system boundaries and thresholds” | The last line is number 43?? |
| 2965 | 2 | 29 | 1 | | | would it be worth saying something about use of decision markets as a way of aggregating opinions (e.g., intrade)? | Outside the scope of this chapter. |
| 3138 | 2 | 29 | 12 | | | section 2.4.4 might helpfully begin with a macro view of the kinds of "errors" that can be made in policy choice (and remedies for those errors). That larger framework, which might be just a few sentences or such and refer to other chapters, will help readers understand the context for the discussion of instruments that follows. Also, the discussion that follows strikes me as overly weighted on market and technology policies and perhaps underplays the role of regulation. (Later chapters also deal, often, with policy instrument choice and they, too, underplay the role of direct regulation.)<br><br>Throughout, the stuff on risk perception and decision making is really helpful. fyi, there is some evidence that different types of people make decisions differently—our lab has a big review paper (now accepted at Perspectives on Politics for publication in March 2013) that looks, in particular, at elite vs. non-elite methods for making decisions. Here's a link:<br>http://papers.ssrn.com/sol3/papers.cfm?abstract_id=1917037<br><br>I have the impression that decision-making strategies that involve "act, observe, learn, and adjust" are under-played in this chapter. Lempert and others, including at EMF, have done a lot in this area and it seems to be a big part of the climate policy analysis literature. Maybe its in the chapter and I missed it. □ | This is an interesting comment. With respect to errors, the intention was to cover these, and their effects on policy, in section 2.2. With respect to the decision-making strategies, that is a good point, and is covered in section 2.3 under robust decision-making and adaptive management. The point with respect to regulation is very much right, and yet I see it as more apprpriate in chapter 16, Ithough we make note of it now in the introduction to 2.4.4. |
| 13858 | 2 | 30 | 1 | | | It seems like the term 'optimal signal' is not what you mean here. Do you mean 'optimal method?' | Optimal signal is a technical term, and denotes forming a linear combination of separaste signals in such a was as to minimize the variance of the combined signal. Think weighted least squares, where different variables are combined with weights proportional to their inverse variances. In climate applications the role of variance is played by natural variability. Owing to short observation |
| 10419 | 2 | 30 | 12 | 33 | | The uncertainty quantification references are good, but you forget to mention Computable General Equilibrium (CGE) models, where you could incorporate uncertainity inside sector modelling | Thank you. However, we would need references to published literature to add |
| 8137 | 2 | 30 | 13 | 30 | 17 | Evidence? Sources? | I trust that the existence of a literature on policy analysis and implementation is not controversial, just as it would not be controversial to claim the existence of a literature on chemsistry, physics, or economics. The specific references to this literature, numbering into the thousands, are tangential to this chapter |
| 3903 | 2 | 30 | 23 | 30 | 23 | The term 'at all costs' implies that these parties are behaving irrationally. Would a less extreme hypothesis be better? | I am not sure why "at all costs" implies irrationality per se. It is not necessarily irrational, for example, to spend all the |
| 3200 | 2 | 30 | 24 | | 25 | What is the fourth reason? | Oops. Change to "for several reasons." |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 2579 | 2 | 30 | 30 | 30 | 30 | The role of subnational and local governments in addressing Sustainable Development issues, notably climate change, has been increasingly recognized by the UM System. For instance, the Rio+20 final declaration has 23 matches to "subnationals" (initial draft had just a couple) | Thank you. I believe that the peer reviewed papers we cite make exactly this point. |
| 13860 | 2 | 30 | 35 | 30 | 40 | Include reference to 'carbon taxes'. It is a major topic of discussion in this context. An example is: Title: Exxon is right: Let us re-examine our choice for a cap-and-trade system over a carbon tax<br>Author(s): Wittneben, Bettina B. F.<br>Source: ENERGY POLICY Volume: 37 Issue: 6 Pages: 2462-2464 DOI: 10.1016/j.enpol.2009.01.029<br>Published: JUN 2009 | Thank you. We have added carbon taxes. |
| 3368 | 2 | 30 | 4 | | | Epistemological challenges related to scenario analysis and uncertainty should not be ignored. Scenario analysis does not follow the scientific gold standard of falsification and there is risk of systematic bias, e.g. due to herd crowding, in e.g. integrated assessments. Discussion of this point seems to be absolutely crucial. One important study on this issue is: "Betz, G. (2009),Underdetermination,Model-ensemble,andSurprises | Thanks, Scenarios of course do not follow the rule of falsification, they never happen. They are biased by authors' perspective. They only give a path for "what happens if." |
| 3369 | 2 | 30 | 4 | | | An example for this herd crowding are future scenarios on bioenergy deployment. More specifically, top-down studies were reluctant to take up bottom-up insights on the life-cycle assessment of bioenergies, producing a bias in bioenergy scenarios, nearly exclusively portraying bioenergy as "carbon neutral". See: "F. Creutzig, A. Popp, R. Plevin, G. Luderer, J. Minx, O. Edenhofer (2012)<br>Reconciling top-down and bottom-up modeling on future bioenergy deployment.<br>Nature Climate Change 2: 320-327" | Thanks for the helpful suggestion. |
| 6377 | 2 | 30 | 4 | | 11 | Another disadvantage of scenario analysis is that the choice of scenarios is somewhat arbitrary. This is one of the issues addressed by RDM, by using large-scale, automated scenario generation. It would be good to discuss this, as RDM has already been presented. (See, e.g., Groves and Lempert 2007, doi:10.1016/j.gloenvcha.2006.11.006) | We have taken this point into account. |
| 8487 | 2 | 30 | 41 | | 46 | Note unanticipated costs as well, and may want to note that action across this expanded scope of governance is not only multi-level, but also formal and informal (see Middlemas 1997) | I don't understand this comment in the context of the specified paragraph. |
| 3367 | 2 | 30 | 4 | 30 | 11 | The paragraph on the limitations of scenario analysis goes to the heart of the AR5 report and should be expanded to allow a more careful interpretation of chapter 6's results. For example, the two following studies detail the limitations of integrated assessment studies with respect to dealing with the uncertainties of future development:<br>A) Ackerman, F., DeCanio, S. J., Howarth, R. B. & Sheeran, K.<br>Limitations of integrated assessment models of climate change. Climatic Change 95, 297–315 (2009).<br>B) Cullenward, D., Schipper, L., Sudarshan, A. & Howarth, R. Psychohistory revisited: fundamental issues in forecasting climate futures. Climatic Change 104, 457–472 (2011). | The section on scenario analysis is not a critical review of IAM's, but a review of scenario analysis. The sec5ion has been expanded. Further, I have re viewed and commented on Ch. 6. Scenarios are not 'predictions' or 'forecasts', they are "projections" the intent of developing scenarios is to cover the range of possibilities. If you will, they attempt to descry be the support of the uncertainty distribution on future paths |
| 5389 | 2 | 30 | 18 | 30 | 46 | In line 38 is stated four reasons, but in the same pargraph up to line 25 only three reasons are mentioned… however, there are four reasons mentioned in the following pargraphs ……. | The section has been edited. |
| 13260 | 2 | 30 | 18 | 30 | 25 | The paragraph states four reasons related to risk and uncertainty, but the explanation cover only three | The section has been edited. |
| 8243 | 2 | 30 | 18 | 30 | 25 | I think also that it also becomes more problematic due to lengthy time taken in policy making. | The section has been edited. |
| 16089 | 2 | 31 | | | | Not clear what the figure means and what its aim is. | This figure is being dropped for the SOD. |
| 13261 | 2 | 31 | | | | Although all actions are directly or indirectly aimed to protect societies and people against adverse effects of climate change, many of them are directly focused on natural systems. The figure has strong presence of action in the upper side, i.e., measures or actions with high sensitivity in social systems. A policy for glacier protection, conservation policies to protect endangered species against climate change threats, etc. could be placed on the lower side, at the right. The only reference to the precautionary principle could be more theoretical that the examples on the upper side of the figure. | This figure is being dropped for the SOD. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 13861 | 2 | 31 | | | | Better to label at least the x axis as low and high rather than + and - which gives the impression of a continuoum that is not reflected by placement of the decisions listed and cannot be justified by the level of analysis representd in the figure. | This figure is being dropped for the SOD. |
| 14831 | 2 | 31 | | | | This is almost a useful figure. It would perhaps be more useful if it had a single axis showing different types of uncertainty (from deep and unqualtified to straightforward and well-quantified), and types of decisions that characterized those types of uncertainty were above the axis, and apropriate deciison-making tools were below the axis (perhaps with lines connecting decisions and corresponding tools) | This figure is being dropped for the SOD. But I also disagree with the comment. The point of the fgure was not to view uncertainty in terms of its |
| 14241 | 2 | 31 | | | | This is the only figure in the article that I did not find very helpful, ever somewhat confusing. Should the vertical position denote increasing sensitivity? Why is the design of a carbon monitoring system more subject to uncertainty in the climate system than e.g. formation of the national climate policy commitments? I would think it's the other way round. The precautionary principle would make the resulting climate outcome probably less subject to climate uncertainties, but is more responsive to the introduction of uncertainty. While these are just examples of possible misunderstandings, it might be worthwhile to re-think the layout itself. | This figure is being dropped for the SOD. But to answer your example question, the design of a carbon monitoring system is very sensitive to uncertainties in natural systems, such as decomposer food webs in the soil, as well as in social systems, such as non-point emissions sources of black carbon. The formation of national climate policy commitments, in the context of a global target to achieve a particular climate target such as 2°C, would be in theory |
| 3904 | 2 | 31 | 11 | 31 | 17 | These lines focus on irrational decision-making, in the sense of someone who is not taking decisions that are clearly optimal in terms of their own preferences. The real problem with public policy is that decision-makers are behaving optimally, but their incentives (political, bureaucratic of whatever) are not well aligned with interests of 'the common person', 'the representative individual', the 'median voter' or whatever other expression is used to represent the (non-partisan) 'public interest'. So bad policies result from the conventional political expediency that magazines like the UK Economist document in every issue. Could the chapter be structured so as to distinguish the problem of failure to optimise (ie irrational behaviour) from the problem of optimising the 'wrong' objective function (eg the imperative to win the next general election)? | Good points that we will address more fully in the SOD |
| 13862 | 2 | 31 | 16 | | | Remove word 'the' since this section cannot discuss ALL examples. OR replace 'the' with 'some' | Good point. Thanks. |
| 10684 | 2 | 31 | 21 | 31 | 22 | Why is establishment of a stabilisation target sensitive only to uncertainties in the natural system? Surely the magnitude of many climate change impacts (and thus the level to be avoided) is dependent on vulnerability and exposure of social systems too? Indeed, Article 2 talks about food production and economic development - both strongly socio-economic systems. | The statement was too condensed and will be modified. |
| 9797 | 2 | 31 | 26 | | | What is a "social planner" from your point of view? You furtheron refer to a modelled decision maker. This might work in quantitative models but does not reflect real decision makers. What can they learn from this chapter? I have already raised this issue earlier, that the chapter should address the decision makers perspective more appropriately. | To us, in a nutshell, it describes a perfectly cooperative society - a benchmark how good it could get. The idea is that 'if you maximize the cake to distribute, it is easier to get an agreement afterwards'. Social planner |
| 11519 | 2 | 31 | 26 | 34 | 22 | The title of section 2.4.2 indicates it is about pathways, but only a small proportion (section 2.4.2.3) address this topic. | If one takes a global mitigation decision to be a pathway, as this Report does, then this section is very much about |
| 8138 | 2 | 31 | 7 | 31 | 19 | Evidence? Sources? | This figure is being removed for the |
| 14242 | 2 | 31 | 9 | 31 | 10 | Please define System 1 and system 2 or refer to where it was defined. | Done. |
| 7896 | 2 | 31 | | | | The concept of the social planner should be explained with repsect to utilitarian ethics and economic theory. What kind of knowledge is the social planner supposed to have? Is the social planner a benevolent utilitarian or is she looking for an efficient economic solution or do you consider both to be the same? Is the social planner assumed to have God-like knowledge? | The concept of a social planner, as we understand it for our chapter, shall be made more explicit in the SOD. |

|---|---|---|---|---|---|---|---|
| 4894 | 2 | 34 | 24 | | 29 | The 2 sorts of evaluations are not in contradiction. Clarity in this is a crucial issue for the ongoing c.c. negotiations. Actually these effects of uncertainties depend on the nature/type of the uncertainty: i.e. whether it is related to the phenomenon (e.g. ozone layer depl. or to the necessary common mitigation action and its "share" for individual countries e.g. in line with the c.b.d.r.). The latter factors governing the political willingness to agree were clearly demonstrated e.g. for such conventions/protocols a the LRTAP and its protocols, the instruments on ODS or the UNFCCC-KP and their unclear followup. | This is an important point and I have changed the text accordingly. |
| 7275 | 2 | 34 | 28 | | | uncertain as -> uncertain about | Thanks. Have changed it to "uncertain |
| 4895 | 2 | 34 | 32 | | 42 | The same as above, however, here: some kind of learning has the reverse effect; namely, learning more on the potential adverse impacts + on the opportunities for some assistance (or lessening uncertainties about such opportunities) had a clear positive impact on the number of "candidates" for the KP, i.e. accelerated the ratification by the developing countries. | This may be, but I don't know of any papers documenting this. I wish the reviewer had provided a reference. |
| 4511 | 2 | 34 | 43 | 34 | 48 | Reference could be made here to recent work by DeCanio and Fremstad ("Game theory and climate diplomacy," Ecological Economics, in press) showing how recognition of the seriousness of climate catastrophe on the part of leading governments could transform a Prisoner's Dilemma game into a Coordination Game, leading to greater likelihood of reaching an international agreement to limit emissions. | Thank you, references have been considered |
| 4615 | 2 | 34 | 7 | 34 | 10 | The meaning of this sentence is not clear | Thank you. We changed 'what' to 'which' |
| 14835 | 2 | 34 | | | | This does not appear sufficiently relevant to this chapter to devote this much text to it. | A decision was made concerning the overall organization of the report that in this chapter we would cover research results concentrating on the issue of uncertainty across a range of policy and governance contexts, rather than having that literature reviewed in the policy and sectoral chapters. That is what is going |
| 7897 | 2 | 34 | | | | The problem of treaty formation is mainly addressed in game theoretical ways. The perspective of institutionalism is marginalized (Oran Young, one of the leading proponents of inst., is mentioned once). If game theory is adopted as genral appraoch for decision making, the prisoners dilemma and the problem of sub-optimal outcomes must be taken into account. Game theory without prisoners dilemma is not state of the art. It neglects the fact that maximising one's own position has highly undesirable consequences: everybody ends up in jail; i.e. humanity will faces "dangerous anthropogenic climate change" and most "players" will be worse off. | This is a very valid comment. At the least, we need to acknowledge that there are other academic approaches to understanding treaty formation than those relying on game theory. At the same time, however, we have struglled to find references in these other literatures focusing on the issue of |
| 7358 | 2 | 34 | | | | A sub-section addressing "compliance" in addition to MRV is necessary to fully reflect the elements relating to uncertainty and international agreements | This is a good point. We have indicated the connection with compliance. |
| 4710 | 2 | 34 | 18 | | | This whole section seems out of place in this chapter -- shouldn't it be moved wholesale to Chapter 13: International Cooperation: Agreements and Instruments? | The short answer is yes. The longer answer is that a decision was made concerning the organization of the report that Chapter 2 would highlight particular issues of uncertainty, and the relevant research results concentrating on uncertainty, across a wide range of policy and governance contexts. Given that, the material fits here, just as later |
| 4897 | 2 | 35 | | | | 2.4.3.3 (a) At the outset, industry is also mentioned (together with land use), however, later there is no concrete reference to that sector. (b) In terms of MR(V) regimes in developing countries, besides the referred uncertainties and lack of MR-capacities another essential (and sensitive) point is the "sovereignty" issue (that includes the uncertainties on how other parties may use the information received through the (M)RV channels): it is clearly indicated in course of the negotiations and also in the relevant outcomes of the COPs). | This may be, but I don't know of any peer reviewed sources that say this. |

| 7276 | 2 | 35 | 10 | | | Who is "they"? | Thank you. The text has been revised |
| 7277 | 2 | 35 | 21ff | | | break the sentence in two, e.g. "[...] in time. He found [...]" | I don't understand this comment in the context of the specified page and line |
| 12527 | 2 | 35 | 3 | 37 | 7 | This paragraph cites two slightly varying views on the inefficacy of the multilateral negotiations approach, most notably if indirectly referring to the UNFCCC. This represents a very narrow range of views from a very extensive literature, and this summary should be expanded to include those broader views. From personal experience observing the UNFCCC and related activities for nearly a decade, the UNFCCC process has actually delivered a broad range of innovative results, including the launch in Cancun of an important array of new global delivery mechanisms for climate action, the Green Climate Fund, Adaptation Committee, Climate Technology Center and Network, and progress toward a REDD+ mechanism. Progress is alarmingly slow on core issues in the UNFCCC negotiations, and the Durban Platform is somewhat vague while launching an important new 4-year negotiating round toward a new instrument. But the “death of multilateralism” (or more specifically, the “death of Kyoto” has been pronounced ceaselessly for 20 years, and yet the process continues and makes progress, even if it is slow, uneven and difficult. There are many valid points of view in the debate about how far the multilateralist approach has come and what its prospects are. There is no reason to truncate the range of those views and the vitality of that debate as the cursory summary here now does. | Thank you. The text has been revised accordingly. |
| 4896 | 2 | 35 | 32 | | 34 | It would be worth mentioning that it is the "essence" of the EU's ETS. (Personal comment: this was one of the key reasons/goals in 1997 of the "background" agreement between US and RF in the finalization of the KP and the insertion and acceptance of Art 17 during the last days(nights over there.) | Thank you. The text has been revised accordingly. |
| 6077 | 2 | 35 | 33 | 35 | 33 | The text is correct. The point, however, is that if one country's marginal abatement cost is exceptionally high, the country will never join such treaty.In this sense, this explanation is not relevant. | Thank you. The text has been revised accordingly. |
| 7278 | 2 | 35 | 35 | | | What about remote sensing via satellite? | Alas, people have thought of. There are huge uncertainties in translating satellite measurements of relfected incoming |
| 7279 | 2 | 35 | 42 | | | What is soil carbon? | Soil carbon is the carbon contained within the soil, typically biomass that has not yet decomposed. It is the largest |
| 11522 | 2 | 35 | 8 | 35 | 34 | Section 2.4.3.2 is largely based on literature review, but I don't see any summary or explaination regarding to the topic of national commitments. | Thank you. The text has been revised accordingly. |
| 4254 | 2 | 35 | 13 | | | It's not immediately clear why a country with more resource vulnerability would be more averse to a climate change treaty - could this be explained more clearly | Not "resource" but "source." That means that their economic sectors accounting for emissions are not so vulnerable to the burden placed upon them by climate |
| 4914 | 2 | 36 | 29 | | | {Add: p} that promote research, | Thanks, done! |
| 13865 | 2 | 36 | 29 | | | change 'romote' to 'promote' | Thanks. Done! |
| 7280 | 2 | 36 | 29 | | | romote -> promote | Thanks, done! |
| 13866 | 2 | 36 | 34 | | | change 'fostering' to 'reducing' | Thanks, done! |
| 16091 | 2 | 36 | 40 | 37 | 3 | Low prices in ETS has been shown repetitively to be linked to overallocation and low targets, lax banking procedures... This paragraph links the problems mainly with "regulation", certainly a cause of volatility, but of a lower order of magnitude that targets themselves. | Yes. But the overallocation has itself been linked to uncertainties in economic growth and associated emissions, which are factors that influence the relationship between the size of the cap and the market price. We believe that the |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 4898 | 2 | 36 | 47 | 37 | 3 | Three factors mentioned; the high price volatility within the ETS was also due (to large extent) to those uncertainties which have led to significant annual "overallocations". | The overallocation has itself been linked to uncertainties in economic growth and associated emissions, which are factors that influence the relationship between |
| 13683 | 2 | 36 | 49 | 36 | 49 | Add after "Chevallier 2009": "Vasa and Michaelowa (2011) assess the impact of policy uncertainty on carbon markets. They find that the possibility to create and destroy carbon markets with a stroke of a pen leads to extreme short-term orientation, rent seeking behaviour and high volatility in market prices. In their view, these negative effects can be reduced if climate policy decisions have a long-term nature with clear consequences of non-compliance." Reference: Vasa, A.; Michaelowa, A. (2011): Uncertainty in climate policy – impacts on market mechanisms, in: Gramelsberger, G.; Feichter, J. (eds): Climate change and policy, Springer, Heidelberg, p. 127-144 | Thank you. This is an extremely valuable point. We have added the proposed text. |
| 13262 | 2 | 36 | 8 | 36 | 12 | in 2008, Chile also had tier 2 in their inventories. Chile has done it for the key categoeries of the Agriculture sector | Thank you. That is interesting to know. |
| 17327 | 2 | 36 | 24 | 39 | 44 | Firms behavior is covered for the most part in this session but there is no transition or highlighting of this fact, only the attentive reader will notice. The behavior of Firms/investors/ institutions, is important to all the sectoral chapters. If it can be explained here in a generic form then the other chapters could pick and cross-reference to this session in Chapter 2. Consider highlighting in the introduction of this session that this session makes specific emphasis on firms behavior. | This is a good suggestion, and I have done this. |
| 4711 | 2 | 36 | 24 | | | This section goes into policy issues in general but should be more closely focused for the purposes of this chapter on how UNCERTAINTY and RISK influence policies. | I wish you had made more specific suggestions as to how. We tried very much to focus on precisely this, concentrating on the literature examining how the performance, and ultimately relative desirability, of different policies |
| 14243 | 2 | 36 | 24 | | | The chapter very much invites a discussion of taxes versus cap and trade, where uncertainty is a major driver of the differences in efficiency. In particular, Weitzman (1974), Prices vs Quantities, The Review of Economic Studies, Vol. 41, No. 4. (Oct., 1974), pp. 477-491, Karp & Hoel (2002), Taxes versus quotas for a stock pollutant, Resource and Energy Economics 24: 367–384, Karp & Hoel (2001), Taxes and quotas for a stock pollutant with multiplicative uncertainty, Journal of Public Economics 82: 91–114. If this impact of uncertainty on the choice of the policy instrument is discuessed elsewhere at length, a reference in this section might be useful. | This is important, and yet was an issue addressed quite extensively in the AR4. We do not repeat it here. |
| 6078 | 2 | 36 | 24 | | | The title of this subsection is "Choice and design of policy instruments under uncertainty". This sebsection consists of two interventions, i.e. market price/tax and RDD&D. In a real would economic incentive is just one of the instruments. For example, direct regulation plays an important role in US climate policy and voluntary initiative do the same in Japan (see Chapter 15). In this sense, it will be better to discuss various instruments rather than focussing on carbon tax in the first category. | This is an important point.We have rewritten the introduction to section 2.4.4 to acknowledge it. |
| 6079 | 2 | 36 | 40 | | | In subsection 2.4.4.1 almost solely discuss about EU ETS (and regulatory uncertainties). The description is quite informative and interesting (such as citation from Blyth et al. 2007 in page 37 line 8). That said, the latter part seems to duplicate with the description of Chapter 14 where EU ETS will be discussed. Coordination between two chapters will be necessary. | This section does not limit itself to the single example of the ETS, although that is the cap and trade system that is the most well developed, and hence can generate the greatest amount of data for |

|---|---|---|---|---|---|---|---|
| 9972 | 2 | 36 | 41 | | | This section should explain that market-based mechanism such as emission trading has several problems. Volatility of emission permit prices affects volatility of product prices as evidenced by fluctuating price developments in the EU-ETS. Therefore, the market-based policy tools of cap-and-trade cannot provide credible incentives for the technological change, as described in (Montgomery, 2005, abstract) and (Baldursson, 2009, page29). These literatures are listed in the No62 line of this table.<br>In addition, CO2 leakage caused by the implementation of the ETS happened actually through transfer of industry from one country to others. Market mechanisms at least under Kyoto-like international scheme, where the condition of all countries' meaningful participation is not met, does not work well, as shown in (Rosendahl, 2011, abstract), (Aichele, 2012, page336), and (Peters, 2011, page1). These literatures are listed in the No50 line of this table. | It is not the purpose of this section to go into all problems, such as leakage. Issues of permit price volatility is something that the section already covers, as the review suggests that it should. |
| 4616 | 2 | 37 | 11 | 37 | 13 | This is an example where the irreversibility effect and real options work. | Yes. |
| 7282 | 2 | 37 | 18 | | 19 | What about the two full stops around Patino-Echeverri et al? | Fixed. Thanks. |
| 12615 | 2 | 37 | 19 | 37 | 21 | This is a very old reference. Since this time CCS legal and regulatory frameworks have been put in place in Australia and many parts of Europe and USA. I therefore do not feel signling out regulatory uncerntainy as an issue solely for CCS is appropraite. Please see the IEA CCS Model Regulatory Framework and IEA CCS Legal and Regulatory Review for references. | We did not mean to single out CCS, and have nothing in particular about the technology. It is just that Reinelt and Keith happened to study the impact of regulatory uncertainty (i.e. carbon price fluctuations) in the context of investment into one low carbon technology, i.e. CCS. The presence of a legal framework for CCS (covering, for example, legal liability for leakage), which you are right exists now to an extent that it did not in |
| 12658 | 2 | 37 | 19 | 37 | 21 | This is a very old reference. Since this time CCS legal and regulatory frameworks have been put in place in Australia and many parts of Europe and USA. | Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 4900 | 2 | 39 | | | | 2.4.4.3 There are also various buyers'/consumers' (mis)perceptions on the durability (lifetime of efficient operation) of new energy-efficient household equipments (like compact fluorescent bulbs) that also motivates the (un)willingness to replace the existing "old" ones. | Perhaps, although I don't see this as an issue having to do with uncertainty. |
| 6080 | 2 | 39 | 45 | | | I wonder whether the descriptions of this subsection (energy efficiency and behavioral change) have anything to do with uncertainty. The main issue is lack of information. In this sense, this subsection may not be necessary for this chapter. Also double checking with Chapter 10 (Industry) will be necessary. | I think that this section could probably focus more in uncertainty issues. |
| 16917 | 2 | 4 | | 5 | | At the moment this has strong overlap (and considerable duplication) with the Introductory section. My sense is that it works better in the latter role, and that the authors might consider a largely fresh approach to Exec Sum in the Second Order Draft. For IPCC Audience, the present Exec Sum does induce a slight reaction of “so what?” from a policy perspective. | The Executive Summary in the SOD will provide the main insights of the chapter |
| 6367 | 2 | 4 | | | | Througout the executive summary and introduction, the phrase "risk and uncertainty" is used, but neither term is defined. Definitions of these vary, so it's important to identify what is meant herein. I see a definition of "risk" finally appears on p. 47, line 32. | The terms risk and uncertainty are defined at the beginning of the Introduction of the SOD |
| 7218 | 2 | 4 | | 6 | | The executive summary does not contain any results, but only talks about what questions will be addressed. The summary should contain the important meat! Maybe have a science journalist reword it so that it reaches its intended audience (the decision makers?) | The Executive Summary in the SOD will provide the main insights of the chapter |
| 2176 | 2 | 4 | 1 | 30 | 11 | I wonder if we need to incoporate some additonal analysis on value/benefits along side risk/uncertainty in this chapter. If we are talking about policy measures to encourage certain kind of environmental or sustainable behavioral change, then we need to factor in that risk/uncertainty make sense in the context of certain value/benefits. For instance, some recent research published on clean cookstoves show that end users may understand the risks of indoor air pollution associated with traditional cookstoves, but the | Thank you, we now have xpanded the section on risk perception and integrated it more with the methods section |
| 2177 | 2 | 4 | 1 | 30 | 11 | but the value/benefits of using the newer, cleaner cookstoves do not outweigh the risk/uncertainty of switching to the newer cleaner models. | Thank you, we now have xpanded the section on risk perception |
| 7837 | 2 | 4 | 1 | 6 | 5 | There is a lot of repetition in these paragraphs. It is suggested to merge paragraphs and to avoid any repetition. | Sect. 2.1.1 is being rewritten for the SOD and has taken this point into |
| 7838 | 2 | 4 | 1 | 6 | 5 | It is suggested to avoid terms that are not really common but are used only in a specific context such as "myopic" or "heuristics" as such language would significantly reduce the readability. | These two terms have been entering public and policy discourse, and we have added more references to their use |
| 7840 | 2 | 4 | 1 | 6 | 5 | This executive summary reads more like an introduction but not like a summary of the finding of the assessmernt ogf literature. An indication for that finding is that the executive summary does not include any reference to the underlying sections of the report. | The Executive Summary in the SOD will provide the main insights of the chapter |
| 3894 | 2 | 4 | 1 | 6 | 5 | A key criticism of this chapter is that it does not address the problems that (1) there are different views about how the future might unfold, and no objective basis for resolving all those differences, (2) people have different attitudes to risk and so would not all agree about the best course of action even if they had exactly the same expectations for the future and (3) politicans and advisers are self-interested parties with their own agendas. Those who feel most strongly about climate change will take the strongest action, individually, or collectively, but the social planner has no objective basis in this chapter for imposing the preferences on that group on dissenting individuals and groups. What is needed is a discussion of decision-making under uncertainty when information is dispersed, costly to collect, individuals differ, and politicians behave like politicians anywhere. Poor policy advice will result if the problem is posited instead as "assume that there is a social welfare function, assume that all useful knowledge about ways and means and incentives can be collected together by a central planner, and assume that politicians will follow the central planner's sage and altruistic advice". None of these assumptions are valid, yet this chapter (eg on page 5) seems to assume that they are valid and that the real problem is that real people don't behave as they 'should'. | Thanks for this comment. Factors (1) and (2) are amply addressed, albeit in somewhat different terms. The discussion of expert judgment emphasizes that experts don’t - and shouldn't - agree on future scenarios, and points to methods for validating and synthesizing divergent opinions. 2.3 emphasizes that utility is specific to an individual, which is to say, different people have different utilities and therefore different attitudes towards risks. Re (3), we may presume that almost all parties are self-interested. The problem of balancing diverse and diverging stakeholder interests is at the |

|---|---|---|---|---|---|---|---|
| 8479 | 2 | 4 | 13 | | 19 | Importance to consider risk perception in the context of risk assessment, perception and communication (all of which together compose risk management) See for example Guehlstorf "Political Theories of Risk Analysis" Spring 2005 | We agree. The chapter addresses how risk assessment, risk perception and communication impact on risk |
| 7834 | 2 | 4 | 15 | 4 | 16 | Substitute "choice process" by "decision making process". | Text changed. |
| 4740 | 2 | 4 | 20 | 4 | 24 | Proposition to replace those 5 sentences by a picture/grapf | Thanks for the suggestion, Text will be rewritten, using a table. |
| 10782 | 2 | 4 | 20 | | 24 | subject in line 20 seems to be the same as the one in line 24. | Thanks for the suggestion, Text will be rewritten, using a table. |
| 10162 | 2 | 4 | 20 | 6 | 5 | Much of this text is repeated almost word for word under Introduction (2.1.1). It seems a bit unnecessary to repeat the same thing twice, in addition it would make more interesting reading if the executive summary was rewritten using its own words. | The Executive Summary in the SOD will provide the main insights of the chapter. |
| 4741 | 2 | 4 | 25 | 4 | 36 | For the farmer wetness/flood should also be mentioned (not only drought). Furthermore the choice of the crops by the farmer could be lead by market prices (forward, etc.).<br>Regarding the carbon tax, I agree with the statement, however such a tax may create a market distorsion if not implemented in all countries. | The points on the farmer's crop decision and the carbon tax will be taken into account if we use these examples in the SOD. |
| 4695 | 2 | 4 | 25 | 4 | 37 | Seems like these two sections could be combined and are a bit redundant. | Sect. 2.1.1 has been revised in the FOD so the point is not relevant |
| 7835 | 2 | 4 | 26 | 4 | 27 | The following langauge is suggested: .. A faremr making decisions on what crops to plant should consider the likelihood … | Sect. 2.1.1 has been revised in the FOD so the point is not relevant |
| 13778 | 2 | 4 | 27 | | | Change 'himself' to a gender neutral term. | Accepted. |
| 4694 | 2 | 4 | 31 | 4 | 33 | "A government implementing a carbon tax needs to be concerned with the uncertainties associated with its ability to monitor firms' activities and the impact of a specific penalty on firms' actions." It also needs to be concerned particularly with the likelihood that larger level economic forces will lead to the tax not leading to the desired reductions in emissions. | Accepted. The text will be modified accordingly. |
| 6058 | 2 | 4 | 31 | 4 | 33 | This example is not necessarily relevant. Major uncertainty in introducing carbon tax is the uncertainty of its effect as governments do not exactly know the shape of marginal abatement cost curbe. | Noted. We think the reviewer is saying the same thing as we do, only in |
| 7836 | 2 | 4 | 33 | 4 | 36 | Language is much too prescriptive. A less prescriptive wording is sugegsted, e.g.: National governments might consider climate change scenarios and their associated costs and benefits in terms of investments in mitigation and adaptation. | Good suggestion taken into account in the SOD |
| 8229 | 2 | 4 | 37 | 4 | 37 | At first reading I thought this is going to talk about the key uncertainties (the nature). I think this paragraph could be clearer. It should clearly state that the stakeholders, policy makers need to understand the key uncertainties in the absence of any policies and how different policies could reduce these uncertainties.<br><br>The authors cited evidence from studies on cognitive, social, and clinical psychology on risk perceptions of uncertain events (Hume, 2000; 6 Weber, 2006). Are any of these studies related to climate shocks? Or are there any studies based on climate events which can be used to draw lessons in the natural system risk context.<br><br>How do the hypothetical results of Leiserowitz (2006) (cited in page 13, line 28, chapter 2) compare with studies involving people who have experienced or exposed to climate shocks such as hurricanes? Are there some studies those can be compared to make the argument in the paper? □ | Very useful observations. We are not aware of studies of specific climate shocks that use the methodology in the Leiserowitz et al. 2006 paper, but added a suggestion that such studies would be useful in our Future Research section. |
| 6059 | 2 | 4 | 37 | 5 | 4 | Examples cited as "Key uncertainties and risks that matter for climate policy" are not necessarily the proper ones, though they deserve important uncertainties. Key uncertainties and risks should be such as 1) fat tail issue of catastophe risks, 2) relationship between bio-CCS and global food security, 3) uncertainty of immediate participation of all the countries into a global framework under which all the countries assume emission reduction/limitation obligation. | Intro is rewritten |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 2246 | 2 | 4 | 4 | 52 | 22 | This Chapter fails to admit that there is no evidence that greenhouse gases have any harmful effect on the climate, so at present the risk is negligible.. The measures listed here are all unnecessary | It is true that we fail to address this issue an omission due to two reasons. First, it is the task of IPCC WG1 to assess the evidence for greenhouse gases having a harmful effect on the climate, and we defer to their judgment. Second, our chapter concerns the effects of a wide range of risks and uncertainties on decisions and policy. Many of these risks |
| 8228 | 2 | 4 | 4 | 4 | 5 | I think there is something missing. Risk and uncertainty of what? Word missing - Earth's climate system? Or the authors intend to say<br>"Risk and uncertainty at various levels – starting from earth's climate system and the effect of GHG emissions to how people react …." | The omission was intentional. Coping with risk and uncertainty in the process of policy-making is an issue that transcends the particular risks or the uncertainties associated with particular systems, such as technological systems |
| 7833 | 2 | 4 | 4 | | | The following language is suggested: This chapter addresses how to interpret …. | The section has been reworded. |
| 3187 | 2 | 4 | 4 | 54 | 23 | The words "risk" and "uncertainty" are used throughout. Give a definition early on, so readers understand what you have in mind. | Good point, Informal definitjions have been established. Following the glossary of the Society for Risk Analysis, "Risk" is gliossed as "The potential for realization of unwanted, adverse consequences to human life, health, property, or the environment;", It can be elaborated ain the fashion of Kaplan and Garrick (1981) in the first article of the first issue of RISK ANALYSIS."uncertainty was defined as "a subjective state of 'partial |
| 13779 | 2 | 4 | 44 | | | change 'impact' to 'affect' [in general, the word 'impact' is improperly used in many cases throughout.] | Wording change made in the SOD |
| 13780 | 2 | 4 | 44 | | | remove word 'on' | Wording change made in the SOD |
| 12517 | 2 | 4 | 7 | | | The discussion does not make clear the difference between "risk" and "uncertainty." Neither does the glossary. It is evident, reading through the draft, that the intended perspective is not the traditional ("Knightian") distinction between event likelihoods where outcomes can be assessed based on previous experience vs. those where that is less or not possible. But it is unclear what other conceptual view is intended. This should be made explicit so that these terms are understood properly in reading the text. | Thanks, according to Frank Knight (1921) "uncertainty" is subjective probability, and this is amply discussed. Please refer to the response to #3370. |
| 11477 | 2 | 4 | 7 | 4 | 9 | Circular logic, lack of clarity in the sentence, "risk and uncertainty" is unnecessarily repeated. | Intro is rewritten |
| 13777 | 2 | 4 | 8 | | | remove 'under conditions of uncertainty' which is repeated from the beginning of the sentence. | Intro is rewritten |
| 11478 | 2 | 4 | 4 | 6 | 5 | The executive summary matches the introduction almost word-for-word. It provides no benefit to the reader because it does not provide alternative explanations for key concepts. The executive summary should be revised to be a more effective summary of the key points of the chapter. | The Executive Summary in the SOD will provide the main insights of the chapter |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 8913 | 2 | 4 | | 9 | | I find the proposed framework (Section 2.1.1 including Figure 2.1 plus Executive Summary) quite confusing; maybe it is just a matter of the labeling of the various elements. The first element is 'The decision to be made'. This sounds like the decision is at the beginning of the process. Shouldn't the decision be the outcome at the end of all these evaluations? I would as a first step expect the definition of the decision situation and the selection / construction of decision alternatives. Furthermore, it is difficult to understand the differences between the elements. The descriptions for Element 1 (The decision to be made) and Element 2 (Key uncertainties ...) on page 4f and page 7f sound very much alike, both focus on the risks that are associated with a decision alternative. Again, I would expect that Element 1 focuses more on the alternatives and how they are brought into the decision situation rather than specifically on the risks. Further, the labels for Element 2 (Key uncertainties and risks that matter for climate policy) and Element 5 (Risk and uncertainty in climate change policy issues) are almost identical. What is the difference? Element 5 is at the end of the evaluation process. Thus, I would expect that Element 5 captures the result of the evaluation, for example the decision or a rank ordering of the decision alternatives. | The chapter authors have also come to the conclusion that xection 2.1.1, as written in the FOD, was not the most productive. We are reframing it around a number of very different decision-environments, and likely leaving out the figure that you found so difficult. |
| 4516 | 2 | 4 | | | | Suggest that the chapter assess the topic of uncertainty and risk associated with climate policies, their testing and maturity, and how such risks factor into investment decisions. This application is relevant to discussions in a range of chapters in this report on Mitigation, whereas the current examples give, e.g., in this chapter's executive summary (what farmers might plant) would be more relevant to a discussion of adaptation in the report of Working Group II. This is touched on in 2.4.4.1 but not mentioned in the Executive Summary. | Thank you. The executive summary is re-written and now better reflects these concerns. However, we must be mindful that judgments of 'testing and maturity' come dangerously to the forbdden zone of policy prescription. |
| 4517 | 2 | 4 | | | | The Executive Summary reads more like an introduction to the chapter than a summary of key findings. Suggest the summary be shortened and focus on key findings supported by assessed literature. | The Executive Summary in the SOD will provide the main insights of the chapter. |
| 13258 | 2 | 4 | 7 | 4 | 9 | the sentence is self explanatory, it uses "risk and uncertainty" to define risk and uncertainty. I suggest to end the sentence as follows: "(…) and make choice under no completely controlled conditions or under which some probability of fail is always present." | Introduction is rewritten |
| 4697 | 2 | 4 | 1 | | | Executive Summary could be more specific. As is, it's a bit vague, peraticularly with respect to how to foster better decisions in the face of risks and uncertainty and a-rational decision-making by individuals. | The Executive Summary in the SOD will provide the main insights of the chapter. |
| 12232 | 2 | 4 | 1 | | | The Executive Summary should focus on the key findings of the chapter. And perhaps some of the very well written text in the Summary could be captured in the Introduction. | The Executive Summary in the SOD will provide the main insights of the chapter. |
| 6057 | 2 | 4 | 1 | 6 | 5 | Citation of examples (always farmers, carbontax etc.) are rather redundant. | We are modifying the examples in the SOD and linking them to Table 2.1 |
| 13776 | 2 | 4 | 5 | 4 | 5 | should read 'uncertainty about', not 'uncertainty in'. The system is not uncertain, our knowledge is. | Introduction is rewritten |
| 4838 | 2 | 40 | 11 | 40 | 20 | The is a paper coming in the International Journal of Environment and Sustainable Development that analysed the factors that impact willingness to invest in Norwegian household which empirically shows many of the described effects. The reference is Klöckner, C. A., Sopha, B. M., Matthies, E., & Bjørnstad, E. (in press). Energy efficiency in Norwegian households - identifying motivators and barriers with a focus group approach. International Journal of Environment and Sustainable Development. I will send a copy of the paper via comments@ipcc-wg3.de | Thanks. |
| 4712 | 2 | 40 | 21 | 40 | 34 | Cialdini and colleagues have consistently shown that, faced with System 1 type motivations, people are best motivated to conserve energy by being made aware of what descriptive social norms are (ie, what fractions of "similar others" are conserving energy). By contrast, this section again assumes a "knowledge-deficit" explanation of excessive energy consumption which does not accord with much of the social psych literature's insights. Particularly the claim that: "To encourage households to invest in energy efficient measures, programs need to be developed to highlight the benefits from investing in the energy efficient measure in terms that the household can understand and to spread the upfront costs over time so the measures are viewed as economically viable and attractive." This may be part of the solution but is by no means a complete, or the most effective or cost-efficient, approach. | Interesting. |

| 6783 | 2 | 40 | 44 | 41 | 29 | Add some discusstion about investment diaster reduction will improve adaptation capacity . | This is beyond the scope of our chapter. |
| 12238 | 2 | 40 | 7 | 40 | 7 | It would have been useful to know which nation the survey is from. | It was from the United States, which is |
| 8244 | 2 | 40 | 1 | 40 | 1 | Are there similar studies on developing economies? | When focusing on technologies that promote RDD&D for future pathways for emissions reductions, there is no distinction between developed or developing economies. A technology |
| 8246 | 2 | 40 | 12 | 40 | 13 | There are also studies revealing that consumers not necessarily estimates the fuels economy of cars for example. Bento Antonio M., Shanjun Li and Kevin Roth (2012), "Is there an energy paradox in fuel economy? A note on the role of consumer<br>heterogeneity and sorting bias?", Economics Letters 115: 44-48, Allcott, Hunt (2011). “Consumers’ Perceptions and Misperceptions of Energy Costs.” American<br>Economic Review, Papers and Proceedings, Vol. 101, No. 3 (May), pages 98-104. | Interesting, and worth including. |
| 17328 | 2 | 40 | 32 | 40 | 34 | It will be interesting if the results from the "provision of social norm information" will be explained somehow. Is there something in the literature about "perceptions-reactions-uncertainties" that support/explain this results? | What is the provision of social norm information? |
| 8245 | 2 | 40 | 7 | 40 | 10 | Please specify on which country the study is based. | The study is based on the U.S. However, the findings are applicable to any country with similarly alternative, but |
| 4713 | 2 | 40 | 44 | | | This section should discuss the fact that an important deterrent to adaptation is government policy that removes the incentives to adapt. Funding reconstruction of homes in areas that will be increasingly prone to hurricanes (e.g., New Orleans, Florida) sends precisely the wrong signal but involves considerable expense. To the extent that government policy provides "levees and bulwarks" against the impacts of climate change, the need to adapt vanishes. A more pedestrian version of the same thing occurs when we realize that we can "adapt" to climate change by turning the air conditioner on higher rather than moving to cooler areas, taking off our sweaters, or simply getting used to higher temperatures. | This is important, but is tangential to our chapter for two reasons. First, it isn't an uncertainty issue. Second, it would take a lot of space, which we have in limited supply for a topic that is covered in much greater detail in WG2. |
| 14371 | 2 | 41 | 12 | | | Could add Cline (2011, pp. 85-86), which broadly supports the $100 billion Copenhagen figure for 2020. | OK. Thanks! |
| 8242 | 2 | 41 | 30 | 41 | 42 | While one of the possible negative impacts of climate policy is diminished competitiveness for job creation, it should be noted that climate policy may be beneficial in that it may improve efficiency, spur innovation and create jobs in new market niches such as clean technologies. | That is true, but it is beyond the scope of our chapter. |
| 7290 | 2 | 41 | 32 | | | imply -> implies | Thanks! Done. |
| 2967 | 2 | 41 | | | | more discussion of adaptation would be helpful, particularly the possible use of RDM to deal with uncertainties. | This would be beyond the scope of our chapter. |
| 14836 | 2 | 41 | | | | It is worth citing Naomi Oreskes here, on the implications of doubt (and the actors introducing doubt) | I don't understand. Wouldn't theoretical stuff on doubt fit better into 2.2? |
| 6081 | 2 | 41 | 43 | | | I have a difficulty to understand how this subsection has to do with this chapter that discuss "Integrated Risk and Uncertainty Assessment of Climate Change Response Policies". | It is important to the extent that popular support for policies -- which in democratic societiies is important for the policies' continued success -- is often |

| 11523 | 2 | 43 | 20 | 43 | 21 | The use of the phrase "NIMBY" or Not In My BackYard, is politically charged and inappropriate for a scientific publication because it portrays localism as self-serving and parochial, rather than a caring for one's own habitat. A "sense of place" or "homeland" is very strong in many indegenous/local communites and they have prevented environmental degration. | You are right. I have deleted the term NIMBY. |
| 3315 | 2 | 43 | 27 | 43 | 27 | "Future development pathways" is vague. A more concrete paraphrase to accompany the technicality should be found, if possible. | I can't find the words you are describing. |
| 7292 | 2 | 43 | 28 | | 30 | Sentence unclear | Thanks. Added "those people" after |
| 8414 | 2 | 43 | 41 | 43 | 42 | "This model … the truth". This seems to be simplistic: there is not only one reason behind the public refusal to accept a firm scientific consensus. But it is hard to believe that the industry-sponsored mass disinformation campaigns have no effect at all.<br>The text seems to make a caricature of the problem in order to dismiss the importance of the industrial pressure on politics. | Thank you. |
| 11724 | 2 | 43 | 43 | 43 | 45 | I feel that IPCC itself seems to complain about public opposition by using this citing. It's good to be deleted. | Thank you. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 10638 | 2 | 43 | 43 | 43 | 45 | Public opposition to the IPCC consensus on anthropogenic climate change has been attributed to the fact that IPCC sometimes calused serious misunderstandings among decision makers, climate negotiators and mass media, which may hjave misled climate negotiations, espcially with respect to the target of the response strategies. This is what Yamaguchi et al argues in the chapter 11, Epilogue, IPCC and Communication of Climate Change Mitigation A Balanced Approach to Climate Change | Thank you. |
| 9974 | 2 | 43 | 43 | 43 | 45 | This part should be deleted completely because the expression of "industry-sponsored scientists" is too subjective and there is no evidence for the fact. | Thank you. |
| 6082 | 2 | 43 | 43 | 43 | 43 | The citation of Oreskes and Conway 2010 is inappropriate. Firstly the expression "IPCC consensus" is inappropriate and misleading. IPCC's official expression is "Most of the observed increase in global average temperatures since the mid-20th century is very likely due to the observed increase in anthropogenic GHG concentrations. It is likely that there has been significant anthropogenic warming over the past 50 years averaged over each continent (except Antarctica)" (refer to Page 5 of SPM of AR4). Secondly there are literatures that disagree to this citation. If Chapter 2 team wish to hold this citation, the team have to cite literature from other camp for the sake of IPCC's neutrality. | Thank you. |
| 14837 | 2 | 43 | 46 | | | It is not clear why the Oreskes and Conway analysis is equated with a simplistic linear model and then dismissed. It is relevant fron the standpoint of the public opinion and commitment of policy makers, even if it is not the sole determinant. | Thank you. |
| 4917 | 2 | 43 | 6 | | 7 | "If storage under the land were prohibited, then the industry would have to 6 turn to the more expensive option of storing under the sea floor." This statement is abs. irrelevant here. | You are right. I am deleting the sentence. |
| 8412 | 2 | 43 | | 45 | | This section fail to consider an important issue, the influence of disinformation campaign organized by industrial lobbies on how uncertainty is considered by policymakers, and how a “manufactured uncertainty” is used as a toll to block or to delay climate mitigation policies.<br>Although it is true that the science-policy interface is indeed complex, many works have highlighted the importance, for the science–policy interface, of the influence of vested interest, and their practice of manufacturing controversy to avoid pro-climate regulations.<br>It is useful that the AR5 and in particular this Chapter describe and underline these tactics, because still today they are important to understand how uncertainty is considered by policymakers, how they shape the debate and how they are effective in slowing new climate legislation..<br>As an example, some of the deniers’ tactics used are:<br>• manufacturing uncertainty by raising doubts about even the most indisputable scientific evidence.<br>• promoting scientific spokespeople who misrepresent peer-reviewed scientific findings or cherry-pick facts in their attempts to persuade the media and the public that there is still serious debate among scientists that burning fossil fuels contribute to global warming and that human-caused warming will have serious consequences.<br>• attempting to shift the focus away from meaningful action on global warming with misleading charges about the need for “sound science.”<br><br>Like Big Tobacco before them, many Big Oil lobbies have been enormously successful at influencing governments and Parliaments, thus blocking regulation on climate. Documents highlighted in many reports provide evidence of oil industry corporations’ cozy relationship with government officials, which enable them to work behind the scenes to gain access to key decision makers. In some cases, industrial proxies have directly shaped the global warming message put forth by federal agencies. | These are very good points, which revisions to the section are broadly addressing. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 8413 | 2 | 43 | | 45 | | I suggest to rewrite the entire paragraph framing it in a more complete, and to update and broaden the references. I suggest to add the following references.<br>Gelbspan R. (2004) Boiling Point, Basic Books<br>Hansen J. (2010) Storm of my grandchildren. Bloomsbury; see Chapter 1, 2 and 3<br>Hoggan J., Littlemore R. (2009) Climate Cover-up, Greystones<br>Mann M. |---|---|---|---|---|---|---|---|
| 13781 | 2 | 5 | 10 | | 11 | This example mixes reference to 'risk' and to 'probabiliby.' This leaves out the 'consequence' part of risk without explanation. | This § will be re-written and the reviewer's comment be taken into |
| 13782 | 2 | 5 | 11 | | 15 | A better example is short-term coastal investment that ignores long-term loss of that investment due to sea level rise | This is another nice example that illustrates a focus on short-term horizons |
| 8231 | 2 | 5 | 11 | 5 | 15 | In the example provided on the coastal village taking the wrong decision, two key components may lead to taking a bad decision: 1) uncertainty and risk about future benefits of protecting against sea level rise, and 2) preference for present vs future welfare and risk aversion, which are determined by the discount rate chosen to discount long term benefits. In this case, it seems like it is discounting (preference for present over future) which impacted their decision rather than uncertainty and risk. If the example is about risk and uncertainty, it should be made clear that the coastal village took a bad decision because of uncertainty and risk over future benefits rather than due to how those were discounted. As such, the sentence "A coastal village may decide not to undertake measures for reducing future flood risks due to sea level rise because they focus on the next few years" could be replaced by "A coastal village may decide not to undertake measures for reducing future flood risks due to sea level rise because most benefits, which occur in the long term, are more uncertain than the required short-term investment costs". | The example in the SOD is revised to reflect these points |
| 3899 | 2 | 5 | 11 | 5 | 12 | Is the coastal village a real example or a hypothetical one, and what is the basis for assuming that the villagers are using the wrong discount rate and the unamed persons assessing what the 'long-term discounted benefits' really are using the right discount rate? | The example is hypothetical and has been revised so that discount rates are not discussed |
| 3900 | 2 | 5 | 15 | 5 | 17 | As posited, this would be rational behaviour by firms, being neither myopic normisperceiving risks. | Good point. The example has been moved to the discussion of Decision Tools for Making Better Choices in the |
| 6060 | 2 | 5 | 15 | 5 | 17 | This is not necessarily a proper example. This may not apply to developed countries. | Examples are not direct related to the developed world. Most people live in developing countries. Nevertheless, |
| 3901 | 2 | 5 | 17 | 5 | 19 | Again this would be rational behaviour by governments. The imperative of an incumbent government is to get re-elected. This imperative is illustrated by the common (smug) saying that perceptions are more important than reality in politics. | Government behavior with respect to postponing mitigation measures may be rational for the reason stated due to the wait and see attitude of the public |
| 8230 | 2 | 5 | 2 | 5 | 4 | The sentence should also note that uncertainty and risk impact policy development also on the adaptation side. | We will augment the text accordingly. |
| 4696 | 2 | 5 | 25 | 5 | 41 | This section on decision tools basically relies on rational models, failing to pick up on the psychological/not-economically-rational aspects of decision-making that the previous section alludes to. | Intro is rewritten |
| 18444 | 2 | 5 | 25 | | 35 | Same text repeated on page 8, from line 34 to line 44 | The Executive Summary in the SOD will provide the main insights of the chapter |
| 7839 | 2 | 5 | 27 | | | It is suggested to use throughout the paragraph the same term for the same content. Models and tools are not synonyms; therefore it is suggested to substitute "models" by "tools". | Agreed. We will implement the suggested changes. |
| 14822 | 2 | 5 | 33 | | | "… while governments debating the merits of a carbon tax may turn to cost-benefit analysis." This implies that CBA can be used to help determine the optimal tax, by optimizing mitigation costs against the benefits of reduced impacts. This is a poor example of trying to match a decision type with its appropriate decision tool. The uncertainties associated with the magnitude of climate impacts, the inherently value-laden judgements, the intergenerational dimension, the fact that this is a commons problem that requries mitigation action with costs exceeding the immediate benefits... all suggest that CBA is an inadequate tool for setting a tax rate. Perhaps CEA, though. | Text has been modified. |
| 12518 | 2 | 5 | 40 | | | Add after “management” -- “game theory, group process,” | Intro is rewritten |
| 3902 | 2 | 5 | 42 | 5 | 42 | The text should make it clear that its normative proposition applies to policy advisers. Political decision-makers will of course adopt policies that are likely to help them get re-elected. | The text in the Introduction now reads “Policies should be designed…” to |

|---|---|---|---|---|---|---|---|
| 14523 | 2 | 5 | 47 | | | As part of broader treatment of risk management, this chapter might focus more on decision structuring, framing, and the setting of goals and objectives. Towards that end, the authors might use a more general statement of objectives here, rather than a specific set of policy proposals focused on greenhouse gas emissions and concentration targets. | The role of goals and objectives is noted in the Introduction under Problem Formulation and is discussed in more detail in Sect. 2.2 where concepts of |
| 4742 | 2 | 5 | 5 | 5 | 19 | Does this paragraph state that politics have too short term vision (as a long term is expected/requested?). The role of decision makers is to reconcialiate short term and long term vision, and have an adequate communication on it. For instance industrial need such a long term vision in order to invest in the most appropriate technology in the industrial process. However most of the time there is a gap between financial viability and economical viability (due to this lack of long-term vision or/and un-match of short-term and long term visions) | Interesting points on short term and long-term vision that will be taken into account in the SOD |
| 18443 | 2 | 5 | 5 | | 19 | Same text repeated on page 8, from line 12 to line 26 | The Executive Summary in the SOD will provide the main insights of the chapter |
| 3895 | 2 | 5 | 5 | 5 | 10 | This review of the literature does not establish that it is irrational (ie sub-optimal) for people to use rules of thumb or 'simplistic heuristics in choosing between alternatives. Time is scarce and analytical resources need to be directed at where the costs of being wrong at likely to be the most serious. If there is a literature that purports to establish that people systematically and commonly en masse repeatedly make the same bad decisions, failing to learn from experience or to consult experts, or to use warranties and insurance policies to manager isks, that should be cited here since it is novel and controversial, as far as individuals are concerned. (Such behaviour - the failure to learn from one's own mistakes - is one definition of insanity.) Another difficulty with this theory is that it negates the basis for any public policy based on the assumption that people will respond to it rationally. On the other hand, politicians in democratic socieities have perhaps the strongest incentives to be myopic -as illustrated by the UK Economist magazines famous phrase - a week is a long time in politics and Harold Wilson on a turning circle would rival a London taxi'. It would be odd if the paper discusses short-termism in private behaviour but not in pubic political behaviour. | We could not agree more with all of your comments, and now have much more explicit treatment of the behavioral reality vs. rational-economic fiction of decisions and actions at ALL levels of analysis, from consumers to policy makers. See our new Table 2.1. We also now preview that such arguments will be made in the section you are responding to. |
| 3896 | 2 | 5 | 7 | | | The representations of individual behaviour in economics (eg welfare economics and public choice theory) are positive, not normative. The Arrow-Debreu model is not a theory of how people should behave. | there are differences in the way these terms are being used by different communities. Normative is defined by wikipedia as follows: Normative - Wikipedia, the free encyclopedia en.wikipedia.org/wiki/NormativeNormative has specialized contextual meanings in several academic disciplines. Generically, it means relating to an ideal |
| 3898 | 2 | 5 | 9 | 5 | 10 | Farmers who take the wrong decisions (as evaluated by themselves) because they are ill-informed about the risks are not behaving inconsistently with any positive model of optimising behaviour in economics. | Point noted. |
| 18441 | 2 | 5 | 9 | | | TO READ-Decision Makers tend to make myopic action plans that utilize simplified methodologies. | This sentence in the SOD will be modified to reflect this suggested change |
| 17700 | 2 | 5 | 5 | 5 | 18 | Economic agents tend to use the known Keynes saying…. "In the long run we are all dead" | Point noted. |
| 7299 | 2 | 50 | 3 | | | add exact citation for source of Figure | The section has been edited. |

|---|---|---|---|---|---|---|---|
| 5227 | 2 | 52 | 19 | | | It could be stated that the aim of the metrics is to help the climate policy by providing a clear indicator which measures the greenhouse gas emissions in commesurate units (e.g. CO2 equivalents) for the goal-setting and follow-up of the climate policy. Thus the metrics should be formulated so that it serves the climate policy. The ultimate objective on the UNFCCC (Article 2) is twofold: stabilization of ghg concentrations and limiting the speed of change (sufficient time-frame to adapt). Thus this two goals cause challenges for metrics especially concerning relevant policy time horizon. This discussion could be given here. | The intention of the metrics is stated in the intro of the IPCC Uncertainty Guidance Notes Mastrandrea et al., 2011: 'These guidance notes are intended to assist Lead Authors of the Fifth Assessment Report (AR5) in the consistent treatment of uncertainties across all three Working Groups. These notes define a common approach and calibrated language that can be used broadly for developing expert judgments and for evaluating and communicating the degree of certainty in findings of the |
| 5228 | 2 | 53 | 37 | | | Please add after "approach" the words "and in the case of GTP100 the cost increase is clearly greater" (Ekholm et al.) EKHOLM, T., LINDROOS, T.J., SAVOLAINEN, I. Robustness of climate metrics under climate policy ambiguity. Submitted for publication in Climatic Change. | We will read this paper and decide whether to include it in the next draft. |
| 15470 | 2 | 58 | 22 | | | This section was more technical than the previous sections that described the other tools. This made it harder to understand. Suggest either simplifying or adding more explanations. | This section has now been simplified. |
| 15471 | 2 | 59 | 28 | | | Reading between the lines, it sounds like there is a limited number of studies that use this tool. Also the uncertainities on what it can and can't do are greater. This should be mention in the text. | Thank you. The text has been revised accordingly. |
| 8116 | 2 | 6 | 10 | 6 | 15 | The phrase suggests a (single) causality of risk and uncertainty on the one hand and choices on the other. It neglected the complexity of choices and the fact that risk and uncertainty play often minor roles in decision making. | We will augment the text to some extent along those lines. |
| 13785 | 2 | 6 | 10 | | | change 'impacts' to 'affects' | Wording change made in the SOD |

| 4699 | 2 | 6 | 39 | | | Exec summary should not be cut and paste of this section -- they should differ. | The Executive Summary in the SOD will provide the main insights of the chapter |
| 13783 | 2 | 6 | 8 | | | should read 'uncertainty about', not 'uncertainty in'. The system is not uncertain, our knowledge is. | Intro is rewritten |
| 4041 | 2 | 7 | | | | The model depicted in Figure 2.1 aims to illustrate the interconnections (broadly speaking) between some of the main elements of decision-making under uncertainty. However, the model appears as uni-directional and too simplistic/reductionist, with no reference(s) or mention of how this model relates to what is now published in the wider literature on decision-making and policy formulation of 'wicked' societal problems such as climate change (highly complex, and hardly ever linear as depicted). Perhaps this section should just discuss these elements in the narrative, rather than illustrating them along a linear progressive axis/proceess (which is misleading). | Both the figure and the chapter have changed a lot in response to this and many other helpful reviewer comments, and now hopefully reflect the complexity of climate mitigations and the literature on complex decisions much better |
| 2155 | 2 | 7 | | | | The approach in this chapter starts with a step (or box in Figure 2.1) of “the decision to be made.” I presume that the authors have other steps preceding this step in mind including defining the context or the objective. For the farmer, used as an example in this chapter, an objective might be to maximize yield or return on investment or some other objective. The objective drives the decision to be made and the alternatives requiring consideration. Ayyub (2003) offers several methods to help users, such as the contributing factor diagram method that starts with defining an answer variable. The ISO definition of risk as the “effect of uncertainty on objectives” requires this definition of objectives as a starting point.<br>Reference: Ayyub, B. M., Risk Analysis in Engineering and Economics, Chapman and Hall/CRC, 2003. | Figure 2.1 starts with Problem Formulation where goals and objectives are discussed |
| 8390 | 2 | 7 | | | | This figure needs to be more clearly explained and defined. What do arrows mean? What is the role of the boxes? | The Problem Formulation box in Fig 2.1 notes the importance of formulating goals and objectives as an input into the descriptive and normative analyses and |
| 4906 | 2 | 7 | | | | Fig 2.1: I guess that "(normative analysis)" to be added to the 4th box | Done |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 16918 | 2 | 7 | | 7 | | I can see the structuring value of Figure 2.1 but it does seem a little odd to have the prime structuring Figure without an obvious specific "place" for the actual decision-maker; also am not clear on relationship of the first two boxes (try running a "shall I insulate my house?" decision through this …). It might be useful to compare against Triandis' theory of decision making, as also elaborated and applied to climate change in DECC (2011). DECC (UK Department of Energy and Climate Change) (2011) An introduction to thinking about 'energy behavior': a multi Model Approach. http://www.decc.gov.uk/assets/decc/11/about-us/economics-social-research/3887-intro-thinking-energy-behaviours.pdf Last Accessed September 4, 2012 | Fig 2.1 has been modified so that the Problem Formulation box considers the institutional arrangements and the relevant decision makers noting their goals and objectives. |
| 8480 | 2 | 7 | | | | What is "better" in this context? Highly ambiguous and political - can imply efficiency, efficacy, political utility or vote maximization - needs more precision. | Intro is rewritten |
| 13790 | 2 | 7 | | | | Box on 'Decision Tools' could also list 'Normative Analysis' in parentheses in same form as box on 'Risk Perception' | Wording change made in the SOD |
| 7222 | 2 | 7 | | | | more specific examples, e.g. communities in Japan that built high enough wall against tsunamis vs. those that did not. | This example would fit better in WGII but we will consider it. |
| 8117 | 2 | 7 | 1 | 7 | 1 | Not only tools but also procedures should be integrated in this framework. | Intro is rewritten |
| 8710 | 2 | 7 | 10 | 7 | 30 | The preparation of technical manuals containing simple and cheap technologies to be applied as adaptation measures to climate change can help communities to make decisions about the implementation of more efficient strategies. For this, it is necessary that the manual is written in accessible language to people at all levels of schooling. As an example, we can mention the book prepared by the Bank of Brazil Foundation (Fundação Banco do Brasil http://www.fbb.org.br/), with the title Water and Climate Change - Social Technologies and Community Action (the book follows as additional material attached) which contains numerous technologies supported by the founding members and aims to bring these technologies to a greater number of communities in order to make the means of production and consumption of these communities more sustainable and adapted to possible problems caused by climate change. | While this subject is not direclty relevant to the chapter, we are conscious of the need to use language that is accessible to the reader. |
| 7221 | 2 | 7 | 14 | | 17 | very similar to lines 20ff | The revised Introduction addresses this |
| 11487 | 2 | 7 | 19 | 7 | 19 | Change 'Figure 1' to "Figure 2.1' | The Executive Summary in the SOD will provide the main insights of the chapter |
| 4627 | 2 | 7 | 2 | 7 | 3 | I find figure 1 less than compelling. Any decision made under uncertainty (or risk, the terms are essentially interchangeable) has two components: the technical nature of the risk, and the individual's behavioral response to risk. The technical nature of risk might be determined objectively, as in games of chance, or subjectively as in most other situations. Even when there is a large amount of (objectively agreed on) relevant data, most assessments of technical risk involve subjectivity. This is particularly true when events are in the distant future, when forecasts by their nature are less accurate. Most work on estimating forecast error (which determines technical risk) is based on models that are stochastic and linear-in-parameters. Climate models are nonlinear deterministic models for which estimating the forecast error is usually done by perturbing initial conditions and this is not the only source of forecast error. Behavioral response to risk is innate to the individual and is almost certainly influenced by the nature of the event. For example, a person may be more risk averse in emotional settings than in making business decisions. While it is possible to determine a person's risk preference function, it is not necessary to do so if the individual is simply asked to choose between a pair of risky scenarios. When an individual's risk preference function is established it is possible to determine biases in decision making compared with what a rational decision-maker would do, though for future events the rational decision depends critically on the personal discount rate. The only way there is a feedback loop in this setting is if the decisions made by an individual or an aggregate of individuals do not result in the outcomes desired by policymakers. In other words, when estimates of optimal action based on estimates of technical risk and individuals' response to risk do not actually occur, then a policymaker is likely to change the "rules of the game" e.g., by changing the tax or subsidy structure, or changing the regulatory mix, to push decision-makers in the desired direction. | The rationale for Fig 2.1 is to highlight how behavioral considerations need to be coupled with normative analysis to develop risk management strategies for the problem formulation phase The revised Introduction makes this point clearer. Now that the initial box is labeled Problem Formulation the feedback can come from various inputs to the risk management process. |

|---|---|---|---|---|---|---|---|
| 11479 | 2 | 7 | 2 | 7 | 3 | Relationships between the elements of in this diagram are not clear. Arrows do not seem to indicate causality, nor do they seem to represent a processes of analysis or decision-making. The figure presents a model which is quite linear, although in reality, different factors will be influencing each other. For instance, Figure 2.1. seems to have a break in its logical flow when it reaches the last element. Facing a decision is to be made, the decision maker evaluates key uncertainties and risks that include, on the one hand, risk perception and behavioral responses, and on the other, decision tools under risk and uncertainty. The logical continuation would be the outcome of this decision making process and that is the decision itself or at least some measure or policy. However, the last element restates risk and uncertainty, and therefore, the diagram resembles a tautology. Furthermore, the chapter does not reveal any additional insights as to relationships between these elements. | Figure 2.1 has been relabeled and revised in the revised Introduction so that the first box is Problem Formulation and it should be clearer to the reader that both Descriptive and Normative analyses feed into the Risk Management process with feedback to the Problem Formulation phase. |
| 11480 | 2 | 7 | 2 | 7 | 3 | It is unclear why "Risk perception and behavioral responses…" are combined. It would be useful to discuss these topics separately (later in the chapter) and illustrate them as distinct elements here. | This section heading was specified by the IPCC scoping conference. The chapter does discuss them as distinct |
| 14527 | 2 | 7 | 2 | | 4 | Do you want to use the word “climate policy” or “climate-related decision"? The former is much more narrow category than the latter. For instance, the recent increase in U.S. auto fuel-efficiency standards is certainly a climate-related decision, though less often explicitly identified as a “climate policy.” | We focus on climate policy, but the definition of climate policy that we have used so far is the one from the AR4, and is quite expansive. While there is no glossary entry for "climate policy," the Executive Summary of the AR4 WGIII CH3 states: "The literature on climate change continues to reflect the wide variety of national policies and measures that are available to governments to limit or reduce greenhouse gas (GHG) emissions. These include regulations and standards, taxes and charges |
| 14526 | 2 | 7 | 2 & 7 | | 4 & 19 | One of the most important initial steps in a risk management process is identifying and, when possible, agreeing on goals. This figure and text ought to be revised to include this crucial step. A clear statement of goals is important for individual decision-making. It is even more important for climate-related decisions, many of which will be group or organizational decisions. | The Problem Formulation box in Fig 2.1 notes the importance of formulating goals and objectives as an input into the descriptive and normative analyses and |
| 7220 | 2 | 7 | 3 | | | label the arrows or leave the figure out | We are leaving it out. |
| 7223 | 2 | 7 | 42 | | | What is the difference between cost-effectiveness vs. cost-benefit analysis? | We have two separate sections explaining each of the two concepts. 2.3.2 and 2.3.3. These concepts are |
| 8118 | 2 | 7 | 7 | 7 | 19 | Quite a few examples in this chapter are too simplistic and misleading. This is only one example: 1. For farmers it is daily business to make decisions about which plants should be planted next season. 2. The grow conditions of plants on a seasonal basis are most dependent on the weather and almost not dependent on climate change. 3. Other variables like soil quality, marked price and cultivation technique are much more relevant as climate change. So, for an individual farmer, the seasonal planting decision does not have to be influenced by climate change. Only irreversible or long-term decisions like investments or policies are sensitive to climate change. This is only an exemplary comment that all examples have to be proved on their realistic relevance for the scope of this chapter. | Thanks, some examples have been changed or improved, see SOD. Weather changes with CC and climate variability. CC may change soil quality and cultivation techniques |
| 16919 | 2 | 7 | 7 | | 19 | Linked to the above: The key problem here is not so much the range of decisions, but the range of decisionmakers. My sense is that it may be important to separate out (1) private decisionmakers, (2) government decisionmakers on internal policy decisions, and (3) decisionmakers and influencers in international negotiations (which collectively one might hope tries to converge towards some kind of global strategy). The objectives, and processes, are quite different in each case. | The points regarding the range of decision makers has been addressed by Table 2.1 in the revised Introduction. This taxonomy is designed to link Chap. 2 with the other chapters in WGIII. |

|---|---|---|---|---|---|---|---|
| 11486 | 2 | 7 | 7 | 19 | | This part repeats page 4 line 25 to line 36 | The introduction has been rewritten. |
| 13791 | 2 | 7 | 9 | | | Change 'himself' to a gender neutral term. | Thank you. Correction has been made. |
| 8232 | 2 | 7 | | 7 | | Each item depicted in figure 2.1 has been described individually in section 2.1.1 but the links between each of them have not been described well enough in order for the reader to understand clearly what Figure 2.1 illustrates. | We have clarified Fig. 2.1 in the SOD so the links between the boxes are clarified |
| 6303 | 2 | 7 | 7 | 7 | 8 | In describing "the decision to be made," it is essential that the problem be properly scoped and justified, before a "set of alternatives" are identified. So many times, decision makers proceed to identifying alternatives to a problem that has been scoped in a particular way that already delimits alternatives, so scoping the problem properly is vital and should be noted here. | Figure 2.1 has been revised in the SOD so the first box is Problem Formulation |
| 11150 | 2 | 76 | 11 | | 15 | States that no research has been undertaken to date that identifies the drivers of public concern or acceptance, as well as the anticipated risk levels associated with CO2 storage. It is a bit unclear to me if this statement refers to no research being done in Barendrecht or in general, but in both cases the statement is false. Barendrecht has been researched extensively and has been reported on in several publications. Generally, a plethora of research exists on the drivers of public concern or acceptance of CCS on national level as well as on the local level (case studies), using methods ranging from focus group discussions to information choice questionnaires which aim to measure public opinion development when people are adequately informed about CCS. Recently, a special issue of Energy&Environment was devoted entirely to this topic (volume 23, numbers 2 & 3, 2012: ISSN 0958-305X) including up-to-the-minute views on key issues facing CCS today. Stuart Haszeldine gives his take on what happened with the Longannet project; Vattenfall likewise gives its view on the cancellation of its proposed CCS project in Germany; other perspectives are provided by Greenpeace, the Green Alliance, the Global CCS Institute, the Indian government and leading consultants. Academic contributions from social scientists stress the importance of values, justice, communities and place. Other contributions include: site selection, water demand of CCS, CCS in the media, direct carbon dioxide capture from the air compared to CCS and using CCS to teach science in schools. Furthermore, research efforts have resulted in recommendations, toolkits and guidelines on communicating CCS. A list of references will be sent as ancillary material entitled IPCC AR5 WGIII refs CCS.docx. | Thank you. The text has been revised accordingly. |
| 11151 | 2 | 76 | 19 | | 20 | Here, concerns over local risks and impacts are labeled NIMBY concerns. The term ‘not in my back yard’ (NIMBY) is a well established policy belief. As a result of this belief, project proponents often call public protest ‘emotional’ or ‘irrational’ thereby implying that no valid arguments are used or that the opponents are acting selfishly. Policy makers do not always use these labels consciously to frame arguments as invalid. Rather, it appears that the NIMBYism belief is so widespread that it may implicitly influence the words chosen to describe public opposition. However many disagree with the idea that NIMBYism accounts entirely for the gap between positive public attitudes and negative behaviour towards specific projects, a.o. Devine-Wright, P. (2009). "Rethinking NIMBYism: The Role of Place Attachment and Place Identity in Explaining Place-protective Action." J. Community Appl. Soc. Psychol. 19(6): 426-441. Research on public protest against wind farms for example indicates that the visual impact of wind turbines is the dominant factor in explaining opposition against them, but also suggests that public animosity towards a wind farm is partly reinforced by the planning procedure itself: Breukers, S., & Wolsink, M. (2007). Wind power implementation in changing institutional landscapes: An international comparison. Energy Policy 35, 2737-2750. Top-down, hierarchical, and technocratic approaches to decision making may lead to feelings of injustice and inequity within local communities. These reasons should not be confused with the notion of NIMBYism. | Thanks for these references. We are removing the term NIMBY. |
| 8121 | 2 | 8 | 12 | 8 | 16 | Please provide agreed evidence for these statements. Another perspective is that normative models of choice tend to be simplistic and not suitable to represent a real complex problem situation. | The evidence for these statements is provided in Section 2.2, as we say in line 27 on p. 5 in the FOD. We preview now more explicitly in the paragraph you refer to that heuristic and other non- |

|---|---|---|---|---|---|---|---|
| 11488 | 2 | 8 | 15 | 8 | 17 | This argument demonstrates an overestimation of the knowledge of "experts" in so far as it fails to describe how those experts are identified. The broad claim that decision makers are myopic and use simple heuristics requires qualification. | We are simply describing observed regularities, but have tried harder to avoid unwanted connotations of terms |
| 11489 | 2 | 8 | 16 | 8 | 17 | The notion that farmers underestimate risk of drought is derived from priviliged societies in which crop insurance protects farmers from disaster. In most of the world, such insurance is not available, and farmers are unlikely to underestimate such risk. Their options for adaptation, however, are constrained, and they may not (from a behaviorist point of view) demonstrate their calculation of drought risk. This example seems unusual and misleading. | These are just possible examples, not general statements that apply to all contexts. We have tried harder, however, to add more examples relevant to non-western and developing country |
| 8119 | 2 | 8 | 17 | 8 | 18 | As said above, for farmers the risk of drought on a yearly basis is almost independent from climate change. | Our chapter in general is pointing out that risks and uncertainties arise from many sources, not just the climate |
| 13794 | 2 | 8 | 17 | 8 | 18 | This example mixes reference to 'risk' and to 'probabiliby.' This leaves out the 'consequence' part of risk without explanation. | thank you, we substituted "probability" for "risk" here. Chapter 2 in general makes the point that risk is being used in different ways by different groups, but that risk needs to incorporate both the |
| 13795 | 2 | 8 | 18 | 8 | 22 | A better example is short-term coastal investment that ignores long-term loss of that investment due to sea level rise | Yes, this is another good example, thank you. |
| 4907 | 2 | 8 | 35 | | | probabilities .. are uncertain. ?? | Thank you, the sentence was reworded. |
| 8120 | 2 | 8 | 38 | 8 | 40 | Imprecise: models do not reduce costs directly. Model results can raise the quality of decisions and this may lead to increasing profits. | Agreed. We will implement the suggested changes. |
| 6061 | 2 | 8 | 39 | 8 | 42 | The difference between investing in irrigation system and merit of carbon tax is unclear. Namely, why cost effectiveness criterion applies to the former and cost benefit criterion applies for the latter. If it says "communities deciding on which irigation system they invesr", it is reasonable that cost effectiveness criterion applies as society has always decided to invest to irrigation system. Whereas, cost benefit criterion should be applied to decide whether to invest in irrigation system or not. | Text has been modified to reflect clearer examples |
| 9790 | 2 | 8 | 45 | 9 | 2 | Already here and later on in section 2.3 resilience management should be considered as a major methodology. The International Organization for Standardization is currently preparing a standard on this topic and thus companies will use this structure later on for establishing their own tools. | Intro is rewritten |
| 8916 | 2 | 8 | 7 | 8 | 7 | Section 2.1.1 is the current section; I assume this reference is wrong? | Noted |
| 13792 | 2 | 8 | 7 | | | change 'impacts' to 'affects' | Wording change made in the SOD |
| 13796 | 2 | 9 | 16 | | | change 'impact on' to 'affect' | Thank you. The correction has been |
| 11491 | 2 | 9 | 17 | 9 | 17 | Change 'Figure 1' to "Figure 2.1' | All tables and figures have been correctly labelled, and captioned. |
| 6063 | 2 | 9 | 21 | 9 | 21 | "Implementing carbon market" may be replaced with pricing the carbon. | I disagree with the reviewer here. The implementation of a carbon market is not only to put a price on carbon, but may also include other benefits such as redistributing the emissions threshold through bilateral trading of quotas. |

|---|---|---|---|---|---|---|---|
| 8481 | 2 | 9 | 24 | | 26 | Important to consider the spectrum and difference between policy (as strategy) and policy instruments (as implementable tools) May also be helpful to note the different types of policies and policy instruments via a basic typology (see for example the work of Ted Lowi, and Four Systems of Policy... in particular) | Thank you for this helpful comment. In the SOD we are trying hard to clarify this point. The core communication element that we are emplying is a matrix that maps the climate policy space according to different types of choices, and different sets of actors making choices. Among the choices to be made is the choice of policy instrument. An instrument, of course, is a tool, and a piece of furniture built with hand tools |
| 14528 | 2 | 9 | 24 | | | I am not sure it's helpful to define "policy" in terms of "strategy." | The dictionary I looked at defined policy as a consistent approach to dealing with problems in order to achieve a particular outcome or set of outcomes. That made sense to me. I have a policy of getting up at 6:00, in order to make sure that my kids get to school by 8:00. "Strategy" is one way of describing this, and not a bad way. What it does do is allow the word "policy" to be construed expansively, and not limited to particular |
| 9112 | 2 | 9 | 27 | 9 | 29 | Growing proportion is tied to complex international flows of goods. Schulz shows an extreme example from Singapore where almost everything is imported (Schulz, N. B. (2010): Delving into the carbon footprints of Singapore — comparing direct and indirect greenhouse gas emissions of a small and open economic system, Energy Policy, 38, 4848–4855.) | This is an interesting article, showing how in a place like Singapore the direct emissions generated locally account for less than half of the the total emissions generated by the people's consumption. But it is quite tangential to our chapter, and even to the point being made in this sentence, since the Schulz paper |
| 6368 | 2 | 9 | 35 | | 37 | Should say "even more difficult to predict than they had previously been thought to be." The point is that the uncertainty existed previously, but was unacknowledged. So prediction only appeared easier earlier. | Intro is rewritten |
| 13797 | 2 | 9 | 36 | 9 | 37 | The difficulty is inherent. The perceived uncertainty may change with this new information. | Intro is rewritten |
| 8122 | 2 | 9 | 38 | 9 | 38 | These general statements should be avoided. Handling uncertainty is quite normal and not unique for handling climate change risks. Besides rational reasoning, other factors like culture, history and so on are relevant for sound decision making. The chapter should focus only on situations sensitive and relevant for climate change! | We agree that all of these factors play a role, but the chapter's role as a framing chapter is also to make the general point that uncertainty and risk DO influence the processes by which people make |
| 13798 | 2 | 9 | 38 | | | Change 'presence' to 'perception' | Thank you. The change has been made. |
| 13800 | 2 | 9 | 38 | 9 | 45 | One's access to and understanding of decision-making tools also affects the process. | Thank you. We have incorporated this |
| 7224 | 2 | 9 | 39 | | 41 | the sentence does not parse. | The section has been edited. |
| 13799 | 2 | 9 | 40 | | | Remove first 'that' | Thank you. Correction has been made. |
| 11492 | 2 | 9 | 40 | 9 | 41 | Missing word: "outcomes that … from their choices"; and missing "?" question mark. | Thank you. Correction has been made. |
| 11493 | 2 | 9 | 43 | 9 | 45 | Grammar: "intent of possibly change their decisions' - needs correction. Missing "?" mark | Thank you. Correction has been made. |
| 7225 | 2 | 9 | 43 | | | change -> changing | Thank you. Correction has been made. |
| 7226 | 2 | 9 | 43 | | | whey -> when | Thank you. Correction has been made. |

|---|---|---|---|---|---|---|---|
| 9113 | 2 | 9 | 47 | 9 | 49 | Construction related (embodied included) emissions have been shown to cause a large share of the emissions when a region goes through a rapid growth phase, e.g. Minx, J.C.; Baiocchi, G.; Peters, G.P.; Weber, C.L.; Guan, D.; Hubacek, K. A “carbonizing dragon”: China’s fast growing CO2 emissions revisited. Environ. Sci. Technol. 2011, 45, 9144–9153. | This reviewer recommends the inclusion of this sentence with its reference. I believe the contribution is relevant, but I am not sure of how to address its |
| 6062 | 2 | 9 | 9 | 9 | 10 | It is unclear why the chapter considers from the "social planner's perspective". If this means policy makers perspective, the subject to be taken up in dealing with concentration tagget should definitely be catastrophic loss and its fat tail issue on probability density function of climate sensitibity. | We will be clearer in the SOD why we ventilate the social planner's perspective. The idea is, indeed, that it gives at least one version of a plausible choice for policy maker that observes the known system dynamics most important for the decision problem at stake. Targets have |
| 4628 | 2 | 9 | | | | As a general comment I would say that too little is made of the problem of making forecasts. Estimating the technical nature of risk in climate forecasts is an immense challenge. The word “forecast” occurs about six or seven times, and three of these are references to seasonal forecasting or weather forecasting which have no relevance in making climate forecasts. Given the long time horizon for most climate forecasts, we cannot take the step usually taken by forecasters of comparing forecast and actual outcomes. The various computer models of climate, which like all quantitative models contain a high degree of subjectivity, can collectively give an impression of the forecast distribution. But these models are generally not stochastic in the way most econometric models are. And even econometric models tend to underestimate the forecast error. In short, forecast error in climate models is of unknown magnitude and not likely to be better estimated in the near future. We have just started to apply standard forecasting techniques to decadal forecasts (of global temperature).<br>This section is where some of these problems could more forcefully be pointed out. | Correct. There are two approaches in the chapter, the independent U&R perspective and the climate perspective. Although forecast is not related to climate research it may be used within the chapter as part of U&R assessment. |
| 14823 | 2 | 9 | | | | This section must not only enumerate different types of uncertainty, but distinguish between then and explain their characteristics: profound and unquantifiable and entangled with values, or straightforward and quantifiable?<br><br>It should also say something helpful about which are most important for climate policy. Arguably, one would be the profound uncertainty associated with the unknown magnitude of the downside risk of unmitigated CC. This completely defines the climate problem and structures the nature of the response. | The distinction made between different types of risk and uncertainty in this section is by no means the only one, and other distinctions including the ones you point to are clearly important, and are being made in Section 2.3 on tools. |
| 4700 | 2 | 9 | 23 | | | Perhaps distinguish between reducing risk as reducing the probability of the bad outcome occurring vs. reducing risk as reducing the impacts of the bad outcome. That is, planting drought-tolerant plants differs from insuring yourself against a drought while planting NON-drought-tolerant plants. | In this section we are focused on the broad range of sources of uncertainty and risk that impact climate policy. The distinction on the goals of uncertainty or |
| 6064 | 2 | 9 | 23 | | | When dealing with uncertainties and risks, ordinary ones and others that include uncertainties that may lead to catastrophic damages (shown here as fat tails or tippint points) should be discussed separately as these are really serious issue of risk management under uncertainty. Also inevitable global warming and the necessity of adaptation, R&D or geoengineering should be explained, if briefly. Also another uncertainty with respect to immediate participation to global framework of all the countries as well as uncertainty of global economic situation that is an important driver should explicitly be included here. | In this section we are focused on the broad range of sources of uncertainty and risk that impact climate policy. Fat tails are mentioned in the climate impacts and damage costs paragraph, and then also in Section 2.3 on tools to deal with uncertainties and risks. One of the additional uncertainties you describe |

| 11524 | 2 | Overall | | | | All of the examples in this chapter are based on the knowledge and knowledge-systems of Europe, North America, and Australia. This chapter lacks any examples from other areas of the world where the on-the-ground realities of climate change, perceptions of climatic risk, decision-making processes, and epistemological conventions are different. This chapter lacks applicability for most of the Earth's population, particularly those who are most vulnerable to climate change impacts. At the very least, the authors need to acknowledge that diverse knowledge systems exist, and that these will serve decision-making processes in the parts of the world that they have not investigated. | Accepted. The text will be modified to acknowledge that diverse knowledge systems exist and CAs will provide additional material in this regard that will be incorporated in the text. |
| 11525 | 2 | Overall | | | | The implications of the term "policy" needs to be elaborated, because it seems to exclude decisions made by individuals. The difference between policy makers and social planners is not clear. The inconsistent use of these terms often reveals an emphasis on top-down approaches to climate change mitigation and adaptation yet ultimately climate change response will be undertaken by individauls and their communites. | Than you very much -- this is a crucial point. Moving into the second roder draft we are now clearly considering the actions of individuals, and drawing a clearer distinction between prescriptive literature (based on a set of priorities assumed to lie with a social planner) and a descriptive literature. At the same time, we have also been quite clear to use a definition of the word policy that |
| 17311 | 3 | | | | | Gender issues: | No action; these are addressed briefly in section 3.11 |

| 17355 | 3 | | | | | Comments on Chapter 03<br><br>Finn Arler, Aalborg University, Denmark<br><br>First of all, it is worth underlining from the start that the chapter is full of good points and well-considered arguments. There are several points and arguments I would like to deal with in more detail, though, but due to lack of time I will only make a few quick points. The first two comments are related to the concept 'community', which, in general, plays a very downplayed role in the chapter. The third one is just a hint about the absence of discussions of the concept 'complex equality'.<br><br>1. The way the distinction between Polluter Pays, Beneficiary Pays and Community Pays Principles is presented (p. 14), appears somewhat confusing. It seems as if the three principles are alternatives, whereas in fact they are rather supplementary principles, at least in relation to the climate change problem.<br><br>It begins with the polluter/emitter, who is expected to pay. There are various reasons for exemptions, e.g., if the emitter had no knowledge, and could not be expected to have knowledge about possible consequences, but let us put these exemptions aside for now. If the emitter is also a beneficiary, this strengthens the responsibility. Beneficiaries, who are not polluters (or belong to the polluting community), are not asked to pay. For instance, foreign producers may benefit from the technological progress made by the polluters, foreign tradesmen may benefit from the wealth of the polluting society, etc., but these beneficiaries are seldom if ever asked to compensate victims. This means that the Beneficiary Pays Principle is not truly an alternative to the Polluter Pays Principle.<br><br>If it is difficult to identify the individuals, who are responsible for the pollution, or if a specific community (a nation) has accepted pollution/emissions within their jurisdiction (typically because the whole community is expected to benefit from the activities leading to emissions), it makes sense to make the community as a whole responsible - but then it is as the polluter (who is often also a beneficiary) rather than instead of the polluter.<br><br>There is one difficult case, though, namely the descendants of the original polluters. They are not necessarily polluters themselves, but are beneficiaries from previous generations' emissions. Notice again that we are not talking about people, who benefit from the wealth created by the previous polluters, but who do not belong to the polluters' community. Nobody expects these people to pay (although one could expect them to be timid about blaming the direct descendants of polluters).<br><br>The question is only, whether the people, who belong to the same community (nation) as the previous polluters, should pay, i.e. by compensating for damages caused by the pollution. Seen from an extremely individualist point of view, they shouldn't. They haven't done anything themselves, and cannot be blamed. If current people separate themselves as radically as this from their ancestors, however, it is difficult to see why they should be entitled to | No action; these are good points but this part of the chapter is minor and probably shouldn't be expanded. |
| 10230 | 3 | | | | | Figure 3.6 is v2.0 McKinsey cost curve, but we would advise using the latest published version which is v2.1. We would also advise using the 2030 curve rather than the 2015 one shown in Figure 3.6 as this is the year on which our analysis focuses. Please find the v2.1 2030 chart on page 8 in the publication "Impact of the financial crisis on carbon economics: Version 2.1 of the global greenhouse gas abatement cost curve" found at the following link: http://www.mckinsey.com/client_service/sustainability/latest_thinking/greenhouse_gas_abatement_cost_curves. The labels on Figure 3.6 would then of course need to be changed to 2030 from 2015 | Noted; will be addressed in SOD |

|---|---|---|---|---|---|---|---|
| 3330 | 3 | | | | | The chapter is lacking a discussion of the main normative obstacles to responding to climate change on the model of Gardiner (2011) and section IV of Thompson, A. and Bendik-Keymer, J. (2012) Ethical Adaptation to Climate Change (MIT Press). Such obstacles -such as the pure intergenerational problem or institutional fragmentation of agent responsibilities may be some of the best and most important places for any ethical consideration of climate change to begin. In general, chapter 3 does not critically examine the structures of authorty or legitimacy that we have inherited in a pre-climate forcing (or aware of CF) world. This makes the discussion lopsided: focused on going-forward tools that may not effect the underlying forms of power that have given rise to systems of law and legitimacy that hinder or promote climate forncing. | Noted; will be addressed in SOD. We intend to include more on the literature on cooperation, which includes the classic prisoners dillema. |
| 4121 | 3 | | | | | Please review chapter 4 sections 4.2.2, 4.2.3, 4.7.2, and 4.7.3. If you feel that these sections contain redundant and/or inconsistent duplications of chapter 3 discussions, please advice chapter 4 authors on how to revise their sections. | No action; presumably issues in chapter 4 will be highlighted by reviewers. |
| 4129 | 3 | | | | | It would be useful to highlight the relation of your chapter to the AR4. What has happened since? How were key concepts and methods framed in the AR4 and how do you extend on this assessment? | No action; this is tough for a framing chapter, particularly considering that AR2 was the last AR that considered economics in depth (although |
| 4130 | 3 | | | | | Your chapter covers many important issues but it is not always clear how they relate to each other. Individual sections seem very disjunct. It would be helpful for the reader of you developed a storyline that links all issues (which is challenging given the excessively broad scope of your outline) and explains why they are assessed in this order. Moreover, each section should state how it relates to subsequent chapters because your primary role as a framing chapter is to establish transparency over concepts and methods that are used in different parts of the report. | Noted; will be addressed in SOD |
| 4131 | 3 | | | | | It would be useful if you could state at the beginning of your chapter how its contents relate to chapter 2. Chapter 2 also discusses CBA, CEA, etc. to some extent. Why and how does your assessment of these concepts and methods differ from chapter 2? | No action; we are not focusing on uncertainty. |
| 4132 | 3 | | | | | Please respect the page limit (65 pages) for the Second Order Draft of your chapter. | Noted; we will make the best effort to shorten the length of the chapter as we |
| 4144 | 3 | | | | | Please review chapter 5 section 5.10 and make sure that the concept of co-benefits is consistent with yours. | Noted; we are revising our co-benefit discussion. Suggest Chapter 5 refer to the SOD and make sure things are |
| 4486 | 3 | | | | | See comment #20. | No action; comment unclear - no page or section reference numbers |
| 4491 | 3 | | | | | A general comment on the chapter: The text tends to posit a narrow range of possibilities for the issue being discussed, lists without much analysis the arguments on various sides of the (narrow) framing, and then proceeds to continue the discussion as though the extremely serious problems even in the narrow discussion do not exist or somehow have been settled. Such a format works better for discussions of scientific issues than for discussions of ethics and morality. The chapter does say in several places that it is not intended to be prescriptive, but it might be emphasized that "the literature" by no means constitutes the last word on the various issues being discussed. | No action; comment unclear |
| 2208 | 3 | | | | | <no comment here as cells could not be enlarged to fit the text> | No action; comment unclear - no page or section reference numbers |
| 15290 | 3 | | | | | Table 3.4 may be seen as a summary of the present knowledge. However, the Table contains results from rather old studies and it is later described in the chapter that there are possibilities of significant underestimations. I therefore suggest that the table is deleted or replaced by a true summary of the present knowledge. | Noted; will be addressed in SOD |

| 9289 | 3 | | | | | The relationship between the discussion of prioritarianism in section 3.3.3 and that in section 3.4 (p.21) is not clear. One can distinguish between telic and deontic forms of prioritarianism. It is clear that in section 3.4 it is the telic form that is under discussion, since prioritarianism is there stated by way of a value function. But I am not sure which is intended in section 3.3.3. I guess that it may be a deontic form, since it appears in a section titled "justice/equity/responsibility" and a subsection titled "intragenerational justice: distributive justice", and since the author does not anywhere explicitly say that the reason we e.g. "have a reason to give some priority to benefitting people who are not well off" is because doing so leads to a better distribution. If so, it would be helpful to make this clear, and in particular to make clear that the doctrines called "prioritarianism" in these two sections are not the same. If not, it would be helpful to make clear the intended connection between the talk of priority/reasons/ought-statements in section 3.3.3 and the value function given in section 3.4 (or revise the chapter structure - there is some danger of duplication here). | Will be addressed in SOD |
| 16928 | 3 | | | | | Fankhauser S, R.Tol, and D.Pearce, 'The Aggregation of climate change damages: a welfare-theoretic approach,' Environmental and Resource Economics, Vol.10. 1997 pp.249-66 | No action; comment unclear - no page or section reference numbers |
| 11992 | 3 | | | | | General comment: Please address not only the right to live of people but all species. Many cultures respect that already today and do not talk of animals as "resources" but as relatives. You mention for example Bhutan and Brazil's constitution but also American Indigenous people and Aborigenes have a more balanced view. Alternatively, you should define on what basis you consider humans superior to Elephants, Dolphins, flies etc.. | No action; we cannot make such prescriptive statements |
| 4258 | 3 | | | | | This table seems to exclude more recent examples which attempt to assess the social costs of catastrophic climate change e.g. Http://www.economics-ejournal.org/economics/discussionpapers/2011-40 by Ackerman and Stanton | Noted; will be addressed in SOD |

|---|---|---|---|---|---|---|---|
| 13413 | 3 | | | | | GENERAL COMMENTS<br><br>The treatment of historical responsibility could be strengthened by stating the share of cumulative emissions of developed countries (eg since 1850 or 1950), giving some estimates. (The range is usually 70-75 per cent). This could be included in the first paragraph of page 12 of a new paragraph after that.<br><br>There is need for better balance or clearer conclusions on whether developed countries have responsibility/obligations to take measures to assist poorer countries with their climate actions and their development efforts, because of the developed countries' overwhelming contribution to cumulative emissions. In some places (especially on page 13-14), the treatment of this issue appears to be weighted towards arguments against responsibility because of ignorance etc. More space should be given to the counter-arguments by writers such as Shue and Gardiner.<br><br>The recent work on climate equity and climate justice in the literature on greenhouse development rights, and on the equitable access to atmospheric space in the context of the carbon budget, has not been reflected in this chapter, which is a significant omission.<br><br>The section on sub-section on technology transfer (3.12.6.1) is poorly treated. There is too little space dedicated to it, although as a framing chapter, this chapter 3 is supposed to deal with the basics of this topic which is so important for the solution to the climate change crisis, and also specifically to enabling developing countries to contribute to the global solution. It is also critical not only to the economic issue but to the "ethical" issue, as developing countries consider technology transfer to be central to any global agreement on climate actions. The very small space given to this central issue in this framing chapter was due to a misconception that this chapter would not deal with this issue, whereas the Wellington Accord clearly designates this chapter to deal with the framing of this issue. The zero draft had a much longer treatment of the issue, including on technologies in the public domain and patented technologies, the issue of IPRs in the context of access to affordable technology and the principles and mechanisms of international cooperation for technology development and transfer. Unfortunately most of the zero order text has been eliminated. Worse, what remains is often a distortion of the meaning and balance of what was in the original draft and in the zero order draft.<br><br>In general, issues of interest to developing countries' researchers and policy makers have not been sufficiently addressed in the chapter. A much more lively and relevant review of the discussions and literature on social, economic and ethical concepts, including on the recent significant expansion of work on equity, climate ethics and climate justice, should have been done in the chapter. | No action; this would be normative and policy-prescriptive, which is not the intention of the report |

|---|---|---|---|---|---|---|---|
| 8571 | 3 | | | | | Considering the centrality of debates about economics and ethics I understand why the IPCC has chosen to include this in its 5th Assessment. These are crucial issues, and are likely to remain central in domestic and international policy discussions. In addition, as someone whose research is focused primarily on the relationships between economics and ethics in climate policy, I recognize that this is an extremely difficult area to integrate in a single chapter. I fully recognise the challenge the authors have accepted in agreeing to lead this chapter. However, I am deeply concerned about this chapter and am unconvinced that it represents a constructive addition to these ongoing conversations, and it may even run the risk of reigniting long-standing frustrations about the way neo-classical economics has been used in the climate change context. I think that the core problems in the chapter revolve around the lack of recognition for the boundaries of economics - it is afterall, one one among many ways of seeing the world - and the lack of integration between the first part of the chapter, which is focused on ethics, and the bulk of teh chapter, which ignores ethics almost completely in its focus on econonmics. While I realize this may have been unintentional, the overarching tone of the chapter is something along the lines of, "we have to talk about ethics so we will in broad terms, and then lets get that over and get into the meat of the problem and really focus on economics". This is totally understandable, but is not an integration of ethics and economics and is not particularly helpful for readers who may be coming into these debates looking for a useful synthesis of current discussions in the broad literature on ethics and economics in climate policy. Finally, I was startled that no-where in this entire chapter did the question of rights, or a rights-based approach to ethics, emerge while this has been included in literature in this area and has been used as a point of reflection about some of the limitations of neo-classical economics in this context. I realize you can't cover anything, but ignoring an entire branch of ethical thought about this while some comparatively less central areas of economics are covered in detail seems odd, especially as a rights-based framework presents a radically different alternative to CBA or other economic approaches to valuation. Overlooking this area detracts from the authority and legitimacy of the chapter. I really hate to say this, but in its current form I remain unconvinced that this chapter should even be included in the IPCC, although I realize this is probably not an option at this stage. It requires an enormous amount of non-facile work in order to make a legitimate claim that it has represented a reasonable discussion of the ethics of climate change, much less an integration or thoughtful dialogue between ethics and neo-classical economics. Some of the latter sections are better than the earlier ones, and in several situations (such as the discussion of WTP) the latter section is clearer, more balanced and generall more coherent. In my detailed comments I have suggested removing teh earlier sections to avoid duplication, or at the very least, bracketing the earlier less balanced sections with clear references pointing readers to these stronger sections. Overall sections 3.4 through 3.7 are the weakest. I would strongly recommend serious reconsideration of these sections, as included in my more detailed comments, one constructive strategy for better framing these sections would be to include clearer and strong paragraphs at the start of each section that clearly indicate the limitations of the assumptions used in the section (ie. all of these are non-transparent in their sole use of neoclassical eocnomics as the default appropriate strategy for climate policy decision making, an assumption that does not resonate with the stated goals of the chapter and which is cognitively ill at ease with several other sections - such as 3.11.2) | Noted; will be addressed in SOD. This is a very thoughtful point. And we certainly do need to make sure what we have makes a contribution. However, our goal is not to integrate economics and ethics. These are separate topics with some overlap. |

| 17804 | 3 | | | | | While I like very much this chapter - however in the context of this book it would then have an added value if the various indicators or metrics would be applied across the sectorial sectors and the others - this would then substantially contribute also in the formulation of sustainable development goals. The chapter has to my opinion still an impoprtant bias - it has the major hand of economy - in it and a major philosophy on how using wellbeing - and possibley link to an economic metrix - nevertheless in some instances, places countries areas not even the minimum has been existed in estimating simply the number of death attributable or the number of injuries attributable etc etc - thus a careful revision and shortening of this chapter is required and a transposal accross the other chapters in the metrix used - or a summary table from the sectorial chapters in this chapters - providing the linkage of this general more philosophy to the various mitigation sectors. There are many more issues to be mentioned here from health sciences, and social equity studies - which seem to have been omitted and rather been fragmented - if thought of- accross the chapter. | No action; comment unclear |
| 10686 | 3 | | | | | The table 3.3 and accompanying discussion misses at least one new set of metrics in the literature: the Peak Commitment Temperature (PCT) and Sustained Emission Temperature (SET). See Smith S. M. et al. (2012) Equivalance of greenhouse-gas emissions for peak temperature limits. Nature Climate Change. | Noted; will be addressed in SOD |
| 5129 | 3 | | | | | To shorten the chapter, I suggest curtailing efforts to provide a CBA primer; sections on policy intruments and criteria for comparing them could be combined into one streamlined chapter. A good deal of cross-referencing with the chapter could be cut if the overall schema of the chapter was clearer. The discussion about common and civil law could be presented very briefly. | Noted; will be addressed in SOD |
| 15375 | 3 | | | | | This section starts to lose the tight organization and terse exposition. It is repetitive of much of the earlier material, the author notes this. The discussion of IAM is lengthy but not well-informed. It states broad generalizations based on a couple of biased surveys, and could have simply looked at the actual publications describing the models and results to see how wrong Terry Barker and others were. A list of IAM's that are being discussed and a table comparing their content and basic methodology needs to be included. Right now this seems too much like a set of off the cuff generalizations with random examples – the danger of the approach I applauded in the first part of the chapter. DICE, RICE, PAGE and FUND are good models, but the IAMC includes many more. Leave it to chapter 6. | Noted; will be addressed in SOD |
| 10848 | 3 | | | | | In this section, it would have been good to mention and discuss that most economic models of mitigation will somehow implicitly assume an "exchange rate". Discussing how that is done, reporting on the values obtained, etc, would be extremely beneficial to the metric community. | Noted; will be addressed in SOD |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 15378 | 3 | | | | | This section absolutely must include a discussion of Mark Jaccard's work on consumer behavior in order to deal with the issue of "consumer misperception" in a way that is compatible with earlier discussions of prescriptive and market based policies. There are a number of problems with the position stated here. 1. Unless policies actually remove the specific market failure at a cost less than the foregone gains from moving to a perfect market, they will not necessarily improve welfare. [For a citation, see just about any paper by Stavins or Jaffe and Stavins on energy efficiency]. Specifically, has there been any analysis of the full implications of using corporate average fuel economy or appliance efficiency standards to remedy an information problem? 2. The observation that consumers suffer "buyer's remorse" in the particular form of wishing their newly purchased vehicle had better fuel economy does not imply that a. a government imposed standard will make them any better off, given the lack of information regulators have about individual preferences and circumstances and the frequency of "voters' remorse". b. Buyer's remorse is not confined to new car purchases. Therefore either the rationale for regulating vehicle choices applies to every other instance of buyer's remorse (I am particularly subject to it when I eat out, so shouldn't there be minimum standards for restaurant food? Oh, that's right, New York City does regulate restaurant food) c. Since buyer's remorse violates the basic axioms that characterize preferences that lead to a consistent ordering (or utility function) it is far from clear how to define any welfare criterion based on consumer preferences – is there not an argument that decisions under uncertainty (which includes all purchase decisions in some degree) should always be represented in terms of ex ante preferences rather than hindsight re-evaluations? | AGREE action will be taken |
| 3372 | 3 | | | | | 3.10.1 mentions 5 metrics for evaluating climate change effects, citing Schneider (2000). But then only one metric, economic cost, is further explored in 3.10.2. Why are the other metrics not specified? These other metrics seem to be particularly relevant for exploring the co-benefits of mitigation action, and are utilized in the sectoral chapters.This issue is, in my opinion, at the core of the AR5. | Noted. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 16933 | 3 | | | | | IPCC is so loaded with costing models and gurus that I will refrain from commenting on the specific model results, but I am a bit puzzled about the purpose of this section. One point that I think could usefully be made is that however “costs” are defined and models run, the costs of mitigation are set within both vastly larger determinants of economic growth – they are a difference in percentage growth rates of some small and highly uncertain fraction of a percent. Morever the determinant sof long-run growht remain something of an economic puzzle, but we know that innovation is important. Another way to make the point is that a scatter plot of EMF-22 results of 2050 GDP vs CO2 across all models and scenarios shows almost no discernible relationship (Grubb, Hourcade and Neuhoff, Chapter 11).<br>However, the discussion on the McKinsey curve unfortunately seems to illustrate the extent to which disciplinary bias risks denigrating this chapter. Apparently the McKinsey curve is “highly controversial” (a statement repeated) whereas models that assume the baseline is perfectly optimal, that all actors are rational optimising agents with perfect foresight, that there is no endogenous technical change, etc etc, are not controversial. This is really not the intellectual standard one would hope for, even in a First Order Draft.<br>The same applies even more to the discussion on “negative cost” measures, where the comments also contradict both the theory ("System 1") implicit in the FOD Chapter 2, and the evidence in much of the rest of the AR5 draft chapters (most obviously, buildings). The “negative cost” issue is well over twenty years matured, with a huge literature, and this text reads like first reactions from an economist who has read nothing about it. The evidence incidentally, spans not only technological assessment but applied policy evaluation (there is plentiful material in the other AR5 chapters, to which I could add our own analysis in Grubb, Hourcade and Neuhoff, Chapters 4 and 5, which review respectively the theory and the empirical evidence from policy evaluation). Again moreover this is duplicating old debates and discussions in the IPCC; the chapter should at least acknowledge that the McKinsey estimate of “negative cost” potential was substantially smaller than the IPCC AR4’s own estimate (c. 3.5 vs 5 GtCO2 from the buildings sector respectively).<br>Finally, I am not convinced it is fair to criticise the McKinsey curve for its proprietary nature. The 200-page report they published was far more detailed than many academic papers, and a scan of their website seems to me to show a considerable degree of transparency and debate. The core point however is just that McKinsey curve is the only consistent study to aggregate bottom-up assessments globally into a cost curve, the main alternate being the IPCC's own AR4 assessment which was presented in a different way, and suggested a bigger First Domain (and smaller Second Domain) potential. □ | Noted; will be addressed in SOD |
| 18347 | 3 | | | | | Please link your discussion of different modeling approaches to relevant section in Chapter 4 (4.5.3.1) to avoid redundancies and sharpen specific chapter-relevant focus. | Noted; will be addressed in SOD |
| 10685 | 3 | | | | | It is good to see some discussion of alternative emissions metrics here, which are the subject of a fair amount of academic research and political discussion (see Plattner, G-K. et al. "IPCC Expert Meeting on the Science of Alternative Metrics", IPCC 2009) but have been underplayed in previous WG3 reports. But the discussion here contains much high-level theory and little relevant application. For instance, how do the metrics relate to the 2 degree limit (and 1.5 degree limit) specifically? Plus it would be very useful for readers to see how the use of different metrics would affect estimates of aggregate CO2e emissions, both for historical trends and future pledges. Even if this is just done using the GTP100, which is perhaps the most commonly cited alternative to the GWP100, it would be a big step forward. | Noted; will be addressed in SOD |
| 11357 | 3 | | | | | I think that this section provides a good overview of metrics from the economic perspective -- I like the way that the discussion starts from the general economic frameworks and then the individual metrics are drawn. | Thank you for your comment. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 16934 | 3 | | | | | Damages: Surely in a chapter on social, economic & ethical dimensions, the most important points to make are that the quantified estimates cited are rendered controversial by all the issues discussed previously in the chapter around aggregation, plus the discounting / intergernational debate, the missing values, etc. I also find it bizarre to discuss these issues without referring for example to the more qualitative risk studies, for example Downing's risk matrix (Watkiss and Downing, 2007).<br>AR5 is the first IPCC assessment that could take full account of the post-Stern debates on climate impacts and valuation. This chapter does not do these justice. One overview is given in the first chapter of Grubb, Hourcade and Neuhoff, 'Planetary Economics: the three domains of sustainable energy development.', Taylor and Francis (Chapter 1) | Noted; will be addressed in SOD |
| 16641 | 3 | | | | | What are the practical draw-backs from applying weights this way? | No action; comment is too vague; no line number or page number. |
| 12790 | 3 | | | | | You may also like to cite experimental studies, with regard to leadership e.g. see Arbak, Emrah; Villeval, Marie-Claire (2007): Endogenous Leadership Selection and Influence. Hg. v. Centre National de la Recherche Scientique. Centre National de la Recherche Scientique. Écully (Working Papers, 07-07), or Potters, Jan; Sefton, Martin; Vesterlund, Lise (2007): Leading-by-example and signaling in voluntary contribution games: an experimental study. In: Economic Theory 33 (1), S. 169–182) | AGREE action will be taken |
| 5128 | 3 | | | | | The section on behavioural economics and culture (apart from offering a curious blend of topics) was the strongest for me, as it uses concrete examples, eschews high theory, and helps broaden discussion. | NOTED Thank you for your comment. |
| 3373 | 3 | | | | | In contrast to the general approach of chapter 3, this section is written in a bottom-up manner, detailing examples. It does not give concepts and categorizations of behavioral issues. This section could learn from chapter 2, and offer a categorizing, thus enabling also the sorting of examples, which are not mentioned in the text. | NOTED general action will be taken |
| 12789 | 3 | | | | | The relevance of subjective justice perceptions is important, here: a fair burden-sharing rule is more likely to be accepted and followed (Third Assesment Report, WGIII). So the stability of an agreement could be improved if the agreement is in line with the individual perception of fairness. | NOTED general action will be taken |
| 5323 | 3 | | | | | As mentioned already in the remarks to chapter 1 and in the comment on Chapter 2, section 2.4.3: The authors seem to ignore possible switching cost and other hidden cost incurred by the consumers through adopting new technology. | AGREE action will be taken |
| 4113 | 3 | | | | | Please discuss this section with chapter 2 authors. | AGREE action will be taken |
| 4507 | 3 | | | | | It seems biased to give such prominent treatment to cultural constructs such as buen vivir and Gross National Happiness without giving equally explicit to the "stewardship" model of human/environment interactions as developed by Evangelical Christians (as in, for example, Katherine Hayhoe and Andrew Farley, A Climate for Change). Other major religious traditions also stress obligations to future generations and other species. | DISAGREE Buen Vivir and GNH don't have anything to do with a religious point of view, they enhance an alternative (non western) cultural attitude! So I don't |
| 15457 | 3 | | | | | The chapter contains a section on social and cultural issues (3.11.2), as part of an effort to seek alternative efforts to traditional mitigation strategies. Similar alterantive ways of understanding issues of vulnerability and adaptation should also be discussed briefly, so that problems of universaalism and specificity are acknowledged and addressed. A good source for "Asian' perspectives, containing a critique of some of the dominant universalizing tendencies, is in "Human Security and Climate Change in Southeast Asia", eds., Lorraine Elliott and Mely Caballero-Anthony. Routledge Security in Asia Pacific Series, 2012 | NOTED but adaptation and vulnerability are treated in WGII |
| 5325 | 3 | | | | | I also do not know why this section is important for the IPCC report. The section also ignores all the critical literature on social capital. To name two important critical contributions:<br>Robert Solow (2000) "Notes on Social Capital and Economic Performance," in Dasgupta, P. und I. Serageldin (ed.: Social Capital, a Multifaced Perspective, The World Bank, Washington D.C.., pp 6-10.<br>J. Sobel (2002): "Can we trust Social Capital?" Journal of Economic Literature 40, 139-154. | NOTED general action will be taken. |

|---|---|---|---|---|---|---|---|
| 3374 | 3 | | | | | It is not well motivated why technological change is such an important concept that it deserves its own subsection. | No action; this section is given and agreed by the WGIII Plenary |
| 9010 | 3 | | | | | This section on learning by doing does not mention that learning by doing in many developing countries is unduly constricted by the international property rights regime. If the issue about technogical transformation for climate change is one of acceleration, then the IPR regime could be an obstacle to this objective. See United Nations (2011a). World Economic and Social Survey 2011: The Great Green Technological Transformation. Sales No. E.11.II.C.1. | Will be addressed in SOD |
| 9009 | 3 | | | | | The section confines itself to literature on technological change of specific products and sectors. It cites studies that say that "innovation responds quickly to price changes" (p. 70 , lines 30-31). The kind of technological change required to respond to climate change is system-wide, both on the production and consumption side. It is important to cite problems that must be faced when system wide technological change, not just individual sectoral change, is required. For example: Wilson, Charlie, and Arnulf Grübler (2010). Lessons from the history of technology and global change for the emerging clean technology cluster. Background paper prepared for World Economic and Social Survey 2011. Wilson, Charlie (forthcoming). Historical scaling dynamics of energy technologies: a comparative analysis. This publication studies the problems of system-wide technological changes in response to climate change: United Nations (2011a). World Economic and Social Survey 2011: The Great Green Technological Transformation. Sales No. E.11.II.C.1. A survey of the more development-oriented literature would have identified the system-wide challenge required in technological development. | Will be addressed in SOD |
| 12531 | 3 | | | | | There are recent noteworthy developments in “experience curve” assessment. I am providing separately a recent summary paper, “Experience Curves and Solar PV” (2012-09-03-nwec-experience-curves-and-solar-pv.pdf) with additional references. Suggested additional language in this section: “A new paper sponsored by the Santa Fe Institute (Nagy et al. 2012) summarizes a meta-evaluation of estimation methods including cost per cumulative production (“Wright’s Law”), cost per annum (“Moore’s Law”), cost per rate of annual production (“Goddard’s Law”); time-lagged variants of the single factor approaches; and hybrid or multifactor estimators combining the single factor approaches (based on work by Nordhaus and Sinclair, Klepper, and Cohen). Forecast skill for each of the methods was assessed with a hindcasting approach across 62 technologies in four categories (chemical, hardware, energy and other), with time series ranging from 11 to 39 years. The analysis concludes that the traditional experience curve approach (Wright) performs quite well across technologies and different time scales, and is significantly better overall than the other approaches, although Moore is very close over shorter time ranges. The robustness of the results for the experience curve approach is striking.” Bela Nagy, J. Doyne Farmer, Quan M. Bui and Jessika E. Trancik, 2012. Statistical Basis for Predicting Technological Progress, arXiv:1207.1463v1 [physics.soc-ph], http://arxiv.org/abs/1207.1463 . | Will be addressed in SOD |
| 18359 | 3 | | | | | Please link this discussion to the relevant sections in Chapter 13 (13.9.3) and 16 (16.5) to sharpen chapter specific focus and avoid redundancies. | Will be addressed in SOD |
| 12532 | 3 | | | | | This discussion should be expanded. There is considerable literature and research on open source technology and intellectual property, and this is an important development pathway for mitigation and adaptation measures for climate response. | Noted for reorganizing section in SOD |
| 9011 | 3 | | | | | This section on international cooperation for technology transfer and development could be strengthened by referring to a vast literature (there are only two citations right now). For example, there are suggestions and citations for needed actions at the international level in Chapter VI entitled "Building a Global Technology Development and Sharing Regime in United Nations (2011a). World Economic and Social Survey 2011: The Great Green Technological Transformation. Sales No. E.11.II.C.1. | Good point, but this issue is addressed in more detail in chapter 13 |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 6983 | 3 | | | | | Some suggestions: (1) moral responsibility for CC - individual, collective, or both?; (2) criminal justice and CC; (3) ethics of geoengineering; (4) the role and nature of feasibility constraints in moral arguments about CC; (5) triage; (6) methods in ethics for assessing different post carbon futures. | No action; too general for research need |
| 16642 | 3 | | | | | Shorten this discussion. Many of the technical details can be left out. | No action; comment must be referring to another section, as this section is only |
| 11007 | 3 | | | | | While ethics permeates the discussion of climate policy, its role appears to be largely one as rationalizing interest-based positions. Further the research tracing the roots of ethical behavior to evolutionary biology suggests that, insofar as ethics influences behavior, it often favors behavior that is more 'tribal' and less universal and more emotive and less rationalistic than is suggested by the discussion. | No action; this comment appears to misunderstand the discipline of ethics. |
| 16630 | 3 | | | | | Delete the sentence that starts with "[t]his is to assume…" | No action. Disagree with comment |
| 5125 | 3 | | | | | This appears to be the result of a numbering problem; the section is almost completely redundant. Following the intro and overview in the current 3.1, this section should be omitted and 3.3 on adjusted up. | Cross-referencing has been corrected. The section is essential for describing |
| 9343 | 3 | | | | | Section on procedural justice should conclude with some discussion on how and in what context it can be applied to issues of climate change 9as thesection on distributive justice) | Will be addressed in SOD; will add an example, if possible |
| 2577 | 3 | | | | | Section too theoretical. Would be good to have cases of litigation against national governments in favor of climate law, compensations etc. If possible, with tipologies of settlements | Will be addressed in SOD |
| 9014 | 3 | | | | | Section 3.3 and the executive summary highlights the legal principle of wrongdoing for determining responsibility. It ignores literature among philosophers and ethicists, such as Gardiner (2010) and Shue (1996, 2010), which argues that wrongdoing is not necessary to assign social responsibility. See: Shue H. (2010). Deadly delays, saving opportunities: creating a more dangerous world? In: Climate Ethics Essential Readings. S.M. Gardiner, S. Caney, D. Jamieson, H. Shue, (eds.), Oxford University Press, Oxford; New York pp.146–162. Available at: http://site.ebrary.com/id/10399387 | Thank you. We added a sentence and a cross-reference |
| 13009 | 3 | | | | | The more general philosophical issues about the traction of normal concepts of responsibility should probably be mentioned (see, for example, Jamieson, 'Ethics, Global Warming and Public Policy' 1992; Sinnott-Armstrong, 'It's Not My Fault'; Gardiner, 'Is No One Responsible for Global Environmental Tragedy' 2011). | Thank you, we added a discussion of the responsibility of individual persons. |
| 4482 | 3 | | | | | This section leaves all the issues hanging. The entire IPCC exercise is pointless if the obligation of present to future generations is not recognized. The discussion of the various definitions of "harm" is unduly abstract. | No action; disagree. This section is simply meant to outline the rest of the |
| 2114 | 3 | | | | | On line 37, it is claimed that both options of applying prioritarianism to emission rights are problematic. So is the conclusion of this section that prioratarianism about emissions is implausible? If so, is there a recommended alternative? | Agreed. We changed the wording. |
| 4487 | 3 | | | | | As above, legal systems pertain to existing nation-states. The international law of torts is, to put it mildly, undeveloped. These arguments having to do with different concepts of torts seem like scholasticism (in the bad sense), given that there is no encompassing international legal authority, and there is not likely to be one in the forseeable future. (And would such a single world-wide authority really constitute movement in the direction of greater justice? It is not at all clear that it would.) | No action; international law beyond scope of chapter |
| 2121 | 3 | | | | | The discussion is 3.3.7.1 & 3.3..7.2 could be better structured. As it stands, there is considerable repetition and overlap between the different "components". | Will be addressed in SOD |
| 9015 | 3 | | | | | This section involves a sophomoric discussion of welfare functions, and issues of aggregation across individuals and across time. Nevertheless, it devotes enormous space and word count to additively separable forms, without evaluating the relevance of these approaches to ethical and social decision-making on climate change. This section is thus a chief example of the irrelevant and wasted literature review in this Chapter. The discussion on page 19 with the figures on distribution of invididual well-being across time does not refer to any existing peer-reviewed article. This section ignores the literature on historical responsibility and agreed international principles such as the right to development and equitable access to development. | No action; disagree with comment |
| 3608 | 3 | | | | | Connection to climate change mitigation issues too loose and abstract because lacking concrete examples in the text. Please add more application examples! | Some examples have been added. But the applications of general theory are not |
| 16632 | 3 | | | | | The paragraph that starts in this line needs a connection to the previous paragraph or a transition/subtitle. | No action; comment unclear; no line |

| 13011 | 3 | | | | | Clare Palmer's interesting (2011; in the Arnold volume) argument about the problems facing some ecological analyses may be worth a citation. | Added |
| 2207 | 3 | | | | | A recent and relevant source for this entire section is John Nolt, “Nonanthropocentric Climate Ethics,” WIRES Climate Change 2, 2011, pp. 701-711. (http://wires.wiley.com/WileyCDA/WiresArticle/wisId-WCC131.html). | Reference added |
| 3329 | 3 | | | | | I find this expression, "non-human values" equivocal and potentially confusing. "Values concerning non-humans" or something of the sort would be better. | It's now defined. |
| 4489 | 3 | | | | | Recommend dropping this entire section. | No action; sections are set by IPCC |
| 6975 | 3 | | | | | D.o. | No action; no comment |
| 8489 | 3 | | | | | As Hochschild (1981) notes in "What's Fair?", there are multiple "domains" of equity and equality, including social, political, economic, health, environmental, etc. Citizens may not hold equal or consistent orientations to equality (of opportunity, or condition) across those domains. | It's not clear how this point is relevant. |
| 6976 | 3 | | | | | D.o. | No action; no comment |
| 16634 | 3 | | | | | A version of this paragraph should be close to the beginning of the section and deleted from its current position. | No action; comment does not provide paragraph reference |
| 16930 | 3 | | | | | Aggregation of costs and benefits<br>This section might usefully start with an important caveat along the lines in my general comments: aggregation approaches reside within and are constrained by a moral framework of norms and rights. To take a blunt and highly personal example: my father is very ill with Alzheimer’s disease. He needs constant care, adds nothing to the economy, consumes a lot of resources of the UK National Health Service, and is clearly no longer enjoying life. Any conceivable cost-benefit analysis would suggest that his life should be terminated. The State, fortunately in my view, has absolutely no right to do so; nor do I, or anyone else. The cost-benefit aggregation of welfare is only an acceptable basis of decisionmaking within carefully described boundaries.<br>The problem of climate change most fundamentally is that it does involve the logical equivalent of transgressing the Westphalian principle of Sovereignty, but with no agreed basis on the acceptable implications of this. The idea that the welfare of Tuvalu, or those living in the Bangladeshi delta, can be aggregated into irrelevance is not accepted by those who live there (the issues of WTA vs WTP metrics is core here: see section 3.10). Unless this section starts by acknowledging this limitation, it will alienate those who feel vulnerable, and make them believe that cost-benefit is a codeword for trampling on and ignoring their rights and interests.<br>I am not sure if the brief dive into maths helps, or will alienate some readers.<br>Finally, in a different vein, fundamental issues in Aggregation also surfaced in the Stern review and subsequent debates, most notably involving Dasgupta’s critique around consistency in equity weighting (eg. Dasgupta 2007). Note that Dasgupta concluded that with high levels of inequality aversion and uncertainty ‘no optimum policy exists .. consumption discount rates cannot be defined and social cost-benefit analysis of projects becomes meaningless.’ | The chapter has been reorganized in response to this comment and others like it, to make the limitations more explicit. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 16932 | 3 | | | | | I don't understand the purpose of the section on "The Paretian Approach" in this section. In some circumstances (e.g. many of those pertaining to 1st Domain processes) Pareto improvements are possible. The dilemmas of aggregation are then avoided because one set is Pareto superior to another. This is essentially the economic terminology for the broader principles of First Domain effects. Since this chapter is about clarifying ecnomic principles, it might be useful to clarify the economic processes that correspond to First, Second and Third Domain (eg. see Figure 2.3 in Grubb, Hourcade and Neuhoff, Chapter 2). However, the whole point is that the three domains are not substitutes, but complementary. Domain 1 / Pareto improvements are not alternates to cost-benefit, but simply reflect different dimensions of the element; consequently, I am not sure how they fit logically in this section. (Grubb, Hourcade and Neuhoff, Planetary Economics: the Three Domains of Sustainable Energy Develpoment, Chapter 2 (submitted, and sent to IPCC Secretriat), Figure 2.3 Three Economic Processes) | Noted. |
| 9016 | 3 | | | | | This section discusses issues of aggregation among individuals and across time, a discussion that is neither new nor made relevant to the question of climate change in the section. It talks about the issue of proper discount rates but does not reflect that discount rates could differ among individuals and countries not only due to tastes but also due to differences in incomes, wealth, and level of development. It devotes some space to th relationship between market rates of interest to the discount rates but must recognize the fact that ethical judgements and considerations of equity must play a decisive role in any setting any weighting between current and future generations. It would also be useful and more accurate if the discussion in this section could recognize Ramsey's original own deep doubts about the mechanics of aggregating across generations and relatively weighting their marginal utiliites. | No action; we have considered the point but feel is not valid. Discounting aspects are explicitly treateds in section 3.6 |
| 3609 | 3 | | | | | Connection to climate change mitigation issues too loose and abstract because lacking concrete examples in the text. Please add more application examples! | A few more examples have been added. But the theoretical underpinnings of |
| 7362 | 3 | | | | | This discussion adds little to the analysis and is unncessary. | No action; others attach importance to |
| 4635 | 3 | | | | | Section 3.6 makes the case forcefully that "there is no consensus on the pure discount rate". Economists who work in the area of benefit-cost analysis hardly need to be told this fact. However, they and non-economist policy-makers could use help. Can the section be summarized beyond "use a rate between 1.4% and 7%" or "many analysts suggest a rate of around 2%"? While it would be easy to repeat the benefit-cost analysis at different discount rates, and many of us have done this, someone at some point has to come up with a specific rate. This is also true if one tries backing in to the analysis by calculating the discount rate at which two projects would return the same net benefit. | No action; the report should recognize disagreement. Please go to specific authors for specific numbers (our table 3.1). Cannot create a consensus that does not exist. |
| 13000 | 3 | | | | | Discounting is one of the most important issues in climate ethics and economics. Unfortunately, the treatment here is much too brief (e.g., see the second assessment report), and appears to take almost no account of the ethical questions and objections surrounding discounting (see, e.g., chapter 8 of Gardiner, A Perfect Moral Storm). I would recommend an expansion and a particular focus on the ethical concerns. | No action; space limited. |
| 18596 | 3 | | | | | 3.6 discusses discounting and discount rates – but to what extent is this really relevant? Isn't the problem that some alternatives (or sorts of behaviour) are unacceptable from an "ethical" perspective to at least some individuals? What are we trying to discount? The balance between consumption or investments or how to distribute something that is ultimately restricted over time? Is discounting a relevant way to handle fundamental choices in society? | No action; NPV is the standard tool. This section tried to elicit the ethical element behind this concept, with applications to the distant future. |
| 3610 | 3 | | | | | Connection to climate change mitigation issues too loose and abstract because lacking concrete examples in the text. Please add more application examples! | Need to discuss use of concrete examples throughout chapter |
| 13007 | 3 | | | | | I'm surprised that there is no mention here (or elsewhere in the chapter) of the claim in the literature that there is a strong overlapping consensus at least on the claim that the richer, more developed countries should take the lead and accept heavier initial burdens (e.g., Shue 1999, Singer 2002, Gardiner 2004, 2011). Even if one disagrees, it seems relevant to discuss this alleged consensus. | No action; no change implied, adequately addressed (see lines 31-32 on page 32) |
| 8490 | 3 | | | | | It may be helpful to place this section earlier in AR5 | Will refer to TSU, not sure we agree |

|---|---|---|---|---|---|---|---|
| 18736 | 3 | | | | | This section heavily focuses on economic approaches to the assessment/evaluation of policies and institutions. While the overview of criteria appears balanced as far as the contribution of mainstream economics is concerned (e.g. in terms of challenges faced and approaches used), it is extremely narrow in disciplinary focus and fails to incorporate the valuable (and, in the real world, highly relevant) contributions of other disciplines. One example is law, which is the means by which policies become operational in most cases and, as a discipline, by definition deals with interactions between sets of rules, principles and rights and duties. Accordingly, interactions between policies can only be fully understood when their potential legal conflicts with existing or future procedural and substantive rules are also factored in, as these can either result in the inapplicability or only partial applicability of the policy, or significantly hamper its implementation (or result in other consequences, such as litigation or liability for damages/compensation). By the same token, the success or failure of policies is often strongly affected by how well these harmonize with the existing legal framework, and how conducive that framework is to their effective implementation. For instance, procedural or institutional rules (which body has what power to play which role in the operationalization of a policy) can be decisive for the real-life application of a theoretically superior policy. Unfortunately, there has been very little jurisprudential scholarship specifically on evaluation of climate change policies, and hence it is difficult to pinpoint seminal research (see, e.g., Hollo, Erkki et al. (eds), Climate Change and the Law, Dordrecht: Springer, 2012); rather, it is necessary to understand the legal system in its entirety (and conversely grasp related scholarship very broadly) to fully capture the role of this discipline in evaluating climate policies. The same would apply to other disciplines that can contribute to the assessment of policies, such as e.g. behavioral psychology and its study of the behavioural factors that motivate or hamper change in human behavior e.g. to reduce emissions. Also, A brief acknowledgment of the epistemological challenges of the main criterion (environmental effectiveness: how to establish causality in complex physical and socioeconomic systems? How to define the environmental outcome that serves as the benchmark of effectiveness when mitigation policies typically pursue so many different and not always compatible environmental and other (social, economic, innovation etc.) objectives? Etc.) and the inevitable contingency, i.e. proneness to value judgments of all other criteria would seem helpful here, as it is barely discussed in ch. 3. Social science and humanities literature has begun looking at the limitations of the criteria developed in neo-classical economics, but is still scarce. See Mehling, Michael (2002): “Betwixt Scylla and Charybdis? Effectiveness in International Environmental Law.” 13 Finnish Yearbook of International Law 129-182; Erkki J. Hollo, Kari Kuusiniemi, Eriika Melkas and Michael Mehling (2002), “Legal Aspects of Climate Change: Instrument Choice and the Kyoto Mechanisms,” in Understanding the Global System: The Finnish Perspective, edited by Jukka Kayhkö and Linda Talve, pp. 177-182. Turku: FIGARE, 2002 | Noted to be considered in revising |

|---|---|---|---|---|---|---|---|
| 9005 | 3 | | | | | This section constitutes the nub of the fundamental weakness of the Chapter 3. The main line of reasoning of the section is correct that the "major differences between developing and developed countries' conditions and circumstances lead to differences in suitability and performance of policy instruments" (p. 38, lines 24-25). This should have been the touchstone for the policy discussions in the chapter since by nature climate change is a inter-state, and more accurately a global North-South, policy issue. There is only one reference in the whole section and this presents a stark contrast with the other sections which have numerous, overlapping citations. There exist many references that could have been referred to, just to cite two examples consider the following: (2009b). United Nations World Economic and Social Survey 2009: Promoting Development, Saving the Planet. Sales No. E.09.II.C.1.; and United Nations (2010a). World Economic and Social Survey 2010: Retooling Global Development. Sales No. E.10.II.C.1. The bibliography of these publications point to a vast policy evaluation literature pointedly ignored in this chapter. In many of these alternative uncited analyses, price mechanisms are seen to be either less effective or unacceptably inequitable. The text in this section gives an example of this in: "the use of certain market mechanisms, such as carbon trading schemes, may not be suitable or effective, or require significant efforts for creating the institutional prerequisites" (page 38, lines 36-38). | Will be addressed in SOD |
| 11010 | 3 | | | | | key point is that there are tradeoffs among the criteria by which policies may be evaluated. Shaping policies to make them politically acceptable within a given institutional setting makes them less efficient. Also, policy makers' knowledge is imperfect. Note 23 accurately observes that political factors have often been more important than economic ones. But the draft has almost nothing to say about what those factors are. In fact institutions and the uneven distribution of power within societies results in very uneven weights in the welfare of groups within a society. Whether the selectorate is broad or narrow with respect to the ruling coalition on the one hand and the population as a whole on the other is likely to profoundly affect policy choice. Further, policy instruments differ in the "political visibility" of costs and benefits. Compared to Pigouvian taxes, command and control regulations offer less easily perceived costs and more easily perceived benefits. At least in countries with broad rationally ignorant selectorates there is a bias toward the choice of less economically efficient command and control. | Good point; we took this into account in revising section. See new sentences in 3.9.1.4. |
| 4500 | 3 | | | | | It would seem appropriate in this section to cite the critique(s) of conventional integrated assessment models, such as Ackerman et al. (2009) which already is listed in the bibliography. There is by no means a consensus that existing integrated assessment models accomplish the objectives listed in this section. | We now refer to this paper in this paragraph. |
| 17913 | 3 | | | | | The explanation of co-benefits are inconsistent with agreements made in Wellington implying that LAs also use the term denoting climate benefits (and costs) from policies targeted at other policy objectives. The explanation additonally omits the possibility that climate policies often have an impact on pollution abatement costs and move the intersection points of marginal abatement costs and marginal social damages of pollution - thereby potentially yielding net gains for society. According to Pitcher (2000, p. 131), this is due to the fact that "policies to control greenhouse gas emissions have joint products; they also end up reducing emissions of other gases, or have impacts that are germane to other areas of concern…it is no longer possible to assign unique costs to the various outputs". Please take into account the definition and conceptual issues discussed with the Co-Chairs and the TSU prior to LAM3.<br>Hugh Pitcher (2000) Extending Integrated Climate Assessment Models to Include Ancillary Benefits: Problems and Prospects. In OECD, "Ancillary Benefits and Costs of Greenhouse Gas Mitigation". Proceedings of an IPCC Co-sponsored Workshop, Washington D.C., USA. | We revise explanation of co-benefits, in a whole new section. |
| 17914 | 3 | | | | | From the last short paragraph of the sub-section, it does not become clear whether the term co-benefit extends to these "other national objectives" (line 14). For chapters 4 through 12 and 15, these other objectives play an important part in the co-benefit/co-cost discussions. Please liaise with the relevant chapters in the cross-cutting meeting to determine a viable labor division and synthesis of results with respect to the co-benefits/co-cost assessment across chapters. | We now refer to the new longer section on co-benefits |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 15361 | 3 | | | | | This section agrees with me on the prior comment, but sweeps all the prior issues about the Pareto principle under the rug. | No action; no change implied |
| 15363 | 3 | | | | | This section is nice, points out how choice of an ethical system can be self-serving. Once it is possible to show that a particular ethical system leads to a specific distribution of wealth among parties, then those who gain from such an outcome have every reason to advocate that particular system. Therefore, a systematic comparison of ethical arguments to outcomes for parties making those arguments would be very enlightening, especially if combined with an analysis of whether those parties reveal their adherence to the same ethical arguments in their other dealings and decisions. For example, suppose some parties advocate an ethic that implies that a class, of which they are a member, should pay compensation to another class. Do those parties now provide a higher percentage of their GDP as aid to the class deserving compensation as part of climate policy? | No action; no change implied, confirming |
| 15364 | 3 | | | | | The discussion on prescriptive policies versus market-based policies in this section needs to be applied in each of the policy chapters (e.g. chapters 13-16). | No action; needs addressing in chapters 13-16 |
| 15365 | 3 | | | | | This is weak; many examples of modeling of cap and trade with regulatory measures show that the prescriptive measures move more costly actions down the supply curve and push out less costly, so that the same emissions are achieved at higher cost. This clearly applies to CES, RPS, CAFÉ, and LCFS. See: Jan Imhof. “Subsidies, Standards and Energy Efficiency”. The Energy Journal. Vol. 32 (Special Issue 1). October 2011. | Will be addressed in SOD |
| 15366 | 3 | | | | | This is weak; many examples of modeling of cap and trade with regulatory measures show that the prescriptive measures move more costly actions down the supply curve and push out less costly, so that the same emissions are achieved at higher cost. This clearly applies to CES, RPS, CAFÉ, and LCFS. See: Jan Imhof. “Subsidies, Standards and Energy Efficiency”. The Energy Journal. Vol. 32 (Special Issue 1). October 2011. | No action; duplicate |
| 15368 | 3 | | | | | This overlaps with international and regional chapters – though much clearer, it needs to bring in perspective on on-the-ground adaptation, how institutions shape economic outcomes of policies, and realism in assessment of aid and possibility of delivering on the ground improvements without harm. | No action; Chapter 3 deals with concepts, and Ch 13, 15 (for instance) deal with evaluative aspects as such. |
| 15372 | 3 | | | | | This needs to start with Acemoglu, Shirk, etc to discuss how Limited Access Order policies are designed to maintain the rulers in power in a limited selectorate by distributing patronage – climate becomes another example. And even in more advanced economies the same holds – see Lane and Montgomery, Weingast on nuclear power, Cohen and Noll, etc. See: Daron Acemoglu, “Why not a political Coase theorem?” Journal of Comparative Economics. Shirk, Susan L. China: Fragile Superpower. New York: Oxford University Press, 2007. Lane, Lee L. and Montgomery, David, Political Institutions and Greenhouse Gas Controls (November 5, 2008). Reg-Markets Center Related Publication No. 08-09. "Congressional Influence over Policymaking: The Case of the FTC" (Barry Weingast, Randall L. Calvert, and Mark J. Moran), in Mathew D. McCubbins and Terry Sullivan (eds.), Congress: Structure and Policy (Cambridge University Press, 1987), Ch. 19. Linda R. Cohen, and Roger G. Noll (With Jeffrey S. Banks, Susan A. Edelman, and William M. Pegram). The Technology Pork Barrel. Washington, D.C.: The Brookings Institution, 1991. | No action. We feel that this political discourse would take us too far afield from climate policy, especially in a short section of a chapter that cannot cover all such considerations. |
| 15373 | 3 | | | | | This section provides a clear statement of the efficiency criteria normally applied in economic studies. I do not think it does as good a job of stating distributional criteria criteria. The ethics section makes it clear that distributional criteria embody ethical judgments, that they are not self-evident, and that different ethical systems would support different criteria. Thus any simple summary of distributional criteria is likely to be oversimplify. | Good point. We now clarify that the point of measuring distributional effects is then to insert them into a SWF. We added a parag that refers back to SWF in section 3.4.5 |

|---|---|---|---|---|---|---|---|
| 15374 | 3 | | | | | The treatment of co-benefits is generally good. However, it leaves out the critical qualification that a comprehensive C-B is required to estimate co-benefits properly, and that if optimal controls are put on each of the sources of co-benefits, by the envelope theorem the co-benefit terms disappear from the first-order conditions. Thus the degree of co-benefits depends on the sign and magnitude of the deviation from optimality in controlling other externalities and the assumption that optimality cannot be achieved. If optimality can be achieved for all externalities, then the only significance of co-benefits is that the objective function in cost-benefit analysis is not separable, and the optimal value for all externalities must be solved for simultaneously. | We now refer to the new longer section on co-benefits in SOD. |
| 9336 | 3 | | | | | the chapter attempts to cover several aspects of the literature on ethics and economics but then ends abruptly; it does not provide the linkages which are important to policy makers: for example, a mix of policy instruments is indicated but when is it preferable to use legal instruments as compared to economic instruments? also, the quantitative CB approach is privileged, sometimes at the cost of repitition (pointed out later in a specific content. In particular, a discussion on deliberative approaches could be added. a last section to bring the pieces in the discussion to a logical end with choices for decision makers under different situations could be added. | Noted; will be addressed in SOD. More examples to be included in SOD. |
| 17292 | 3 | | | | | This is an innovative, timely and important contribution to the Fifth Assessment Report and IPCC assessment as a whole.<br><br>The executive summary is well written and internally consistent.<br><br>The chapter as a whole is in better shape than several other First Order Drafts. | Thank you for your comments. |
| 16623 | 3 | | | | | Try shortening to about half its current length. | Noted; we will make the best effort to shorten the length of the chapter as we |

|---|---|---|---|---|---|---|---|
| 8787 | 3 | 0 | | | | The apparent ignorance of the authors of some of the earliest and still most salient literature on ethics and climate change (Jamieson D (1992) 'Ethics, public policy, and global warming', Science, Technology and Human Values, 17(2), 139-53 - Also in Light A and Rolston III H (2003) Environmental Ethics: An Anthology, London: Blackwell and reprinted in Jamieson D (2003) Morality's Progress. Oxford: Oxford University Press) and more recent literature (e.g. Garvey J (2008) The Ethics of Climate Change: Right and Wrong in a Warming World, London: Continuum, Gardiner's work referred to in Chapter 4 of the WGIII AR5 FOD) is shall we say surprising. Jamieson (1992) is all the more salient since Charlesworth M & Okereke C (2010, Policy responses to rapid climate change: An epistemological critique of dominant approaches, Global Environ. Change, 20:121-129, doi:10.1016/j.gloenvcha.2009.09.001) demonstrates the epistemological assumptions of economistic approaches to climate change are false - we cannot robustly predict costs to be used in CBA. That the ethics of utilitarianism is given prominence is not surprising, though disappointing given Jamieson (1992). That only deontological forms of ethics are the only others given any prominence (with the partial exception of Buen Vivir and GNH) is again unsurprising; however, it is unforgiveable given Jamieson (1992). It is all the more unfortunate as evidence is available that the utilitarian ethics that underpins conventional economics is the principle ethical starting point of only a minority of the global population - albeit the most influential proportion. In summary economic approaches to climate changes are irrational and undemocratic. I have completed a currently unpublished book manuscript that directly addresses making climate and sustainable development policy in the light of inability to predict the Earth System with a virtue epistemology and ethics approach being a central response. Evidence of the democratic distribution of ethical assumptions and discussion of the application of virtue to sustainable development issues include, http://www.earthcharterinaction.org/invent/images/uploads/echarter_english.pdf, Palmer M and Finlay V (2003, n.b. page xi, Faith in conservation: New approaches to religions and the environment, Washington DC: The World Bank, http://go.worldbank.org/3L9IDQNFO0 or http://www.arcworld.org/books_resources.asp. Accessed 9 May 2011); Connelly J (2006) 'The virtue of environmental citizenship' in Dobson A and Bell D (Eds.) Environmental Citizenship, Cambridge, Mass.: MIT press; Sandler R and Cafaro P (Eds.) (2005) Environmental virtue ethics, Lanham, Md.: Rowman and Littlefield ; Inglehart R, Basanez M, Deiz-Medrano J, Halman L & Luijkx R (2004) (eds.) Human Beliefs and Values: A Cross-Cultural Sourcebook based on the 1999-2002 values Surveys, Mexico City: Siglo XXI; and to an extent BBC World Service polls http://www.bbc.co.uk/pressoffice/pressreleases/stories/2007/11_november/05/climate.shtml, http://www.bbc.co.uk/pressoffice/pressreleases/stories/2009/12_december/07/poll.shtml and http://www.bbc.co.uk/pressoffice/pressreleases/stories/2010/01_january/17/poll.shtml. | Will consider these references |
| 8790 | 3 | 0 | | | | It is surprising that this chapter does not mention work such as that by Okereke (an author of Chapter 4) on justice and climate change. | Will consider this reference |
| 8793 | 3 | 0 | | | | The coverage of the literature that the authors choose to discuss is adequate, though limited by being framed by their assumptions being largely restricted to consequential and deontological ethics and predictive epistemology. | No action. We feel that the text adequately addresses this issue. |
| 12239 | 3 | 0 | | | | General comment: There seems to be some inconsistancy on the level of detailes between the different sections. Making the text more consistent in respect to these aspects will make the text easier to read and the information easier to grasp. | Noted; smoothing out the choppiness among the various section is a goal for SOD |
| 12240 | 3 | 0 | | | | General comment: Some of the information might be redundant, and can be removed, e.g.line 1 - 2 on page 14, and line 18-19 on page 41. | No action - Line references do not appear correct |
| 12241 | 3 | 0 | | | | General comment: The complecity is varying substantially between sections. It seems like the different authors in this chapter had completely different readers in mind. F.ex. The reader who needs the specification: "A policy is more cost-effective if it achieves a given pollution abatement at lower cost." (page 41 line 18-19) will find it hard to understand section 3.10.3 or 3.10.5. | Noted; smoothing out the choppiness among the various section is a goal for SOD |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 12242 | 3 | 0 | | | | General comment: This chapter is a bit too detailed. If the text were restricted to explain the main conclusions and dilemmas under each headline it will be easier to read and the main points under each headline will come across a lot clearer. | No action. Our goal is to assess the literature; detail is inevitable. |
| 12243 | 3 | 0 | | | | General comment: Some of the sub-subsections have introductions of the kind: "This subsection summarizeses..." (e.g. 3.10.4 and 3.11.1), while others don't. We'd recommend that this type of introduction is restricted to sections(3.X) and not used on sub-subsections. | Good point; will try to address use of introductions to sections in revision. |
| 4919 | 3 | 0 | | | | One general conceptual problem related to the analysis of the ethical aspects is that the impacts of the expected worse future climate conditions (for next generations or for some regions) are considered as a possible basis e.g. for compensatory duties etc. It is admitted that it is not easy to define what is the wrong (worse) climate and what is the basis to which the future well being (worse off) could be compared, however, another critical problem associated with climate change is identified (according also to the former IPCC ARs and the UNFCCC as well) with the rate/speed of the change because of the limited ability to adapt to it (i.e. the problem of the "time frame"). | No action; good point but not clear what action is being requested. |
| 10689 | 3 | 0 | | | | Some parts of the chapters are written more like a review and not as an assessment. I suggest that the authors put more emphasis on the assessment aspects. | Noted; good point which we will keep in mind in our revision. This is a framing chapter however, which makes the |
| 10714 | 3 | 0 | | | | I'm not sure if chapter 3 is the best place, but somewhere in WGIII the various alternatives for design of multi-gas policies (as embedded in the UNFCCC) should be discussed; i.e. whether a gas-by-gas approach, a basket approach (like in the Kyoto Protocol) or a multi-basket approach is chosen. There are some papers in the literature on this. (see brief disussion of this - and references - in section 8.7.1.5 of WGI). | No action - Chapter 3 is not the best place for this issue to be addressed |
| 10715 | 3 | 0 | | | | Section 3.10.3 on metrics could be better integrated in the chapter with stronger links to applications in the chapter (and probably also in other parts of the report). | The section is already too long; but will try to link it better |
| 12998 | 3 | 0 | | | | The second half of the chapter (from 3.6 onwards) seems disconnected from the first half, especially in that the ethical aspects seem to be displaced by the narrowly economic. Also, more could be done so that the first two chapters anticipate the first half of this chapter. Indeed, there is some question about why chapter 3 does not come earlier, given that value claims are already being made in chapter 2. | Will work to smooth things out in SOD. We agree that our chapter might appropriately go before the current Ch 2 but that is a decision for the IPCC. However, ethics and economics are two somewhat separate issues addressed in |
| 13008 | 3 | 0 | | | | I'm surprised by the relative lack of discussion of some normative perspectives, such as human rights and the capabilities approach. | We cover the rights of nature. This chapter is not intented to be prescriptive. |
| 8820 | 3 | 0 | | | | This is a clearly written chapter that provides an overview of social, economic, and ethical concepts relevant for assessing climate change impacts and policies. Most of the comments provided below reflect my own experience in the decision sciences and what I perceive to be a general tendency in the chapter to overly rely on the insights and prescriptions of economics, to the extent that important insights from other social sciences are at times neglected. | Thank you for your comment. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 16927 | 3 | 0 | | | | This chapter has an almost impossible task. Unlike most others, which are focused on topics specifically related to climate and energy, or the literature mostly of recent years (eg. Chapter 2), the chapter 3 outline appears in effect to be asking to interpret Millennia of thought on social, economic and ethical concepts, as they might pertain to climate change. This is an awesome task. The authors have my sympathies.<br>Unfortunately the chapter in its current form does not even get close. The present draft seems to suffer from a partisan emphasis, a lack of awareness of numerous key debates and perspectives, and a fatal lack of intellectual integration.<br>Because of the central importance of the issues, this is sad because it represents a huge missed opportunity. Shedding objective clarity on these issues could be tremendously helpful, and help the governmental audience to understand some of the most fundamental obstacles to global cooperation, and thereby help to overcome them. Unfortunately, in its current form the chapter risks doing the opposite, and may risk undermining the entire AR5 (WG3) report in the process. The last time the IPCC formally attempted to address such broad, cross-cutting and sensitive issues of ethics, valuation etc was in the Second Assessment Report. The resulting controversy almost destroyed the institution. Some governments, led by India, threatened to walk out, and ended up rewriting the PSM and demanding changes in the underlying chapter on 'cost-benefit' in ways to which the Authors of that chapter formally objected. In end, it should be noted, it was the authors that subsequently seemed to shift their position (without overtly admitting it), when they later clarified what they had stumbled over and concluded that economics could not be expected to come up with a global 'cost of damages' answer (Fankhauser, Tol and Pearce, 1997).<br>The Third Assessment report did discuss a number of the principles to try and clarify at least what went so wrong, and I would strongly suggest that this chapter starts from the points reached out in the TAR (the Technical Summary seems to contain a useful road into this)..<br>The present draft shows no awareness of this history and little better understanding of the issues. This, combined with the partisan coverage, lack of awareness of key debates, and a lack of intellectual integration, at present could place the AR5 in similar difficulties. It must be addressed.<br>Though I am aware of this historical knowledge, my own research expertise is not really aligned with the scope of the chapter. Having spent ten years at the UK's leading economics faculty, to some extent I must share the bias towards western economic thought that this chapter displays. A colleague of mine (Sonia Klinsky) who did her PhD at UBC on the topic of climate and justice has submitted detailed comments on the content of this chapter, which seem to me compelling.<br>Consequently I confine my specific comments to two main areas: section 3.5 on aggregation of costs and benefits (the topic on which the Second Assessment blew up); and 3.10 on metrics of costs and benefits.<br>However I offer the following broad cross-cutting thoughts for the authors to consider.<br>(1) There can be genuinely incommensurate ways of assessing a problem, when moral frameworks clash. A classic example in philosophy (I may have details wrong) is if three children are playing and one finds a musical instrument. They may have completing claims to ownership: one found it first; one may be able to play it, and thus gain most value from it; the third may recognise it as something his father lost the previous year, and hence claims family rights. There is no "objective" right answer. A decision may be reached through negotiation (which could include, for example, sharing). The outcome of such negotiation may indeed reveal preferences including | Noted; we are sensitive to the value of a statistical life issue, which was a problem for some in the SAR. Integration with Chapters 2 and 4 is nice but logistically difficult. |
| 4257 | 3 | 0 | | | | This chapter doesn't seem to consider health co-benefits explicitly-- in fact health as a topic sems to be absent | No action; health is not the focus of this chapter. |

|---|---|---|---|---|---|---|---|
| 8143 | 3 | 0 | | | | This is an extensive chapter that is well-written and covers a lot of material on topics related to procedural and distributive justice, social welfare functions, cost benefit analysis (CBA), time and discounting as well as technological change. The challenge is to integrate these concepts so the reader sees how they are connected. One way to do this is construct some illustrative examples related to mitigation and/or adaptation (e.g. carbon policy, investment in energy efficiency measures) that will enable you to:<br><br>• Link concepts of distributive justice and the construction of a social welfare function more closely<br>• Tie CBA more closely with discounting over time<br>• Show how technological change relates to the above conceptual and methodological issues<br>• Highlight concepts of behavioral economics that should be considered in designing and evaluating different policy instruments<br><br>In our FOD Chap. 2 we provide a set of examples in the Introduction (Sect. 2.1) that we weave into our discussion at various points of the chapter. Feel free to use any of these examples or variations on them if that would be helpful in this regard. We then introduce System 1 and System 2 behavior that forms the basis for Kahneman's book Thinking, Fast and Slow and illustrate how it impact on Perceptions and Behavioral Responses to Risk and Uncertainty (Sect. 2.2) and Tools for improving decisions related to uncertainty and risk in climate change (Sect. 2.3). Some of this material may be relevant to linking concepts of behavioral economics and descriptive models of choice in your chapter. I elaborate on these points in the Specific Comments. | Good suggestion. In fact, such examples (as are in Ch 2) are intended for the SOD. |
| 11530 | 3 | 0 | | | | This is an extensive chapter that is well-written and covers a lot of material on topics related to procedural and distributive justice, social welfare functions, cost benefit analysis (CBA), time and discounting as well as technological change.<br>In our FOD Chap. 2 (attached) we introduce System 1 and System 2 behavior that forms the basis for Kahneman's book Thinking, Fast and Slow and illustrate how it impact on Perceptions and Behavioral Responses to Risk and Uncertainty (Sect. 2.2) and Tools for improving decisions related to uncertainty and risk in climate change (Sect. 2.3). |---|---|---|---|---|---|---|---|
| 11014 | 3 | 0 | | | | The current draft of Chapter 3 fails to take advantage of the new institutional economics (NIE) and positive political theory (PPT) literatures. These fields of study discuss many central issues of economic development and the links between political institutions, economic institutions, and technological change. The relationships studied are important potential influences that require consideration in the new IPCC scenario building process. Further, the NIE and PPT literatures throw much light on the question raised in Chapter 3 about how national institutional matrices will influence the institutional and political feasibility of using various mitigation policies and policy tools. A revision of Chapter 3 appears to be the most logical place in AR 5 to remedy this neglect.<br>The NIE literature suggests that societies' institutions differ greatly in the degree to which they permit entry into political and economic activity. These differences are stable over long periods of time. They appear to affect per capita GDP growth rates as well as the rate of technological change. There are multiple implications for future patterns of economic development as well as for the feasibility of both mitigation and adaptation.<br>Institutions constrain policy choice and policy performance. These constraints are likely to be important to both mitigation and adaptation. A few of the well-established links between national institutional matrices and political behavior include the following. 1) The timing of major contests for political power has a major effect on policy makers' discount rates. 2) The range of organizations for which government provides third-party contract enforcement affects the prevalence of collective action problems. 3) Large N selectorates reinforce rational ignorance, while small N selectorates bias the political process in favor of providing private rather than public goods. 4) Institutional matrices often create "veto gates" at which actors are empowered to block implementation of proposed policies; societies differ greatly in the number and distribution of such veto gates. 5) Institutional change, like technological change but through different mechanisms, tends to be path dependent.<br>Accounting for these and other institutional constraints suggests a new criterion for policy choice which is quite relevant to climate policy analysis. "…[A]n extant mode of organization for which no superior feasible alternative can be described and implemented with expected net gains is presumed to be efficient. (Williamson, Oliver E. "The New Institutional Economics: Taking Stock, Looking Ahead." Journal of Economic Literature Vol. XXXVIII, September 2000: 595–613) Consideration of institutional factors also largely explains the lack of progress toward mitigation noted in Chapter 15 of the AR 4 Working Group 3 report. | No action. These are good points, however, the chapter cannot cover all of economics. |
| 17150 | 3 | 0 | | | | In general, good, sound and balanced chapter - with plausible justification for treatment of ethical issues in AR5 in general. | Thank you for your comments. |
| 17151 | 3 | 0 | | | | Fact-Value dichotomy (e.g., the possibility of value-free economics) assumed throughout ch 3, even though much literature heavily criticizes this view (Putnam, H.: The Collapse of the Fact/Value Dichotomy and Other Essays. Cambridge Mass.: Harvard University Press, 2002. Or: Douglas, H.: Science, policy, and the value-free ideal. Pittsburgh: Univ. of Pittsburgh Press, 2009. Or: Caldwell, Bruce J.: Beyond Positivism. Economic Methodology in the Twentieth Century. Revised Edition. London: Routledge, 1994). Example: p. 8, l. 12: "Positive questions are essentially value-neutral". ------ As a result of this misconception, ch 3 fails in addressing (at least mentioning) implicit (opaque) value judgments in economic, technological and other studies related to mitigation options - as another highly important task of ethics in climate policy. Already on the level of data selection for empirical analysis, even more on the level of parameter choice in Integrated Assessment Models, and concerning the scope of studies in general (what do they not take into account? Why?). Literature (for example): Beckerman, Wilfred: Economics as applied ethics. Value judgements in welfare economics. Houndmills, Basingstoke: Palgrave Macmillan, 2011. Or: Ackerman, Frank/DeCanio, Stephen J./Howarth Richard B./Sheeran Kristen: Limitations of integrated assessment models of climate change. Climatic Change, 95 2009, 297-315. | No action; this is a mistaken comment. There is no suggestion that economics is value-free. |

|---|---|---|---|---|---|---|---|
| 17152 | 3 | 0 | | | | Unclear throughout ch. 3: Relationship between ethics and economics. It should be made clearer that the normative presuppositions and objectives of (welfare) economics (such as "efficiency") are obviously "values" (in your terminology). These values should be (explicitly) framed and reflected in ETHICAL terms therefore. They cannot be derived from mere economic concepts. In other words: the role of economic arguments (e.g., compared with the role of social, ecological, and other arguments) in the evaluation of climate policy options can only be determined by ETHICAL considerations. Moreover, ethical considerations (should) already integrate all relevant knowledge from economics, etc. Thus, one cannot play off ethical arguments against economic ones, as sometimes suggested by the authors and by many economists (e.g., when assuming a trade-off between ethics and efficiency, even though efficiency is one normative target among others - and not even a very important one). These issues remain unclear/ unresolved in the Executive Summary (no explanation of relationship between welfare economic approach and ethical considerations of justice and values), in the Introduction (for instance, p. 8, l. 14f: "using economics and ethics to answer questions of what should be done"), etc. Chapter 3.7 discusses parts of the ethics-economics relationship, but with a much too narrow focus: ethics is reduced to equity (and assumed as being independent from efficiency, which is disputed among economists). | Noted. We think we are fairly clear on the normative aspects of economics. We will try to integrate the sections better in the SOD |
| 17153 | 3 | 0 | | | | Missing in ch 3: mentioning that climate political (or WG III AR5) PROBLEM FRAMING is always value-laden (what counts as "problem", etc) and therefore implying lots of ethical questions. | No action; comment unclear |
| 17154 | 3 | 0 | | | | Missing in ch 3: ethics of dealing with risks and uncertainties. Even though risks and uncertainties are discussed in other chapters of WG III AR5, it should at least be mentioned in ch 3 (which is about ETHICS!) that these aspects are among the biggest ethical challenges related to climate policy-making. | No action; this issue is more appropriate for chapter 2 |
| 6952 | 3 | 0 | | | | The title of the chapter is 'Social, Economic, and Ethical Concepts and Methods'. However, only 10 or so pages of the 76 pages of content address ethical and moral issues, whereas economics gets around 46 pages. This imbalance does not reflect the many developments in the philosophical literature on CC of the last 10 years. Key debates that are not surveyed (or mentioned) relate to: the attribution of moral responsibility for CC to individual or collective agents (or both, or none); moral justifications for the precautionary principle; the ethics of geoengineering; the role and nature of political representation. | No action; we feel this issue is adequately addressed |
| 18586 | 3 | 0 | | | | Many questions confronting society with regard to climate change are issues of economics and ethics, rather than natural science. This chapter (intends to) frame the ethical and economics dimesions of climate change. True but what is the conclusion. To draw science-like conclusions on ethics? | No action. Comment unclear; no page or section reference numbers |
| 18587 | 3 | 0 | | | | What ought to be done is the subject matter of ethics. | No action. Comment unclear; no page or section reference numbers |
| 18588 | 3 | 0 | | | | True, but what are the implications? To try to sort outsome sort of science-like conclusions on ethics? The intention is unclear and the delivery is vague. | No action. Comment unclear; no page or section reference numbers |
| 18589 | 3 | 0 | | | | CBA is mentioned and discounting is discussed but as a reader it is hard to read out conclusions/learnings. It would be interesting to add case studies and clarify the consequences of different levels of discounting. | No action. Comment unclear; no page or section reference numbers |
| 18590 | 3 | 0 | | | | A long discussion on different principles for responsibility ends in nothing (more than it is hard) and than turns into a discussion on legality/legal principles. Will this really be helpful? | No action. Comment unclear; no page or section reference numbers |
| 18591 | 3 | 0 | | | | Legal rights? For whom? In what sort of context? Now the discussion turns into civil or common law principles. | No action. Comment unclear; no page or section reference numbers |
| 18592 | 3 | 0 | | | | “Cosmopolitan democracy” | No action. Comment unclear; no page or section reference numbers |
| 18593 | 3 | 0 | | | | What is the long reasoning aiming at? Reaching “divine justice” or action on mitigation? | No action. Comment unclear; no page or section reference numbers |
| 18594 | 3 | 0 | | | | Coming up next is a division of values into non-human and human. | No action. Comment unclear; no page or section reference numbers |
| 18595 | 3 | 0 | | | | And so “wellbeing” is analyzed/discussed | No action. Comment unclear; no page or section reference numbers |

|---|---|---|---|---|---|---|---|
| 18597 | 3 | 0 | | | | Policy instruments are understood as the key means or operational forms for achieving policy objectives and policy targets. Policy instruments are often understood to have the effect of guiding social considerations targeted by public policy, providing incentives or disincentives and information. | No action. Comment unclear; no page or section reference numbers |
| 18598 | 3 | 0 | | | | A long discussion end without any sort of firm conclusions. | No action. Comment unclear; no page or section reference numbers |
| 18599 | 3 | 0 | | | | The subject is now turned into an overview of policy instruments (no direct link). Should it be coupled to later chapters? (13 – 15?) | No action. Comment unclear; no page or section reference numbers |
| 18602 | 3 | 0 | | | | The problem is not the analysis/the overview (restrictions and flaws was clearly declared from the very beginning) but how the material has been used sometimes. | No action. Comment unclear; no page or section reference numbers |
| 18603 | 3 | 0 | | | | MACCs and wedges are also discussed in other chapters (at least in chapter 6 and 7) but neither the basic descriptions nor the conclusions seem to be aligned. | No action. This chapter set up the framework; other chapters will be |
| 18607 | 3 | 0 | | | | The chapter goes through a lot of interesting material but where does that lead us? | No action; comment unclear |
| 18608 | 3 | 0 | | | | Is an ethical response to climate change an issue that can be answered by science. If so, when? The intention goes, in my eyes, far beyond what can be delivered. Ethical conclusions will be drawn by societies/communities in the form a “value systems/paradigms”. They can be informed by science but hardly formed. | No action. Comment unclear; no page or section reference numbers |
| 8998 | 3 | 0 | | | | The Chapter takes the tone of an undergraduate textbook to review what its authors consider to the relevant literature on social, economic, and ethical concepts and methods. Large word counts are taken up by mostly well-known approaches that are irrelevant to policy making at the international level on issues related to climate change. The self-stated claim of the chapter is "not to attempt to answer normative questions" (line 17 page 8). The authors intend the chapter to be a "resource for policymakers and researchers who are trying to solve normative questions. In that sense, the chapter is policy-relevant but not policy-prescriptive". The chapter as written privileges market-based policies that are effective mainly in developed countries. Because of this bias, much of the literature it surveys is irrelevant to its self-stated intention. The incomplete treatment of literatures creates an imbalance in favor of normative approaches that work best in to developed country contexts which have operating - though perhaps poorly regulated - private markets. There is a need to recognize more of the development-oriented literature. | Noted. We recognize the importance of developing country perspectives. We are also trying to move away from textbook treatments. |
| 9013 | 3 | 0 | | | | There is no coverage of the recent and growing literature on carbon budgets in the the chapter. If there is anything that is new since AR4, it is this literature and should be incorporated in the chapter | No action. We don’t think this is necessary in framing chapter. Perhaps more appropriate for one of the policy |
| 9017 | 3 | 0 | | | | Drawing on the literature, it is important for the survey of the intellectual property literature to balance the coverage between the conditions under which monopoly property assignment of intellectual property has a positive and the conditions under which this approach has a negative impact on innovation and dissemination of technologies. When the current developed countries were poor, the enforceable intellectual property protection regime was mainly at the national level. The survey should reflect the variety of aspects under which developing countries are at a disadvantage in undertaking climate change technological transformation. | Noted; will be addressed in SOD. CA provided paragraph addressing this comment. However, there is little evidence that IPR has been a barrier to diffusion of climate-friendly technologies. |

|---|---|---|---|---|---|---|---|
| 12777 | 3 | 0 | | | | Within this chapter justice issues are looked at from different points of view as well as as an interdisciplinary perspective. Therefor it is often not easy to follow which perspective is taken. To support the reader you may like to consider restructuring the chapter (e.g. according to the dimensions of justice; see Executive Summary, line 26, or bundling of ideas acording the differentiation: Intragenerational justice: egalitatrian principle, CBDR, Need ..., Intergenerational justice and historical responsibility...or: present the main idea, then introduce the single building blocks, ways of measuring the blocks...). You may also like to check who the readers are (Are readers able to follow, can the reader make links between the statement. You may also like to consider which statements can be grouped because they depend on the same main presuppositions (e.g. with regard to uncertainty or dicount rate). You may find some ideas for structuring the arguments in Chap. 4 and in Chap. 3 on page 46. Actually, at this stage, it does not make much sense to give comments on the chapter as there is far too much confusion. Especially this concerns 3.1, 3.2, 3.3 (3.3.6 and 3.3.7.1 are much better organised, in section 3.3.7.2 and 3.3.7.3 the main point is the missing references), 3.4.3, 3.4.4. (3.4.5 is easier to follow, however, at some places it might also be worthwile to think about the placement of the arguments, to be more focused on the climate problem), 3.4.6 (provide better links to climate problem and referecnces, consider shortening), 3.5.1 (reconsider the structure of arguments and for whom it is written, ll 20-28 are fine, however the link to justice considerations is missing, (3.5.2 is easy to follow, 3.5.3. also easy to follow, however, focus should be on the main point), 3.6, 3.7. (link to welfare theory is missing), 3.8 (high potential for shortening, e.g. 3.8.2.1 to 3.8.2.3, statements could be better linked with the other sections of chapter 3), 3.9.1.2, (3.10 and 3.11 easier to follow, still, some arguments should be reconsidered and more focused, the sections can also be shortened, (3.12. is fine). You may also like to consider whether it might make sense to strictly differentiate between the normative concepts of justice and the individual perceptions of what is fair and may like to use the term fairness for the subjective perspective (with regard to the climate context see e.g. Ittner, H., Ohl, C. (2012), International negotiations on climate change: Integrating justice psychology and economics – a way out of the normative blind alley? In: Kals, E., Maes, J. (Hrsg.), Justice and Conflicts: Theoretical and Empirical Contributions. Springer, Berlin, Heidelberg, ISBN 978-3-642-19034-6, 269-282). | No action; section titles were given |
| 7898 | 3 | 0 | | | | Although in chapter 3 many aspects are discussed that are also dealt within chapter one, links and cross references are missing and should be included. | No action; Ch 1 is an overview so it is inevitable that there will be overlap. |
| 7899 | 3 | 0 | | | | Some sub-chapters are rather isolated. For instance, the key claims of section 3.3. are largely ignored by the other sub-sections. Also, several points that are made in sections 3.11 and 3.12 challenge assumptions the analysis in sections 3.5, 3.7, and 3.10 are based on. Cross references should be included and/or discussions moved to other sections. To provide just one example: in section 3.12 it is argued that technological inovation should be modelled endogenously; studies projecting costs of mitigation that are cited earlier assume innovation to occur exogenously. This difference should be noted and discussed. | No action; we note these particular differences in the text. |
| 7900 | 3 | 0 | | | | With the exception of section 3.3 the chapter omitts almost all contributions from the field of climate ethics. This is surprising given the titel of the chapter. Another surprise is that although there have been hardly any contributions to climate ethics from a utilitarian or welfarist perspective so far (notable exceptions are Broome 1992, 2012 and Lumer 2002), most of chapter 3 deals with these approaches while duty and/or justice based perspectives are ignored (see references mentioned in the following, in particular in comments 60 and 82). Two salient concepts, C&C (Meyer 2000) and GDR (Baer et al. 2009), are mentioned only once and are discussed nowhere. | Will be addressed in SOD |
| 7901 | 3 | 0 | | | | Important issues that are discussed in the literature (sometimes at great length) are not dealt with, such as: wich stabilization levels can be justified on ethical grounds, mitigation duties of high emitting countries, responsibilities to finance adaptation / provide compensation to those (most) vulnerable to climate change, and duties of individual persons. | No action; these are policy-prescriptive issues, inappropriate for IPCC |

|---|---|---|---|---|---|---|---|
| 16622 | 3 | 0 | | | | Chapter 3 does a great job in gathering the main social, economic, and ethical concepts and methods surrounding climate change. However, many sections the chapter fail to provide insight on how the concepts and methods included in the chapter or a particular section can be used in practical policy-making. Addressing this issue would make the chapter more engaging and will provide a common thread to the ideas included in the chapter. I would like to point out that by and large most of the relevant information is already included in the the chapter. That said, the organization of the chapter would greatly benefit from a short introduction to each section that highlights the relevance of the material in the section for the reader—how this material can be useful in policy making—and examples of how the concepts and methods in the chapter have been implemented in the literature (and maybe in policy if proved successful).<br>For the section introductions, in many cases there is a paragraph in the section does serves this purpose but it is located at the end of the section (or subsection). I recommend that the authors move these paragraphs much earlier in the section.<br>Also, in some sections, many applied examples are already mentioned in the references but need to be highlighted. I recommend that the authors do so. In other sections, the theory is presented with some practical objection that make it difficult implement. In these cases, I recommend that the authors point out the kind of advances in the theory that would make the policy implementable or workarounds/simplifications that have already been applied but may have some shortcomings. | A very good point which we will try to address in the SOD. |
| 3139 | 3 | 0 | | | | There is some overlap between this chapter and chapter 2 (e.g. on CBA and other approaches to aggregating costs and benefits) that could help both chapter streamline if resolved.<br><br>This chapter has a very different feel from WG1 and WG2 chapters and much of WG3. there is little/no discussion of "what's happened since AR4." I don't have a problem with that, but perhaps it is useful to have some text at the outset indicating that the kinds of issues addressed here haven't in past had much attention in IPCC. Thus most of this is "new." | No action. There hasn't been an economics and ethics chapter since at least AR2. Furthermore this is a framing chapter. Thus it seems inappropriate to just focus on what has happened since AR4. |
| 5120 | 3 | 0 | | | | The chapter title includes "social', but the exec summary truncates to economics and ethics; suggest including some high-level framing in terms of social interactions (decisions and behaviours) and obligations (living together despite differing values). This framing would help to draw a tighter bead on the "legal" aspects of the chapter (justice and rights) | No action. Although social is in the title, the outline is focused on economics and ethics, which is reflected in the text. We do address social issues, particularly in |
| 5126 | 3 | 0 | | | | I regret that I have now run out of time for more detailed commentary on the chapter; however, I have read it through carefully and while I conpletely understand the material and respect the selection of sources, I remain unclear about just what the chapter is meant to achieve. No doubt this is my failing and not the authors'. Nevertheless, the chapter appears quite fragmentary; there are certainly good overviews of relevant matters in economics and justice, but the connecting tissues are missing. Much of the content is quite abstract, and I cannot see it as aiding a decision maker any more than consulting a good text would. Given what is in place in the chapter, it seems to me that it needs to be reframed as an overview of the way economics think about policies to address climate change (including the implications from technology change) accompanied by a normative critique. The critique would draw on what tends to be missing or underemphasised in economic thinking, as well as what different policies imply under different considerations of ethics and justice. | Will be addressed in SOD. But we will not be able to refocus entire chapter to talk about the use of economics. |
| 5127 | 3 | 0 | | | | I do not follow the order of the chapter. Why, for example, is aggregation of costs and benefits at section 3.5 and the metrics of costs and benefits at 3.10? The secion on technology change seems almost an afterthought. | Noted. The sections are not easy to organize logically. We have tried reordering them a number of times and there seems to be no easy solution. The |

|---|---|---|---|---|---|---|---|
| 3612 | 3 | 0 | 0 | | | Problem of Chapter 3 is that it partly lacks the connection to the concrete climate issues important in this report. Chapter 4 is indicated as too long as it now already surpassed the allocated number of pages. The description of different issues, such as equity and burden sharing (4.7.3.2) or the indicators or equity (4.7.4.1) are presented more suitable. It may be considered to integtrate these sections into Chapter 3 rather than deleting them in Chapter 4. | No action; Chapter 3 is already too long -- cant move sections from Chapter 4. |
| 14310 | 3 | 1 | | | | In addition to cost benefit analysis, other approaches deserve a much broader discussion. Cost effectiveness and the rich literature on the "tolerable windows approach" (guard rail approach) or the safe landing approach should be discussed as well. For the guard-rail approach please refer to "T. Bruckner, K. Zickfeld: Emissions Corridors for Reducing the Risk of a Collapse of the Atlantic Thermohaline Circulation, in: Mitigation and Adaptation Strategies for Global Change 14, 61-83, 2008" and the references therein. | No action. This might be more appropriate in the policy chapters. |
| 3371 | 3 | 1 | | | | It is a little unclear what the "social" in the city refers to, and where it appears in the text. | No action; we address social issues in |
| 4918 | 3 | 1 | | | | Ch.3 Social, Economic, and Ethical Concepts and Methods | No action; comment unclear |
| 4932 | 3 | 1 | | | | MISPRINTS etc. | No action; comment unclear |
| 16667 | 3 | 1 | | | | This is supposed to be a chapter about ethical concepts. A great deal of ethics concerns individual behavior and motivation. None of that literature is reviewed in this chapter. It should at least be acknowledged that this is a very partial review of the terrain and a great deal of the usual concerns of ethics are being left out. For two papes that bring questions of individual responsiblity to bear on climate change see Dale Jamieson, “When Utilitarians Should be Virtue Theorists,”Utilitas 19,2 (June, 2007):160-183; and “It’s Not My Fault: Global Warming and Individual Moral Obligation” in Perspectives on Climate Change: Science, Economics, Politics, Ethics, ed. Walter Sinnott-Armstrong and Richard Howarth (Elsevier, 2005) | Will be addressed in SOD |
| 16676 | 3 | 1 | | | | The 10 pages that should be dropped should NOT be the ethics since that is what is new and addressed only chs 3 and 4. Some of the economics is discussed elsewhere in the report and that is the natural place to look for cuts. If I had to cut I guess I would look to 3.8, 3.92, and 3.10 | Thank you for your comment. |
| 9381 | 3 | 1 | | 111 | | The whole chapter is very close to welfare-ethics and to utilitarianism. Yet, it lacks a more comprehensive portray of the ethics of climate change. This would include: ethics of risk, human rights approaches, cosmopolitan interpretations of justice, interpersonal and international obligations which result from that normative framework, Aristotelian approaches which include theories of human flourishing, basic-needs-accounts, theories of ecological justice and approaches to environmental ethics which address the value of natural goods to non-human entities, finally theories which discuss climate as a public good. Moerover, the general scope of ethics is not so much the issue of how exactly burdens and profits shall be outweighed against each other (even though this is of course an important question) and how human well-being can be quantified, but rather: Which claims can be justified both regarding the chance to a decent life for all persons (Aristotelian, Kantian approaches) and regarding a vulnerable nature which suffers from climate-change (environmental ethics). | Will be addressed in SOD |
| 15216 | 3 | 1 | | | | There are some repeated topics and descriptions. It needs to be restructure the chapter. | Noted; will be addressed in SOD |
| 13013 | 3 | 1 | | 111 | | In my view this chapter is poorly structured and very uneven, not only in the clarity of the writing, but also in the degree to which the material is general or specialized, and accessible to lay readers or rather technical. I suspect that this is because it is an amalgam of work by different authors.<br>One way of improving the structure of the chapter might be to bring section 3.7.3, which now begins on p.31, up to the front, to serve as an introduction to the major ethical issues. It is much clearer, less technical, and more relevant than much of the material that now comes before it.<br>Although this would help, I’m not sure that the problem of the chapter’s structure and uneven writing and uneven level of detail in the different sections is remediable unless someone does a total rewrite. | Will be addressed in SOD |
| 9190 | 3 | 1 | | | | it should be noted the costs presented here is assuming that the governmental intervention is cost effective - often it is not the case. As such these are minimum cost estimate. | No action; comment unclear |

|---|---|---|---|---|---|---|---|
| 11566 | 3 | 1 | | 77 | | General comment: the chapter is called "Social, economic, and ethical concepts and methods". The chapter focuses nonetheless primarily on economic concepts. Little is said about the social and socio-economic concepts and about the difference between economic and other methods. Furthermore, the chapter does not take into account new movements within the academic literature on rational choice, social dilemma theory, public goods and institutional theory. Especially, it is extremely problematic that the chapter does not discuss the work of Elinor Ostrom. Furthermore, it would be more beneficial if the chapter is presented more in the style with chapter 4 that is dilemma and problem driven. The Ostrom approach would be consistent with the conclusions of chapter 4 and 13. | No action. Ostrom is discussed (see p40) and section 3.11.3 |
| 6471 | 3 | 1 | 1 | 77 | 30 | The entire chapger is ethically problematic from the standpoint of acknowledging that according to some ethical theoriies, conflcts between values are resolved not through efficiency arguments but by acknowledging duties, responsibillities, and obligations entailed by deontological arguments including but not limited to human rights based theories. The chapter may remain as wrritten but to solve this problem but it must strongly and expressly acknowledge that rights based theories and other ontological aruments hold that welfare maximation goals may not ignore or jsutify failure to abide by ethcial obligatio This could be remedied by a stement in the preamble thatsays Some ethicists hold that deonotologiasl theoires on which rights to be protected from climate change harms are based may not be modified by utilitarian or welfarte maximizzation techniiues that undermine clear obligations to prevent harm to human life and ecological systems on which life depends. Ethicsists hold that conflicts beteen utilitarian or cosequentiist climate change policy guidence should be reolved on the basis of the strength of ethical aruments not on consequentalist grounds. | Will be addressed in SOD |
| 9385 | 3 | 10 | | 14 | | The debate on justice is very much focused on the future-generation-perspective and the past-generation-perspective (inter-generational justice). Even though this is important, cosmopolitan frameworks also argue for obligations to help persons in need independently of causation of harm; this means that the temporal dimension is not the most important perspective. | No action; we disagree. We believe this issue is adequately covered in the sections 3.3.3 and 3.3.5 discuss issues of intra-generational justice and the |
| 10701 | 3 | 10 | 1 | 10 | 7 | The Ad hoc group for the modelling and assessment of contributions of climate change (MATCH) produced several papers that are relevant for the issues discussed here; see http://www.match-info.net/ | Will consider these references; may include grey literature |
| 11551 | 3 | 10 | 1 | | | "Developing countries will suffer disproportionally more from climate change". Yes but it depends on the response capacity of the country, cf. Chapter 4. | Will be addressed in SOD |
| 3920 | 3 | 10 | 1 | 10 | 1 | This 'suffer proportionately more' sentence seems to be conflict with the discussion latter in the chapter on the non-identity problem. | Agreed. We change 'people in developing countries' to 'developing countries' and delete the parenthesis. However, it should be noted that we have this "conflict" only if we do not |
| 9338 | 3 | 10 | 11 | 10 | 14 | wWho is morally responsible for achieving justice? important question?Who is morally responsible for achieving justice? important question? Any positions in the literature on this? Could be highlighted | No action; we disagree as we ask the question in the next lines and discuss it |
| 4481 | 3 | 10 | 18 | 10 | 24 | This paragraph is confused. In what sense can past generations "owe" something to the present generation? The past is history, and persons who lived in the past have no capacity to act in the world any longer. Also, it is unduly narrow to cite only Rawls in the context. The nature of our obligations to future generations runs through all the major religious traditions, including the natural law tradition. Rawls represents only a tiny sliver of the literature on this vast subject. | No action; we disagree. In the text we say: "justice considerations apply to intergenerational relations if". Justice considerations to not apply to the relations between past and currently living people. But it makes sense to say that currently living people stand under imperfect duties towards past people. |
| 2111 | 3 | 10 | 18 | 10 | 19 | Awkward sentence. | Agreed. Deleted sentence |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 7907 | 3 | 10 | 19 | | | Intergenretional justice is not central in rawls Theroy of Justice. Early contributers to the debate about obligatrions to future generations are Parfit (1984), the contributions in Sikora/Barry (1996, reissued), Partridge (1990), and Howarth (1992). | Noted. In our assessment Rawls's discussion of the Savings Principle is an important contribution. At the same time |
| 2110 | 3 | 10 | 2 | 10 | 3 | Ungrammatical sentence. | Agreed. Change to 'There is'. |
| 3923 | 3 | 10 | 25 | 11 | 13 | Some of these intergenerational propositions seem to be proposing not only that abortion is ethically unacceptable but that a failure by each and every woman to conceive to the biological maximum is violating a fundamental human right. Where in this chapter do the authors guide policy makers as to how to use their own values to make decisions about such ethical matters? Another problem is that the reference in line 32 to 'minimal duties of justice to future generations' in a global emissions cap context ignores all the non-emissions benefits each generation passes on to future generations in material and non-material forms. Again, on current projections future generations will be more wealthy than today's generation, so what is being proposed appear to be a transfer from the poor to the rich. Again it would be helpful if the executive summary included its guidance as to ethical answers to these questions. | No action; disagree with comment. The duties are "minimal" as fulfilling them is required for protecting future people against violations |
| 4921 | 3 | 10 | 26 | | | I understand that the focus (based on cited literature sources) is on future temperature as a key factor determining the quality of life, however, in context of (anthropogenic) climate change not only the present emissions affect the life conditions of future generations, but also the changes concerning the sources of these emissions, primarily the rate of utilization of the (finite) fossil fuels (rate of depletion of these resources), the longer-term "benefits" from these activities (e.g. modern or less modern energy or transport related technologies infrastructures; there is a hint to the latter, i.e. better technologies in line 40). As concerns the fossil fuel resources, some also raise the idea of setting caps on the (rate of) use of these resources. | No action; comment unclear |
| 13002 | 3 | 10 | 27 | 10 | 32 | One might mention that the classic source for these kinds of arguments is Henry Shue's papers from the 1990s. | Agreed, added references |
| 7908 | 3 | 10 | 28 | 10 | 34 | Here, the perspectives seems to shift from a rights-based approach to an approach resting on the good life. Please clarify if our observation is correct and if so, provide reasons for this shift. | Agreed, changed accordingly. |
| 17159 | 3 | 10 | 3 | 10 | 8 | Putting so much emphasis on the asymmetry obviously implies a highly disputed value judgment, namely that historical emissions are a huge moral problem. This view is rejected by many authors (and by some governments). Therefore, for being non-policy-prescriptive, the authors should put less emphasis on this asymmetry. By the way: this is again a perfect example for how value-laden problem framing always is... | No action. Disagree that the asymmetry as stated commits us to the view that "historical emissions are a huge moral problem". In 3.3.4 the assessment of the |
| 3921 | 3 | 10 | 3 | 10 | 3 | Is there an ethical basis for the idea that those who are descendants of those who inflicted, unknowingly, a latent harm on future generations in one particular respect, while creating a middle class out of the poor more generally, now have particularly responsibility to those who might have no realistic hope of escaping poverty except by piggy-backing on the know-how and access to resources and trading opportunities of the 'West'? Remember that the chapter aims to help policy makers determine such ethical matters, using their own values. It would be useful if the executive summary contained its guidance in such respects. | No action; the issue is covered in 3.3.4 |
| 6958 | 3 | 10 | 34 | 10 | 34 | The reference to Rawls here is, I think, misleading: it gives the impression that he explicitly addresses the question of a global cap on emissions. | Agreed! Reference was moved |
| 9339 | 3 | 10 | 38 | 10 | 40 | why is this sentence within parentnesis? | Agreed, parenthesis deleted |
| 4480 | 3 | 10 | 4 | 10 | 4 | There is no basis for asserting that the developed countries face "potentially modest damages from future climate change." The statement might be true if the effects of climate change were known to be only minor, but the developed countries are also vulnerable to potential global catastrophes brought on by climate change. | Agreed. Will change 'potentially' to 'relatively' |
| 6957 | 3 | 10 | 4 | 10 | 34 | insert 'relatively' before 'modest' | Agreed. |
| 11009 | 3 | 10 | 41 | | 43 | The draft at this point intimates the larger question. What valid basis exists for setting ethical principles by which to judge the behavior of nations and generations in a radically diverse world? | No action; we disagree: The comment poses a good question, but it is unrelated to this paragraph and cannot |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 3922 | 3 | 10 | 8 | 10 | 14 | Again it would be useful if the executive summary provided the chapter's answers to the question of what ethics has to offer in answering these questions. | No action; we disagree as this would be too difficult to do. However in 3.7 we |
| 14839 | 3 | 10 | 17 | | | This section is confusingly presented, with an underemphasis and under-elaboratino of the main point and overemphasis on counter-points that maybe academically interesting but teribly pertinent or widely held. The first one and a half paras could be elaborated, and the remainder addressed more concisely or eliminated. | Will be addressed in SOD |
| 15637 | 3 | 10 | 6 | | | "historical and causal responsibility" - not clear how these two terms are being distinguished. If causal refers to current (as opposed to historical) emissions, then the statement is no longer correct. | Agreed. Deleted "historical and" |
| 11196 | 3 | 10 | 17 | | | suggest add s people (the last word of the heading), ie rights of future peoples | No action; we disagree as we do mean |
| 15638 | 3 | 10 | 38 | | 40 | The view that future generations may well be better off should contain some proviso about the possibility of catastrophic climate change. | We disagree: No need to do this. When we mention one possibility, we don't |
| 7311 | 3 | 104 | 1 | 104 | 2 | "Plourde CG (1972) A model of waste accumulation and disposal " reference. This reference is VERY old. Please consult ref's in Chap 10.AR4.WGIII. and subsequent literature on drivers for waste generation and disposal practices, including the "de-coupling" of waste generation from the primary drivers of population and prosperity, esp. in highly developed countries with high levels of financial support for recycling and waste minimization activities. | No action. Section 3.12.4 p. 72 - text just refers to this as an example of early work on environmental externalities that have since been addressed more recently (2012 example given) |
| 8145 | 3 | 11 | | | | You might want to illustrate the different views of distributive justice by extending the emissions permit example to show how they would be allocated depending on what system one uses. | No action; difficult to address given our length constraints |
| 6959 | 3 | 11 | 1 | 11 | 4 | A further response to a rights-based conception of intergenerational justice is to push a (Kantian) obligation based view: present people have duties to future people, but it need not follow that future people have rights against present people. In my view, Onora O'Neill offers the best defence of this approach in 'Towards Justice and Virtue: A Constructive Account of Pratical Reasoning' (Cambridge: Cambridge University Press, 1996). | Agreed. We added a sentence to the first paragrah of this sub-section. |
| 12132 | 3 | 11 | 1 | 11 | 13 | This does a good job of summarizing some key issues quickly. One that it leaves out, however, is the claim of 'will theorists' that future people cannot have rights because they cannot exercise them. See, for example, Hillel Steiner (1983) 'The Rights of Future Generations', in Energy and the Future, ed. Douglas MacLean and Peter G. Brown. Totowa, NJ: Rowman and Littlefield, pp. 151-65. | Agreed. We added the reference. |
| 16668 | 3 | 11 | 14 | | | The usual cites for equal allocation of emissions permissions plus trading are Dale Jamieson, "Climate Change and Global Environmental Justice, " P. Edwards and C. Miller (eds.), Changing the Atmosphere: Expert Knowledge and Global Environmental Governance (Cambridge: The MIT Press, 2001): 287-307; and Peter Singer, One World, Yale University Press, 2002; both following Agrawala & Narain, Global Warming in an Unequal World | Agreed. We added references |
| 4483 | 3 | 11 | 15 | 11 | 35 | As noted above (in comment #10), this approach to "distributive justice" seems to suggest that "justice" is like dividing up a fixed pie. The real-world economy is not like that. It would be unjust in the extreme to coercively redistribte the goods and services produced in all the world's countries according to some abstract scheme. Production and distribution are inextricably linked, and the effort and talent (and capital) involved in production give the producers a prima facie claim to the fruits of that production. Furthermore, promoting the notion that "justice" is like dividing a pie will make it much more difficult to make progress on climate, because there can be no criteria for agreement if the negotiations take the form of purely redistributive conflicts. In short, ignoring production in discussions of distributive justice is an unwarranted abstraction from the actual functioning of the global and national economies, and violates the basic right of people to own what they produce. | Thank you for the comment. The subject matter here is not all goods that are relevant for well-being but the remaining permissible emission permits. |
| 13003 | 3 | 11 | 15 | 11 | 19 | The distributive concerns are not limited to the particular mode of implementation (i.e., a cap and trade permit scheme), but arise from any intervention (e.g., via taxation, standards, etc.). | Agreed. We changed the text accordingly |
| 7911 | 3 | 11 | 15 | 11 | 35 | There are many egalitarians that do not presuppose equality for the sake of equality but ascribe instrumental value to equality . Rather, there is a presumption in favor of equality. The presumption is not prone to the levelling down objection. Also, is prioritarism really the most common perspective? The defense of prioritarinism should be substantiated. | No action; disagree with comment. We don't understand the 'presumption in favour of equality'. We do not mean to defend a particular view. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 13015 | 3 | 11 | 15 | 11 | 35 | The quick survey of principles of intergenerational justice should at least mention classical utilitarianism, which seeks to maximize value irrespective of distribution but takes account of diminishing marginal utility, and therefore ends up being significantly more egalitarian than present distributions, or likely future distributions. | Agreed. We discuss utilitarianism later in the chapter and we put a reference in the text |
| 11552 | 3 | 11 | 15 | 11 | 35 | The discussion of equality should take into account the difference between absolute and relative equality. Richard Wilkinson & Kate Pickett “The Spirit Level: Why More Equal Societies Almost Always Do Better” (2009) shows that relative inequality within countries matter (in terms of health, etc.) more that absolute global inequality. | Disagree with comment. We don't see the relevance of the literature for the topics discussed. |
| 4936 | 3 | 11 | 18 | | | [Del] By distributing [tradable] emission permits .. ~ The possibility of trading is a different (additional) issue, at least irrelevant here. | Noted; we deleted "tradable" |
| 9001 | 3 | 11 | 18 | | | The use of the word "tradable" is specious and is not needed in the phrase "distributing tradable emission permits". It is the distribution of permits, whether these are tradable or not that are necessary to achieve a "globally just" distribution of emissions. Markets might not work; "we" might be smart enough to distribute the permits correctly without requiring the subsequent trading of permits. As a philosophical-ethical chapter, this an example of this chapter's heavy reliance on the a framework where markets - working via property rights (a category always created by social arrangement based justified on philosophical grounds) - to achieve social ends. | Agreed. We deleted "tradable". And see what we said on p. 11, line 43-44 |
| 3924 | 3 | 11 | 18 | 11 | 18 | Who is 'we' - a policy elite? And if we are a policy elite what weight should we put on dissenting views? | Agreed. We changed the text accordingly |
| 2113 | 3 | 11 | 20 | 11 | 20 | Comma missing (after parantheses). | Agreed. |
| 6961 | 3 | 11 | 21 | 11 | | Surely add a reference here to Rawls, as a prioritarian? | No action; disagree. This is controversial. However, we added a |
| 3925 | 3 | 11 | 22 | 11 | 22 | Does a strictly egalitarian position require 'a fair go' (meaning some sort of equal opportunity to move from log cabin to president), or does it mean equality of outcome, (in the Gini coefficient sense that effort, skill and merit should go unrewarded)? The phrase 'equality is of intrinsic value' could be read in the second way. | No action; disagree. 'Equality of intrinsic value' is neutral between equalities of different things |
| 3926 | 3 | 11 | 26 | 11 | 27 | The proposition that we should promote wellbeing of X over Y does not explain why 'we' should not ignore X and instead promote the wellbeing of Z over X and Y, where Z is the least well-off in the world. | No action; disagree if the comment is meant as a criticism. 'We' always |
| 17702 | 3 | 11 | 31 | 11 | 35 | The sufficitarian views should be mentioned on this chapter it is only briefly mentioned in this part. The suficitarian view combined with the Prioritarianism view can be of great importance. | No action; the combination of sufficientarianism and priroritarianism (below the threshold) is an interesting view, certainly worth exploring, but, |
| 12133 | 3 | 11 | 33 | 11 | 34 | Prioritarianism is 'the most common perspective on distributional justice' among contemporary analytic academic philosophers. That seems to me an adequate justification for focusing on it—but it is only fair to note that worldwide, egalitarianism is surely more widespread among the general public | No action; it might be true that "egalitarianism is surely more widespread among the general public", |
| 9287 | 3 | 11 | 34 | 11 | 35 | I am far from sure that the claim that prioritarianism is “the most common perspective on distributional justice” is correct. For example, the vast majority of economics literature using any social welfare function uses a straightforward utilitarian one. It is surprising that this section does not mention utilitarianism at all. | Agreed. We changed the text accordingly. Utilitarianism is being discussed in a another section of the |
| 13004 | 3 | 11 | 35 | | | I'm surprised to hear that prioritarianism is the most common perspective. | Agreed. We changed the text |
| 13016 | 3 | 11 | 35 | 11 | 35 | On what basis is it claimed that prioritarianism is the most common perspective for distributional justice? I know of no evidence for this claim, which strikes me as dubious. | Already addressed. |
| 15641 | 3 | 11 | 36 | 12 | 2 | It is not clear why prioritarianism is singled out as raising concerns about the background distribution of resources - in principle these could apply to any of the egalitarian positions outlined above. This paragraph could be enhanced by referring to some of Simon Caney's more recent work on the distinction between holistic and atomistic accounts of climate justice (eg Caney, S. 2009. Justice and the Distribution of Greenhouse Gas Emissions. Journal of Global Ethics 5 (2):125-46.) | No action; already addressed. For Caney see p. 12, lines 1-2, we replaced to the one suggested: 2009. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 3927 | 3 | 11 | 36 | 12 | 2 | This section ignores the problem that 'we' are not a benevolent government. In reality, the contemplated distributions will take place through political processes, meaning most likely that they will favour those with the greatest political clout. If the chapter aims to help policy makers with ethical issues, it needs to put them in the context of what is likely to happen when politicians actually move to put in place the proposed redistributional mechanisms. This further illustrates why a positive theory of state action is necessary. | No action; disagree. The literature reviewed in this section does not predict likely outcomes of the ongoing negotiations |
| 4937 | 3 | 11 | 37 | | | emission rights ~ as above, better to call it: emission permits (throughout this section) | Agreed. We replaced emission rights by |
| 12134 | 3 | 11 | 41 | 11 | 42 | The logic of why the worse off would benefit more from being able to sell an equal share of emissions (declining marginal utility?) needs to be specified, and an explanation needs to follow of why the first option is problematic. | Comment unclear. |
| 9800 | 3 | 11 | 42 | 11 | 43 | The currently highly unequal distribution of rights is crucial in the justice discussion. Whenever emission targets are set, two drawbacks have to be considered: 1. concerning intragenerational justice the status quo of living has to be considered, moreover a huge part of the emissions of developing countries is caused by products sold in the industrialized countries. 2. concerning intergenerational justice the legacy value has to be considered, i.e. the possibilities we leave for future generations. REFERENCE for legacy value | No action; in the text we consider these issues in the other subsections (issue 1 in 3.3.4, issue 2 in 3.3.2) |
| 4922 | 3 | 11 | 43 | | 46 | To some extent, this is actually the case for an "inter-national" system, namely, the EU's ETS. | No action; this sub-section reviews the philosophical literature. |
| 14840 | 3 | 11 | 48 | | | Caney could just as well be interpretted to be arguing that it is questionable to insist that the prioritarian ideal is the preferred distribution when the distribution of only one good is being adjusted, it may well be the case that an even *greater* reallocation to the worse off is justified. Again, this section seems to provide undue emphasis to counter arguments that are not evidently of relevance to the climate context. | Agreed. We changed the text accordingly |
| 2115 | 3 | 11 | 48 | 12 | 2 | A brief explanation of why this claim is true might be helpful. | Will be addressed in SOD |
| 7909 | 3 | 11 | 6 | 11 | 13 | At this point, the future individual paradox (FIP) occurs for the first time and a way to circumvent it is suggested. However, later on the FIP is mentioned several times as a problem. More convincing would be to discuss the FIP in greater detail here and refer to this section later on. You should also note that Parfit himself has recently argued that the FIP does not nullify our duties towards future generations (2011). | Agreed. We improved the discussion and added the reference. |
| 2112 | 3 | 11 | 7 | 11 | 13 | I wonder if this discussion of the Non-Identity Problem is not too condensed to make sense to those unfamiliar with the Problem. I realize that space is very limited, but perhaps something can be done to explain the Problem more clearly. Alternatively, if there is no space for that, then perhaps the attempt to explain it should be given up. (However, given that the Problem crops up several times later in the chapter, perhaps the latter is actually not the way to go.) | Agreed. We improved the discussion |
| 13014 | 3 | 11 | 7 | 11 | 13 | This account of the non-identity problem would be incomprehensible or misleading for anyone not familiar with it. A better and clearer account is needed. | Agreed. We improved the discussion |
| 6960 | 3 | 11 | 9 | 11 | 13 | A different tack is to argue that we owe justice to future people not because of the particualr identities they will come to have (which generates the NI problem), but just in virtue of the fact that they will be people. Jeffery Reiman argues that this is a Rawlsian approach to the NI problem ('Being Fair to Future People', Philosophy and Public Affairs, Vol. 35, 2007, 69-92). I think he interprets Rawls correctly, and that this approach is also generated by the Kantian vision of intergenerational justice mentioned in the previous comment. In general, I think Kantian approaches are seriously under-represented in the chapters as a whole. | Agreed. We improved the discussion. The fourth response to the NIP (new text) reflects the idea the commentator refers to; we added the reference. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 7910 | 3 | 11 | | | | You write: "If an intergenerationally just global quota has been determined, and if there are going to be emission permits allocated under that quota, then the question of how emission permits ought to be distributed among the states (and, ultimately, the individuals) on this planet arises." This is certainly correct. However, the very important question what a just global quota could be is neither addressed in section 3.3 nor at any other point in chapter three. Given that many ethical contributions on how far current generations should lower GHG emissions (and hence, what "our" quota should be) exist (e.g. Gardiner 2004, 2011a, Ott et al. 2004, Page 2006, Caney 2010a, Ott/Baatz 2012) and that this is one of the most important questions concerning climate change, it should be explicitly addressed at greater lenght in chapter 3. In addition, questions about how to allocate emissions permits eventually depend on how much permits are available in the first place. | No change needed. In my understanding the text does address the question "what a just global quota could be" by discussing in 3.3.2 how considerations of justice can help to specify the "just global quota". Of course, I am happy to add references. I do not think that this section should assess normative theorists' specific suggestions of what the "just global quota" is since these suggestions have to rely on empirical claims, the assessment of the normative |
| 17158 | 3 | 11 | 14 | | | You could add that there are also more complex ethical theories discussing distributive issues. There might be more than only one criterion for how to distribute wealth, etc. See for instance Kowarsch, M./Gösele, A.: Chapter 7: Triangle of Justice, in Edenhofer, O./Wallacher, J./Lotze-Campen, H./Reder, M./Knopf, B./Müller, J. (eds.): Climate Change, Justice and Sustainability: Linking Climate and Development Policy, Dordrecht: Springer 2012, pp. 73-90. They argue that three dimensions of justice are to be taken into account at the same time: basic needfulfilment, basic opportunities, fair procedures. Distributive questions can only be solved when applying all these criteria at the same time. | No action; disagree with comment |
| 15639 | 3 | 11 | 18 | | | Re "tradable" - in principle, a just distribution could be achieved without requiring that permits (or 'entitlements') be tradable. Being tradable seems to be more strictly a condition for efficiency rather than justice. | Agreed. We deleted tradable. And see what we said on p. 11, line 43-44 |
| 15640 | 3 | 11 | 20 | | | It could be worth explaining that what all egalitarian views (whether direct or indirect) share is the idea of the equal worth or dignity of all human beings (see eg Sen (1980). Equality of what?). Otherwise it isn't clear in what sense indirectly egalitarian views are indeed egalitarian. | Comment unclear. The view referred to is controversial. |
| 13265 | 3 | 11 | 36 | 12 | 2 | there is the factual case, not explicit, that current emissions rights (considered as the per CO2 per capita emissions) are not fairly distributed and that any, even hypotetical, allocation of emission's rights should have to deal with this assimetry. It is considered to analyse this case in the report? | No action; already addressed |
| 3320 | 3 | 112 | 29 | 112 | 31 | I find the usage of "distributive justice" here odd. Distributive justice standardly concerns the partition of benefits or burdens, not whether justice is determined with respect to outcomes. Take human rights, for instance, which figure prominantly in climate ethics debates. They are neither procedural nor distributive in the traditional sense. They are deontological: concerned with specific results, namely, that rights are upheld, but are not concerned with distributing rights in any ordinary or traditional sense of partition being up to the judgment. Rights involve judgment in terms of applicability and balancing, but neither is distribution per se. So, I would strongly recommend revisiting this paragraph by making a different between procedural and *substantive* justice, including both distributive justice and human rights justice as species of substantive justice. | Will be considered further. |
| 3322 | 3 | 112 | | 114 | | I find the absence of qualitative normative approaches such as capabilities theory or human rights troubling. The executive summary will provide the at-a-glance overview of normative frames for many policy makers and observers. That human capabilities or rights are not even mentioned is a serious oversight from the standpoint of considering climate ethics in a balanced way. | Will be addressed in SOD |
| 3321 | 3 | 113 | 27 | 113 | 32 | I find this paragraph vague to the point that I cannot evaluate what it is saying. Are the "instruments" *means* or *normative* guides? If the latter, then I find the assertion lacking credibility without much more said. | This will probably be de-emphasized in SOD, since it is the subject of later chapters in WGIII. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 3323 | 3 | 115 | 1 | 115 | 10 | Again, there is much more to climate justice and ethics than well-being and fairness. Questions of right are not primarily procedural and are not primarily concerned with maximizing or distributing well-being. Rather, rights are commonly thought of as the conditions of dignity, or the consequences of freedom (autonomy). When related to well-being, rights are concerned with the basic needs or conditions of agency of individuals. The absence of a discussion of rights or capabilities (which are not directly framed in terms of well-being, which is a matter of functioning not capability) makes this paragraph seriously misleading and concerns me that the entire chapter will have majorly misleading discussions of justice and ethics. | We can't say everything in one paragraph, and we can't deal with a prediction about what will happen later in the chapter. |
| 3324 | 3 | 115 | 27 | 115 | 28 | First, well-being and cultural values hardly exhaust the relevant human values at stake in climate justice or ethics. Autonomy or freedom, agency or capability (dignity) ought to figure centrally. None of these is reducible to well-being or considers itsself anything short of universal, i.e., not culturally limited. Second, "non-human values" is equivocal and perhaps non-sense. Perhaps you mean, "values concerning non-human life" or something of the sort? You aren't implying, I assume, that you will consider the values of -made by or held by- non-humans, if there be such values? | Noted; will be addressed in SOD |
| 3326 | 3 | 116 | 14 | 116 | 14 | "Non-human values" is confusing again. Also I would include mentioning "biotic integrity" alongisde "biodiversity." A wave of criticism of the term "biodiversity" is beginning to form and the result may be to blindside appeals to the term for a time until sufficient conceptual clarification is done. Biotic integrity does not share the exact same domain as biodiversity but handles many of the objects or situations I believe you have in mind, siuch as species extinction, wilderness, and so on. | The mention of biodiversity has been removed. |
| 3325 | 3 | 116 | 4 | 116 | 12 | Again, the absence of considerations of right or of capability seems a major oversight here. Both are neither compensatory nor always or ever distributive (capability is distributive, but in a way that is embeds quantiy within qualitative structures that are highly determinative of the shape of any possible distribution) -but could at best be used to justify appeals to either and to shape the way in which such appeals could possibly be discharged to the satisfaction of justice. | Capabilities are dealt with under wellbeing. The entire section on justice is about rights. This has been made more explicit. |
| 3327 | 3 | 117 | 38 | 117 | 40 | This is speculation and plays into techno-optimism. Moreover, it is normatively problematic. Unless we have strong, definite grounds which allow us to predict a rise in technological capacity which will offset climate burdens sufficiently to allow humans to improve well-being, then claiming it "might" be so is distraction or worse. Consider, it might be the case that if my daughter goes and climbs a cliff-face well above her current climbing ability that she will emerge victorious with improved skills. But I would be rash to speculate so in the absence of determinate and strong grounds that she will emerge victorious. | The author of this comment forgets that growth results from investment as well as technical progress. However, we will delete 'human', and try to make this clearer. |
| 3328 | 3 | 117 | ftnote 1 | 117 | ftnote 1 | Gardiner (2011) has the most sophisticated analysis of a *morally non-arbitrary* concept of a generation. I would cite it. | Agreed, I added a reference to Gardiner 2011 |
| 6962 | 3 | 12 | 1 | 12 | | Perhaps add a reference to Jonathan Wolff and Avner de-Shalit, 'Disadvantage' (Oxford: Oxford University Press, 2007) re. their pluralist account of disadvantage. | Thank you, reference added |
| 9801 | 3 | 12 | 19 | 12 | 22 | I would be very cautious using the argument that "people living today would not exist at today's level of prosperity had previously living people not engaged in the emission-generating activities as they did, and thus nobody is better or worse off owing to the emissions of previously living people." Politicians and business practionners might use this argument also for future generation to excuse their decisions today. | No action; we cannot omit an argument for fear of it being misused. |
| 2202 | 3 | 12 | 19 | 12 | 22 | Confusingly stated; not only would these people living today not exist at their present level of prosperity; they would not exist at all. | Agreed. Text was changed accordingly |
| 7912 | 3 | 12 | 2 | 12 | 2 | At the end of section 3.3.3 in remains unclear which distribution of permits is to be regarded as just. If you are not willing to make such assertions, you could at least clarify which distributions would definitely be unjust. For instance, on page 32 different principles are mentioned though some (most?) of them should not be considered accroding to the analysis in section 3.3.3 (e.g. the "sovereignty principle"). Please be more explicit at this point. | Is discussed in ch. 4 and further below in sec. 3.6 |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 9290 | 3 | 12 | 20 | | | As far as I can see the clause “at today's level of prosperity” is unnecessary (and therefore confusing). Isn't the point that owing to the non-identity problem, the people who in fact live today would not have lived at all in the case in question? | See above response to comment 2202 |
| 9291 | 3 | 12 | 21 | 12 | 22 | “and thus” - this follows only if the auxiliary premise that nobody can be better or worse off existing than not existing is used. That premise is controversial (IIRC e.g. Arrhenius, Holtug, Rabinowicz, Bykvist all deny it). | No action; we are only describing an argument, not endorsing it. In addition, we disagree with the characterization of |
| 12528 | 3 | 12 | 22 | | | Add after "people" -- "Shue (2009) provides a bounded view of these issues to develop a balanced framing for policy development." Henry Shue, 2009. SBSTA Technical Briefing: Historical Responsibility. http://unfccc.int/files/meetings/ad_hoc_working_groups/lca/application/pdf/1_shue_rev.pdf | Will consider this reference; there is a peer-reviewed article that would be better to refer to |
| 4484 | 3 | 12 | 23 | 12 | 37 | The claim is made that the arguments in this paragraph refute the arguments in the previous paragraph. This is only an assertion, however; there are arguments to be made on both sides of the "historical responsibility" question, and this paragraph by no means settles them. | This is not the claim. The first sentence says 'speak against', not 'refute'. We changed the wording. The claim is that there are two ways of taking into account historical emissions from the perspective |
| 13659 | 3 | 12 | 23 | 12 | 37 | There is emphasis n the problems of assigning 'historical responsibility' in this section on account of 'lack of knowledge'. However, it can be seen that even if the year from which accounting is done is changed to 1970 (around which time, CO2 emissions were globally acknowledged to cause environmental damage), Annex-I countries bear responsibility for a majority of the emissions (in spite of knowledge of the problem). So historical responsibility can be argued to be current responsibility (Kanitkar et.al) | No action; we seem to agree or I do not understand the comment. |
| 13425 | 3 | 12 | 23 | | | Not clear what “do not speak against” means. May be clearer if it is changed to “From the perspective of distributive justice, however, these objections should not stand in the way of taking into account…..” or something to that effect. | Agreed. |
| 9340 | 3 | 12 | 27 | 12 | 29 | Historical responsibility can still remain ;it is important to remember this and highlight that the three conditions mentioned earlier do not take away historical responsibility. | No action; we believe the text adequately reflects this |
| 2116 | 3 | 12 | 27 | 12 | 28 | I wasn't sure why taking emissions into account in this way is not (at least partly) open to the objections of the previous paragraph. Regarding the first objection, it might still be argued that at least until they reach adulthood, present people still cannot reasonably be expected to influence past people's action. And regarding the second objection, if past people are to be excused for ignorance of the consequences of their actions, then this seems to apply also to the *by-products* of their actions. | No change needed. Presently living people cannot influence past people's actions. From the perspective of distributive justice what counts are the benefits that people have realized and will realize from their own and past |
| 13005 | 3 | 12 | 38 | | | Tim Hayward and Steve Vanderheiden's papers on ecological space might deserve citation. | Agreed. We added references. |
| 13414 | 3 | 12 | 38 | 12 | 42 | Missing from this paragraph and from the chapter as a whole are references to significant recent work on concepts of equity in the context of climate change and climate justice, including the carbon budget approach linked to equitable sharing of atmospheric space (which has been dealt with by several writers, including in the BASIC experts report) and the greenhouse development rights framework (Baer et al, 2008). | Agreed. We added references |
| 9524 | 3 | 12 | 4 | | | Please, add words, 'idea of', in front of historical responsibility as it is under discusson in UNFCCC. | No action; disagree with comment |
| 7359 | 3 | 12 | 4 | 12 | 4 | "This is usually interpreted to imply that current and historic differences among countries should play a role in determining emission reduction obligations" - this does not state clearly enough that the "historic differences" are the historic differentiated contributions. It also could be useful to quote the entire Article 3(1) or at least its concluding sentence that: "Accordingly, the developed country Parties should take the lead in combating climate change and the adverse effects thereof." So it is not just emission reductions but also in the approach to "adverse effectts" so adaptation that developed countries have agreed to do more. A link to the Rio Declaration Pricinple of CBDR may also give readers a better understanding of the relevance and application of the principle. | Agreed, we made changes |

|---|---|---|---|---|---|---|---|
| 9118 | 3 | 12 | 40 | 12 | 42 | Heinonen & Junnila have deontrated with a case study of two Finnish cities that the impact of increased driving may be rather small due to multiple factors, but primarily to GHG emissions per VMT in a city structure being substantially higher than of those in less dense areas. | Thank you. Reviewing the literature on this issue does not belong in this. |
| 4923 | 3 | 12 | 6 | | 8 | Actually the UNFCCC itself makes clear that interpretation in the preamb.: "Noting that the largest share of historical and current global emissions of greenhouse gases has originated in developed countries .. " and in para 3.1. "in accordance with their common but differentiated responsibilities and respective capabilities. Accordingly, the developed country Parties should take the lead .." Concerning the footnote, those commitments/obligations only for: developed countries (included in Annex II of the UNFCCC) .. | We made some changes in response to 7359 which address this comment, too. |
| 9525 | 3 | 12 | 7 | 12 | 8 | Please, replace here with the following, as this principle of 'common but differentiated commitments and responsibilities' remains the subject of interpretation and negotiation (Honkonen, 2009); some states insist developed countries should have mitigation obligation in proportion of their historical emissions but there is no common recognition how parties deal with their historical emissions under UNFCCC. | We made some changes in response to 7359 which address this comment, too. |
| 8248 | 3 | 12 | | 14 | | The main focus of the authors remains to provide insights on potential complexities associated with allocations of emissions rights across regions (or agents) based on their differential historical emissions-activities.<br>Comment: At this point, it might also be worthy to discuss about distributive and social and ethical aspects of emission allocation in a situation in which emissions in one country has gone down dramatically due to external circumstances (such as that in Russia) relative to the historical level (e.g. 1990).<br>While the three principles of responsibility sharing are well discussed, are there some studies that estimate how different country responsibilities (e.g., developing and developed country) might alter if alternative measures are used. In other words are there estimates that can practically be applied to different countries as emission rights for the future? | Thank you. Reviewing the literature on this issue does not belong in this. |
| 6963 | 3 | 12 | | | | I think this section could be cut without loss. | No action; sections are set by IPCC |
| 15642 | 3 | 12 | | | | The emphasis in this and the subsequent section on "historical" responsibility over other kinds of responsibility is somewhat problematic. Some parties to negotiations would see references to historical responsibility as being synonymous with "full" historical responsibility (i.e. strict responsibility of developed countries for all past emissions). While this may be an overly restrictive view of what historical responsibility entails, it is nevertheless the case that there is an important distinction between (a) historical responsibility and (b) _causal_ responsibility for emissions (which may relate to past, present or future). 3.3.4 implies as much by saying that CBDR applies to both current and historic differences (line 7). However, later sections - in particular section 3.3.5 - sometimes blur this distinction. For example, the Polluter Pays Principle is not purely an instrument for assigning historical responsibility (indeed some theorists argue it is purely prospective), but it is certainly associated with causal responsibility. | Thank you. Agreed. We put emphasis on the distinction in 3.3.5 |
| 10951 | 3 | 12 | 1 | 12 | 42 | Note the sensitivity of outcomes of a responsibility approach to choices made.Note also that a "forwardlooking" responsibility approach can get a very different outcome for fast-growing DCs. Confer: Rive, Torvanger, Fuglestvedt (2006), Climate agreements based on responsibility for global warming: Periodic updating, policy choices, and regional costs, Global Environmental Change, 16, 182-194. | Thank you. The article investigates the likely distributional implications of alternative ways of taking into account historical responsibility for DCs and over |
| 13266 | 3 | 12 | 19 | 12 | 22 | this third argument is complex. Not all people have been benefited from the emissions of previous generations. For the poorest in least developed countries, this argument do not apply. Maybe a threshold of living standard could be set to recognize who have been benefited and who have not. | No action; we are only describing an argument, not endorsing it. For the discussion of the argument, see below. |
| 15644 | 3 | 12 | 19 | 12 | 22 | Suggest removing further discussion of the non-identity problem here and below as it has been amply discussed above; some would argue that the prominence of this issue in academic debate is disproportionate to its relevance to policy. Removing this would contribute to shortening the chapter overall. | No action; no change needed. It is true that some have that view |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 16960 | 3 | 12 | 19 | 12 | 22 | To further support my comment about not labouring the non-identity problem, here is a sample from a new book on climate change and intergenerational justice: 'Although it [the non-identity problem] presents a real philosophical puzzle about how some approaches to justice can conceptualise harm-avoidance principles with intergenerational scope, its dominant place in debates about intergenerational justice does no favours to philosophical contributions to such debates, and - in my opinion - has become a serious hindrance to progress in the face of real and pressing political problems.' (McKinnon, C. 2012. Climate Change and Future Justice: Precaution, Compensation, and Triage. Abingdon, UK: Routledge., pp.41-42) | No action; see response to the previous comment 15644 and see comment 7909 |
| 15643 | 3 | 12 | 8 | | | CBDR applies not only to "emission reduction obligations" but also to adaptation obligations as well. Alternatively, change line 4 to "Historical responsibility with respect to mitigation" | We made some changes in response to 7359 which address this comment, too. |
| 8822 | 3 | 13 | | | | this section on intra-generational justice reads too much like a tutorial; I'd make major cuts here in the text and rely on cited references if the reader wants additional details. | Disagree with comment. We believe the text provides a survey as is required. |
| 16669 | 3 | 13 | 1 | | | A book-length treatment of the compensation issue is Catriona Mackinnon, Climate Change and Future Justice: Precaution, Compensation and Triage (London: Routledge), 2011. | Will consider this reference; may be grey literature |
| 4485 | 3 | 13 | 13 | 13 | 18 | All three "principles" implicitly assume that the individuals involved are members of a community with well-defined rights and obligations to each other. This is not the reality; we live in nation-states, and it is unrealistic and counterproductive to pretend that all individuals can be viewed as members of a single global collective. We may have some responsibility for the actions of our own governments, and we may feel a sense of empathy or solidarity with citizens of other nations, but no national government is going to treat all people in the world as if they were their own citizens. This can be illustrated by considering what would constitute "justice" if some government or governments) behave in an aggressively genocidal manner (e.g., Nazi Germany). Would it be "just" to allocate emissions rights to such a government or governments? The point is that the justice argument cannot be separated from existing political realities. This comment applies to the philosophical underpinning of the entire chapter. | No action; disagree with comment; do not see why this is an objection to the principles. They are about what rights and responsibilities there should be. |
| 10423 | 3 | 13 | 13 | 13 | 20 | Expand this section | No action; we believe the text adequately |
| 3607 | 3 | 13 | 13 | 13 | 18 | Please add "Disregarding transaction costs, according to the Coase-Theorem (Coase, 1960), compensatory payments lead to the same optimal emission reduction, regardless the polluter or the injured party pays". Cite: R. H. Coase (1960). The Problem of Social Cost. Journal of Law and Economics 3, 1–44. | Disagree with comment. None of the three schemes asks the injured party to pay. |
| 3928 | 3 | 13 | 13 | 13 | 20 | Ronald Coase has made the point that, in the absence of well-defined property rights, the attribution of cause from proximity effects is arbitrary. From the victim's point of view the polluter is the cause. From the polluter's point of view it is instead the victim's proximity (or even their existence) that is the cause. (Coase's actual famous example, was the free range farmer's cattle feeding on the cropper's crops and the question of who should pay for the fence.) However, once the property right is established, the conflict can be sorted. (Perhaps the free range farmer buys the croppers land, or perhaps the free range farmer becomes a cropper?) Who knows what the outcome will be? Coase won the Nobel for this insight and it is surely important enough for the chapter to acknowledge. | Disagree with comment. See previous response. |
| 17703 | 3 | 13 | 19 | 13 | 28 | Why suddenly from a neutral level of analysis, the text jumps to an individual lever with he or she. I does not seem right; probably just referring to "agents" will fit better. | Thanks. We replaced "he or she" by agent. On the victim-side we kept he or |
| 2203 | 3 | 13 | 2 | 13 | 2 | They not only suffer disproportionately; many of them die. See first comment. | Thank you. In parantheses we added "or will die prematurely owing to these |
| 9119 | 3 | 13 | 21 | 13 | 21 | To my knowledge the intake fractions are much higher in cities (e.g. Apte, J.; Bombrun, E.; Marshall, J.; Nazaroff, W. (2012): Global Intraurban Intake Fractions for Primary Air Pollutants from Vehicles and Other Distributed Sources, Environmental Science and Technology, 46, 3415−3423.). | No action; comment unclear |
| 9341 | 3 | 13 | 24 | 13 | 24 | ; | No action; no comment |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 4924 | 3 | 13 | 24 | | 28 | The PPP is universally accepted (as a principle "in principle") according to the 1992 Rio Principle 16, but indeed it is not universally applied. As a matter of fact, the PPP is part of the UNFCCC: in form of financial and technological assistance by the Annex-II developed countries to the developing countries. Indirectly the BPP is also there when the (better) "respected capabilities" of the developed countries are also considered as an argument for their duties for compensatory measures (i.e. assisting developing countries).. | Thanks you. See above, response to comment 15645. |
| 13415 | 3 | 13 | 29 | 13 | 46 | This treatment of arguments on why the polluter pays principle cannot be applied (or can be applied in only a very limited way) in relation to compensation is much too one sided. At least equal space should be given to the opposite argument. This counter-argument has been made by others such as Gardiner 2010 and Shue (1992 and other articles) -- for example their point that if people in poorer countries are deprived of their share of an important resource needed for their very survival, then ignorance is not an acceptable reason for not assisting or compensating especially since the rich nations' overuse of the resource denies the poor of extricating themselves from the problems the rich created. | Thank you. This is a misunderstanding. The review in this section agrees with the point made in the comment, see end of sec. 3.3.5 (and compare 3.3.4): "Principles of distributive justice can also be applied (at least to some degree) to the distribution of duties to pay for adaptation measures to those who suffer from climate damages. It has been suggested that these duties should be allocated mainly to the highly industrialized and rich countries according to their ability-to-pay that reflects their causal role in bringing about the problem in question (Shue, 1999; Caney, 2010; Gardiner, 2011). Secondly, currently living people stand under intergenerational duties of justice with respect to climate justice if they can be said to know not only about the seriously harmful consequences of their |
| 2117 | 3 | 13 | 31 | 13 | 31 | Aren't the rights to receive compensation also potentially relevant to *future* people? | Agreed. We changed to "for currently living and future people" |
| 2118 | 3 | 13 | 33 | 13 | 35 | A reference to sec. 3.3.6., where this question is discussed in the legal context, might be useful. | Agreed. We added cross-reference |
| 11553 | 3 | 13 | 33 | | | The discussion of duties bearers might have should take into account the difference between the duty to avoid (local) environmental pollution and (global) climate change. In the former case people cannot claim ignorance. | No action; we're only dealing with climate change, so this is irrelevant. |
| 9120 | 3 | 13 | 38 | 13 | 44 | Potentially with fine particulate matter also. And the direction of GHG's is not clear due to the wealth and proximity effects. | No action; comment unclear |
| 2204 | 3 | 13 | 38 | 13 | 38 | Even under the usual conditions for the nonidentity problem, there are ways in which a person might be said to be harmed without appeal to a threshold conception of harm. Consider this notion of harm: Person P is harmed by an action A if P is made worse off by some consequence of A than if P had been unaffected by that consequence. This idea explicitly allows that one may be harmed by some consequences of an action and not harmed (perhaps even benefited) by others. In climate change case, one consequence of our prolonged GHG emissions is the existence of certain future people; another is, let's say, their suffering and/or dying in a drought. The suggested concept of harm implies that our emissions harm these people by afflicting them with drought, thereby making them worse off than they would have been had they not been so afflicted—which could have been the case, for example, if they had migrated before the drought began. The fact that they would not have existed were it not for our emissions does not nullify the harm. (Example is from John Nolt, "Response to Critics of 'How Harmful Are the Average American's Greenhouse Gas Emissions?'" Ethics, Policy and Environment, accepted, revised and forthcoming.) | No action; in the text the point is made on p. 12, lines 30-33. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 14841 | 3 | 13 | 1 | | | This section relies heavily on an distinction between wrongful actions that call for compensatory measures and other actions that may lead to undeserved benefits or cause harms. It is not clear how important (if at all) this distinction is in the climate context.<br><br>That PPP is "...far from universally accepted..." is a strong and unsubstantiated statement.<br><br>The our basic problems are obviously each subject to counter-arguments that should not be omitted. Is the identity problem relevant? Are the inheritors of the benefits of emissions of those who are now dead responsible (see Shue). Is the difficulty of defining a threshold harm sufficient to absolve the polluter? | Thank you. - The distinction is considered important by many authors and in many contexts. At the same time ist importance is contested as sections 3.3.5 together with 3.3.6 show. - Agreed. We deleted "far from universally accepted". |
| 15645 | 3 | 13 | 1 | | | The conceptual distinction between sections 3.3.4 and 3.3.5 is unclear, and suggests that using distributive and compensatory justice as a point of distinction between the two sections may not be ideal, particularly as considerations of historical responsibility are split across the two sections. Moreover, it is at best incomplete to say that the three principles identified in 3.3.5 (lines 17-18) are principles of compensatory justice when in fact they are at least as plausibly principles of distributive justice (see eg Caney, S. 2010. Climate Change and the Duties of the Advantaged. Critical Review of International Social and Political Philosophy 13 (1):203 - 28.). It may be more straightforward, for example, to combine 3.3.4 and 3.3.5 into a single section on principles for assigning responsibilities for emissions. | No change needed. We do not think that PPP is "at least as plausibly" understood as a principle of distributive justice. This claim is more plausible with respect to BPP and CPP but as I say in the text these principles are heavily disputed. -- Also, we do think that the issue of historical responsibility should be discussed (as in the draft) from both |
| 3929 | 3 | 13 | 1 | 14 | 47 | Surely a chapter on ethics in relation to the use of government action should acknowledge John Stuart Mill's famous harm principle and advice policy makers how to think about it from an ethical perspective taking their own values into account? It seems to be a natural fit with the non-identity principle. Mill's harm principle says its OK to remonstrate with people that they should behave morally and ethically, but it is impermissible to take away their freedom to make a moral choice, unless their action would impose a harm on others. The non-identity principle seems to be making a case that actions today can't be said to be imposing a harm on unborn generations. Surely the chapter should be providing policy makers with guidance on how to evaluate these two points from an ethical perspective? | Thank you. We added references on harming as wronging. |
| 12779 | 3 | 13 | 25 | 13 | 25 | Because of PPP being part of the CBDR the statement that PPP is "...far from universally accepted" should be reconsidered. | Agreed. We changed 'far from' to 'not' |
| 13267 | 3 | 13 | 45 | 13 | 46 | this a double edge argument. Some people is not worse but rather not exist at all, that is true. But there are potential people who should have existed, but factually does not, if the past emissions were not emitted. Technology improvements plays for both sides, on one, better medical equipment and infrastructure allow some people that in past conditions did not exist, to exists now; on the other, better technologies for natality control create the figure that some people could have exist, but do not. | No action; comment unclear |
| 6311 | 3 | 13 | 45 | 13 | 46 | I would encourage the authors to limit the discussion of Parfit's non-identity problem. While it has been reviewed amongst philosophers extensively in the literature, it is deemed by many to be relatively nonsensical. For the purposes of the credibility and integrity of this report, I would limit discussion on what comes across to the reasonable, non-philosophical public as rather silly. | Disagree with comment. The non-identity problem is genuine. Reviewing the philosophical and normative literature on climate change requires |
| 8146 | 3 | 14 | | | | It would be helpful to provide examples of how the BPP and CPP principles relate to climate change (CC). | Noted; space constraints prevent us from providing much in the way of |
| 13416 | 3 | 14 | 1 | 14 | 8 | This treatment of arguments on why the polluter pays principle cannot be applied (or can be applied in only a very limited way) in relation to compensation is much too one sided. At least equal space should be given to the opposite argument. This counter-argument has been made by others such as Gardiner 2010 and Shue (1992 and other articles) -- for example their point that if people in poorer countries are deprived of their share of an important resource needed for their very survival, then ignorance is not an acceptable reason for not assisting or compensating especially since the rich nations' overuse of the resource denies the poor of extricating themselves from the problems the rich created. | No action; this comment is the same as comment 13415, see our response to comment 13415 |

|---|---|---|---|---|---|---|---|
| 6964 | 3 | 14 | 1 | 14 | 2 | I outline an approach to intergenerational corrective justice that overcomes the problem of dead duty bearers: Catriona McKinnon, 'Climate Change and Future Justice: Precaution, Compensation, and Triage' (London: Routledge, 2011), esp. chapter 4. | Agreed. We added a reference and refer to McKinnons partial solution of the problem. |
| 11554 | 3 | 14 | 1 | 14 | 2 | The discussion of the identity problem should consider that there may also be an identity problem at the victim side. Who should have compensation? | Agreed. We added this dimension of the discussion |
| 9292 | 3 | 14 | 16 | 14 | 18 | “Owing... section 3.2.4)”. I found this sentence confusing. Is the point that past emissions that e.g. raised the standard of living for predecessors but happened to have no knock-on effects (e.g. via technological progress) for present people are excluded? If so, I don't understand how the non-identity problem is relevant here. | Agreed. We clarified this. |
| 2120 | 3 | 14 | 16 | 14 | 20 | Passage is cumbersome. | Agreed. We clarified this. |
| 12135 | 3 | 14 | 18 | 14 | 19 | BPP's implication that existing people should be responsible only for emissions from which they have benefited seems to me exactly right. While some disagree, it may be worth noting that this is not necessarily an objection to the principle. | No action; we do not claim that it is an objection to the principle as such. |
| 12136 | 3 | 14 | 20 | 14 | 22 | Need benefiting from injustice be voluntary in order to create an obligation to disgorge the gains? (Note Butt's argument that it need not [2007, p. 134].) | Noted. |
| 6965 | 3 | 14 | 21 | 14 | 21 | The word 'feasibly' does a lot of work here. It would be good to indicate that somehow. | Noted. We deleted "feasibly" and added |
| 11555 | 3 | 14 | 23 | 14 | 33 | The presentation of the community pays principles is too short. In general, thorough discussions of collective responsibility and remedial responsibility are lacking. | Cannot be addressed given the space constraints |
| 6966 | 3 | 14 | 26 | 14 | 26 | Janna Thompson's communitarian approach to intergenerational justice should be referenced in connection with 'transgenerational community' (see Janna Thompson, 'Intergenerational Justice: Rights and Responsibilities in an Intergenerational Polity', London: Routledge, 2009). | Agreed. We added a reference to Thompsons 2001 article in Ethics. |
| 2119 | 3 | 14 | 3 | 14 | 4 | There is something confusing about this conclusion, with its focus on PPP. For example, the third problem identified in the previous paragraph does not seem to arise for PPP, as the question of whether or not the polluter *benefited* from the emissions is not obviously relevant to her compensatory duty under PPP. | Agreed. We clarified this. |
| 12137 | 3 | 14 | 31 | 14 | 33 | Shouldn't the criterion be whether the past emitters could reasonably have anticipated whether their emissions would be harmful? | No action; this is how the "ignorance" problem is explained on p. 13, lines 33- |
| 9293 | 3 | 14 | 32 | 14 | 33 | In light of the last sentence, I take it that “can [now?] be shown” should read “were known at the time of emission”. | Thank you. In the sentence we now refer back to the first and second problem as |
| 9342 | 3 | 14 | 34 | 14 | 47 | a great deal of space to illustrating the limited applicability of the principle of compensatory justice. any other approaches? | No action; we review distributive justice in 3.3.4 |
| 14844 | 3 | 14 | 34 | | | That the applicability is "limited" has not been compellingly established. | Thank you. 'Compellingly' is too much to expect in this survey. We changed the |
| 16670 | 3 | 14 | 39 | | | distinction between causal responsibility vs. ability to pay was discussed in following prior to other references: Dale Jamieson, “Global Responsibilities: Ethics, Public Health, and Global Environmental Change,” Indiana Journal of Global Legal Studies 5,1 (Fall 1997): 99-119 | Thank you. We added a reference. |
| 12138 | 3 | 14 | 39 | 14 | 42 | There does not seem to be a plausible rationale based on *distributive justice* for including the causal responsibility of past people as a factor in allocating the burdens of adaptation, as opposed to ability to pay. | Thank you. We changed the wording. We mean to refer to the correlation between level of (past) emissions and |
| 6967 | 3 | 14 | 45 | 14 | 46 | A third and distinct reason for thinking that present people have IG duties of justice is that they have an obligation to (at least) put future people at risk of life in conditions in which the pursuit of justice is not possible. | Thank you. We changed the wording and added a cross-reference. |
| 14842 | 3 | 14 | 8 | | | "…a small part of the problem…": is not substantiated. | Agreed. Was changed to "some part". How big the part is depends on the percentage of emissions (causally relevant for climate change today and in |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 14843 | 3 | 14 | 9 | | | BPP: again, discussion of the counter-arguments to the objections, which do not seem strong. (What about partial responsibility for past emissions that led to benefits being enjoyed? How strong is the condition of voluntary acceptance?) | No action; cannot be addressed given the space constraints |
| 12780 | 3 | 14 | 1 | 14 | 2 | I am not sure if this assumption is replicabel to climate policy, since countries do not die. | No action; point is made: See below, p. |
| 6465 | 3 | 14 | 3 | 14 | 8 | The analysis of the polluter pays principle is based excusively on obligagtions of individuals. Yet nations have responsiblility under the UNFCCC under the "no harm" priciple in the Preamble, and various express provisiions dealing with obligations ofd developed and developing countries. If this is true the limitations of the 'plluter pays principle" identified in this section are not applicable. A sentence should be added distinguishing obligagions of individuals from nations. | Agreed. See sec. 3.3.6 |
| 8147 | 3 | 15 | | | | Can you provide an example of a causal link with respect to legal issues and its relationship to CC (e.g. liability of a firm for polluting)? | Will be addressed in SOD |
| 4619 | 3 | 15 | 18 | 15 | 18 | bon père de famille | Will be addressed in SOD |
| 9121 | 3 | 15 | 18 | 15 | 21 | Again the implications of accumulation of wealth (agglomeration economies) and the GHG's from the construction of infrastructure systems (including buildings) should not be forgotten. | No action; comment unclear |
| 9122 | 3 | 15 | 22 | 15 | 24 | Higher density may potentially lead to more consumption of goods, especially if rebound effect exists due to savings on transport costs (see the first comment concerning the whole AR5). | No action; comment unclear |
| 14846 | 3 | 15 | 30 | | | The causal link is trivially shown in the case of depleting a finite common resource, the depletion of which prevents subsequent legitimate use. | No action; consulted with legal expert - this is incorrect, at least in the context of tort law. It is necessary to show that the |
| 6968 | 3 | 15 | 30 | 15 | 39 | Reference should be made here to Sinnott-Armstrong's rejection of the Harm Principle as generating liability for individuals for CC in virtue of their emissions: his arguments draw on (he claims) the absence of a causal link between individual emissions and CC. See Walter Sinnott-Armstrong, 'It's Not My Fault: Global Warming and Individual Moral Obligations' in Gardiner, Stephen M., Caney, S., Jamieson, D., and Shue, H. (eds), Climate Ethics: Essential Readings (Oxford: Oxford University Press 2010). An excellent response is Hiller, Avram, 'Climate Change and Individual Responsibility', The Monist, Vol. 94, No. 3 (2011), pp. 349-68. And John Nolt's controversial paper should also be mentioned: Nolt, John, (2011), 'How Harmful are the Average American's GHG Emissions?', Ethics, Policy and Environment, 14:1, 3-10. | No action; comment is mistaken and this is not an appropriate place to mention this literature |
| 9526 | 3 | 15 | 35 | | | Please, delete also. | No action; disagree with comment |
| 6969 | 3 | 15 | 40 | 15 | 46 | This paragraph could be cut without loss. | No action; this paragraph was included because some of the arguments for climate responsibility rely on theories of |
| 9003 | 3 | 15 | 47 | | | Legal systems do not recognize legal liability from externalities. Existing legal systems appear to provide inadequate and incomplete help to making progress on normative questions. | No action; consulted with legal expert - the chapter makes it clear that the legal system is a source of possible insight on |
| 16631 | 3 | 15 | 47 | 16 | 2 | Change the sentence that starts with "[t]his approach…" to this approach could lead to serious errors because weighting monetary values helps capture wealth differences among different countries. | Noted. |
| 4925 | 3 | 15 | 6 | | | Just recently a court (ECJ) decided against aviation companies as emitters of GHGs .. | Will be addressed in SOD |
| 4926 | 3 | 15 | 9 | | 14 | Just recently a court (US AC) decided that the GHGs are pollutants .. (i.e. with harmful effects and certain duties for the emitters within the USA) .. | Will be addressed in SOD |

|---|---|---|---|---|---|---|---|
| 14845 | 3 | 15 | | | | This section seems fails to distinguish between states and individuals (or firms), which may well have different responsibilities. This may especially be the case after having signed an international declaration (Rio, 1992) stating: " "In view of the different contributions to global environmental degradation, States have common but differentiated responsibilities. The developed countries acknowledge the responsibility that they bear in the international pursuit of sustainable development in view of the pressures their societies place on the global environment and of the technologies and financial resources they command." As CO2 remains in the atmosphere, the mentioned degradation continues even as a result of historically emitted GHG pollution. | No action; we are avoiding discussion and interpretation of UNFCCC and related international agreements (beyond the scope of our chapter). |
| 12781 | 3 | 15 | | 16 | | All topics regarding historical responsibility or intergenerational justice should be summarized in one section. | No action; disagree with comment; it seems reasonable to separate legal |
| 7360 | 3 | 15 | | | | This section discusses legal concepts of historical responsibility from a compensatory perspective but misses discussion of legal concepts in the allocation of emission rights considering historical responsibility. This is not addresed in 3.3.4 and so should be inculded here. Some discussion of such issues is availble in: Carlsson, Jonathan. (2009) 'Reflections on Problems of Climate Justice: Climate Change and the Rights of States in a Minimalist International Legal Order.' Transnational Law & Contemporary Problems Vol,18, 45. and Parikh Jyoti, et. al. (1997) 'Climate Change, North-South Co-operation and Collective Decision-Making Post-Rio.' Journal of International Development, Vol. 9, No. 3. 403 | No action; international law beyond scope of chapter |
| 3930 | 3 | 15 | 1 | 16 | 2 | This section arguably needs to make the point that a common law determination does not generally dictate the outcome. Polluters who are determined to be outside the law can make themselves legal by achieving the plaintiff's consent. | No action; comment unclear |
| 4569 | 3 | 15 | 17 | 15 | 18 | Add: Grossman, David A., Tort-Based Climate Litigation. 2009. In: William C.G. Burns and Hari M. Osofsky (eds.), Adjudicating Climate Change: State, National, and International Approaches. Cambridge University Press Cambridge UK, 193-229. | Will consider these references |
| 3141 | 3 | 15 | 2 | | | section 3.3.6 might benefit from some discussion of legal cases (e.g., in Alaska) where countries have actually tried to address climate with nuisance and other frameworks. The attribution problems, within the legal system, are a severe barrier. And a little case study or two (just a few sentences) would help underscore that. | Will be addressed in SOD |
| 15646 | 3 | 15 | 27 | | | Re "1990" - explain that this determination was on the basis of the publication of the IPCC's first assessment report. | No action; consulted with legal expert - it does not seem to me that the |
| 4568 | 3 | 15 | 7 | 15 | 8 | Add: Burns, William C.G. and Hari M. Osofsky. 2009. Overview: The Exigencies That Drive Potential Causes of Action for Climate Change. |---|---|---|---|---|---|---|---|
| 7913 | 3 | 16 | 25 | 16 | 31 | What would the ideal of deliberative democracy mean for climate policy and decision making? In our opinion, it would be more important to elaborate on that. And: procedural justice clearly is more than just providing information. | Will be addressed in SOD |
| 11198 | 3 | 16 | 31 | | | The UN General Assembly has recognised the right of Indigenous Peoples to not only be consulted or to participate in activities that will affect them but accords them the right to give or withhold their free, prior and informed consent to developments that may impact them. This right to FPIC includes the right to reject development proposals from any third party, government or industry, that affects their customary territories. (United Nations Declaration on the Rights of Indigenous Peoples). | Will be addressed in SOD |
| 6970 | 3 | 16 | 6 | 16 | 8 | This makes it look like procedural and distributive justice are alternatives, whereas (for many) distributive justice is the outcome of procedural justice. | No action; disagree with comment |
| 14848 | 3 | 16 | | | | Sec. 3.3.7 on procedural justice could greatly benefit from some of the empirical research carried out on the conduct of the UNFCCC negotiations, and the disparate capacity to engage between developed countries and developing countries. | No action; this issue is too large to be addressed here |
| 3931 | 3 | 16 | 4 | 16 | 8 | This section seems to be saying that if a political majority determine to kill all non-believers that is fine from a procedural justice viewpoint as long as the public decision was taken in a fair way, independent of outcome and the oppressed minority had a fair say in the decision. But that notion of untrammelled majoritarian democracy is starkly inconsistent with the idea of individual human rights. This might be the ideal 'deliberative democracy' it is not the ideal of checks and balances and protections for human rights that are central to the US constitution. The idea of individual basic rights is supported elsewhere in the chapter in the intergenerational context, its application to the procedural justice section would seem to be relevant and appropriate. | Will be addressed in SOD. It may be enough to remove 'independent of outcome' from the first sentence. |
| 11556 | 3 | 16 | | | | In relation to the discussion of levels and scope of procedural justice two contributions should be taken into account. Steve Rayner “How to eat an elephant: a bottom-up approach to climate policy” (Climate Policy 10 (2010) 615–621) and Elinor Ostrom “Green from the Grassroots” (Project Syndicate, June 12, 2012). Both papers discuss the relevance of polycentric and overlapping local and national policies - combined with a thin global agreement. | Will be addressed in SOD; this issue is more appropriate in 3.11.2 |
| 8824 | 3 | 17 | | | | this section, on “non-human values,” would become more meaningful if it were to begin with examples of the types of impacts and areas of risk that are relevant because they are directly related to climate change. | Done that to some extent |
| 17164 | 3 | 17 | 11 | | | Chapters 3.4 and 3.5 do not make sufficiently clear that the aggregated view is highly problematic from many ethical perspectives. It seems like a bias toward utilitarianism here. | This was not the intention of the section and chapter. We have changed the |
| 12139 | 3 | 17 | 11 | 17 | 14 | It seems to me that more of a transition is needed in shifting to 3.4, indicating that the account is moving from largely deontological accounts of distributive justice to consequentialism. | We have put more stress on the transition. |
| 7915 | 3 | 17 | 12 | 17 | 24 | Please explain the concept of a value that your remarks are based on. What is a value: a whish, preference, good, benefit, etc.? | Not every common concept can be defined. Our use of a concept reveals |
| 7916 | 3 | 17 | 15 | 17 | 18 | This reads as if an unpolluted environment is a luxury good. That thi is not the case is demonstarted, for instance, by Martinez-Alier (2002). | This remark has been removed |
| 9386 | 3 | 17 | 19 | | 27 | In discussing values, much emphasis is laid on the "incommensurability thesis"; yet this is a very general observation which does not say much about the particular values involved. | Noted; another example added. |
| 17161 | 3 | 17 | 19 | 17 | 27 | In my opinion, the authors make it too easy for themselves when arguing that different kinds of values (environmental, cultural, social, economic, etc) cannot and should not be compared with each other. If a decision is to be taken, then such a comparative valuation is absolutely necessary and indispensable: Weighing different kinds of goods is at the heart of most decisions. But the point is that not everything can be reasonably valued with one single (quantitative or pseudo-quantitative) metric, such as in monetary terms (values require a common nummeraire to be commensurable). Rational choice does not necessarily require commensurability, but only comparability. See, e.g., Beckerman, W.: Economics as applied ethics. Value judgements in welfare economics. Houndmills, Basingstoke: Palgrave Macmillan, 2011, p. 97. | The authors do not argue that different kinds of value cannot and should not be compared. |

| 2205 | 3 | 17 | 26 | 17 | 27 | Procedure is not the only other possible determinant of rightness in such cases. One may count all choices that are worse than no other as right. Or one may used localized and expanded conceptions of betterness. | Have changed 'will' to 'may' |
| 16675 | 3 | 17 | 29 | | | The section on non-human values should make reference to respect for nature. The Taylor book of that title (published in a new edition in 2011) is only cited for its arguments concerning the moral status of individual organism. For a broader conception of respect for nature see Dale Jamieson, "Climate Change, Responsibility, and Justice," Science and Engineering Ethics 16 (2010): 431-445 | Included |
| 9387 | 3 | 17 | 34 | | 36 | The comments on Kant are rather cursory - actually, a whole strand of thought in the human rights-traditions refers to the diginity of persons. | We don't have the space to treat Kant properly |
| 6973 | 3 | 17 | 40 | 17 | 40 | Why 'vehicles'? Why not 'who experience pleasure, pain, suffering …'? | Corrected |
| 9388 | 3 | 17 | 42 | | 44 | It is not very fair to cite Routley and his ideas about "chauvinism" in order to introduce non-human values. In recent years, authors in the field of environmental ethics have given detailed and very elaborated accounts of non-human values. | We've expanded a bit |
| 9389 | 3 | 17 | 42 | 18 | 12 | The overview over environmental ethics - or positions which defend a value in nature - is very cursory. It does not represent the current situation in research. | We've expanded a bit |
| 11557 | 3 | 17 | 8 | 17 | 10 | Another justification of just procedures is an epistemic argument. If people and societies are challenged by a knowledge deficit (as for example Hayek argues), then polycentric deliberation through democratic and just procedures may be necessary due to epistemic reasons. | Will be addressed in SOD |
| 17160 | 3 | 17 | 1 | | | You should add justifications for procedural justice beyond mere instrumental reasons (such as your first reason, which is however very unspecific), for instance that human rights etc imply a certain right to "self-determination" and to co-decide about the way certain goods are provided in society. See, for instance, again: Kowarsch, M./Gösele, A.: Chapter 7: Triangle of Justice, in Edenhofer, O./Wallacher, J./Lotze-Campen, H./Reder, M./Knopf, B./Müller, J. (eds.): Climate Change, Justice and Sustainability: Linking Climate and Development Policy, Dordrecht: Springer 2012, pp. 73-90. There are many other publications arguing this way. | Will be addressed in SOD |
| 6972 | 3 | 17 | 1 | 17 | 10 | This section could be cut without loss - it adds very little. | Will be addressed in SOD |
| 13932 | 3 | 17 | 8 | 17 | 10 | The reference to "imprefect procedural justice" is not that clear. You may consider deletion. | No action; disagree with comment |
| 8595 | 3 | 17 | | 17 | | A section on values is a good idea, but it would be very helpful to have a more balanced introduction. A clear paragraph identifying the limitations of what this section is and is NOT covering (including rights) would be helpful | Done that. |
| 8148 | 3 | 17 | | 22 | | How is value and well-being linked to CC? What do different strategies imply about well-being? Can you illustrate how different social welfare functions impact the rankings of different strategies regarding CC in a more concrete manner with an example (e.g. carbon tax policy)? | Have added examples. |
| 8249 | 3 | 17 | | 22 | | The authors talked about the concept of individual and aggregated social wellbeing in the form of a society's social welfare function over time.<br>Comment: The authors' explanation of estimating a temporal social welfare function (SWF) is clear. However, since the focus is on estimation of a temporal SWF, it might be more elaborating if they explain little more on the procedural issues relating to the measure of temporal SWF. For example, some key temporal issues such as uncertainty in population growth due to exhaustible resource constraints over time are not covered in their discussions in this subsection. | At this point we are dealing with values. There are empirical constraints on the promotion of values, such as resource constraints. We cannot deal with constraints at this point. They come up later in the chapter and the volume. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 14309 | 3 | 17 | 11 | | | The current version of the chapter shows a strong bias in favor of using social welfare functions to support climate change decision making. Many pages are devoted to the derivation of social welfare functions, whereas their fundamental shortcomings are not discussed in detail. Only 3 lines refer to the problems of aggregation (page 20, lines 33 - 35). The discussion of the "Paretian approach" (Section 3.5.3.) is not a suitable substitute for such a discussion as it refers to a method that was suggested to work even under the condition that no such a thing like a social welfare function exists. It does not, however, discuss the reason why "Some economists have claimed ..." that there are severe problems in deriving social welfare functions (page 20, line 33). As these reasons (e.g. the Impossibility Theorem of Arrow) have led the 2nd Assessment Report to make a strong recommendation against the usage of social welfare functions (and especially against the usage of optimization approaches to climate change decision making in general) the AR5 must refer to this statement and explain the progress (if there had been some) that led to a reconsideration of this recommendation. The mere observation that many researchers have used CBA is not sufficient to abstain from a detailed discussion of the weakness of CBA applied to a global problem. | The remarks in the SAR do not seem to constitute a strong rejection of social welfare functions or optimization. We believe we have stated the required assumptions correctly. |
| 8581 | 3 | 17 | 11 | 17 | 28 | This section on values would benefit from a first few lines more clearly linking it to the previous discussion of ethics so that the reader can more easily make the jump from one section to the next (as they stand there is almost no connection made). It is also intriguing that the examples used to discuss value in the second paragraph are both largely monetary. Its also not clear that these examples have anything to do with VALUES (more freedom to devote to environmental resources? This may be a result of certain kind of wealth, but is hardly a value if framed in this way). Line 19 is particularly problemtic - it fundamentally assumes that the ONLY way to assess an outcome is through a utilitarian aggregation. This is a serious problem. How for instance, does this section propose to deal with extinctions? Is the loss of life truly captured through aggregation? Does value lie only in the aggregate? This entire chapter assumes that utilitarianism (and then narrowed even more stringently into neo-classical economics) is the only way to represent value even though the literature on ethics and climate change, and on the utility of utilitarianism for complex policy contexts, would point out the limitations of this. | More linking has been created between sections. The word 'aggregation' was evidently misleading and has been removed. |
| 7914 | 3 | 17 | 11 | | | From 3.4 onwards the whole debate is on value and welfare. Debates on justice and deontological reasoning are skipped, although most literature in climate ethics is on justice and, so far, there only very vew utilitarian/welfarist contributions exist (see comment 50). Section 3.3, which takes this (partially) into account, is unrelated to discussions in other sub-chapters. Demands for redistribution and compensation are mostly ignored in chapters 3.4 to 3.10. | We try to deal with one topic at a time. Section 3.3 is about justice and section 3.4 about value. |
| 6467 | 3 | 17 | 17 | 17 | 28 | This section must acknowledge that some ethical principles would not resolve conflicts of values throug weighing or balancing but would restrict certain behaviors absolutely if they interfere with basic rights or deontological duties, This sectio as written is very misleading in that it does not recognize that disputes about ethical duties according to many ethical theories should be settled based upon the strenth of ethical arguments. For this reason it is important to add a sentence ot this section something like: Some ethical theoires hold conflicts between values must be resolved by the strenght of ethical arguments. If for instance, an activitiy creates a human rights violattion, that activity is ethically unacceptable and cannot be justified on consequentialist analyses. | This is not about a conflict of different ethical principles, but a conflict of the values that are recognized in a single ethical theory. The idea that rights constitute a side-constraint on maximizing value is discussed in sections 3.2 and 3.3. It does not conflict with the weighing of values. |
| 12782 | 3 | 17 | 28 | 17 | 28 | The subdivision of human values, which is used in the following sections should be mentioned here. So that human values include cultural and social values, wellbeing and its aggregation, lifetime wellbeing functions, social welfare functions, valuing population. Maybe it could be helpful to make subsections:<br>3.4.2 Human values<br>3.4.2.1 Cultural values<br>3.4.2.2 Wellbeing etc. | We do not have the space to reiterate the structure of the section. |
| 6312 | 3 | 17 | 28 | 17 | 29 | Again, it is simply inaccurate to say that "values can be classified into human and non-human values." Use a different language, i.e. anthropocentric and non-anthropocentric, or similar. | Anthropocentric' is now mentioned as a synonym for 'human'. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 7917 | 3 | 17 | 29 | 18 | 18 | The whole section is highly superficial, given standards of environmental ethics. Also, you should discuss the consequences for climate policies if some of the perspectives mentioned are adopted. Eventually, the section should be skipped given it's insufficient depth. | Section expanded a bit |
| 9393 | 3 | 18 | | 23 | | These pages are very much an excursus about social welfare-theory and utilitarianism. This does not represent the range of options to work on competing values in ethics. | More emphasis has now been given to the range of options. |
| 13566 | 3 | 18 | | | | also related to comment 4, and so relating to consistency, later on, these broader dimensions are touched on including the definition of wellbeing (on page 18) in a broad sense as that (which is) good for a person - in addition to the Gross National Happiness of Bhutan (see also Happiness Planet Index http://www.happyplanetindex.org/), there are also studies which trace a persons wellbeing / happiness and affinity to the environment to time spent in nature (see work of Nisbet et al. 2009 Environment and Behaviour) http://eab.sagepub.com/content/41/5/715.short and 2011 Journal of Happiness Studies http://www.springerlink.com/content/t657024255174pt7/) | Comprehensive references have been included |
| 4938 | 3 | 18 | 11 | | | {Add} The {}increased speed/rate of the loss | No action; disagree with comment |
| 9527 | 3 | 18 | 11 | | | please, delete .) (parenthesis and period). | Done |
| 11558 | 3 | 18 | 16 | 18 | 18 | If human value cannot be measured. What is the relevance of using the aggregate of people's willingness to pay for it as a measure of its value? More needs to be said about what value theory is assumed. | This comment seems to result from a misunderstanding at this point, since we |
| 17139 | 3 | 18 | 19 | | | See also: Petheram, L., Zander, K., Campbell, B., High, C., and Stacey, N. (2010) 'Strange Changes': Indigenous perspectives of climate change adaptation in NE Arnhem Land Australia. In Global Enviornmental Change 20 (4): 681-692; Nakashima et al. (2012) Weathering Uncertainity: Traditional Knowledge for Climate change Assessment and Adaptation. UNESCO and UNU Press. | We checked the first reference; it contains little evidence of damage to culture specifically. The second reference appears to be grey |
| 12140 | 3 | 18 | 20 | 18 | 23 | It may be worth noting that whether there are any goods that are not measured in terms of good for individuals (human or otherwise) is controversial (that there are not is assumed at the top of p. 20). | Some sentences have been added about this controversy. The top of page 20 |
| 3932 | 3 | 18 | 20 | 18 | 21 | Can a reference be provided for this assertion? It looks like a novel assertion, because as I understand it, the economist's concept of individual utility maximisation would not see any such division. Human wellbeing can't be divorced from the cultural and social context. Individual's act on the basis of the overall effect on their wellbeing, defined in the broadest possible context. | This has been dealt with by means of a reference and some sentences. |
| 11216 | 3 | 18 | 25 | | | add s to people, ie Arctic indigenous peoples | Done |
| 11217 | 3 | 18 | 26 | | | add s to people, ie Cultural values and indigenous peoples. Correct section is 3.11.2.3 (not 3.10.2) | Done |
| 17140 | 3 | 18 | 26 | | | Reference is made that a further discussion of cultural values and indigenous peoples is included in section 3.10.2 - however, section 3.10.2 deals with The Cost of Mitigating GHG's and does not include a discussion of these issues. A discussion of Social and Cultural Issues is included in section 3.11.2 | Numbering corrected |
| 3933 | 3 | 18 | 28 | 18 | 28 | Since this is an ethical chapter, should it not note that the benchmark for the Gini coefficient is equality of materialistic outcome - specifically, actual outcomes are compared with the benchmark that x percent of the population should receive x percent of the income, for all values of x and regardless of effort, luck, skill or merit. | This matter of detail is not needed here. |
| 9390 | 3 | 18 | 33 | | 35 | The overall value of human life is not well-being, but dignity (or call it autonomy, self-respect etc.). The focus on well-being is understandable in two frameworks: theories on distributive justice and - in a way - a utilitarian framework. Yet, it is not adequate in a discusison of "values". | Wellbeing is explicitly defined to include all of a person's good. So it includes dignity if dignityis a good. |
| 7918 | 3 | 18 | 33 | 19 | 4 | The capabilities approach is briefly mentioned. Then, the move from values to aggregation quickly shifts the perspective to utilitarian ethics. This perspective, however, obscures problems of justice and human rights, importants aspects of the capabilities approach and other ethical approaches (see comment 50). The whole section (including 3.5-3.7) is interesting for utilitarians only. | No action; we deal with the aggregation of people's good, whatever it consists in. This is explained |
| 17162 | 3 | 18 | 4 | 18 | 5 | One could add: Leopold, Aldo: A Sand County Almanac. New York: Oxford University Press, 1949. And: Schweitzer, Albert: Kultur und Ethik, Beck: Munich 1996. | One of these added |
| 2206 | 3 | 18 | 4 | 18 | 5 | A more up-to-date and better argued source than Taylor is Agar N. Life's Intrinsic Value: Science, Ethics and Nature. Columbia University Press, New York, 2001. | Added |
| 17704 | 3 | 18 | 8 | 18 | 10 | Poor quality graph, great idea but not properly explained. Some color would be good. | Figures will continue to be improved in |

| 2335 | 3 | 18 | 33 | 21 | 44 | For this section, I would like to add some points from my research article to elaborate main argument in the sub sections.<br>“The profile of wellbeing varies among different social structures. Interns of material sense of wellbeing, lack of a telephone does not count as poverty in a developing country, because telephone is not considered a necessity. However, in a developed country, a telephone is considered as a consumer good, the lack of which is deemed as poverty. Furthermore, social stratification leads to ordering sense of wellbeing. Social network, civic conscience and mutual trust as the elements of the social capital of society to strengthen the people participation, caste system appears as obstacle for the social process.” Reference:-<br>Withanachchi, S. 2011, “Participatory Development Approach in Local Governance – Its Relevance for Economic Development: a case study of Sri Lanka”, Federal Governance, vol. 8 no. 3, pp. 50-68 | Noted |
| 13933 | 3 | 18 | 11 | 18 | 11 | There is a typo. A ) in excess. Two parethesis in excess occur on footnote 3 in that same page. | Corrected |
| 3142 | 3 | 18 | 19 | | | section 3.4.2: there are some reports (by UNESCO, I think) on impacts of climate change on world heritage sites.<br><br>throughout, the role of uncertainty and perception (especially in light of chapter 2) seems under-played. Section 3.8 addresses uncertainty, but do the perspectives discussed earlier in the chapter—for example, varied justice perspectives—lead to different assessments under different kinds of uncertainty?<br><br>The chapter should get a steer from the TSU on policy design and choice (addressed in section 3.8 and 3.9). These are good discussions, but the same issues are rehashed (usually with lower quality writing and analysis) throughout WG3 and this needs to get streamlined. □ | Peer-reviewed literature on cultural damage is scarce. It is not really feasible to say much about uncertainty in the space; this has to be left to chapter 2. Overlap with other chapters is being addressed as well as we can. |
| 9344 | 3 | 18 | | | | Could add the discussion on well-being in the conceptual framework of the Millennium Ecosysttem Assessment (2003) and (2005) | Not peer-reviewed |
| 6974 | 3 | 18 | | | | The relevance of the material in this section to ethical debates about CC should be better signposted. | Some examples have been added. But it seems obvious that valuation is needed |
| 16672 | 3 | 19 | | | | I'm not sure about this distinction between values that contribute to the good of a community and those that contribute to humans as individuals. It could and has been argued that the former are values precisely in virtue of functioning in the latter way. | Yes. This controversy is now mentioned with a reference. |
| 8582 | 3 | 19 | | | | The quality of graphics is hard to read and I don't actually understand what this is trying to convey. | Figures will continue to be improved in |
| 9391 | 3 | 19 | 1 | | 2 | In ehtics, the most important question is how well-being is defined, not how it is aggregated. Moreover, the claim which the authors formulate is not coherent with the former claim of the "incommensurability" of values. If well-being is a value, there is nothing more to say than that there are trade-offs which cannot be avoided. | No action; comment unclear |
| 2122 | 3 | 19 | 1 | 19 | 3 | The reader may benefit from some brief sign-posting explaining the focus on *aggregation* of wellbeing. | Text has been changed. |
| 16633 | 3 | 19 | 1 | 19 | 1 | Delete. | No action; other comments imply that this sentence needs stressing, not |
| 4488 | 3 | 19 | 19 | 3 | 23 | Why include this discussion when its premises (numerically measurable utility that is cardinally comparable across individuals) are so easily rejected? This discussion and the accompanying Figure are potential candidates for excision. | Not everyone thinks they are easily rejected. |
| 7919 | 3 | 19 | 19 | 19 | 23 | A cardinal scale at every point in time is a heroic and completely unrealistic assumption. | Some basis for it is referred to. |
| 9392 | 3 | 19 | 3 | | | Usually, ethics does not define the well-being of a society in terms of aggregates, but in terms of either community values or political values (equity, justice, common goods such as health-care, public education, good condition of the environment) plus individual well-being. | This is well covered by the existing text. |
| 13934 | 3 | 19 | 9 | 19 | 9 | This figure is not helpful and uses space. The text is clear enough. Suggest deletion of this figure. | Conflicts with previous comment. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 8583 | 3 | 20 | 1 | 22 | 28 | It is strange that in a chapter on ethics and economics, the strategies for defining a social welfare function are covered in depth (line 1 on pg 20, to the end of page 22), while the ethical problems of these, and some of the ramifications they have on discussions about population are refered to only vaguely and in only 4 lines (lines 28-31 on page 22). It is this type of systemic lack of balance that is going to result in profound criticism of this chapter. | No action; subsection on population on p. 22 adequately addresses this issue |
| 11559 | 3 | 20 | 1 | 30 | 24 | Textbook style explanation of economic concepts. The economic concepts should be related to the ethical, social and political dilemmas (as it is done in chapter 4 where sections are problem driven discussions). The relevance of the concepts for environmental issues and climate change should be stressed. What implication does it have for climate ethics how we measure well-being? The sections may be shortened. | Noted; we already intend to shorten textbooky sections for SOD |
| 3934 | 3 | 20 | 33 | 20 | 35 | Why is the adjective 'sceptical' used here rather than "mainstream" or "valid"? What economists have accepted is that interpersonal utility comparisons are inherently subjective, making choices between contending weighting systems arbitary. The sentences in lines 33 and 34 are a bit misleading in that they omit the subjectivity-arbitrariness aspect. If there is any claim to the contrary - that these comparisons can be made on a non-arbritary objective basis, it should be documented. Failing that, the rest of this section starting in line 36 with the words 'we set it aside' looks like a cop out. | Sceptical' is a correct adjective. References to means of interpersonal comparison are included. |
| 7935 | 3 | 20 | | | | In general, models discussed overstate mitigation costs (see section 3.12: inovation is - unplausibly - modeled as exogenous) and underestimate damages (reasons are amongst others: high dicount rates, the models only account for certain types of harms, damages are assumed to be linear, etc.). Again, a critical discussion of the models would be valuable that takes up the many critical points raised throughout chapter 3. | Noted; will be addressed in SOD |
| 9002 | 3 | 20 | | | | The discussion on social welfare functions is of little practical value to make progress in arriving at normative decisions in the question of climate change which involves agreement and negotiations among human populations (states) and not central planning. Even in a national context, the use of social welfare functions might not be justified. One possible way to provide a perspective on the usefulness of the concepts related to aggregation is to refer to the possibility that if the a global social welfare function were to be used as a framework, the Convention recognizes two kinds of 'individuals' - Annex 1 and non-Annex 1 countries. The application of the principle of common but differentiated responsibility would entail a greater weight to non Annex 1 welfare functions. | Parties to negotiations make judgements of value, which should be soundly based. This chapter aims to help them. |
| 10263 | 3 | 21 | 22 | | | Routa, J., Kellomäki, S., Kilpeläinen, A., Peltola, H. and Strandman, H. 2011. Effects of forest management on the CO2 emissions of wood energy in integrated production of timber and energy biomass. GCB Bioenergy 3: 483–497. Citation from the article: "Over the life cycle, the net CO2 emissions per unit of energy are smaller for wood than those for fossil fuels; i.e. on average 99 kgCO2MWh 1 for Norway spruce (range 65–152 kgCO2MWh 1), 123 kgCO2 MWh 1 (range 78–192 kgCO2MWh 1) for Scots pine and for coal 341 kgCO2MWh 1, if the emissions for production and transportation of coal are excluded (Statistics Finland, 2005). Intensive management for timber and energy biomass clearly decreases net CO2 emissions in energy production."<br>"Intensive management for timber and energy biomass clearly decreases CO2 emissions in energy production. Thus, it seems possible to produce forest biomass for energy purposes with relatively low CO2 emissions by applying intensive management and in this way also substitute for fossil fuels (Sathre, 2007)." | No action; comment is aimed at a different chapter |
| 2123 | 3 | 21 | 33 | 21 | 34 | I can see that the alternative of *average* utilitarianism is not important here, as we are dealing with a fixed population; but still, this sentence might seem puzzling to those familiar with the alternative. So perhaps it could be noted as a view to be discussed in the next subsection. | Wording has been altered |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 6977 | 3 | 21 | 40 | 21 | 44 | This paragraph could be cut without loss. | It has been cut. |
| 9288 | 3 | 21 | 43 | 21 | 44 | “Is not consistent with Harsanyi's theorem” - it would be better to state which axiom(s) of Harsanyi's theorem is violated by the SWF under consideration (esp. since anyone who would otherwise advocate the maximin SWF is likely to bite the corresponding bullet(s)). | Has been cut |
| 4490 | 3 | 21 | 7 | 3 | 12 | There are hidden Malthusian assumptions in the assertion that this form of utilitarianism leads to anti-natalist policies. For example, a larger population may lead to a larger number of geniuses (Mozart, Einstein, Salk), with corresponding increase in the average utility of all. | No action; comment unclear |
| 16673 | 3 | 22 | | | | This begins a discussion on the failures or weaknesses of the applications of cost-benefit analysis to cliimate change. This point was made early on in the discussion in Dale Jamieson, “Ethics, Public Policy, and Global Warming,” Science, Technology, and Human Values 17, 2 (Spring 1992): 139 153. Moreover, Mark Sagoff's classic attacks on cost-benefit analysis would seem apropos here as well. | Done. |
| 17705 | 3 | 22 | 19 | 22 | 27 | There can be a average critical level utilitarianism function too | No action; yes, but not everything can be mentioned. We have to balance |
| 2124 | 3 | 22 | 2 | 22 | 3 | This is the sort of sign-posting I had in mind in comment 16 above. | Sign-posting has been improved. |
| 16635 | 3 | 22 | 2 | 22 | 6 | What/who determines value? This would lead nicely into the economic discussion of anthropocentric measures of value. | The epistemology of value is discussed in the sections on economic |
| 3935 | 3 | 22 | 28 | 22 | 29 | This sentence should surely be copied into the executive summary. | Noted; will be addressed in SOD. |
| 7921 | 3 | 22 | 39 | 23 | 7 | You should mention (and dicsuss) general objections against constructing a social welfare function, especially if the function is supposed to represent well-being globally over a century. Criticism to such an approach goes back to the 40s (Neumann/Morgenstern 1943). | No action; comment is unclear |
| 9345 | 3 | 22 | | | | p.22, line 31:Section 3.4 In examining the value of population, how do the authors view the contribution made by population to production of goods and services which add to well-being. | No action; we distinguish objectives from constraints. This is a matter of |
| 7920 | 3 | 22 | 31 | | | Here, you move straight from a utilitarian to an economic anaylsis. As is well-know, economics is not just applied utilitarianism. The many differences between both approaches go completely unmentioned, thereby concealing the many problematic assumptions the economic concepts (that are dealt with later on) are based upon. Rather than moving on to aggregating costs and benefits you should discuss what the analysis in 3.4 means for acting on climate change. | Noted; need for more climate examples already intended for SOD. |
| 13935 | 3 | 22 | 2 | 22 | 31 | Do not think this section adds much. Can be a short footnote of previous section. | No action; disagree with comment. Population is perhaps the most important, and perhaps the most |
| 7922 | 3 | 22 | | | | Is the old economic idea to claculate efficient (optimal) climate policy still alive in chapter 3.5? If so, you must try to show why positions that deny this very possibility are not plausible (see comment 36). Also, if you think that it is possible, you must address optimality in a triangular affair as stated in the first chapter, i.e. calculate the optimal mix between mitigation, adaptation and geoengineering. | No action; comment unclear |
| 7923 | 3 | 22 | | | | The problem of weighing and aggregating peoples utility is highly sophisticated and has not been resolved in utilitarian theory so far. In addition, it faces rather fundamental challenges (as famouslyexpressed by Parfit (1984) and Rawls (1971)). Therefore, the goal to maximize utility over time is problemtaic and discussions on how to do it best should occupy less room. | If it's difficult it needs more space, not less. |
| 10965 | 3 | 22 | 32 | 27 | 4 | The point that is being made in this section is in the last sentence of four words. The section could be shorter in areas like covering the Pareto criterion. | We do have to cover the Pareto criterion and the potential Pareto criterion. |
| 6468 | 3 | 22 | 33 | 22 | 37 | This section fails to acknowledge that aggregation of harms and benefits is ethically problematic according to some ethical theories including deontological and rights based theores. In fact the entire section of Chapter 3 is ethically problematic from a deontological ethical perspective. This can be remedied by acknowledging as the Stern report did, that if human behavior create human rights violations, the welfare aggregation techniques may be unacceptable. | The comment ignores the existence of 3.3. However, the chapter has been reorganized to place more stress on this point. |
| 9346 | 3 | 23 | 1 | 23 | 1 | page 23 line 1: what does ' times arre separable' mean? | No action; this expression is defined. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 16636 | 3 | 23 | 12 | 23 | 19 | Why not assess the different views? Are they irrelevant to policy-making? Or are the authors being prescriptive by omission? Explain the reasoning behind this to clarify doubts. | No action; comment unclear. The paragraph says that the assumption is |
| 12141 | 3 | 23 | 2 | 23 | 3 | The concept of separability is first introduced in 3.4. Also, doesn't 'weak separability' need to be defined? | No action; the notion 'weakly separable' is not used in the analysis. |
| 4492 | 3 | 23 | 20 | 23 | 28 | This paragraph (and the preceding text) implicitly assumes that "practical decision-making" has to be case in cost-benefit form. It most definitely does not. There are other criteria, the most basic being "right vs. wrong." (This is not meant to imply that it is easy to determine which is which in some situations.) It is a economistic fallacy to assume that all collective action problems can be framed as cost-benefit problems. | No action; disagree with comment. Judging goodness is always a matter of balancing goods against bads. |
| 16637 | 3 | 23 | 20 | 23 | 28 | Clarify how social welfare functions can be used as practical tools or what can the theory helps us understand. Shorten this section. Many of the technical details can be excluded. Highlight the examples with practical applications. | Practical dimensions of CBA will be expanded |
| 14244 | 3 | 23 | 6 | 23 | 11 | It might be worthwhile noting that, in the context of how section 3.4.4. aggregated temporal well-being into life-time wellbeing, the pure discount factor in equation 3.5. assumes that individual temporal well-being is aggregated at the same rate as wellbeing is aggregated over generations. However, there is some argument to be made that individual temporal well-being should be aggregated according to the individual's time preference, while the generational discount rate is usually considered more suceptible to normative reasoning. Section 3.5.1. assumes that temporal individual well-being is aggregated over individuals first and then aggregated discounting at a rate delta. If 3.4.4. should still hold, then delta entangles individual and generational discount rate assuming implicitly that they are the same. Work like that of Calvo & Obstfeld (1988) [ Optimal time-consistent fiscal policy with finite lifetimes. Econometrica 56: 411–432.] distinguishes the discount rate at which individual's discount their own temporal well-being and the rate at which a social planner discounts the lifetime well-being of different generations. Also note that in the climate change context, Schneider et al. (2012, forthcoming) [Tradingoffgenerations: Equity, discounting, and climate change. European EconomicReview, http://dx.doi.org/10.1016/j.euroecorev.2012.08.006 ] show that there is a tension between intra- and intergenerational equity if a normatively chosen generational discount rate differs from an individual's time preference rate. | Noted; partially addressed in revision. |
| 4348 | 3 | 23 | 22 | 23 | 48 | Indication of negetive side of use of forest biomass is important. However, suggestions from the positive side to overcome the disadvantages are useful for the dicision makers. | No action; comment unclear; page and section reference numbers incorrect |
| 6313 | 3 | 23 | 29 | 24 | 37 | It should be noted here that many have argued that converting ethical values to monetary values cannot happen without loss in all situations. See the work of Mark Sagoff, for example. | Included reference to Sagoff |
| 8584 | 3 | 23 | 30 | 25 | 44 | It is a problem that an entire section discussing the - very difficult and ethically problematic - use of monetization to represent value, and WTP/WTA does, at no point, refer to any of the literature that addresses the limitations of WTP/WTA as a methodology. I honestly cannot imagine another section of the IPCC leaving out a debate of equal importance and pretending it does not exist. It would require little extra space to acknowledge the limitations of this methodology which are CORE to the purpose of the chapter, which is presumably to present the literature that specializes in the interface between ethics and neoclassical economics when attempting to address cliamte change. | Noted; there is now more about this |
| 11560 | 3 | 23 | | | | Compensation is only discussed in relation to money distribution. There is need for a thorough methodological and theoretical explanation and justification. | Mentioned problems of money as a numeraire |
| 6469 | 3 | 23 | 29 | 25 | 44 | This section is ethically problematic if it fails to sacknowledge that applying monetary values to determine ethial duties is according to some ethicall theories unacceptable and deontoligical theories in particular. The section is acceptable if it is clear that the utilitarain assumption of this section are contested by many ethical theories and that these conflicts are resolved by ethics on the strenght of ethical arguments about duties, not by efficiencey calculations. | There needs to be something at the beginning to forestall this sort of thing. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 8149 | 3 | 24 | | 25 | | There is a nice discussion of contingent valuation methods and the challenges in using it in Chap. 14 of Boardman et al Cost Benefit Analysis: Concepts and Practice (Prentice Hall, 2006). The chapter also discusses some of the judgment biases (e.g. loss aversion, ordering effects, embedding) that impact on behavior. You might want to include some of these concepts here as a way of introducing descriptive models of choice. | Noted; will be addressed in SOD. These issues are now covered in seciton 3.10. |
| 11532 | 3 | 24 | | 25 | | There is a nice discussion of contingent valuation methods and the challenges in using it in Chap. 14 of Boardman et al Cost Benefit Analysis: Concepts and Practice (Prentice Hall, 2006). The chapter also discusses some of the judgment biases (e.g. loss aversion, ordering effects, embedding) that impact on behavior. You might want to include some of these concepts here as a way of introducing descriptive models of choice. | No action; duplicate |
| 9802 | 3 | 24 | 1 | 24 | 2 | The contingent valuation approach is subject to controversy for different reasons. Concerning climate change you should address one of these reasons: the monetary value of climate change is very difficult to assess on an individual level, due to time (the effects will happen in the future) and space issues (they will occur somewhere else). Nevertheless it is a good screening approach. | Noted; mentioned problems of money as a numeraire |
| 12244 | 3 | 24 | 29 | 24 | 30 | Please change "extremes of wealth between rich and poor countries" to "extreme differences in wealth between rich and poor countries". | Done. |
| 13937 | 3 | 24 | 39 | 24 | 47 | This box does not add. The text is sufficientñy clear regarding qalys. | Since value of life is a difficult topic, a |
| 16931 | 3 | 24 | 39 | 25 | 28 | Box 3.1 “Value of Life”.<br>This box (and the associated text) needs to show far more sensitivity to the issues and the history of the IPCC Second Assessment. In the first place, the SAR did clarify that the concept is entirely about the “Value of Statistical Life (VOSL)” – not the general Value of Life. I would strongly urge this chapter to use the precise term.<br>Second, the writing seems to miss entirely the fundamental point that led to the blow-up in the SAR. VOSL varies between countries – absolutely. As long as there are no transboundary effects, this doesn’t matter: it is a simple statement of fact. However, since climate change is a global problem with intimate transboundary effects, it is a fundamental moral issue as to whose VOSL is appropriate. VOSL obviously reflects the resources a country has. To be blunt, extending the example in the chapter, if US emissions kill Indians, it is US resources that would be deployed to reduce these emissions. The Indian VOSL is logically irrelevant except in an “opportunity cost” sense that the US could save more Indian lives in other ways, but this is only hypothetical and hence of no relevance unless it is matched by actual US foreign aid expenditure and substitution thereof.<br>Both the political history of the SAR confrontation and the basic logical points it revealed are summarised in Grubb M., C. Vrolijk and D.Brack, The Kyoto Protocol: A Guide and Assessment (1999, Earthscan, London), Annex 2: Key themes in economic debates: insights from the IPCC Second Assessment Report. I would hope that by now there are full accounts since but I have not seen them. | This report takes a different view about the value of life than the SAR's. This is because it takes a different approach to the foundations of cost-benefit analysis. However, we are careful not to say the SAR was mistaken. We do not have the space to engage in much debate about this. |
| 12142 | 3 | 24 | 42 | 24 | 43 | Note that consequentialist theories do not have to accord the same weight to benefits and harms. | We can't say everything. |
| 4620 | 3 | 24 | 44 | 25 | 28 | It should be pointed out that it is the value of qalys which enter benefit-cost analysis and not qalys themselves as these cannot be invested; S.Frederic, Understanding discounting, J. Econ.Psychol., 2006, 27: 667-80 | Noted; the box points out that qalys need an exchange rate with money to be included in a cba |
| 13936 | 3 | 24 | 1 | 24 | 2 | Declared preference valuation are not only contingent valuation ones. This has to be clarified. But, more than that, all methods are "subject to controversy, not only contingent valuation as the text seems to suggest. Think you should rephrase this sentence. | Noted; will be addressed in SOD. Techniques of valuation have been moved to 3.10. |
| 13938 | 3 | 25 | 29 | 25 | 38 | This paragraph is a digression. Optimal taxation appears as out of the subject this section is dealing with. | No action; disagree with comment |
| 7926 | 3 | 25 | 29 | 25 | 38 | It is an old and outdated perspective that taxes are always inefficient, as shown by the year of the citation. | Noted. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 16638 | 3 | 25 | 39 | 25 | 44 | This paragraph needs more support. Add more references. Move the sentence that talks about the catastrophic collapse of population to a footnote or develop the full argument. This is an intriguing but potentially contentious idea. | The possibility clearly exists, and there seems to be no reason to ignore it. |
| 18385 | 3 | 25 | 8 | | 40 | The problem with these economic calculation is that they fail to take account, to use a simple example, of the fact that paying the high cost and intensity of care required for extended life make the reduce the availability of these doctors, increase their prices both of which make care more difficult & refocus research on long-life vs tropical diseases, for example. These points are only infrequently included in cost-benefit analses. | No action; this comment muddled values with constraints. |
| 12783 | 3 | 25 | 34 | 25 | 34 | Is the reduction of inequality a target of climate change policy in general?. Rich countries may also focus on the need principle for the distribution of emission rights (In this context also see Carlsson, Fredrik; Kataria, Mitesh; Lampi, Elina; Lofgren, Asa; Sterner, Thomas (2011): Is Fairness Blind?--The Effect of Framing on Preferences for Effort-Sharing Rules. In: Ecological Economics 70 (8), S. 1529–1535. Online verfügbar unter http://www.sciencedirect.com/science/journal/09218009) | No action. This seems to miss the point. It's not that inequality is a target but that it affects valuations. |
| 8150 | 3 | 26 | | | | Can you relate the Pareto criterion to a CC example? | There is more detail in the box. |
| 15360 | 3 | 26 | | | | That is not the application of potential Pareto; it is to separate efficiency and allocation according to the second theorem of welfare economics – no decision in isolation. Potential Pareto says unless we are unable to fix distributional effects the action offers an opportunity to get the best outcome. | No action; the potential Pareto criterion is stated and then refuted. There is no fault with the logic. |
| 3936 | 3 | 26 | 10 | 26 | 11 | The statement that a greenhouse gas exernality makes the world economy inefficient in a Pareto sense is false as stated. The world economy can only be made more efficient in a Pareto sense if some way can be found of improving the welfare of at least one person without reducing that of anyone else. To prove that proposition one must identify that way and use it to prove the point. And in doing so one must consider all the real world problems with political processes, taxes etc. The sentence gives no evidence that any such measure has been identified. Lines 11-12 suggest that instead what is being proposed is that the externality could be eliminated in a frictionless situation where all potential losers were costlessly identified and fully compensated without incurring any transaction costs or adversely affecting any incentives. No resources would be spent in lobbying for colmpensation for example. If that is what is being argued, it is little wonder that the point does not register strongly in international negotiations. A related point is that the economists' neolclassical models commonly assume that NGOs and others will not self-create to deal with the externality independently of government action. | This has been put into a box with more detail |
| 7361 | 3 | 26 | 11 | 26 | 14 | It is very unclear what is meant by it being "possible to eliminate the externality in a way that is good for everyone." The incorporation of the externality into prices may over time result in the same (or inreased) level of welfare but in a theoertical sense but in a "real" sense that internalisation imposes significant immediate costs that cannot be construed as anything other than "sacrifice." I am also unsure that the phrasing "eliminate the externality" is appropriately specific. | This has been put into a box with more detail |
| 6978 | 3 | 26 | 30 | 26 | 43 | This material could be cut without loss: the subsequent para is sufficient. | No action; disagree with comment |
| 12245 | 3 | 26 | 34 | 26 | 43 | These paragraphs are a bit unclear. Please elaborate the basis for the critique. | It's hard to see how it could be unclear. The argument follows the standard form |
| 12246 | 3 | 26 | 44 | 27 | 4 | We think this critique is a bit misplaced, as the potential Pareto criterion is a criterion for efficiancy and not suited for deciding matters of wealth distribution. | No action; the potential Pareto criterion is stated and then refuted. There is no |
| 10421 | 3 | 26 | 5 | 26 | 14 | This framing of the externality might be controversial without additional references. | Noted; this has been put into a box with |
| 7927 | 3 | 26 | 5 | 26 | 14 | We do not understand why nobody would be worse off, if externalities are internalized. What is with those that received benefits from externalizations? Please explain. | This has been put into a box with more detail |
| 16639 | 3 | 26 | 6 | 27 | 24 | What are the consequences of this assumption in practical evaluation? | No action; something wrong with the numbering of this comment. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 9394 | 3 | 27 | | 30 | | The discussion on "discounting future goods" is very informative; yet, it does not include the discussion on whether or not discounting is desirable/is right in a moral sense. Authors in the camp of strong sustainability are very critical of discounting. Authors who defend an eco-centric approach often reject discounting. | We are aware of this. Discounting techniques and sustainability conditions may contradict each other. A discussion about this should be made on the |
| 11365 | 3 | 27 | 11 | 27 | 12 | The text says that the discount rate tells us how much one should do for the future. But: the discount rate *alone* does not tell us that. One needs *additional* assumptions for that. In order to know how much one should do for the future one needs in addition to assume, for example, that the objective of policy should be to "maximize the discounted total of utility (...) over time" (page 28, line 25-26). This additional assumption together with the discount rate then tells us how much one should do.<br>However, this additional assumption is highly controversial. Maximizing a SWF -- especially one that consists of a sum of (discounted or undiscounted) utilities -- goes not only against the commonsense of many but also against the views on intergenerational justice discussed in section 3.3.2. Many would consider it much more reasonable to define a level of welfare that is owed to future generations (or other things that are owed to future generation) *independently* of maximizing a certain sum. Maximizing a sum could demand too large sacrifices from the present generation (if a low discount rate is used) or too little from the present generation (if a high discount rate is used).<br>For references, see for example:<br>Simon Caney (2008), "Human Rights, Climate Change, and Discounting," Environmental Politics, 17 (4), p. 549.<br>John Rawls (1971): A Theory of Justice, Cambridge: Harvard University Press, pp. 297 - 98.<br>Dominic Roser (2009), "The Discount Rate – A Small Number with a Big Impact", in Center for Applied Ethics and Philosophy (ed.), Applied Ethics: Life, Environment and Society (Sapporo: The Center for Applied Ethics and Philosophy, Hokkaido University), pp. 12 - 15. | No action; see justice sections for different ways of viewing social welfare. As 99% of the literature on discounting, this section is based on the assumption that the collective objective is to maximize a discounted sum of future expected utilities. |
| 4622 | 3 | 27 | 21 | 27 | 21 | the value of consumption (see comment 36) | No action; comment unclear |
| 10703 | 3 | 27 | 23 | 27 | 23 | Could it be explained more why different discount rates should be used for different assets ? | Will be addressed in SOD |
| 7928 | 3 | 27 | 4 | 27 | 4 | Rather than "credible" you should write "morally acceptable" or "unfair" or "immoral". | No action. What is at issue is the truth of a proposition, not the fairness of a |
| 3937 | 3 | 27 | 4 | 27 | 4 | The argument that it is not credible to propose that the rich should benefit at the expense of the poor without compensation for the poor seems to be inconsistent with the proposition that the world today should make an uncompensated sacrifice in favour of wealthier future generations. Should the paper advise policy makers about how to think about this implication? | This is a good point. The example is now tightened up. No inconsistency need arise. |
| 4621 | 3 | 27 | 5 | 27 | 5 | The title should read: Discounting the value of future goods because not all goods can be invested (see comment 36) | Will be addressed in SOD |
| 9803 | 3 | 27 | 5 | | | Please sound this paragraph with the corresponding deliberations in chapter 2. | Noted. Cross chapter consistency will be |
| 9285 | 3 | 27 | 6 | 27 | 19 | The last line is confusing in light of the previous paragraph. The first paragraph in this extract says 'the discount rate tells us how much one * should * do for the future' (emphasis added). The second paragraph then asserts that there are normative and positive perspectives on the discount rate, and that 'both approaches can be relevant, depending on the application'. This is naturally read as implying that there is a purely positive approach to the question of what one should do. But that is absurd. The point might instead be that one can ask both normative and positive questions about discounting (how much should we discount/how much do various bodies discount in various contexts), rather than that there are both normative and positive approaches to answering a single question. Or it might be that some approaches to answering the normative question take answers to the positive question as part of their input, alongside normative additional premises (e.g. a 'democracy'-based premise to the effect that governments/intergovernmental organisations ought to discount to the same extent that individuals in fact do in such-and-such settings). I suspect the latter is what the author has in mind, but this isn't clear from the current text. | Will be addressed in SOD; will add 'under the normative approach' at the beginning of the sentence |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 8585 | 3 | 27 | 6 | 27 | 13 | The word should is used repeatedly in this paragraph. The inference is that the result of CBA tell us what we SHOULD do. This blatantly disregards any other ways of making decisions and leads the reader to imply that CBA results are the only form of evidence required for making what are necessarily incredibly complex decisions. I realize this seems like a ridiculously petty comment but I am drawing attention to it because of the much broader assumptions it makes that are rife throughout this chapter which gives profound preference to neoclassical eocnomics over any other way of thinking about climate change decision making. | No action; CBA is justified as the benchmark operational toolbox to evaluate policies from the previous section of this chapter. Limitations to CBA are expressed in other chapters. |
| 10422 | 3 | 27 | 6 | 30 | 24 | Less theory about the General Ramsey rule and how it can be framed to incorporate climate change vulnerabilities, or intergenerational inequities in the face of climate change | No action; the Ramsey rule is precisely about taking into account of intergenerational inequalities and |
| 9347 | 3 | 27 | | | | A concluding para needs to be added to Section 3.5 to provide guidance with respect to climate change: what about cost-benefit and climate chage? | No action; we believe the issue is already dealt with adequately. In addition, note that the entire ipcc work is |
| 8596 | 3 | 27 | | 27 | | I have mentioned several detailed comments for this section - and as I have suggested elsewhere - an entire reorganization of the text would be best solution. However, at the very least a better introductory paragraph that says something along the lines of; "Aggregation is required for a variety of economic analysis techniques and is covered in this section. It should be noted however, that assumotions about aggregation can be problematic from an ethics perspective. For instance, as discussed in Section 3.4, many values are difficult to monetize. In addition, many issues of concern may not be feasible or meaningfully aggregated. Despite these limitations this section is focussing primarily on eocnomic strategies of aggregation due to their widespread use. As discussed in Section 3.9 adn 3.11, there are other ways of valueing wellbeing and of conducting analysis" | Noted; the chapter has been reorganized in response to this comment and others like it, to make the limitations more explicit. |
| 14257 | 3 | 27 | | | | When discussing delta (the pure time preference discount rate of future utility), I miss discussion of the vast empirical and experimental literature showing evidence of a delta that decreases with the time horizon of the future cost/benefit. Quasi-hyperbolic discounting is one possible example; hyperbolic discounting another. These intuitive preferences are very important when the time horizon is as long as for climate change impacts. CBAs should reflect/respect such preferences. | Will be addressed in SOD |
| 8151 | 3 | 27 | | 30 | | Discounting future goods You might want to introduce descriptive models of discounting that illustrate hyperbolic discounting and other behavioral principles in behavioral economics. (See the discussion on quasi-hyperbolic time discounting in FOD Chap. 2 Sect. 2.2.3) and the examples we use to highlight these points. You could then relate these descriptive models to normative discounting models (i.e. exponential discounting). | Will be addressed in SOD |
| 11533 | 3 | 27 | | 30 | | Discounting future goods You might want to introduce descriptive models of discounting that illustrate hyperbolic discounting and other behavioral principles in behavioral economics. (See the discussion on quasi-hyperbolic time discounting in FOD Chap. 2 Sect. 2.2.3) and the examples we use to highlight these points. You could then relate these descriptive models to normative discounting models (i.e. exponential discounting). | No action; duplicate |
| 7924 | 3 | 27 | | | | Please account for the philosophical literature on discounting (e.g. Parfit 1984, Broome 1992, the conbtributions in Ott/Hampicke 2003, Ott 2003, Baum 2009, Roser 2009, Caney 2009, Hampicke 2011). Section 3.6 is not an appropriate review of the relevant literature but is highly biased and no progress with repsect to SAR has been made. Given that the preceding sub-sections draw on utilitarian thinking it should be mentioned that utilitarians reject discounting future utilities/well-being. | Noted. |

|---|---|---|---|---|---|---|---|
| 12784 | 3 | 27 | 20 | 27 | 26 | When dealing with discounting issues you may also like to have a look at Pigou, A. C. (1920), The Economics of Welfare. London: Macmillan and Company or Ramsey, F. P. (1928), A Mathematical Theory of Saving, in: Economic Journal 38, 543 – 559), Arrow, K. J. (1999), Discounting, Morality and Gaming, in: P. R. Portney und J. R. Weyant (Hrsg.), Discounting and Intergenerational Equity, Resources for the Future, Washington D.C., 13 – 22). Buchholz W., Schumacher, J. (2008), Discounting and Welfare Analysis Over Time: Choosing the η CESifo Working Paper Series. | Will consider these references |
| 12785 | 3 | 27 | 32 | 27 | 32 | This utility function is not consistent with the notation in the previous section. | No action; this utility function is not introduced in the previous section. See |
| 10702 | 3 | 27 | 5 | | | Interesting and useful section. But could it be showed more clearly how discounting of costs (and impacts of emissions) are being done? (Or alternatively, point to parts of the chapter where this is used). This could make it easier for non-economists to understand the application and the role of discounting in the context of climate change. | No action; this is not the right chapter to do that. |
| 10966 | 3 | 27 | 5 | 30 | 24 | Comparison of different approaches such as those of Stern and Nordhaus has already led to an appreciation that discount rates tend to be overused. Much of this is recognition that both collective values in an increasingly urbanised society, and growing dependence on long term infrastructure, are quite different to the more individualistic consideration of values that applies in the commercial context. In order to be more specific for the context of climate change, this section should consider the growing recognition that some forms of government decision making for the allocation of major assets can be classified as either delays in mitigation or as maladaptation. For example, construction of a major state highway on land less than 2 meters above sea level is an obvious example where use of a discount rate determines a planning horizon of about 30 years, but it then tends to cluster a wide range of public and private investment into assets that will not be sustainable. The future impacts will be experienced by an increasing population which has also been accumulating per capita wealth at a rate higher than inflation. So depreciation is outweighed by the other factors. | No action; all these effects may be relevant to Benefit-Cost Analysis, but this does not affect the way we should determine the rate at which these costs and benefits should be discounted. |
| 14245 | 3 | 27 | 5 | | | This is a very nicely written summary of dicounting. However, I would like to raise awareness on the literature discussing non-constant and, in particular, hyperbolic discount rates. In particular, in the context of the current chapter on Ethical Concepts and Methods, I would consider the case of interest where hyperbolic discounting arises as a consequence of intergenerational altruism. While the papers on this topic emphasizing the point in the climate change context are still under submission [e.g. Karp, Provision of a public good with altruistic overlapping generations and many tribes], Ekeland & Lazrak (2010) [The golden rule when preferences are time inconsistent, Mathematical and Financial Economics, 4(1)] make the point in a slightly different context. Ekeland & Lazrak's reasoning implies hyperbolic discounting formulas very similar to those applied in the climate change economics by Karp (2005) [Global warming and hyperbolic discounting, Journal of Public Economics 89: 261–282]. A different rational for hyperbolic discount rates relates to which some of the authors of the chapter contributed themselves, derives hyperbolic discount rates from the limited substitutability between environmental goods and anthropegenically produced consumption, which connects directly to the ethical concept of weak and strong sustainability, which itself is likely discussed in more detail in a different chapter. | All these new insights from the recent literature and DP are useful and important. However, given the limitation of space, it is extremely difficult to introduce them in the text. |
| 12247 | 3 | 27 | 5 | | | This section 3.6 is very informative, well written and to the point on a very difficult subject. | Thank you for your comment. |
| 4347 | 3 | 28 | | | | Like 11.2, consump-side options in the table should be enriched. The contents in the table can be devided into several potions. | No action; comment unclear; page and section reference numbers incorrect |
| 4493 | 3 | 28 | 16 | 28 | 16 | As noted above (in comment # 12) the "Ramsey rule" as applied to the climate problem is an analytical mistake. Different kinds of assets have different rates of return. | No action. Yes, the Ramsey rule is about the rate at which safe assets should be discounted. A risk premium must be added for risky projects, as in |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 7925 | 3 | 28 | 16 | 28 | 24 | The interpretation of equation 3.6 is far too simple. The discount rate depends on expectations regarding growth AND the scarcitiy of many DIFFERENT goods. | No action; this is not related to discounting. CBA should also take into account of the evolution of scarcity, thus |
| 12143 | 3 | 28 | 17 | 28 | 17 | The reader needs to be introduced to the concept of pure time discounting before δ is introduced and defined. | No action; because of lack of space, we prefer to leave the text as it is now. |
| 2125 | 3 | 28 | 23 | 28 | 23 | Is there an implicit assumption here that individual well-being is determined by preference-satisfaction? If so, is the assumption necesssary? | No action; we assume that. |
| 11366 | 3 | 28 | 26 | 28 | 26 | This is a minor remark but genuine utilitarianism would not accept a rate of pure time preference (delta) larger than zero. If one uses a delta > 0, one has foregone utilitarianism. | No action; we allow for delta=0 in the text. |
| 14372 | 3 | 28 | 30 | | | Should refer to previous IPCC related analysis of this issue in: K.J. Arrow, W. R. Cline, K-G. Maler, M. Munasinghe, R. Squitieri, and J.E. Stiglitz, "Intertemporal Equity, Discounting, and Economic Efficiency," in Bruce, Lee, and Haites, Climate Change 1995: Economic and Social Dimensions of Climate Change (Cambridge Univ. Press), chapter 4. | Will consider this reference |
| 6979 | 3 | 28 | 34 | 28 | 34 | The description of the arguments referred to as 'largely intuitive' is seriously misleading. These argument are moral/ethical. Also, Rawls' rejection of a positive discount rate should be referenced here, as should Gardiner's discussion in Stephen Gardiner, 'A perfect moral storm' (Oxford: OUP, 2011), chapter 8. | Will be addressed in SOD |
| 13939 | 3 | 28 | 37 | 28 | 38 | Suggest to rephrase last sentence before the box. "One additional? argument is that it? Places an extremely moral burden on the current generation". | Will be addressed in SOD |
| 9804 | 3 | 28 | 40 | 29 | 5 | Are deliberations like Box 3.2 really intended to be integrated in the IPCC report? They are nice thought exercises, but I do not see the impact on the reader. Either you should further elaborate on climate change or you leave it out. | No action; we consider it to be useful for helping the reader to understand the meaning of the calibration. |
| 4623 | 3 | 28 | 7 | 28 | 7 | to inequalities. Add "one will have an incentive to spread consumption over time" | Will be addressed in SOD |
| 7929 | 3 | 29 | 11 | 29 | 12 | The median of 4-5% should not be seen as a reasonable choice for it ignores important arguments against such a rate. See the next comment (80). | Will be addressed in SOD |
| 14373 | 3 | 29 | 9 | | | Cline (1992) was the first to use the Ramsey framework for discounting climate change on a century-scale horizon. It would be appropriate to include this reference in the table. Its entries are: delta = 0 (zero pure time preference); eta = 1.5 (elasticity of marginal utility; reaffirmed in Cline 2007 based on observed income tax structures); g = 1% long-term per capita growth. (Cline 2007: Yale Symposium on Stern Review; www.ycsg.yale.edu/climate/stern.html) | Will be addressed in SOD |
| 9286 | 3 | 29 | 9 | | | The 'delta'-value of 0.1% for Stern 2007 is not strictly speaking correct, given the way the author has defined delta on p.28. (Delta is defined here as the rate of pure time preference. Of course Stern's 0.1% is discounting for risk, not pure time preference.) | No action; we agree. Because of lack of space, we prefer not to enter into this level of details. |
| 4624 | 3 | 30 | 10 | 30 | 10 | …to the distant future, add "giving rise to a declining discount rate" | No action; comment unclear; line |
| 16640 | 3 | 30 | 16 | 30 | 24 | This paragraph should be closer to the start of the section. It provides a good introduction to the ideas in the section. | Will be addressed in SOD |
| 7456 | 3 | 30 | 18 | 30 | 25 | "The strategic energy fund has three lines of financing ---3) the scaling up renewable energy plan (SREP) launched in 2009 to enable government support for renewable energy market creation". Already in most if not all developing countries there is a vibrant market in fuelwood and charcoal trading etc. However, in some countries there are bans on charcoal production (but not trading), nighttime transport of fuelwood and charcoal, but not petroleum products, etc. These private-sector initiatives should be encouraged and SREP should be involved in removing such restrictions. Mainly they are in place so that 'officials' can collect bribes. | No action; comment unclear; section reference appears incorrect |
| 4494 | 3 | 30 | 2 | 30 | 15 | This paragraph does not do justice to Weitzman's insight. His result does not depend "heavily" on the marginal utility tending to infinity as consumption approaches zero; rather, the argument is that in the face of irreducible uncertainty the possibility of catastrophic outcomes comes to dominate the analysis. It is misleading to downplay Weitzman's argument just because marginal utility may not actually go to infinity. | Will be addressed in SOD; will remove the word "heavily" and a new sentence that recognizes the importance of catastrophes. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 4495 | 3 | 30 | 23 | 30 | 24 | It is not necessarily the case that the discount rate should be the "risk-free" rate. Insurance policies have negative rates of return. As a side note, there is no observable risk-free rate; U.S. t-bills, for example, are not necessarily risk-free. | We agree. We remind the reader that this section is mostly about the risk free rate, and that a risk premium should be added/substracted if the projet |
| 7930 | 3 | 30 | 23 | 30 | 24 | "The discount rate described here should be used to discount risk-free costs and benefits." Is there any specific discount rate described in this section? If so, which? | No action; same comment as 4495 |
| 4496 | 3 | 30 | 31 | 30 | 32 | It is not the case that equity can be separated from efficiency when there are externalities. It seems odd to make this assertion in a text devoted to the largest global externality of all. | No action; no change implied, adequately addressed (line 32 of page |
| 8587 | 3 | 30 | 31 | 30 | 35 | "Conceptually, climate change mitigation among countries translates to determining emissions entitlements according to chosen equity principles, and then trading in entitlements in markets". Really? Statements like this that do not recognize valid debate about what climate change mitigation SHOULD include (many would argue that trading should not be included for ethical reasons; many other would argue that trading has serious limitations for mitigation) are profoundly problematic. It is possible that this section was poorly written, and that the authors meant to write that "in a stricly neo-classical theoretical model climate change could be simplified into allocations of entitlements which could then be traded, however the realities of climate change pose difficulties for this theoretical construct, and there are many other ways of understanding the challenge of mitigation". However, as it stands this is another example of the failure of this chapter to reflect much of the ethics literature, and to miss key opportunities for constructive discussions between ethics and neo-classical economics thinking. | No action; no change implied as the views of some against suitability and goodness of trading is noted elsewhere in the chapter and in lines 13 to 18 on page 31 of this section |
| 3938 | 3 | 30 | 32 | 30 | 33 | The paper needs to be aware that markets and the common law do commonly have mechanisms that respond to potential inefficiencies due to externalities. For example, many negative externalities (eg proximity to noise) get reflected in lower land values. Those who buy those properties are thereby compensated for the adverse location effect. Economists distinguish beween pecuniary and non-pecuniary externalities. So the text needs to have a more nuanced discussion of externalities. Another point is that markets achieve an efficient allocation of resources even if an uncompensated externality exists - they do so as long as no other feasible real world arrangements would provide better (but still imperfect) arrangements. Another way of making the point is that efficiency has to be judged against the next best achievable alternative, it is meaningless in a policy context to assess market efficiency against an unachievable perfect world alternative. | Noted; will be addressed in SOD |
| 6980 | 3 | 30 | 6 | 30 | 7 | How is this statement of what prudence requires 'in line with' sustainable development? | No action; because it reduces the discount rates, thereby inducing agenst to emphasize the distant future in their |
| 9348 | 3 | 30 | 24 | | | p30, line 24 section 3.6 Add Simon Levin's paper on ' the difficulty with discounting' | No action; not clear which paper the |
| 8586 | 3 | 30 | 25 | 33 | 26 | The title of this section is "Economics, rights and duties". At no point does the section discuss rights. None of the ethical frameworks covered discuss rights. Teh discussion of economic theory does not disucss rights. The challenges of rights and compensation (and non-compensatory rights) are ignored. Nor does this section actually tackle the relationship of economics to different frameworks of justice despite the first sentence which states that this is the goal of the chapter. For instance, it is not clearly laid out that the first section, Economic efficiency, equity and transfers, implicitly takes a view in which rights do not exist, that compensation is possible, that aggregation of value is possible. These assumptions are central ethical assumptions behind this economic framework and are not identified. | Noted; will be addressed in SOD. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 6470 | 3 | 30 | 26 | 33 | 19 | This section entitled Economics, rights and duties, is deeply ethically problematic in its current form because it resolves conflicts between efficiency and rights conflicts through effienciency arguments. It is seriously flawed ethically because it fails to acdknowledge that equity and rights concerns are usually not resolved by welfare maximization alnalyses. It must contain an express acknowldegment that conflcits between economics,rights, and duties is resolved according to ethics on the strenght of ethical reasoning, not on consequentialist grounds. This is a particularly important addition because the vary title of the section is"economic, rights, and duties>" | Noted; will be addressed in SOD. |
| 3940 | 3 | 31 | 1 | 31 | 2 | An authority should be cited for the proposition that the issue of who should bear the costs can be separated from the issue of where mitigation takes place. The general contending proposition is that the battle over distribution affects incentives, and thereby outcomes. | No action; no change implied, addressed elsewhere in the chapter |
| 3939 | 3 | 31 | 11 | 31 | 15 | Again, a perfect world standard seems to be introduced in the use of the words 'undistorted' and 'all participating' countries. | No action; no change implied |
| 7363 | 3 | 31 | 13 | 31 | 13 | It would be more accurate to say : a system that reconises the difference between the "allocation" of emission rights and the "use" of emission rights "has been regarded as a core element to achieve equitable and cost effective mitigation." It is not necessary to characterise it as a "trading scheme"; instead trading or direct transfers (as referred to at the end of the paragraph) could be included as two models of reflecting the same general premise/objectives. | Noted; will be addressed in SOD |
| 4928 | 3 | 31 | 19 | | | .. e.g. in context of project-based mechanisms or green investment schemes of mitigation actions | Noted; will be addressed in SOD |
| 4939 | 3 | 31 | 27 | | | {Add} abatement potential is in {}many developing countries (because it is not valid for many other developing countries, esp. for majority of the LDCs) | Noted; will be addressed in SOD |
| 4927 | 3 | 31 | 3 | | 6 | Oversimplification? i.e unclear how developing countries' mitigation actions fit in this "translation". | No action; no change implied, invalid |
| 15362 | 3 | 31 | 3 | | | This part comes very close to confusing the question of whether there can (in a game theoretic sense of an outcome that is acceptable to all participants) be agreement on an allocation so that coordinated mitigation can proceed with the ethical question of the right thing to do. Of course, if all participants are motivated by the same moral imperative, then they would choose the outcome that is consistent with, or ranks highest under, that ethical point of view. It should be apparent from history in general and the progress of negotiations, from observing the level of and reasons for foreign aid, and from the stated positions of the parties that there is no such agreement. The discussion of ethical systems leads to characterization of what an ideal climate policy would be from the point of view of different systems. Political economy and the study of international relations reveal what nation-states are actually likely to do in negotiating international agreements and acting unilaterally. Moral reasoning provides a critique of observed and predicted outcomes, which may over time, if articulated well in the families, churches and communities where values are formed, lead to discomfort with the status quo – or to realization that there are other, higher priorities for action to change political systems in order to align public policy better with ethical norms and moral imperatives. Confusing what ought to be with what is likely to be, or worse yet failing to examine proposed solutions critically because their technical deficiencies are covered with moral rhetoric, almost always leads to change for the worse. | No action; no change implied already addressed in various sections |
| 6981 | 3 | 31 | 34 | 31 | 35 | These transfers could be intergenerational in scope. | No action; no change implied |
| 13006 | 3 | 31 | 42 | 31 | 43 | In the interest of balance, such worries also arise for economic arguments. | No action; no change implied |
| 8152 | 3 | 31 | 8 | | | I like the example of using Pigou to determine optimal adaptation and mitigation as it relates to emissions reduction. | Thank you for your comment. |
| 17293 | 3 | 31 | | | | There is an emerging literature on this and also part of the UNFCCC Cancun Text. | No action; no change implied |
| 14847 | 3 | 31 | | | | Sec. 3.7.3 may be redundant with material discussed in more detail in Ch 4. | Noted. |
| 8153 | 3 | 31 | | 32 | | An example illustrating how these different principles apply to CC would be helpful here. | Noted to be considered in revising |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 15647 | 3 | 31 | | | | There is considerable overlap between this section and section 4.7.3.2 (equity principles). It would seem preferable to discuss the operationalisation of equity principles in greater detail in Chapter 4 rather than Chapter 3. The graph provides a simple illustration of the implications of different principles, and could be maintained wherever it is relocated to. | Noted to be considered in revising |
| 17163 | 3 | 31 | 36 | | | You could possibly take into account: Knopf, B./Kowarsch, M./Lüken, M./Edenhofer, O./Luderer, G.: Chapter 26: A Global Carbon Market and the Allocation of Emission Rights, in Edenhofer, O./Wallacher, J./Lotze-Campen, H./Reder, M./Knopf, B./Müller, J. (eds.): Climate Change, Justice and Sustainability: Linking Climate and Development Policy, Dordrecht: Springer 2012, pp. 269-286. There you can find both a systematic overview of ethical proposals for allocation of emission permits, and an economic estimate (graph!) of what this would mean for different regions in terms of costs. | Noted, will be addressed in SOD; reference cited appears to be grey |
| 15648 | 3 | 31 | 41 | 31 | 42 | Some of the same authors have nevertheless found that some degree of consensus exists between policymakers from developed and developing countries about longer-term convergence towards equal per capita emissions, the polluter pays principle, and the exemption of poor countries from onerous obligations: see Lange, A., C. Vogt, and A. Ziegler. 2007. On the Importance of Equity in International Climate Policy: An Empirical Analysis. Energy Economics 29:545-62. | Noted; will be addressed in SOD |
| 9395 | 3 | 32 | | | | The authors give a list of principles following Ringius et al. (2002). Even when this list serves as an example, it is necessary to include some of the principles which are now under discussion: "Grandfathering" (which might be part of "souvereignty"), "Across the Board", "Basic Needs", "Rawlsian Principle", "Proportionality Principle". Each of these principles represents what the authors say is in fact critical: "common, but differentiated contributions and rights", p. 33, line 11. | Noted to be considered in revising |
| 6982 | 3 | 32 | 1 | 32 | 2 | Reference Keith Hyams, 'A Just Response to Climate Change: Personal Carbon Allowances and the Normal Functioning Approach', Journal of Social Philosophy, 40/2, 2009, 237-56. | Noted to be considered in revising |
| 12144 | 3 | 32 | 22 | 32 | 23 | Why is grandfathering termed 'the sovereignty principle'? | Noted to be considered in revising |
| 13017 | 3 | 32 | 22 | 32 | 25 | What is here called “the sovereignty principle” seems to be several different possible principles, some of which have nothing in particular to do with sovereignty, as far as I can see. | Noted to be considered in revising |
| 4929 | 3 | 32 | 29 | | 33 | At least there are some "hints" how to operationalize the equity for the developed countries: (Art. 4.2.a " taking into account the differences in these Parties' starting points and approaches, economic structures and resource bases .." | No action; no change implied |
| 9004 | 3 | 32 | 29 | | 31 | This sentence is an instance of specious reasoning and uncalled for: "These agreements do not however resolve the fundamental issues in operationalizing equity principles." The sentence refers to the UNFCC Common but Differentiated Responsibility. Principles in agreements have to be operationalized; one cannot expect agreements to "resolve" them "fundamentally" since they are fundamental principles by nature. In fact, Box 3.3 to which the paragraph refers says that the Kyoto Protocol is its "first concrete expression" (page 33, line 13). The reason used to criticize the principle is therefore uncalled for. | No change needed, but should be considered in rewrite |
| 12529 | 3 | 32 | 33 | | | After "principles" add -- "Baer et al. (2009) provide a criteria-based effort sharing framework combining the perspectives of responsibility and ability-to-pay based on the UNFCCC principle of 'common but differentiated responsibilities and respective capabilities and their social and economic conditions.'" | Noted to be considered in revising |
| 9349 | 3 | 32 | 5 | 32 | 5 | p. 32 line5: the previous two lines, give three alternatives. which of these three does the word " this approach refer to" explain to make clear. | Noted to be considered in revising |
| 3611 | 3 | 32 | 5 | 32 | 5 | Please add "E.g., Oberheitmann (2010) proposes the inclusion of historical emissions since 1750 for the allocation of per-capita emission rights based on cummulated CO2-emissions" . Cite: Oberheitmann, A. (2010). A new post-Kyoto climate regime based on per-capita cumulative CO2-emission rights—rationale, architecture and quantitative assessment of the implication for the CO2-emissions from China, India and the Annex-I countries by 2050. |---|---|---|---|---|---|---|---|
| 7931 | 3 | 32 | | | | This section should be moved (or related) to section 3.3. Here, the distribution of emission permits is discussed already. A similar list was presented in SAR and the progress in the literature since then is ignored. In addition, there is abundant literature on different distributive principles that should be accounted for (in addition to those cited below: Meyer/Roser 2010, Müller et al. 2009, Schüssler 2011, Shue 1993, 1999, WBGU 2009, Jagers/Duus-Otterström 2007, Gosseries 2004, Caney 2009, Bell 2008, Vanderheiden 2008, and probably many more). Also, the souvereignity principle is dismissed in the ehtical literature. A choice between the rivaling concepts is not as arbitrary as portrayed (see for example Gardiner 2004). Also, many authors argue that a combination of two or more principles can make up for the shortcomings of each principle considered on its own (Page 2008, Caney 2010b, Bear et al. 2009, Baatz 2013). The remark that "Normative interpretations of justice, equity and responsibility (see section 3.2) can be operationalized in different ways, implying different patterns of mitigation effort sharing and international transfers (Tol, 2001; Ringius et al., 2002; Heyward, 2007; Müller et al., 2009; Baer et al., 2009; Ekholm et al., 2010). There are no universally accepted principles to determine this choice. The use of equity arguments between nations and within societies may be self-serving (Lange et al., 41 2010)." seems to be a bad joke given two decades of profound investigations and discussions. Obviously, much more can and must be said at this point. | No plans to move section, but comment will be considered in SOD |
| 10376 | 3 | 32 | 1 | 32 | 7 | Egalitarian Principle is not very clear that the equal share is the equal of past emissions, present emissions, future emissions or the accumulated emissions. | Noted to be considered in revising |
| 12786 | 3 | 32 | 18 | 32 | 25 | It would be helpful to mention the difference between PPP and SOV (consideration of historical emissions under PPP). | Noted to be considered in revising |
| 15649 | 3 | 32 | 30 | | | Note that the same Article of the UNFCCC (3.1) refers even more specifically to equity, in the phrase that all parties should protect the climate system "on the basis of equity" - this should be included. | Noted to be considered in revising |
| 9397 | 3 | 33 | | 37 | | The discussion of "policy instruments" in ethics needs to comprise the debate on "good governance" and needs to discuss the role of democracy in terms of: How can people be involved in decision-making-procedures? What is the role of local communities in terms of subsidiarity? and: What are the democratic principles underlying decisions about environmental policies? Otherwhise, this section of the chapter is not coherent with the claim at the beginning of the report (introduction) that civil society and non-governmental associations play a crucial role in achieving the aims of mitigation. (The authors mention this on p. 45, 24-29, but don't give a normative background.,) | No action - this is treated in chapter 15. |
| 3941 | 3 | 33 | 1 | 33 | 19 | The ethical basis for the UNFCCC's normative prescriptions in this box are unclear in the light of this discussion in this chaper. Its proposals seem to be aimed a redistribution from rich countries to the poor, but if this is its principle, why is it proposing a transfer from today's rich to those who will be even richer in the future? Could the chapter provide policy makers with more guidance concerning how they should assess ethical values in relation to these propositions? Another point is that these rights and duties make no reference to himan rights - including the human right to be free to make moral choices. | Noted to be considered in revising, one suggestion is to remove Box 3.3 |
| 4940 | 3 | 33 | 11 | | | This principle of ‘common but differentiated commitments and responsibilities’ remains | No action; no change implied, confirming |
| 4930 | 3 | 33 | 13 | | | The differences in production/consumption/emission volumes and the related responsibilities (but w/o explicitly referring to the CBDR) were used for distinguishing the commitments of the developed and (majority of) developing countries in context of the 1987 Montreal Protocol (its Article 5 on "Special situation of the developing countries"). Similarly the 1991 legal instrument on reduction of VOC emissions (LRTAP/VOC protocol) introduced) specific emission control commitments for less responsible countries (Art.2.2.c: instead of 30% reduction on the duty to stabilize .. .) | Noted to be considered in revising, one suggestion is to remove Box 3.3 |
| 13424 | 3 | 33 | 16 | 33 | 17 | It is misleading to state that the on-going climate negotiations are aiming for an outcome with mitigation obligations on all major emitters. Nowhere in the agreed climate convention decisions has there been any statement to that effect, nor has the term “major emitters” been accepted or used in the decisions. There are many interpretations of the recent Durban Platform decision (Dec 2011) and if it is to be alluded to, it is important to have a balanced treatment of the literature and of the position of various Parties. | Noted to be considered in revising, one suggestion is to remove Box 3.3 |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 4941 | 3 | 33 | 17 | | | all major? emitters ??? ~ actually on all countries (with flexibilities to SIDS and LDCs) | Noted to be considered in revising, one suggestion is to remove Box 3.3 |
| 13940 | 3 | 33 | 2 | 33 | 19 | Suggest deletion of Box 3.3 since it does not contain any new info and you need to shorten the chapter! | Noted to be considered in revising, one suggestion is to remove Box 3.3 |
| 9805 | 3 | 33 | 20 | | | What is specific concerning climate change. If climate change is "just" one specific subdimension of environmental protection, the decision maker could read a textbook on policy instruments and regulations. | Noted; will be addressed in SOD. We will make this section more specific to |
| 13941 | 3 | 33 | 31 | 33 | 32 | It seems there is a typo where you state "… ate policy instruments in particular, see reduction,…" | Will fix in SOD |
| 13567 | 3 | 33 | 31 | | 21 | I found some of this language a little confusing - suggest some rewording | Noted to be considered in revising |
| 13423 | 3 | 33 | 8 | 33 | 9 | Developed countries are not “called on” to provide new and additional resources but have committed themselves to do so. | No action; no change implied, adequately addressed |
| 15650 | 3 | 33 | 3 | 33 | 19 | The box (or accompanying text above) should be more specific in stating that _all_ parties have "common but differentiated responsibilities and respective capabilities" for protecting the climate (as per UNFCCC Art 3.1). The reference to "common but differentiated commitments and responsibilities" is incorrect if it is intended as a quotation from the UNFCCC. At line 13, it is debatable whether Kyoto-style differentiation was its "first concrete expression" of CBDR. Arguably some commitments under the UNFCCC itself, eg on financing (Arts 4.3 and 4.4) qualify as the first concrete expression of CBDR. In any case, it would be preferable to see Kyoto-style differentiation as the "high point" of differentiation, and one that is unprecedented in any other international environmental agreements (see Rajamani, L. 2012. The Changing Fortunes of Differential Treatment in the Evolution of International Environmental Law. International Affairs 88 (3):605-23.). | Noted to be considered in revising, one suggestion is to remove Box 3.3 |
| 8411 | 3 | 33 | | | | I suggest to give more attention in this chapter (or in section 1.4.4) to the effects of energy subsidies. As stated by UNEP (2008, Reforming Energy Subsidies. Opportunities to Contribute to the Climate Change Agenda) it is becoming increasingly apparent that many types of energy subsidies today run counter to the goal of sustainable development: they can undermine private and public investment in the energy sector, which can impede the expansion of distribution networks and the development of more environmentally benign energy technologies such as decentralised renewable energy technologies. Fossil fuel incentives play a heavy burden on government finances, weakening the potential for economies to grow and reducing the potential to invest in social equity. | No action; this is out of the scope of "framing" chapters. As such, assessment aspects of policy instruments are addressed in, e.g., Ch 13 & 15 |
| 6084 | 3 | 33 | 20 | | | Subsection of 3.8 need to be restructured. For example, 3.8.2 should be titled as various types of policies followed by 3.8.2.1 economic instruments, 3.8.2.2 prescriptive approaches, 3.8.2.3 information instruments, 3.8.2.4 voluntary actions and agreements. | Good point. This will be restructured. |
| 17294 | 3 | 33 | 21 | 33 | 26 | “Policy” needs to be defined and the broader issues those are included needs to be identified or indicated. | Good point. We can do that. |
| 11189 | 3 | 33 | 27 | 35 | 31 | P34 (line 14-20): The discussion on 'hybrid instruments' is very short and supperficial and merely lists some 'old' seminal papers and a theoretical recent one. However, it fails to mention that the most comprehensive 'real world' climate policy to date, i.e. the EU ETS system, actually (and increasingly) is a 'hybrid instrument'. Here the quantity approach (limited number of allowances) is combined with a price approach (indeed, auctioning will be the rule in the power sector from 2013 onwards in the EU). Saveyn et al. (2011) compare the socio-economic effects for the EU for 4 different grandfathering/auctioning/carbon taxation schemes in the context of the Copenhagen Accord. This analys shows that auctioning generates a substantial amount of public revenues. Auctioning (and taxation) complies better with the ‘polluter pays principle’ and avoids handing out ‘windfall profits’ to sectors that can easily pass on the opportunity cost of allowances to their customers. BOX 3.4. is not making any reference to these 'real world hybric instruments' either. Literature: Delbeke, J., Klaassen, G.,Van Ierland, T., Zapfel, P., 2010 The role of environmental economics in recent policy making at the European Commission. Review of Environmental Economics and Policy 4 (1), 24–43 / | Good Point. We can add the point about the EU-ETS … some of the other points ARE addressed in other section of our chapter, like the bit about revenue from selling permits. |

Review of Environmental Economics and Policy 4 (1), 24–43 / | No action; duplicate |
| 13568 | 3 | 33 | | | | only a suggestion but just to point you out to work we've done on a systematic review examining ex post assessments of the effectiveness of climate policiesh as it assesses policies with a finer grain (includes source of authority, regulatory target, etc. and focuses on the policy cycle versus just instrument choice) See page 23+ and Figure 6 http://www.sciencedirect.com/science/article/pii/S0301421500000707 | Noted to be considered in revising |
| 9396 | 3 | 34 | | | | Since this chapter is about ethics, it would be helpful to include approaches which develop a normative background for policies regarding climate change. These are, i.e., authors who work on "ecological citizenship" (Andrew Dobson), and work on "Greening the state" (Wissenburg et al.). | No action - is treated in 3.11 |
| 11561 | 3 | 34 | 13 | | | It is relevant to mention here that "the political acecptability of carbon taxes is low"? | No action - we do not want to evaluate what policies are more or less politically |
| 11725 | 3 | 34 | 14 | 34 | 20 | Disagree. At least ['Hybrid' policies combining price and quantity control are likely to be superior.] should be deleted.Refer to No.13. | Will be addressed in SOD |
| 10639 | 3 | 34 | 14 | 34 | 20 | Doubtful. There is few arguments to support this statements. Please refer No. 7 | No action; unclear what no. 7 is |
| 9975 | 3 | 34 | 14 | 34 | 14 | This part should be deleted completely. Levying "carbon tax" and "cap & trade" simultaneously is not meaningful and would fail to reduce CO2 emission because carbon tax and cap & trade are theoretically same mechanism to reduce CO2 emission, as described in (Clive, 2007, page4-5).<br><br><Reference><br>[1] Clive Hamilton, Frank Muller (2007). Critique of the McKibbin-Wilcoxen Hybrid Emission Trading Scheme, Australia Institute. Available at: http://www.ies.unsw.edu.au/docs/WP98.pdf | Need better explanation of hybrid instrument |
| 11562 | 3 | 34 | 14 | | | "Hybrid policies combining price and quantity control are likely to be superior". Why? More needs to be said. | Need better explanation of hybrid |
| 7932 | 3 | 34 | 21 | 34 | 22 | Legal instruments should not be termed "command and control" policies. This just expresses an economic bias against the law. We propose using the term "legal regulation". | Consider using prescriptive regulations instead of command and control |
| 13942 | 3 | 34 | 26 | 34 | 26 | There are two .. in that line! | Will be fixed in SOD |
| 9976 | 3 | 34 | 31 | 34 | 33 | This part should explain that CO2 leakage caused by the implementation of the ETS happened actually through transfer of industry from one country to others. Market mechanisms at least under Kyoto-like international scheme, where the condition of all countries' meaningful participation is not met, does not work well, as shown in (Rosendahl, 2011, abstract), (Aichele, 2012, page336), and (Peters, 2011, page1). These literatures are listed in the No50 line of this table. | No action; this is out of the scope of "framing" chapters. As such, assessment aspects of international policy instruments are addressed in Ch 13 |
| 12248 | 3 | 34 | 35 | 34 | 38 | Please elaborate further on under which assumpltions prescriptive instruments can perform better then market based instruments. | Good point; we will take this into account in revising section |
| 10976 | 3 | 34 | 31 | 34 | 33 | Market mechanism is highly recommended here in order to minimize total abatement cost. However, not only merits but also demerits should be stated here. | Good point; we will take this into account in revising section |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 8250 | 3 | 34 | 31-33 | 35 | 2-5 | While the authors cover many policy instruments that have been discussed in literatures, however, the existing international flexibility mechanisms such as “clean development mechanism” and “Joint implementation” are not explicitly discussed in this subsection. There is a suggestion that some words about the above mechanism can be incorporated around somewhere between lines 31-33. If these instruments are discussed in a later chapter, then it might be the place to provide a reference about those chapters as well. | Scope of section needs clarifying |
| 9977 | 3 | 35 | 33 | | | Carbon pricing is only one of mitigation measures. In this regard, this section should include "voluntary target scheme" as one of mitigation actions, depending on circumstances. There are successful examples of "voluntary target scheme" in the world. Each industry in Japan has voluntary target and the voluntary target scheme has played a big role, as described in (Yamaguchi, 2012, page35 and 154), (Manuel, 2010, page 6 and 13), and (Yamaguchi, 2010, abstract). In addition, there is also a successful example of "voluntary target scheme" in Netherlands, as shown in (Martijin, 2002, page162). These literatures are listed in the No63 line of this table. | No action; voluntary agreements are already discussed in this section (and in the box). |
| 4497 | 3 | 36 | 1 | 36 | 1 | Footnote 15 is much more important than the other points made in this paragraph, and should be elevated to being part of the text instead of just a footnote. | No action; it is important, but not covered in our chapter; that's why the |
| 11726 | 3 | 36 | 28 | 37 | 3 | Expression should be met with section 15.3.6. | Will ensure consistency with chapter 15 |
| 9978 | 3 | 36 | 28 | 37 | 3 | This part should explain the advantages of "voluntary target scheme" and successful examples in the world. Each industry in Japan has voluntary target and the voluntary target scheme has played a big role, as described in (Yamaguchi, 2012, page35 and 154), (Manuel, 2010, page 6 and 13), and (Yamaguchi, 2010, abstract). In addition, there is also a successful example of "voluntary target scheme" in Netherlands, as shown in (Martijin, 2002, page162). These literatures are listed in the No63 line of this table. | No action; the performance of policy instruments is left to other chapters (sectoral, national, international) |
| 6085 | 3 | 36 | 28 | 36 | 29 | After objective, add "There are voluntary initiative that does not include regulatory authority, ex.Japan". | Noted - action will be taken - discussion of voluntary agreements will be changed |
| 13569 | 3 | 36 | 4 | | | if there is interest in examining the policy cycle more thoroughly (see page 13 inour above report for the Network for Business Sustainability), an interesting examination of Germany's experience in the ETS using the Kingdon garbage can model (different streams, policy windows), please see Brunner Understanding policy change: Multiple streams and emissions<br>trading in Germany Global Environmental Change 18 (2008) 501– 507 http://www.pik-potsdam.de/members/brunner/publications/understanding-policy-change-1 | No action; no change implied |
| 13943 | 3 | 36 | 8 | 36 | 9 | "These legal mandates are called direct regulations or command-and-control approaches". Is already explained before and again in footnote 16. This is redundant. | Will be addressed in SOD |
| 7933 | 3 | 36 | | | | There are many success stories of environmental regulation in the EU, Germany and Japan (for instance, the so called "top runner approach" in the latter). See, e.g., Martin Jänicke (2012b) as well as his further writings on this topic. | Noted - we will add examples from section chapters |
| 8154 | 3 | 36 | | | | You might want to consider how individuals process information and the types of decision rules they utilize in determining ways to communicate information for achieving social change (See FOD Chap. 2 Sect. 2.2.2 ) | No action - this is treated in 3.11 |
| 11534 | 3 | 36 | | | | You might want to consider how individuals process information and the types of decision rules they utilize in determining ways to communicate information for achieving social change (See FOD Chap. 2 Sect. 2.2.2 ) | No action; duplicate |
| 18600 | 3 | 37 | | | | The double dividend hypothesis (p 37): no clear conclusion. | No action; the double dividend hypothesis does not have a clear |
| 11727 | 3 | 37 | 13 | 37 | 17 | It is reasonable. Hamilton et al. also says that hybrid mecanism would fail the various tests of good policy.<br>1.Hamilton et al.:[Critique of the McKibbin-Wilcoxen Hybrid Emission Trading Scheme], http://www.ies.unsw.edu.au/docs/WP98.pdf | Noted - need better explanation of hybrid instruments |
| 9496 | 3 | 37 | 13 | 37 | 16 | good sentence - I can agree | Thank you for your comments. |
| 10640 | 3 | 37 | 13 | 37 | 17 | Good argument. Hamilton et al. also says that hybrid mecanism would fail the various tests of good policy.<br>1.Hamilton et al.:[Critique of the McKibbin-Wilcoxen Hybrid Emission Trading Scheme], http://www.ies.unsw.edu.au/docs/WP98.pdf | No action; duplicate |

|---|---|---|---|---|---|---|---|
| 9979 | 3 | 37 | 14 | 37 | 16 | This part should be kept in SOD because this is a good example of the problem. Levying "carbon tax" and "cap & trade" simultaneously is not meaningful and would fail to reduce CO2 emission because carbon tax and cap & trade are theoretically same mechanism to reduce CO2 emission, as described in (Clive, 2007, page4-5). This literature is listed in the No5 line of this table. | Noted - need to clarify hybrid instruments |
| 8751 | 3 | 37 | 40 | 41 | | The achievement of more sustainable consumption patterns depends on how consumers value environmental resources (instead of quality)? | No action; relevant, but not in this section / discussed elsewhere |
| 13570 | 3 | 37 | | | | the dearth of studies to do with policy interactions is duly noted. That being said, you may wish to have a look (page 69) of the NBS report which also echoes the importance of bundles. In addition, we are currently developing a paper through the climatepolicyinnovation.org network which reflects further on our findings to do with the importance of policy combinations / interactions http://www.climate-policy-innovation.com/ | No action; these aspects are further discussed in "assessment" chapters (e.g. 13, 15) or even sectoral chapters. |
| 18386 | 3 | 37 | | 38 | | Why focus only on the interaction between carbon taxes, policies to reduce emission and emission trading ---all of which have serious flaws as policies that might lead to changes in habits and practices with respect to energy use, transport systems, continued search for new oil & gas finds and none moving us towards a transition to a sustainable , clean and green world. It seems an excesively narrow approach. | No action; comment is too vague for action. |
| 17295 | 3 | 37 | | | | Policy interactions may include “disaster” and “renewable energy” policies as identified in the two respective recent special reports of IPCC. | No action; we believe the issue is already dealt with adequately, e.g. when elaborating on green certificates or insurance (footnote 15). Evlauation |
| 11190 | 3 | 37 | | | | Carraro et al. (1996) develops the politically important concept of ‘employment double dividend’. Carraro, C., Galeotti, M., Gallo, M., 1996. Environmental taxation and unemployment:<br>some evidence on the ‘double dividend hypothesis’ in Europe. Journal of Public<br>Economics 62, 141–181. | Good point; we will take this into account in revising section |
| 11383 | 3 | 37 | | | | Carraro et al. (1996) develops the politically important concept of ‘employment double dividend’. Carraro, C., Galeotti, M., Gallo, M., 1996. Environmental taxation and unemployment:<br>some evidence on the ‘double dividend hypothesis’ in Europe. Journal of Public<br>Economics 62, 141–181. | No action; duplicate |
| 11563 | 3 | 37 | | | | The different policy instruments are primarily discussed in terms of economic efficiency. Other considerations should be taken into account as well. What ethical and political consequences may different policy instruments have? Different instruments give priority to different key policy agents. What ethical implication may that have? | No action - ethical aspects are laid in previous sections of Ch3. For actual implicatons of policy instruments, see assessment chapters (e.g. 13, 15) |
| 12846 | 3 | 38 | 12 | 38 | 17 | My reading based on the preceding lines 7-8 is that the lesson is not simply that raising revenue could reduce inefficiencies. Instead, the lesson seems that revenue would have to be used to reduce other distortions, as stated in lines 7-8: “the superiority of carbon taxes or emissions trading depends on whether generated revenues can be directed to reduce other distortionary taxes.”<br>If the lesson is that revenue should be directed to reducing distortionary taxes, the example of EU permit auctioning is misplaced here (as the revenue from auctioning is not dedicated for reducing distortionary taxes). Rather, the province of British Columbia could be given as an example besides Australia. British Columbia uses carbon tax revenue to reduce business and income taxes (B.C. Ministry of Finance, http://www.fin.gov.bc.ca). | Good point, will be taken into account - DDH discussion will however be moved |
| 13571 | 3 | 38 | 28 | | 28 | It may be worthwhile to make a distinction between developing countries (more to do with ensuring basic educational attainment, % educated within their population, etc.) and OECD nations (more to do with marginalized populations having access / affordability to higher education, etc.) (again, bearing in mind these are generalizations). In other words, just to flag that issues like health (take the U.S. for instance) and education and (affordable) housing are also key concerns for industrialized nations also | Will be addressed in SOD |

|---|---|---|---|---|---|---|---|
| 15370 | 3 | 38 | 31 | | 33 | Easterly (see William Easterly, The White Man's Burden: Why the West's Efforts to Aid the Rest of the World Have Done So Much Ill and So Little Good, 2006.) has argued that plans have not been successful in accomplishing development objectives, whether they have been developed indigenously or encouraged or imposed by multilateral financial institutions. Easterly includes poorer countries in his analysis, which in the terminology of North, Wallis Weingast are fragile Limited Access Orders (North, Douglass C., John Joseph Wallis, and Barry R. Weingast, Violence and Social Orders: A ConceptualFramework for Interpreting Recorded Human History. New York: Cambridge University Press, 2009). Stable limited access orders, including such countries as China and India, have achieved economic growth within a planning framework, but as Acemoglu and Shirk (Daron Acemoglu "Why Not a Political Coase Theorem? Social Conflict, Commitment and Politics", Journal of Comparative Economics, 31, pp. 620-652, December 2003; Shirk, Susan L. China: Fragile Superpower. New York: Oxford University Press, 2007. ) suggest, the plans are successful because they are in the interest of a relatively narrow ruling coalition, and if that coalition does not find adaptation or mitigation to be in its interest they will either fail to be included in the plan or will not be pursued or succeed if they are included. | Will take this into account in SOD |
| 11728 | 3 | 38 | 34 | | | One part of the developing countries don't fit such situation. [Most developing countries] is better expression. | Will be addressed in SOD |
| 9528 | 3 | 38 | 34 | | | Please, add many in front of developing countries due to consideration for China, Korea and transition countries. | Will be addressed in SOD |
| 6086 | 3 | 38 | 34 | 38 | 38 | The sentences here does not make sense. Therefore either delete or rewriting of this paragraph is necessary. Lack of human and financial resources, advanced technology, and have poorer institutional and administrative capacity may lead to the situation where not only certain market mechanisms such as carbon trading schemes but also direct regulation such as performance standards may not function well. Also the contrast between developing and developed countries with respect to policy choices is misleading. For example, actual climate policy introduced in the united states is direct regulation (CAA) and that in Japan is industry voluntary initiative. | Good point. We can clarify. |
| 13572 | 3 | 38 | 38 | | | suggest an example of entrenched distortions, which may be politically challenging (e.g. fuel and electricity subsidies) -- see fuel protests in Nigeria for instance http://www.cnn.com/2012/01/06/world/africa/nigeria-fuel-protest-explained/index.html | Will be addressed in SOD |
| 9350 | 3 | 38 | 21 | | | p.38 line 21: Section 3.8.3idoes not show the application of these general principles of taxes etc. to climatte change. This should be added. How, in other words, do these applynin the global context to an all pervading externality, without an international government? Are you defining GHG emissions as a surrogate for climate change? | Good point. Think about how to apply these principles to climate change. |
| 11191 | 3 | 38 | 15 | 38 | 16 | Saveyn et al. (2011) analyse the potential for a 'double dividend' (incl. employment) in the EU comparing a number of options with an increasing share of auctioning and carbon taxation. Saveyn, B., Van Regemorter, D., and Ciscar, JC. (2011). Economic analysis of the climate pledges of the Copenhagen Accord for the EU and other major countries. Energy Economics 33, S33-S40 | Reference will be considered in SOD |
| 11384 | 3 | 38 | 15 | 38 | 16 | Saveyn et al. (2011) analyse the potential for a 'double dividend' (incl. employment) in the EU comparing a number of options with an increasing share of auctioning and carbon taxation. Saveyn, B., Van Regemorter, D., and Ciscar, JC. (2011). Economic analysis of the climate pledges of the Copenhagen Accord for the EU and other major countries. Energy Economics 33, S33-S40 | No action; duplicate |
| 17332 | 3 | 38 | 18 | 38 | 21 | Consider cross-refering to Chapter 15 when appropriate | Good point. We will look for how to do |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 4931 | 3 | 38 | | | | 3.8.4 In this chapter generally, the equity and responsibility issues in context of the climate change policies (besides their global aspects) appear not only in relation to the developed countries and the developing countries, but also with their specificity for the EiTs (e.g. with their historical responsibility somewhere between the two former groups). In particular and more concretely, in subsection 3.8.4 whilst there are strong differences in these conditions between developed countries and developing countries, it was also clearly recognized that the EiTs were in a "between" situation and it also lead to differences in choice of policy instruments (as compared to those instruments which were generally considered relevant/suitable for the highly industrialized countries). During the early stages of the international negotiations (early 1990s) it was not so evident that these EiTs will undertake any emission control commitments; ultimately it happened with "flexibilities" (as e.g. referred to together with relevant policy choices for various sectors for Hungary in "Climate change and Hungary: mitigating the hazard and preparing for the impacts, 2010, ISBN 978-963-508-605-4 http://www.vahavahalozat.hu/files/vahava-2010-12-korrigalt-2.pdf). | No action; we believe the issue is already dealt with adequately |
| 13422 | 3 | 39 | 1 | 39 | 8 | The use of investment for climate actions is a crucial economic instrument, for both developing countries (thus it is appropriate to mention it here) and also for developed countries. Thus for example a deliberate choice to opt for renewable energy sources has to be operationalized through promoting investments in those sources, even if they are not at the moment as economical as climate-damaging sources. The investment-led approach, with its accompanying policy instruments such as subsidies and legislation, deserves more emphasis, citing the relevant and growing literature. The use of five-year plans in developing countries to allocate investments in climate-related sectors and activities should also be mentioned in this context. A paragraph or more on the investment-led approach (relevant to all countries) could also be usefully added in section 3.8.2 on economic instruments. | Good point. Investmetns can be mentioned in 3.8.2 |
| 13574 | 3 | 39 | 17 | | 20 | the examples of economic objectives are rather broad - encompassing aspects as diverse as innovation, lowering economic costs, etc. and so difficult to say that these may (all) be met | No action; no change implied, adressed p39 line 21 |
| 2271 | 3 | 39 | 18 | 39 | 16 | It is strange that the Assessnent of Performance does not include attempts to find out whether greenhouse gases in the atmosphere have changed as a result of these policies Meaureents over land surfaces are almost completely neglected | No action; no change implied. Covered as environmental objectives i.e. reduced emissions |
| 8155 | 3 | 39 | 19 | | | How much weight should be given to each of these four objectives and how will this tie into CBA? | No action; we have considered the point but feel it is already addressed (e.g. |
| 13573 | 3 | 39 | 2 | | | just to also note that for many developing countries the focus / thrust of power tends to be on the nation state rather than provincial / local levels of public authorities (again bearing in mind some major exceptions) - e.g. mega cities | Will be addressed in SOD |
| 9351 | 3 | 39 | 8 | 39 | 8 | p39 line 8 onwards: what about governance deficit in developing countries and its efect on efficacy of instruments? Authors do not mention improving governance as an institutional requirement | Good point. This should be added. |
| 17165 | 3 | 39 | 9 | | | There is a lack of coherence and linkage between this sub-chapter 3.9 and the chapters 3.3 and 3.4. The evaluation of policy options is again basically an ethical (i.e. comprising all relevant aspects, not merely effectiveness, etc) task, conducted along the same principles as those outlined in chapters 3.3 and 3.4, so please link these passages. It remains somewhat unclear where the several objectives are derived from. | We did work on improving links between sections in SOD. See revisions to first parag of 3.9, and other changes throughout 3.9. |
| 8588 | 3 | 39 | | | | There is a potential here to address some of the challenges of this chapter. I realize that the actual order of sections may not be changeable at this point, however, this type of broader discussion - in which multiple criteria area recognised - would have been valuable before the single-minded dicsussions of CBA etc. By placing this section after the previous it seems as thought the strictly economic criteria should take precedence over all others. If moving entire sections is behind the scope of revisions allowed for this chapter, then one way of addressing this would be to include some of the recognition in this section (ie. that there are many different criteria to deal with in any decision) in the earlier sections on CBA and the use of eocnomics as one tool for helping decision-makers make difficult decisions across non-comensurable dimensions. | Good point; we did consider reorganization, but instead add cross-references to other sub-sections. We added references to sections 3.3 and 3.4, and we add discussion of non-economic objectives. See new parag in 3.9.1. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 13268 | 3 | 39 | 17 | 39 | 26 | How adaptation policies are considered in this four categories description? | No action. Adaptation is out of the scope. This is WGIII, focused on |
| 16929 | 3 | 4 | | | | I defer to the comments of my professional colleague Sonia Klinksy, on most dimensions of this topic, but offer one fundamental point. Almost all streams of considered analysis recognise that modern economic systems reside within some higher-level framework of rules based upon moral codes. Dr Klinsky has touched on some dimensions of this. Within institutional economics, it is generally referred to as the "institutional environment" that defines for example property rights along with the basic rights of individuals. These set the boundaries within which markets operate, and within which welfare can acceptably be aggregated for the purposes of policy (see my extreme example in relation to section 3.5).<br>With climate change, there is no global agreement on these fundamentals beyond the relatively loose principles set out in the UNFCCC. That is a core part of the problem.<br>To put it in layered terms, the economic system (and aggregation of welfare) resides within an social environment (which may or may not be formalised institutionally) that defines and enforces the acceptable principles and applications of aggregation and its boundaries. As we discused in the Washington IPCC meeting, trading relates closely to this, since trading implies exchangeability and hence potential to aggregate. The institutional environment for example enforces property rights, and also the bounds (eg. I cannot own and cannot sell my mother, or - in modern societies - slaves). I am allowed to own and trade other species, unless in general they are classified as endangered. These are collective social rules that define the boundaries. A diagram on this nesting might be useful. At the international level, the truce was essentially struck in the Westphalian system that codified the notion of Sovereignty of nation-states. Thus for example, War cannot be justified on arguments that it could improve aggregate global welfare.<br>Climate change strains the system because it involves the actions of each country impacting on others. Climate change by its nature thus transgresses the principle of sovereignty, without any other agreed moral framework with which to replace it. The likely victims have not agreed to any system of how their welfare could acceptably be aggregated, akin to the democratic system that underpins the moral legitimacy of economies within a sovereign state. Hence the recourse to negotiations and emphasis on procedure.<br>For this reason I believe the Exec Sum should follow much more closely the logical structure of the main chapter, which works from the ethical principles, and philosophies of justice, equity, and responsibility, values and wellbeing, before it gets to the economic 'toolkits' of aggregation. In other words the first sections lay out various moral frameworks; these should be developed to define more clearly the boundaries around various evaluation approaches (including aggregation & CBA). The Exec Sum should then I think lay out these boundaries, note that they may lead to incommensurate ways of looking at the problem "objectively", and that these can only peaceable or morally be resolved through negotiation, including some attempts to find proxies that represent the interests of future generations.<br>CBA forms a utilitarian approach that has to be nestled within this, with all the complexities and caveats around the way in which damages (and costs) are aggregated (section 3.5) and measured (3.10). | No action. ES already follows the structure of the chapter very closely. |
| 7902 | 3 | 4 | 1 | 7 | 24 | In our opinion, this is a rough summary only and should be refined. | Will be addressed in SOD |
| 8825 | 3 | 40 | | | | this section should include a discussion of the practical impacts of uncertainty. For example, Figure 3.4 as shown suggests a far higher level of precision in comparing costs and benefits than usually is possible; thin lines might be replaced by wider lines or bands to illustrate this important point. | Good point. We now clarify uncertainty. We add: "In particular, the diagram presents costs and benefits as if they were certain. A thorough discussion of |
| 14374 | 3 | 40 | 1 | | | Discussion reads like textbook; could be a section that could be edited down | No action; no change necessary, though we continue to edit for readability. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 8589 | 3 | 40 | 1 | 41 | 4 | This section starts out promisingly, with a very nice clear recognition that there are multiple criteria to consider when evaluating mitigation options. Line 8 states this section is going to address 4 critiera. All of this is good so far. And then, on line 12, all of this framing is stopped and suddenly the reader is presented with the economic frame for policy analysis (and figure 3.4). This movement is illogical and leaves the reader with the impression that the other THREE criteria are subservient to economics. If the authors wish to include this discussion of an economics approach to decision making, it should be moved to a more appropriate location such as under section 3.9.1.1 | Good point, this has been clarified. The paragraphs and diagram do relate to all four criteria, not just economics. See new parag in middle of 3.9.1. The diagram can encompass all objectives, not just the first economic objective. |
| 7934 | 3 | 40 | 12 | 40 | 15 | An economic framework for policy analysis is adopted. This aproach supposes rational self-interested agents that maximizes personal utility. Given that these are heroic and counterfactual assumptions and given that there are many other ways to analyze policy-making, a reason is needed why this framewok is considered to be appropriate. | This point is addressed in SOD; similar to comment 8589. See new footnote in section 3.9.1.1 |
| 6087 | 3 | 40 | 2 | 40 | 4 | Criterion of promotion effect of technological innovation and diffusion is missing. In line 21-24 of page 6 of Chapter 3, there are sentences such as "Meeting aggressive emission reduction targets will be difficult without major changes in the technology of producing and consuming energy" and "Markets, left to their own devices, will underprovide technological change, even in the presence of a carbon price. Studies suggest that environmental and technology policies work best in tandem". Also in Chapter 1 (page 3, from line 47), there are sentences that "it is likely that deep cuts in emissions will require a diverse portfolio of policies and technologies. It is very likely that here are many different development trajectories, but it is virtually certain that the ability to meet those trajectories will be constrained if particular technologies are removed from consideration or are given excessive emphasis". Also in Chapter 2 (page 38, lines 23-24), there is a description that "Several researchers suggest that future pathways for RDD&D will be the determining factor for emissions reductions (Prins and Rayner, 2007; Lilliestam et al., 2012)". This is pointed out in Chapter 6 (6.4.1) that "autonomous technology might not be sufficient to limit climate change and dedicated resources and policies might be needed to induce it" (p.60, lines 22-23). In any case without rapid technological innovation and diffusion, deep emission cut will be impossible. It is highly appreciated that this Chapter has an independent section (3.12) on technological change. As pointed out in that section, policy can play a key role in shaping both the derection and magnitude of climate-friendly technological change. With this in mind, whether a certain policy has such effect as to promote technology innovation/diffusion is absolutely important criteria for policy evaluation. Please add "promotion effect for technologicalinnovation/diffusion as fifth criteria. | Good point but note that innovation is usually considered in dynamic efficiency. Still, we take this into account in the revised version of the section - by making the above-mentioned issue clearer (comment 8589). We added mention of technology here, but must point mostly to other sections for more substantial discussion; see section 3.12 |
| 9006 | 3 | 40 | 23 | 42 | 36 | As in other policy evaluation techniques covered in the chapter (see for example section. 3.9.2.1 for an evaluation of quantitative approaches to evaluating policy), there should be a caveat emptor in the potential uses of a partial equilibrium graph Figure 3.4 for policy evaluation purposes of climate change policies. First of all, partial equilibrium graphs implicitly assume full employment, which is not the case in the developing countries. Again, section 3.8.4 recognizes and example of this in: "strong synergies between development, economic and climate policies are found in the literature" (page 38, lines 29-30). When resources are not fully employed as it is the case in developing countries, Figure 3.4 and microeconomic approaches in general do not provide an exhaustive accounting of the impact. Second, there should be a mention that the important distributional impacts are between types of countries - between developing and developed countries - as listed in Box 3.5 on climate policy applied to coal-fired electricity. Climate policy applied to coal-fired electricity at the global level has the potential of preventing developing countries from installing needed energy supply and constricting the development of domestic capabilities, including those of the domestic private sector, and reducing poverty. | Good point; we clarify assumptions, and how unemployment also matters. We add "full employment" to the list of assumptions, and we discuss the generalization to the case with unemployment. |
| 13575 | 3 | 40 | 1+ | | | a couple of comments here 1) suggest highlighting the challenge with attribution / causality - of course some tools attempt to determine this line of reasoning (e.g. logic models) and more nuanced views acknowledge the difficulty in determining that policy x leads to outcome y | No action; good point but we can't discuss causality. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 13576 | 3 | 40 | 1+ | | | just to flag again that economics are only one way to conduct policy evaluation -- these economics models can be helpful but speaking both as a former policy practitioner for the Cdn government and in assessing policies in a an academic sense, there is many a time when what these 'models' indicate rarely reflect what happens on the ground -- policy choices are to do focusing events / crises, political / constituency concerns, ideology, etc. - see Pal (2010) in Beyond Policy Analysis Nelson: Toronto | Will took this into account in SOD - we added caveats and discuss alternative approaches |
| 13577 | 3 | 40 | 1+ | | | an alternative view of policy choice and evaluation comes from systems dynamics and related views - an undergraduate student (Harris Berton) directed me to complexity theory (Morcol 2002) (see Pal 2010 page 357) and that rather than assuming linearity (the world, policy decisions as a clock) one can think of them as a cloud - where boundaries change and shift and is more difficult to assess the individual components of, but nevertheless, it remains a cloud) | No action - good point, but not clear how this is helpful. |
| 13944 | 3 | 41 | | 41 | | Footnote 25 is redundant too. Already well explained in the text. | We deleted that footnote |
| 9398 | 3 | 41 | | | | "Efficiency" needs a more critical discussion - i.e. in debates about collective goods and public goods in particular authors claim that efficiency cannot be achieved, even not in policy practices. Rather, sustainance of the good itself needs to be achieved through information practices, regulatory frameworks which engage civil society etc. | See new discussion in paragraph on efficiency. |
| 18387 | 3 | 41 | | 45 | | section 3.9.1.1 to 3.9.3.2 provide a list of policies as if our countries and policy makers could simply pick and chose among policies without a need to consider might work best in their country or region and in total abstraction from changes in the world economy or in the competitive strategies of the firms who must carry out such policies, if ever they were applied. You need to spend a bit more time to discuss the pros-and cons of enacting such policies and making them work. | No action. Sectoral and assessment chapters deal with these aspects. Consistency among framing chapters (e.g. 2 & 3) and sectoral/geographical assessment chapters is a continuous |
| 8156 | 3 | 42 | | | | I like the example of coal-fired electricity. Can you indicate how general are these six distributional effects to issues of CC? | Now addressed in 3.9.1.2 |
| 13945 | 3 | 42 | 4 | 42 | 27 | Suggest deletion. Keep (5) and (6) as a note, not to confuse readers who calculate aggergate surplus. The rest fits into the text. | No action. Comment unclear |
| 9807 | 3 | 43 | 10 | 43 | 13 | Your statement that the other pollutants might be already optimally regulated, is only valid if the emission level is zero. Otherwise there is always a benefit to society when emissions are lower. | No action. We feel that the text adequately addresses this issue. Lower emissions is NOT always a net benefit; |
| 4498 | 3 | 43 | 14 | 43 | 16 | This paragraph discusses "energy security" as if dependence on imported fossil fuels were the primary problem. However, this is not the case for two reasons. (1) Oil (the main internationally traded fossil fuel) is bought and sold in a world market, so the domestic price of oil in any particular country is largely independent of whether the oil is imported or not. Disruptions of a national economy caused by oil price spikes cannot be avoided by changing the mix of domestically produced and imported oil. (2) The main problem with imported fossil fuels is if the these fossil fuels are purchased from states that are actively or potentially hostile. Buying oil or gas from a hostile power enriches that state, to the detriment of the purchasing nation's security. It is economic strengthening of the hostile power that threatens national security, not the mere fact that the fossil fuels are imported. | No action - we make only one small mention of energy security; this is not the place for extended discussion. |
| 11729 | 3 | 43 | 14 | 43 | 16 | Yamaguchi et al. says that climate response needs the balance between the cost and benefit. This sentence should be deleted since such view point is lacking.<br>1.Yamaguchi et al.:[Climate change mitigation,P2-3], send attachment by another e-mail. | No action. Comment unclear |
| 9497 | 3 | 43 | 14 | 43 | 16 | delete this sentence - Climate policy should be chosen in consideration for both energy security and economy growth | No action. Disagree with comment/comment unclear. |
| 10641 | 3 | 43 | 14 | 43 | 16 | There is more cases where climate policy contradicts energy security. Yamaguchi et al discusses "balanced between energy security and mitigation reponses in his Climate Change Mitigation A Balanced Approach to Climate Change | No action. Disagree with comment |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 11011 | 3 | 43 | 24 | | 29 | Political feasibility cannot be meaningfully discussed in the abstract. It largely depends on how a proposed policy's expected distributional impact aligns with the distribution of power in the society? The latter, in turn, will hinge on the specifics of that society's institutional matrix such as the size of the selectorate relative to that of the total population and the ruling coalition (Bueno de Mesquita et al. The Logic of Political Survival, Cambridge, Massachusetts, MIT Press). Also, does the policy create economic rents, and can these rents, be used to purchase the support of a winning coalition of interest groups? | Good point. This has been added. We make this point explicit in 3.9.1.4 |
| 9806 | 3 | 43 | 3 | 43 | 16 | Paragraph 3.9.1.3. should be elaborated more in detail. Understanding and controlling environmental objectives are crucial when deciding about the appropriate climate change policy. | No action. Sectoral and assessment chapters deal with these aspects. Consistency among framing chapters (e.g. 2 & 3) and sectoral/geographical |
| 17296 | 3 | 43 | | | | It is important to include sustainability objective. | No action. This issue is dealt with more |
| 8590 | 3 | 43 | | | | Similar to an earlier comment (about 3.9.1), the order of these sections does not make sense to me. Placing a discussion about the breadth of approaches of policy evaluation before all the discussions of economics would help address the enormous problems the chapter has in automatically giving econmics preference as a worldview through which to see the challenge of climate change policy. If this type of reordering is at all possible I would strongly recommend it. | Noted; organization and structure of chapter will be addressed in SOD |
| 8826 | 3 | 44 | | | | the references in this section (quantitative approaches) are too focused on the work of economists. I suggest including insights from the decision sciences, including Keeney & Raiffa's Decisions with Multiple Objectives (1993) and Kleindorfer, Kunreuther, and Schoemaker's Decision Sciences: An Integrative Perspective (1993). In addition, this section should include a short discussion of the importance of facing difficult values-based trade-offs across objectives and the relevance of various techniques for helping stakeholders to address tough trade-offs; both references noted in the previous sentence include good discussions of this topic. | We added a paragraph and one of these references. We added this reference, at the end of section 3.9.2.1 |
| 13946 | 3 | 44 | 18 | 45 | 13 | I would recommend to cite for models: "Inside the Integrated Assessment Models: Four Issues in Climate Economics" (2009). Elizabeth A. Stanton, Frank Ackerman and Sivan Kartha. Climate and Development 1:2, pp. 166-184. It is a nice article to clasify climate change models. It could help to shorten this section. Page 59, for example, DICE, RICE, FUND and PAGE can be categoried under Stanton (welfare maximization, general equilibrium, partial equilibrium, cost minimization and simulation models). | Added reference - see footnote near end of section 3.9.2.1 |
| 4499 | 3 | 44 | 27 | 44 | 27 | The proper spelling is DeCanio (no space between "De" and "Canio". It is certainly appropriate to cite DeCanio (2003) in this chapter, but this is an odd placement for the citation, given that the arguments in DeCanio (2003) have mainly to do with flaws and weaknesses in conventional optimizing models, not with the failures of conventional bottom-up models. The DeCanio (2003) citation would be more appropriate in the following bullet point. | This has been fixed in SOD |
| 9352 | 3 | 44 | 34 | 44 | 35 | inp.44, line 34-35. Can it be added here that these models may not suit use for climate change where the future may be different, sometimes drastically different? The limitations of the models are not brought out clearly enough. | No action; there is no single best method (or model) for policy evaluation. Given the allocated words we have, we |
| 8398 | 3 | 44 | 22 | | | I defer to the author's judgement in terms of the exact definitions, but we tend to think of GCAM as a hybrid approach that could also be cited here. See: Kim, S.H., J. Edmonds, J. Lurz, S. J. Smith, and M. Wise (2006) The ObjECTS Framework for Integrated Assessment: Hybrid Modeling of Transportation Energy Journal (Special Issue #2) pp 51-80. | We considered this reference and find that it would add only small amount. |
| 9353 | 3 | 45 | 29 | 45 | 29 | p.45 line 29 a method not included is deliberative approaches. Also a little more on the approaches which are qualitative oriented is warranted. | Good point; we we tried to take this into account in revising section but given the allocated space, we cannot elaborate on |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 8591 | 3 | 45 | | 51 | | This discussion about metrics could be usefully integrated with the limited section on values earlier. This would have helped place some of the other dsicussions (such as of CBA) in a more appropriate context. I realize that reorganization at this late stage of development is usually not possible in the IPCC framework. However, based on the profound, possibly unsolvable, problems in this chapter I am strongly recommending that some reorganization is considered it at all possible. From my perspective it may be the easiest way to salvage this very difficult and problematic chapter. | Noted; will be addressed in SOD |
| 8157 | 3 | 45 | | 61 | | Metrics of Costs and Benefits Do you need all the material in this section. I found it a bit difficult to follow and see the connections with CBA and distributive/outcome justice. You might want to consider introducing an example to highlight key points regarding metrics and tie the discussion more closely to material in the earlier parts of the chapter. | Noted; will be addressed in SOD |
| 18388 | 3 | 45 | | 54 | | Section 3.10 is more realistic and points to the way metrics can affect the choice of trade-offs and can impact differentially on segments of the population and on other actors thus giving rise to the kind of dilemas that we currently fact between pumping more oil, searching for more gas, engaging in new such as fracking and greater use of methane. | Thank you for your comment. |
| 12787 | 3 | 45 | | 49 | | A classification or overview of the pros and cons of the metrics would be helpful as a summary. | No action - this is a good point, but we cannot add to this section by adding a summary. The section already is a |
| 17297 | 3 | 45 | | | | The costs of non-action may strengthen the arguments. | No action; we believe this is covered |
| 17166 | 3 | 45 | 30 | | | Again there needs to be more linkage and cross-references between this section 3.10 and 3.3/3.4. Ideally, 3.10 would discuss proposals for more precise metrics for the many possible ethical targets discussed in ch. 3.3 and 3.4. | Noted; will be addressed in SOD |
| 6314 | 3 | 45 | 36 | 46 | 3 | Here, the authors are finally using the language of anthropocentric vs. non-anthropocentric. Use this language consistently throughout the chapter, rather than human and non-human values, as noted previously. | Noted; will be addressed in SOD |
| 8827 | 3 | 45 | | | | the discussion of participatory approaches (section 3.9.2.2) is too brief. Important references are excluded (see work by Orwin Renn, such as his 1999 paper “A Model for an Analytic-Deliberative Process in Risk Management,” or the 2005 publication of the US National Research Council, Decision Making for the Environment. | No action - insufficient information. We searched multiple databases at online libraries, and could not find this reference. |
| 17333 | 3 | 45 | 15 | 45 | 29 | The literature about how participatory approaches can be used in "decision-support" and political negotiation processes is vast. This three paragraphs do not make justice of it. A good reference is the article by Nancy Roberts (2004) summarizing a lot of the literature. It can be found here http://arp.sagepub.com/cgi/content/abstract/34/4/315. Many references in the communicative planning literature as well. | We add this citation, and a sentence, but cannot possibly do justice to the vast literature in this short chapter. |
| 10270 | 3 | 46 | | 49 | | M. Amann et al.; GHG mitigation potentials in Annex I countries-Comparison of model estimates for 2020, (2009), IIASA Interim Report IR-09-034 is a gray literature, but the manner of MAC curves between CGE type models and technology rich models can be understood. The paper will be useful for readers. | No action; cannot cite grey literature |
| 10271 | 3 | 46 | | 49 | | For understanding differences in MAC (mitigation costs and potentials) among countries, the following paper will be useful in this section. T. Hanaoka and M. Kainuma, Low-carbon transitions in world regions: comparion of technological mitigation potential and costs in 2020 and 2030 through bottom-up analyses, Sustainability Science 7, 2012 | No action; we feel this issue is adequately addressed by existing citations |
| 10272 | 3 | 46 | | 49 | | For understanding differences in MAC (mitigation costs and potentials) among countries, the following paper will be also useful in this section. K. Akimoto et al., "Estimates of GHG emission reduction potential by country, sector, and cost", Energy Policy 38, 3384-3393, 2010. | No action - hundreds of possible cites; we need to pick and choose. This is not the place to discuss in detail. |
| 8158 | 3 | 46 | | | | There is a body of research in behavioral economics on why WTA may differ from WTP (See Chap. 14 of Boardman et al Cost Benefit Analysis: Concepts and Practice. ) | No action; cannot cite grey literature |
| 11535 | 3 | 46 | | | | There is a body of research in behavioral economics on why WTA may differ from WTP (See Chap. 14 of Boardman et al Cost Benefit Analysis: Concepts and Practice. ) | No action; duplicate |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 11564 | 3 | 46 | 20 | 46 | 20 | If it is true that multiple metrics of costs and benefits should be employed, the chapter should take the consequence thereof and focus on multiple metrics instead of primarily monetary cost and benefit. | No action; already addressed by comment 3372 |
| 4625 | 3 | 46 | 25 | 46 | 25 | It's important to note that onlt a money metric may be used in benefit-cost analysis (see comment 36) | Noted; will be addressed in SOD |
| 13269 | 3 | 46 | 27 | 46 | 28 | In same cases, as in some Energy Efficiency appliances, GHG abatement could produce economic gains. These gains also have impact on people, distributtive effects and changes in prices and costs. | No action; we believe this is already covered. |
| 10838 | 3 | 46 | 27 | 46 | 27 | "If GHG emissions are to be reduced, econmomic costs will be imposed on many actors". Surely this is an assumption? This, in my opinion, partially reflects a problem with CGE modelling in that it is assumed that the current state is in perfect equilibrium and thus (most) changes will therefore causes "costs". Perhaps there are win-win situations (as exemplified by the MAC curves in the following pages). Perhaps our models are a poor reflection of reality? Perhaps we, as a society, have missed an alternative development parthway or policy structure that makes GHG mitigation not cost (this is easy to imagine, since energy costs money and we generally like avoiding costs). Or perhaps, as you say, we have everything perfectly correct, and mitigation always costs! My suggestion is to weaken this statement so that you modestly acknowledge that GHG may not in fact cost (under the correct set of assumptions and society). E.g., some affect with "If GHG emissions are to be reduced, economic costs may be imposed on some actors while other actors may receive benefits, ..." | Noted; will be addressed in SOD |
| 12558 | 3 | 46 | 33ff | | | There is a large psychology and behavioral economics literature on subjective well being that is in part acknowledged later on in the chapter, e.g., 3.11.2.1 and 3.11.2.2, which could be foreshadowed here, allowing for the possibility that metrics other than changes in income exist. | Noted; will be addressed in SOD |
| 8251 | 3 | 46 | | 52 | | In this section the authors describe different modeling approaches and their limitations to estimate the cost of GHG mitigation. It seems that the section mainly focuses on the limitation-side of different types of modelling structures. Describing these limitations is plausible in the sense that it can help a reader to understand the scope of models results based on their prescribed structures. However, the readers may also be interested know the merit of each model over others. This part can be extended in this subsection. | No action; good point, but we won't have space for expanded discussion. |
| 8394 | 3 | 46 | 30 | 46 | 31 | A further point is that, technological changes can also involve changes in institutions and various welfare changes. | No action; this is a good point, but this is not the location to make this point. |
| 12557 | 3 | 46 | 34 | | | There is a large psychology and behavioral economics literature on the problems and limitations of contingent valuation measures, i.e., on both the discrepancy between WTP and WTA, and how to interpret responses on these measures in general. This literature deserves to be discussed or at least acknowledged. | No action; CV is covered later, on pages 56 onward. |
| 10705 | 3 | 47 | 1 | 47 | 1 | Footnote 30: A reference is given to section 3.6.3. which must - as far as I can see - be an error. | Noted; will be addressed in SOD |
| 13270 | 3 | 47 | 1 | 47 | 2 | the same comment as above. Some abatement measures could produce a reduction of the energy costs. | No action; already covered. |
| 10706 | 3 | 47 | 14 | 47 | 16 | It would be good if you indicate the impact on the results of including climate feedbacks and also give references to some IAM studies here. | Noted; will refer to later chapter on IAMs. |
| 9355 | 3 | 47 | 15 | 47 | 16 | line 15 16, very important; more focus on this | Noted; will refer to later chapter on IAMs. |
| 9354 | 3 | 47 | 1onwards | | | p47 lines 1 onward: there is some repitition between this section and previous sections could be avoided. | Noted; will be addressed in SOD |
| 4501 | 3 | 47 | 21 | 47 | 21 | It should be noted that the "representative consumer" abstraction is highly questionable. See the article by Kirman, "Whom or What Does the Representative Consumer Represent" in the Journal of Economic Perspectives (1992). | No action. But of course it is questionable; its not meant to be "realistic". |
| 12559 | 3 | 47 | 4 | | | For this statement ('leading to a drop in demand") and elsewhere (talk about a "single representative consumer" in next paragraph) , the authors should (a) specify what the behavioral assumptions are on which their predictions about behavior in response to policy interventions are based, namely rational expectations and responses, and (b) consider how these predictions might change (at least directionally) when these assumptions of rational responses are relaxed or replaced by some the descriptive models of human choice described in Chapter 2, Section 2.2. | No action; here we use the eocnomic model. The next section coveres behavioral models. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 10704 | 3 | 47 | 1 | 47 | 1 | Footnote 30: When you introduce the concept "CO2-equivalent" you could give a reference to AR5 WGI chapter 8. | No action - we don't feel that this would add significant information; too many cross-chapter concepts to mention every |
| 8253 | 3 | 47 | 10 | 47 | 28 | There are limitations to the growth models too. A variety of growth models is based on steady-state calibration of the economy with a small number of sectors and regions. While these models can somehow describe the dynamics of abatement over time, they are not really calibrated to the business as usual state of the economy based on projections. The authors should highlight the pros and cons of the static and the dynamic model. Also, there should be some explicit discussions of recursive dynamic models. | No action; we say this already. |
| 8252 | 3 | 47 | 17 | 47 | 23 | The authors describe the general limitations of models regarding their assumptions on production and consumption activities. But, a notable point is that these models can always be extended to incorporate a spatial issue. For example, Sebastian Rausch et al. (2010) extended their EPPA model by different household groups to assess the distributional consequences of mitigation policy (see MIT Joint Program on the Science and Policy of Global Change report no 185). Also footnote 41 of chapter 3 refers to a study by Paltsev et al. (2007), in which they use EPPA model's results to estimate total cost of emissions abatement. | No action; cannot cite grey literature |
| 15376 | 3 | 48 | | | | The statement about SO2 as a weakness of economic models leaves out the key studies by Ellerman, etc. Convery, Frank, Christian de Perthuis, and Denny Ellerman. “The European Carbon Market in Action: Lessons from the First Trading Period – Interim Report.” Center for Energy and Environmental Policy Research: 08-002, March 2008. | No action; cannot cite grey literature |
| 11012 | 3 | 48 | 24 | | 28 | The opportunity exists to intervene to lower these costs. Most actual public policy is designed and implemented in less that optimal ways, often in far less than optimal ways. The models used in climate policy analysis cannot predict in advance what non-optimal policies will be implemented. There is, therefore, a tendency to model optimal policies. The result is a large and systematic downward bias in the estimates of abatement costs. This is a point on which policy makers should be cautioned. | No action; we believe we deal with this adequately. |
| 9007 | 3 | 48 | 24 | 48 | 28 | This is a good point: "The economic models generally involve an assumption of fully optimizing behaviour by economic agents. Therefore, aside from technological change, any reduction in emissions must be driven by changes in price." These are exactly the kind of explanations this chapter must contribute in to be true to its objective of being a "resource for policymakers and researchers who are trying to solve normative questions. In that sense, the chapter is policy-relevant but not policy-prescriptive" (page 8, lines 19-21). It is important to point out that fully optimizing individual behavior is a strong assumption often not true in practice because of imperfect information, monopolies on either the demand or supply side, and, especially in developing countries, unemployed resources. | Thank you for your comment. |
| 11565 | 3 | 48 | 24 | 48 | 28 | References should be made to chapter 4 and 13. | Noted; will be addressed in SOD |
| 12560 | 3 | 48 | 24 | 49 | 2 | Here is the first acknowledgement of the behavioral assumptions behind the economic models discussed previously. Probably better to move this discussion up to the beginning of the chapter. For the behavioural factors mentioned in this paragraph as having no scope in these models, at least one reference each should be provided. | No action; good point, but we do say things like this earlier in the chapter. And its not clear what location is recommended. |
| 12092 | 3 | 48 | 1 | 48 | 2 | "The conclusions resulting from the models depend on the assumptions made" - suggest also refencing this point as it is a crucial one - Weyant, J. (2000) An Introduction to the Economics of Climate Change Policy, Stanford University, Repetto, R. and Austin, D. (1997) The Costs of Climate Protection: A Guide for the Perplexed, World Resources Institute, Washington, DC. | No action; cannot cite grey literature |
| 6315 | 3 | 48 | 24 | 48 | 25 | The report states: "The economic models generally involve an assumption of fully optimizing behaviour by economic agents. Therefore, aside from technological change, any reduction in emissions must be driven by changes in price." Community-based social marketing models suggest that behaviour can be changed by non-economic means. Perhaps it is worth mentioning here. | No action; we believe the issue is already dealt with |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 12095 | 3 | 48 | 3 | 48 | 25 | One important assumption has been missed here, - whether or not co-benefits, such as air pollution reductions, are considered in the economic modelling. According to the OECD (2008) Environmental Outlook 2030 - "van Harmelen et al found that to compliance costs for regional air pollution policy in Europe, are reduced by 50–70% when combined with greenhouse gas related policies. Similarly, in the shorter-term, van Vuuren et al. (2006) found that<br>for the Kyoto Protocol, about half the costs of climate policy might be recovered from reduced<br>air pollution control costs. The exact benefits, however, critically depend on how climate<br>change policies are implemented and on the baseline policies that are used for comparison<br>(Morgenstern, 2000). Most available studies do not treat co-benefits comprehensively in terms<br>of reduction costs and the related health and climate impacts in the long-term, thus indicating<br>the need for more research in this area (OECD, 2000; IPCC, 2007a)." References Harmelen, T. van et al. (2002), "Long-term reductions in costs of controlling regional air pollution in<br>Europe due to climate policy", Environmental Science and Policy, 5(4), pp. 349-365.Vuuren, D. van et al. (2006), "Exploring the Ancillary Benefits of the Kyoto Protocol for Air Pollution in<br>Europe", Energy Policy, 34, pp. 444-60. Morgenstern, R. (2000), "Baseline Issues in the Estimation of Ancillary Benefits of Greenhouse Gas<br>Mitigation Policies", in Ancillary Benefits and Costs of Greenhouse Gas Mitigation, OECD Proceedings of an IPCC Co-Sponsored Workshop, 27-29 March 2000, in Washington DC, OECD, Paris. IPCC (Intergovernmental Panel on Climate Change) (2007a), "Summary for Policymakers", in, S. Solomon<br>et al. (eds.), Climate Change 2007: The Physical Science Basis. Contribution of Working Group I to the Fourth Assessment Report of the Intergovernmental Panel on Climate Change, Cambridge University Press, Cambridge, United Kingdom and New York. | Noted; will refer to later chapter on IAMs. |
| 12096 | 3 | 48 | 3 | 48 | 25 | Recommend also including the key point from - Schneider, S. and Azar, C. (2002) 'Are the costs of stabilising the atmosphere prohibitive?', Ecological Economics, vol 42, issues 1–2, pp73–80 namely " Top–down (economic) models typically suggest that the cost of a 50% reduction of global CO2 emissions from baseline by 2050 would cost some 1–4% of global GDP, and a 75–90% reduction by 2100 would cost some 3–6%. But since these studies also assume that global income grows by 2–3% per year, this abatement cost would be overtaken after a few years of income growth. Thus, the cost of 'climate insurance' amounts to 'only' a couple of years delay in achieving very impressive growth in per capita income levels. To be ten times richer (than in 2000) in 2100 AD versus 2102 AD would hardly be noticed and would likely be politically acceptable as an insurance." | No action. Good point, but the table only is to show a set of results, not to review all literature. That is elsewhere. |
| 12093 | 3 | 48 | 3 | 48 | 4 | After "A key determinant of the<br>3 economic cost of limiting GHG emissions is the feasibility and future cost of using non-fossil fuel<br>4 energy in electricity generation and in transportation." Please consider adding "Studies suggest that it is technically possible for many nations to transition to 80-100% of their electricity demand to be met by renewables by a certain date, usually by 2050". For an overview of this literature please see - Elliston B, Diesendorf M, MacGill I, 2012, 'Simulations of Scenarios with 100% Renewable Electricity in the Australian National Electricity Market'. Energy Policy 45:606-613. http://www.ies.unsw.edu.au/docs/diesendorf-simulations.pdf This paper provides an overview of the literature here. | No action. Good point. But this is not the place to review all IAM model results. |

|---|---|---|---|---|---|---|---|
| 12094 | 3 | 48 | 4 | 48 | 4 | The text here - "Another is the feasibility and cost of increasing energy efficiency in end uses." .....and please also note that the following Cambridge University team have assessed the practical limits of energy efficiency. Cullen, J., Allwood, J., Borgstein, E. (2011) Reducing Energy Demand: What Are the Practical Limits? Environ. Sci. Technol., 2011, 45 (4), pp 1711–1718 DOI: 10.1021/es102641n http://pubs.acs.org/doi/abs/10.1021/es102641n they found the following "They applied "best practice" energy efficiency changes to numerous energy end use systems. They concluded that 73 per cent of global energy use could be saved by introducing such changes." Also, many of the other IPCC chapters are assessing the feasibility and cost of increasing energy efficiency. So perhaps a table here would be good summarising what the other chapters have concluded for energy efficincy potential? NB - the IPCC AR4 and AR5 has found for that, for instance, the residential and commercial buildings had significant energy efficiency potential. | No action. Good point. But we can't review all results or add more cites here. |
| 12561 | 3 | 49 | 14 | | | Here and elsewhere in the chapter, should "abatement" be replaced with "mitigation", to use the term used in the WG3 title and other chapters? | No action - good point, but this is not necessary. |
| 10707 | 3 | 49 | 16 | 49 | 16 | Carbon or CO2-equivalents? | Noted; will be addressed in SOD |
| 14375 | 3 | 49 | 20 | | | Should look at results in Cline (2011) on alternative abatement cost functions and estimates of costs to meet the 450 ppm ceiling | No action; unclear what reference this is |
| 12562 | 3 | 49 | footnote 37 | | | I would move this footnote into the main text and refer to Ch. 4 | No action; disagree with comment |
| 12563 | 3 | 49 | footnote 39 | | | There is no Section 3.6.4, not sure what section the authors have in mind here? Here or elsewhere, one could also add that such an assessment of the impact of behavioural factors on the cost of mitigation, while it may not exist, is an extremely important omission. | Noted; will fix mention of section 3.6.4. We talk about behavioral factors later. |
| 4744 | 3 | 5 | | 7 | | I notice that chapter 4 is dedicated to sustainable development, but I would have prefered that sustainable development is also mentioned in this 3rd chapter | No action. More appropriate in chapter 4 |
| 15358 | 3 | 5 | | 76 | | see separate file: "wdavidmontgomery - general comments on Chapter 3.doc" | No action; do not have file referred to |
| 6305 | 3 | 5 | | 77 | | Generally speaking, this chapter employs a neo-classical economic perspective in framing many of the ethical questions. While this is not in principle inappropriate, much of the discussion is too detailed and could be shortened or more briefly summarized. For instance, shorten page 6, lines 38 to page 7, line 34, as one example, and/or reduce discussion of the various equations on pp. 21 ff ; or delete/shorten sections 3.3.3, 3.4.4, 3.4.4 and/or 3.4.5, considering that enough is said about these issues elsewhere. Generally, the authors should be encouraged to review the long and detailed explanations of specifics such as wellbeing functions. | The framing of the chapter has been made more explicit. But most of the detail remains because it seems necessary. |
| 6953 | 3 | 5 | 10 | 5 | 10 | Insert 'part of' before 'subject matter of ethics'. | Will be addressed in SOD |
| 8574 | 3 | 5 | 12 | 5 | 31 | The order of topics in the executive summary seems unusual. For instance placing the discussion of distributive vs procedural justice after the slightly random list of justice related questions? I think a careful reworking of the entire executive summary to ensure that the ideas are as integrated as possible, and that they flow in some sort of reasonable order would be an immensely valuable use of presumably short writing time. | Noted. It follows the order of the chapter, which is in flux. |
| 2200 | 3 | 5 | 15 | 5 | 17 | Present emissions do not only affect quality of life; they kill future people in substantial numbers. Please see the file 'Nolt comments on IPCC WG III AR5 FOD' submitted separately to comments@ipcc-wg3.de | Noted. |
| 16624 | 3 | 5 | 15 | 5 | 28 | It may be possible to condense these questions into a smaller number. For example, these questions can be summarized by: | Noted. |
| 3906 | 3 | 5 | 18 | 5 | 21 | Who might be competent to determine an internationally just emissions tractory, and what ethical basis would they have for disregarding the views of those who disagree? And what level of force would be ethically acceptable to deploy against dissidents? A further question that should be asked in this paragraph is "how would this allocation be enforced if it did not coincide with the interests of the most powerful nations, politically and militarily"? | Noted. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 5122 | 3 | 5 | 18 | | 21 | Need to allow for uncertainty and flexibility -- unrealistic to claim "once . . . agreed . . . then" as if the plan simple rolls out | No action. Addressed in chapter 2 |
| 2247 | 3 | 5 | 2 | 5 | 4 | Well put. The ethics and economics that have been lavished on a proposition for which there is no scientific evidence is indeed deplorable. This entire Chapter is monumental nonsense. It should be omitted altogether. | No action. Chapter set by IPCC WGIII |
| 17157 | 3 | 5 | 2 | 5 | 4 | First sentence of Executive Summary strange and unclear (only gets clear through more extensive version in "3.1 Introduction"). | Will be addressed in SOD |
| 10784 | 3 | 5 | 2 | 5 | 4 | Exec Sumary. What does this paragraph mean? Rewrite pls | Will be addressed in SOD |
| 3907 | 3 | 5 | 22 | 5 | 22 | Who is the 'we' in this sentence and should the coercive powers of the state be used to enforce 'our' views on those who dissent? | good point -- we should be careful about that (ie, the authors should be careful) |
| 4745 | 3 | 5 | 23 | 5 | 23 | Proposition to replace "compensatory" by "mitigation", it is a more positive way to address this issue | No action. The meaning is monetary or equivalent compensation, not mitigation |
| 6954 | 3 | 5 | 29 | 5 | 31 | This paragraph sits oddly in the text: why introduce the distinction here? | Will be addressed in SOD |
| 3908 | 3 | 5 | 29 | 5 | 31 | Should it be pointed out that procedural and distributive justice would normally be incompatible goals? A lottery might be fairly drawn, but the holder of the winning ticket might already be the richest entrant. | Will be addressed in SOD |
| 8573 | 3 | 5 | 32 | 5 | 39 | As mentioned in my general comments, the crux of the problem I see with this chapter is the lack of integration throughout. At no point is the connection between the legal systems and the previous discussion of justice addressed, leading readers to get the impression that all of these components have been thrown together, and making it more difficult for them to see why legal arguments may be important in this debate. | Noted; will be improved in SOD |
| 8999 | 3 | 5 | 32 | | 39 | The executive summary devotes much space to legal approaches, which would require "wrongful conduct" to assign responsibility. This is at least an error in emphasis. This emphasis is misplaced since climate change is by nature an international, inter-state issue. Except for some specific mechanisms such as the WTO's dispute settlement mechanism, there does not exist stable international law processes or an supra-international authority to enforce laws/agreements. Enforcement at the international level still relies heavily on force not on legal principles; for example the inequitable, arbitrary and unpredictable debt resolution system for developing countries relies on the power of the creditor community centered in developing countries to cut off all forms of financing to debtor countries. The law is an application of ethical principles on which the international system is still being established. It would be advisable for chapter to stay with treating law as an application of ethics and stay decisively in the realm of ethics, particularly in the executive summary. | No action. This comment seems to reflect a misunderstanding of the discussion of law in the chapter. The chapter does not directly address the question of legal liability for climate change. Instead, it looks to law in order to illuminate the issue of when our society treats people as responsible for certain kinds of actions, particularly when the actions are only shown by later information to be harmful. An earlier draft of the section did actually address |
| 10785 | 3 | 5 | 32 | 5 | 35 | responsibility under either common or civil law has other implications beyond "nuisance or negligence". Please rewrite paragraph to include other responsibilities | No action; comment unclear |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 3909 | 3 | 5 | 36 | 5 | 39 | After of the order of a thousand years of common law decisions, it would be surprising to find that emitting CO2 by burning coal etc was a common law harm, but no one had noticed up to this point. So should it be clarified that the question the chapter is considering is whether a common law action NOW to declare it to be harm might be successful? A particular problem is the non-point-source-pollution problem - how does the plaintiff prove that the asserted harm was caused by the particular defendant in front of the court? Should not the authors consult and cite a legal authority on this point? Another very important point not made here is that a common law determination does not determine the outcome. What it does instead is determine who is in the right, and therefore what concessions either the plaintiff or the defendant subsequently need to make in order to achieve the other party's consent. The outcome (more or less pollution) is not therefore commonly determined by the common law itself. Since the focus of this chaper is on achieving an outcome (mitigation) this point seems to be potentially relevant. | No action. As with the prior comment, this reflects a misunderstanding of the chapter's discussion of the law. In terms of whether the law would find carbon emissions to be a tort, as I noted above there is on-going litigation about this issue, in the U.S. courts and elsewhere.<br><br>I agree with the commenter that a substantial problem is posed by the multiple sources of carbon emissions. There is actually some very interesting legal precedent and scholarship on the issue of multiple polluters, which I would be glad to discuss. But it really falls outside the scope of the "historical responsibility" topic.<br><br>I take it that the other part of this comment is a restatement of the Coase |
| 5121 | 3 | 5 | 4 | | 4 | add social behaviours | No action; less significant |
| 8575 | 3 | 5 | 40 | 6 | 6 | The jump from the first sentence that accurately recognizes the limited ability of any form of economic representation of values, in particularly non-monetary values related to non-human nature, somewhat befuddlingly turns almost immediately into a detailed discussion of social welfare functions which then morphs directly into a detailed discussion of cost-benefit analysis. Any genuine consideration of the difficulties of assigning value to non-human nature, or any consideration of rights, is completely overlooked. This is deeply problematic and is indicative of the overwhelming tone of the chapter which gives great attention to economic debates, without any real appreciation of rights and non-human values or alternative metrics. If nothing else, the executive summary must bound the limits of economics more clearly. For instance, after the first sentence in this section a clearer recognition of the limitations of most social welfare functions (including the idea that they almost never are able to represent rights, or if they do, in curtailed ways) would be useful so that readers could see the boundaries of eocnomics before they get into the detailed discussions of CBA techniques. | The ethics sections of the chapter evidently did not show the correct emphasis. They have been improved in this respect. Chapter has been reorganized in response to this comment and others. |
| 13562 | 3 | 5 | 40 | | | I don't know that 'anthropogenic' is the right word as cultural and social values also relate to humans (suggest maybe 'monetary' / 'rational'? | No action. Disagree with comment; it is an anthropocentric measure. |
| 4475 | 3 | 5 | 42 | 5 | 45 | It is not enough to say that different social welfare functions express different views about the value of equality. The concept of a social welfare function is itself questionable, because it necessarily involves making interpersonal comparisons of "utility". Second, whatever one's position on the "value of equality," a social welfare function may not capture it because SWFs typically are constructed from consumption, without paying any attention to the processes of production that are required to bring the goods into being. The most basic point here is that redistributive measures aimed at maximizing some kind of SWF may, by distorting the incentives to produce, result in a different set of goods to be "distributed." | This comment is mistaken in view of the content of the chapter. We will be more careful to clear up this issue in the executive summary. |
| 9000 | 3 | 5 | 42 | | | The executive summary highlights the social welfare function. This is an error in emphasis. As the chapter mentions later on, the philosophical-logical objections in the literature to the existence of a social welfare function are compelling. A more even-handed treatment of competing methodologies is advisable. | Will be addressed in SOD |
| 16625 | 3 | 5 | 42 | | | 1. What are the effects of present actions to future generations? | No action; comment unclear |
| 12778 | 3 | 5 | 45 | | | In which sense and is "Equality" the norm? | No action; comment unclear |

|---|---|---|---|---|---|---|---|
| 8572 | 3 | 5 | 5 | 5 | 11 | I think that one of the areas in which changes could have the most impact would be in the executive summary. This is arguably the most important part of the document as it is most likely to be read by the largest number of people. I have marked these particular lines because I think they illustrate one of the ongong tendencies through the chapter - to take economics as "self-evident" and then cover the importance of ethics in vague terms. If language like "self-evident" is going to be used for economics, and the chapters is also supposed to give full credence to the importance of ethics, then the language used for the two components needs to be more closely equivalent in tone and emphasis. There is no reason why stronger language for the ethics part of this could be used. For instance, "the significance of ethics to climate policy decision-making is equally significant and central: decisions about climate policy will have profound implications on human and non-human well being and involve judgements about human values and interests. This chapter covers the literature focused explictly on the inevitable importance of ethics in climate change decision-making" would be one way of balancing attention. | Very good point. Will try to balance. |
| 18384 | 3 | 5 | 5 | | | One can question whether the importance of economics is always so self-evident eg. In cost-benefit analysis much depends upon assumptions. I would rephrase. | Will rephrase self-evident |
| 10690 | 3 | 5 | 9 | 5 | 9 | The wording "…reasonable people have differing views on this issues…" sounds strange. Please consider rewording or removing this. | No action; this is standard terminology |
| 17072 | 3 | 5 | 14 | 5 | 15 | After “environment protection” add “and social equity”(Artaraz, M,2002) Artaraz, M (2002) Teoria de ñas tres dimensiones de Desarrollo Sostenible. Escuela Universitaria del Pais Vasco-Euskal. htpp//www-acet.org/ecosistema | No action. Comment unclear; page and section reference numbers incorrect |
| 17073 | 3 | 5 | 14 | 5 | 15 | After”environment protection” add “and social equity”(Kirby,Oeefe and Timberlake, 1995;Sachs,1999) Kirby, J. P. O’Keefe, and L. Timberlake, 1995, Sustainable Development: An Introduction”, in J. Kirby, P. O’Keefe, and L. Timberlake, eds., The Earthscan Reader in Sustainable Development, Earthscan: London. | 3905 | 3 | 5 | 12 | 5 | 39 | The executive summary identifies three normative questions, the answers to which need to be tested ethically. However, it does not indicate what the chapter's answers are to these three questions. As a result it cannot and does not examine these answers from an ethical perspective. Should not an executive summary aim to save the busy executive from having to read the full chapter in order to find the answers to the posed questions? | No action. We don’t answer normative questions. We provide the framework for others to use with their own values. |
| 17156 | 3 | 5 | 1 | | | Although there seem to be three topics addressed in this summary (ethical questions of climate policy, explanation of the welfare economic approach to climate policy evaluation, and pointing out the limitations of economic approaches in terms of general political objectives), this does not immediately get clear. Particularly the end of the Summary is confusing, unstructured, without clear message. PROPOSAL: Shift the third part of the Summary to p. 5 l. 40, that is: below introduction of ethical questions. Argue that from most ethical approaches we can derive a variety of societal/ political general targets relevant to climate policy - not only the target of economic efficiency. Then make clear that the role of economics primarily is to analyze efficiency (not so much the other objectives, which are for instance simply taken as "guardrails" in IAMs). But economics can also, in addition, inform questions of equity, etc. | Will be addressed in SOD; we need to underscore the positive nature of economics and the limits of using it for normative purposes. |

|---|---|---|---|---|---|---|---|
| 18601 | 3 | 50 | | | | McKinsey curves are discussed on p 50 … . More or less dismissed since it not built refereed literature – said to be highly controversial. Misses the point more or less. The basic idea was to sort out cost and volumes by using existing knowledge and make assessments bottom-up in a transparent way. Thereby making it easier to identify the areas where policy action was really needed (and also avoid spending most of the resources on areas without any real potential). The approach is simplistic and static but still it gives an overview. One interesting result was that "negative costs" showed to be quite large. In reality since transaction costs, information costs etc was excluded to show what sort of difference policy can make (tose costs are to a big extent policy dependent). | Noted; will be addressed in SOD |
| 14376 | 3 | 50 | 5 | | | Need to identify sources | Noted; figure can refer to chapter 6. |
| 15377 | 3 | 51 | | | | McKinsey's statements about the cost of mitigation should not be included in AR5, their marketing materials are not even gray literature. McKinsey has refused to submit their methodology to peer review, has not shared data or even stated the nature of the analysis done to construct the curve. There are a large number of studies, for example EPRI's excellent review of studies of the cost of the Waxman-Markey bill, that should be discussed in AR-5 if the door is opened this far for studies not published in peer-reviewed books and journals. I applaud the author's intention to use the mention of the McKinsey work to point out its many flaws, but I think that the risk of legitimizing it by mention in AR5 as well as the precedent of including work whose authors have refused to submit to normal peer review outweigh the satisfaction of critiquing it. To make the points about errors in studies claiming negative costs for mitigation measures, I recommend use of some of Mark Jaccard's excellent published work. See: Rose Murphy and Mark Jaccard, "Modeling Efficiency Standards and a Carbon Tax: Simulation for the US using a hybrid approach". The Energy Journal. Vol. 32 (Special Issue 1). October 2011. | Noted; will be addressed in SOD |
| 3275 | 3 | 51 | | 52 | | As explicitly mentioned in the body text, "The McKinsey curves have been highly controversial representations of mitigation potential". Posting Figure 3.6 here can give a false impression to the public.<br><br>Energy Modeling Forum examined this issue and published report (EMF 2011). You can cite Figure 4 of this report because it compare the McKinsey's results with other study results.<br><br>Energy Modeling Forum, Stanford University, 2011. | 10228 | 3 | 51 | 11 | 51 | 11 | Text refers to Figure 3.6 using "US$ per ton of CO2e", but the Figure uses € per [metric] tonne CO2e | Noted; will be addressed in SOD |
| 2210 | 3 | 51 | 11 | 51 | 11 | Currency should be EUR | Noted; will be addressed in SOD |
| 10708 | 3 | 51 | 11 | 51 | 11 | The unit "CO2e" is used here without any explanation of what this means and how it is calculated. Usually this is based on GWP100 and this should be mentioned. | No action; it is defined earlier in the text |
| 10229 | 3 | 51 | 12 | 51 | 12 | Text refers to the 2030 curve though the 2015 version is shown | Noted; will be addressed in SOD |
| 2209 | 3 | 51 | 12 | 51 | 20 | Recommendation to use the 2030 as that one has been used more regularly. In any case, make the year of the exhibit consistent with the year mentioned in text | Noted; will be addressed in SOD |
| 10231 | 3 | 51 | 20 | 51 | 20 | Text referring to 2015 should be changed to 2030 | Noted; will be addressed in SOD |
| 9808 | 3 | 51 | 20 | 51 | 21 | This metrics can also be used on a company level. Projects can be ranked along their reduction resp. the monetary value involved. Thus an economic-ecological optimization can be reached. | Noted; will be addressed in SOD |
| 16357 | 3 | 51 | 3 | 52 | 14 | Box 3.6. The general tone of this box seems rather negative. Are there studies that go into the details of at least some of the numbers presented by McKinsey and finds that these are wrong ? In this case, please provide additional references.<br>Regarding barriers: did McKinsey ignore barriers in its reports ? Could the existence of barriers turn the curve into an useless picture, or could we conclude that it is very important to address barriers, as net costs in themselves are low for a number of technologies? | Noted; will be addressed in SOD |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 3057 | 3 | 51 | 3 | 52 | 14 | There is a fundamental flaw in the McKinsey curve and MAC curves generally. The flaw is in treating demand-side measures as if they were part of what is effectively a supply curve. Energy efficiency gains are treated as equivalent to the provision of clean energy supply. More efficient lighting, insulation, and "efficiency improvements other industry" are examples of this. But supply and demand are fundamentally different microeconomic concepts, are separate parts of the market-clearing equilibrium mechanism, carry differing dynamics, and should not be mixed together like this.<br>The quantities showing on the x-axis for demand-side measures are usually derived from perceived engineering efficiency gains. But aside from the implementation shortfall problem already noted in the text, there is the thorny problem of rebound mechanisms. For example, the segment of this "supply" curve showing as "efficiency improvements other industry" is subject to substantial rebound according to various analyses, so the horizontal length of this segment needs to account for this. Unfortunately, this length will depend on numerous determining elements including all factor prices, factor technology gains, and factor substitution elasticities. Without projecting, say, wage rates, the length of this segment will be mis-specified. Similarly, the segment showing as "lighting - switch incandescent to LED (residential)" is mis-specified owing to rebound effects. The Journal of Physics article on solid-state lighting referenced above shows the perils of assuming such a switch would have any effect at all on lighting-associated energy use over the long run [Tsao, J.Y., Saunders, H.D., Creighton, J.R., Coltrin, M.E., Simmons, J.A., 2010. "Solid state lighting: an energy-economics perspective." Journal of Physics D: Applied Physics 43 (35), 354001]. Similar rebound arguments apply to insulation.<br>A further difficulty with such MAC curves is that it is frequently assumed that the supply options showing as "above cost" to the right will come at no cost to economic welfare if implemented, or at least these broad economic costs are rarely, if ever, accounted for in MAC curves. But simply put, one cannot force a more expensive energy supply into the system to displace a less expensive energy supply without reducing economic welfare. Such a strategy may be advantageous socially, environmentally, and even economically if climate change impacts forestalled are large enough, but these narrowly-construed economic welfare losses and costs need to be explicitly accounted for in specifying the associated costs on the y-axis if a true picture is to be given for policy makers. Numerous researchers account for such welfare losses as associated with, say, a carbon tax, but MAC curves rarely seem to. | No action - Good point; however, we can't get into a whole analysis of the McKinsey curve, and do our own analytical review of it, and cannot cite grey literature |
| 10234 | 3 | 51 | 8 | 51 | 8 | The text uses the phrase "highly controversial" with regard to the McKinsey cost curve analysis. We acknowledge there is debate around our approach, and indeed have engaged in discussion with numerous partners in academia, NGOs and international institutions on how to continue to improve it. The cost curve has been well received and proven a useful tool (one of many tools) for various constituencies. We would also welcome further debate with you and benefit from your expertise | Noted; will be addressed in SOD |
| 17275 | 3 | 51 | 8 | 51 | 10 | I agree with the fact that the weak point of the McKinsey cost curve is the lack of transparency, but if it is stated that it is controversial, there should be a reference to situations, reports, conferences, etc. where that is discussed. Otherwise, it should be just noted that lack of transparency is a weak point. | Noted; will be addressed in SOD |
| 17276 | 3 | 51 | 8 | 51 | 10 | The negative cost part is indeed heavily debated in the literature. Here lots of references can be provided (including earlier IPCC reports!). | No action; already addressed by other comments |
| 2211 | 3 | 51 | 8 | 52 | 2 | Avoid duplication of statements around "highly controversial" and respective reasons. Also not obvious why the McKinsey curve is regarded as "highly" controversial, compared to other work in the field, e.g. where customized CGE models are used to create cost curves. Two comments in the next lines of this xls | No action; already addressed by other comments |

| 2212 | 3 | 51 | 8 | 52 | 2 | 1) On the comment of "metholodogy is proprietary the following should be noted: a) The general methodology is described on several pages in the reports, e.g. "McKinsey & Company, Pathways to a low-carbon economy - Version 2 of the Global Greenhouse Abatement Cost Curve, January 2009", Pages 145-149, b) The same report has a comprehensive appendix on input assumptions, pages 160-189, c) To enable transparency of methdology, assumptions and results for academics and other groups, McKinsey has put all calculation logic for each lever and all input assumptions by lever, region, time online in the webservice "Climate Desk" (solutions.mckinsey.com/climatedesk). Academic institutions have free access to the webservice- it requires a short registration registration process. McKinsey has contacted all IPCC WGIII directly to make them aware of this free service, some are using it. | Noted; will be addressed in SOD |
| 2213 | 3 | 51 | 8 | 52 | 2 | 2) On the comment of "not emerged from the refereed literature". Let me state what McKinsey did. An overall academic review panel has been formed for the entire report referenced above (which has been serving as the "blueprint" for the national studies) incl. several IPCC WGIII members, see page 139. This review panel has interacted intensively with the McKinsey team over the entire period of the study. For each sector, expert groups have been formed from industry, associations, and academics (incl. IPCC WGIII members) which have been developing and reviewing the methodology and assumptions for each lever, time and region (see page 140). | Noted; will be addressed in SOD |
| 15447 | 3 | 52 | | 54 | | This an excellent summary of metrics, but the policy-relevant points could be brought out more clearly, to respond to the focus of 4/CMP.7: "the GWP was not designed with a particular policy goal in mind and, depending on the specific policy goals, alternative metrics may be preferable." Some reference to one or more specific policy goals and their relationship to metrics therefore would be useful. It would be useful to have a couple of paragraphs on the question of the treatment of short lifetime gases, since this is a specific aspect that is to be covered in the 2015 SBSTA review . (4/CMP.7 " notes the limitations in the use of GWP based on the 100-year time horizon in evaluating the contribution to climate change of emissions of greenhouse gases with short lifetimes") There is clearly a policy discussion to be had on the broader issue of short versus long lifetime gases . There has been some discussion in the literature on short lived climate forcings - of which in the Kyoto basket, methane is the relevant one. The obvious specific policy goal here is limitation of global warming to a temperature target such as 2 degrees above pre-industrial levels or to a concentration target. | Noted; will be addressed in SOD |
| 10232 | 3 | 52 | 1 | 52 | 1 | The text uses the phrase "highly controversial" with regard to the McKinsey cost curve analysis. We acknowledge there is debate around our approach, and indeed have engaged in discussion with numerous partners in academia, NGOs and international institutions on how to continue to improve it. The cost curve has been well received and proven a useful tool (one of many tools) for various constituencies. | 9530 | 3 | 52 | 1 | 52 | 2 | Please, delete here due to duplication of line 8, page 51. | No action; already addressed by |
| 8254 | 3 | 52 | 1 | 52 | 14 | Another important drawback of MAC curves not mentionned in the paragraph is that they often include several abatement opportunities that, once adopted, make others ineffective. For instance, using the McKinsey MAC curve of Figure 3.6, if nuclear technology as a mean of producing electricity is adopted, the solar technology won't present an opportunity for reducing GHG emissions anymore. These interactions between abatement opportunities are often not specified in MAC curves. | Noted; will be addressed in SOD |
| 16244 | 3 | 52 | 1 | 52 | 14 | An additional, not mentioned, limitation of the McKinsey curves is the lack of addressing temporal aspects explicitly (or even stating the temporal assumptions explicitly), e.g, abatement costs for buildings with a very high energy consumption might be much lower than for energy-efficient buildings, however, this potential is declining over time once buildings are retrofited. | Noted; will be addressed in SOD |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 7381 | 3 | 52 | 15 | 55 | 3 | This section is a nice text book introduction on metrics, but it is not a comprehensive assessment of the metrics literature nor does it derive policy-relevant conclusions. It misses key aspects of the recent metrics literature, such as the potential for 2-basket approaches (Smith et al 2012), the use of metrics for Lifecycle Assessments (e.g. Peters et al 2011), the implications of metrics for the distribution of mitigation costs and potentials across regions (Reisinger et al 2012, accepted for Climatic Change). Also the links between metrics (not just Tol et al, also Azar and Johansson 2012, Peters et al 2012, Boucher 2012), and the key distinction between end-point and integrated metrics, and what this implies for the underlying policy goals and values. The draft is an introduction to metrics but not a policy-relevant assessment - all the assessment of whether and how important metrics actually are in a policy context, and who is most affected by different metrics choices, is currently contained in 5 lines on P54 L34-39. That's insufficient. It requires a fundamental re-structuring to shift from presenting the theory to assessing the implications. | Noted; will be addressed in SOD |
| 7382 | 3 | 52 | 15 | 55 | 3 | I'm looking for take-home policy messages from this section (how much do alternative choices matter, and to whom, and under what conditions), and find very few in the current draft. The authors should work to ensure there are real policy-relevant conclusions in this section, building on the literature (which is much wider than what the authors have reflected in their current draft). My suggestions for policy-relevant conclucions would be: in a first-best policy world, metrics are economically unimportant from a global perspective, but could be far more important on a regional and sectoral perspective. On the latter we have very little literature. A change in metrics would result in a large shift in the perceived contributions of different sectors to climate change, and hence their perceived need to participate and timing of their participation. It thus also interacts with R, D, D & D cycles. The latter has not been explored at all. Also the political economy of metrics, and of changing metrics, may be as important in considering metrics as the choice of metrics itself. Also consider implications of metrics changes on CDM projects and their viability. | Noted; will be addressed in SOD |
| 7383 | 3 | 52 | 15 | 55 | 3 | To make policy-implications of metrics more tangible, delete the table and simply reference Tanaka et al 2010 (and presumably Deuter et al 2012). Instead, spell out actual exchange rates under different metrics, and present a pie chart of the contribution of different sectors to current global emissions using different metrics to illustrate the importance of metrics on how different sectors and gases are perceived. Check whether chapter 5 does this and make sure it is done either there or here. The apparent major differences for different sectors under different metric choices should then be ontrasted with the relative unimportance of metrics in a first-best policy world from an economic perspective. However, the section should emphasise that most if not all economic evaluations of metrics have been based on first-best policy worlds, but that their relevance in second-best worlds, and their interaction with politics and behavioural change, has not been explored in detail at all (although there will be more literature coming out shortly, and the structure of the chapter should cater for that). | Noted; will be addressed in SOD |
| 4322 | 3 | 52 | 17 | 52 | 17 | "unit for unit" in this context is the expression not to use! You should state explicitly the unit you're talking about (presumably RF per unit concentration ?). | Noted; will be addressed in SOD |
| 10717 | 3 | 52 | 17 | 52 | 18 | The sentence "Unit for unit, methane is…" needs rewording. What is the unit? Per molecule in the atmosphere the ratio is roughly 25, but if you relate this to emissions the picture is more complicated due to the differences in time scales of removal. Then the time horizon issue is introudced, and as you discuss later, should the effects be measured by RF, integrated RF, dT etc? | Noted; will be addressed in SOD |
| 4323 | 3 | 52 | 18 | 52 | 19 | The issue of climate metrics has been and should be extended to short-lived species which are not greenhouse gases (eg black carbon). So the question here should be wider. | Noted; will be addressed in SOD |
| 10718 | 3 | 52 | 19 | 52 | 19 | Is this needed "(of which there are many)"? If so, make that clear earlier in the chapter. | Noted; will be addressed in SOD |
| 4324 | 3 | 52 | 22 | 52 | 23 | You provide two examples here, but are these the best examples? There is only 1 or 2 multi-gas emission trading scheme to my knowledge (CDM and New Zealand). One also needs an exchange rate in the case of a GHG tax. Moreover there is a question whether the same exchange rate is to be used for all these different usages (a question I do not really have the answer for). | Noted; will be addressed in SOD |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 4325 | 3 | 52 | 29 | 52 | 29 | C- D or C+D. If damages are counted as a positive cost, then shouldn't it be C+D that you're trying to minimise? | Noted; will be addressed in SOD |
| 12788 | 3 | 52 | 29 | 52 | 29 | Equation 3.7 should be adjusted to equation 3.8, i.e. the variables should be the same. | Noted; will be addressed in SOD |
| 2214 | 3 | 52 | 3 | 52 | 14 | On the notion of negative cost opportunities. It would be helpful that IPCC would include a bit more "flavor" from the elaborations from McKinsey on the matter (pages 39 to 41 in the McKinsey report). 1) the costs shown in the cost curve are pure technical project costs and exclude transaction and program costs (those were estimated with a wide range of 1-5 EUR/tCO2e). Also, the curve takes a societal perspective, a decision maker curve will experience changes in the costs (and to a lesser extent potentials). Also reasons for the implementation of efficiency solutions are mentioned. (Note: McKinsey likely publishes a v3.0 update in fall 2012, which has addressed several of those points with additional research.) | Noted; will be addressed in SOD |
| 10719 | 3 | 52 | 31 | 52 | 31 | Add "change" after "climate". | No action; do not feel this is essential |
| 10839 | 3 | 52 | 32 | 52 | 33 | "defines the appropriate exchange rate". This is an assumption, right? The assumption being Equation 3.7 is the only correct way to specify the problem. If that is the case, then okay to use "define", however if not the case, then I think the language needs to be weakened by replacing "define" with something like "is one way to determine" | Noted; will be addressed in SOD |
| 4326 | 3 | 52 | 34 | 52 | 36 | This is a very important point. A lot of the information that is needed is information on the future (climate change, emission pathway, etc). Foresight is needed to the "benevolent planner" to find the optimal solution, but foresight is also needed to the stakeholders on how the cost of carbon and the exchange rate will change in the future. The point that the optimum requires the exchange rate to evolve in time should be made more clearly. | Noted; will be addressed in SOD |
| 10849 | 3 | 52 | 34 | | | "The problem with 3.7 is that a great deal of information … is needed". Like what? Discount rate is an assumption. C as a function of emissions can be determined via a variety of means, such as SCMs coupled to economic models, and D could be estimated in a myriad of defendable ways. I therefore do not see what is stopping anyone from using it? In any problem we required a " great deal of information, some of which is not readily available, ", but that does not stop us making some simplifications and solving the problem the best we can. What is stopping us from doing this here? Because it is "difficult" do we just drop this approach and take an alternative? | Noted; will be addressed in SOD |
| 10720 | 3 | 52 | 36 | 52 | 36 | The term "second best metrics" is unclear. As I see it, the use of metrics is, in principle, second best, since in the case of optimal trajectory metrics for comparing emissions and deciding which gases to abate would ideally not be needed. So it is rather a second best _approach_ compared to the optimal trajectory. So the thinking behind the application of eq 3.7 and the exchanges rates or weights obtained should be made clear. If the point is to use these weights (i.e. distribute to the emitters) to obtain an approximation to the optimal trajectories then this should be made clear. | Noted; will be addressed in SOD |
| 10841 | 3 | 52 | 36 | 52 | 36 | "second best". What is the rationale that 3.7 is the first best and the others are simply poor alternatives? Clearly, the definition of which is best is a value judgement, so I think you need to state what values you use to define the "first best", or approach this from a different angle. | Noted; will be addressed in SOD |
| 4502 | 3 | 52 | 5 | 52 | 5 | Characterizing the negative net cost emissions reductions as a "free lunch" is unnecessarily pejorative, because everyone is familiar with the aphorism that there is no such thing as a free lunch. It should be pointed out that while such negative net cost possibilities may exist, there is no way that the goal of limiting temperature rise to 2 degrees C or less can be achieved without incurring substantial costs. | No action; we believe this is clear enough. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 10233 | 3 | 52 | 6 | 52 | 14 | The text mentions that McKinsey's analysis of negative cost abatement opportunity "may be flawed" and that it ignores the distribution of costs and benefits that accrue to parties involved in implementing such abatement measures. We would like to clarify that the curves show technical potential and we acknowledge that regulatory and financial support are needed to actually capture this potential. We acknowledge the barriers 'in the field' to the implementation of technical abatement levers, including market imperfections such as agency issues (the accrual of benefits to parties who do not bear the costs, which you mention), lack of information for parties who would benefit and insufficient financing for upfront investment and also examine some of the ways in which these barriers can be overcome to realise the abatement potential identified (through for instance new policies, regulations, information campaigns and financing mechanisms). In our US Energy efficiency report (with EPA/DOE), for example, we explicitly dive into the negative cost portion and lay out why the potential is there, what the barriers are, and scenarios about how much of that potential might be realistically captured. For more detail please also see in particular pages 41, 56 and 110 in the publication "Pathways to a low carbon economy" at the following link: http://www.mckinsey.com/client_service/sustainability/latest_thinking/pathways_to_a_low_carbon_economy We would very much welcome a call with you to discuss this further | Noted; will be addressed in SOD |
| 4321 | 3 | 52 | | 55 | | I found the "emissions metrics" section to be relatively well written. It certainly reflects the state of affairs in the literature. However I would have expected the authors to i) discuss more the implications of using different metrics and ii) take sides a bit more (what do you think as informed Lead Authors is the right metric/approach to use?). | Noted; will be addressed in SOD |
| 4327 | 3 | 52 | | 55 | | The flow of the section could be improved. First the authors discuss metrics as an "exchange rate" (page 52, line 20ff), then the concepts of absolute metric and relative metric (ie the exchange rate previously discussed) are introduced (page 53, top), and then the discussion returns to the issue of exchange rate (or relative metric) on page 53, line 27 without really saying it. | Noted; will be addressed in SOD |
| 10716 | 3 | 52 | | | | It would be good with stronger links to physical metrics. (Some work has been done on this; e.g. Boucher 2012 (ESD) and Fuglestvedt et al. 2003, Climatic Change (pages 299-301) | Noted; will be addressed in SOD |
| 10840 | 3 | 52 | | 53 | | I do not understand the use of equation 3.7 AND 3.8. Are they analgous or alternatives? One includes costs, one doesnt? You confidently state (or imply) that 3.7 is the way to do things, and then come back to Equation 3.8. Logically, this would imply that they are analogous in which case you need only one. On the other hand, if they are different, when do I use one and when do I use the other? A few words on the connections betwee these equations and how one leads to the other would be useful. | Noted; will be addressed in SOD |
| 10855 | 3 | 52 | | 54 | | Overall, I feel this is an important section. Metrics have generally been the domain of WGI (though this is an unusual choice) and WGIII generally has little knowledge of metrics, despite the fact that the use of GWP100 is prevalent (such as in Life Cycle Assessment) and many economic models implicitly have metrics. This section, I believe, is extremely important to raise the importance of metrics in the WGIII community. At the moment, this section does not say much more than WGI and I see this as a missed opportunity. I think it is important to state how metrics are used in WGIII (links to many chapters, such as Life Cycle Assessment in many chapters, economic models, emission trading, etc, etc). Thus, it is imperative that WGIII has a deep and meaningful understanding of metrics and their issues. I think it is okay to show the different assumptions behind metrics, but at the moment the discussion is scattered, there does not seems to be a clear path linking 3.7, 3.8, GDP, CGP, cost effectiveness, etc. I think a systematic and more structured approach is needed (at the moment it seems to jump backwards and forwards). | Noted; will be addressed in SOD |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 10709 | 3 | 52 | 15 | | | I support that you approach the metric issue from a general perspective and then present some specific metrics (GWP, GTP and GDP) within this framework. But it would be good with some more “bridges” to or common ground with WGI. Thus, WGIII could give some more attention to the physical metrics and assess these from the point of view of economics. More focus on application of metrics in policy analysis and design of policies is, in my view, needed. I think direct references to the metric sections in chapter 8 of WGI would be useful. I also suggest that the authors read the section on metrics in WGI - and contact relevant LAs - to ensure consistency accross working groups in AR5. | Noted; will be addressed in SOD |
| 10710 | 3 | 52 | 15 | | | The discussion on metrics could go deeper in to the material published in the literature and do more critical assessment (and not only review). Some attention to which applications particular metrics are meant to serve would be useful. I also miss more discussion and assessment of how the various metrics behave and how they could function in various policy contexts. | Noted; space constraints are a real problem for us. |
| 10711 | 3 | 52 | 15 | | | To me it is not clear how the authors assess the state of the science in this field and the adequacy of the various metrics. Since metrics (i.e. GWP) plays a crucial role in calculations of contributions of various emissions, sectors/activities, nations, regions etc to climate change - as well as in design of policy regimes - it is of great importance to have this field properly assessed by other disciplines than natural science alone. There are many implicit value based choices in the design and application of metrics – and many users are not aware of this. Thus, I think, these aspects of metrics need to be made clear and discussed in an assessment like this. | No action; it's unclear how to make this point operational. The comment wants to make the assessment more clear, but the comment is not clear about how to do that. |
| 10712 | 3 | 52 | 15 | | | Furthermore, I think you could discuss more the use of fixed time horizons (which is common practice for GWP) vs use of a varying time horizon. Since GWP is the most common metric I think it would be good to give some more attention to this, and also show the formula, with a more explicit discussion of the weighting of effects over time. The adequacy of GWP in the context of a 2 deg C target should be assessed. | Noted; will be addressed in SOD |
| 10713 | 3 | 52 | 15 | | | The metric section would also benefit from more quantifications and examples; e.g. effects of using different metrics, different choices of discount rate or time horizon, different background conditions, damage functions etc. A table with some metric values would also be useful. This could be done for CH4, N2O, CF4 and some short-lived HFCs. | Noted; will be addressed in SOD |
| 11323 | 3 | 52 | 15 | 55 | 3 | To some extent this section overlaps a bit too much with the metric section in the WG1 report and it overlaps especially with the sub-section about new and refined metrics in the WG1 report. Not that I am against a metric discussion in WG3 as such, rather I think it could be very useful, but as the section is written now the overlaps are notable. Also, the beginning of the section is focused on placing metrics in a relative abstract economic framework. In principle I have no problem with that, it would be fine for a research paper or a textbook in climate economics, but I cannot see the point with doing it here, especially since the aim with chapter 3 is " intended as a resource for policymakers and researchers who are trying to solve normative questions. In that sense, the chapter is policy-relevant but not policy-prescriptive.". The introduction of section 3.10.3 it simply too abstract as it is now. Also, I think the section would benefit from a discussion on how one would can approach the mutligas problem in a policy context, i.e., a gas by gas approach, several different basket where gases with similar lifetimes are grouped in the same basket or one basket with the most important greenhouse gases (such as the approach is in the Kyoto protocol). As I presume the author(s) of the section is aware of there have been some recent papers written about this. Finallly, I think table 3-3 is an nice overview, but it needs some editing, see below for details about this. | Noted; will be addressed in SOD |
| 6888 | 3 | 52 | 15 | | | Suggest to have a look at and refer here to the WGI AR5 assessment of the physical science basis of emission metrics in Chapter 8, WGI AR5. | Noted; will be addressed in SOD |
| 11324 | 3 | 52 | 27 | 52 | 35 | Suggest deletion of this part plus equation 3.7. This is too theoretical and does not add much to the rest of section 3.10.3 | Noted; will be addressed in SOD |
| 12249 | 3 | 52 | 16 | | | This section is on a completely different complexity level than the previos sections. I would recommend to skip the mathemathics, and stick to qualitative discussions as done in all previos sections. | Noted; will be addressed in SOD |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 10845 | 3 | 53 | 17 | 53 | 20 | You say that the results will be different, but it really matters if they are slightly different or significantly different (you write "important difference"). Some references on this would be good. IPCC994 Report on Radiative Forcing, page 219, discusses this. They refer to a difference of 15% being small. Is 15% an "important difference"? | Noted; will be addressed in SOD |
| 10842 | 3 | 53 | 20 | 53 | 23 | I do not think there is anything necessarily wrong with this section, but I think it is fair to say that the metric literature would not phrase it this way. The reason for a fixed time horizon had absolutely nothing to do with discounting, but everything to do with the long-term behaviour of co2 making it a divergent problem. See, for example, your ref to Lashof and Ahuja (1990) and other literature around that time, including IPCC 1990. For more background, the GWP was based on the ODP which integrated to infinity and this is how the literature develops the concept of the GWP. See introduction and citations here, for example, Peters, G.P., Aamaas, B., Berntsen, T., Fuglestvedt, J.S., 2011. The integrated global temperature change potential (iGTP) and relationships between emission metrics. Environmental Research Letters 6, 044021. | No action; not clear what are the operational implications. |
| 10721 | 3 | 53 | 22 | 53 | 23 | The different ways of weighting effects over time needs more dicussion. And it is important to make it clearer how this is done in GWP which is used in almost all multi-gas assessments and comparisons of impacts of emissions and emission reductions. | No action; we discuss discounting earlier, and little space here. |
| 11358 | 3 | 53 | 24 | 53 | 26 | Choices of impact parameters etc. are discussed in Tanaka et al. (2010, Carbon Management, doi:10.4155/cmt.10.28), which can be introduced in this paragraph. | Noted; will consider this reference |
| 10722 | 3 | 53 | 25 | 53 | 26 | As this is written now it does not add much to the assessment of metrics. So I suggest telling more about what the Deuber et al study finds. | No action; space is limited. The point of the citation is for readers to go there for |
| 10723 | 3 | 53 | 27 | 53 | 36 | It would be good to explain more why GDP has a uniqe postion among the metrics. Since this chapter should also be (I assume) written for non-economists, it would be good with some more introduction to this. In addition, an assessment of how such a metric would function in various policy contexts is needed. | Noted; will be addressed in SOD |
| 10850 | 3 | 53 | 27 | | | "From an economic point of view". I am not sure you have the answer, but at least worth considering, what would one do from a "non-economic point of view"? | No action; that's the rest of the subsection, e.g. "physical metrics." |
| 10851 | 3 | 53 | 27 | | | "the first best approach", which was earlier stated to be Eqn 3.7? Thus, 3.7 is the GDP by deduction? If so state. If not, please explain why we have to "first best" approaches. | Noted; will be addressed in SOD |
| 12252 | 3 | 53 | 29 | 53 | 29 | If it is possible, it would be nice to use a different abbreviation for the "Global Damage Function". It is standard to use GDP for Gross Domestic Product, and it is used as such other places in this chapter. Even though it is ulikely that the two would be mixed up, it is better that GDP only means one thing throughout the chapter | Noted; will be addressed in SOD |
| 10843 | 3 | 53 | 31 | | | It is a problem, I think, that GDP also means Gross Domestic Product. This section is so short, just write Global Damage Potential in full and drop the GDP | No action; already addressed by comment 12252 |
| 10844 | 3 | 53 | 37 | | | A couple of words on why it is difficult to operationalise would be beneficial | Noted; will be addressed in SOD |
| 4328 | 3 | 53 | 39 | 53 | 39 | Unless I'm mistaken you mean "cost-benefit" here. | Noted; this is incorrect, but the reference to cost-effectiveness can be better |
| 10852 | 3 | 53 | 39 | | | Why is "cost effectiveness" a second best economic approach? Surely this is an assumption? Perhaps society would rather doing something in the cheapest way possible? I am not an economist, but the choice between GDP and cost-effectiveness seems more like an assumption than some undisputed law of nature (economics)? It would be good to expand on the reason for the choices here. This also gets mixed in with what is "politically feasible", and thus the economically preferably may not be politically feasible. | Noted; will be addressed in SOD |
| 12250 | 3 | 53 | 4 | 53 | 6 | The variables I and r are introduced, but they are never used again in this chapter. This leads to confusion, as one expects to find the variables just introduced in the subsequent equation. If this sentence is ment to be a more general description, it is not necessary to give the "pertubation" and the "pathway" variable names. It is also hard to find any link between this sentence and the equation it leads up to. | Noted; will be addressed in SOD |
| 10853 | 3 | 53 | 40 | | | But damges could be included physically (number of deaths from climate change) or in money (value of statistical life, for example) or other measures of damages as used in the GDP. Thus, I do not see that this class of metrics cant consider damages? | Noted; will be addressed in SOD |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 10724 | 3 | 53 | 43 | 53 | 44 | Is it correct to say that scenario uncertainty is avoided if you use a constant background? This is also a scenario (although a very unlikely one). | Noted; will be addressed in SOD |
| 11359 | 3 | 53 | 43 | 53 | 44 | An exception is the TEMP (Tanaka et al., 2009, Climatic Change, 10.1007/s10584-009-9566-6), which is defined by using actual emission trajectories. The idea of the TEMP is to equate the temperature consequences on realistic emission trajectories (Shine, 2009, Climatic Change, 10.1007/s10584-009-9647-6). Changing background concentration is also discussed in literature dealing with physical metrics (e.g. Gillett and Matthews, 2010, Environmental Research Letters, http://stacks.iop.org/1748-9326/5/i=3/a=034011; Reisinger et al., 2011, Environmental Research Letters, http://stacks.iop.org/1748-9326/6/i=2/a=024020). | Noted; will consider this reference |
| 10854 | 3 | 53 | 44 | 53 | 46 | A constant background is a choice, which may have valid reasons? A metric need not represent reality, but may be a defined set of rules (a game) for making comparisons. In any case, it is quite feasible to use a varying background and examples of this are in many places in the literature. Thus, if this is a "weakness" then it can be easily fixed. | Noted; will be addressed in SOD |
| 12251 | 3 | 53 | 9 | 53 | 9 | Probably just a fomatting error: Equation 3.8 is repeated twice on this line. | Noted; will be addressed in SOD |
| 11325 | 3 | 53 | 21 | 53 | 21 | Please make clear that the "standard approach" IN ECONOMCIS "would be to use exponential discounting". Exponential discounting may not be the standard approach outside economics. | Noted; will be addressed in SOD |
| 15449 | 3 | 54 | 1 | 54 | 2 | The fact that policy makers have used these metrics for purposes beyond what scientists envisaged should be brought out (through reference to recent material) and this will be helpful for the 2015 metrics review to increase awareness among the policy community of policy-metrics relationships that could be examined as part of this review. | Noted; will be addressed in SOD |
| 7384 | 3 | 54 | 1 | 54 | 2 | This could be strengthened - 100-year SAR GWPs are used near universally wherever different GHGs need to be compared or aggregated. They are also used for reporting under the UNFCCC, life cycle analysis, industry reporting tools, etc etc. Would be helpful to add and make clear that the IPCC never recommended using 100-year GWPs but presented them initially (Shine et al, 1990) to highlight the difficulties of aggregating gases via a single metric. | Noted; will be addressed in SOD |
| 10732 | 3 | 54 | 16 | 54 | 17 | "…excludes short- and medium time scales (as in the case of GTP)" needs rewording. The GTP may very well capture the effects on very short, short and medium time scales. That depends on which time horizon that is chosen. | Noted; will be addressed in SOD |
| 10846 | 3 | 54 | 16 | 54 | 17 | The temporal weighting function in the GTP. What is it? You mean the temperature IRF, then word it as though it is a physical weighting and not an economic discounting. | Noted; will be addressed in SOD |
| 10733 | 3 | 54 | 26 | 54 | 28 | It would be good if you could discuss the differences (pros and cons) of analytical and transparent metrics and model based metrics; see 8.7.1.5 and 8.7.1.6 in WGI chapter 8. | Noted; will be addressed in SOD |
| 15448 | 3 | 54 | 29 | 54 | 39 | These paras appear to assume a watertight, prefect, complete scenario. The discussion needs also to cover less than perfect scenarios- which is the policy-relevant world. Scenarios with less than 100 percent coverage of sectors and of gase are more likely. | Noted; will be addressed in SOD |
| 10967 | 3 | 54 | 29 | 54 | 33 | Metrics for comparing GHGs are very significant in the policy process and are still not being treated comprehensively in the IPCC assessments, despite the cross-WG meetings that have been held. But a more specific comment for this paragraph is that it should consider the recent evolution of ways for comparing CO2 and methane in the context of RCPs or stabilisation scenarios. For example, I recently reviewed and supported the paper: Lauder, A., I.G. Enting, J.O. Carter, N. Clisby, A.L. Cowie, B.K. Henry, and M.R. Raupach, "Offsetting methane emissions --- an alternative to emission equivalence metrics", International Journal of Greenhouse Gas Control, (submitted), 2012. This shows a credible way in which one-off sequestration of CO2 can offset continual emissions of methane, and is an extension of the treatment of the forcing equivalence index (FEI) in the context of stabilisation done in: Manning, M., and A. Reisinger, Broader perspectives for comparing different greenhouse gases Philosophical Transactions of the Royal Society A, 369, 1891-1905, 2011. In both cases variations in emissions that maintain a stabilisation scenario were being considered rather than the more academic approach of comparing pulse emissions of gases. | Noted; will be addressed in SOD |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 7385 | 3 | 54 | 29 | 54 | 39 | The draft is silent on a range of other things we also know about metrics in a first-best policy world (cite Reisinger et al 2012, amongst others): global cost differences are small; but effect on regional costs and production can be more significant, especially if metrics are considered in the context of global trade; metrics also affect the timing of cost-effective peak CO2 emissions to reach a defined long-term goal (i.e. higher metric value for CH4 allows a small delay in peak of CO2 emissions); metrics have a small but distinct effect on the amount of overshoot to meet a defined long-term goal in a cost-minimisation framework. These are all important and highly policy-relevant conclusions that are in the literature and need to be brought out in this section if it is to be a comprehensive policy-relevant assessment. Note all these are for a first best policy world. | No action; this section is not to be a comprehensive policy-relevant assessment. |
| 11360 | 3 | 54 | 3 | 54 | 3 | It is good to have an acronym comparable with other metrics, but the "price ratio", the original name proposed by Manne and Richels (2001, Nature, doi:10.1038/35070541), can be mentioned here. | Noted; will be addressed in SOD |
| 10734 | 3 | 54 | 31 | 54 | 31 | "shorter than that of CO2" needs rewording since CO2 does not have one single lifetime | Noted; will be addressed in SOD |
| 4333 | 3 | 54 | 32 | 54 | 32 | Please cite the final revised paper rather than the Discussions paper: Boucher, O., Comparison of physically- and economically-based CO2-equivalences for methane, Earth System Dynamics, 3, 49-61, 2012. | Noted; will be addressed in SOD |
| 10735 | 3 | 54 | 32 | 54 | 33 | Is it really as simple as this? | Noted; will be addressed in SOD |
| 7386 | 3 | 54 | 32 | 54 | 33 | The way that Reisinger et al 2012 is cited here is potentially misleading. That study explored higher values for CH4 in the context of a time-dependent GTP; hence the emphasis on CH4 gradually increases over time and becomes much higher only towards the end of the 21st century. Reisinger et al did not consider high metric values up-front as the current sentence could be seen to imply. | Noted; will be addressed in SOD |
| 4330 | 3 | 54 | 33 | 54 | 33 | and therefore on some countries. | Noted; will be addressed in SOD |
| 10968 | 3 | 54 | 34 | 54 | 39 | Table 3.3 is a very useful summary but another review paper on metrics is about to come out in Climatic Change and it has a very similar table covering some additional forms of comparison. See Tanaka, K., D.J.A. Johansson, B.C. O'Neill, and J.S. Fuglestvedt, Emission metrics under the 2°C climate stabilization, Climatic Change Letters, (submitted), 2012. | Noted; will be addressed in SOD |
| 7387 | 3 | 54 | 34 | 54 | 37 | This is the only really policy-relevant conclusion in the current draft, i.e. it tries to answer the question "so how much do different metrics actually matter?". Note it should not be "less than 5%" but "about 5%" once all relevant literature is taken into account, see Reisinger et al 2012 and Johansson 2006, 2012.) Please provide a confidence qualifier for this conclusion (given the number and consistency of studies, and consistency with theoretical expectations, I'd suggest "high confidence", but at a minimum "high agreement, robust evidence"). Also cite van Vuuren et al 2006, as the multi-model intercomparison further justifies the suggested high confidence rating. | Noted; will be addressed in SOD |
| 10736 | 3 | 54 | 35 | 54 | 35 | There is a recent paper by Reisinger et al (Climatic Change) that may be referred to here. | Noted; will be addressed in SOD |
| 4331 | 3 | 54 | 37 | 54 | 37 | 5% in the global mean. Is this small or large in relation to other imperfections of a real world climate mitigation policy? What about differences in costs at the country level? | Noted; will be addressed in SOD |
| 7388 | 3 | 54 | 38 | 54 | 39 | That's hardly the point; I think we have enough literature and detailed model studies to be highly confident that in a first-best policy world, metrics have little effect on global economic costs, and I doubt we need more studies to further assure us of that point. What has been far less explored and does deserve and require more study is (a) the regional and sectoral (rather than global) implications of metrics, and (b) to consider those implications within second-best policy scenarios, and (c) to link economic model studies with the political economy of mitigation, i.e. how metrics change the perceived importance of different sectors and their contribution to collective mitigation efforts. | Noted; will be addressed in SOD |
| 10730 | 3 | 54 | 7 | 54 | 7 | The Tol et 2008 paper has been revised and resubmitted. | Noted; will be addressed in SOD |
| 4329 | 3 | 54 | 8 | 54 | 10 | You should make it clear that you're *not* talking about the GTP with a fixed time horizon here, but a GTP with a decreasing time horizon as one approaches a target year (in comparison with a time-evoleving GCP along an optimum trajectory). Implicit here is the fact the exchange rate changes in time, which is something stressing as probably not obvious to most readers. | Noted; will be addressed in SOD |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 10731 | 3 | 54 | 8 | 54 | 8 | The similarity between GCP and GTP applies for a slightly different version of GTP and not the original standard version using chosen time horizons (e.g. Shine et al 2005 (Climatic Change)). In Shine et al. 2007, the GTP is given with a time horizon that is determined by the proximity to the target year. It is this version of GTP you refer to here, which should be made clear. The wording "...temperature change induced at a given point in time in the future..." needs to be changed. | Noted; will be addressed in SOD |
| 11326 | 3 | 54 | 21 | 54 | 39 | I think this part of the metrics section is relevant and do add to the discussion in the WG1 report and could be expanded in the WG3 section about metrics. | No action; not clear how to operationalize this comment. |
| 8395 | 3 | 54 | 37 | 54 | 37 | While it is accurate to say < 5%, many of these results are far less than 5%. An altered wording that conveys this would be useful. | Noted; will be addressed in SOD |
| 8396 | 3 | 54 | 37 | 54 | 39 | We have just published such a study which demonstrates that the impacts are quite small. In part this is due to inclusion in the IAM of indirect emission reductions that occur in methane due to the comprehensive climate policy. Reference: Smith SJ, JF Karas, JA Edmonds, J Eom, and A. Mizrahi (2012) Sensitivity of Multi-gas Climate Policy to Emission Metrics Climatic Change (2012, published on-line). DOI 10.1007/s10584-012-0565-7 | No action; cannot cite grey literature |
| 10737 | 3 | 55 | | | | Regarding the two first rows: It should be proportional to integrated RF not just RF. | Noted; will be addressed in SOD |
| 10738 | 3 | 55 | | | | Add "change" before "potential" in the GTP. | Noted; will be addressed in SOD |
| 10739 | 3 | 55 | | | | The version of GTP that is given with a time horizon determined by the proximity to the target year should also be inlcuded in the table (See figure 8.29 in WGI) | Noted; will be addressed in SOD |
| 10740 | 3 | 55 | | | | The metric integrated Global Temperature change Potential (iGTP) introduced by Peters et al. 2011 (Environmental Research Letters) | No action; comment unclear |
| 10847 | 3 | 55 | | | | I like this table, though, I have many comments. References are not in the reference list. GWP, "constant" I think might be incorrect. Check. From SAR it is definitely constant, but I dont think for FAR. GWP-LA is used mainly in one paper, and most would not agree to this approach in this context. There are also problems with this, as described in Fuglestvedt et al 2003 Climatic Change, in that different components require different discount rates. GTP, "exogenous scenario", I am not sure where you get that from, but generally, GTP IRFs are taken from existing literature and the most used by Boucher and Reddy is based on a 2xCO2 experiment. Or perhaps you meant this? MGTP uses constant and scenarios. Also see (Peters, G.P., Aamaas, B., Berntsen, T., Fuglestvedt, J.S., 2011. The integrated global temperature change potential (iGTP) and relationships between emission metrics. Environmental Research Letters 6, 044021.). More generally, the MGTP is just the integral of GTP in absolute form, and renormalised, and so it has the same background as GTP. Since GTP requires CO2 and temperature IRFs, then the background of CO2 is relavent to GTP. What is "theta"? I have never heard of "EGWP" and why do you reference it? A new column in the table which states which metrics are used often and which have been used once, or a few times, etc would be good. This would show GWP and GTP as the most important, currently. The point is, it is perhaps not so useful to alert people to metrics which have been otherwise disgarded or ignored in the literature, unless there is good reason to include them. Overall, keep the table, but make it better than it already is! | Noted; will be addressed in SOD |
| 11361 | 3 | 55 | | 55 | | To make the table more comprehensive, FEI can be added (Wigley, 1998, Geophysical Research Letters, 10.1029/98gl01855). As far as I am concerned, Gillett and Matthews (2010) is the first study that proposes a metric which has a form of the MGTP as correctly cited. MGTP is also called "integrated Global Temperature change Potential (iGTP) (Peters et al., 2011, Environmental Science and Technology, 10.1021/es200627s) or (IGTP) (Azar and Johansson, 2012, Earth System Dynamics Discussion, 10.5194/esdd-3-113-2012)). | Noted; will be addressed in SOD |
| 9809 | 3 | 55 | 22 | 55 | 24 | Not all impacts can be measured directly in terms of monetary values. Your example of heat stress might have an impact on productivity of the workers or it might cause more diseases and thus have an impact on the health system costs. | Noted; will be addressed in SOD |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 11327 | 3 | 55 | 2 | 55 | 3 | This table is nice and presents a nice overview, but all the parameters and variables need to be explained clearly. Also, I do not see the point why theta is divided by H for GWP (correct for MGTP though) and why the discount factor (exp-rt) is multiplied r in the temporal weighting functions. Also, I think (although I have only spent a minute on this) that the temporal weighting function for CETP should be written as theta(t-tx)*exp(-rt), where tx is the year the stabilization target is reached. | Noted; will be addressed in SOD |
| 8592 | 3 | 55 | 5 | 57 | 19 | This is a better discussion of WTP although it still glosses over the limitations of it. I would argue that the previous section be deleted (why have it discussed in two places in the same chapter), or at the very least, clearly pointing to this stronger coverage of the same ideas. | Noted; will be addressed in SOD |
| 6316 | 3 | 55 | 5 | 55 | 6 | This sentence sounds overly definitive and yet, is open to dispute. As it stands, it reads: "In order to assess a proposed mitigation policy, one needs to compare an economic measure of its 5 costs with an economic measure of its benefits." As chapter 2 amply shows, there are other ways of assessing mitigation policies than performing CBA. Re-word. | Noted; will be addressed in SOD |
| 13947 | 3 | 56 | 3 | 56 | 8 | WTP and WTA are already dealt with at the beginning of the chapter. No need to discuss it again. | Noted; will be addressed in SOD |
| 14849 | 3 | 57 | | | | This section, and the table 3-4, may be very problematic. First, it should be heavily caveated, explaining fully the numerous ways in which these estimates are idealized formulations, based on minimal empirical data, include only a subset of sectors, exclude the possibility of major non-linearities, high level of spatial aggregation, rely on paraeters that are completely uncalibrated, in many cases rely on estimates known to be hopelessly out of date and overtaken by science, etc., etc.<br><br>As these figures tend to be grossly underestimated. It is quite easy to envision this table being grossly misinterpretted in shorter, less careful written pieces (as in the media) of the results of the WGIII report. | Noted; will be addressed in SOD |
| 8255 | 3 | 57 | | | | To better illustrate how Integrated Assessment Models work, section 3.10.5 should contain a diagram illustrating how assumptions about climate, the economy and technology impact results. | No action; wgIII has a whole chapter later on IAMs. This is not the place. |
| 7301 | 3 | 57 | 21 | 59 | 5 | Section 3.10.5 includes important information on possible economic impact of climate change. Unfortunately, the information provided in the Table 3-4 lacks sufficient explanation as well as discussion. The major conclusions that could be made from the table are also unclear. It would help, if more explanation is provided to the information included in the Table 3-4. | Noted; will be addressed in SOD |
| 12253 | 3 | 57 | 20 | | | Please consider to shorten this section | Noted; will be addressed in SOD |
| 12257 | 3 | 59 | 11 | 59 | 12 | "… which are variables like temperature, precipitation, for costal areas, mean sea level etc."- It is confusing and uneccesary to specify "for costal areas". The way it is written now it is listed as one of the variables. | Noted; will be addressed in SOD |
| 12258 | 3 | 59 | 15 | 59 | 16 | "The damage measurement starts where the the climate modeling leaves of, with the Wckt's, and involves two mappings" - Fragmentet and difficult to understand. | Noted; will be addressed in SOD |
| 12259 | 3 | 59 | 17 | 59 | 17 | "… the that impact…" - Remove "that" | Noted; will be addressed in SOD |
| 12260 | 3 | 59 | 18 | 59 | 18 | Wrong indexing on the "W". | Noted; will be addressed in SOD |
| 12261 | 3 | 59 | 18 | 59 | 18 | Don't use T as a mapping. It is already used as a time-symbol: -T=starting time. The confusion becomes complete when the indices are removed in equation 3.9. | Noted; will be addressed in SOD |
| 12262 | 3 | 59 | 18 | 59 | 18 | Remove one of the "may depend"s. | Noted; will be addressed in SOD |
| 12263 | 3 | 59 | 18 | 59 | 21 | Please shorten this sentence. It would also be much easier to read if the variables were not mentioned with symbols. | Noted; will be addressed in SOD |
| 12266 | 3 | 59 | 19 | 59 | 19 | Same as above, but for the time index. In addition "tau<t" is not necessarily the past. t=0 is the present (as said in line 8), thus "tau<0" will be the past. | Noted; will be addressed in SOD |
| 12264 | 3 | 59 | 20 | 59 | 20 | Is upslope a different location? | Noted; will be addressed in SOD |
| 12265 | 3 | 59 | 20 | 59 | 24 | Why is it specified that the damage can happen at a place l different from k. k can be any location, so it is redundant to specify l as a location different from k. | Noted; will be addressed in SOD |
| 12267 | 3 | 59 | 24 | 59 | 24 | Footnote 55: The mappings in the equation are not called G and F, but V and T. | Noted; will be addressed in SOD |
| 12268 | 3 | 59 | 28 | 59 | 30 | Here it is referred to table 3-5, which does not exist. I presume it is suppose to be table 3-4? | Noted; will be addressed in SOD |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 12254 | 3 | 59 | 3 | 59 | 3 | Please explain what an "IAM" is. | Noted; will be addressed in SOD |
| 9008 | 3 | 59 | 3 | 59 | 5 | Despite the claim these models are not in the summary Table 3-4: "These are the DICE model (Nordhaus, 2008, 2010) 3 and its regional cousin, RICE (Nordhaus and Boyer, 2000); the FUND model (Tol and Yohe, 2009); and the PAGE model (Hope, 2006)." | Noted; will be addressed in SOD |
| 12269 | 3 | 59 | 40 | 59 | 40 | Wrong variable names are used: The mappings are not called G and H, but V and T. | Noted; will be addressed in SOD |
| 4503 | 3 | 59 | 5 | 59 | 5 | Footnote 54 referencing Ackerman et al. (2009) is entirely misleading. The Ackerman et al. paper was a critique of integrated assessment models. While it is true that the paper mentions models other than the ones listed in the text, the main point(s) of the Ackerman et al. paper had to do with fundamental limitations of all such models. Footnote 54 makes it appear that Ackerman et al. were entirely comfortable with the IAM approach to benefits estimation. The chapter should cite Ackerman et al., of course, but should put more emphasis on the weaknesses of the IAM approach to climate policy analysis. | Noted; will be addressed in SOD |
| 12255 | 3 | 59 | 6 | 59 | 24 | This entire paragraph needs to be rewritten as it is barely understandable as is. The "need to fix" are highlighted below. | Noted; will be addressed in SOD |
| 12256 | 3 | 59 | 7 | 59 | 8 | "...groups of decades, such as decades" | Noted; will be addressed in SOD |
| 4476 | 3 | 6 | 1 | 6 | 6 | This paragraph seems to imply that utilitarianism and prioritarianism are the only possible ethical stances. But this is surely wrong. What about ethical systems involving absolute rights, transcendental values, and/or obligations that cannot be gauged in material terms? It may be more straightforward to justify action to stabilize the climate on religious grounds than on utilitarian grounds, for example. | Noted; will be addressed in SOD |
| 8576 | 3 | 6 | 1 | 6 | 26 | At no point is this fairly detailed discussion of CBA framed within the substantive literature on the limitations of CBA for complex decisions like climate change and the ethical challenges of doing this! Considering that this chapter is supposedly an integration of discussions of ethics and economics this is a profound problem. By simply jumping into CBA discussions without any caveats, the IPCC is essentially imposing a framework in which CBA is the default option for assessing decisions, and in which the profound limitations of CBA for non-linear and multi-dimensional contexts become invisible in debate. Considering the attention the IPCC has invested in communicating uncertainty elsewhere, overlooking these discussions of how econonimcs deals with uncertainty (of multiple kinds) is problemtic. | The chapter has been reorganized in response to this comment and others like it, to make the limitations of cba more explicit. |
| 10962 | 3 | 6 | 1 | 6 | 26 | The Executive summary puts too much emphasis on discounting. This does not reflect the balance of issues being covered in the whole chapter, but also my reading of the literature in this area suggests there is now growing recognition that discounting ignores intergenerational equity and so is not a sensible basis for long term planning. Even from a more practical basis, investment in infrastructure that has to support an increasing population for more than 100 years can be seen as appreciating in value, not depreciating. | No action; disagree with comment |
| 16626 | 3 | 6 | 1 | 6 | 11 | 2. How to allocate the costs of action or inaction amongst states or countries? | No action; comment unclear |
| 4746 | 3 | 6 | 11 | 6 | 11 | Add "and people" at the end of the sentence. | Will be addressed in SOD |
| 12130 | 3 | 6 | 12 | 6 | 13 | This implies that discounting is *necessary* for comparison. But comparison is possible with a zero D.R. | No action. Disagree with comment; this |
| 3911 | 3 | 6 | 14 | 6 | 14 | What would be the ethical basis for using a discount rate chosen by a policy elite to determine what sacrifice voters today should make 'for the benefit of future generations'? Surely, the role of the policy elite is to explain the trade-offs and allow citizens to determine for themselves what sacrifice they are willing to make, both in the form of personal initiatives and through collective processes? | No action; comment unclear |
| 4747 | 3 | 6 | 15 | 6 | 19 | A reference to Stern report may be useful according to me. | No action. It is referenced in the text, though it is grey literature |
| 3912 | 3 | 6 | 15 | 6 | 17 | This sentence also has a connotation that a policy elite is capable of making decisions about a discount rate in order to determine what sacrifices today's voters should make, whether they like it or not. Again the question arises as to the ethical and democratic basis for such an attitude to democratic decison-making. | Will be addressed in SOD; this is not our intended meaning |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 4618 | 3 | 6 | 17 | | 17 | It should be pointed out that efficient intertemporal allocation of resources is the purpose of the discount rate and not intergenerational equity; the discount factor is the price (trade-off rate) of present consumption in terms of future consumption a spointed out on p. 27 (l. 28-30); it's the social welfare function which deals with distributive justice | No action. Disagree with comment |
| 3910 | 3 | 6 | 2 | 6 | 2 | Is not the word 'appropriately' a cop out? Is not any weighting scheme fundamentally arbitrary from an ethical perspective? Is it ethical to propose that one person's well-being is more important than another's, and if so what implications does this have for the democratic notion of universal suffrage based on one vote person? My impression is that the mainstream view in economics is that any given social welfare function is subjective, making the choice between them fundamentally arbtitrary. If the chaper envisages that the choice is made through political processes then doubtless, it will reflect the preferences of those with the greatest political clout at the time. Would not it be useful for the chapter to comment on the ethical basis for thus politicising such decisions? | No action. Mistaken comment; chapter discusses what is appropriate |
| 4477 | 3 | 6 | 20 | 6 | 26 | Invoking the "Ramsey rule" as a way of normatively determining the appropriate discount rate is simply incorrect. The Ramsey rule must be generalized in the real-world in which there are different investments having different risks and different rates of return (including insurance that may have a negative rate of return). The discount rate also depends on the degree of substitutability of different goods, present and future. The different goods (such as produced goods and the unproduced environment, for example) may have different discount rates appropriate for comparing present and future values. Finally, the entire expected utility framework within which Ramsey-like discount rates are derived may break down if there is some potential for future catastrophic events (see the alternative approaches to the catastrophic risk issue of Weitzman and Chichilnisky, for example). | No action. The Ramsey rule determines a normative discount rate for safe project. It just states “price=MRS”, an efficiency condition that holds independent of the existence of risk, insurance, multiple goods, and so on. As shown for example by Gollier (JET, 2010), but also many other authors before him (Sterner, Guesnerie,…), it is equivalent to use a single DR on money together with a set of relative prices of goods that evolve over time, or to use a set of different DR, one for each good |
| 3914 | 3 | 6 | 24 | 6 | 26 | Given the interest in this chapter on distributional issues, should it not point out that low income investors are more likely to be paying credit card rates of interest on debts than they are to receiving returns on bills and bonds? Expressed more technically, the rate of return on bills and bonds is not an opportunity cost for those who don't own bills or bonds. The opportunity cost to this group of an extra dollar spent on fuel bills, for example, might be more like a credit card rate of interest. | No action; comment unclear |
| 16629 | 3 | 6 | 27 | 6 | 27 | Link this discussion to the previous discussion on social welfare functions. Merge these two paragraphs together into a shorter paragraph. Maybe delete the sentence that starts in line 3 and ends in line 5. | Will be addressed in SOD |
| 5123 | 3 | 6 | 27 | | 32 | Unlike above comment, this para usefully notes the need for flexibility, but presents it a static when a more likely scenario will require dynamic adjustments in the suite of policies in use | Will be addressed in SOD |
| 4748 | 3 | 6 | 33 | 6 | 35 | I was wondering of the term "social" or "societal" should be included. Is it also behind the term "environmental"? | No action; goes in distributional or institutional. |
| 8577 | 3 | 6 | 33 | 6 | 43 | I am very confused by the discussion on policy evaluation. Is this trying to say that tehse are the criteria countries SHOULD use? That they are using? That they are 'allowed' to use? | No action; see longer section for more detailed discussion on criteria that |
| 13564 | 3 | 6 | 33 | | 39 | wondering if it would be useful to clarify how 'mitigation' policy and 'carbon' policy are being defined as they're both being used | No action; carbon policy is somewhat broader than mitigation policy. But this |

|---|---|---|---|---|---|---|---|
| 6083 | 3 | 6 | 33 | 6 | 34 | Criterion of promotion effect of technological innovation and diffusion is missing. In line 21-24 of page 6 of Chapter 3, there are sentences such as "Meeting aggressive emission reduction targets will be difficult without major changes in the technology of producing and consuming energy" and "Markets, left to their own devices, will underprovide technological change, even in the presence of a carbon price. Studies suggest that environmental and technology policies work best in tandem". Also in Chapter 1 (page 3, from line 47), there are sentences that "it is likely that deep cuts in emissions will require a diverse portfolio of policies and technologies. It is very likely that here are many different development trajectories, but it is virtually certain that the ability to meet those trajectories will be constrained if particular technologies are removed from consideration or are given excessive emphasis". Also in Chapter 2 (page 38, lines 23-24), there is a description that "Several researchers suggest that future pathways for RDD&D will be the determining factor for emissions reductions (Prins and Rayner, 2007; Lilliestam et al., 2012)". In any case without rapid technological innovation and diffusion, deep emission cut will be impossible. This is pointed out in Chapter 6 (6.4.1) that "autonomous technology might not be sufficient to limit climate change and dedicated resources and policies might be needed to induce it" (p.60, lines 22-23). It is highly appreciated that this Chapter has an independent section (3.12) on technological change. As pointed out in that section, policy can play a key role in shaping both the derection and magnitude of climate-friendly technological change. With this in mind, whether a certain policy has such effect as to promote technology innovation/diffusion is absolutely important criteria for policy evaluation. Please add "promotion effect for technological innovation/diffusion as fifth criteria. | We added mention of technology, as part of economic efficiency, but must point mostly to other sections for more substantial discussion; see section 3.12 |
| 11005 | 3 | 6 | 41 | | 43 | Delete ‘legitimately”. As a description of reality the sentence is fine. ‘Legitimately’ turns statement into a normative judgment, and it is not IPCC’s role to say what is or is not legitimate policy for any state. | Will be addressed in SOD |
| 8578 | 3 | 6 | 44 | 6 | 48 | This paragraph is confusing. The first lines seem to discuss behavioural changes. The rest of it discusses WTP without any recognition of the severe limitations of these techniques for valuation. Again, this paragraph illustates the ongoing tendency of this chapter to jump into hihgly contentious economic metrics (from the perspective of many discussions of ethics and from the perspective of the practical and methodological challenges of using these metrics of value) without any recognition of these debates, of the limitations of the techniques or of some of the implications of these limitations. Not only does the paragraph not make logical sense, but also does it not help in a respectful integration of ethics and economics. | No action; comment unclear |
| 13565 | 3 | 6 | 44 | | 48 | In addition to pertaining to this specific section, this comment is more of an 'overall' comment on my behalf - while the text points out that that GHG emissions aren't only a technical issue, metrics used to ascertain impacts of 'behaviour' and 'substitution' stem from economics (change in income, Willingness To Pay, etc). Economics are obviously important, but it seems rather heavily skewed towards modes of measurements used in economics -- there are other dimensions and disciplines uesd to determine the role of other factors (e.g. social, culture, political). Justice and equity are a part of this (as is noted) but also would like to flag alternative lenses. For instance, more systematic approaches to assessing steering change (including reducing GHG levels on a grand scale) include the work of Geels and others (e.g. http://pubs.e-contentmanagement.com/doi/abs/10.5172/impp.2004.6.2.344) and transitions; Smith et al (2005) Research Policy http://www.sciencedirect.com/science/article/pii/S0048733305001721; and Rogers (2003) Diffusion of innovation which attempt to examine socio-technical 'fit'. See also chapter 1 Ockwell and Mallett (2012) "Introduction: Low carbon technology transfer: from rhetoric to reality" in Ockwell and Mallett (eds) Low Carbon Technology Transfer: from Rhetoric to Reality. Routledge: Abigndon. http://www.routledge.com/books/details/9781849712699/ | No action; no change implied |

| 5124 | 3 | 6 | 44 | | 48 | A massive literature now exists ciriticising an economic definition of wellbeing. See, eg: MJC Forgeard, et al. 2011. Doing the right thing: Measuring wellbeing for public policy. International Journal of Wellbeing 1(1), 79-106; and Stiglitz, Sen and Fitousi. 2009. Report by the Commission on the Measurement of economic performance and social progress. Later uses in the chapter recognise the broader definition of wellbeing in principle, but the default remains economic. | No action; we do not believe this issue is appropriate to address in this chapter |
| 4478 | 3 | 6 | 47 | 6 | 48 | WTP and WTA may not be appropriate measures (and may not even exist) for certain kinds of problems, including the possibility of environmental catastrophe. WTP and WTA implicitly assume substitutability of income and everything else, and WTP and WTA are wealth-dependent. Respondents in contingent valuation surveys have been known to case "protest votes" by answering "zero" to a question about their valuation of some event that is either inconceivable or so far outside their experience that they are unable to put a dollar value on avoiding it. | No action; disagree with comment |
| 4749 | 3 | 6 | 48 | 6 | 48 | Please explicit acronyms: WTP "willingness to pay", and WTA "willingness to accept" | Will be addressed in SOD |
| 3913 | 3 | 6 | 5 | 6 | 6 | Should a sentence be added that points out in this context that future generations are commonly projected to be wealthier than today's generations? | No action. We do mention this in the text. |
| 16627 | 3 | 6 | 8 | 6 | 8 | Authors could also choose to include individuals and/or a time component in the second question above. | No action; comment unclear |
| 16628 | 3 | 6 | 9 | 6 | 11 | Before the discussion about social welfare functions, add a sentence that explains why it is important to have economics provide an anthropocentric measure of value and how this can be an input to decision- or policy-making. This sentence can help lead the discussion of social welfare functions and the following concepts. | Noted; will be addressed in SOD |
| 12272 | 3 | 60 | 12 | 60 | 26 | Check the wording of this paragraph. There are several strange choices of words which might make the reader draw the wrong conclusions, e.g. "...extrapolation from studies in literature to other countries and regions." and "damages from energy". | Noted; will be addressed in SOD |
| 12270 | 3 | 60 | 3 | 60 | 3 | Wrong variable names are used: The mappings are not called G and H, but V and T. | Noted; will be addressed in SOD |
| 12273 | 3 | 60 | 32 | 60 | 33 | Please remove the reference to "Jensens's inequality". Few people will know the inequaliy in question, and the reference is not necessary. | No action; disagree with comment |
| 12274 | 3 | 60 | 33 | 60 | 36 | "…expected damages of" This sentence is incomplete. | Noted; will be addressed in SOD |
| 12271 | 3 | 60 | 7 | 60 | 7 | If Equation 3.11 is suppose to be presented, the parameters a and b needs to be explained. | Noted; will be addressed in SOD |
| 8828 | 3 | 61 | | | | the discussion of “behavioral economics and culture” should also include citations to Kahneman’s 2011 book, Thinking, Fast and Slow and to the 2008 book by Thaler and Sunstein titled Nudge: Improving Decisions about Health, Wealth and Happiness. | AGREE action will be taken |
| 9356 | 3 | 61 | 10 | 61 | 11 | p61line 10: this very important argument with respect to ' fat tails' does not come up very clearly: expand it | Noted; will be addressed in SOD |
| 4505 | 3 | 61 | 13 | 61 | 24 | The Weitzman approach should also be mentioned here; Weitzman develops the consequences of employing a Bayesian framework for learning about the structural uncertainties. | No action; comment unclear |
| 12275 | 3 | 61 | 18 | 61 | 18 | What is "...rate of time preferences..."? | Noted; will be addressed in SOD |
| 4506 | 3 | 61 | 20 | 61 | 20 | Again, the Ackerman et al. paper cited in footnote 60 is not the same as the one given in the bibliography. | Noted; will be addressed in SOD |
| 12276 | 3 | 61 | 22 | 61 | 24 | Fragmentet sentence: "...this approach, which was adopted by… and is computatationally more demanding." | Noted; will be addressed in SOD |
| 13948 | 3 | 61 | 25 | | | Behavioural economics and culture section is too long. At least suggest deletion of Box 3.7 and 3.8 | AGREE action will be taken |
| 9187 | 3 | 61 | 25 | 68 | | good text on behaviorial economics. Please mention to efficiency regulation and energy management systems, if possible. My chapter Ch 15 has a lot of relevant discussons. (15.5.2 regulation and information section), also relevant are 15.5.5 Voluntary agreement, and 15.13 Frequently asked questions. - please take a look. | Noted. |
| 9214 | 3 | 61 | 25 | 68 | | please also summarize the following terminologies - organizational economics, evolutionary economics, new institutinoal economics, to the extent they are relevant with the energy efficiency policies. Much energy efficiency policies (such as energy audit , enegy management systems, see ch15 for details) are meant to influence on the bevariour of organiations (such as firms), not individual citizen. | NOTED general action in other sections of the chapter |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 4504 | 3 | 61 | 3 | 61 | 12 | The findings reported in footnote 59 are more important than a footnote and should be included in the text itself. (In addition, the chapter authors should check the Ackerman reference; the paper by Ackerman and co-authors that makes the point discussed in footnote 59 it is not the same as the Ackerman et al. (2009) reference given in the bibliography. The papers are different and the co-authors are different.) In addition, it is not entirely accurate to say that the Weitzman results stem from a fat right tail in the probability distribution of temperature increases and damages. The Weitzman result arises from a combination of deep structural uncertainty and the impossibility of learning enough about the underlying structure within the necessary decision-making time frame. | Noted; will be addressed in SOD |
| 9810 | 3 | 61 | 35 | 61 | 38 | See the systematic review on LCC: Eric Korpi, Timo Ala-Risku, (2008) "Life cycle costing: a review of published case studies", Managerial Auditing Journal, Vol. 23 Iss: 3, pp.240 - 261 | AGREE action will be taken |
| 8084 | 3 | 61 | 22 | 61 | 24 | As the alternative approach mentioned here is an important one, both methodologically and computationally, it could be useful to add in the list of papers mentioned on line 24 : “Bréchet, Thénié, Zeimes and Zuber (2012)” and, space permitting, it would be instructive to add the comment: “these last authors obtain the result that cooperation among countries induces risk reduction.”<br>Reference:Bréchet, Th., J. Thénié, Th. Zeimes and S. Zuber (2012). The Benefits of Cooperation Under Uncertainty: the Case of Climate Change, Environmental Modeling Assessment 17,149–162. DOI 10.1007/s10666-011-9281-3. | Noted; will be addressed in SOD |
| 8593 | 3 | 61 | | 63 | | This is a better discussion than some of the previous ones. It could be helpful to tie it to some of the earlier sections (ie. pointing out the gaps between theoretical ideals of how neoclassical economcs should work in terms of providing advice, and how people actually behave). Clearer road marking to this section would help authors develop text that more appropriately establishes the boundaries of economics knowledge about climate policy. | AGREE action will be taken |
| 7936 | 3 | 61 | | | | This is an innovative section that raises new and interesting points (with respect to SAR, TAR, and FAR). The results of 3.11 should encroach on the preceeding sections. | AGREE |
| 3140 | 3 | 61 | 25 | | | Section 3.11 seems like a grab bag of issues. Can they be woven into the text earlier; put in the later chapter on energy systems (e.g., the discussion of consumer undervaluation of energy costs), etc.<br><br>There is a huge overlap with chapter 4. I suggest that authors of both chapters review the other carefully and make some decisions about the strategy.<br><br>The discussion of policy infeasibilty is very important but highly diffuse. To narrow, let me repeat a comment I make in chapter 6: "BECCS plays a huge role in the IAMs that can meet goals like 2 degrees. Given that, why not use BECCS as a case study/box in chapter 3 since that would help tie together the issues discussed there with the large role that is assumed for BECCS in some scenarios. □ | AGREE with first and second comment, action will be taken. Third point in the comment unclear. |
| 8393 | 3 | 61 | 37 | 61 | 36 | The section seems to assume that "experienced utility" ("subjective well-being" of happiness studies) is the conception of wellbeing that policy should foster. This is not the usual view in economics, which is that welfare is the satisfaction of preferences, not subjective wellbeing. So there is some tension between this part and section 3.4.3 where it is stated that "we do not try to assess these differing views about the nature of wellbeing." it would help to make the conflicting goals of happiness-maximization vs. preference-satisfaction explicit to see how this part relates to the main body of the chapter on values and policy objectives (cf. Fleurbaey, M. (2009). Beyond GDP: The quest for a measure of social welfare.<br>Journal of Economic Literature 47(4), 1029–1075, particularly section 6.3.) | AGREE action will be taken |

| 8159 | 3 | 61 | | 62 | | See the discussion in the FOD Chap. 2 Sect. 2.4.4.3 for a more detailed discussion of some of the behavioral biases that impact on investment in energy-efficiency appliances as it relates to System 1 behavior. | AGREE action will be taken |
| 11536 | 3 | 61 | | 62 | | See the discussion in the FOD Chap. 2 Sect. 2.4.4.3 for a more detailed discussion of some of the behavioral biases that impact on investment in energy-efficiency appliances as it relates to System 1 behavior. | No action; duplicate |
| 12564 | 3 | 62 | 11 | 62 | 18 | An ACEE white paper (http://www.google.com/url?sa=t&rct=j&q=&esrc=s&source=web&cd=1&sqi=2&ved=0CB8QFjAA&url=http%3A%2F%2Fwww.aceee.org%2Ffiles%2Fpdf%2Fwhite-paper%2Fcomments-on-is-there-an-energy-efficiency-gap.pdf&ei=YhtSUPzYMYjZ0QG1kYDACQ&usg=AFQjCNGiGZ5RlDty-ZdF-fZGCr81cyDTQw) makes the point that both this Alcott paper and the Alcott & Greenstone 2012 paper make "selective and otherwise misleading citations to the literature to make their case" [for more rationality on the part of energy consumers than is, in fact, observed]. these concerns should be acknowledged somewhere, or use of these references reduced. If there are unobservables that make it difficult to prove that consumers are misoptimizing, then surely the same applies to the claim that they are optimizing? | NOTED general action. |
| 11013 | 3 | 62 | 42 | | 44 | At the same time, low costs to the operator may be accompanied by high net costs to society. The costs of such programs are often obscure to both the policy maker and the public. As a result, mistakes are quite possible. Furthermore, the public often has great difficulty in assessing the costs and benefits of non-market policies (Arnold, R. Douglas. The Logic of Congressional Action. New Haven: Yale University Press, 1990). The result may be that the normal institutional checks on ill-advised public policies may function poorly or not at all. | NOTED general action |
| 12565 | 3 | 62 | 42 | | | the person to reference for social norms and energy use is robert (bob) cialdini and his collaborators, not Alcott, who is only one of many people who have since discussed this work. | NOTED general action. |
| 13685 | 3 | 63 | 19 | 63 | 19 | Insert after "... Administration 2010.": "The possibilities of a voluntary reduction of consumption have been assessed by Jackson (2005) and Schrader and Thøgersen (2011)." References: Jackson, T. (2005): Live better by consuming less? Is there a double dividend in sustainable consumption, in: Journal of Industrial Ecology 9, p. 19-36, and Schrader, U.; Thøgersen, J. (2011): Putting Sustainable Consumption into Practice, in: Journal of Consumer Policy, 34, p. 3-8 | AGREE action will be taken |
| 9399 | 3 | 63 | 28 | | 30 | The authors lay emphasis on the "deviations from the neoclassical model". Yet, they do not develop or cite alternatives, i.e. theories on public goods (climate is a public good) or theories on the commons. | NOTED general action will be taken in others sections of the chapter. |
| 12568 | 3 | 63 | 32 | 63 | 35 | Chapter 2's Section 2.2.1.1 Learning from personal experience vs. statistical description is clearly very relevant here, as it makes the point that the phenomenon described in this paragraph (that people overweight low probability events (e.g., catastrophic events as the result of climate change) is only true when people learn about such events by statistical description. The opposite (i.e., an underweighting of low probability events) is true when people learn about such events by personal experience, and also when personal experience is paired with statistical summaries. Given that personal experience with local weather has a strong influence on predictions of climate and climate change (see e.g., Psychol Sci. 2011 Apr;22(4):454-9. Local warming: daily temperature change influences belief in global warming.<br>Li Y, Johnson EJ, Zaval L.), one would predict that policy makers and voters will be less receptive to climate policy, the opposite of what this paragraph predicts, but more in line with reality. | AGREE action will be taken |

|---|---|---|---|---|---|---|---|
| 12570 | 3 | 64 | 1 | 64 | 5 | the first sentence here is ambiguous. It could be read to suggest that in "other parts of the world" public assessments of climate change DO agree with scientific assessments, which is by in large not the case. Instead, public assessments diverge from scientific ones, and increasingly so over time, contrary to rational Bayesian updating, in pretty much all parts of the world where public assessments have been collected, albeit to different degrees. The statistics in the second part, which come from a relatively small sample by Leiserowitz et al., 2011, could and probably should be replaced by the larger Gallup and Pew poll results. Some of such figures are cited in the Weber & Stern reference in Comment 11 above. | AGREE action will be taken |
| 12571 | 3 | 64 | 11 | 64 | 22 | This paragraph needs references to its various assertions and also some examples, e.g., what experiences with indigenous people, what cultural movement initiatives that provide new meaning? Refer to Section 3.11.2.3 for the point on gender equity. | AGREE action will be taken |
| 9811 | 3 | 64 | 12 | | | The study "Europeans' attitudes towards climate change" Special Eurobarometer 313 and 322, Brussels 2009 should be referred to. | AGREE action will be taken |
| 11218 | 3 | 64 | 13 | | | add s to people, ie experiences with indigenous peoples. | AGREE action will be taken |
| 13684 | 3 | 64 | 13 | 64 | 13 | Insert after "... life is conducted": "For example, household energy use patterns for space and water heating differ massively between Japan and Norway due to a frugal lifestyle with regards to space heating in Japan compared to profligacy in Norway, but a massive energy use for hot baths in Japan not seen in Norway (see Wilhite et al. 1996). Even within cultures, differences between social groups can be massive (see Gram-Hanssen 2010)." References: Wilhite, H.; Nakagami, H.; Masuda, T.; Yamaga, Y., Haneda, H. (1996): A cross-cultural analysis of household energy use behaviour in Japan and Norway, in: Energy Policy, 24, p. 795–803. Gram-Hanssen, K. (2010): Residential heat comfort practices: understanding users, in: Building Research & Information, 38, p. 175-186 | AGREE action will be taken |
| 17141 | 3 | 64 | 16 | | | Reference to Wallerstein 1998 is very outdated - a lot of literature exists on indigenous peoples and climate change mitigation that is more relevant/recent. For instance: Kronik and Verner (2010) The Role of Indigenous Knowledge in Crafting Adaptation and MItigation Strategies for Climate Change in Latin America. In Social Dimensions of Climate Change: Equity and Vulnerability in a Changing World. Edited by Robin Mearns and Andrew Norton. The World Bank Washington DC. See also: Russell-Smith, J., Whithead, P., Cooke, P., (2009) Culture, Ecology and Economy of Fire Managemnet in North Australian Savannas: Rekindling the Wurrk Tradition | AGREE action will be taken |
| 9400 | 3 | 64 | 24 | | 42 | "Buen Vivir" is also part of the discussion of chapter 4. In the context of ethics, it would be more appropriate to cite recent approches in virtue ethics which elaborate on attitudes which mirror "respect for nature". There are authors who work on "virtue ethics and the environment". | DISAGREE "Buen Vivir" doesn't refer only to respect for nature as a virtue ethic, because that approach stills anthropocentric. Buen Vivir and Vivir Bien have in its bases a biocentrism approach, so they mean much more |
| 6088 | 3 | 64 | 24 | 64 | 25 | This attitude is quite common throughout the world except region that believes in monotheism. You may be able to cite from Buddhist country literatures. | DISAGREE We don't think that a religious discussion is appropriate here. |
| 7938 | 3 | 64 | 6 | 67 | 44 | Please outline the consequences for climate policies from the different perspectives briefly portrayed here. Wouldn't they reject neoclassical calculation of maximizatzion of welfare altogether? | AGREE action will be taken |
| 8594 | 3 | 64 | 6 | 67 | 44 | A better integration of this section - and moving it to earlier in the chapter - would be helpful in presenting a more balanced palate of options for thinking about value and what is important to measure and consider in climate policy than is currently included in the chapter. Also -- the better discussion of indigenous people and gender issues could be used to balance the earlier significantly weaker sections on distibution within economic analysis (bc any recognition of the characteristics of individuals that influence distirbution was entirely excluded in BOX 3.5 on page 40). | NOTED general actions will be taken in other sections of the chapter |

| 13578 | 3 | 64 | | | | on Buen Vivir, I recently (August 2012) was a PhD external examiner for an interesting thesis which examined the inherent contradiction involved in attemtping to incorporate Buen Vivir into aspects of Bolivia's industrial strategy based around developing lithium (University of Zacatecas, Roberto del Barco, the role of Lithium in Bolivian Development (in Spanish) | Noted. |
| 15125 | 3 | 64 | 23 | 64 | | 3.11.2.1 Buen Vivir, Vivir Bien | AGREE action will be taken |
| 15126 | 3 | 64 | 24 | 64 | 41 | There is a difference betwen Vivir bien (Bolivia) and Buen Vivir (Ecuador), It will be a good practice to distinguish both concepts or write both words. | AGREE action will be taken |
| 15127 | 3 | 64 | 41 | 64 | 42 | "Whether such an approach has any effect on GHG emissions without reducing quality of life is unclear". It´s just a commentary. | AGREE action will be taken |
| 8830 | 3 | 65 | | | | The section on measures of “Gross National Happiness,” although interesting, again seems to be a tutorial and should be omitted from this chapter. | Noted. |
| 17312 | 3 | 66 | | 67 | | I don't think that it makes sense to treat gender within this chapter. "Women as a sector of society" (page 66 line 45) sounds weird. Gender is a cross-cutting issue and relates to women and men in terms of their respective roles in society. Gender indicates the differences between women and men that are socially constructed. It involves gender identities and attributes, roles and relationships, including power relations. Gender roles vary substantially across different cultures and societies and can be changed over time.<br>The gender dimension of mitigation should receive more attention, e.g. by including a separate chapter. | Noted. |
| 9401 | 3 | 66 | | | | Indigenous communities are portrayed in a very rosy picture. Other authors say that they are particularly endangered and vulnerable. Even though the authors mention this, it looks as if indigenous communities are in a situation to carry burdens regarding climate change. I doubt this. Moreover, not all practices of indigenous communities really contribute to the preservation of nature. | Noted. |
| 7448 | 3 | 66 | 1 | 66 | 21 | This blueprint should be a goal for every country. | NOTED but this comment could be |
| 7449 | 3 | 66 | 24 | 66 | 47 | This is an excellent example of what some people can do. | NOTED Thank you. |
| 7450 | 3 | 66 | 24 | 66 | 47 | If the vast areas of forests are to be managed better, their ownership should be vested with the local people. Simple training for such people should be provided. | Noted. |
| 12572 | 3 | 66 | 34 | 66 | 44 | In the context of "strong geographic identity" and "alternatives to monitoring at the local scale", i would definitely cite the work of Elinor Ostrom and different empirical studies inspired by it, as summarized or collected, for example, in her book that downscales the "tragedy" of the commons to a "drama": Ostrom, E., Dietz, T., Dolsak, N., Stern P. C., Stonich, S., & Weber, E. U. (Eds.) (2002). The Drama of the Commons. Washington, D. C.: National Academies Press. This work is also very relevant for the final (very short) section 3.11.3 on Institutions for collective social action. | Noted |
| 17142 | 3 | 66 | 37 | 66 | 39 | For more accuracy consider rephrasing to: Some indigenous peoples are integreated into dominant societies and other continue to exist on the margins of dominant society and many have reproduced and safeguarded their cultures to various degrees. | Noted. |
| 17143 | 3 | 66 | 39 | | | Might be relevant and important to note that indigenous peoples also own 11% of the worlds territories where a majority of climate mitigation projects are being implemented - for full reference see: Sobrevila, M. (2008). The Role of Indigenous Peoples in Biodiversity Conservation: The Natural and Often Forgotten Partners. Washington DC: The World Bank. | Noted. |
| 17313 | 3 | 66 | 46 | 66 | 47 | Today, much more recent literature on gender and climate change is available. A review of existing literature related to industrialized countries is provided in EIGE (European Institute for Gender Equality: "Review of the Implementation in the EU of area K of the Beijing Platform for Action: Women and the Environment Gender Equality and Climate Change", 2012, available at http://www.eige.europa.eu/sites/default/files/Gender-Equality-and-Climate-Change-Report.pdf | AGREE action will be taken |
| 12145 | 3 | 66 | 46 | 66 | 47 | Needs to specify how 'the relation[ship] between communities and the environment is not gender-neutral'. | AGREE action will be taken |

|---|---|---|---|---|---|---|---|
| 11219 | 3 | 66 | 30 | 66 | 44 | The following material is a suggested rewrite for the part of this section on indigenous peoles (lines 30-66). It expands on the points made in the original text, adds more references and includes their rights vis a vis mitigation activities.<br><br>Indigenous peoples, numbering around 500 million across the globe (Chao 2012), are peoples who self-identify as a collectivity based on their distinct culture and history, and have priority in the occupation and use of the customary land and natural resources (Daes 1996) on which they depend primarily for their livelihoods. Land and the natural environment are integral aspects to indigenous peoples' sense of identity, culture and belonging, and hold fundamental importance for their collective physical and cultural survival as peoples (Gilbert 2006:115; Xanthaki 2007: 237 - 279).<br><br>The rights of indigenous peoples are enshrined in international law and most clearly expressed in the United Nations Declaration on the Rights of Indigenous Peoples which gives prominent place to indigenous peoples' rights to lands, territories and resources (UNDRIP 2007 inter alia Art. 3, 4, 8, 11, 19, 25 – 29, 32) and requires States to obtain the right to Free, Prior and Informed Consent of indigenous peoples (as an expression of their right to self-determination) prior to any development on their lands and territories (UNDRIP, Art. 32).<br><br>The customary lands of indigenous peoples contain 80% of the earth's remaining healthy ecosystems and global biodiversity priority areas, including the world's largest tropical forests in the Americas, Africa and Asia (GEF 2008, Sobrevila 2008:xii). Primarily dependent on natural resources and inhabiting biodiversity-rich but fragile ecosystems, indigenous peoples find themselves particularly vulnerable in the face of climate change, with little access to resources to cope with these changes (Henriksen 2007, UNPFII 2008). They continue to be marginalised in decision-making and unable to participate fully and actively in local, national, regional and international climate change mechanisms (Tauli-Corpuz & Lynge 2008, Griffiths 2009; Dooley et alii 2011). And yet mitigation is not only critical to the preservation of their environment, but to that of their traditional knowledge, culture, livelihoods, food security, customary lands and self-determined development, all of which are protected under international human rights law (Tauli-Corpuz et alii 2009).<br><br>Climate change mitigation is therefore not only an environmental issue but also a human rights issue in which indigenous peoples are key stakeholders (Kang Kyung-wha 2008, Diaz 2008, Rogue 2009) and where international standard-setting processes that affect indigenous peoples, such as those related to climate change, should abide fully to the standards of the United Nations Declaration on the Rights of Indigenous Peoples, both in terms of the participation of indigenous peoples in these processes and their results (Anaya 2012).<br><br>At the same time, it is increasingly recognised that valuable insights into mitigation can be drawn from indigenous peoples' customary knowledge of environmental phenomena and change, which they have accumulated over centuries of coexistence with and inter-dependence with, the natural environment (Nakashima et alii 2012). Successful strategies of adaptation, such as community-based forest governance (Friends of the Earth 2008, Persha 2011, Nepstad 2006, Hayes 2008) and the management of ecosystem services (Galloway McKlean | AGREE action will be taken |
| 17335 | 3 | 66 | 45 | 67 | 8 | One additional half line could be added somewhere here to say that studies using demographic categories for analysis (not only gender but also age) can allow visualization of so far invisible aspects that may prove important (targeting education, and policies) for mitigation efforts. | AGREE action will be taken |
| 12146 | 3 | 67 | | | | The discussion of social capital is the passage in this report that seems to me the best candidate for cutting. That's not to say that social capital might not be worth discussing—however, the present treatment contributes little of value. | NOTED coordination across framing chapters will be taken |
| 4508 | 3 | 67 | 1 | 67 | 8 | This paragraph appears to be largely a statement of feminist ideology rather than any sort of scientific contribution (e.g., "the social construction of gender"). | Noted. |
| 12147 | 3 | 67 | 1 | 67 | 8 | This paragraph either needs to be expanded or deleted. As it presently stands, it's not clear what it's talking about. | Noted. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 12148 | 3 | 67 | 14 | 67 | 23 | This vaguely written passage fails to convey a clear definition of what social capital *is*. What does 'with temporal and spatial variability' mean? Wouldn't '[t]he sum of all the resources of each individual or social group in relation to their position in the social structure and their way of establishing social relationships' refer to just about anything an individual or group could possess? How does anyone ever interact except as part of an 'associative network of iindividuals [or] groups'? How is 'solidarity' defined and measured? | Noted. |
| 12149 | 3 | 67 | 28 | 67 | 29 | The causal logic of this claim needs to be specified. If A (social capital), B (human capital) and C (social development) all cause fluctuation in D (community empowerment), this does not ipso facto imply feedback effects among A, B, C and D. Such feedback may exist, but the passage needs to explain how. | Noted. |
| 12150 | 3 | 67 | 30 | 67 | 43 | The link to climate change needs to be made more explicit. Is the point that social capital can assist communities in adapting, or what? | Noted. |
| 11220 | 3 | 67 | 7 | | | I disagree with the statement that it is unclear how effective a gender approach to mitigation will be. Women from rural poor communities are and will, in general, suffers disproportionately from climate change, due to changes in seasons, rainfall, temperature etc. Without careful planning, such women will also be negatively affected by mitigation activiites, losing access to lands, forests, water etc. On the other hand, successful mitigation activities in forests under threat from large scale clearance will be most successful where the women who presently depend on those resources are closely involved in mitigation efforts.. | Noted. |
| 18604 | 3 | 68 | | | | Technological Change is discussed (p 68 ….) but should be linked to social change and social innovation (the social element is probably huge but hard to measure and when it comes to cc values will have to be a driver). Policies are needed to price emissions (?). Would be really interesting to compare what can be the expected outcome of a strategy/approach without any direct element pricing externalities (i.e. beyond supporting R&D) and an approach with a combination of “social” and technological innovation | No action; these aspects are addressed in either previous chapters (eg. 2) or subsequent assessment chapters (e.g. 13, 15) |
| 4626 | 3 | 68 | 26 | 68 | 26 | The concepts of social learning and policy learning are relevant here. Social learning is the set of activities which depend on the participation of the group members in discourse, imitation, or shared collective or individaul actions while policy leazrning is adaptation to external change by organizations which attempt to retain and strengthen their own objectives and their domination over existing socio-economic structures; policy learning can be done through new new coalitions of advisors and technical knowledge (Adger W.N. and P.M. Kelly, Social vulnerability to climate change and the architecture of entitlements, Mitigation and Adaptation Strategies for Global Change, 1999, 4:253-66) | AGREE action will be taken |
| 13949 | 3 | 68 | 28 | | | The Technology section is far too long. It may be shortened by reorganizing it under 2 main subsections: efficiency considerations and equity considerations. | Will be addressed in SOD |
| 13581 | 3 | 68 | 39 | | | You may wish to have a look at Ockwell and Mallett (2012) (eds) book Low Carbon technology transfer from rhetoric to reality (chapter 1) as one thing that is argued that low carbon techs are unique in certain aspects (urgent - cannot 'wait' for the market; climate change is a public good; and many of these technologies are at varying stages of development - points particularly germane to developing country settings) | Dealt with better in other chapters |
| 13582 | 3 | 68 | 39 | | | Like comment 4, just to point out that while a lot of attention goes on market failures alternative lenses take a more systematic approach (Mallett 2012 Technology Cooperation for Sustainable Energy– a review of pathways, Wiley Interdisciplinary Reviews on Energy and Environment (WIREs); Ockwell and Mallett (eds) book above; Rogers (2003) Diffusion of Innovations on social aspects; co-evolution (Smith, Sterling); carbon lock in (Unruh 2000 Understanding Carbon lock-in Energy Policy http://www.sciencedirect.com/science/article/pii/S0301421500000707); etc. These more systematic approaches try account for 'energy systems' and hence the various infrastructure and actors in place to do directly or more marginally with these technologies | Dealt with better in other chapters |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 6089 | 3 | 68 | 44 | 68 | 44 | Very minor point. The text says "because pollution is not priced by the market". This should be changed to "because pollution is not fully priced by the market". Reason; There exists EU ETS. Also even under direct regulations, firms spend money to reduce pollution. This means pollution is partially priced, though it is not through market. | Addressed in SOD |
| 12573 | 3 | 68 | | | | see comment 16 | No action; comment unclear; don't know |
| 17336 | 3 | 68 | 2 | 68 | 26 | What are the structures that could give impetus to action? The question for example of the role that media has in creating interest around the topic of climate chage is here not mentioned or elaborated in any manner. However, the media in general have had episodes of rising alertness toward climate followed by total avoidance of the topic. There most be some studies reflecting on the effects on public perceptions given this patterns. The strong role media has played in the difussion of climate information is not discussed in the report in any manner. This is like omitting the elephant in the room. This session offers a space where to have a substantitated in research paragraph about this. | AGREE but media role should be discussed in other sectorial or assessment chapters. Perception from a conceptual point of view is treated in section 3.11.1.4. |
| 8161 | 3 | 68 | | 76 | | Technological Change. This is a well-written section that provides a complementary perspective to some of the material in Chap. 2 on choice and design of policy instruments under certainty (FOD Chap 2 Sect. 2.4.4) | Thank you for your comment. |
| 17298 | 3 | 68 | | | | The concept that changes in technology enhances interactions and communication, which strengthens societal exchanges and optimizes pricing. | No action; no change implied, confirming |
| 3288 | 3 | 68 | 27 | 75 | 11 | This is good, solid, strong material and should not be shortened. | Thank you for your comment. |
| 13580 | 3 | 68 | 27 | | | while some may consider this aspect to be a part of diffusion, just to note Rogers (2003) diffusion of innovations that a distinction is made between initial use and confirmation -- when the person decides to continue using the technology or note. Others also flag that this confirmation concept may change over time and that a negative experience may have further, deeper negative implications on a technology's use than a positive one (see Mallett (2007) the social acceptance of renewable energy innovations: the role of technology cooperation in urban Mexico, Energy Policy 35, 2790–2798 | Not central to section |
| 10788 | 3 | 68 | 27 | | | The whole section could be replaced with a table summurizing the different technology systems | Noted for reorganizing section in SOD |
| 11407 | 3 | 69 | 1-5&26 | | | the argument here and in other paragraphs of this chapter center on the compensation of the original innovator, and seems to overlook the impact of appropriation regimes on follow-on innovators: 'Since every generation is both 'the first' to future producers, and 'the second' to prior producers, the conflict is pervasive and sets limits on the extent to which, even in a dynamic analysis, it is efficient to recognize and enforce rights in information products. As Arrow put it, 'precisely to the extent that [property rights in information are] successful, there is an underutilization of the information (Benkler, 2001: 270). The impact of lead-time (now only mentioned in lines 28-29) should also be referred to in lines 1-5. | No action - not central to section |
| 12151 | 3 | 69 | 33 | 69 | 33 | Please define the 'winner's curse'. | Will be addressed in SOD |
| 12530 | 3 | 69 | 9 | | | "Appropriability" is not a constraint in network economics. This is particularly important for innovation and diffusion of knowledge. However, development is subject to path dependence. These insights are particularly important in assessing and accelerating learning as an adaptive governance and management strategy for climate response. See Yochai Benkler, Coase's Penguin, or, Linux and "The Nature of the Firm," The Yale Law Journal, Vol. 112, No. 3 (Dec., 2002), pp. 369-446. | Will be addressed in SOD |
| 18605 | 3 | 69, 76 | | | | The IP "problem" is discussed on p 69 (indirectly) – no clear conclusions<br>The same issue is also discussed on page 76. IP is discussed in several chapters (among them 3 and 15). Different material is used and different conclusions are drawn. | Addressed elsewhere as cross-referenced |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 8579 | 3 | 7 | 1 | 7 | 20 | This entire section needs to be reframed. As it stands lines 19-20 are tacked on without any context allowing the reader to see what the point it -- that sometimes we would like to have information about aggregate wellbeing and that there are many ways of trying to do this. ONE (among many) ways of trying to generate information about wellbing is to use income as a partial indicator of wellbing and then model is in MAC curves. Other ways of looking at wellbeing might include measurements of happiness, such as those in Bhutan. Any model of aggregation necessarily imposes assumptions about what is important and how it should be measured. And then it could get into the details of the neo-classical eocnomics worldview. | Will be addressed in SOD |
| 10692 | 3 | 7 | 11 | 7 | 13 | I think the word "emission metric" and the concept GWP should be mentioned in this para in order to make this more concrete and related to applications. | No action. It is in the text; this is just the executive summary. |
| 10963 | 3 | 7 | 11 | 7 | 13 | Methods for considering tradeoffs between CO2 and methane are not being very well considered in this chapter - see my comments on pages 54 & 55, but I think that the text can be clearer here without being much longer. For example, the current UNFCCC approach has become locked into the use of GWPs which were never designed to achieve climate stabilisation. | No action; we already address these tradeoffs. |
| 14838 | 3 | 7 | 14 | | | "Aggregate measures…" this is a particularly important statement, with implications for use of economic methods such as CBA and E(U) that should be drawn out. | No action. It is in the text; this is just the executive summary. |
| 11006 | 3 | 7 | 16 | | 18 | But there is also much evidence that many public policies decrease welfare. There are several ways in which policies purporting to avoid non-optimal energy consumption can lead to net welfare losses. Regulators may misread either consumer preferences or producer costs. Standards based on broad averages may deprive some consumers of valued options. Standards may also act as entry barriers that augment producer market power. Thus, as Coase long ago warned in “The Theory of Social Cost”, the simple existence of a market failure is insufficient grounds for state intervention. The costs of the likely policy imperfections must be weighed against the costs of the market failure. | Noted; will be addressed in SOD |
| 6955 | 3 | 7 | 19 | 7 | 20 | Integral to what? | Will be addressed in SOD. |
| 4750 | 3 | 7 | 21 | 7 | 22 | According to me, not only "energy" should be mention … other sources/sectors should be addressed | Will be addressed in SOD |
| 10420 | 3 | 7 | 25 | 17 | 11 | This section is too theoretical. I do see some applicability of social justice here, but applied research in climate change of this social justice concept should be the focus here. | Noted. This is a difficult section and we are trying to increase the use of |
| 7903 | 3 | 7 | 26 | 7 | 45 | Please make more clear at this point that economic theory entails normative assumptions and, hence, ethics. These assumptions must be made explicit and analysed. There is a huge literature on the normative foundations of economics (instead of many see Hausmann/McPherson 1996). Since the 90ies there is an ongoing discussion of the ethical basis of climate economics and problems that arise if one tries to calculate an "optimal" climate policy. See comments 36 and 44. | No action. This suggestion is too vague to be of use. We treat ethics and economics at some length in the chapter. |
| 2107 | 3 | 7 | 28 | 7 | 29 | *Resolved* how? This might not be obvious to those unfamiliar with previous IPCC reports. | wording will be clarified in SOD |
| 15279 | 3 | 7 | 29 | 7 | 29 | "peoples" to be "people"? | Will be addressed in SOD |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 8416 | 3 | 7 | 31 | 7 | 32 | It would be fantastic if we could say that the primary questions confronting the society with regard to climate change are issues of economics and ethics, and that the people is aware of what is happening to the climate. Unfortunately, in the society there are widespread doubts related to the reality of climate change and the responsibilities of human activities, and this has a great influence on mitigation actions. There are a lot of references that show that an important part of our society, between 20-25% (In Europe – see Eurobarometer surveys) and 40-45% in USA (i.e. see works by Leiserowitz – Yale University http://environment.yale.edu/leiserowitz/climatechange/US.html) doesn't see climate change as a very serious problem.<br>There are a lot of reasons why people don't recognize the gravity of the climate crisis; and also it is of great importance from an ethical perspective an analysis of how should the public be informed on the climate problem (see. Sommerville R. , 2010, How much should the public know about climate science?, Climatic Change, editorial)<br>I suggest that the chapter considers this issue, discussing also the necessity to face the problem at the root, evaluating whether to find remediation to the climate crisis, together with technological and economical matters actions to combat climate changes, is necessary bring into question a deeper level, a thinking over the meaning of this continuous run to the increase of productions, consumptions and the use of Earth's no renewable resources. (see Caserini S., 2008, Climate denialism evolution and the delay of mitigation actions. VI International Conference on Ethics and Environmental Policies. Ethics and climate change scenarios for justice and sustainability) | No action. Commenter makes a good point but communication of IPCC summaries and natural science research is not the subject of the chapter. |
| 4920 | 3 | 7 | 31 | | 32 | I question this very categorical argument e.g. because of huge sci. tasks related to the future behaviour of the climate system at global and regional level that is crucial for setting proper actions. "primary questions confronting society with regard to climate 31 change are issues of economics and ethics, not natural science." | wording will be clarified in SOD |
| 12131 | 3 | 7 | 31 | 7 | 32 | Such a claim would not be very persuasive, because while there is little doubt that climate change is occurring, there remains the crucial questions of how much and what kinds. | Good point. Will be reflected in SOD. |
| 2108 | 3 | 7 | 35 | 7 | 38 | Shouldn't *benefits*, and not only costs, also be mentioned here? | That is what is meant by the costs of inaction. Will try to clarify in SOD. |
| 7904 | 3 | 7 | 37 | 7 | 40 | Mitigation of and adapting to climate change will contribute to poverty alleviation stratagies and related social goals. Unmitigated climate change will only worsen the situation of the global poor. The IPCC should not adopt the artificially cunstructed trade-off between mitigating/adapting to climate change and other valuable social goals. See also comment 36. | No action. This is not something we can address here |
| 10693 | 3 | 7 | 43 | 7 | 43 | The wording "…reasonable people have differing views on this issues…" sounds strange. Please consider rewording or removing this. | Will be addressed in SOD |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 15632 | 3 | 7 | 44 | | 45 | The text could make a clearer statement here or in section 3.2. or 3.3 about how its role in reviewing the literature compares with previous efforts to do the same in earlier IPCC assessment reports. Is it principally providing an update on the literature since AR4, or is it attempting to provide a more comprehensive review than any previous ARs, in which case it would be valid to reach further back into earlier literature? It seems that both objectives would be valid (a still valid but less valuable task would be simply to provide a 'primer' on the issues solely for the purpose of framing future chapters - at times the ethical discussion seems to be doing little more than this). However, in doing so the chapter should demonstrate more clearly the sense in which it is building on previous ARs. It seems to me that the major advances that the IPCC can make in the overall area of equity are more in the quantitative comparison of different ways of translating moral principles into specific burden-sharing approaches (this is more a matter for Chapter 4). However, chapter 3 could still make some important contributions at the level of overall ethical principles. For example, it could give more of a sense of how some key moral principles have been most recently understood. eg have there been any advances in the last 5-6 years on how the polluter pays principle is understood, or have any objections to it been strengthened or refuted? A further contribution that the chapter could make is highlighting ways in which certain principles may take on particular salience in the light of recent trends, including (a) changing patterns of emissions across developed / developing countries; and (b) increasing realisation of the urgency of mitigation (which may have considerable implications for whether a "fair" approach - such as one including full historical responsibility - is even feasible (see eg Tavoni, M., S. Chakravarty, and R. Socolow. 2012. Safe Vs. Fair: A Formidable Trade-Off in Tackling Climate Change. Sustainability 4 (2):210-26). | Since this is a framing chapter and since there have not been ethics and economics chapters before, we are not simply doing an update from AR4. Will make this clearer in SOD. |
| 10694 | 3 | 7 | 45 | 7 | 45 | I suggest adding "…and assessing" after "reviewing". (See also my comment on the need for more assessment and not only review). | Will be addressed in SOD |
| 4479 | 3 | 7 | 6 | 7 | 10 | This paragraph asserts a tautology with "low confidence." Either the negative net cost opportunities exist or they do not, with the magnitudes in dispute in either case. How can there be "low confidence" in a statement that covers all possibilities? | Good point; will be addressed in SOD. The modifier applies to the existence of negative costs as well as why they might |
| 10691 | 3 | 7 | 7 | 7 | 7 | "carbon emissions" is often used synonymously with GHG emissions. When possible, I think one should use the latter since there are significant contributions from non-CO2 gases. In any case, the terms used need to be clearly defined. | Will be addressed in SOD |
| 17330 | 3 | 7 | 30 | 7 | 30 | …solutions that are both just and cost effective". What about socially acceptable? | Socially acceptable is implicit in "just" though we will try to clarify in SOD. |
| 13931 | 3 | 7 | 41 | 7 | 45 | I think that the distinction between economics and ethics is not very clear on this page. I say so because the paragraph I mention states: "What ought to be done, at least in contexts that involve values and human interests, is the subject matter of ethics". I would say the same of economics. Economics states what markets do (what "is") and what "ought to be done" to fulfill pareto optimality (efficiency in resource allocation considering costs and benefits) or minimize costs to reach a given environmental goal. You may need to rephrase that sentence to make differences among normative statements in economics and ethics clearer. This is correctly done on page 8 lines 11 to 21. | Good point. Will be reflected in SOD. |
| 6306 | 3 | 7 | 41 | 7 | 42 | The report states: "One might ask why there is a discussion of ethics in an IPCC assessment. The answer is simple." It seems eminently reasonable to me (and many others) that there be a discussion of ethics in the IPCC assessment. The authors' statement here implicitly undervalues the role of ethics by making it sound as if it is unreasonable to include it. I suggest re-wording, to say something like: "Discussions of ethics constititute an essential part of an IPCC assessment because...." | Will be addressed in SOD |
| 13263 | 3 | 7 | 19 | 7 | 19 | Ecuador also as example of coutries including direct reference to life integrity in its constitution | Will be addressed in SOD. Text can be modified as follows: Several countries (such as Bhutan, Ecuador and Bolivia) |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 17329 | 3 | 7 | 19 | 7 | 20 | This reads as a very vague statement not worth for an executive summary. If policy makers are to read only the Summary, then it is only just to make the issue that alternative worldviews focusing on lifestyle changes and attitudes toward nature have gone from debate form to become specific "constitutional" mandates in a couple of countries. What is missing is a better formulation at the moment. Consider re-writing. | Will be addressed in SOD |
| 3263 | 3 | 70 | 43 | 71 | 5 | Dechezleprêtre et al. (2011) cites China as the 4th most important inventor country ahead of many industrialized countries, therefore the claim here that "most climate friendly innovation occcurs in developed countries" fails to provide a full picture of the actual story. | Will be addressed in SOD |
| 13583 | 3 | 71 | 1 | | | another study (Abdel Latif 2012 Chapter 5, the UNEP-EPO-ICTSD study on patents and clean energy: key findings and policy implications in Ockwell and Mallett (eds) low carbon TT, also echoes that while low carbon / clean tech patents are concentrated in developed countries when assessed vis a vis patenting activities as a whole, some emerging economies have been leaders (India on PV, and Brazil and Mexico on hydro and marine) | Addressed elsewhere |
| 13584 | 3 | 71 | 34 | 73 | | much discussion on exogenous versus endogenous growth tends to focus on firms versus people and households and other institutions (e.g. schools, hospitals), communities, etc. and other actors which have different characteristics and motivations than firms. See IPCC 2000 Section 1.5 Methodological and Technical Issues on TT | No action; not central to section |
| 9812 | 3 | 71 | 36 | 71 | 40 | The use of the terms exogenous and endogenous is opposite to their usual meaning, exogenous meaning coming from outside, whereas endogenous means coming from inside: "Exogenous technological change is assumed to progress at a steady rate over time, independent of changes in market incentives. One drawback of exogenous technological change is that it ignores potential feedbacks between climate policy and the development of new technologies. Models with endogenous technological change address this limitation. Endogenous technological change models relate technological improvements in the energy sector to changes in energy prices and policy." and thus might be misleading. | We believe this is clear |
| 15379 | 3 | 72 | | | | This is a good mention of Nordhaus critique, that due to multi-collinearity we have no idea whether LBD happens in general or in the way described | Thank you for your comment. |
| 12791 | 3 | 72 | 5 | 72 | 5 | You might like to add some more words on the Nordhaus-Model (DICE) as it is mentioned a lot of times. | Addressed elsewhere |
| 12152 | 3 | 73 | 33 | 73 | 33 | The phrase 'productivity of fossil fuels' is confusing: One can easily take it to mean how much a given unit of fuel *contributes*. Would it be better to say *production*? | Will be addressed in SOD |
| 17299 | 3 | 73 | | | | The example of cell phone technology in developing countries is worth noting. | No action; out of the scope of section |
| 10952 | 3 | 73 | 39 | 75 | 11 | Confer: Fischer, Torvanger, Shrivastava, Sterner, Stigson (2012), How should support for climate-friendly technologies be designed?, Ambio, 41(Suppl. 1), 33-45. | Relevant to other chapters |
| 4509 | 3 | 74 | 19 | 74 | 23 | Work by Nathan Lewis suggests the opposite---that there is quite adequate room for deployment of solar sources. Lewis's work should be cited and the contrast noted. | Will be addressed in SOD |
| 13585 | 3 | 74 | 35 | | 36 | I think this point is very important and so would suggest highlighting it earlier on, and more throughout so that the message doesn't get 'lost in the weeds' | Will be addressed in SOD |
| 7310 | 3 | 74 | 44 | 74 | 45 | "waste to energy technologies which are further from being competitive with traditional energy technologies". This statement is not correct. Several "energy-from-waste" technologies have been "competitive" for many decades, including 1) waste combustion systems for district heating, elec. gen. in Europe, Japan and elsewhere; 2) landfill gas recovery for biogas use, elec. gen. [fully commercial since the first U.S. project in 1975]; and 3) anaerobic digestion of wastewater and wastewater biosolids for biogas production & use. Please update; suggest using references in AR4.WGIII.Chapter 10. | Will be addressed in SOD |
| 13417 | 3 | 75 | | 76 | | This subsection on technology transfer is far too brief, since it is a critical issue in the discussion of climate change and climate negotiations and agreements. It was agreed that Chapter 3 as a framing chapter would give the fundamental concept and treatment of this issue. Providing less than 2 pages out of 77 pages to this topic is too little. (See general comments on chapter for more comments on this) | Good point, but this issue is addressed in more detail in subsequent assessment chapters (e.g. 13, 14, 15 and 16) |
| 15380 | 3 | 75 | | | | This is a good conclusion | Thank you for your comments. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 18389 | 3 | 75 | | 76 | | I found the whole section on technology transfer very week, old fashioned, impling that developing countries have benified from the evolution of the patent systems when they, with the liited capacities they have to engage in research or learn through licensing have little access to the knowledge they need to innovate and where their engagement in international collaborative research has mainly consisted of accepting to be in projects they have not designed and projects in which the research is mainly carried out in the industrialized countries. There are exceptions, of course (see the Global Energy Assessment (2012) Cambridge U.P. especially section 25.7) and it would be useful to revise this small section and provide some examples of what could , in fact, be done. | We believe this is adequately addressed |
| 2336 | 3 | 75 | | | | There are some consideration when technological is transferred to developing countries.<br>1. Appropriate technological transfer- some methods and equipment are not bearable or cannot be maintained in long run by developing countries themselves.<br>2. There should be financial aid for technologies which are already innovated in developing countries. □ | No action; we believe the issue is already dealt with adequately |
| 13586 | 3 | 75 | 1 | | 2 | while it is not clear exactly where political feasibility is captured (perhaps that is how institutional aspects mentioned on page 6 in Chapte 3 - suggest making clearer) I would suggest that this point be stressed. As an example, in our NBS study (Auld et al. 2011) - we found from Sawin 2004 there was a program to promote Renewables in the Netherlands which was cancelled as 75% of the credits and subsidies were being given to foreign versus domestic players Sawin, Janet L. 2004. Policy Lessons for the Advancement & Diffusion of Renewable Energy Technologies Around the World. Paper presented at International Conference for Renewable Energies, Bonn. | Good point, but this issue is more relevant to subsequent assessment chapters (e.g. 15 and 16) |
| 13588 | 3 | 75 | 19 | | 26 | I think Comment 20 is relevant here (that low carbon technologies are unique in a number of ways as stated above) | No action; addressed elsewhere |
| 13589 | 3 | 75 | 19 | | 26 | Haselip et al 2011 make a distinction between transfer and diffusion http://www.tech-action.org/Guidebooks/TNA_Guidebook_OvercomingBarriersTechTransfer.pdf | Grey literature |
| 14850 | 3 | 75 | 2 | | | The sentence "However…" seems to directly contradict the sentence on p. 74 line 24 "in general,…" | Will be addressed in SOD |
| 13591 | 3 | 75 | 22 | | 24 | How is trade being defined? E.g. where can the work of NGOs / communities (capacity building, equipment, skills, etc.) be captured? | No action; not relevant to section. |
| 11408 | 3 | 75 | 22 | | | it is misleading to state that 'trade in products' is a modality of transfer of technology, which requires the transmission of knowledge and the opportunity for the recipient to actually learn why and how a certain technology works. The chapter should be based on a more rigorous concept of transfer of technology. For instance, the Draft International Code Of Conduct On The Transfer Of Technology [1985 Version] defined it as follows: "Transfer of technology … is the transfer of systematic knowledge for the manufacture of a product, for the application of a process or for the rendering of a service and does not extend to the transactions involving the mere sale or mere lease of goods." | Adequately addressed |
| 13590 | 3 | 75 | 31 | | 33 | Sauter and Watson's report on Leapfrogging (which is noted in Chapter 14, page 48 lines 1-2) http://www.ingentaconnect.com/content/ind/ijtg/2011/00000005/f0020003/art00001 and Gallagher (2006) http://www.sciencedirect.com/science/article/pii/S0301421504001739 may be helpful | Will be addressed in SOD |
| 11409 | 3 | 75 | 33 | | | technological 'catch up' is not equivalent to 'leap-frogging' as suggested here. The latter concept assumes that certain stages of technological development and learning can be omitted; Carlota Perez, for instance, has argued that this is only possible when new techno-economic paradigms emerge. | Will be addressed in SOD |
| 13592 | 3 | 75 | 40 | | | suggest alternative word such as appropriate, relevant, pertinent, versus 'right' | Will be addressed in SOD |
| 13593 | 3 | 75 | 40+ | | | Suggest having a look at Bell (1990) cited in Ockwell et al. 2007 UK-India Collaborative study on technology transfer. Phase I http://www.sussex.ac.uk/sussexenergygroup/documents/uk-india-full-pb12473.pdf and also Sanjaya Lall's - awareness, know how and know why skills (http://www.g24.org/Publications/Dpseries/28.pdf | Grey literature |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 13587 | 3 | 75 | | | | Just to say that while the term technology transfer is still prevalent, alternative terms such as technology cooperation are gaining more currency -- see Heaton, G. R., R.D. Banks, D. W. Ditz (1994). Missing Links: Technology and Environmental Improvement in the Industrializing World. Washington D.C., World Resources Institute (WRI): 1-53.; Martinot, E., J. E. Sinton, B. M. Haddad (1997). "International Technology Transfer for Climate Change Mitigation and the Cases of Russia and China." Annual Review of Energy and Environment 22: 357-401. (as also noted in IPCC 2000) - also Mallett (2007) the social acceptance of renewable energy innovations: the role of technology cooperation in urban Mexico, Energy Policy 35, 2790–2798 and Mallett 2012 Technology Cooperation for Sustainable Energy– a review of pathways, Wiley Interdisciplinary Reviews on Energy and Environment (WIREs) http://wires.wiley.com/WileyCDA/WiresJournal/wisId-WENE.html | Not central to section |
| 3289 | 3 | 75 | 12 | 76 | 38 | This should be deleted because of overlap and replaced by a reference to chapter 13, International Cooperation | Only the framing is maintained here |
| 17300 | 3 | 75 | | | | Informal Research and development as practiced by non-literate farmers with seeds or fertilizer applications and observation to climate stress offer interesting examples. In fact some of these informal technology development could be extremely significant. These can be of major economic value. These are not patented hence can reach other farmers faster. | Not central to framing chapter |
| 18606 | 3 | 76 | | | | Page 76: “As is clear from even a causal reading of this chapter, there are many questions that are not completely answered by the literature.” What sort of conclusion should be drawn from that statement? The conclusion drawn here is to try to formulate issues/themes where research is needed during the coming decade as a prep. action for AR6 (!!!) so it can say more about the ethics and economics of climate change (the chance is slim! Some issues raised have no single answer and have been discussed/penetrated for 100s or 1000s of years). | Noted; this section has not been written yet. Text is a placeholder. |
| 11414 | 3 | 76 | | | | More generally, the chapter fails to reflect important academic work regarding the limitations of IP as an incentive for innovation. One increasingly widespread view is that the role of the patent system in promoting innovation is less substantial than usually claimed (Landes and Posner, 2003; Levin et al., 1987). Patents may even stifle the very innovation they are supposed to foster (Jaffe and Lerner, 2004). There is compelling evidence indicating that ‘collective invention’ based on sharing innovations is more efficient than patenting them (Bessen and Meurer, 2008); some studies suggest that innovation not only thrives in a competitive environment, but that more profit can be generated by inventors in a system based on the broad diffusion and common use and improvement on innovations (Torrance and Tomlinson, 2009). | Addressed elsewhere as cross-referenced |
| 13594 | 3 | 76 | 1 | | 4 | Suggest a line denoting that IPRs are more than patents (trademarks, copyright, etc.) but that most discussion to do with low carbon technology focuses on patents due to the potential for preventing access - you may wish to have a look at Mallett et al. 2009 UK-India Collaborative study on technology transfer. Phase II for further discussion on IPRs and how carbon technology http://www.sussex.ac.uk/sussexenergygroup/documents/decc-uk-india-carbon-technology-web.pdf | Good point, but this issue is addressed in more detail in subsequent assessment chapters (e.g. 13 and 15) |
| 11411 | 3 | 76 | 12 | | | the reference to ‘adjustments’ excludes the consideration of an overhauling of the IP system to respond to current social, economic and technological needs, as well as alternative models to promote innovation, such as open innovation systems that are proving to be efficient in various areas (e.g. medical research, food and agriculture, software) | Will be addressed in SOD |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 13419 | 3 | 76 | 14 | 76 | 21 | This paragraph is taken from the zero draft. However in the zero draft the paragraph is part of a long discussion on the debate in the literature on the significance and effects of IPRs on climate related technologies. This paragraph describes the argument that IP is not a problem. This had been followed by several paragraphs in the zero draft that dealt with findings in the literature on why and how IPRs are and can be a barrier to technology development and transfer. However all these other paragraphs have been eliminated, thus giving the mislead. Also, paragraphs in the zero draft on the potential use of flexibilities in the IPR regime and the regulation of conditions in voluntary licenses have been eliminated.ing impression that the literature does not recognize the potential of IPRs to be a barrier. | Will be addressed in SOD |
| 7364 | 3 | 76 | 14 | 76 | 24 | Despite referring to only one study in contrast to three, much more discussion is dedicated to the argument that IP regimes assist technology transfer. It would be helpful to draw out more of the analysis of how they (IPRs) may hinder technology transfer. | Will be addressed in SOD |
| 11412 | 3 | 76 | 19 | 76 | 21 | the reference to Barton's study does not properly take into account other considerations made by the author on barriers to the access of climate change relevant technologies. | Will be addressed in SOD |
| 13420 | 3 | 76 | 22 | 76 | 24 | This very short paragraph is all that remains from the zero draft which had given details of research findings on the barriers that IPRs can pose to technology transfer. | No action; already addressed in 13419 |
| 13595 | 3 | 76 | 22 | | 24 | As a follow up to my colleague David Ockwell's work, Phase II http://www.sussex.ac.uk/sussexenergygroup/documents/decc-uk-india-carbon-technology-web.pdf shed some further insights which may be helpful. 1) that IPRs weren't preventing access to these technologies but were playing a role on the rate of diffusion (NOTE a number of sources indicated that this may change and that access would likely decrease as Indian firms moved farther up (and down) the value chain 2) that internationa lsources of R&D cooperation were increasing rates of development and diffusion (e.g. university or industry experience abroad and coming back to India; Indian firms acquiring the majority share or outright ownership of firms in developed countries; that there were strong linkages which may not be as apparent on the surfacesuch as diaspora communities e.g. one interviewee told me pl. 72 of Phase II that 60-70% of researchers working on PV in the US (firms, govt institutes, unis) were of India origin more or less, and 3) a creative way in which to attend to IPR concerns and R&D efforts are to establish collaborations early on between partners and where the role of IPR-sharing (or not) is made clear at the outset -- see Phase II for details | Noted. We avoid grey literature. |
| 11658 | 3 | 76 | 22 | | | The IPRs are not the only barrier to technology transfer and diffusion. As shown in Ockwell et al. 2010 and UNEP, EPO&ICTSD 2010, other issues, such as absorptive capacity of recipient firms, infrastracuture, initial cost of new technologies and market conditions will play an eually important role in facilitating access to technology. As Chapter 13 also describes the relationship between IPRs and technology transfer, the related text in Chapter 13 should be referred in Chapter 3. Reference: Ockwell et al. (2010) Intellectual property rights and low carbon technology transfer: Conflicting discourses of diffusion and development, Global Environmental Change, 20, pp. 729-738, UNEP, EPO and ICTSD (2010) Patents and clean energy: Bridging the gap between evidence and policy, UNEP, EPO and ICTSD. | Good point, but this issue is addressed in more detail in subsequent assessment chapters (e.g. 13 and 15) |
| 11413 | 3 | 76 | 22 | 76 | 24 | this brief reference to IP as a potential barrier is insufficient to reflect the view of developing countries' governments and academics who have highlighted how IP can be a barrier for access to technology in this and other fields, as shown by Watal, 1998, Anderson &Sarma, 2007, Zhou Yuanchuan, Zou Ji et Wang Ke (2010), among others. | Addressed elsewhere as cross-referenced |
| 13418 | 3 | 76 | 3 | 76 | 4 | Although the subject title is technologies in the public domain and patented technologies, there is no treatment of the significance of technologies in the public domain, or expansion of public domain technologies. References to this in the zero draft were eliminated. | Good point, but this issue is addressed in more detail in subsequent assessment chapters (e.g. 15 and 16) |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 13421 | 3 | 76 | 32 | 76 | 38 | This paragraph is retained from the zero order draft but the reference to Correa (2011) as the source of this paragraph's ideas should be re-instated. The two other subsequent paragraphs in the zero order draft that give examples of innovative technology cooperation models, and on establishing R and D networks of research institutions in developing countries are significant and may be re-instated. Shortage of space should not be a reason for such a brief treatment to the technology transfer issue. | Addressed elsewhere as cross-referenced |
| 11410 | 3 | 76 | 7 | | | the statement that 'It is widely accepted that patents have the function of providing incentives for innovation…' needs to be qualified, since this function is strongly dependent on the context where the IP regime applies. IP does not work in the same way in a country with a sophisticated R&D infrastructure, availability of human resources and risk capital and in poor countries where IP has no real impact in promoting innovation. | Will be addressed in SOD |
| 14851 | 3 | 76 | 1 | | | This section is important and could be elaborated. | Noted for reorganizing section in SOD |
| 6319 | 3 | 76 | 22 | 76 | 24 | Could the authors add one additional sentence to explain how, or to provide an example, as to how IP protection can prove to be a barrier to technology transfer? | Addressed elsewhere as cross-referenced |
| 14852 | 3 | 76 | 25 | | | This section is important and could be elaborated. | Adressed elsewhere as cross-referenced |
| 4354 | 3 | 77 | | 111 | | The bibliography omits Donald Brown et al., 'White Paper on the Ethical Dimensions of Climate Change', College Park: Rock Ethics Institute, Penn State University, 2006, and this is a serious omission. | No action; this is grey literature, and cannot be used in the report |
| 12792 | 3 | 77 | | 77 | | You may like to add that a just distribution of costs and benefits is a central point of discussion in international climate change negotiations. Regarding COP15 it even hampered the negotiation. | Good point |
| 12793 | 3 | 77 | | 77 | | What about the justice motive? | Answers to FAQs are inevitably |
| 12794 | 3 | 77 | | 77 | | Maybe there is more to mention than "poverty". | No action. This is not meant to be an |
| 6090 | 3 | 77 | 22 | 77 | 30 | Add as fifth category "technological promotion aspect". | No action. That is covered in the text. |
| 11221 | 3 | 77 | 27 | | | It will also need to respect the right of indigenous peopels and local communities in threatened forest areas to play a decisive role in mitigation planning and implementation, so that they are not empoverished or disadvantaged, and so that their knowledge of the ecosystem is incorporated into mitigation activities. | No action. Already covered in text. |
| 14853 | 3 | 77 | 9 | | | The answer to the FAQ 3.2 is not sufficient. The distinguish between states and firms (or individuals) is relevant. | Answers to FAQs are inevitably abbreviated. |
| 3915 | 3 | 77 | | | | FAQ 3.1 says that the chapter reviews how the literature views the ethical aspects of what should be done about climate change, but FAQ 3.2 and FAQ 3.3 don't invoke any ethical issues. | No action. Ethics is not the only subject of the chapter. |
| 6320 | 3 | 77 | 2 | 77 | 30 | Given the fact that the authors have described the value of indigenous perspectives, could a question be added regarding the need to respect cultural differences in discussions of climate change policy? | No action; that is embodied in the first FAQ |
| 12153 | 3 | 79 | 20 | 79 | 20 | I cannot find any evidence that Arrhenius 2011 has yet appeared in print. | Noted; it was accepted long ago by the publisher. The author promises it by |
| 8821 | 3 | 8 | | | | at the top of this page a focus on individual well-being is clearly stated, yet communities also can be impacted – and values or ethics of communities can be quite different from those of individuals, as can the required evaluation mechanisms. | This is mentioned in the text of 3.4, and now with more stress. |
| 13001 | 3 | 8 | 1 | 8 | 10 | It would be helpful to signal that other matters, such as rights and nonhuman nature (e.g., animals, plants, species), are relevant too. These are mentioned later, but are significant enough to warrant inclusion from the outset. | No action. As noted, these are already addressed. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 8788 | 3 | 8 | 11 | 8 | 14 | Questions of at least conventional economics are always at least based on normative ethical assumptions. That is, in examining 'how firms have reacted in the past to cap-and-trade programs for limiting emissions' is done through the lens of economics would typically look at the relative increase or reduction in utility, GDP or simply money. A deontological approach could look at whether legal duties have been met and whether there has been a change more generally in considering and abiding by duties, rights and responsibilities. A virtue approach could consider whether individual and groups have a better understanding of virtue, have acted more virtuously in the specifics and more generally. With great hazard of being misunderstood, but to put the last point in language that economists and those committed to that ethical position might understand; have and will virtues such as wisdom (or prudence), humility, justice, compassion, courage and moderation of consumption increased or decreased. To summarise, questions of economics are never 'positive', they are always normative and this applies throughout the draft AR5 reports and previous IPCC reports. | No action. Wording is adequate in text. |
| 8789 | 3 | 8 | 17 | 8 | 19 | It is stated 'This chapter does not attempt to answer normative questions, but rather provides policymakers with the tools (concepts, principles, arguments and methods) to make such decisions using their own values.' As already stated the chapter itself is framed by barely recognised ethical and epistemological assumptions which are likely to reinforce the assumptions of many of the most influential policy making organisations and policymakers which are unlikely to be the assumptions the majority of the global population. Popper's 'Open Society' raises questions about the possibility and benefits of separating normative questions from social science and the dangers of this turning into historicist justification for closed totalising ideologies. Whether this is the case with the dominance of conventional in current policy processes I will leave the reader to judge. | No action. Outside the scope of the chapter. |
| 3917 | 3 | 8 | 17 | 8 | 21 | The ethical basis for the proposition in this sentence that decision-makers should make public policy decisions using their own values should be examined in this chapter. The implication is that the policy makers' values are more important than voters' values. This may be particularly dangerous for civil society when dissenting voters' values are strongly held. Another problem is that the rest of the chapter seems to fail to provide the promised guidance. For example, where in the chapter does it tell policy makers how to use their own values to determine an 'intergenerationally just emissions trajectory" (see line 18 on page 5)? | We agree with the comment and the wording will be changed for the SOD. |
| 9012 | 3 | 8 | 18 | 8 | 21 | The self-stated claim of the chapter is "not to attempt to answer normative questions" (line 17 page 8). The authors intend the chapter to be a "resource for policymakers and researchers who are trying to solve normative questions. In that sense, the chapter is policy-relevant but not policy-prescriptive". The chapter as written privileges market-based policies that are effective mainly in developed countries. Because of this bias, much of the literature it surveys is irrelevant to its self-stated intention. There is a need to recognize more of the literature to pertains to development. | No action. We state the limits of our discussion but we are constrained to look at the existing literature. |
| 4933 | 3 | 8 | 20 | | 21 | This is a common principle for the whole IPCC work: "In that sense, the chapter is policy-relevant but not policy-prescriptive.", i.e. it could be e.g: "In that sense, the chapter closely follows the general IPCC guidelines on being policy-relevant but not policy-prescriptive." | Good point. Will be reflected in rewriting for SOD. |
| 8144 | 3 | 8 | 22 | | 26 | Where does descriptive behavior fit into the characterization of ethical issues? Individuals may behave differently than either normative or positive models suggest they should act. | No action. We discuss this in section 3.11 |
| 11531 | 3 | 8 | 22 | | 26 | Where does descriptive behavior fit into the characterization of ethical issues? Individuals may behave differently than either normative or positive models suggest they should act. | No action; duplicate |
| 6956 | 3 | 8 | 26 | 8 | 26 | outcome-based' is a better term than 'criteria-based'. | Will be addressed in SOD |
| 13563 | 3 | 8 | 27 | | 28 | in supporting the above comment, and to do with consistency, the text here states that human values include wellbeing and cultural values | No action; same comment as previous comment. |
| 4934 | 3 | 8 | 33 | | | {Add} mitigation of greenhouse gases {}emissions | Will be addressed in SOD |

| 3918 | 3 | 8 | 44 | 8 | 45 | This presentation is a bit confusing. Can ethics really determine that outcomes are ethically unfair if the process has been ethically fair? If so, how can ethics to choose between an ethically unfair process leading to the ethically fair outcome and the opposite conjunction? | No action. The text assumes that the outcome of a fair (e.g. democratic) decision procedure can be unjust (e.g. by denying human rights to a minority of the inhabitants or by externalizing the |
| 7905 | 3 | 8 | 46 | 9 | 3 | Please clarify the relationship between axiological and deontological dimension of ethics. In our opinion it is claerly misleading to see justice as one value among others. At least to Kantians and Rawlsians justice is on another level as "values of different sorts". | More space has been given to the variety of views about the relation between justice and value. |
| 3916 | 3 | 8 | 9 | 8 | 10 | Can any authority be cited in support of the assertion that developing real policy solutions inevitably involves creating efficient, just and fair policy solutions? A Google search of the words 'Pork Barrel US Congress' or earmarks with demonstrate the very real concerns about the tendency for legislators to favour interest groups at the expense of the overall public interest, even in the US. Again this sentence suggests the absence of a positive theory of government action. | wording will be clarified in SOD |
| 6307 | 3 | 8 | 11 | 8 | 14 | I suggest rethinking the reliance upon the notion of the term "value-neutral." The example given here of "how firms have reacted in the past to cap-and-trade programs" may not be as value-neutral as it first appears. After all, the term "how" may imply value (i.e. was it a "good" reaction or a "bad" one?!) Perhaps using terms such as "empirically descriptive" would avoid challenges of finding truly "value-neutral" examples. | Slight rewording necessary for SOD. |
| 15633 | 3 | 8 | 25 | | | Re "historic responsibility" - I believe "historical responsibility" is the more common (and preferable term) despite the former being used in some literature (e.g. Mueller et al 2009). For example, "historical responsibility" is the term used in the Cancun Agreements (LCA decision, Part III A, Preamble). It is also used elsewhere in the chapter (eg heading for 3.3.4). | Word changed noted. |
| 6308 | 3 | 8 | 27 | 8 | 28 | This chapter makes an awkward distinction between "human" and "non-human" values. I would suggest that all values are human, although of course, non-human objects (animals, ecosystems, the planet) can, of course, be "valued." Here, as in chapter 2, I would opt for the anthropocentric (or human-centred) vs. non-anthropocentric (or ecocentric or biocentric) distinctions, rather than using inaccurate terms such as "non-human values." | Will be addressed in SOD |
| 10786 | 3 | 8 | 40 | | | Leonardo Boff, the Brazilian philosopher, has raised some ethical principles to be applicable to humanity, life, nature, and the environment, with startling views on the Earth planet. Please refer to his several papers in English and other languages. | We considered this point but feel no reference to Boff required. Boff is known for ecologically-oriented liberation theology; the points he has made about ecology are much broader than the issues on mitigation we cover, and we |

|---|---|---|---|---|---|---|---|
| 15634 | 3 | 8 | 41 | | | This comment encapsulates what I see as a fundamental structural issue that the chapter needs to address. The conceptual framework for the discussion of ethics is unclear and impedes the clarity of the overall discussion in this chapter. While it makes sense to distinguish broader questions of value from more specific questions (eg justice), several problems remain.<br>The first is that key concepts such as "justice", "equity" and "fairness" are not defined or placed in a clear relationship to one another.<br>Second, it is arguably erroneous to treat fairness as "a part of justice" (page 9, line 3). Despite Rawls's well-known theory of "justice as fairness", Rawls himself did not see the two as purely synonymous (Rawls [1999]. A theory of justice. Revised edition, p.11), nor did he see fairness as a subset of justice. If anything, Rawls saw fairness as potentially reaching beyond justice to broader considerations of what is "right" (Rawls 1999, p.15). This distinction is not of merely theoretical interest but is of broader relevance to the applicability of discussions of justice and fairness to climate policy. The framing of climate change as a matter of "justice" may be theoretically valid, but the question of its scope beyond national borders is subject to considerable debate among theorists. Moreover, the applicability of ideas of justice in policy arenas is highly contentious (as evinced by the reluctance of developed countries to countenance many positions advocated by the civil society "climate justice movement").<br>By contrast, the principle of "equity" is firmly enshrined in the UNFCCC. "Fairness" is arguably also widely accepted as a criterion that is synonymous with equity. However, if fairness (and by implication equity) is seen as a subset of justice, there is a risk that those who reject the frame of justice will be more inclined to find considerations of equity and fairness unpersuasive. The more preferable view I believe is the converse view, namely that justice is a part of fairness (or, at a wider degree of consensus, that they overlap but are not identical). Accordingly, if the concept of justice is defined as giving people their due (Campbell (2010), Justice, 3rd edition, p.13), or what they are owed / have a right to, and fairness is defined as a broader criterion of even-handedness or proportionality in the treatment of people, then it becomes clearer that not every instance that is unfair is thereby also unjust (whereas the converse could hold true). | Some further explanation of the concepts has been added. Only a few theorists share the commentator's understanding of justice and fairness. Some wording has been altered to allow for it. |
| 16959 | 3 | 8 | 41 | | | To supplement my previous comment about the relationship between justice, equity and fairness, note that the structural distinction between outcomes and process could apply to fairness as well (as in the distinction between substantive and procedural fairness). I do not suggest jettisoning the discussion of justice, particularly since much research on climate ethics is framed in terms of justice. Rather it should be noted that principles discussed with specific reference to climate "justice" could also inform broader considerations of fairness as well, such as the polluter pays principle, ability to pay and so on. | See response to 15634 |
| 6309 | 3 | 8 | 46 | 9 | 4 | Distinguishing between criteria of value (strange term) and criteria of justice seems awkward to me. I recommend deleting these lines. Separating issues of justice from "values" is hardly uncontroversial. | No action. This text is just explaing how the chapter is organized |
| 4332 | 3 | 82 | 20 | 82 | 21 | Please cite the final revised paper rather than the Discussions paper: Boucher, O., Comparison of physically- and economically-based CO2-equivalences for methane, Earth System Dynamics, 3, 49-61, 2012. | Noted; change made in SOD |
| 9382 | 3 | 9 | | | | The interpretation of ethics as primarily being focused on human well-being and fairness is quite contested. Ethics is about normative standards of what each person deserves and about principles which mediate between ecological necessities and justified claims. This includes approaches from the camp of pollitical ethics. | No action; comment unclear |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 8580 | 3 | 9 | 13 | 9 | 25 | One of the problems of this chapter is that the conversation repeatedly gives preference to a neo-classical perspective without balancing or even recognizing that it is doing it. For instance, dividing the ethics as "theoretical" and the economics as "practical" is deeply problematic. This language infers that ethics has nothing useful or real to contribute (this attitude permeates this chapter in so many small ways I simply cannot identify them all). If nothing else this movement from broad discussion of a range of values and a range of ways of thinking about values to a very narrow focus only on those values that are represented in social welfare functions and then an even further narrowing into CBA should be acocmpanied by CLEAR and explicit recognitions of teh limitations of this. The text could read something like, "Sections 3.3.3 to 3.3.6 concentrate on the value of human wellbeing. This is a more narrow focus that excludes many values, such as that of non-human nature. However, this more narrow focus can be useful in certain sitations because it can more easily accomodate the aggregation of human wellbeing, as long as this is represented in constrained terms such as income". This much more appropriate indicate clear understanding of the limitations and narrowing of the chapter. As for lines 22-25 - why is CBA "particularly crucial for climate change"? This seems like a strong NORMATIVE statement when in fact the utility of CBA for situations as complex as cliamte change as been well disputed in both the ethics and economics literature. This would be much more accurately framed as ; "Section 3.5 then focuses on assessing the strenghts and weaknesses of one specific strategy that has been used in climate change policy making, CBA". Also - why is discounting the only debate covered in this section when the representation of rights and the challenges rights pose to aggregation is another central debate in ethical reflections on the use of CBA? | Some of this comment represents a misreading, particularly the comment on 22-25. However, the comment rightly identifies the progressive narrowing of the analysis, which leaves out particular considerations at each point. This structure of assumptions has been given more stress. |
| 9799 | 3 | 9 | 26 | | | I really enjoyed reading this section from a scholars point of view. For decision makers it might be too much like a textbook. Stress for each section why this chapter is important for the IPCC AR5 and the decision makers it addresses. | Will add practical examples in SOD |
| 2109 | 3 | 9 | 26 | 9 | 26 | Something seems to be wrong with the numbering here (should be 2.3?) | Will be fixed in SOD |
| 10696 | 3 | 9 | 29 | 9 | 29 | I suggest adding "… and assess" after "review" and that you put more emphasis on this. | Agreed |
| 9337 | 3 | 9 | 3 | | | tFairness as a part of justice??? The idea contained in this needs to be explained | This sentence has been removed |
| 9384 | 3 | 9 | 32 | | 34 | In the context of climate change, concepts of environmental justice and ecological justice are equally important. They are not exclusively inter-personal concepts, but integrate justice to the environment. | Will be addressed in SOD |
| 8792 | 3 | 9 | 36 | 9 | 39 | Despite considering justice 'a political virtue' this chapter does not appear to consider virtue notions of justice. This severely limits the chapter's attempts to 'indicate where there are differences of opinion in the literature' about justice and clearly makes the 'review of the literature in this section ... policy relevant [and] policy prescriptive'. | Will be addressed in SOD |
| 16674 | 3 | 9 | 36 | | | Why the scare quotes on 'just' and 'correct'? | Agreed. Will remove scare quotes |
| 11008 | 3 | 9 | 36 | | 37 | The authors note the great diversity of ethical views. However, in framing ethical issues, the draft relies heavily on what appears to be a fairly limited slice of the western philosophic tradition. In fact, many of the leading lights in the history of western ethical thought would reject the entire framework in which the discussion is cast. The Buddhist or Confucian traditions might tend to the same result. What grounds are there, other than convenience for selecting this ethical framework rather than some other? | Noted. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 15635 | 3 | 9 | 4 | 12 | | The categorisation of forms of justice could be considerably clearer. First, the forms of justice could be mapped more clearly onto the distinction made on the previous page between processes and outcomes. A more systematic and coherent classification would be as follows: justice is composed of the following forms: (a) outcome-focused justice [or "substantive" justice] which includes (i) distributive justice and (ii) compensatory [or "rectificatory" / "corrective" justice; and (b) procedural justice. Second, referring to "rectificatory" or "corrective" justice rather than "compensatory" justice arguably avoids the implication that compensation is the exclusive remedy for this type of injustice (when other remedies such as restitution or preventing future harm may be possible or preferable). In addition, it is common among luck egalitarians to see compensation as a part of distributive justice (as in the idea of compensating for undeserved inequalities). | We do distinguish outcome justice and procedural justice. Section 3.3 contains a taxonomy of forms of justice |
| 4935 | 3 | 9 | 41 | | | Avoid interpretation that the goal is the GHG-emission, instead: .. benefits from various activities which (unintentionally) also generate GHG-emissions | Will be addressed in SOD; will rewrite this sentence |
| 10697 | 3 | 9 | 42 | 9 | 43 | The statement "…, it makes no difference where on the globe the emissions occur" is only true for long-lived and thus well-mixed GHGs. For the short-lived gases (and aerosols like black carbon) the location of emissions is very important. There is an extensive literature on this and there are many papers I could refer (some examples are given below). I suggest adding a clarification in the text of this issue (with references) and that you also point to chapter 8 of IPCC WGI report. | Agreed. Will delete this sentence |
| 10698 | 3 | 9 | 42 | 9 | 43 | 1) Berntsen et al., 2006. Abatement of greenhouse gases: Does location matter?. Climatic Change, 74 (4): pp. 377-411.<br>2) Collins et al., 2012: Global and regional temperature-change potentials for near-term climate forcers. Atmos. Chem. Phys. Discuss., 12, 23261-23290, 2012 | Noted. As we deleted the sentence we do not review this literature |
| 2201 | 3 | 9 | 43 | 9 | 44 | The term 'several decades' denotes a misleadingly short interval. Climate continues for centuries, probably millennia. | Agreed. Change to 'long after'. |
| 17701 | 3 | 9 | 44 | 10 | 5 | Could some countries from the North could possibly even benefit from climate change. Deicing of permafrost, better agriculture, etc? | Agreed. Added 'and even some benefits' |
| 10699 | 3 | 9 | 45 | 9 | 45 | In addition to the reference given here there are other references that may be used; see next comment | No action; will be addressed by |
| 10700 | 3 | 9 | 45 | 9 | 45 | Two relevant references: 1) Höhne, N. et al., 2010. Contributions of individual countries' emissions to climate change and their uncertainty. Climatic Change, 106 (3): pp. 359-391. 2) den Elzen, Michel, Jan S. Fuglestvedt, Niklas Höhne, Cathy Trudinger, Jason Lowe, Ben Matthews, Bård Romstad, Christiano Pires de Campos and Natalia Andronova, 2005. Analysing countries' contribution to climate change: Scientific and policy-related choices. Environmental Science and Policy, 8 (6): pp. 614-636. | Will consider these references |
| 9383 | 3 | 9 | 5 | | | The distribution of costs and benefits is pivotal in a utilitarian framework in ethics; yet, in Kantian or Aristotelian approaches to ethics it is not accepted as part of the ethical framework, but criticized as a pragmatic parameter. | This is not appropriate objection to the mention of costs and benefits at this point. |
| 3606 | 3 | 9 | 6 | 9 | 7 | The issue of "common, but differentiated responsibilities" should already be mentioned here going beyond the historical emissions. | No action; "common, but differentiated responsibilities" is a conception of responsibility to be introduced later in |
| 7906 | 3 | 9 | 6 | 9 | 7 | In our understanding the historical dimesion is important but not central. | The word 'central' has been changed |
| 8791 | 3 | 9 | 7 | 9 | 10 | The section numbering here appears to be incorrect - there is no 3.2.1 to 3.2.7 as discussed. | Cross-referencing has been corrected |
| 10695 | 3 | 9 | 7 | 9 | 8 | The references to sections here seems to be wrong. | Cross-referencing has been corrected |
| 3919 | 3 | 9 | 8 | 9 | 10 | Should all these section 3.2 references be to section 3.3? | Cross-referencing has been corrected |
| 6310 | 3 | 9 | 14 | 9 | 14 | Again, it is awkward language and problematic to describe biodiversity as a "non-human value." At best, refer to is as a non-anthropocentric set of values or something of that nature. See comment #10 above. | Anthropocentric' and 'non-human' appear to be synonyms in this context. |
| 4353 | 3 | 9 | 4 | 9 | 12 | The execution of this programme is apparently absent from the draft text. | Cross-referencing has been corrected |

|---|---|---|---|---|---|---|---|
| 8247 | 3 | 9 | 4 | 9 | 25 | The references about sections and subsections provided in these lines are not matching with the contents of this chapter | Cross-referencing has been corrected |
| 10964 | 3 | 9 | 26 | 15 | 10 | I think that this section is too long. A good range of the literature is being mentioned but it could be summarised more briefly and the key point is that equity issues do not seem to be able to achieve any simple form of consensus. Sometimes it can be more an issue of what is an acceptable level of inequity, before a revolution starts. | Organization of the multiple ethics sections and lengths needs discsussion |
| 17155 | 3 | 9 | 26 | | | Balance of ethical topics inappropriate: reduce the length of all the sections on historical emissions and compensatory justice (within ch. 3.3) by about 50 %. This is of course an important climate ethical topic (particularly from the perspective of developing countries). But compared with other climate ethical topics discussed in the literature, it bulks quite large in ch 3 here! Compare in contrast, for example, the only little space dedicated to procedural justice. Moreover, there are some ethical approaches denying that compensatory issues should play any role at all (on a general ethical level). For instance: Kowarsch, M./Gösele, A.: Chapter 7: Triangle of Justice, in Edenhofer, O./Wallacher, J./Lotze-Campen, H./Reder, M./Knopf, B./Müller, J. (eds.): Climate Change, Justice and Sustainability: Linking Climate and Development Policy, Dordrecht: Springer 2012, pp. 73-90. | Only issue relevant here is balance and length of ethics sections (see comment 10964). Reference is grey. |
| 10787 | 3 | 9 | 26 | | | The section 3.3 is written in a highly theoretical manner without reaching a meaningful conclusion. It could be rewritten in Plain English. | Will be addressed in SOD |
| 17331 | 3 | 9 | 38 | 9 | 39 | repetitive consider erasing. | Will be addressed in SOD |
| 15636 | 3 | 9 | 42 | | | "effects of GHG emissions" - should specify that these are the effects 'on global temperatures' (or the like), as GHG emissions may have various other local effects (e.g. particulate pollution). | Will be addressed. This point is strictly correct. The sentence will be deleted. |
| 13264 | 3 | 9 | 41 | 10 | 7 | It is not easy to assess how much damage a country, developed or developing, will suffer from climate change. Maybe it is easier to express the idea in terms of how vulnerable regarding climate change is a country, as vulnerability is a combination of the natural phenomena and the preparedness to cope with it from each country. The consequences of an huracan or a typhoon in a developing and a developed country are good examples of this difference | Will be addressed in SOD; will add 'vulnerability' in the text, as appropriate |
| 12606 | 4 | | | | | There could be more on the issues of fuel poverty amongst rich nations, as the rich/poor divide is still large even there. I will send through a draft chapter from a report I am writing which could help, though it is UK centric. If required a could write a page on these issues for the WG. | Accepted<br>Introduce briefly in 4.1.2.1<br>Discuss in 4.4.1 |
| 4137 | 4 | | | | | Please review sections 4.3 and 4.4. in light of chapter 5 discussions. If you feel that these sections contain redundant and/or inconsistent duplications of chapter 5 discussions, please revise your sections. | Noted. Chapter 5 has been reviewed with a view to avoiding reduncies and |
| 3084 | 4 | | | | | Figure heading says 'residential sector' but the figure itself suggests it covers the residential and other sectors. Needs to be clear what's meant by 'other sectors' (see next point) | Accepted. Figure and caption have been reivsed. |
| 17337 | 4 | | | | | The good effort this chapter is doing to link to the concepts presented in Chapter 2 and 3 should continue and link with visions of sustainable development applicable to sectors, where the SD debate has become quite specific. A clear link with the chapters work need to be coming through this chapter in this regard as well. | Accepted, table has been introduced for better linkage of chapters. |
| 8496 | 4 | | | | | Model 3 - (focus shits vs shifts) | OK |
| 2578 | 4 | | | | | No mention to greenwashing, a powerful driver to derailing climate commitments | Accepted.<br>(Esteve, Chuks) |
| 2564 | 4 | | | | | Meaningless without references and some minimal empirical data | This is just an illustration of the notion. |
| 2565 | 4 | | | | | Meaningless without references and some minimal empirical data | OK, this is an illustration of the notion. |
| 12776 | 4 | | | | | Please check, whether the question is sufficiently adressed by the answer given. | Noted. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 16262 | 4 | | | | | To shorten the chapter I find the following two sections to be of less relevance to the focus of the chapter (i.e. the two way relationship between SD and equity on the one hand and climate change on the other): Section 4.3 Determinants, drivers and barriers (of SD) - this is a rather general and non-exhaustive list of factors impacting on SD. The intention to 'emphasize their relationship with mitigation and adaptation' does not come across clearly. The focus seems to be on determinants of SD rather than on the determinants of the nexus between climate and SD/equity. The section could be significantly shortened by strengthening its focus and omit general talk about determinants of SD. Section 4.6: Mitigative capacity and mitigation and link to adaptive capacity and adaptation - this section also looses its focus by only dealing with climate issues without relating it to SD and equity issues. | Accepted but the sections can be shortened, not deleted. |
| 15458 | 4 | | | | | In many countries around the world, the issues of sustainable development and equity are critically linked to problems of accountability, transparency and corruption. Esepcially when it comes to resource management, management of resource crisis, inequality of resource access, and mitigation strategies, corruption is a huge impediment. Bringing in this issue will create a new focus in limking sustainability and equity issues to climate change debates within the larger context of democratic deliberation. | Accepted.<br>We can include this in a more general section about political economy; i.e., distribution of decision-making power and how it is wielded, and what effect this has in the feasibility of implementing |
| 7367 | 4 | | | | | The distinction based on the Annexes of the Convention makes sense but I am unsure the inclusion of the "LDCs" is important here. Perhaps someway of reflecting regional contributions, and not just one group of countries? | intention is to show the relative value of indicators, not suggest value is substantial. |
| 7366 | 4 | | | | | The figure runs counter-clockwise which is confusing, the labels should also be above the graphics. | Noted, will improve figure |
| 17301 | 4 | | | | | The chapter is well designed. It brings together the concepts of equity and SD in some details. The chapter attempts to do justice to the vast emerging literature.<br><br>Most of the practice and innovation of both SD and equity is being undertaken in the developing world and mostly as projects. Hence the literature of this area is weak and the assessment in this chapter does not show it well. Attempts may be made to reach out and find the literature on this. As several authors of the chapter probably have access to quality and reliable grey literature.<br><br>Despite the IPCC strict guideline of inclusion of grey literature, attempts may be made to enrich the chapter with examples.<br><br>General remark is that the two recent IPCC special reports on (a) Disaster and (b) Renewable Energy can offer input for this chapter.<br><br>An approach on equity in<br>(a) mitigation<br>(b) adaptation<br>(c) capacity building and<br>(d) finance<br><br>may form a good basis for supplementing the existing texts.<br><br>Since the authors have identified a number of gaps where more text will be analyzed and several tables and diagrams, which will be developed further, I am making general comments at this stage of chapter writing. More detailed analysis and review comments will be given to the subsequent drafts. | Taken into account. Ambuj will provide examples to be put in various sections. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 2924 | 4 | | | | | Is het possible to illustrate only the year 2005? and additional to illustrate a figure from for a limited value of pathways? | Noted, Figure to be revised |
| 2925 | 4 | | | | | Is it possible to add a timeschedule of the evolution of conceptional thinking? | Noted, will improve figure |
| 3957 | 4 | | | | | A general comment is that this chapter, is that like chapters 1-3, it ignores the problems of incentives and inadequate information that bedevil political processes and the centralised direction of the activities of vast numbers of individuals. When discussing moral and equity issues they also seem to ignore the critical issue of when it is moral and ethical to use the coercive powers of the state to throw dissenters into prison, or worse. | Taken into account. The governance subsection will be sharpened (Chuks) |
| 4044 | 4 | | | | | This section could be substantially shortened if it just dealt with and elaborated on those approaches that consider Sustainable Development and Equity in the context of climate change mitigation/adaptation, rather than discussing the whole raft of 'various' approaches. Particularly section 4.2.1 could do with more extensive editing to just a few sentences that outline key concepts/trends. | Taken into account in the new version of 4.2. |
| 18345 | 4 | | | | | The discussion of drivers needs to be coordinated with Chapter 5 (section 5.3) to sharpen specific SD focus. Please think about how your discussion of determinants, drivers and barriers should be taken up in subsequent chapters and how it is actually taken up. | Coordination with ch5 to be improved (Esteve). |
| 4840 | 4 | | | | | Again, this section is too long and should be presented in a more concise manner. | Will shorten and/or make more clear. |
| 8257 | 4 | | | | | It should be more consistent or linked with section 4.2.1 in which the definition of sustainability is given and three pillars are spelled out. Similarly, the equity may be explicitly defined in the three broad categories - intergenerational, intra-generational, and procedural. | Taken into account in the revision of 4.2. |
| 8492 | 4 | | | | | As noted above, this tends to frame SD as an outcome, rather than a process. Similarly, it may be helpful to discuss proximal and distal drivers in this context, and the importance/relevance of interaction effects between the different determinants | Accepted. We acknowledge the need to show further the interactions between the different determinants. However, we would not support the writing of an additional sub-section on interactions, but rather stressing the interconnections in existing sub-sections. Regarding the "proximal" and "distal" terminology, we |
| 8258 | 4 | | | | | It discusses about the determinants, drivers and barriers of sustainable development, but less about those of equitable development. It would be nice if the authors can discuss about the barriers and drivers of equitable development. | Accepted. We are in agreement with this comment. We need to stress the equity dimension of SD more prominently in each sub-section and we |
| 13751 | 4 | | | | | I miss a bit the role of knowledge as a driver or barrier of change for sustainable development in this section. Isn't in particular scientific knowledge an important driver to address sustainable development issues? This is one of the core ideas behind sustainability science and I would recommend to add a sub-section on knowledge. | Accepted. We agree that the role of knowledge is important and that it may need to be more stressed and highlighted in the text. However, we are |
| 9253 | 4 | | | | | There is no mention of the effects on population migration etc due to parts of the northern hemisphere warming more than most of the southern hemisphere. This could be a key factor in changes of resource use, local sustainability and survival. Certainly an issue for small southern hemisphere countries; a mere 4M immigrants to NZ would double the population/demand for food/electricity/water etc. | Accepted. The SOD's section on population and demography will pick up on migration issues and build on existing evidence of climate-induced migration |
| 4841 | 4 | | | | | Again, this section is too long and should be presented in a more concise manner. | Accepted. The section will be |
| 12707 | 4 | | | | | Please take a climat change fokus when addressing the issues (esp. the first two which may also be skipped) | Rejected. We are inclined to think that an introductory paragraph is needed to frame the issue beyond the climate |
| 4842 | 4 | | | | | Again, this section is too long and should be presented in a more concise manner. | Accepted. The section will be |
| 12708 | 4 | | | | | This section can be shortened (you may like to delete all parts which are not directly linked with climate change issues) | Accepted. The section will be synthesized in the SOD. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 4843 | 4 | | | | | This section is very lengthy. The length should og down considerably here to make it fit into the framework of the report. | Accepted. The section will be synthesized in the SOD. |
| 12710 | 4 | | | | | This section can be shortened (you may like to delete all parts which are not directly linked with climate change issues) | Accepted. The section will be synthesized in the SOD. |
| 12714 | 4 | | | | | This section can be shortened (you may like to delete all parts which are not directly linked with climate change issues) | Accepted. The section will be synthesized in the SOD. |
| 3233 | 4 | | | | | Section is fine as such. But it should be better integrated into the topic of the chapter. | Accepted. The overall SOD, including this section, will strive for further |
| 17641 | 4 | | | | | Please summarize again this section. The section seems to be long. | Accepted. The overall SOD, including this section, will strive for further |
| 12715 | 4 | | | | | This section can be shortened (you may like to delete all parts which are not directly linked with climate change issues) | Accepted. The overall SOD, including this section, will strive for further |
| 12194 | 4 | | | | | I recommend to shorten the descriptive parts of this chapter and instead focus on the analysis of determinants, drivers and barriers with regard to sustainable development and equity. | Accepted. There is generally a need to strike a balance between the framing of SD and equity, the weight we give to these dimensions in each sub-section, |
| 12195 | 4 | | | | | In the context of chapter 4: how do you approach the topic of finance, what is the analytical framework and object of analysis of chapter 4.3.8? Does this chapter aim to cover UN related finance initiatives/literature only? (you refer to the UNCSD and UNFCCC) | Accepted. We agree with the reviewer's comment. There is a need to recognize what sources of finance in the UNFCCC and beyond exist, but we need to place emphasis on how finance is determinant or how it influences SD and equity in the context of climate change. We need to |
| 4844 | 4 | | | | | This section is again lengthy and is only summing up existing financing fonds. There are very few scientific results reported about their impact. | Accepted. See comment above. |
| 12716 | 4 | | | | | No comments since it will be rewritten. | Noted. |
| 18337 | 4 | | | | | Guiding question: Please think clearly about the purpose of the consumption debate within the AR5 report and liaise with Chapters 5, 12 and 14 regarding a clear and suitable division of labour. What are the relevant insights to be gained from this debate and as discussed in the literature, for e.g. burden sharing proposals? What role does the consumption debate in context of behavioural change play? How should the issue of 'embedded emissions' be taken up in connection with the discussion on trade in Chapters 13 and 14? | Accepted. Meetings organised in Vigo with relevant authors from Chapters 5, 12, and 14. In Chapter 4 we discuss empirical and conceptual aspects of 'consumption' more broadly, focusing on |
| 16245 | 4 | | | | | This section makes an implicit assumption that consumption is reflected by flows of goods or services, while ignoring the role of stocks. This neglect of a stocks perspective can be very misleading, because equity, quality of life, and well-being are often better reflected by the stocks of the natural and built environment than by consumption flows into these stocks. This difference is also relevant for carbon accounting: countries that have built up their infrastructure stocks in the past (typically industrialized countries) usually have large stocks but a low demand for emission-intensive materials such as steel and cement, while emerging market economies have still relatively small but rapidly growing stocks, which leads to higher emissions in the production of these key materials (which constitute about half of all industry emissions). | Accepted. We will retain the focus on consumption and also consider the role of stocks in level of consumption, and discuss critically the apparent neglct of life-cycle approaches to consider stocks. Would have been useful with a reference, but we will search for some. |
| 12720 | 4 | | | | | The relevance for climate change issues should come out more clearly. In this regard there should also be some words on the decoupling of growth and emission development. The relationships mentioned, here, also calls climate policy to come up with a shift in current income distributions. This should be made transparent. | Ok, but avoid overlap with other chapters. |
| 12722 | 4 | | | | | I miss the link to climate change issues. | Admittedly, the link is indirect, but it is there: Inequality (supposedly) affects consumption patterns, which in turn affect GHG emissions. We will explain the links more clearly in the beginning of |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 8494 | 4 | | | | | There is a significant literature in public health relating to this issue, and the importance of relative deprivation, and in turn the implications for health and well-being. This extends beyond consumption, to broader questions of income, social gradient and equity. See for example the WHO Commission on the Social Determinants of Health, Marmot (2007) in the Lancet, and the Whitehall Studies (Marmot I 1978) Journal of Epid. and Community Health | Accepted. We will review some references on the general health aspects of well being and the link to consumption levels and inequality, but not literature on the socio-economic determinants of specific diseases. These references will include (Jakab and Marmot, 14; Marmot; |
| 12725 | 4 | | | | | The link to climat change issues is not obvious. The chapter should be shortened and more focused. | We can shorten this sub section and make the climate linkage explicit. Also need to consider that the link between production and climate change is not treated with as much detail as the consumption discussion, but this is partly due to the initial description of the |
| 4845 | 4 | | | | | For me this section could be most interesting (given my background). Unfortunately, the contributions of John and Tim are not included yet but I trust the two will deliver a good summary of the psychological research in the field. | Accepted. |
| 12727 | 4 | | | | | The link to climat change issues is not obvious. The chapter should be shortened and more focused. | There is a link and this can be made more explicit. Check if John and Tim |
| 4846 | 4 | | | | | The usually weak correlation between consumer attitudes in population surveys and consumer behaviour needs to be discussed in this section. | Not relevant. |
| 13689 | 4 | | | | | Please add text regarding the importance of voluntary choice of frugal lifestyles, often linked to religious beliefs (see e.g. Lastovicka, J.; Bettencourt, L.; Shaw Hughner, R.; . Kuntze, J. (1999): Lifestyle of the Tight and Frugal: Theory and Measurement, in: Journal of Consumer Research, 26, p. 85-98; Pepper, M.; Jackson, T.; Uzzell, D. (2009): An examination of the values that motivate socially conscious and frugal consumer behaviours, in: International Journal of Consumer Studies, 33, p.126–136); Shaw, D.; Newholm, T. (2002): Voluntary simplicity and the ethics of consumption, in: Psychology and Marketing, 19, p. 167–185; Etzioni (1998): Voluntary simplicity: Characterization, select psychological implications, and societal consequences, in:Journal of Economic Psychology, 19, p. 619-643. | Accepted. We will review the following references on 'voluntary simplicity': (Lastovicka et al., 1999; Shaw and Newholm, 2002; Etzioni, 2004; McDonald et al., 2006; Pepper et al., 2009; Shaw and Moraes, 2009). I included this in section 4.4.3 [JT] |
| 16340 | 4 | | | | | A suggestion for evidence for this section which has yet to be written. Residents living in a sustainable communty in London report high levels of well being and quality of life even though they are consuming fewer resources than the local average "BedZED seven years on" http://www.bioregional.com/news-views/publications/bedzed-seven-years-on/ | Accepted. We will read the suggested report and review scientific literature that reports on similar experiments. Half paragraph on the "attitude-behavior" or "values-action" gap moved from section |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 16341 | 4 | | | | | I think a reference to the useful application of the forthcoming sustainable development goals would be a good signpost here. It was agreed at Rio+20 (paragraphs 245-251) that a set of "Sustainable Development Goals" will be developed. I think that this should be mentioned in WGIII report, as I think this will be an important way that nations will be delivering truly sustainable development and so mitigation strategies post 2015. The document says that the SDG's should be "action oriented, concise and easy to communicate, limited in number, aspirational, global in nature and universally applicable to all countries while taking into account different national realities, capacities and levels of development and respecting national policies and priorities. (...) Governments should drive implementation with the active involvement of all relevant stakeholders (.....) progress towards the achievement of the goals needs to be assessed and accompanied by targets and indicators (....) The document states that a working group will be set up of experts to report to the 68th session of the UN. There is a process where stakeholders will be able to input to this expert panel and to the UN. IPCC and readers of the IPCC report should be making sure that they have the right science to base the goals on. The UN will be looking for this. The SDG's are expected to be the mainstay of the post 2015 development agenda | Accepted. This comment should probably be addressed sooner Chapter 4 than in Section 4.4.3.2, such as in Section 4.2, and hence by Yokeling. |
| 12730 | 4 | | | | | The link to climat change issues is not obvious. The chapter should be shortened and more focused. | Noted. |
| 4847 | 4 | | | | | Why is this section included in chapter 4? I do not understand how it fits in here. Since Edgar Hertwich is a lead author in one of the other reports I assume that this topic will be handled in another report much more thoroughly than it can be here. Can 4.4.5 be edited out of report 3? | Not accepted. The reason is that we were asked by the IPCC to do so. The whole section will be better coordinated with Chapter 6 (and 14) through |
| 4848 | 4 | | | | | This section overlaps to a substantial degree with 4.4.5 | Accepted. In the SOD, Section 4.4.6 will be limited to a conceptual and methodological discussion of spatial considerations in sustainability assessment (currently the title of section 4.4.6.2) to serve as a guide to the reviews of such assessments throughout the rest of the report. The discussion of GHG emissions embodied in trade will be more generic (not only GHG emissions but a wide range of resources |
| 18338 | 4 | | | | | Guiding question: In how far is your development pathways discussion relevant for preparing the discussions in Chapters 5 and 6 (in particular as Chapter 6 does not discuss specific sustainable development pathways)? Also, it would be useful to discuss the risks and SD implications of different transformation pathways and related response measures (leapfrogging evidence, trade-offs, synergies, positive and negative co-effects), in particular with a view to the subsequent sectoral analyses. | Link to Ch.5 and 6 critical, explored during LAM3 with relevant chapter authors. |
| 18139 | 4 | | | | | Title: Given the preference for using development path in the text as explained in footnote 9, title should also reflect this and state "development paths" instead of "pathways"). | Will keep pathway in title (as imposed by IPCC plenary). If necessary, will |
| 16342 | 4 | | | | | An example of a civil society approach to implementing sustainable development paths based on limit to resources and equity is "one planet living" http://www.bioregional.com/oneplanetliving/what-is-one-planet-living/ | it is better to not quote specific initiatives such as "one planet living" because there is a huge list of similar initiatives. |
| 8495 | 4 | | | | | Note the importance of institutions, institutional design and institutional inertia as part of this 'equation' | Good point. Will look for peer reviewed |
| 18346 | 4 | | | | | Please link your discussion of different modeling approaches to relevant section in Chapter 3 (3.10.2) to avoid redundancies and sharpen specific chapter-relevant focus. | Will explore link and overlap with Chapter 3 |
| 18349 | 4 | | | | | Please link this discussion to the relevant section in Chapter 3 (3.12) to sharpen specific SD focus and to avoid redundancies. | Will explore link with Ch.3 but 4.5.3.2 has a priori a different approach so it's |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 10431 | 4 | | | | | Remove this section or rewrite it as a shorter more applied section | 4.5.3.2 is very short. Presents interesting concept of Technological Innovation Systems but can be |
| 12739 | 4 | | | | | Maybe you like to add an introductory sentence (pointing out that mitigation requires technological transition, so the question arises how to foster). | Accepted. |
| 12198 | 4 | | | | | General comment: it is not clear what exactly you are referring to if you speak of 'repsonse capacity' as you do not insert any references; see e.g. the related article by Gallopin (Gallopín, G. C., 2006, Linkages between vulnerability, resilience and adaptive capacity, in: Global Environmental Change 16, 293-303.) on the conceptual interlinkages between vulnerability, resilience, adaptive capacity that outlines part of the respective scientific debate. | Noted. Response capacity is just a catchword for mitigative and adaptive capacity. |
| 8265 | 4 | | | | | Section 4.6 could develop more on the differences between reactive adaptation measures and anticipatory adaptation, and provide examples of policies for each type, as well as the pros and cons of each of them (with regard to costs, avoided climate change costs, and how they cope with risk and uncertainty). The section could also develop on planned vs autonomous adaptation. An overview of these types of adaptation can be found at: http://know.climateofconcern.org/index.php?option=com_content&task=article&id=148#; | Accepted (Dick). |
| 12199 | 4 | | | | | What are the references the definition of 'adaptive capacity' is based on? | Noted. (Dick) |
| 12202 | 4 | | | | | General comment: The title of this sub-chapter is 'mitigative and adaptive capacities'. Yet in the text you write about 'mitigation' and 'adaptation' and not about 'capacities' | Rejected. |
| 18334 | 4 | | | | | The chapter almost seems to begin again from this point, and proceeds with considerable clarity. Almost tempted to say cut and start from here. | Noted. |
| 18339 | 4 | | | | | Guiding question: As most of the results presented in the AR5 rely on neoclassical approaches, please think about how to frame your discussion of SD adjustments to existing economic tools (4.7.2) so that it provides a useful framing for the reader? | Noted. |
| 3617 | 4 | | | | | Delete or integrate with Chapter 3 (see comment 9 above) | Taken into account. |
| 12750 | 4 | | | | | You may like to consider to make either crossreference to Chap. 3 or to place the chapter there. | Taken into account. |
| 3618 | 4 | | | | | Delete or integrate with Chapter 3 (see comment 9 above) | Noted. |
| 8935 | 4 | | | | | This section can potentially be considerbly shortened by summarizing the different aproaches in Chaper 13 | Coordination with ch 13 is under way. |
| 3619 | 4 | | | | | Delete or integrate with Chapter 3 (see comment 9 above) | Noted. |
| 2563 | 4 | | | | | Needs more referencing. Too subjective | Accepted. |
| 8498 | 4 | | | | | Note that some sustainability planning kits, etc. have added culture and governance as pillars of sustainable development. Most recently, the UN has inluded institutions | Noted. (Yoke Ling) |
| 4839 | 4 | | | | | Especially the first half of the summary is too long and too narrative (too little concrete). It should be edited by at least 1/3 | Accepted. |
| 17091 | 4 | | | | | should specify more clearly state the limitations of modelling in making the transition between pathways AND in addition to technology it must consider lifestyle shifts (demand management) as well | Noted (Franck) |
| 17094 | 4 | | | | | 'equity and burden sharing in the context of climate policy' should also consider sharing of the global carbon budget and not just costs | See "Resources sharing approaches" |
| 17092 | 4 | | | | | "Why sustainability and equity matter" should not be considered in terms of the three pillars of sustainable development because they deal with the integration of policies and not with "equitable access to sustainable development" as agreed at Cancun by all countries, that is, sustainability and equity matter because they are about comparable standards of living and equality within global ecological limits. Please see the 'core principles' in this text in page7 lines 17 – 27 | Will reference EASD (in 4.7.3). Insufficient literature on EASD to form basis of this section. |
| 17093 | 4 | | | | | the key gap is how all can achieve comparable standards of living within the global carbon budget. The Rio + 20 World Conference of Sustainable Development agreed that people are at the center of sustainable development | Useful overall framing for key gap. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 17090 | 4 | | | | | not relevant in framing issues with respect to global sustainability, which is the concern here with reference to global equity. If these are retained then the distinction between global and national equity must be made clearly. | Noted. |
| 10274 | 4 | 0 | | | | K. Akimoto et al., "Consistent assessments of pathways toward sustainable development and climate stabilization", Natural Resource Forum (forthcoming) will provide beneficial information on climate change and sustainable development including their trade-offs and synergies. Please see the paper. | Noted. Will check this paper (Yoke Ling) |
| 3203 | 4 | 0 | | | | The relationship between avoiding climate change and ensuring sustainable development is commented upon at the beginning of Chapter 4, but not discussed properly later. There is clear evidence for the claim that serious climate change may well undermine future generation's well-being, and thereby undermine sustainability. Hence, avoiding serious climate change is necessary for sustainability. In the report it is also argued that sustainable development is necessary for avoing climate change (see comments below). For this, no empirical evidence is offered. E.g., one might hope that changing consumption patterns so that wellbeing is generated in a more sustainable manner will be an important ingredience in combating climate change. However, the last couple of decades have seen a spread of the consumption patterns of North-America and Western Europe to newly developed countries. Is it at all feasible to implement the required change in consumption patterns during the time available before climate change becomes serious and irreversible? I strongly suggests that Chapter 4 discuss in a serious manner the possibility that effective policies, supported and enforced by a sufficient coalition of countries, that succeed in combating climate change might undermine short-term development in parts of the world and hence, the potential wellbeing of people living there. Also, the emphasis at some instances seems to be whether combating climate change is a means to sustainable development and equity; it should be the overriding goal in this context. | Accepted. We specify the interrelation SD-climate change and policy in the new version (section 4.1,4.2) |
| 8795 | 4 | 0 | | | | The tenor of much of the chapter makes barely recognised predictive epistemological and utilitarian ethical assumptions. | Taken into account (more references). |
| 8796 | 4 | 0 | | | | There is a danger that Human capital is an unexamined concept in this chapter and the usage typically makes humans and their relationships little more than cogs in the machinery of industrialism and capitalism. Some uses do suggest a less utilitarian view - e.g. where increased human capital could promote 'for changing consumption patterns'. | Will edit the executive summary to avoid such interpretations. (Esteve) |

|---|---|---|---|---|---|---|---|
| 18295 | 4 | 0 | | | | There is much that is terrific about this draft chapter - it is ambitious, scholarly and informative, and often a fine guide to the relevant literature. I want to acknowledge this at the outset, because for brevity's sake I concentrate on my criticisms which will therefore make my response seem unduly negative and tough. Overall I find the chapter is too long and tests endurance. Its overall argument unclear. It crammed with detail but also has sections that are over-elaborated and seem poorly tied to the main task of the chapter and of the IPCC5. Too often I wondered why I was reading what I was - even when it was interesting. Stylistically, the chapter still needs further work to make it less staccato and lumpy. Numerous sections feel as though they are simply parked there rather than part of a larger argument or narrative and its material on climate change could almost be separated out. By contrast, the executive summary does not read as clearly as it must, recognising that this is often all people read of a chapter, and this may also be a reflection on the problem of the clarity of purpose of the chapter overall. The summary presentation of equity principles is confusing and needs clarification. Discussions of sustainable development (SD) are intrinsically fascinating but I feel the chapter sometimes loses itself and is not clear enough about where and how SD and climate change overlap and influence each other. The chapter should be edited with a view to clarifying, enhancing and reinforcing this connection. Its contents needs work to eliminate repetition (for instance, discussions of ethics, and of indicators) crop up several times. The foundational material on ethical principles for both SD and CC should be dealt with once, and early on. The chapter requires a conceptual summary of SD at the outset, introducing the main elements which are then elaborated upon. The reading of the literature on SD is sometimes superficial and needs to be both toughened and deepened, using Brundtland Report more prominently. There are five core principles guiding SD: i) intragenerational equity, ii) intergenerational equity, iii) biodiversity preservation, iv) precaution, v) ecological/planetary limits to growth. The last three are not given full enough consideration. Inparticular, the chapter offers little comment on three significant related bodies of research: on 'limits to growth' (both in the original debate and more recent revisitations) which has been an important driver of the SD debate, on dematerialisation, or on ecological modernisation. A discussion of critiques of conventional (material-based) economic growth and of green growth is vital, especially post Rio+20. The chapter also underplays the importance of institutions (political, legal and social) as factors guiding and occasionally determining the capacity for social and technological transitions/development. | Agreed: need clarity and coherent narrative.<br><br>On conceptual summary of SD: 4.2 should address the reviewer's point.<br><br>Will add a discussion of green growth and its contested relationship with equity (Chuks in 4.2).<br>Also the connection between degrowth and SD, the general decoupling question (Esteve, Franck) in 4.5.<br><br>Importance of institutions: part of political economy discussion 4.3.4. (Chuks) |
| 3276 | 4 | 0 | | | | The use of the term “luxury” is misleading (see e.g. Sections 4.4.1 and 4.7.3.1): I suggest it is replaced by “non-essential” or “inessential”. This is because luxury consumption can refer to purchase of goods that are higher than average price per unit, such as a Burberry coat or expensive cheese. In fact the purchase of luxury goods by consumers is generally less environmentally damaging than average consumption (Girod and De Haan 2010). The reason is that consumers have income, and once they have it they will either spend it or save (invest) it. But whatever they do with it, it’s use will give rise, directly or indirectly, to GHG emissions. So if consumers purchase luxury items which have below average GHG intensity of expenditure (kgCO2e/$), emissions will be lower than if they spend the same amount of money on cheaper goods. Also, luxury items are likely to have higher durability and hence longer product lifetimes, which can also reduce the throughput of goods and contribute to reducing emissions. Thus whereas in general the purchase of “inessential” items should be discouraged, the purchase of “luxury” goods by consumers with excess income should be encouraged.<br>This discussion does, of course, lead on to a discussion concerning incomes and and economic growth, which Tim Jackson will, I believe, be adding to the report.<br>Reference: Girod, B. and P. De Haan (2010). "More or Better? A Model for Changes in Household Greenhouse Gas Emissions due to Higher Income." Journal of Industrial Ecology 14(1): 31-49. | We agree that the concept of luxury consumption is imprecisely defined; what is considered luxury today can be considered a necessity tomorrow. It is a value loaded termm, which is diffult to apply in an objective way [JT, translation from Danish by Simon]. Yes, luxury consumption may have lower GHG emissions, but not always (e.g. driving a speedboat or a large car, causes large emissions). Over-consumption versus under-consumption, is the main issue, and is linked to inequality. "Essential" versus "In-essential" consumption also lends itself to normative interpretation. The main point is to examine what effect inequality has on emissions. (Simon) |

|---|---|---|---|---|---|---|---|
| 16935 | 4 | 0 | | | | Despite the flagged sections "to be completed" and some points of disagreement noted below, this chapter is in a superb state for a FOD: congratulations to the authors. The starting review of previous IPCC reports is extremely helpful. As someone not well versed in this area, I found it all an enjoyable and informative read. My comments are correspondingly limited.<br>I have one overall stylistic criticism which is that – in sharp contrast with many of the other chapters – the absence of Figures is striking. Almost the only numeric Figure in this chapter at present (Figure 4.1) is so complex as to be almost incomprehensible. I understand that some more Figures are due to be included in the SOD; give careful thought to this, and also to the clarity of their message.<br>This chapter should potentially have particularly close intellectual relationships to chapters 3, 5, 12 and 14, some way of fostering links could be useful (and possibly it might make sense to move / adapt one or two figures from these). | Noted. More figures will be added. |
| 18335 | 4 | 0 | | | | General comment: Chapter 4 still fails to provide a clear and easily accessible framing of sustainable development that can be taken up by subsequent chapters. The TSU is thus submitting a range of questions that can guide the author team in focusing their discussions in the relevant sections. | Taken into account in particular by a new table linking to other chapters. |
| 18336 | 4 | 0 | | | | Guiding question: Please think carefully about how other chapters, such as Chapter 6, should be read with a view to the SD debate presented in your chapter? Here, you should think about how to provide a vision of what will be discussed (such as the decoupling of growth and emissions, mitigation reductions, the weak and strong SD debate within the context of stabilization scenarios), and clearly outline what is beyond the scope of the AR5. Could you also please develop a clear vision in how far your guiding narrative regarding consumption and wellbeing, equity and capacity building should be taken up in subsequent chapters? | We will connect better to the other chapters (new table).<br><br>The framing definitions will be improved (4.2). |
| 18340 | 4 | 0 | | | | The chapter strongly requires the introduction of formal definitions of SD such as those presented in the excellent paper by Fleurbaey, 2009. In this context relevant indicators should be introduced and discussed. | Some formulae can be introduced. (Marc) |
| 18341 | 4 | 0 | | | | The chapter needs to include the co-benefit debate (incl. green growth) and elaborate its importance in the SD context. In this context, linkage to Chapter 3 needs to be improved by highlighting the multi-objective nature of the welfare function. Also, relevant sustainability indicators should be introduced to be taken up in the relevant sections of the sector chapters. | Taken into account. A box on co-benefits and some discussion, coordinated with ch3, will appear in 4.2. (Marc)<br><br>Noted. A key message is that there are no sector indicators of SD, apart from |
| 18342 | 4 | 0 | | | | The chapter needs to improve its usage of relevant literature in several sections. | Noted. |
| 18343 | 4 | 0 | | | | The consistency of the equity and justice discussion needs to be improved and better linked to Chapter 3 (please note the currently unclear distinction/interchangeable use of terms intergenerational justice and intergenerational equity). Following on from this, better guidance on how equity issue could be operationalized for policy making would be useful. | Taken into account in 4.2 and 4.7. |
| 18344 | 4 | 0 | | | | Regarding the policy and finance context, the chapter should address the following aspects more clearly: a) Access to climate finance for developing countries to avoid lock-in; b) Public-private partnership discussion should be expanded and better linked to SD, c) SD perspective on CDM should be included, d) SD objectives as emerging from international arena (Rio+20 update) should be covered. | Taken into account in the new finance subsection 4.3.8 and the revised 4.7.3 (Yoke Ling, Sivan, Esteve) CDM might go to finance or technology (Yoke Ling; example of double goal mechanism in |
| 17636 | 4 | 0 | | | | This chapter was organized previous studies in a careful manner. However it the chapter was seemed to be long. Please try to summarize for each sections for being shortened. The reviewer suggests to make tables for organizing previous studies in order for readers to understand clearly. | Accepted. |
| 18609 | 4 | 0 | | | | Hard to read since big parts of the intended material is either un-written or will be revised (will be hard since the chapter is already sustantially over the target). | Noted. |
| 18610 | 4 | 0 | | | | An endless overview but leading us to …? | Noted. |
| 18611 | 4 | 0 | | | | A practical approach to sustainability isnot indicated/presented. | Noted. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 18612 | 4 | 0 | | | | In reality it is probably very hard to agree upon what is sustainable in an absolute sense (sustainable to whom, given what and in which time perspective?) | Noted. We already say there are different meanings provoking different |
| 18613 | 4 | 0 | | | | Would be more fruitful to relate sustainablility to choices to be made and to discuss sustainability in relative terms? | Noted. This is already done to a large extent (indicators). |
| 18614 | 4 | 0 | | | | Equity is even harder. There is a huge difference between taking equity related issues into account or to use cc measures as tools to achieve equity but the difference is not made. The latter will make it even harder to agree on any sort of progress in the cc area. | Noted. The former is indeed the focus of this chapter, as far as equity is concerned. |
| 18615 | 4 | 0 | | | | FAQs much clearer in message – why? | Noted. |
| 9018 | 4 | 0 | | | | There is a need to revise the executive summary to capture the relationship between mitigation and adaptation and sustainable development, particularly the relationship between the last two concepts. | Accepted. |
| 9019 | 4 | 0 | | | | The Chapter must elaborate on the relationship among the three pillars – economic, social and the environment - in sustainable development. Potential policy instruments – such as carbon taxes, trade policy, international financial mechanisms – have each their own differential impact on these three pillars. | True but not directly relevant, as policy instruments are not the topic of this chapter. |
| 9020 | 4 | 0 | | | | There should be greater use of tables and figures in the Chapter to illustrate concepts such as the equitable access to sustainable development. | Accepted. |
| 9021 | 4 | 0 | | | | It is important to expand the discussion on the role of inequality, burden sharing, and the concept of common but differentiated responsibility in this chapter on sustainable development. Income inequality is the driver of inequality in consumption and inequality in consumption is in turn the main determinant of the availability of development space for poor countries. Excess or luxury consumption is needed in order to sustain jobs and exports among developing countries. Luxury consumption in turn closes off development space. | Accepted. Sections 4.2 and 4.4 will clarify, as well as 4.7. |
| 9023 | 4 | 0 | | | | There should be a broader discussion of technological development and transfer within the framework of sustainable development. There should be a a discussion of why relying on voluntary, private channels will be inadequate to provide the scale and affordability of the transfer needed to developing countries. The precedents of the green revolution and the Montreal protocol can be recognized as successful precedents on the role of international public policy and resources to transfer technology commensurate to the scale and timeliness required. | 1) The technology point can be integrated into our sub section on sustainable production 2) The mechanism (policy and resources) of spreading the green revolution was effective. |
| 9024 | 4 | 0 | | | | There is inadequate coverage of the financial transfers required for sustainable development. The Convention has set out the responsibilities for developed and developing countries in terms of technology transfer and financial support for realizing sustainable development goals | Transfers required for SD -- is it well defined? For CC -- should be taken up in Ch 16. In Ch 4, can raise issue and connect to equity discussion (4.7.3) and |
| 11126 | 4 | 0 | | | | It would be beneficial if it were substantially reduced, in particular sections 4.2.1, 4.2.2 and 4.3.5. In particular, discussion of equity is too long and the same is true for the concept of PAT and how it's componentes are presented in this chapter. | Noted (accepted re shortening). |
| 12841 | 4 | 0 | | | | In English speaking countries the word sustainable means ecological sustainable where as in Brasil it means economical sustainable. I propose to add a new FAQ "Is economical sustainable equal to ecological sustainable?" The content could be: in the long term it is, but for the short term it is not always true. | Taken into account in 4.2 (Yoke Ling) |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 3143 | 4 | 0 | | | | There is a huge overlap with chapter 3. I suggest that authors of both chapters review the other carefully and make some decisions about the strategy. For example, much of section 4.7 overlaps chapter 3. Discussions of justice also overlap.<br><br>The chapter is massively over limit; maybe it could be trimmed by focusing more squarely on what's new since AR4.<br><br>The chapter is very heavy on theory and large passages of text and has much too little real empirical information.<br><br>Section 4.3 and 4.4 overlap other chapters—such as the discussion of drivers (chapter 1, chapter 5, 6, and 7) and the discussion of social decision making (chapter 2). | Taken into account in the revision (shortening). But theory and reference to chap3 and concepts prior to AR4 are needed for this framing chapter.<br><br>Coordination with other chapters under way. |
| 18457 | 4 | 0 | | | | Clearly, the authors of this chapter have done a very thorough professional job of presenting the current knowledge base about many aspects of sustainable development and its connections with equity issues. The authors really know their stuff. | Noted (thank you). |
| 18458 | 4 | 0 | | | | Clearly, the authors of this chapter have done a very thorough professional job of presenting the current knowledge base about many aspects of sustainable development and its connections with equity issues. The authors really know their stuff. The general question is whether, at this stage in the evolution of IPCC reports, it makes sense any longer to conceive of an IPCC chapter as an encyclopedic coverage of diverse literatures – given the expanding knowledge base and the explosion of published literatures. Many observers think that, instead, chapters should be moving toward assessments of the literatures and the main points to be drawn from those foundations for the WG report. In other words, rather than saying "here is the knowledge base," a chapter should be saying "here is what the knowledge base tells us." In this case, it seems to me that the chapter covers so much territory that it loses any thread of main arguments and points. It is too long and too detailed, following an Executive Summary that comes across as dense and academic. It would be highly useful to (a) extract from the content of the chapter a limited number of key takeaway messages, (b) organize the ES around those messages, maybe in bulleted form, and (c) then use that structure to rethink what to say in the body of the chapter (and how to shorten it). For example, after p. 15 the chapter does not really return to a discussion of equity issues until p. 59, essentially allocating only about 20 of the 81 pages to equity. My suggestion would be that the discussions of sustainable development – sections 4.3, 4.4, 4.5, and 4.6 – be substantially condensed, in a number of cases recognizing significant overlaps with other chapters (e.g., regarding development pathway transitions with Chapter 6). This part of the chapter might have twice the impact if it were half as long. | These remarks will help us shorten and clarify. |
| 6091 | 4 | 0 | | | | It may be better to add a paragraph describing that climate change is one of the very important factors of sustainable development and, therefore, how to allocate scarce resources among various issues including poverty, health care, climate change etc. is one of the key issues in pursuing SD (Refer to 1st paragraph of the Executive Summary of Chapter 6). Also, though there are frequent citation of Rio Declaration in 1992, I found very few description on RIO + 20. What is important here is that, after 20 years, SD is becoming more and more urgent issues. This kind of description should be welcomed if readers find them in executive summary. | CC as important factor of SD is main point made in second para of key message (see p.10). This will improve in the new section 4.2.<br><br>Will discuss Rio+20. |

|---|---|---|---|---|---|---|---|
| 4026 | 4 | 0 | 0 | 0 | 0 | The current draft represents a good and comprehensive overview of the topic. However I fully agree with the TSU that the text needs to be shortened. On the other hand, I would not suggest leaving out any (sub)section of the chapter completely. They are all important. The authors will likely need to find the way to shorten almost each and every section of the report. For example, the historical perspective might be shortened while the focus on recent developments, which are directly relevant to the climate change politics, needs to be preserved. This actually brings me to say that the chapter might as well need to be streamlined. All in all this is the climate assessment but it is yet to be clarified what is driving what? Is sustainable development driving the climate change policies or it is the other way round – the climate change policies is now a main driver of decision-making for sustainable development? For example, FAQ4.1 does not provide a consistent response. Otherwise, I do not have particular comments. Thank you. | Taken into account. Will shorten as part of overall shortening. The relation SD-climate policy will be specified further (inducing a revision of FAQ 4.1) (Marc, Sivan) |
| 10433 | 4 | 0 | 0 | | | There is no flow between paragraphs in this chapter | Accepted, will try to improve. |
| 5461 | 4 | 1 | | 7 | | The executive summary of this chapter does not discuss a key element of sustainable development- the potential for common pathways to this goal. The chapter summary seems focused more on the concept of SD rather than the implementation or tools to reach this goal. As authors note pn pg 6 oine 7 studies indicate a path forward- yet they seem to contradict themselves in a following paragraph- pg 6 line 15- the paragraph starting on line 18 seems to be the key to this discussion and the focus on ilucidating solutions should be more pronounced- the discussion on most of pg 7 seems superfluous and not likely to reach consensus | Focus on "how do we get there" could provide helpful way to tighten narrative. |
| 5492 | 4 | 1 | | 82 | | This chapter reads as though the authors were overwhelmed by the quantity of potentially pertinent information and unclear as to how to best synthesize it. Sustainability is not a clear concept and can have varying meanings based on the frame of reference used. Because of this, much of the chapter is devoted to review of concepts of sustainability, that while potentially related, are less critical than a more focused and narrow discussion with limited mention of the related topics. Personal happiness is one example of this. Perhaps the authors could more clearly couch their discussion in the Millenium Development Goals- and by doing so more clearly relate sustainability to GHG emissions | Discussion of MDGs may be useful as one small (and intermediate) step toward SD. |
| 3375 | 4 | 1 | | | | I have difficulties figuring out what the punchline of this chapter is. Could the chapter summarize relevant sustainable development dimensions at the end, providing a guide for the sectoral chapters when it is their turn to discuss SD issues? | 4.8 does this and will substantiate more (new table) |
| 16677 | 4 | 1 | | | | This chapter needs to lose 25 pages. The first 4 sections could certainly be shortened. While the equity discussion should remain it should be shortened and back reerence the previous chapter. Part of the problems is that equity as it is used in this chapter is rather different than the notions of ethics and justice used in the previous chapter. | Noted. |
| 15217 | 4 | 1 | | | | There are some repeated topics and descriptions. It needs to be restructure the chapter. | Will shorten and tighten narrative focus. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 13995 | 4 | 1 | | 1 | | Chapter 4 covers an important theme in a WGIII context, as it links sustainability and responses to climate change. In terms of responses such as adaptation, transformation and linkages to equity and sustainable development, these are also broadly discussed in WGII. What is clear from reviewing both drafts is that WGIII approaches the concepts and relationships with a narrower lens that is very much informed by economic perspectives. Other perspectives and literatures are not well represented and assessed. Clearly, to understand how change comes about (particularly at the magnitude and scale being discussed here) calls for an assessment of knowledge on the personal, cultural, institutional and systems changes that are needed to foster more resilient and sustainable development paths. This also involves questioning business-as-usual and asking what role culture and cognition (translated into economic and social policies, legal and legislative frameworks, resource management practices, educational systems, and power relationships) play in facilitating change. One specific example is the lack of reference to behavioral psychology in the discussion about consumption. Some may be covered 4.3.3, but a more holistic discussion on what drives and limits responses would include these perspectives throughout the chapter. | 13996 | 4 | 1 | | 1 | | The chapter starts out quite clear and structured, but from section 4.6 and onwards the text comes across as unstructured and lacking flow. The author team may consider reorganizing some of the text and also cutting back on sub-headings. In some cases the sub-headings do not match the text that follows. One example is 4.6.1.2. | Noted. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 13997 | 4 | 1 | | 1 | | The chapter aims to discuss responses to climate change, including both mitigation and adaptation, and adaptive capacity and mitigation capacity. The chapter also wants to get at the root causes that climate change shares with other global challenges that both generate risks and push the world into unsustainability. If these deeper root causes had been the backbone for the discussion in chapter 4, it may have been easier to cover both mitigation and adaptation. But as the chapter now reads, it only partly covers both and in some parts it is even stated that the primary focus of the chapter is on mitigation. It would have been good to present the aim of the chapter more clearly upfront. This chapter has a difficult task, and unfortunately it suffers from the rather artificial thematic division between WGII and WGIII in terms of mitigation and adaptation responses. There is little doubt in the literature that ethical and sustainable responses to climate change include both mitigation and adaptation. Some even argue that mitigation is the greatest adaptation that society can do, and as the more newly introduced transformation theme takes form, there will potentially be more literature focused on ways to increase capacities and competencies of individuals, groups and institutions to understand, initiate and facilitate change and responses. | Primary focus is mitigation. Still, point is well taken, Chapter could benefit from focus on root causes (beyond those drivers discussed in 4.3, such as those discussed in Sygna's comment immediately below) |
| 13998 | 4 | 1 | | 1 | | There is a focus on consumption and production in this chapter, and subsequent chapters will focus on sectors. Since this chapter is that overarching one where responses are linked to the wider sustainability debate, there should be more coverage of the role of the financial and trade systems, governance and development paradigms, power and gender relations, knowledge production systems, and values and worldviews. | Accepted. |
| 11567 | 4 | 1 | | 43 | | Very interesting and well discussed passages. | Noted (thank you). |
| 7751 | 4 | 1 | | 115 | | I wanted to preface my comments with a short note to explain: i) I am an LA for WGII and wanted to review something in WGIII to get a sense of what was evolving - to make sure we are linking appropriately with WGIII; ii) I am not an expert in mitigation; iii) I have only reviewed the parts of this chapter on which I feel that I have some expertise - hence there are many sections that I have not read. | Noted. |
| 18302 | 4 | 10 | 1 | | | The point is better made here.... CC underlines the potential for equity and SD. | Accepted. |
| 18303 | 4 | 10 | 10 | 7 | 14 | 'Can help' is an overstatement. If this second claim is to be made, it needs to be referenced.While I do not hold to the line that authoritarian action around climate change can be sustained indefinitely, the effectiveness of very different governance regimes in implementing short term technology-altering change is clear, and the 'inequitable' nature of those regimes may be central to their success. This chapter fails to grapple with this problem. | Noted. Here we do not talk abour political regimees, only about general equity. |
| 14009 | 4 | 10 | 12 | | | Suggest adding "…without QUESTIONING EXISTING DEVELOPMENT PRIORITIES and adopting…" | Accepted. |
| 14377 | 4 | 10 | 15 | | | Sounds like Club of Rome in 1970s | Will delete the "transgressing planetary |
| 14313 | 4 | 10 | 21 | 10 | 24 | Given the chapter focus on both mitigative and adaptive capacity, have/will cross-linkages with WGII chapter 20 on Climate-resilient pathways: adaptation, mitigation, and sustainable development been/be taken more explicitly into consideration in the next draft versions of chapter 4? | Will review latest WGII draft. |
| 18304 | 4 | 10 | 22 | | | Suggest changing 'will' to 'may'. The assertion about the link between SD and equity, and CC responses is discussed above. The assertion here is a value position which may be challenged. For instance, it is arguable that emphasising the SD elements of CDM may (sadly) lead to poorer mitigation outcomes. Also, the term 'climate challenge' is an aggregation that limits consideration. Change to 'the challenges of mitigation and adaptation'. | Accepted. |
| 14010 | 4 | 10 | 23 | | 24 | Since the chapter aims towards discussing both mitigative and adaptive capacity, there needs to be a deeper discussion of why this is important in a sustainable development context, and that means going deeper into the social and human dimensions of responses and change. It should also be discussed whether adaptive capacity in SD context is different from what is talked about in WG II, where it partly is limited to responses to impacts. | Important point. General socioeconomic development (such as educating girls) as part of SD strengthens adaptive capacity but is different from specific adaptation measures |
| 5463 | 4 | 10 | 25 | 10 | 43 | Two paragraphs are great- | Noted. |

|---|---|---|---|---|---|---|---|
| 8797 | 4 | 10 | 32 | 10 | 35 | Discussion of the harm to individuals, societies and nature from over consumption and under consumption could include mention of 'Global Virtue Tradition' - in particular moderation or temperance - that stretches back before Aristotle's Nicomachean Ethics, is arguably the ethical starting point of the majority of the global population, includes epistemology most capable of coping with difficulties in predicting the Earth System and includes directly relevant literature such as http://www.earthcharterinaction.org/invent/images/uploads/echarter_english.pdf, Palmer M and Finlay V (2003, n.b. page xi, Faith in conservation: New approaches to religions and the environment, Washington DC: The World Bank, http://go.worldbank.org/3L9IDQNFO0 or http://www.arcworld.org/books_resources.asp. Accessed 9 May 2011); Engel JR & Engel JG (Eds.) (1990) Ethics of environment and development: Global challenge, international response, London: Belhaven; Connelly J (2006) 'The virtue of environmental citizenship' in Dobson A and Bell D (Eds.) Environmental Citizenship, Cambridge, Mass.: MIT press; Sandler R and Cafaro P (Eds.) (2005) Environmental virtue ethics, Lanham, Md.: Rowman indicates something of the connection between consumption, ethics and climate science, with my currently unpublished book manuscript being a much more in depth treatment. | Helpful references (for 4.3.3); Melissa Lane's book is another reference. |
| 18305 | 4 | 10 | 36 | | | The term 'data' is plural…. 'there are more data'... | Accepted. |
| 3215 | 4 | 10 | 48 | 11 | 2 | A just transition to reduced emissions is a nice plan A. Does there exist a plan B and do we need it? | Noted. Interesting question. |
| 18306 | 4 | 10 | 48 | 10 | 48 | A just transition is desirable… but it may not be necessary in the short term… Perhaps 'A just transition is desirable if enduring public support is to be gained….' | Accepted. |
| 2914 | 4 | 10 | 36 | 10 | 43 | proposal is to remove this alinea | To revise. What is meant is lack of access to meeting basic needs. |
| 6891 | 4 | 10 | 4 | 11 | 5 | Please provide more specific references to WGI/WGII AR5. | Accepted. |
| 8491 | 4 | 11 | 10 | | 12 | See comment 20 | See response to comment 20. |
| 5464 | 4 | 11 | 21 | | | Would seem logical to mention valuation of ecosystem services in this section | Rejected. This is dealt with in 4.7. |
| 8798 | 4 | 11 | 26 | 11 | 27 | That the key message understood by Chapter 4 from Chapter 3 is 'notions of well-being and social welfare function' is unsurprising but a sad indictment of the narrow focus of Chapter 3 on undemocratic and irrational utilitarian ethics in the face of an unpredictable Earth System which cannot be adequately understood to be fed in to CBA (Charlesworth and Okereke, 2010). | Taken into account. The notion of well-being is explained to be broader than this reader might think. |
| 3216 | 4 | 11 | 3 | 11 | 4 | What is the empirical basis for stating that this is likely? | Taken into account in the revision, by improving the framing of key concepts. |
| 7761 | 4 | 11 | 33 | 17 | 16 | This section, 4.2, is very theoretical and lacks empirical evidence. I have to admit the text looks much like my introductory lecture to sustainable development that I give to the 3rs year undergrads. A lot of this information provided in this section is straight from text books, it is not cutting edge research with relevance for lcimate change mitigation. I would reduce the entire section in its current form to a couple of paragraphs and use the remaining space to provide up to date and relevant empirical evidence. Specific comments onthis section follow | Taken into account in the revision (shortening, but key concepts must be introduced). Not all readers will have followed your 3rd year lecture. |
| 7762 | 4 | 11 | 39 | 13 | 21 | This section 4.2.1 seems unnecessary, refer to a text book which describes all this, cut to a couple of sentences - what is new in this area? | See previous box. |
| 11731 | 4 | 11 | 4 | 11 | 6 | Those targets and time peaking are not political agreement. Amendant to the apropriate wording is needed. Reffer Decision 1/CP.16 and Decision 1/CP.17. | The term used in this sentence is part of the Executive Summary and so we need to revisit the section that addresses this too. On page 11, It is explicity stated as "politically agreed targets". 2C was politically agreed in the Copenhagen Accord of 2009 but several UNFCCC Parties objected to the non-participatory manner that document was forged so it is in its entirety only formally"noted". 1.5 |

|---|---|---|---|---|---|---|---|
| 10642 | 4 | 11 | 4 | 11 | 6 | Those targets and time peaking are not politically agreed. Amendant to the apropriate wording is needed. Refer Decision 1/CP.16 and Decision 1/CP.17. | See previous box. |
| 9980 | 4 | 11 | 4 | 11 | 6 | This part should be changed from "agreed targets such as 1.5 or 2 ℃" to "noted targets such as 2 ℃". These targets are not agreed but only politically mentioned. In addition, the 1.5 ℃ target is not realistic and even 2℃ target is extremely difficult to attain, as described in (Höhne, 2011, conclusion) and (Rogelj, 2011, abstract).<br><br><Reference><br>[1] Höhne, N., C. Taylor, et al (2011). National GHG emissions reduction pledges and 2℃: comparison of studies. Climate Policy, 1-22, DOI:10.1080/14693062.2011.637818. Available at: http://iopscience.iop.org/1748-9326/5/3/034013/fulltext/<br>[2] Rogelj, J., W. Hare, C. Chen & M. Meinshausen (2011). Discrepancies in historical emissions point to a wider 2020 gap between 2℃ benchmarks and aggregated national mitigation pledges. Environmental Research Letters, 6, 9, DOI:10.1088/1748-9326/6/2/024002. | Accepted. |
| 9813 | 4 | 11 | 44 | 11 | 45 | Especially in this chapter you should add a very important part of the Brundtlanddefinition, that is omitted quite often "and chose their own lifestyle" | Noted. There is a long discussion of lifestyles in the chapter (section 4.4). |
| 18307 | 4 | 11 | 5 | | | Delete 'rather' | Accepted (Yoke Ling). |
| 3217 | 4 | 11 | 7 | 11 | 9 | Are we going to change the way people think within the very years available before GHG emissions must be reduced significantly? And how? | Agree - the UNFCCC/Kyoto Protocol legal regime as well as the Bali Roadmap were all agreements that would have made a difference if they had been implemented fully and |
| 15651 | 4 | 11 | 10 | | 12 | One area where social scientific assessment can inform policy on the issue of equity is through empirical assessment of the strength of particular perceptions among different groups about what is equitable in the context of climate change policy. See e.g. Lange, A., C. Vogt, and A. Ziegler. 2007. On the Importance of Equity in International Climate Policy: An Empirical Analysis. Energy Economics 29:545-62. This area of research could be accorded more prominence in Chapters 4 (as opposed to the more theoretical literature covered in Chapter 3). | Accepted. Useful reference. |
| 10977 | 4 | 11 | 4 | 11 | 6 | Is the target of one point five degrees centigrade really agreed politically? It might be difficult to achieve even two centigrade. | This needs to be clarified. "Politically discussed targets" ? |
| 6892 | 4 | 11 | 4 | 11 | 6 | Such statements on projected climate change need to be based on the WGI AR5 assessment, probably best on WGI AR5 Chapter 12. Reference needs to be added. | Accepted. |
| 13272 | 4 | 11 | 26 | 11 | 26 | It is said: "(…) the hazard confronting future generations"; it should say "(…) the hazard confronting current and future generations" | Accepted. |
| 18308 | 4 | 11 | | | | This section does not really deal with the issue of SD indicators. | Accepted. There was a typo in the title. |
| 14314 | 4 | 11 | 33 | | | The section on approaches and indicators remains quite general and the presentation of key concepts of SD and equity could be tightened up. More generally, the added value of repeating literature findings and discussions that in many cases preceed both AR4 and AR3 can be questioned. It would be interestingand novel if the section could have a more pronounced emphasis on tying up the concepts of SD and equity directly to climate change and to the latest literature and 'real world' trends. It does so at the very end, page 17 line 4 to line 16, but the discussion of low carbon development strategies/economy/society/energy development could be expanded to include e.g. the concept of 'climate compatible development', 'climate resilient development', NAMAs, the issue of mainstreaming climate change into development planning and decision-making processes, and these approaches or concepts could then be discussed in the context of the original and broader definitions and interpretations of SD and equity and their theoretical underpinnings be explored. | Taken into account (Yoke Ling) |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 4684 | 4 | 11 | 39 | | | This chapter could be appreciated as the first comprehensive review of IPCC reports regarding sustainability and sustainable development. A more detailed explanation of the concept and its definition, along with historical background before publication of the Brundtland report is needed. The Brundtland report was not the first to launch the concept and definition, and these concepts should be understood within their historical context. For example, please see:<br>- Lele (1991), World Development 19(6): 607-621.<br>- Dresner (2008), Earthscan.<br>- Robinson (2004), EcolEcon, 48(4): 369-384. | Rejected. We are asked to streamline and focus on recent ideas/facts. |
| 12683 | 4 | 11 | 40 | 12 | 10 | In addition you may like to mention that the Brundtland Report includes intergenerational justice ("… the ability of future generations to meet…") as well as the need principle ("… in particular the essential needs of the world's poor..."). | Accepted (Yoke Ling). |
| 9814 | 4 | 12 | 1 | 12 | 4 | Besides the concept of needs and limitations you should add the concept of lifestyle, that is actually adressed in other parts of the report. | Accepted (Yoke Ling). |
| 18311 | 4 | 12 | 11 | 12 | 16 | This para is insufficiently clear. The Brundtland Report does not do this unless you are reducing 'development' to mean an increase in' material capacity', which that report does not do.Debate over its definition of SD has recognised that tension exists between its desire for intragenerational equity and intergenerational equity. A development path is 'sustainable if the capacities for development can be preserved etc'. It is unclear in the present sentence what 'benefits' might be and can be read to suggest that material outcomes must endure eternally. The debate referred to later on this page - between supporters of weak SD, who believed that under SD resources and nature can be transformed to/substituted by capital for human benefit, and supporters of strong SD, who are much more limiting - should be introduced here. | Accepted, the paragraph will be deleted. |
| 18313 | 4 | 12 | 17 | 4 | 25 | This para weakly fails to take a position on a central debate about SD. If one accepts a triple-bottom-lone version which gives each element equal priority, then what are the consequences for action around climate change, specifically for biodiversity preservation? This discussion should follow that about weak and strong SD. | To be taken into account (Yoke Ling). |
| 9815 | 4 | 12 | 17 | 12 | 25 | When defining sustainable development you should also include the time perspective. Especially in the current economic system shorttermism is a | Noted. |
| 8256 | 4 | 12 | 26 | 12 | 41 | Two approaches of sustainability, weak sustainability V.S. strong sustainability, are reviewed here. It would be more illuminating to provide some evidences or arguments to shed light on which approach is more relevant or realistic. | Noted. This is an ethical divide, not an empirical issue. |
| 18135 | 4 | 12 | 27 | 12 | 29 | Reference required. | Accepted (Yoke Ling). |
| 5465 | 4 | 12 | 30 | | | Here appropriate valuation of factors in strong sustainability would seem to remove this discrepancy | Noted. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 8711 | 4 | 12 | 42 | 12 | 45 | One of the most important tools in monitoring and predicting the health of ecosystems is the use of biological parameters, as the composition and abundance of species within ecosystems, research in this direction are able to determine what the characteristics of natural ecosystems are and how this can change over the changes caused by climate change. The effects are shifts in geographical range, promoted by shifts in temperature patterns that delimit species boundaries. Each 1o C of change moves ecological zones on Earth about 160 Km. The methods to monitor this changes include long-term observation and re-surveys of previously sampled sites (Thuiller,W . Climate Change and the ecologist. Nature. Vol 448 / 2 August 2007. ). But only the monitoring of taxonomical composition of ecosystems couldn't be enough to understand how the ecosystem functionality is affected by climate change. A new approach for this is the identification of functions related to each species with the intention to understand the importance of species organization to maintain the ecosystems service, trough this is possible to develop a computational model capable to predict how and when these functions can collapse. A good model for this is called Complex Adaptive Systems (CAS), which is a self-organized system, where the controlling rules define how the system changes in response to changes of the past and present in the environment where they are submitted (LEVIN, S. 1999. Fragile Dominion. Complexity and the Commons. Massachusetts, Perseus Books). In CASs systems, the redundancy of species playing the same function in ecosystem is much more important than the simple number of individuals or species. In this sense, different species can play the same function at different conditions, so the system acquires resilience to face changes like climate changes. The universality of the concept of complex adaptive systems brings out an alternative perspective to the context of ecosystems involving great diversity of organisms and complex trophic interactions. For example, in the case of tropical ecosystems, it's possible to understand not only the role of taxonomic groups, such as is the case of genres or species, but also the role that taxa take when organized into functional groups. Thus we can understand how changes in the scale of observation can influence the perception of the different functional behavior of ecosystems, and from that understand how their integrity is maintained, and most importantly, how and when it can collapse (Gontijo, A.B. 2009 "Estudo e modelagem das dinâmicas estruturais de assembléias de formigas tropicais em diferentes escalas ecológicas" Master's degree dissertation. Federal University of Ouro Preto. Tropical Biomes Ecology Program. http://www.repositorio.ufop.br/handle/123456789/397?mode=full&submit_simple=Apresentar+o+registro+completo). | These useful references are introduced. |
| 14011 | 4 | 12 | 42 | | 45 | There is now a large and well established literature on vulnerability, and the new direction is more on how to adress vulnerabilities and create human security through climate change responses and sustainable development. | OK |
| 15271 | 4 | 12 | 42 | 12 | 45 | In addition to vulnerability, the notion of resilience should be mentioned here as an important concept in discussing sustainability. Sustainability of a system can be understood as a balance between efficiency and resilience (Lietaer, Ulanowicz, and Goerner, 2009). Resilience is dependent upon diversity and connectivity. Diversity refers to the existence of different types of agents acting as "nodes" in the network. Connectivity concerns the number of pathways between agents. A system's resilience is enhanced by more diversity and more connections to fall back on in times of trouble or change. In many cases efficiency tends to increase through streamlining, which usually reduces resilience by decreasing diversity and connectivity.<br>Goerner, Sally J., Bernard Lietaer, and Robert E. Ulanowicz (2009). "Quantifying Economic Sustainability: Implications for Free-Enterprise Theory, Policy and Practice." Ecological Economics, 69, 76-81. | Reference introduced. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 18310 | 4 | 12 | 6 | 12 | 8 | This treatment of sustainability seems to ignore a body of writing on this issue. For effective reference, see Dobson in the journal Environmental Politics. Sustainability does not refer to 'the preservation of a certain state of affairs' but rather to the maintenance of the capacity of human and biological systems to evolve over time. Similarly, the definition of 'progress' has been much debated and cannot be simply invoked here. Perhaps better to write "development refers to the improvement of welfare and well being in human societies, and etc...". It would be good to introduce, here, the fact that - definitionally - sustainability (and SD), has temporal and spatial elements, and also encompasses humans and other species. Then these elements can be expounded systematically... with some reference to how climate change affects them. Some of them do come through, but seemingly more haphazardly, later in the chapter. The 'rights of Nature', however, is generally poorly handled and largely overlooked in this rather anthropocentric view of SD. | Taken into account (Yoke Ling). |
| 13273 | 4 | 12 | 16 | 12 | 16 | At the end of the paragraph I suggest to add: "(…). And in this sense, the climate system is a key environment component to consider when addressing Sustainable Development and environmental issues." | This is clarified in the new version, 4.2 is substantially revised. |
| 15108 | 4 | 12 | 20 | 12 | 22 | Add: ¨ Sustainability in the economic sphere has to do with the preservation of a healthy economic and financial system IN BEBEFIT OF THE WHOLE, while sustainability in the social sphere is TO WORK FOR THE BENEFIT OF THE POPULATION INSTEAD OF about avoiding conflicts and social unrest¨. | The sentence has been deleted. |
| 13274 | 4 | 12 | 21 | 12 | 22 | Social conflicts are inherent of social dynamics, so maybe it is better to replace "avoid" with "properly manage" | The sentence has been deleted. |
| 18316 | 4 | 13 | | | | There is no mention of the spatial dimension of sustainability - global, regional, local? | Accepted. |
| 12684 | 4 | 13 | 1 | 13 | 10 | Maybe you like to reconsider whether the statements made, here, are in line with the concept of SD. | Not relevant. |
| 8800 | 4 | 13 | 22 | 17 | 16 | It may be more useful to focus on inequity principally created by market ideology, market fundamentalism or market dogmatism (e.g. Soros G (1998) The Crisis of Global Capitalism) and Stiglitz (http://www.nobelprize.org/nobel_prizes/economics/laureates/2001/stiglitz-autobio.html). That is it is easier to identify inequity and its causes and perhaps address these causes than produce a universally agreed description of equity which can be worked towards. To be even blunter, working against inequity is 'easier' than achieving equity. | There is a tension over the extent of the role of the market and there is interesting analysis in the wake of the recent financial crises and the limits even viability of the carbon market in the absence of ambitious emissions |
| 18317 | 4 | 13 | 22 | | | This tighter discussion of distributional, allocative and procedural elements of equity could have been prefigured in the introduction and the earlier section on 'principles'. | It is indeed in the introduction. |
| 5466 | 4 | 13 | 23 | | | This paragraph can be deleted | Rephrased. |
| 12686 | 4 | 13 | 23 | 13 | 32 | You may like to proof whether "Equity Theory" is the right wording, here, or whether it might make more sense to talk about different dimensions of Equity and ways of operationaliz the concept. You may like to check Adams, J.S. (1965). Inequity in social exchange. In L. Berkowitz (Ed.), Advances in experimental social psychology (Vol. 2, pp. 267-299). New York: Academic Press. | This comment ignores the relevant scholarship. Thomson 2011 is more relevant. |
| 18314 | 4 | 13 | 4 | | | This needs clarification. The first part of this sentence can be true only if the time frame is cut short, and therefore the notion of sustainability becomes purely semantic. The second part can be right, as benefits need not be distributed equitably. | This paragraph has been deleted. |
| 5467 | 4 | 13 | 44 | | | Is it possible to consider equity for a finite period and would that make use of this concept less cumbersome? | This had to be shortened drastically. |
| 8799 | 4 | 13 | 44 | 14 | 3 | It can be argued that the problem is less discounting than it is 'comparing streams of utility over time'. Asking the broader question 'what is the right thing to do or right approach to take' should lead to more satisfying answers, as this can include a range of ethical schemes with virtue typically being more comfortable with taking a longer view than at least utilitarian ethics - this can often be seen by the organisations and individuals who take a long term view rather than maximising short term profit. | Not clear comment. |
| 18315 | 4 | 13 | 6 | | | Counter-intuitive. An example would be useful here. Swidden agriculture - logging forests intermittently with stone axes and then burning them on a long cycle ?? | This paragraph has been deleted. |
| 2915 | 4 | 13 | 11 | 13 | 21 | Suggestion is to start with 'Indeed … sustainable development. One guiding principle is …. | Not relevant. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 18136 | 4 | 13 | 3 | 13 | 3 | The concepts here are quite complex and could be simplified .For example, the difference between welfare and well-being needs to be elaborated. The thrust of the paragraph and what it intends to convey is not easily apparent. | Accepted, will clarify. |
| 18309 | 4 | 13 | | | | This section does not deal effectively with equity in climate policy | Rejected. |
| 18312 | 4 | 13 | | | | This section does not deal effectively with equity in climate policy. It should come after section 4.2.3. (which should include the more general discussions that are also part of thissub section) and specifically confine itself to the underlying philosophical considerations of 'common but differentiated responsibility' (CBDR) specifically in relation to issues of historical, distributional and procedural justice... | Chapter 3 deals with the concept and philosophy of historical and distributive justice. |
| 12685 | 4 | 13 | 23 | 13 | 23 | Sustainability might be one form of equity or at least contain a limited number of equity characteristics that match with the sustainability definition (SD). So the SD already contains the relevant equity principles in its notion even it is controversial which equity characteristics are leading the process of sustainabile development. In any case, there are equity concerns definitely not belonging to sustainbility. They can be left aside for climate change discussions. Moreover it is not obvious why sustainability and equity are dealt with in a separate way at several places of the chapter. So if there is a reason for not dealing with equity and sustainability in an integrative way, the difference between the two normative concepts should be outlined at the beginning of the chapter. In the other case for the climate change discussion relevant characteristics of the equity principle could be considered with regard to potential controversies under the headline sustainability principle. | Noted. Sustainability is not the same as equity. |
| 12687 | 4 | 13 | 27 | 13 | 28 | The impact of democracy on sustainability could be explained in more detail. It might be useful to base this question on the sustainability issue of the Brundtland Report definition rather than on the three pillar model (see comment 1, 21). For the temporal dimension of the last mentioned model democracy is not necessarily constitutive. Citizens of democracies have the highest amount of per capita emissions today (especially European states and the USA). Moreover engagement of democracies for sustainability may not be due to the democratic structure of the state but could also be a result of the scarcity of resources or due to high damage potential in the course of climate change. Above that the mentioned motives may not only be found in democratic but non-democratic states, too.<br>In contrast, with regard to the spatial dimension of sustainability, democracy could gain importance, especially if there is proof for the thesis that democratic states might be mor willing to share wealth with each other than with non-democratic states. In this case, e.g., the contraction and convergence approach (see IPCC Draft, Chapter 4, Section 4.7.3.3, p. 70, line 38) might be easier to implement within democratic than non-democrativ structures. In any case it should be laid out at which level democratic structures are helpful: a) at the national level, b) at the international level or c) both. Here, the international level might be the most interesting “democracy” concern. Still only some characteristics of democracy may play a role when dealing with climate protection (e.g. equal representation, transparency and the integration of equity concerns may help to reach an international agreement). | To be taken into account. |
| 18318 | 4 | 14 | 14 | | | I don't understand this sentence. | This has been revised and shortened due to space constraint. |
| 3218 | 4 | 14 | 16 | 14 | 29 | The argument of Asheim et al. (2012) is reliant on the modeling of the future as consisting of an infinite number of generations. If the present is better off than the future, then a uniform addition to future generation's wellbeing at the sacrifice of present wellbeing reduces inequality and increases the sum of utility independently of the degree of inequality aversion (i.e. how wellbeing is mapped into utility). | The new formulation here is actually more general as it is compatible with a finite horizon (the priority for the future is then not absolute but strong). |
| 18319 | 4 | 14 | 33 | | | This sentence seems a little loose. | It has been deleted. |
| 14012 | 4 | 14 | 35 | | 39 | A very important point with reference to preserving the status quo, that in many cases is the source of the problem. | Noted. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 5468 | 4 | 14 | 4 | 29 | | Could more clearly be illustrated with a figure | Rejected for lack of space (and this is not central to the chapter). |
| 7763 | 4 | 14 | 4 | 14 | 39 | I am not convinced by this argument. I would either think how better to explain these points or delete all this text | This has been revised and shortened due to space constraint. |
| 7764 | 4 | 14 | 40 | 14 | 50 | Nicely argued, BUT there are no references, on what are you basing this? | Accepted. |
| 14378 | 4 | 14 | 41 | | | Basically misguided to contend that the 4 billion have nots cannot aspire to current living standards of the top 1-2 billion because that would be inherently unsustainable. Even with current “production processes,” but that is a red herring because productivity will increase. Don’t forget that the same arguments were made in the 1970s and shown to be wrong: the global economy did not collapse because of the exhaustion of natural resources. | Taken into account, see 4.2.2 and 4.5. |
| 3219 | 4 | 14 | 45 | 14 | 48 | Is the following statement an empirical fact or an ethically based side constraint on climate policies: "Put more bluntly, any attempt to preserve the natural environment by keeping living standards low for a large part of the world population will face strong political resistance, and will almost certainly fail." | This is empirical. |
| 12690 | 4 | 14 | 49 | 14 | 50 | Is it really the question? Or should not rather climate policy fulfil the claims of SD? | The sentence has been deleted. |
| 2916 | 4 | 14 | 1 | 14 | 3 | suggestion: IPCC WG3 consider that the horizon in finite and uncertain. Remove sentence 2 and 3 | Rejected, this is a misunderstanding. |
| 15109 | 4 | 14 | 41 | 14 | 43 | Add: ¨On the one hand, the convergence of developing countries toward the standard of living of the richest populations is admittedly unsustainable if the consumption and production processes of the rich are universally adopted, AND WILL EXCEED THE REGENERATION CAPACITY OF EARTH ¨ . | Accepted. |
| 12688 | 4 | 14 | 16 | 14 | 18 | For sustainability questions equity needs to foucus on contradicting interests between the present and future generations. But it may not imply an unconditional preferential treatment of future generations. Discounting of future generation’s interests is e.g. dealt with in Arrow, Kenneth J., Discounting, Morality and Gaming, in: Portney, Paul R. Weyant, John P. (Eds.), Discounting and International Equity, Washington 1999, pp. 13-22. Discounting is mostly based on attended (technological) efficiency increase and on uncertainties (see e.g. Buchholz W., Schumacher, J. (2008), Discounting and Welfare Analysis Over Time: Choosing the η CESifo Working Paper Series). So the conflict between present and future generations might be resolved best when the discounting rate is well justified and the critic is given with regard to the assumptions of discounting (too optimistic efficiency assumption or a too pessimistic assumption about the uncertain utility of natural resources in future, cf. Buchholz/Schumacher, ibid). You may also like to add the idea of Mansbridge, Jane, Rethinking Representation, in: American Political Science Review 2003, S. 515-527 (515). | Noted. Note that there is a key difference between discounting utility and discounting money (or consumption). |
| 12689 | 4 | 14 | 49 | 14 | 50 | Maybe it makes sense to differentiate between intragenerational and intergenerational equity. Intergenerational equity is according to the Brundtland Report part of sustainability. So the phrase "sustainability can be achieved via equity principles" may be misleading as it suggests that sustainability does not imply intergenerational equity. So it maybe helpful to use the term "intragenerational equity" here. | The sentence has been deleted. |
| 5470 | 4 | 15 | | | | It appears from this discussion that the concept of SD can also be used to describe social goals from a particular perspective ie women's rights. It seems to the reader that these alternative views of SD are tangential to the discussion- could be condensed and summarized by saying as has been said earlier, that SD can have a human focus (soft) or an ecological focus (hard). Subsets of the soft SD include particular perspectives such as income distribution or women's rights- this would allow you to cut a significant portion of the discussion without sacraficing much | OK - to be condensed. |
| 14379 | 4 | 15 | 1 | 15 | 14 | Doesn’t acknowledge the reality that Copenhagen has succeeded Kyoto as more practical given the essential inclusion of China and other major emerging market economies in emissions restraint. | Misinterpretation/mis-understanding of Copenhagen and entire set of climate agreements and decisions. See YL |
| 7765 | 4 | 15 | 1 | 15 | 14 | Delete - unnecessary | See YL response re: 319 and 320 |
| 12693 | 4 | 15 | 19 | 15 | 20 | Is Equity the antonym of unequal? You may like to reconsider the wording. | The wording seems good. |
| 3220 | 4 | 15 | 21 | 15 | 22 | Empirical basis for the statement that the mentioned approach is gaining ground? What is meant by sustainable development being a human right? | The first statement has been deleted. The second is referenced. |

| 7766 | 4 | 15 | 26 | 15 | 30 | No reference. Reference needed to verify this. If there is no reference - delete | The sentence has been deleted. |
| 12691 | 4 | 15 | 31 | | 33 | You may also like to look at Kals, E., Maes, J. (Hrsg.), Justice and Conflicts: Theoretical and Empirical Contributions. Springer, Berlin,Heidelberg, ISBN 978-3-642-19034-6, 269-282. | This reference is added. |
| 12279 | 4 | 15 | 42 | 17 | 16 | Please consider to include some of the conclutions from O'Briens study; O'Brien, K., 2011: Global environmental change II: From adaptation to deliberate transformation. Prog Hum Geogr, in section 4.2.3 | This reference is added. |
| 18320 | 4 | 15 | 43 | | | The phrase often used about SD is that it is a 'contested concept', which means that many competing definitions abound, and the vagueness of th Brundtland definition itself spawned many of these competing versions. Again, see article on SD definitions by A Dobson in 'Environmental Politics'. It is vital to have the debate about thecontested meaning of development noted here. Herman Daly. | OK |
| 8801 | 4 | 15 | 47 | 15 | 49 | It should be noted that von Weizsäcker et al. (1998) is critical of contemporary economic structures and the philosophical assumptions that underpin these (ibid, 143-209, 271-299). Further it suggests that efficiency gains will not be enough (ibid, 258, 269, 292-3), particularly given that the advertising industry (and much popular culture) can probably create infinite wants. (ibid, xxvi-xxviii) give examples of how contemporary economic structures unjustly militate against taking action to address environmental issues and have questionable moral and philosophical underpinnings (ibid, 271-299). In particular von Weizsäcker et al. (1998, 139-142) suggest that finance structures tend to favour investment in resource use rather than resource efficiency, which is linked with a tendency to subsidise non-renewable energy production a huge amount, even by so called 'free-market' governments (ibid, 153-4). It is worth noting that von Weizsäcker et al. also suggest that current market economies encourage the 'seven deadly sins' or encourage classical vices (ibid, 1998, 143). | Noted. This part has moved to 4.5. |
| 5469 | 4 | 15 | 5 | 18 | | Some comment on whether this perspective on SD is compatible with emissions reductions or an obstacle to them would be helpful- discussion can also be edited | This refers to a different paragraph. This is a study that needs due attention as it is one of very few from a developing country perspective on equity and |
| 9295 | 4 | 15 | 42 | 17 | 16 | In order to facilitate sustainable development, the cement industry in Japan has integrated climate policy with recycling policy. The reference shows a case study to make an analysis of treatment cost of municipality wastes (MORIMOTO, NGUYEN, CHIHARA, HONDA and YAMAMOTO; Journal of Life Cycle Assessment, Japan, Vol.2 No.4 October 2006 "Proposals for Classification and an Environmental Impact Evaluation Method for Eco-Services: Case study of Municipal Waste Treatment in Cement Production") | Noted. We need to decide how to deal with specific case studies or practices. |

|---|---|---|---|---|---|---|---|
| 12694 | 4 | 15 | 26 | 15 | 29 | As democracy, human rights are important in international politics in general. But in international law human rights are not absolutely binding. For example the human rights covenants are not signed and ratified by every state of the world and so can be considered as binding law for the ratifying states only. The Universal Declaration of Human Rights is a resolution of the UN only which has recommanding but not binding character. Regional agreements on human rights, eg. the European Convention on Human Rights have no universal coverage, too. Human rights within customary law are only viewed as binding when referring to the minimum standard (ius cogens). It is controversial which human rights are ius cogens norms. Zenović mentions the right to live, the right to humane treatment, the prohibition of criminal ex post facto laws, the prohibition of genocide, the prohibition of war crimes, the prohibition of slavery, prohibition of discrimination on the basis of race, color, sex, language, religion, or social origin. On the other hand there are human rights which are not in focus, the prohibition of imprisonment for civil debt and the prohibition of crimes against humanity, the right to legal personhood, freedom of conscience and the right to self-determination. And "negative freedoms" and broad positive obligations of states are no ius cogens norms at all (Zenović, Predrag, Human rights enforcement via peremptory norms – a challenge to state sovereignty, Riga 2012, http://www.google.de/url?sa=t&rct=j&q=&esrc=s&source=web&cd=10&ved=0CH0QFjAJ&url=http%3A%2F%2Fwww.rgsl.edu.lv%2Ffiles%2Fdownload%2F33&ei=3udJUNiXLZCTswaVo4CADQ&usg=AFQjCNHcW1EhKJtL6nO4BPImTyQdArR5tA, pp. 35-36). So it seems problematic to talk of an absolute "legal duty" to cooperate in order to realize human rights. | OK. There is however under the Covenant on Economic, Social and Cultural Rights the obligationof Parties to "take steps... to the maximum of its available resources, with a view to achieving progressively the full realization of the rights recognized in the present Covenant by all appropriate means, including particularly the adoption of legislative measures" |
| 18137 | 4 | 15 | 27 | 15 | 30 | It would be useful to state why this recommendation was made. | The sentence has been deleted. |
| 12695 | 4 | 15 | 29 | 15 | 29 | The inclusion of gender research with regard to the climate change problem should be motivated more clearly (what is the difference if aspects of gender are not included?). | The quoted literature shows the strong potential impact of changing gender |
| 12692 | 4 | 15 | 1 | 15 | 14 | This is a repetition of passage p.13, 11-21 and also outlaid in Chap. 3. So it can be shortened or even deleted. | 1) Shorten to include the reaffirmation of equity and CBDR at Rio+20 with specific reference to climate negotiations 2) Clarify that the UNFCCC and Kyoto Protocol are the current legal regime; |
| 18322 | 4 | 16 | | | | By this stage of the chapter, I was wondering how this material linked to climate change. A tougher and earlier linkage - in the intro? - through the Rio Declaration, the requirements of CBDR and of the UNFCCC might help | Accepted - also Rio+20 outcome |
| 3222 | 4 | 16 | 33 | 16 | 35 | Is social transformation something that the IPCC should be concerned over and beyond the need for reducing the GHG intensity of wellbeing. | Sure, because it may belong to the list of objectives that put demands on policies |
| 12698 | 4 | 16 | 40 | 16 | 47 | What would that mean for climate policy? There is no link presented. | To be developed (CA). |
| 14315 | 4 | 16 | 5 | 16 | 18 | The concept of sustainable economic development is not explained, nor are the arguments of Allaby, Hopwood et al, and Schelling balanced by inclusion of references that could support, or the opposite, their theoretical and empirical validity. | Noted. |
| 7767 | 4 | 16 | 5 | 16 | 39 | I am not clear what point is being made here, or how this sectionis relevant to sustainable development and mitigation? I would delete | Not relevant. |
| 18321 | 4 | 16 | 9 | | | The term 'economic wellbeing' is confusing….and mixes two conceptual languages. | Accepted. Will try "affluence". |
| 2917 | 4 | 16 | 4 | 16 | 4 | Please refer also to more recent literature when available. It is a relevant topic. | Moved to 4.5. |
| 6321 | 4 | 16 | 26 | 16 | 39 | I hope that the authors will not think me to be too presumptuous but I would like to suggest that "alternative paradigms of sustainable development" are the topic of my book: Ingrid Leman Stefanovic, SAFEGUARDING OUR COMMON FUTURE: RETHINKING SUSTAINABLE DEVELOPMENT (Albany: State University of New York Press, 2000.) The argument is made that a condition of achieving sustainability is to augment primarily calculative, reductionist modes of thinking that are common today, with more thoughtful, originative perspectives. | OK |

|---|---|---|---|---|---|---|---|
| 12696 | 4 | 16 | 7 | 16 | 12 | Arguing for a high growth level as a driver towards sustainability is problematic even if poor countries receive the whole benefits. It might be more plausible if the spatial dimension of sustainability is taken into account as is the case in the sustainability definition of the Brundtland Report (IPCC Draft, Chapter 4, Section 4.2.1., pp. 11-12 and Section 4.2.2, p. 13, lines 25-26). There, the spatial dimension of sustainability tries to ameliorate the situation of poor countries. In contrast, e.g., the contraction and convergence approach (see IPCC Draft, Chapter 4, Section 4.7.3.3, p. 70, line 38) does not necessarily depend on growth but can also be based on redistribution. Consequently economic growth is no synonym of sustainability (Since e.g. redistribution could be a more sustainable path, especially, if material growth depends on scarce ressources which cannot be substituted. And because, in the past, growth accelerated climate change and did not limit it as outlined in this chapter, e.g., p. 32, line 4-5; p. 34, line 14-15). Even if partial respectively limited growth could be useful for introducing sustainable politics, respectively, departing from unsustainable pathes a matierialistic growth policy remains problematic against the background of the three pillar modell (see comment 1). So it might be better to talk about "sustainable growth" or "long durable global wealth", here. | Here we just mention one view among others. |
| 12697 | 4 | 16 | 31 | 16 | 34 | Which inequities are meant in detail? How is environmental justice defined in Hopwood et al. (2005)? The definition and application is an important part to analyze environmental as well as economical impacts (refer to Chap.3). | More detail is provided. |
| 11269 | 4 | 17 | 1 | 17 | 3 | “market-friendly reforms” has been implemented everywhere, especially since the 90s. However, since the electricity crisis in California, reforms have been critically scrutinized and have caused social outcries. This added -more recently in the context of the global crisis-, to concerns related to energy security has pushed reforms into the background. Serious assessments of those reforms in different countries are available: at least they have mixed results. | Accepted. |
| 3224 | 4 | 17 | 12 | 17 | 12 | What is the relevance of a niche market in this context? | Not relevant. |
| 14013 | 4 | 17 | 17 | 31 | 20 | Section 4.3 has a challenging task, as it aims at discussing determinants of sustainable development and equity, and at the same time it aims to say why this is relevant for adaptation and mitigation (or probably the capacity to respond). To some extent the chapter meets the first aim, but not the second. | Accepted. We need to ensure that the determinants of the entire section speak to both SD and equity, and to CC |
| 14014 | 4 | 17 | 26 | 19 | 3 | Is this where the research stands on what drives or hinders sustainable adaptation?At least the section presenting the I=PAT (page 18, line 28-31) seems to be very much outdated and calling it a traditional method seems inappropriate. | Accepted. The debates around the Holdridge identity will be updated, and cross-referencing to chapter 5 (where |
| 7768 | 4 | 17 | 26 | 18 | 44 | This section (4.3.1) focusses on basic population and demography issues, while this provides an interesting background for people with no knowledge about this area it is not about mitigation and sustainable development. There are many clear links bwteen population, demography and sustainable development, this is an area full of interesting issues, e.g. discussion of IPAT and its failings, emissions pathways, cultural practices around emissions...it would be good to see more of this, and less of the current content. I would delete the current text | Accepted. We take not of the reviewer's concerns and we agree that there is a need for updated engagement with the population/climate change literatur.e |
| 12701 | 4 | 17 | 27 | 18 | 27 | This part can be shortened as it is not directly linked with climate change issues. The link is not provided till line 28. | Accepted. The overall SOD, including this section, will strive for further |
| 12700 | 4 | 17 | 32 | | | The relation between SD and Equity is not clear. Which are the reference points for an equitable future and how do age, sex etc. relate to them? | Accepted. The SOD will develop our conceptual framework much better in section 4.2 and such framework will help to structure the argument of subsequent sections. Section on population and |
| 7451 | 4 | 17 | 4 | 17 | 5 | Mention is made here of ‘low carbon economy’ and ‘low carbon society’. All living things depend on carbon for subsistence. | Not relevant. |
| 7452 | 4 | 17 | 4 | 17 | 5 | A distinction should be made between ‘renewable carbon’ and non-renewable’ carbon. Increasing the use of ‘renewable carbon’ should be vigorously pursued. | Accepted. |

| 2919 | 4 | 20 | 23 | 20 | 35 | Suggestion is Cultures as a subtitle. Suggestion is to illustrate the revisiting the collapse of Rapa Nui. Possibly it is feasible to refer to the contribution of Jan Boersema (revisiting the collapse of Rapa Nui) during the 8th international conference on easter island and the pasificin 2012? | Accepted. We will take into consideration the reviewer's comment when writing the behavioural section, as |
| 2920 | 4 | 20 | 36 | 22 | 46 | In my opinion this part 4.3.4 could be shortened. | Noted. |
| 17338 | 4 | 20 | 23 | 20 | 35 | Consider linking to the examples of Buen Vivir and Gross National Happiness introduced in Chapter 3. | Noted. |
| 12706 | 4 | 20 | 7 | 20 | 8 | Human capital can provide environment-related technologies but also lead to unsustainable technology path ways. Therefore the following phrasing might be more appropriate (and in line with p. 23, line 11): "Human capital can provide the basis..." | Noted. |
| 18325 | 4 | 20 | | | | This section is very Foucauldian and does not do sufficient, in my view, to address issues of state capacity. See works by Lafferty and Meadowcroft, Janicke. | Accepted. We don't understand the "Foucauldian" reference, but we agree that the role of the State as an agent of |
| 13750 | 4 | 20 | | 22 | | If I understand the context of this section right, the task is to review the current literature with regard to answering the question what determines, drives and hinders sustainable development and climate policies. Therefore, I would propose to strengthen this analytical focus in this particular section: What are these drivers and barriers? This section is in large part accurate and up to date, but mostly descriptive and little focused on the initial question. I would rather suggest to focus this section in the latter part more on individual drivers such as governmental decision making versus other actors. | Accepted. However, we don't agree that this point is relevant only for 4.3.4. In line with the co-chairs' view, we acknwoledge that there is a need to strike a balance between framing and the literature review that highlights the |
| 2337 | 4 | 20 | | | | The decentralization should be more analyzed with process of localization. The decentralization is popular political term, but it has vague conceptualization. Thus, localization has to be discussed in environmental governance. The reason is that localization is an integral part of reduction of energy consumption in the case of sustainable consumption and production. Localizing socioeconomic systems, decentralizing governance lead to advance sustainable lifestyles and livelihoods with new social order of sustainable societies. Furthermore, localism is the focus on emerging across with the principles of devolution, of decentralization and of subsidiarity. The Manifesto on the Future of Food by the International Commission on the Future of Food and Agriculture (2006) argues how the localization will facilitate to the reduction of energy consumption. Under current export-oriented monoculture production and an explosion of the long-distance food trade directly cause to increase use of fossil fuel around the word. Obviously, this fossil fuel consumption for food transport damages the eco system and local agro-economic system. On the other hand, local poor farmers become poorer. Thus, localization of agricultural and consumption system has more advantage rather than having just economic advantage for multinational companies. Reference :- Manifesto on the Future of Food , International Commission on the Future of Food and Agriculture (2006) www.arsia.toscana.it/petizione/documents/cibo/cibo_ing.pdf | Accepted. But we may locate this discussion elsewhere in the chapter. |
| 14380 | 4 | 21 | 1 | | | Here and elsewhere the chapter verges on positions that seem likely to serve as fodder for those who will critique the effort as an attempt to impose global governance | Rejected. We don't understand the comment. |
| 7772 | 4 | 21 | 1 | 21 | 33 | Introductory text book stuff on governance, not related to climate change, reduce to 3 sentences max | Noted. |
| 3227 | 4 | 21 | 34 | 21 | 41 | This statement is not simple to interpret, and it might be something that there is not consensus about. | Noted. We will delete the correspondent |
| 7773 | 4 | 21 | 34 | 21 | 48 | much superfluous text, reduce to 2 sentences summarising key points | Noted. |
| 12709 | 4 | 21 | 44 | 21 | 44 | Maybe it is helpful to use "intragenerational equity" instead of "equity" to avoid misunderstandings (See Comment 14) | Rejected. In text, equity refers to both intra and inter-generational concerns |
| 9123 | 4 | 22 | 0 | | | I think consumption of other goods should be included. Consumption is a sum of many things, but mainly proximity/availability, budget constraints and preferences define the choices. Cities may promote consumption-intensive lifestyles and thus densification may have a parallel negative impact. In addition, if GHG mitigation creates monetary savings, rebound effect takes place (e.g. Turner 2009, see first overall comment for details). | Noted. |
| 8493 | 4 | 22 | 23 | | 24 | What exactly are the trends in global capitalism and political economy that are referred to here - being explicit will assist the validity of the message | Accepted. We agree that there is a need for more clarity in the text message. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 3228 | 4 | 22 | 31 | 22 | 33 | Consensus about this? Should not arguments in favor of market-based policy instruments to ration access to the atmosphere as a sink for carbon emissions be mentioned? | Accepted. We acknwledge the need to expand the references and perspectives |
| 7774 | 4 | 22 | 31 | 22 | 37 | Nice use of examples to explain the point, it would be nice to see more of this evidence based synthesis | Noted. |
| 2178 | 4 | 22 | 47 | 25 | 29 | Technology section (4.3.5) seems to downplay if not ignore the role of mobile phone technologies in mainstreaming a wide range of sustainability/climate mitigation/adaptation activities in the developing world, particularly in many African countries. Renewal energy deployment in the developing world is not going to happen in the same way as in the OECD countries for many institutional factors and none of the complexity involved in this key difference is not reflected in this section. | Accepted. We will make sure to address the literature that the reviewer implicitly points towards. |
| 9124 | 4 | 22 | 5 | 22 | 11 | The overall impact of agglomeration economies, accumulation of affluence and proximity may cause a reverse GHG effect, even more if supported by rebound effect due to savings on transport and energy costs. | Accepted. The reviewer touches upon something that we will indeed address in the SOD. However, the point in text may |
| 8904 | 4 | 22 | 13 | 22 | 18 | The role of government in sustainable world is very important as they are responsible of land attribution, utilisation and decision making for their communities or citizens. | Accepted. The role of the State should be further emphasized. |
| 7775 | 4 | 23 | 12 | 23 | 23 | I am not clear why you selected health and energy as the two sectors to look at. It would be helpful to explain why you think these are the sectors of interest re: STI | Accepted. We should make this choice more explicit or otherwise expand with |
| 7453 | 4 | 23 | 16 | 23 | 18 | “2.7 billion people rely on traditionally high-polluting biomass cookstoves for household cooking and heating in 2009 and 1.3 billion do not have access to electricity.” | Noted. |
| 7454 | 4 | 23 | 16 | 23 | 18 | This is a very emotive statement. Cookstoves are not polluting, it is the type of biomass that is used that creates the ‘pollution’. | Noted. |
| 7455 | 4 | 23 | 16 | 23 | 18 | Dry unprocessed biomass and charcoal cause very little pollution. Cooking outside again quickly dissipates the smoke etc. There are simple solutions to reduce indoor air pollution and to improve the end use efficiency of the devices. Again, electricity is not a cooking fuel in developing counties because of cost and reliability. Providing electricity to the 1.3 billion without it is very desirable, but it will not be used for cooking! | Noted. |
| 3229 | 4 | 23 | 17 | 23 | 17 | Highly polluting in what sense? If biomass is not depleted, these are carbon-neutral. | Noted. |
| 5734 | 4 | 23 | 19 | 23 | 20 | The figure regarding undernourished people can be updated | Noted. |
| 8803 | 4 | 23 | 4 | 23 | 7 | Science and technology are regarded as key means to achieve sustainability, particularly if they contribute to maintain economic development whilst using environmental resources more efficiently and enhancing social development.' In a report by the IPCC I would have expect an explicit recognition that resources are unlikely to be the limit on sustainability especially a conventional economics can address these issues adequately albeit typically unfairly - rather stress to the Earth System is the more fundamental issue. von Weizsäcker et al. note that it may be ‘the absorptive capacity of the earth for all the pollutants and wastes’ (1998, 258) that is critical to unsustainable development. Faber Faber M, Proops J & Manstetten R (1998, 42-44, Ecological economics; concepts and methods, Cheltenham: Edward Elgar) also suggest it is waste and pollution problems that are more important than resource issues. | Accepted. We should incorporate this point into the text. |
| 17339 | 4 | 23 | 47 | 23 | 50 | A counter-example to the study by Winkler et al, (2007) may be emerging not with policies to introduce Electric Vehicles. Where for example in Denmark a skilled work force, public awareness and specific tax incentives have not helped a rapid uptake of this new technology. Recent studies already point to this, see Chapter 8. | Accepted. We take note of this comment and we will introduce the correspondent text and literature. |
| 18326 | 4 | 23 | | | | This section could be toughened by making it refer more directly to the competing technological and financial demands of mitigation/adaptation actions. | Noted. |
| 12711 | 4 | 23 | 36 | 23 | 36 | Instead of (respectively in addition to) basing the argument for "supporting the poor" on the recommendation of some scholors it might be better to directly link the argument to politically more relevant documents (e.g., the spatial approach of sustainable development as difined by the Brundtland-Report dealt with on pp. 11-12 or article 3 UNFCCC which allows shifting the comment of Prahalad 2004 to the discussion of common but differentiated responsibilities). | Noted. |
| 17340 | 4 | 24 | 11 | 24 | 15 | Not only economic reasons, in the case of biomass also environmental issues (iLUC) have compromised the adoption of this option. | Noted. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 8747 | 4 | 24 | 14 | 24 | 15 | The development of carbon capture and storage technology is also constrained by scepticism/mistrust along with investment... | Noted. |
| 5473 | 4 | 24 | 18 | | | Comment on CDM technologies not being sustainable- not needed here- you are talking about information transfer and whether the transfer has been successful- not if the information transferred is appropriate | Noted. The text will be re-drafted. |
| 14316 | 4 | 24 | 24 | 24 | 32 | Would be interesting to also include consideration of the implications of climate impacts on the feasibility/sustainability of a massive scale-up of RETs. There is also a growing literature on the potential conflicts (including equity considerations) and competition between alternative uses in various sectors (water, energy, agriculture, tourism) of resources that become increasingly scarce due to the impacts of climate change. | Accepted. Literature on these fronts will be reviewed and commented upon. |
| 11732 | 4 | 24 | 28 | 24 | 30 | This kind of concern should be recognized. | Noted. |
| 9531 | 4 | 24 | 28 | 24 | 30 | A good example | Noted. |
| 17640 | 4 | 24 | 33 | 24 | 37 | For development of RETs, is it sure that it is required to extract fossil fuel and other minerals? The reviewer does not think it is closely linked with these extractions and RETs development. | Accepted. We note the reviewer's point and we will make sure to include updated references on the extraction of |
| 5474 | 4 | 24 | 45 | | | Discussion of RET should more clearly bring in the importance of social factors- education re adoption of decentralized systems- this is indirectly stated in text but needs to be a separate sentence- showing linkages of the range of perspectives for sustainability | Noted. |
| 8749 | 4 | 25 | 15 | 25 | 15 | It has been suggested (by whom?) | Accepted. More referencing is required. |
| 11733 | 4 | 25 | 2 | 25 | 4 | This kind of concern should be recognized. | Noted. |
| 9532 | 4 | 25 | 2 | 25 | 7 | Good comment | Noted. |
| 7776 | 4 | 25 | 35 | 25 | 47 | all intersting text but not related to mitigation - delete | Accepted. We recognize the need for succinctness; however, we sustain the need for concept definition and framing of issues beyond climate change in the |
| 8748 | 4 | 25 | 8 | 25 | 9 | In particular contexts,such as ?? | Accepted. We acknowledge the need to delete "in particular contexts", as these |
| 12713 | 4 | 25 | 29 | 25 | 29 | When talking about technology and efficiency the "Rebound effect" matters, i.e., GHG emission reduction is not taking place because (1) material economic growth (over)compensates the savings of CO2 and/or (2) CO2-activities (e.g. fossill fuel-intensive production) are shifted to countries that do not participate in climate change agreements (Carbon Leakage). E.g., see Eichner, Thomas/Pething, Rüdiger, Carbon Leakage, the Green Paradox, and Perfect Future Markets, in: International Economic Review 2011, S. 767-805 (767). It might be worthwile considering also this aspects when evaluating the potential of technical solutions for the tackeling of climate change. (See also comment 21) | Accepted. The literature on the rebound effect will be carefully addressed. |
| 12712 | 4 | 25 | 11 | 25 | 11 | An additional study which might be interesting, heree: Toft, Schuitema, Thogersen, 2012; Abstract in the IAREP 2012 conference proceedings. | Noted. |
| 18327 | 4 | 25 | | | | The legacy of development argument can be inserted with material on path dependency and 'lock-in'. It seems orphaned here and is disproportionately short given other subsections and the importance of this topic. | Accepted. This section will be moved to either the start of 4.3 or merged earlier into our introduction and conceptual |
| 14317 | 4 | 25 | 30 | | | Perhaps this subsection should be moved. Its current position between Technology and Natural resources does not seem to accommodate the flow of the chapter. | Accepted. This section will be moved to either the start of 4.3 or merged earlier into our introduction and conceptual |

|---|---|---|---|---|---|---|---|
| 3231 | 4 | 26 | 16 | 26 | 17 | Dematerialization and depopulation should not only be mentioned here. | Accepted. We acknowledge that the term "only" is misplaced here; it would be better to use "key" instead. However, we also recognize the need to improve referencing and re-consider the use of |
| 18328 | 4 | 26 | 24 | 26 | 33 | This para seems to misunderstand the nature of CBDR, which is built on developing countries' insistence that the legacy of (mis)development be recognised and addressed. It seems gestural and adds little of substance. Delete? | Noted. |
| 17088 | 4 | 26 | 24 | | 33 | the quotes are only from developed country authors. I would like to refer you to my peer reviewed papers in 'Climate Policy' and "Climate and Development' which you could also use as references. | Noted. |
| 3232 | 4 | 26 | 26 | 26 | 28 | This point might be important and should not only be mentioned here. | Accepted. we acknowledge that the issue of CBDR should be taken more centrally into consideration by the |
| 5475 | 4 | 26 | 34 | | | Section on natural resources- should be more clearly linked as a potential model for how sustainability considerations could be linked to diverse development models- this discussion shows a range of different outcomes for resource rich economies- likely included as critical to models based on sustainability. Say this directly in a few sentences- potentially include a chart with range of outcomes | Accepted. We recognize the need to provide a more explicit conceptualization between natural resource use, economic development models, and the impacts |
| 3230 | 4 | 26 | 7 | 26 | 11 | Perhaps re-formulate; unclear what this sentence means. | Noted. |
| 8905 | 4 | 26 | 34 | 26 | 50 | Make the use of natural ressource more sustainable. Nature can be one of the solution of sustanability (IUCN, 2009). | Noted. |
| 14318 | 4 | 26 | 34 | | | Some of the key links between natural resources and climate change are not pinpointed in the present draft version. One would e.g. expect to see more of a distinction between exhaustible and non-exhaustible/renewable resources, forestry/REDD/LULUCF issues, conflicts in resource use from a SD and climate perspective and so forth. | Accepted. The next version will try to make this differences more explicit. |
| 8259 | 4 | 26 | 1 | 26 | 3 | Some discussions as to what the development mechanism of China and India had been that helped them grow independently of the MDGs process, while other regions lagged behind. Some remarks on these issues would provide the readers a good understanding of the process of sustainable development. | Noted. |
| 12717 | 4 | 28 | 41 | 28 | 41 | Finance aspects of climate change are dealt with in chapter 16. So the aspects raised in this chapter could be shifted to chapter 16 in order to concentrate of the main charecteristics of sustainability, here. | Rejected. However, we don't agree to take finance out of this chapter. Rather we prefer to emphasize its role as a determinant for SD and equity (both a barrier or driver) and exclude a detailed |
| 12196 | 4 | 29 | 41ff | | | The sentence "UNFCCC parties have established…" is not correct as the Adaptation Fund was established under the Kyoto Protocol, not the UNFCCC. | Noted. |
| 11993 | 4 | 30 | 3 | 30 | 8 | It is wrong that the fact that lowest hanging fruits are developed first suggest that the CDM cannot support improved energy access for poorest people or to achieve widespread sustainability. This is a question of demand i.e. The moment there is a demand for CERs from specific methodologies such as the water purification and cookstove methodologies in certain countries, the CDM is exactly the prime instrument to give these people access. It has proven that time and again. Please keep to the evidence and look at the wide research done under the High Level Policy Panel: The research is available on their dedicated webpage cdmpolicydialogue.org. | Accepted. We agree on the need to disentangle two points: 1) the fact that the CDM has so far targeted low hanging fruits; and b) the ability (or inability?) of the CDM to support other forms of technology. |
| 13687 | 4 | 30 | 38 | 31 | 8 | Update data and figures as per the latest UNEP Riso data by the time of finalization of AR 5. Byrne's data will be obsolete then. | Noted. |
| 11055 | 4 | 30 | 38 | 30 | 38 | Regarding the CDM success, the discripsion include contradiction comaparing chap.16 | Accepted. We will ensure that there is coherence with Chapter 13 discussion. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 7365 | 4 | 30 | 38 | 31 | 8 | I would question the inclusion of the CDM under the "finance" heading. The CDM serves as a means of supplementing developed countries' mitigation actions in order to meet their commitments. It would be inappropriate to "double count" the CDM as 'finance' as well as mitigation action from developed countries. Of relevance here may be the "share of proceeds" element of the CDM, rather than the CDM projects themselves. | Accepted. We agree with the reviewer's comment and we accept the need to re-consider how the CDM is treated in the overall chapter and particularly in section 4.3.8. |
| 18329 | 4 | 30 | 40 | | | The term 'significant bias' is ambiguous. 'Emphasis' may be a better term. The CDM embodies the contradictory impulses of SD and mitigation - where the expenditure on the emerging economies probably delivers greater mitigation outcomes and better results for future generations as a whole than if these resources were directed to LDCs. Moreover, the 'bias' is possibly appropriate given the preponderance of global population in these countries. This tension could be used as a powerful example in this chapter. | Noted. We need to consider phrasing carefully. |
| 13686 | 4 | 30 | 41 | 30 | 41 | Insert after "... Centre on Energy 2011": "The CDM has generated revenues of several billion Euro for project developers (see Michaelowa and Buen 2012 for a discussions of the strengths and weaknesses of the mechanism)." Reference: Michaelowa, A.; Buen, J. (2012): The CDM gold rush, in: Michaelowa, A. (ed): Carbon markets or climate finance?, Routledge, Abingdon, p. 1-38. | Noted. References will be introduced. |
| 12197 | 4 | 30 | 9 | 30 | 10 | “Meanwhile…” The formulation of this sentence is not clear. What means “unevenness”? Does this refer e.g. to the financial amounts or financing procedures? The term meanwhile suggests an implicit criticism and comparison of the two institutions. I suggest to describe the facts and leave the interpretation to the political debate. If you intend to provide the basis for a comparison, the number of projects funded under the AF is lacking and the adaptation related projects under the SCCF needed to be spelled out, for example. | Accepted. There is a need for greater clarity. |
| 16937 | 4 | 31 | 1 | | 6 | I think this is correct but should not be surprising: another way of putting it is that a "Second Domain" instrument like the CDM, founded upon assumptions of optimising market instruments for price-led investments, cannot be expected to address "First Domain" phenomena (see chapters 2 and 7 of Grubb, Hourcade and Neuhoff op.cit). Earlier empirical data relating to CDM performance, and analysis of sectoral performance, was pubslihed as M.Grubb and T. Laing, "Global carbon mechanisms: lessons and implications." Climatic Change, 2010. | Noted. |
| 13032 | 4 | 31 | 3 | 31 | 6 | The sentence beginning with "This suggests…" is a non-sequitur. Just because a technology is mature, does not mean that all people have access to it. The fact that CDM might favor more mature technologies does not mean that CDM cannot contribute to energy access, industrialization or sustainability. On the contrary, when more mature RE technologies are rolled out in more markets this actually increases the opportunity for increased energy access, industrialization and sustainable development. | To be taken into account. |
| 8804 | 4 | 31 | 39 | 34 | 13 | Good to see questioning of consumerism including 'The spread of consumerism or consumption-based lifestyles is arguably a “mega driver” of global environmental degradation – including global warming.' | Accepted. |
| 14319 | 4 | 31 | 41 | 31 | 43 | Perhaps relevant to include a range of estimates from various sources here? | I assume the commnent refers to consequences of choice of scale and other boundary conditions of sustainability , and if so, I agree it would be useful to add some illustrative |
| 10860 | 4 | 31 | 41 | | | I presume that "global consumption" means GDP here? I would at least state as much, and what is the source of the GDP data? | Accepted. Will check the source and add the information. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 13688 | 4 | 31 | 6 | 31 | 8 | Replace "For a .. Jover 2012" by "The contributions of CDM to sustainable development have been assessed by Sutter and Parreno (2007), Olsen (2007), Policy and Operations Evaluation Board (2008), and Corbera and Jover (2012)". References: Olsen, K. (2007): The clean development mechanism's contribution to sustainable development: a review of the literature, in: Climatic Change, 84, p. 59-73. Policy and Operations Evaluation Board, Ministry of Foreign Affairs (2008): Clean and sustainable? An evaluation of the contribution of the Clean Development Mechanism to sustainable development in host countries, IOB evaluations no. 310, The Hague; Sutter, C.; Parreño, J.C. (2007): Does the current Clean Development Mechanism (CDM) deliver its sustainable development claim? An analysis of officially registered CDM projects. In: Climatic Change, Vol. 84, pages 75-90. Reason: Corbera and Jover assess a minuscule project sample and are not representative of the rich literature on CDM and sustainable development. | To be taken into account. |
| 13275 | 4 | 31 | 1 | 31 | 2 | I suggest to add: "(…) tend to be the most attractive and the most profitable -in terms of CO2 equivalent reductions-, (…)" | Noted. |
| 13276 | 4 | 31 | 14 | 31 | 18 | I suggest to add: High transaction cost, very high requirements for additionality demonstration, | Noted. |
| 16263 | 4 | 31 | 3 | 31 | 5 | "This suggests that it is unlikely that the CDM can contribute meaningfully to development goals such as improving energy access amongst the world's poorest people and industrialization in the poorer countries, or to achieving widespread sustainability in the developing world." This statement seems to ignore the latest development in programmatic CDM with 372 progammes submitted for validation up to August 2012 (UNEP Risø CDM Pipeline). Particularly EE demand side, waste and solar projects are better represented in the programmatic approach and Africa gets a higher share of the PoAs (30%) compared to ordinary CDM projects (2,9%). The CMP-7 in Durban decided to highlight the SD co-benefits of CDM projects and activities and at its 69th meeting the CDM EB considered a tool to voluntarily declare the SD benefits and negative impacts of CDM projects and activities. Also, the suppressed demand methodology recently approved and made available to project develoeprs makes it attractive to pursue e.g. rural electrification projects in the poorest countries (LDCs). So, I do not find the above statement to be well grounded. Statements about the future of the CDM should take into consideration the research done by the CDM Policy Dialogue, which has just published its report in September 2012 including recommendations to be considered for COP-18 in Doha. | Accepted. We will make sure to include the latest literature on the CDM, drawing on chapter 13. |
| 12718 | 4 | 31 | 5 | 31 | 5 | Article 12 No. 2 of the Kyoto Protocol (KP) mentions explicitely the purpose of the Clean Development Mechanism (CDM). "The purpose of the clean development mechanism shall be to assist Parties not included in Annex I in achieving sustainable development and in contributing to the ultimate objective of the Convention, and to assist Parties included in Annex I in achieving compliance with their quantified emission limitation and reduction commitments under article 3." Within the wording of article 12 KP, the assistance of developing countries is explicitely subordinate to emission reductions. Thus the industrialization of poorer countries would only call for emission reductions if this would be sustainable. However industrialization might not always lead to sustainable progress (see comments 21, 38). Therfore, the industrialization of poorer countries can not be assumed to be sustainable per se be and so, it cannot be seen as a binding aim of article 12 KP. | Rejected. We do not consider emission reductions subordinate to sustainable development in the CDM context. In any case, we provide insights on the CDM effects on host countries' sustainable development, and in forthcoming SOD we will provide cross-referencing to Chapter 13, where this question is further explored. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 18330 | 4 | 31 | | | | This is a great section - but the issue of waste is not really addressed. Perhaps drop from title? Also, it does not really pay much attention to the 'dematerialisation thesis' and its associated problems. | Accepted. Waste generation and - management will be specificially discussed, in relation to both 'sustainable production' and 'sustainable consumption'. The 'Dematerialisation thesis or myth, and its problems, will be discussed in Section 4.4.4 on 'sustainable production' specifically in the context of industrial symbiosis. Relevant references using the term dematerialisation include (Hond, 2000; Trainer, 2001; Rodrigues et al., 2005; Lawn, 2006; Tapio et al., 2007; |
| 15110 | 4 | 31 | 21 | 31 | 21 | In the section 4.4 Production, trade, consumption and waste patterns, not are developed enough the aspects of trade and waste patterns that are very important for sustainable aspects. | Accepted. A sub-section will be written on sustainable production. Waste generation and - management will be specificially discussed, in relation to both |
| 14321 | 4 | 31 | 21 | | | Would it be relevant to link this section's discussion to section 4.5.2 and its discussion of the relationships between growth/income levels and emission levels of various GHG's? (e.g. the environmental Kuznets curve, etc) | Accepted. Will make links with section 4.5.2. "Differences between pathways with regard to emissions, where relevant. |
| 10789 | 4 | 31 | 41 | 32 | 12 | Please insert photos of consumpion patterns of middle classes in different countries and cultures. The photographer Peter Menzel has published some startling photos of how families across the world purchase things. Source: Peter Menzel, photographer. http://www.menzelphoto.com | Will make an attempt, but photos are usually not allowed in the report. The suggested website does not function. |
| 9022 | 4 | 32 | | 33 | | It is important to highlight that inequality among countries is the bigger driver of inequality than inequality within states. This is implied in the discussion in these pages but could be more explicitly stated in the interest of a comprehensive and accurate treatment of the subject. | Partly accepted. There are large income inequlities in very large countries such as the US, Brazil, and China, and within-country inequality in these and a range |
| 10864 | 4 | 32 | 1 | | | This paper may have some useful indicators, such as emissions embodied in trade Peters, G.P., Minx, J.C., Weber, C.L., Edenhofer, O., 2011. Growth in emission transfers via international trade from 1990 to 2008. Proceedings of the National Academy of Sciences 108, 8903-8908. | Accepted. The discussion of emissions embodied in trade is taken in section 4.4.6.1, and the references fits best |
| 10862 | 4 | 32 | 13 | 32 | 25 | A relevant study here is Hertwich, E.G., Peters, G.P., 2009. Carbon Footprint of Nations: A Global, Trade-Linked Analysis. Environmental Science and Technology 43, 6414-6420. | I assume the comment refers to the paragraph starting on line 19 - 31. If so, the suggested reference is used later in the 4.4.5.2 where the focus is on GHG emission impacts, while on page 32 the discussion refers to environmental |
| 8260 | 4 | 32 | 26 | 32 | 40 | The paragraph should include examples to illustrate how, generally speaking, luxury goods are more emission intensive than subsistence goods. | Accepted. The point is made by several reviewers and will be dealt with. |
| 12719 | 4 | 32 | 26 | 32 | 40 | You may like to consider that luxury consumption may not be THG-intensive in any case. | Comment somewhat incomplete, references would have been helpful. |
| 10863 | 4 | 32 | 26 | 32 | 40 | It is not really started here that what is "subsistence" and what is "luxury" will change. If you use the definions based on elasicities greater than 1 being luxuries, then you will find that a car is a "necessity" in developed countries but a "luxury" in developing countries. I am not sure of a good reference (other than my unpublished work), but at least raising the issue is important here. It is easy for a developed country to drive their cars and not let developing countries have luxury products! | Accepted. Will deal with it. |
| 3234 | 4 | 32 | 27 | 32 | 29 | There are also luxury goods that are not materially intensive, e.g. consumption of culture (if not dependent on travel). | Accepted. The point is made by several reviewers and will be dealt with. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 9816 | 4 | 32 | 28 | | | The concept of "considerate design" argues that luxury goods are more expensive and thus can be a trigger for sustainable development: people buy high quality for a high price and use the goods for a longer period of time. | Accepted. Would be helpful with some references. |
| 3235 | 4 | 32 | 38 | 32 | 38 | Whose priority is this, and how can it be implemented? | Accepted. Rephrase last part of sentence and elaborate point. |
| 10861 | 4 | 32 | 4 | 32 | 12 | I would be a little careful with this paragraph as it is a very western view of consumption. While all levels of incomes will suffer some degree of "consumerism" it is not really correct to imply that consumerism covers those in poverty. | Accepted. It was not intended to imply that, we will make that clear. |
| 8261 | 4 | 32 | 43 | 33 | 2 | It seems unclear what is the difference between inequality among countries and between-country inequality in terms of metrics used to compare inequalities - both seem to be using average per capita income. | Accepted. Will check how the difference can be made easier to understand. |
| 12280 | 4 | 32 | 5 | 32 | 5 | Please consider to replace the term "global warming" with "climate change". Rationale: Global warming is so linked to temperature, while changes happening affect many other parameters such as precipitation and the frequency and intensity of some extremes. | Accepted. Will change terminology from global warming to climate change, and throughout the Chapter. |
| 2921 | 4 | 32 | 30 | 32 | 34 | Please include references to support the judgement. Deserve this remark a more prominent position in this report? | Accepted. Will do with assistance of Contributing authors Tim Jackson and |
| 8906 | 4 | 32 | 27 | 32 | 29 | It's the issue of feed the world in a sustainable way. | I don't understand what is wrong with it. Will check it. Comment not very clear. |
| 14320 | 4 | 32 | 41 | | | Given the title of this section, consider to reorganise the subsections to introduce the relationship between income inequality and consumption inequality before going into the income inequality. It could also be considered to include 'income' in the title | Accepted. Will include income in the title and consider reorganisation of the section. |
| 4349 | 4 | 33 | 26 | 33 | 28 | Cultural and economical conditions may also influences. | Unclear what the comment refers to. |
| 14381 | 4 | 33 | 5 | | | Need to show relationship to causes of global warming. Otherwise too broad | Accepted. Will demonstrate that link more clearly, in a general way. |
| 17145 | 4 | 33 | 5 | | | Suggest inclusion of discussion on indigenous peoples as within country inequality - particularly as their consumption patterns differ greatly from dominant societies and thus their contribution to climate change differs greatly too. | Accepted. Given space limitations. |
| 5476 | 4 | 33 | 7 | | | Please define Gini coefficient | Accepted. Could be included in the |
| 12721 | 4 | 33 | 39 | 33 | 40 | Why trends of cunsumption may not follow trends of income is not clearly stated. Give reason since it may have high relevance for matching life styles with sustainability pathes. | Accepted. Similar comments and reasons were given ealier. Agree to |
| 4350 | 4 | 34 | | | | An arrow from materials to energy is important if we think harvest wood products. We can use waste material woods as energy source. | Unclear what the comment refers to. Seems misplaced. |
| 5477 | 4 | 34 | 14 | | | Major points of this section are that a minimum level of income is required for happiness and beyond that income inequality is responsible for unhappiness- this can be conveyed with much less discussion | Wil consider this as part of overall strategy to shorten the Chapter. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 8805 | 4 | 34 | 14 | 35 | 31 | The discussion of happiness and consumption here tends to make utilitarian ethical assumptions and misses a more profound category of literature. In philosophy virtue speaks more directly to happiness than its utilitarian complement or competitor. Aristotle argues that happiness comes through virtue including moderate (i.e. not too much or too little) consumption. Sandler R and Cafaro P (Eds. (2005) Environmental virtue ethics, Lanham, Md.: Rowman) relate virtue directly to consumption, happiness and environmental issues. Palmer M and Finaly V (2003, n.b. page xi, Faith in conservation: New approaches to religions and the environment, Washington DC: The World Bank, http://go.worldbank.org/3L9IDQNFO0 or http://www.arcworld.org/books_resources.asp. Accessed 9 May 2011); Engel JR & Engel JG (Eds. (1990) Ethics of environment and development: Global challenge, international response, London: Belhaven) suggests that more people in the world would start their ethical deliberations with virtue than with utility. Charlesworth M & Okereke C (2010, Policy responses to rapid climate change: An epistemological critique of dominant approaches, Global Environ. Change, 20:121-129, doi:10.1016/j.gloenvcha.2009.09.001) indicates that virtue is a more rational response to the limitations of climate science than consequential utilitarian approaches. My currently unpublished book manuscript is a more direct and in depth treatment of virtue, climate and happiness. | Accepted. We will briefly discuss virtue ethics, but we reject the idea that there are utilitarian assumptions in what we wrote - quite the contrary, in fact. |
| 12281 | 4 | 34 | 15 | 34 | 16 | Please consider to replace the term "global warming" with "climate change". Rationale: Global warming is so linked to temperature, while changes happening affect many other parameters such as precipitation and the frequency and intensity of some extremes. | Accepted. Will change terminology from global warming to climate change, and throughout the Chapter. |
| 14382 | 4 | 34 | 17 | | | 17 “Reducing the level of material consumption for affluent populations” – Very strange indeed that this could seemingly be endorsed by WGIII. Surely the objective is to change the composition of the inputs away from carbon while spreading more widely the high consumption standards of higher-income countries. | Accepted. We need to clairify and qualify several issues here. We need to distingusih between 'consumption' and 'material consumption' and think about what constitutes 'high consumption'. It also tocuhes on the idea of |
| 8750 | 4 | 34 | 17 | 34 | 17 | … for affluent populations- why only them? This should perhaps read .."for populations in both industralised countries and emerging economies" | There are affluent populations in all countries, perhaps we should refer to 'affluent groups' rather than 'affluent populations' as the latter suggests the |
| 18700 | 4 | 34 | 5 | 35 | 13 | Are the two studies cited the only ones on the topic? Not sure i understand what "consuming less for status seeking or upgrading" means. And not sure the Bradbury study on intrahousehold income inequality is particularly relevant to the topic of the section. But if kept, then it would be useful to find out what precisely the "significant impact on expenditure" was (at least indicate direction of effect). | Accepted. Will bring in more literature and improve clarity of text. |
| 9254 | 4 | 34 | | 35 | | There might be scope here to comment on the organic role of social media (recent but mushrooming technology) in altering perceptions on both consumption and well-being, and political influence once communities start to really fear the effects of climate change (eg due to increased extreme weather events). | Ok, but we also need to simplify and shorten the text. How actual/experienced climate change will change consumption and perceptions of well-being is an |
| 10426 | 4 | 34 | 15 | 35 | 31 | This section is not related climate change or vulnerability to climate change and has to be removed | We will explain better the relevance to climate change, but will not agree to |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 12723 | 4 | 35 | 22 | 35 | 23 | Decoupling growth and well-being is not the main issue. What about GHG-emissions? The assumed relation between growth and emissions should be made transparent. | Whether decoupling growth and well-being is an issue depends on the extent to which it is possible to decouple growth and material consumption - i.e. the dematerialisation discussion or myth. So far we have not been able to do so, so what are the indications that it will be possible in the future. The chapter addresses sustainability at large, and not only GHG emissions. Regading the link |
| 12724 | 4 | 35 | 24 | 35 | 31 | I miss the link to climate change issues. | Accepted. The relevance to climate change will be explained better in |
| 16938 | 4 | 35 | 3 | | 16 | It might be interesting to try and link the "satiation" effects to the apparent disappearance of any systemsatic link between per-capita income and energy/emissions, which seems to occur at lower levels ($10-15,000: see my comments on Chapters 5 and 14, Figure 14-2). However perhaps this is beyond scope of IPCC. | Noted, but it seems over complicated to make this discussion. |
| 8806 | 4 | 35 | 32 | 38 | 34 | It is good to see discussion of sustainable consumption. Lack of concrete progress on sustainable consumption over the last 20 years is in part related to the factors discussed; however, a factor almost completely ignored in the literature - presumably rooted in ideologically assumptions of funding decisions is discussion of reducing or moderating consumption. Nearly all the literature focuses on technological changes to make products with a lower impact or on encouraging consumers to choose products claiming to have lower impacts. This is despite programs to address reduced excessive consumption being mandated in Agenda 21 (1992, 4.5). The previous comment outlines the logic of the consuming enough but not too much bringing happiness and indicates literature that suggests that this is better for societies and the Earth System. Consideration of obesity and anorexia should be sufficient to indicate the logic and that appropriate consumption has psychological and wisdom components. Chapman R (2002, 'The stag-goat and the sphinx: The place of the virtues in environmental ethics', Environmental Values, 11(2), 129-44) and IUCN/UNEP/WWF (1991, Caring for the Earth: A strategy for sustainable living, Gland: The World Conservation Union, United Nations Environment Programme, World Wide Fund For Nature, http://coombs.anu.edu.au/%7Evern/caring/caring.html. Accessed 19 May 2011) are also relevant in specific discussion of temperance. Jackson T (2002, 'Consumer Culture as a Failure in Theodicy', in Consumption, Christianity and Creation - Proceedings from an Academic Seminar held on 5th July 2002, Sheffield: Centre for Sustainable Consumption) is far from irrelevant. | Response: Accepted. This comment related to the comment in line 77 on 'voluntary simplicity' and we will take up the discussion as far as space limitations allow. Suggested peer-reviewed literature has been located (I could not access the Chapman study), or more recent and formally published versions located: (Chapman, 2002; Jackson, 2005).(Kjellberg, 2008) |
| 8746 | 4 | 36 | | 44 | | As a suggestion for reducing the size, the session<br>4.4.3 Sustainable consumption and lifestyle (from page<br>36 to page 44) could be consolidated, and hence save space. | Will consider the suggestion in the overall strategy to shorten the Chapter. |
| 5478 | 4 | 36 | 20 | 37 | 38 | Are there instances where sustainabilty based consumption has preempted the consumer culture? This discussion is compromised as the authors are trying to evaluate the success of sustainability based consumption within a framework of consumer based consumption | Accepted. There are several instances of such changes in pre-industrial societies, e.g. the 'cargo culture', but I am not sure a discussion of these instances will be |
| 18701 | 4 | 36 | 39 | | | Useful to spell out what the three pillars of SD are | Ok, but briefly as they are alreadt explained in start of Chapter 4. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 18702 | 4 | 36 | 41 | 36 | 46 | It may be useful in this section to refer back to relevant sections in Chapters 2 (e.g., Section 2.2) and 3 that distinguish between classical economic assumptions of rationality in expectations and preferences as guiding consumption and other decisions, in contrast to the assumption of behavioural economics and behavioural decision research that expectations can be biased and self-serving and that preferences are often constructed (rather than preexisting) and thus open to contextual factors (see, e.g., Weber, E. U. & Johnson, E. J. (2009). Mindful judgment and decision making. Annual Review of Psychology, 60, 53-86). The research on sustainable consumption summarized here seems to support the latter set of assumptions. | Response. Accepted. The suggested study has been located and added to Zotero. |
| 12726 | 4 | 36 | 11 | 36 | 12 | A mere increase of the demand for sustainable goods and production technologies is not sufficient (see comment 38 referring to the problemd of carbon leakage and comment 21 referring to material growth limits). Sustainable goods must rather replace unsustainable goods. This could be stated more clearly even if the European Commission seems to include the positve aspects of "green growth" only, especially because without a substitution of fossil technologies and of material growth pathes depenmding on scarce resources the effect for sustainablity respectively for climate protection may only be marginal. | Accepted. |
| 13277 | 4 | 36 | 41 | 37 | 9 | Something must be said in this paragraph about marketing and consumption. Not in vain, big companies uses enormous amount of money to convince consumer about the convenience of buying their products. A reference is given in the next page (37, 21) about marketing and prices, but this reference does not capture the complexity of marketing that involves sociological, psicological and even neuro physiological aspects of human behavior. | Accepted. Ther e is a a huge literature on marketing and its consumption impacts, and we need to be selective due to space limitations. One reference is Kjellberg 2008. |
| 18703 | 4 | 37 | 1 | 37 | 14 | Competing goals and selective accessibility of different and oftentimes competing goals as a function of individual and group differences as well as situational context , which can influence the outcomes of decisions (if conceptualized as a multiattribute tradeoff) is one of the implicit themes in this section, which it might be useful to spell out more explicitly. The Weber & Johnson (2009) review article in Comment 4 has a discussion of multiple competing goals and the effects of goal accessibility. | Suggested article added to Zotero. Included in section 4.4.3.1 [JT] |
| 10427 | 4 | 37 | 16 | 37 | 32 | Remove this paragraph | Not accepted. No reason is given for |
| 14383 | 4 | 37 | 32 | | | Where is the role of tax signals in all of this? Affect consumption profiles by taxes that impose a cost on emissions. | Taxes and other policy instruments related to SC will be breifly discussed in Section 4.4.3.2, while avoiding overlap with policy chapters (13 and 15). The section was condensed. This point |
| 12728 | 4 | 37 | 27 | 37 | 27 | You may like to add that individual decisions are not always rational (refer to Chap.3). | Accepted. To be elaborated by John. The section was condensed [JT] |
| 17341 | 4 | 37 | 33 | 37 | 38 | unsustainable lifestyles are reproduced also by the media, which perpetuates the carbon intensive lifestyles of a middle class family in western nations with glamour and great attractiveness. The widespread availability of these images in the media can be consider at minimum here as having a powerful persuasive influence on consumer's attitudes, to say the least. The power of commertialization of the most intimate aspects of the life-style of the rich and middle class is important to consumption patterns globally. This needs be highlighted here. | Accepted. To be elaborated by John. Media influences mentioned in section 4.4.3.2 instead [JT] |
| 14020 | 4 | 38 | 27 | | 34 | Important to stress the importance of social and material contexts, so that consumption is not reduced to individual behaviors and efficient technologies. Literature to consider: the work by Elizabeth Shove and others, including Shove, E. (2005) Changing human behaviour and lifestyle: a challenge for sustainable consumption? In: Consumption - Perspectives from ecological economics. Elgar, Cheltenham, pp. 111-132; | Accepted. Reference is difficult to locate, and somewhat dated. Can we find a more recent reference? |
| 17342 | 4 | 38 | 4 | 38 | 26 | How information influences behavior is explained in Chapter 2 (System 1 and System 2 type of reaction) please make a cross-reference here. | Accepted. Done [JT] |
| 18704 | 4 | 38 | 4 | | | Weber, E.U. & Johnson, E.J. (2012). Psychology and Behavioral Economics Lessons for the Design of a Green Growth Strategy. White Paper for Green Growth Knowledge Platform (OECD, UNEP, World Bank). | Accepted. Reference stored in Zotero. Peer reviewed literature is preferrred. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 18705 | 4 | 38 | 4 | | | Here and below it may be useful to make the point that metrics like the carbon footprint of products help to create new goals (e.g, to reduce CO2 emissions) and to attract and keep attention on those goals, in the competition between goals that i mentioned in comment 5. The reference in Comment 6 discusses this point on its p. 10. | Accepted. Will make that point and use the reference (but which one, the comments are not numbered). Done [JT] |
| 18706 | 4 | 38 | 4 | 38 | 26 | This discussion is useful, but also very developed-world focused. It may be useful to address what these topics mean in a developing world context, including the ideas of a hierarchy of needs (e.g., Maslow, 1954), where concerns with product carbon footprints might be seen as a luxury concern that only developed countries can afford. This is especially true in light of the fact that this chapter also covers equity as a topic. | Accepted. I agree, but exporters in developing countries are nevertheless often compelled to document and reduce the carbon footprint of their |
| 12729 | 4 | 38 | 4 | 38 | 26 | Sundarakani, Balan; Souza, Robert de; Goh, Mark; Wagner, Stephan M.; Manikandan, Sushmera (2010): Modeling Carbon Footprints across the Supply Chain. In: International Journal of Production Economics 128 (1), p. 43–50; p.43) provide further information on the Carbon Foot Print within the supply chain. | Accepted. Although this comment and refernece seems to refer to Section 4.4.4. The suggested study has been |
| 16246 | 4 | 39 | 1 | 39 | 3 | I would not call "industrial symbiosis" a sub-discipline, but a concept explored in industrial ecology. So is design for environment. LCA is not a field as an alternative to industrial ecology, but a tool within the field of industrial ecology. Relevant tools within industrial ecology not mentioned here are Material Flow Analysis (MFA) and environmentally-extended input-output analysis (EE-IO). | Accepted. To be elaborated by Michael |
| 5479 | 4 | 39 | 11 | | | this is being attempted by the state of Oregon - http://www.deq.state.or.us/lq/sw/materialsmgmtplan.htm | Ok. Find studies reporting on this |
| 17642 | 4 | 39 | 26 | 39 | 38 | Such as systematic concept is better approache for monitoring and evaluation, it is important to define "unit" and "boundary" with representativeness heuristic for regionals and countries, etc. | The comment is difficult to understand. |
| 10865 | 4 | 39 | 26 | | | Define "CO2 equivalents". I am sure you use GWP100, but this should be stated. This choice is not unique, and should point to the relevant section of WGI Ch8. In the case of food, using CO2-eq based on GTP will give a quite different result. | Accepted. Will make a note to that effect. What is GTP? |
| 5480 | 4 | 39 | 39 | 40 | 29 | Here the authors go from very big picture- changing basic assumptions on how LCA can be used to estimate GHG emissions to very small picture of different levels of accounting for this- It would be helpful to add additional information on how the broader perspective changes overall understanding of emissions- one or two examples could be used and to limit discussion on the smaller accounting issues | Accepted. Wil have to give this comment more thought, it is not crystal clear what she wants us to do. |
| 10866 | 4 | 39 | 42 | | | For the first point, appropriate references here include Peters, G.P., Minx, J.C., Weber, C.L., Edenhofer, O., 2011. Growth in emission transfers via international trade from 1990 to 2008. Proceedings of the National Academy of Sciences 108, 8903-8908. and the model comparison, Figure 1 (and references), in Peters, G.P., Davis, S.J., Andrew, R., 2012. A synthesis of carbon in international trade. Biogeosciences 9, 3247-3276. | Accepted. Comment refers to 'choice of accounting method', item 1 about reduction in emissions by nations. The suggested references (Glen P. Peters et al., 2011b; G. P. Peters et al., 2012) |
| 5229 | 4 | 39 | 45 | | | The inclusion of new references will add some information. 1. Soimakallio, S., Kiviluoma, J., Saikku, L. 2011. The complexity and challenges of determining GHG emissions from grid electricity consumption and conservation in LCA - A methodological review. Energy 36, 6705–6713. 2. PINGOUD, K., EKHOLM, T., SAVOLAINEN, I. Global Warming Potential (GWP) factors and warming payback time as climate indicators of forest biomass use". Approaches for inclusion of forest carbon cycle in life cycle assessment – A review. GCB Bioenergy (in press). | Accepted. The suggested references (Pingoud et al., 2011; Soimakallio et al., 2011; Helin et al., 2012) have been located and added to Zotero and will be considered, given space limitations. |
| 2922 | 4 | 39 | 34 | 39 | 34 | attempts' - does it suggest the definition is not useful? | Accepted. No, I think I was using the author's own wording. "Attempt to" |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 12731 | 4 | 39 | 9 | 39 | 10 | Labour rights might be important in international politics as democracy and human rights in general (comment 12, 19). But it is no conditio sine qua non for sustainable development. Sustainable production in the sense of the Brundtland Definition of sustainability (pp. 11-12) rather depends on durablity (temporary level of sustainability) and the potential to spread a production pattern worldwide (spatial level of sustainability). Even if low labour standards are morally controversial the durability of the use of ressources would not depend on its amerlioration. In this context also see the inclusion of labour rights within the spatial context of sustainability as included in the contraction and convergence principle (p. 70, line 38). | Accepted. We will qualify the statement. It depends on your conception of SD, i.e. whether the social aspects of sustainabiliyt is considered and deemed important. See early part of Chapter. |
| 16939 | 4 | 39 | | | | If this is the place where AR5 addresses consumption vs production accounting, it might be interesting to try and produce a graphic correlating to Figure 14-2 but showing how it would change on a consumption basis? Or this may be a task for Chapter 5. | Will consider this. |
| 8807 | 4 | 39 | 11 | 43 | 28 | Carbon accounting is largely based on assumptions falsified by Charlesworth M & Okereke C (2010, Policy responses to rapid climate change: An epistemological critique of dominant approaches, Global Environ. Change, 20:121-129, doi:10.1016/j.gloenvcha.2009.09.001) and section 4.4.5 would be a good candidate to be trimmed leaving the references by indicating the literature but less of the detail, in my opinion. | We will adopt a more critical perspective on carbon accounting and LCA in general, using Charlesworth & Okereke (2010) among other references. Carbon accounting, irrespective of its problems, is a strong trend in both private companies, NGOs and governments, so it is important to discuss it thoroughly |
| 10273 | 4 | 39 | | 39 | | T. Homma et al., "Quantitative evaluation of time-series GHG emissions by sector and region using consumption-based accounting", Energy Policy (forthcoming) will also provide consumption emissions by region including non-CO2 GHG, and additional information on the consumption CO2 emission pattern. | Accepted. The reference (Homma et al., 2012) has been located in added to Zotero. More detailed discussion of |
| 7843 | 4 | 4 | 1 | 7 | 44 | This executive summary of chapter 5 is an example how an executive summary should not be written. It is too lon, it does not include references to the underlying subchapters and it does not include information on the level of uncertainty of the findings. All this indicates that this executive summary does njot really reflect the findings of the assessment of the literature but has more the nature of an introduction. | Will take into account. |
| 3277 | 4 | 40 | 13 | 40 | 13 | Multi-regional input-output models are not a class of hybrid LCA-EIO methods. Multi-regional input-output models are a type of EIO model in which the imports to a region are modelled using the technology of the region of origin, whereas simpler EIO models generally assume that imports are produced using the domestic technology of the destination (consumimg) region. | Accepted. Will make the text more accurate/precise. |
| 10867 | 4 | 40 | 14 | | | Accounting systems are a human construct is a better way to put this, Caldeira, K., Davis, S.J., 2011. Accounting for carbon dioxide emissions: A matter of time. Proceedings of the National Academy of Sciences 108, 8533-8534. | Accepted. Will consider the suggested reference (Caldeira and Steven J. Davis, 2011) which has been added to Zotero. |
| 7303 | 4 | 40 | 30 | 43 | 28 | Propose to merge sections on various carbon footprints in one, to reduce the entire length of the chapter. | Will consider this as part of the overall strategy to trim Chapter 4. |
| 5735 | 4 | 40 | 40 | 40 | 40 | What is the source? However this is consistent with FAO's rough calculation of 22% (+ around 15% due to land use): http://www.fao.org/docrep/014/i2454e/i2454e00.pdf | The source is given in the beginning of the sentence - Hertwich and Peters |
| 4570 | 4 | 40 | 15 | 40 | 17 | Add: Rajamani, Lavanya. 2012. “The Changing Fortunes of Differential Treatment in the Evolution of International Environmental Law.” International Affairs 88 (3): 605-623. | Noted. |
| 7332 | 4 | 41 | 25 | 41 | 28 | Uncertainty of consumption-based emissions is dicussed in Lenzen et al (2010). DOI: 10.1080/09535311003661226 | Response: Accepted. Will consider the suggested reference (Lenzen et al., |

|---|---|---|---|---|---|---|---|
| 10869 | 4 | 41 | 25 | 41 | 26 | What is the relevance of the "complexities and uncertainties". There are complexities and uncertainties in current emission accounting, but they are still used. And the complexities and uncertainties are only relevant in some cases. If my policy is a nudge, then the complexity and uncertainty may be irralevent, however, if my policy is a BTA, then it is a different situation. | It is probably a fair point, but it needs clarification; it is important to be very explicit about uncertainty regardless of the type of accounting adopted, and we should probably make a stronger point about this, including the observation by another reviewer that accounting systems are human constructs (negotiated, influenced by political and |
| 16905 | 4 | 41 | 31 | 41 | 33 | How to combine production-based and consumption-based approaches? Would like to see more elaboration and references. | Accepted. Will make an attempt, depending on availability of literature (see references in comment in Line |
| 13691 | 4 | 41 | 31 | 41 | 31 | Add after "… source)": "Furthermore, countries exporting goods benefit from export revenues, with costs related to greenhouse gas emissions as well as any other negative impacts of production of those goods priced in (Steckel et al. 2010, p. 781)". Reference: Steckel, J.; Kalkuhl, M.; Marschinski, R. (2010): Should carbon-exporting countries strive for consumption-based accounting in a global cap-and-trade regime?, in: Climatic Change, 100, p. 779-786 | Accepted. Will consider the argument made and the suggested reference (Steckel et al., 2010) for inclusion. |
| 10870 | 4 | 41 | 32 | | | There are lots of references for this point, eg, Lenzen, M., Murray, J., Sack, F., Wiedmann, T., 2007. Shared producer and consumer responsibility - Theory and practice. Ecological Economics 61, 27-42.; Andrew, R., Forgie, V., 2008. A three-perspective view of greenhouse gas emission responsibilities in New Zealand. Ecological Economics 68, 194-204.; Davis, S.J., Peters, G.P., Caldeira, K., 2011. The supply chain of CO2 emissions. Proceedings of the National Academy of Sciences 108, 18554-18559.; etc | Response: Accepted. Will consider the suggested references (Lenzen et al., 2007; Robbie Andrew and Forgie, 2008; Steven J. Davis et al., 2011) for inclusion, in view of space limitations. |
| 7331 | 4 | 41 | 4 | 41 | 33 | Chapter 14 (14.2.4) discussed more technical difference of consumption-based emissions. Peters (2008) and Kanemoto et al. (2012) discuss the difference between territorial and consumption-based emissions. http://dx.doi.org/10.1016/j.ecolecon.2007.10.014 http://dx.doi.org/10.1021/es202239t | Accepted. Will coordinate with the relevant authors of Chapter 14 (14.2.4), and consider the two suggested references (Glen P. Peters, 2008; |
| 10868 | 4 | 41 | 4 | 41 | 24 | There could be a broader list of references on these issues. Davis, S.J., Peters, G.P., Caldeira, K., 2011. The supply chain of CO2 emissions. Proceedings of the National Academy of Sciences 108, 18554-18559.; Davis, S.J., Caldeira, K., 2010. Consumption-based Accounting of CO2 Emissions. Proceedings of the National Academy of Sciences 107, 5687-5692.; Peters, G.P., Hertwich, E.G., 2008. CO2 Embodied in International Trade with Implications for Global Climate Policy. Environmental Science and Technology 42, 1401-1407.; Peters, G.P., Minx, J.C., Weber, C.L., Edenhofer, O., 2011. Growth in emission transfers via international trade from 1990 to 2008. Proceedings of the National Academy of Sciences 108, 8903-8908.; etc | Accepted. Will consider the suggested references (Glen P. Peters and Hertwich, 2008; Steven J. Davis and Caldeira, 2010; Glen P. Peters et al., 2011a; Steven J. Davis et al., 2011) for inclusion, while also considering space limitations and the possibility that some of these references address very similar questions and report on very similar model results. Some of the suggested references have been cited elsewhere in |
| 3278 | 4 | 41 | 43 | 41 | 43 | Move the word "average" to earlier in the sentence, as follows 'The growth in average CO2 household emissions was 15% on between 1990 and 2004.....' | Accepted. |
| 3279 | 4 | 41 | 45 | 41 | 56 | Replace<br>"and since 1996, increased household energy use"<br>with<br>"with only slight relative decoupling between expenditures and CO2 emissions occurring since 1996". | Accepted. Check the wording in the cited paper. |
| 4572 | 4 | 41 | 29 | 41 | 33 | Add: Shue, Henry. 2013. “Climate Hope: Implementing the Exit Strategy.” Chicago Journal of International Law 13(2). | Noted. |
| 10871 | 4 | 42 | 1 | | | The following review should at least be mentioned Hertwich, E.G., 2011. THE LIFE CYCLE ENVIRONMENTAL IMPACTS OF CONSUMPTION. Economic Systems Research 23, 27-47. | Accepted. Will consider the suggested reference (Hertwich, 2011) for inclusion, |

| 18332 | 4 | 48 | 28 | 48 | 37 | This is a critical para. It would be even more powerful if it were integrated with the argument about population growth and changes in wealth and demographics. | Noted, will see overlaps with Ch.5 |
| 10874 | 4 | 48 | 3 | | | The following should at least be referenced in this section , Steinberger, J.K., Timmons Roberts, J., Peters, G.P., Baiocchi, G., 2012. Pathways of human development and carbon emissions embodied in trade. Nature Clim. Change 2, 81-85. | Noted, reference to be reviewed |
| 5483 | 4 | 48 | 4 | 48 | 21 | How does infrastructure relate here? It would seem that infrastructure choices re multiple variables including transport, waste management, energy are critical to this but are not mentioned directly | Accepted. Will include discussion on infrastructure. |
| 12735 | 4 | 48 | 1 | 48 | 1 | "providing more information" in the brackets might be better replaced by a reference. | Accepted |
| 12736 | 4 | 48 | 22 | 48 | 27 | Different result in Tucker, Michael (1995): Carbon Dioxide Emissions and Global GDP. In: Ecological Economics 15 (3), S. 215–223: positive relationship between CO2 emissions and GDP; it should be mentioned that there are different findings. | Noted, reference to be reviewed |
| 15112 | 4 | 48 | 4 | 48 | 4 | I propose to delete this paragraph or pass to another Chapter because not is directed related with sustainable development | Rejected. Link to sustainable development development to be added. |
| 3615 | 4 | 49 | 17 | 49 | 17 | Please add "For China, Li and Oberheitmann (2008) found that the country is still on the left hand rising part of the Environmental Kuznets Curve. The four year period of negative income elasticities of emissions between 1997 and 2000 which temporarily that lead to an Environmental Kuznets Curve like shape with a decreasing right hand part of the inverted U-type shape was only a structural break." Please cite as: Li, Y. and Oberheitmann, A. (2008). Main factors of decoupling China’s energy related emissions from its economic growth – Where is China on the Environmental Kuznets Curve? ASIEN, 106, 7-23. | Noted, reference to be reviewed |
| 12737 | 4 | 49 | | 49 | | A figure of an environmental cuznets curve might have more explanatory power than this figure. Furthermore, Canada, US, Germany can not be distinguished, also World is probblematic to identify. | Noted, Figure to be revised |
| 14311 | 4 | 5 | 1 | 7 | 44 | The executive summary would benefit | Noted. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 8794 | 4 | 5 | 11 | 5 | 14 | The 'definitions' of sustainability all make more consumerist and utilitarian ethical assumptions than does Brundtland or the Rio Declaration. Literature such as Dobson and Jacobs would help broaden and crystalize the authors understanding of sustainable development and sustainability. | Rejected. There is no consumerist or utilitarian assumption in the text. |
| 3943 | 4 | 5 | 11 | 5 | 11 | Who determines what conception will prevail, and what is the fate of those who disagree? | Collective discussions of objectives are the essence of democracy. |
| 6092 | 4 | 5 | 11 | 5 | 15 | Is this the definition by Chapter 4 members or citation from other literature? Please make it clear. | OK. |
| 4752 | 4 | 5 | 14 | 5 | 15 | I don't agree with the sentence "ensuring sustainable development is less ambitious but more consensual than seeking a socially optimal pathway". Could you please explain are argue how you have reached this statement? | Noted. Will clarify. |
| 3942 | 4 | 5 | 15 | 5 | 15 | Who determines what is the socially optimal pathway and what is the fate of those who disagree? | Collective discussions of objectives are the essence of democracy. |
| 4753 | 4 | 5 | 16 | 5 | 23 | "First" is mentioned but there is no "second", "third", etc. Change the sentence. | Not relevant. |
| 4751 | 4 | 5 | 2 | 5 | 10 | Please provide an IPCC definition of the "sustainable development" | Will check IPCC Glossary (Yoke Ling) |
| 2248 | 4 | 5 | 2 | 82 | 8 | Sustainable development is impossible. There are only two directions, forward and backward. The climate and everything in it evolves, and we should try to take advantage of its course. To try and stop it leads to disaster. Futire generations will not be grateful if we make decisions on their behalf. They will make their own decisions and they are certain to be different and even diametrically opposite from what we want to wish on them. We should have greater concern for the state of our own affairs.. The future generations are going to have to cope with the mess we are making and the likelihood is that they will hate us for it. Currently we are imposing mass unemployment on the next generation. Since ther is no evidence that greenhouse gases are harming the climate the Chapter as a whole is irrelevant | Will shorten chapter. |
| 3205 | 4 | 5 | 20 | 5 | 20 | "it appears" How? | Not relevant. |
| 2935 | 4 | 5 | 22 | 5 | 23 | This line refers to "the need for an ..operational ..meaning of equity", but without any reference to p7 lines 17-27 , which would appear to point towards an answer to this question. | Noted. |
| 3944 | 4 | 5 | 24 | 5 | 24 | Who determines which approach to SD and equity will prevail, and what is the fate of those who disagree? | Collective discussions of objectives are the essence of democracy. |
| 14004 | 4 | 5 | 33 | | 34 | The IPAT model is a narrow and outdated explanation of environmental impacts. The social sciences has shown that it is about much more, including access to resources, power relations, social vulnerability, etc. | Agree. This is quantitative decomposition with no explanatory |
| 7752 | 4 | 5 | 33 | 5 | 35 | I was a little concerned to see the use and support of the IPAT explaination of transition to SD in the Exec Summary. There is a significant critique of IPAT, and this should be cited. Many authors disregard IPAT as it is only useful in limited contexts. E.g. empirical tests show different types of impacts (e.g. CO2 or SO2) relate differently to changes in population, affluence and technology, i.e. the relationship does not always hold. Further the simple multiplicative relationship among the main factors generally does not hold, e.g. doubling population does not necessarily lead to a doubling of impact. This critique must be recognised. | Agree. This is quantitative decomposition with no explanatory value. Must discuss (4.3.1) |
| 3945 | 4 | 5 | 33 | 5 | 3 | Who considers these to be the key factors and who disagrees? ( Niall Ferguson's Reith Lecture series this year is saying that institutional quality is a key factor in the advancement of nations.) | Choice of drivers needs further discussion (4.3) |
| 3946 | 4 | 5 | 33 | 5 | 35 | Is this saying that there is high agreement that greater prosperity makes a cleaner environment more affordable, or is this saying the opposite? | The opposite. |
| 10856 | 4 | 5 | 36 | 5 | 41 | Wouldnt governance also be quite important in shaping these issues? | Sure,this is just said in the following |
| 18296 | 4 | 5 | 37 | | | The word 'income' is too narrow, and could be replaced by 'well being and material standards of living'. | Accepted. |
| 13999 | 4 | 5 | 37 | | | What about humans as agents of change? Limiting this discussion to human capital and the role humans have in production will leave out the discussion about how humans can foster change and the individual and systems level. | Accepted. |
| 3204 | 4 | 5 | 4 | 5 | 4 | Is the existence of co-benefits of climate action for SD and equity an empirical fact, so that its place at the beginning of the executive summary is warranted? | To be clarified (Sivan). |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 4518 | 4 | 5 | 46 | 6 | 6 | Increases in global affluence which is described in this paragraph as “consumption of goods and services” has also driven vast improvements in public health, human environments, and in many cases natural environments (improvement of criteria air pollutants). The one-sided description of the ills of affluence is not balanced by the obvious benefits or the aspirations to seek affluence. Suggest that this paragraph include descriptions of improved conditions (e.g. life expectancy) over the past few decades. | Will take into account. |
| 10857 | 4 | 5 | 46 | | | If you are talking about "global consumption" then it is the same as "global production", and thus your argument is equally applicable to consumption and production | Agreed. |
| 14000 | 4 | 5 | 47 | | | Suggest "…and is a key driver of environmental CHANGE AND degradation, | Rejected. |
| 3947 | 4 | 5 | 47 | 5 | 47 | Who is the authority for this statement and is there a good reason for not acknowledging alternative views - eg see the literature reviewed by Lomborg, the Skeptical Environmentalist, chapter 1? | See comment 149 |
| 12277 | 4 | 5 | 1 | | | Please ensure that the executive summary focus on the key findings in the chapter in line with the current practise of IPCC reports. A lot of the text in the FOD of the Summary is of a descriptive nature, hence the summary can be shortened by omitting this. You might consider to move parts of the descriptive text from the summary and use it instead of the too long text in the body of the chapter, where appropriate. The executive summary in the FOD is in my opinion too long, and should be reduced by at least one page. | Accepted. |
| 15099 | 4 | 5 | 17 | 5 | 17 | To include: ¨Development RIGHT, the elimination of poverty, …..¨ | Rejected. |
| 15100 | 4 | 5 | 46 | 5 | 47 | To include: ¨The global consumption of goods and services has increased dramatically over the last decades, in both absolute and per capita terms, JUST AS UNSUSTAINABLE CONSUMPTION AND PRODUCTION PATTERNS, ARE key driverS of environmental degradation, including global warming ¨ | Rejected. |
| 2909 | 4 | 5 | 46 | 5 | 46 | proposal is to remove 'dramaticly', in stead for instance enormously? | Accepted. |
| 12676 | 4 | 5 | 12 | 5 | 13 | An equal development of the three pillars might be impossible insofar that they limit each other (in this context also see e.g. Norman, Wayne/MacDonald, Chris, Getting to the Bottom of "Triple Bottom Line", in: Business Ethics Quarterly 2004, pp. 243-262). Another argument to refuse an equal importance of each pillar is provided by the limited possibility of substitution of natural ressources (cf. IPCC Draft, Chapter 4, Section 4.2.1, p. 12, line 28; see also Constanza, Robert et al., The value of the world’s ecosystem services and natural, in: Nature 1997, p. 253-260). A reasonable exception (where socio-economic concerns prevail) might be the subsistence level respectively a very low level of "welfare" that might be intouchable when weighing the interests between todays and future generations (Constanza et al., p. 257). Hence, with regard to avoiding contradictions the Brundtland definition of SD seems superior to the "Triple Bottom Line" (IPCC Draft, Chapter 4, Section 4.2.1., pp. 11-12 and Section 4.2.2, p. 13, lines 25-26; see also infra comment 21). | Helpful points (for 4.2.1) |
| 12677 | 4 | 5 | 36 | 5 | 40 | The increase of income and economic returns, the acquisation of skills and the accumulation of knowledge are no aims within sustainable development per se only if they are in line with a durable development path (cf. comment 1). | Noted. |
| 3292 | 4 | 50 | 10 | 53 | 33 | Delete these materials, including Fig. 4.2, in view of the need to shorten the chapter because they are a bit general. | Rejected, see response to comment 5484 |
| 10430 | 4 | 50 | 28 | 50 | 29 | Remove this line | Noted, line to be made clearer |
| 5484 | 4 | 50 | | | | Section 4.5.3.1- this discussion is carried out too much in a vacuum. The authors are trying to apply pre existing models to a structure or range of structures that are at present very poorly defined. As the authors have stated in previous sections- use of a sustainable model likely involves a transition from the existing consumerist model. The value of the Solow growth model may be limited with a new mindset. For me, the most valuable portion of this section lines 38-46 on sequential decision making and inertia- this seems the most applicable and helpful | Noted, 4.5.3.1 provides framing for the tools to analyze transitions. To be revised (see also response to comment 18333) |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 18333 | 4 | 50 | | | | Good discussion - but ity needs a comment that this economic transition modelling fails to account for social and political institutional factors which can offer either profound unanticipated barriers to - or catalysts for - change. As a consequence, the projections are often weakly predictive. An example relates to section 4.5.3.2. The failure of social acceptance of nuclear power led to its economic unviability in most Western countries. Cars were initially also rejected - and if the toll of injury and death associated with them were more forcefully recognised and considered, the successful acceptance and use of the car as a form of mass transport may have taken another path (at leat in terms of design). This element is considered where this chapter talks about' actors losing faith in the regime'... this is almost the only point in this chapter where social institutions are given prominence. | Noted, 4.5.3.1 to include a broader review of model limitations. |
| 16940 | 4 | 51 | 3 | | 12 | This is potentially a crucially important paragraph that in my view misses the fundamental point. Rigidities of all sorts characterise short-term options and constraints, and this para correctly implies that this is about far more than just capital stock, but has a lot to do with behaviour, expectations, habits etc; classic First Domain characteristics. Keynes' General theory can be interpreted as illustrating what these rigidities of "First Domain" characteristics do to classical economic expectations; in that sense Solow's acknowledgement was spot on. However, concluding that neoclassical assumptions are appropriate to "very long times scales" misses the equivalent phenomena at the other end of timescales. Neoclassical (Second Domain) assumptions assuming constant supplly and demand curves ie. constant (or exogenously defined trends in) technology, prefrences, infrastructure etc. For timescales beyond a decade or two, evolutionary effects, path-dependence, endogenous change etc, start to dominate. This paragraph really needs to expand from the Two to the Three domains to make the core points, that different decision and economic processes dominate at different ttimescales, and neoclassical is a reasonable approximation to the middle domain. for details see Chapter 2 in Grubb, Hourcade and Neuhoff, Planetary Economics. | Noted, very important comment, to be included in revision of section 4.5.3.1 |
| 10432 | 4 | 51 | 42 | 51 | 42 | Please look up Gillig, McCarl and Sands 'Integrating agricultural and forestry GHG mitigation responses to general economic frameworks' MITI 9 (3) (2004) 241-259 | Noted, reference to be reviewed |
| 5485 | 4 | 52 | | | | Section 4.5.3.2- is there any information or literature on alterations of the socio-technical landscape in light of the rapid information transfer through social media or innovations that don't require extensive infrastructure? | Noted, will review literature |
| 12738 | 4 | 52 | | 52 | | To which institutional theory does the figure refer to? Should not there be arrows from 2., 3., 4. point to 1.? The arrows could also be displayed in a different colour in order to improve the visualisation of the "evolution". Please note "shits" in the brackets under 3. | Noted, will improve figure |
| 12740 | 4 | 52 | 23 | | | A reference should be made why new technologies are often less efficient. Is not it a question of time? | Noted, will clarify |
| 14022 | 4 | 52 | 7 | 53 | 33 | On technological transitions literature that is highly relevant includes: Berkhout, F. 2002. Technological regimes, path dependency and the environment. Global Env. Ch., 12(1): 1-4; Berkhout, F., Marcotullio, P. and Hanaoka, T. Understanding energy transitions. Sustainability Science [Special Issue: Socio-technical transitions towards sustainable energy and climate stabilization F. Berkhout, P. Marcotullio and T. Hanaoka (eds)] vol 7(2) 2012: 109-111; Adrian Smith, Andy Stirling, Frans Berkhout, 2005. The governance of sustainable socio-technical transitions. Research Policy 34, pp. 1491-1510; Rohracher, H. 2008. Energy systems in transition: contributions from social sciences. International Journal of Environmental Technology and Management, 9 (2-3), 144-161; Rohracher, H. 2008. Energy systems in transition: contributions from social sciences. | 7777 | 4 | 53 | | 55 | | There is some confusion thorughout this section beteen mitigation and mitigative capacity, and adaptation vs adaptive capacity, While these concepts are really clearly laid out in the second para of this section, these definitions are then not used in section 4.6.1.2 'differences between mitigative and adaptive capacities' | now clarified in 4.6.1.2 |
| 14021 | 4 | 53 | 34 | 57 | 23 | The discussion about mitigative capacity and mitigation, and link to adaptive capacity and adaptation is somwhat misplaced also in section 4.5. It is an important section as it has the potential to bridge the gap between adaptation and mitigation, and argue why these two needs to be considered together in a sustainablity context. | this section is being moved into 4.5. It is unclear what gap between mitigative and adaptive capacities needs to be bridged. Reference? |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 3293 | 4 | 53 | 34 | 56 | 21 | This proposed section is ok, except Box 4.2, which should not be included because it is too cryptic and confusing. | Agreed |
| 15113 | 4 | 53 | 44 | 53 | 44 | This subsection¨ Mitigative capacity, adaptive capacity and response capacity¨ would be deleted or pass to another Chapter because it isn´t written in analysis with sustainable development. | This section will be moved to 4.5. A new sentence in intro makes the connection |
| 12200 | 4 | 54 | 3ff | | | You write about the 'abilities of a society' and 'factors that contribute to adaptive and mitigataive capacity' – what are these? | True, we mention broad characteristics rather than specific institutions, and so this section can be made a little more |
| 14023 | 4 | 54 | 1 | | 5 | Are these common factors (shaping both adaptive and mitigative capacity) also described up front? It would be useful, as it very much forms the basis for discussing adaptation and mitigation in one chapter. | not sure what "up front" means, perhaps we can bring this out in intro to chapter |
| 14025 | 4 | 54 | 11 | | 24 | Why there is a gap between response capacity and actual actions, has been widely studied and it would probably include not only literature that points to lack of policial will, but also literature pointing at social practices (see work by Elizabeth Shove, John Urry, Hal Wilhite, etc.) | Social practices is now included. |
| 7780 | 4 | 54 | 13 | 54 | 14 | delete sentence starting 'Some have thus viewed..' as it repeats previous sentence | The best of these two wil be combined |
| 7781 | 4 | 54 | 18 | 54 | 18 | delete 'Caring enhances political willingness', there are many cases where this is not the case, e.g. UK love of animals and hatred of animal testing, yet we still have animal testing | This will be handled in a more nuanced way. |
| 14026 | 4 | 54 | 28 | | 40 | Start out with presenting the multiple factors, processes and structures that affect response capacity (as opposed to starting out with a narrow focus on economic and technological resources), including education, health, institutions, knowledge and technology, social factors such as human capital and governance structures, social capital, socia networks, values, perceptions, customs, traditions and levels of cognition, inequality in the distribution of income, and high access to information. | Not clear why starting point is important. Many of these factors are highly correlated.List will be made more complete to reflect a more cultural perspective. |
| 12201 | 4 | 54 | 29-30 | | | You write that there is a strong correlation between the capacity to develop sustainably and climate response capacity. What is "climate response capacity"? Is there a common definition in the scientific literature? Does this include the field of adaptive capacities? What about the trade-offs between mitigation and adaptation policies? In chapter 15.10.2 the authors write that "mitigative and adaptive capacities are fundamentally disjoint" - how does this logically fit together? | Definnitions of mitigative and adaptive capacity are all pretty vague, as are the definitions of the capacity to develop sustainably. As authors become more specific, the directions of their |
| 8263 | 4 | 54 | 3 | 54 | 3 | A specific definition of mitigative capacity can be inserted here. | We have blended multiple sources here |
| 7778 | 4 | 54 | 3 | 54 | 3 | Make reference to adaptive capacity section in WGII | Agree, and will be done. |
| 7782 | 4 | 54 | 34 | 54 | 40 | Many references to response capacity, start with IPCC (2001), Tompkins and Adger (2005) and then more…it would be interesting to track the trajectory of this idea. | It would indeed, especially since some scholars oppose combininb them, but it would be a longer story. Thompkins and Adger will be cited earlier, the trajectory |
| 14027 | 4 | 54 | 39 | | | Suggest adding: "...effective, EQUITABLE AND SUSTAINABLE responses." | OK |
| 7779 | 4 | 54 | 6 | 54 | 6 | Apologies for referencing my own work, but these ideas about response capacity have been around for some time e.g. see: Tompkins EL, and Adger WN. 2005. Defining response capacity to enhance climate change policy. Environmental Science and Policy 8(6):562-571, this paper has been cited about 40 times, and several of these papers also build on this conceptualisation of repsonse capacity. | We cite Yohe, 2001 who first made the argument but we can include Thompkins and Adger, 2005 |
| 14024 | 4 | 54 | 8 | | 10 | First of all, the effects of mitigation and adaptating are different because they aim towards different goals; one to reduce emissions and the other to reduce vulnerability and enhance resilience. Unclear how the statement that mitigation is a public good informs the discussion on capacity. Furthermore, it maintains a narrow view of what adaptation is about. Also there are moral obligations related to both mitigation and adaptation. | First, this section is about both capacity and ithe use of capacity. Adaptation surely entails moral responsibilities too, and this will be included. |
| 12203 | 4 | 55 | 12 | | | I doubt that adaptation only benefits the "adapters" (does this word exist?). If climate change impacts can lead to migration or a climate-related disaster in a country, for example, does any external intervention then only benefit the recipient country or community? What about avoided effects on neighbouring countries for example? | again, the word "tend" is in the text to cover this. |
| 13693 | 4 | 55 | 12 | 55 | 12 | Replace "While…adapters" by "While some forms of adaptation only generate benefits for those that finance them," Reasons: see comment on p. 55, line 2 | see above comment and response |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 14029 | 4 | 55 | 19 | | 22 | Would be good to consult WG I and WGII on the geographical scale issue, both that mitigation only truly is a global concern (what about black carbon? (Report to Congress on Black Carbon, EPA, 2012)), and that adaptation only has a local dimension (this conclusion probably comes with framing adaptation as purely a technical issue). See also comment #35. | we used the term "largely" to modify a global concern here, not "only" |
| 13692 | 4 | 55 | 2 | 55 | 4 | Replace "A fundamental … private good" by: "Whereas mitigation is generally a global public good, some forms of adaptation are club goods (e.g. a dike protecting a certain region) or even pure private goods (strengthening of one's house to withstand stronger storms). Aakre and Rübbelke (2010) describe the public good properties of many adaptation measures." Reference: Aakre, S.; Rübbelke, D. (2010): Objectives of public economic policy and the adaptation to climate change, in:Journal of Environmental Planning and Management, 53, p. 767-791 | The term "private god" is not in FOD. We already specify that the benefits of mitigation are "essentially" a public good and that the benefits of adaptation "tend" to accrue to the individual, local, or natinoal actor undertaking the action". This wording encompasses the fact that some adaptation goes to groups without burdening the reader with the jargon of "club good". Similarly, roads are built |
| 14028 | 4 | 55 | 2 | | 11 | As commented upon before, this framing is too narrow, also wondering how this informs the difference in mitigative and adaptive capacity. There cannot be many adaptation measures that do not have wider societal consequences. As stressed in various chapters in WGII, adverse impacts from climate change are likely to set back development, hinder sustainable development, threathen human security, etc. . This also holds for impacts experienced by individuals and communities. So arguing that adaptation is not something that has wider societal implications is to narrow. Within sectors one can say the same: take adaptation in the road building sector for example. This adaptation is initiated to reduce costs associated with adverse climate change and it will benefit the sector, but a well adapted road sector will benefit other sectors and society at large. | See response to the same comment above. Not sure these reviewers are looking at FOD. |
| 7783 | 4 | 55 | 2 | 22 | 18 | this section confuses adaptation with adaptive capacity, and mitigation with mitigative capacity, They are not the same (as exlpained earlier in this chapter, yet they appear to be used synonymously in this section. The starting point for this chpater woudl be Yohe 2001 | Text will be modified to note that capacities are developed and maintained for different reasons, not that the capacities themselves are different. This relates to the issue of whether |
| 7784 | 4 | 55 | 27 | 55 | 36 | The previous literatyure on response capacity argues that this capacity is about: availability of technolgy and ability and willingness of society to act. The aspect of willingness is missing from this section | This is a definitional issue. There is a literature on willingness that we are trying to bring out here. Clearly we could |
| 9533 | 4 | 55 | 45 | | | Please, delete however due to duplication. | OK |
| 12741 | 4 | 55 | | 55 | | Mitigation may be a means to reach sustainability so that there could be a positive relationship between mitigation and sustainability. In contrast, the conection between adaptation and sustainability is not so obvious. | Once in the Anthropocene, and it will be a long time before the greenhouse effect of existing green house species go |
| 6893 | 4 | 55 | 23 | 55 | 24 | Please consider revising the sentence "This is true, say, for sea level rise, in which case a few meters difference in elevation can make a major difference". "A few meters difference in elevation" could easily be misinterpreted as "a few meters in SLR", i.e., an elevation in Sea Level of a few meters. Suggest to clarify that you are referring to an elevation above sea level of a specific location here. | Will clarify |
| 3294 | 4 | 56 | 56 | | | Do not include this box. See above comments on section 4.6. | Noted. |
| 14323 | 4 | 56 | 1 | | | This could be expanded to include other issues of costs and financing issues, technical and institutional capacities, short-term and longer term considerations, etc. | Noted. |
| 12742 | 4 | 56 | 23 | 56 | 40 | You may like to mention that there is a discussion about the definition of adaptation and mitigation as complements or substiutes (Ingham, Alan/Ma, Jie/Ulph, Alstair M, Can adaptation and mitigation be complements?, Tyndall Centre for Climate Change Research Working Paper 79, 2005, http://www.tyndall.ac.uk/sites/default/files/wp79.pdf (13.09.2012). | Noted. |

|---|---|---|---|---|---|---|---|
| 14324 | 4 | 57 | | | | This figure does not immediately seem to provide an interesting illustration of the relationship between socio-economic adaptation and mitigation challenges. | figure illustrates alternative pathways, not challenges |
| 3295 | 4 | 57 | 1 | 57 | 23 | Delete figure and the associated discussion. They are too general. | Will consider when shortening. |
| 12743 | 4 | 57 | 19 | 57 | 21 | Maybe you like to add some more details, here. | Noted. |
| 17095 | 4 | 57 | 25 | 59 | 10 | You need to make a reference to ICSU along with the reference to Weizsacker.<br>According to recent scientific consensus arising from an international consultative process the social and biophysical sub-systems are intertwined such that the system's conditions and responses to external forcing are based on the synergy of the two sub-systems. Consequently, the full global system has to be studied rather than its independent components, as none of the challenges can be fully addressed without addressing the other challenges (ICSU, 2010). The key scientific insight is that in actions for achieving global sustainability environmental change and social transformations are tightly intertwined, impacting on our understanding of trends and drivers of global change.....ICSU, 2010, Earth System Science for Global Sustainability: The Grand Challenges, International Social Sciences Council, Paris, Oct 2010 | Yes, but we are writing one section in one chapter of one volume of a three volume report, so "whole system" thinking, though clearly correct, calls out to communication limits. |
| 8264 | 4 | 57 | 3 | 57 | 3 | To edit: "Figure Error! No text of specified style in document" | Noted. |
| 14325 | 4 | 57 | 24 | | | It is unclear why at least parts of this section is not integrated into the previous sections on the same topics (equity, indicators, consumption-based emissions, and so forth). As it presently stands, the (interesting) section seems to re-introduce and discuss the same topics covered in earlier sections of the chapter. | Agreed, but this was an imposed structure (bullet points-sections) |
| 2926 | 4 | 57 | 25 | 77 | 7 | Is it feasible to shorten this part? | Accepted. |
| 8809 | 4 | 58 | 1 | 58 | 11 | Both CBA and cost-effectiveness approaches are called into question by Charlesworth M & Okereke C (2010, Policy responses to rapid climate change: An epistemological critique of dominant approaches, Global Environ. Change, 20:121-129, doi:10.1016/j.gloenvcha.2009.09.001) with forms of precaution being the most widely recognised option that remains logically viable. | This paper will be quoted in another part of the chapter. |
| 12744 | 4 | 58 | 37 | 59 | 10 | A concretization of risks and examples should be added: irreversible damage, tipping points (see also comment 9). Furthermore, the incidence rate and the amount of damage should consequently structure this risk section. There might be a difference in the perception of risks of individuals concerning this two aspects, especially if they are not acting rationally. For some cases, the incidence rate, for others the amount of damage might be decisive (See infra, comment 23). | Noted. See also Ch 2. |
| 15114 | 4 | 59 | | 81 | | The subsections 4.7.1.3, 4.7.2, 4.7.3, and 4.8 have many similarities and repetitions in relation with subsection 4.2, I propose to revise and shorten, the Chapter will reduce a lot of contents. | Accepted. |
| 8810 | 4 | 59 | 22 | 59 | 29 | Charlesworth M & Okereke C (2010, Policy responses to rapid climate change: An epistemological critique of dominant approaches, Global Environ. Change, 20:121-129, doi:10.1016/j.gloenvcha.2009.09.001) suggests that predictions of regional climate changes are sufficiently problematic that any complacency about climate impacts by any group are 'misplaced' to say the least. | Noted. |
| 12745 | 4 | 59 | 22 | 59 | 36 | The statements seem a bit suggestive to me (e.g. call for less information in order to…). You may also like to consider that the fairness motive could also counterbalance the risk effects (as is e.g. suggested in line 48) | Agreed. Revise. |
| 8811 | 4 | 59 | 37 | 62 | 6 | Charlesworth M & Okereke C (2010, Policy responses to rapid climate change: An epistemological critique of dominant approaches, Global Environ. Change, 20:121-129, doi:10.1016/j.gloenvcha.2009.09.001) calls into question all consequential approaches to policy including refinements of conventional utilitarian economic approaches as consequences cannot be robustly be predicted in any meaningful way. These refinements may be useful to move policy in the right direction where economics is typically imposed; however as well as being irrational they are arguable undemocratic as discussed above so a better approach may be to challenge the use of consequential approaches to policy. | This is a very extreme viewpoint which does not seem very constructive. What should be done if consequences cannot be assessed? |
| 4573 | 4 | 59 | 9 | 59 | 10 | Order of authors is reversed. Correct is: Oreskes, Naomi, and Erik. M. Conway | This probably refers to another chapter. |
| 12278 | 4 | 6 | 1 | 6 | 1 | Please consider to replace the term "global warming" with "climate change". Rationale: Global warming is so linked to temperature, while changes happening affect many other parameters such as precipitation and the frequency and intensity of some extremes. | Accepted. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 17082 | 4 | 6 | 15 | | | (and other such references), why use the term “development”? The correct term would be “economic growth” as it applies to both developed and developing countries and also better captures the activities leading to concentration of GHG’s | To be clarified. |
| 14001 | 4 | 6 | 15 | | 17 | The wording chosen for this part leaves one with the impression that yes, development paths chosen will impact emissions, but that it is ambiguous. Could you elaborate on the reasons for the ambiguity? (Is it because we are not sure if it has an impact, or because we don't know the direction of the impacts?). Consider changing the wording to get across that there is a complex relationship that is not yet fully understood. | Will clarify |
| 17083 | 4 | 6 | 18 | | 20 | (and other such references), why use the term “development”? The correct term would be “economic growth” as it applies to both developed and developing countries and also better captures the activities leading to concentration of GHG’s | See 166. |
| 17084 | 4 | 6 | 21 | | | the words “path dependence” need to be clarified, and includes both technology and lifestyles. Must be spelled out! | Accepted. |
| 17085 | 4 | 6 | 25 | | | “technology transitions” refers only to production patterns, and a section on “lifestyles” should be added with reference to consumption patterns. | See 4.4.3 |
| 17086 | 4 | 6 | 25 | | | the words “a number of determinants can be considered drivers or barriers” is not clear. The entire section 4.3 titled “Determinants, drivers and barriers” needs to be reviewed, because, as page 5 line 33 states “population, affluence and technology” are key, and these three elements should be considered in this section, along with a section on ‘patterns of natural resource use, under these titles. References to human capital, education, behaviors, values, culture, governance, legacy of development – what is this – natural resources, finance are not based on scientific evidence of these elements as significant and not included in the other four elements. | See 4.3: Will add clarification about the choice of drivers to focus on. Will make consistent with Exec Sum. |
| 3949 | 4 | 6 | 25 | 6 | 30 | Why the adjective 'scientific'? To understand why governments take the decisions they take requires a positive theory of the state, as distinct from a normative theory. If the policy adviser does not have a positive theory of the state, how can he or she hope to understand why governments behave in the way they do behave? The idea that a model can scientifically predict how state power will be used or abused in the future is a novel one. | Will clarify use of term model, and its role in providing "understanding". |
| 4754 | 4 | 6 | 31 | 6 | 38 | It is also important to match financial and social requirements | Noted. |
| 7753 | 4 | 6 | 31 | 6 | 31 | Check for consistency in the use of 'adaptation' vs 'adaption' throughout | Accepted. |
| 3950 | 4 | 6 | 32 | 6 | 33 | Is the idea that the state would 'guide individual action' an elitist conception of democracy? If so, what fate is envisaged for those who refuse to be so guided? | It is in part a coordination problem, in part a prisoner's dilemma. Both situations can be improved by collective |
| 14005 | 4 | 6 | 33 | | | "Response capacity, the ability to forsee, PREPARE FOR, effectivley respond to…" | Accepted. |
| 3206 | 4 | 6 | 35 | 6 | 38 | What about economic challenges? To give incentives that internalize the external effects that underlie the climate change problem. | Agreed. |
| 18297 | 4 | 6 | 36 | | | It would be preferable to use 'social' or 'socio-political' rather than 'political', as the latter is usually regarded as referring narrowly to formal political institutions and activity and therefore fails to include legal and other social institutional elements. | Will take into account. |
| 17078 | 4 | 6 | 37 | | | replace “project” with policies and strategies, as projects are not being considered here, and the concern is with policy | Accepted. |
| 3207 | 4 | 6 | 39 | 6 | 40 | I do not understand this sentence. | Will clarify. |
| 17079 | 4 | 6 | 39 | | 43 | is a key statement and must be retained | Accepted. |
| 14002 | 4 | 6 | 39 | | 40 | There is a link between SD and climate change, even without anthropogenic climate change, due to social and biophysical vulnerability; adverse weather and climate change can have negative effects on societies, which can influence sustainability. | Accepted. |
| 6093 | 4 | 6 | 39 | 6 | 43 | It may be better to make it clear that there exist trade offs and synergies between pursuing SD and climate change (Ref. Page 5 lines 23-25 of Chapter 6) | Will clarify. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 16936 | 4 | 6 | 4 | | 6 | I find this surprising. In terms of major energy end-use categories, industry is around 30% of energy and 40% of global fossil fuel CO2 emissions (including process emissions). I appreciate that industry is mostly producing products for other end-uses so in their some of this could be assigned downstream, but it hard to see how this can all be assigned to mobility or housing (let alone agriculture). I would also question the use of trying such a total downstream "ultimate use" allocation; surely industrial energy consumption, as the biggest end-use emissions sector, should at least be in the list? The structuring and breakdown, along with both energy and CO2 data, that I have found most useful is set out in Grubb, Hourcade and Neuhoff, Planetary Economics: the three domains of sustainable devleopment, Taylor and Francis forthcoming : Chapter 3, "Energy systems and technologies". | Will check (Simon) |
| 3208 | 4 | 6 | 42 | 6 | 43 | As long as sustainability has not been defined, it is hard to agree or disagree with this statement. | Not relevant. |
| 7754 | 4 | 6 | 42 | 6 | 43 | I am not convinced by the argument in the exec sum, or the chapter, that making development pathways more sustainable can go a long way to mitigation, adaptation, and adaptive/mitigative capacity. I do not think this argument is made in this chapter. I woudl reconsider including this conclusion here. | Important point. We must caveat, unpacking out relationship betw SD and CC. |
| 17080 | 4 | 6 | 45 | 7 | 2 | the paragraph is not clear and should be deleted | Will clarify. |
| 3951 | 4 | 6 | 47 | 6 | 47 | What evidence is there that pessimism is receding and why would it be important if it was when no one has been able to put forward a social welfare function capable of commanding universal support? Once again the question posed for anyone to wanting to exercise the coercive powers of the state is 'what will be the fate of those who disagree with the proposed interpersonal utility comparisons'? | The social welfare function is not a dictatorial machine, just a tool for democratic discussion of policy consequences (different people can refer |
| 17081 | 4 | 6 | 8 | | | why mix production and consumption patterns? The impacts are different and occur at different stages of development and in different countries | Noted. |
| 3948 | 4 | 6 | 9 | 6 | 10 | Is this positing that there is a trade-off between economic growth and sustainable development? If so, should not views to the contrary be acknowledged and discussed - the famous Simon–Ehrlich wager illustrates the debate. | Either engage this comment directly, or present weaker statement that posits this decoupling as "a way to reduce |
| 13271 | 4 | 6 | 39 | 6 | 43 | SD and climate change are also linked in the way climate change is currently affecting people's wellbeing (for instance, how different climate patterns make sustainable or unsustainable important human activities). A paragraph about this relationship could be included just after line 43. (in fact, stated in 4.1.2, pag 10 of the chapter) | Will bring into ES. |
| 15103 | 4 | 6 | 1 | 6 | 3 | Add: ¨This trend involves the spread of high-consumption life-styles in some countries and sub-regions, in many cases INFLUENCED BY PROPAGANDA FOR CONSUMPTION, while in other parts of the world MAINLY IN DEVELOPING COUNTRIES, large populations continue to live in poverty. | Rejected. |
| 15101 | 4 | 6 | 2 | 6 | 3 | Add: ¨ while in other parts of the world; MAINLY IN DEVELOPING COUNTRIES, large populations continue to live in poverty. ¨ | Accepted. |
| 2911 | 4 | 6 | 20 | 6 | 30 | proposal is to have less detailed information in executive summary, for instance remove 'of particular … well being'. | Accepted. |
| 15104 | 4 | 6 | 31 | 6 | 31 | Change adaption by ADAPTATION | Accepted. |
| 15105 | 4 | 6 | 37 | 6 | 38 | Add: and financial (who should pay for projects with diverse effects) challenges, AS FINANCIAL ASSISTANCE FOR DEVELOPING COUNTRIES . | Accepted. |
| 2910 | 4 | 6 | 4 | 6 | 4 | insert probably ('are probably responsible'), remove medium agreement, medium evidence (general remark) | Not relevant. |
| 15102 | 4 | 6 | 5 | 6 | 6 | Mobility,PRODUCTION OF food IN EXCESS WHERE ONE PART FINALIZE CONVERTED IN GARBAGE, and housing are responsible for about three-quarters of consumption-related environmental impacts in industrialized countries | Rejected. |
| 12678 | 4 | 6 | 10 | 6 | 10 | It seems reasonable to enlarge this remark: "from unsustainable economic growth" because growth does not per se menace the climate change even if in many cases it does (see infra, comment 21). | Accepted. |
| 3236 | 4 | 60 | 12 | 60 | 12 | Biodiversity can also be included in an anthropocentric analysis, by taking into account the future effects of lack of biodiversity. In addition, biodiversity cannot maintained without protecting insentient beings. | Yes, this is written in the previous sentence. |
| 12749 | 4 | 60 | 12 | | | It should be made clear who delivers the values. | Anybody is free to put ideas on the table. We should not be afraid of democratic |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 12747 | 4 | 60 | 3 | 60 | 7 | On p. 58 reference is made to a second best world (cost-effectiveness). So it should be made clear in which sense a social welfare function matters, here. | Good point. Change the wording and specify the articulation. |
| 3956 | 4 | 60 | 43 | 60 | 43 | Is there any authority that can be cited in support of the assertion that Arrows theorem does not point to a radical impossibility? Similarly can any authority be cited that rebuts Hayek's arguments that centralised determinations whose efficacy depends on being able to harness widely dispersed information of a specific and detailed nature will fail to work well if they contain no mechanism for allowing that information to be harnessed at a lower enough cost? See http://www.econlib.org/library/Essays/hykKnw1.html | Yes, cite Sen 1999 and Fleurbaey-Maniquet 2011. |
| 12746 | 4 | 60 | 11 | 60 | 12 | Not to hurt sentinent beings is not exactly the same as the (broader) biodiversity question. The anthropocentric approach dominates the social sciences. If the IPCC integrates an ecocentric point of view in its consideration this should be explained and marked as a contrast to the elsewhere anthropcentric point of view. Anyway, the surrogate representation of sentinent beings might be a rather difficult task for humans because they only are able to represent their own perspective. Hence, if the sentinent beings should be integrated into a utility function, a non-human perspective would be hard do quantify. Thus, it seems more reasonable that humans are only able to represent their own interests. Anyway, biodiversity can be an indirect human interest or right because it can be a material prerequisite to human existence and human utiliy, too. Biodiversity or a stable climate are part of environmental stability and balance. They are constiutive for human life. So from the human point of view there is a big protection interest already. Sentinent beings can be protected as (positivistic) preferences of humans or even as humans' aesthetic interests (see IPCC Draft, Chapter 4, Section 4.8.3.1, p. 80, line 43). | We simply think it is worth mentioning the nonanthropocentric view as it exists and is not so marginal. |
| 5486 | 4 | 60 | 13 | | | Section 4.7.2.2- if you want to edit text- much discussion on well being which is difficult to define and difficult to build metrics around. Instead could you substitute metrics like access to fresh water and sanitation, sufficient food and education. Previous discussion has indicated a relationship between these and happiness- these are easier to quantify | Capabilities cover these aspects. Don't interpret well-being in a narrow sense. |
| 12748 | 4 | 60 | 40 | 60 | 40 | There should be at least one reference when refering to "many practioners". | OK, like Stern and Nordhaus. |
| 12751 | 4 | 60 | 47 | 61 | 5 | The monitization of policies could be explained in more detail. If sustainablility questions should be examined by measures of monetarization at least some concepts should be mentioned respectively cross reference be made. Above that the question of how to cope with uncertainties could also be raised in this context. Especially because of uncertain natural science-based causalities (tipping points, irreversible damage, substitutability of natural resources) the quantification of costs and benefits may be too vague. So uncertainity should be made transparent and some ideas given how to cope with (e.g. by a qualitative balancing process that includes uncertainity in a transparent way or by normative borders as e.g. given by the precautionary principle when high risks are at issue). | This is already explained in quite some detail but will be taken into account. |
| 3237 | 4 | 61 | 1 | 61 | 2 | Are the implicit distributional preferences shared by the actual decision-makers? What should be done if not? | This comment misses the problem which is: What methods are available to decision-makers? Obviously they cannot |
| 12752 | 4 | 61 | 23 | 61 | 25 | Would not this also hold in case of a "piecemeal" approach? | Not clear. |
| 5487 | 4 | 61 | 37 | | | Don't participatory strategies require a certain level of education and if so, is it possible to differentiate the benefits associated with education and the benefits associated with a paticipatory strategy? | Participation does not "require" education but it does work better when education is there. Education without participation would not make sense in |
| 12753 | 4 | 61 | 24 | 61 | 25 | See comment 72. | Not trackable. |
| 16908 | 4 | 62 | | 73 | | Overall, section 4.7.3 gives a fairly good overview of the context and various framework regarding equity and burden sharing. | Thank you |
| 3238 | 4 | 62 | 17 | 62 | 20 | It is justified by the benefits of reduced climate change when also the benefits for everyone else is taken into account! | The point here is that it is the benefits OF OTHERS' MITIGATION to |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 8812 | 4 | 62 | 7 | 63 | 15 | Unquestioned utilitarian assumptions limit the imagination of this discussion of 'commons'. | Clarify, make clear that "rational" is only limited positive descriptive value. Exceptions arise. However, see |
| 8089 | 4 | 62 | 37 | 63 | 15 | Please note the following, which repeats for chapter 4 a comment made on chapter 13:<br>This reviewer wishes to suggest that what is mentioned in these two lines be more explicitly connected with what is said in lines 37-40 and 45-47 of p. 62 of chapter 4: the transfers discussed here (in chapter 13) do have a fundamental role in making the Paretian approach (discussed in chapter 4) a feasible one in terms of voluntary agreements.<br>Astonishingly, both here in chapter 13, and there (throughout chapter 4), the inescapable necessity of a voluntary character of any international agreement is pretty much ignored, the authors seeming to be dominated by the quest for equity. But on this subject, undermining the voluntary dimension is a severe lack of realism.<br>NB : in referring to p. 62 of chapter 4, I ignore lines 41-44, because they are an extreme, and actually, as stated, incorrect implication of paretianism. There are better things to say on Pareto improvements in international affairs. | Will address this. Is voluntary nature undermined by equity? |
| 3240 | 4 | 63 | 17 | 63 | 27 | Does this facilitate the avoidance of climate change? | Remains to be seen. |
| 15652 | 4 | 63 | 17 | | 27 | There is some overlap between this paragraph and Box 3.3 - suggest cross-referencing and either shortening here or removing box 3.3. | Accepted, linkage improved. |
| 3239 | 4 | 63 | 3 | 63 | 5 | Adding fairness may increase the cost of some parties to participate, and therefore increase the risk of defection. | Discuss with paretianism discussion. |
| 17087 | 4 | 63 | 3 | | | should read 'Right to Sustainable development' based on the UNFCCC and the Cancun decision | Will ensure consistency with references |
| 15653 | 4 | 63 | 30 | | 37 | Could condense reference to Rio Declaration by simply highlighting that Principle 7 links CBDR to sustainable development more broadly. | Will shorten while overall shortening. |
| 12754 | 4 | 63 | 3 | 63 | 5 | This statement is not evident for different perceptions of fairness. | Reference |
| 12755 | 4 | 63 | 38 | 63 | 47 | It should be made transparent if the reference is the need principle, here. | Not clear. |
| 3241 | 4 | 64 | 1 | 64 | 3 | See: Lange, Andreas, Andreas Löschel, Carsten Vogt and Andreas Ziegler, "On the Self-Serving Use of Equity Principles in International Climate Negotiations", European Economic Review 54, 2010, 359-375. | Helpful reference. |
| 12756 | 4 | 64 | 1 | 64 | 15 | The considerations, here, are convincing but I expected to find these issues in Chap.3. | Noted, this has been coordinated with |
| 15654 | 4 | 64 | 1 | | 3 | Sentence re self-serving interpretations could refer to Lange, A., A. Löschel, C. Vogt, and A. Ziegler. 2010. On the Self-Interested Use of Equity in International Climate Negotiations. European Economic Review 54 (3):359-75. | Helpful reference. |
| 12757 | 4 | 64 | 25 | | | In the documents referred to there is nothing said about "equality". So, where is the link and how does "equality" fit with e.g. CBDR? | See p. 67 |
| 5488 | 4 | 64 | 28 | 65 | 36 | this has been discussed elsewhere- can mostly be edited out with only summary points retained to take it to the current topic | Noted. Text has been revised. |
| 2566 | 4 | 64 | 31 | 64 | 40 | Extremely important item, poorly referenced. The principle of common but differentiated responsibilities should not be used as it is by diplomats, evading commitments and overlooking the closing opportunities to stabilize global temperatures at safe levels, ie the ultimate goal of the UNFCCC. A reference: http://jed.sagepub.com/content/19/3/335.abstract | Add references |

|---|---|---|---|---|---|---|---|
| 15656 | 4 | 64 | 36 | | 37 | The distinction could usefully be drawn here between _retrospective_ understandings of responsibility (i.e. for contributing to a problem) as opposed to _prospective_ understandings of responsibility (i.e. for fixing a problem). These have been elaborated extensively in the philosophical literature. See for example Miller, D. 2001. Distributing Responsibilities. Journal of Political Philosophy 9 (4):453-71. This distinction is best elaborated further in Chapter 3 in the discussion on historical responsibility. | Agreed. Helpful reference |
| 15657 | 4 | 64 | 44 | | 46 | The existence of a "no-harm rule" in international law is contested. See for example Birnie et al (2009) who argue that existing rules of customary international law do not prohibit transboundary harm per se, and that therefore 'it is erroneous to refer to a “no harm” rule in this context' (Birnie, P., A. Boyle, and C. Redgwell. 2009. International Law and the Environment. 3rd ed. Oxford: Oxford University Press, p.137. | Will elaborate. |
| 15655 | 4 | 64 | | | | There is considerable overlap between this section and section 3.7.3. The latter section contains some important material, but it seems best to integrate it into chapter 4 (in the more applied chapter) rather than in chapter 3. | Noted, this has been coordinated with Chapter 3. |
| 11569 | 4 | 64 | | 68 | | The section may belong to chapter 3. | Noted, this has been coordinated with |
| 12758 | 4 | 65 | 17 | 65 | 21 | You may like to emphasize that this implies a double burden for the current generation. | Taken into account, this will be clarified. |
| 16907 | 4 | 65 | 22 | 65 | 36 | it should also be pointed out that projections of future emissions should not be used as an excuse to negate historical emissions and the consequent responsibility. | not in this discussion. |
| 11056 | 4 | 65 | 28 | 65 | 28 | In the context of supporting these studies , we analyzed accumulative CO2 and found developing countries would match the 1990 level of developed country in 2013 using Nordhaus(1994) CO2 absorption formula and CDIAC and SRES scenario data (estimated by AIM) .<br>Miki YANAGI, Yosuke MUNESUE, Shuzo NISHIOKA (1999) “An Equity Evaluation for Burden Sharing in the Mitigation Process of Climate Change,” Paper presented at annual conference of Society for Environmental Economics and Policy Studies, 1999. | Helpful reference. |
| 11570 | 4 | 65 | 37 | 66 | 14 | Some of this is covered elsewhere. | Noted. |
| 16906 | 4 | 65 | 4 | 65 | 5 | Some more recent references and calculations regarding historical emissions should be added here, for example, http://www.pnas.org/content/109/32/12911 | Helpful reference. |
| 10953 | 4 | 65 | 3 | 65 | 36 | Confer: Rive, Torvanger, Fuglestvedt (2006), Climate agreements based on responsibility for global warming: Periodic updating, policy choices, and regional costs, Global Environmental Change, 16, 182-194. (See comment 1.) | Helpful reference. |
| 6894 | 4 | 65 | 6 | 65 | 8 | Please revise to be more precise. One of the major factors controlling CC is certainly the atmospheric GHG concentration, but CC is also influenced by orbital parameters, aerosols, volcanic eruptions etc. | Taken into account, this will be clarified. |
| 8497 | 4 | 66 | | 67 | | Capacity - note there is a large literature that deals with this concept, but it tends to view it in a limited way (as is the case here) At a minimum, one could focus on two dimensions of community capacity (decisionmaking and implementation) but must also consider the generally undisputed assumption that increasing capacity will result in improved outcomes. We are increasingly aware that there are often exogenous factors which limit or intervene with this assumption | See "Response Capacity". |
| 15658 | 4 | 66 | 19 | 66 | 32 | It would also be useful to mention as a possible starting date 1990, being the date of publication of the first IPCC report. This date has been proposed by several theorists, including Steve Vanderheiden (2008). Atmospheric Justice: A Political Theory of Climate Change. | Not neceessary to make point. |
| 6895 | 4 | 66 | 34 | 66 | 39 | WGI AR5 should not serve as a reference for "Some would argue that..." -- please adjust sentence; Please be more specific in citing WGI AR5 Chapter 6 here. | Add reference. (Note IPCC WGI is ref to ocean acidification.) |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 12759 | 4 | 66 | 45 | 66 | 48 | The definition of declining marginal utility of income is confusing, here. You may consider: The more income a person has the smaller is the additional utility which he or she gains from more income. And then mention that poorer people lose accordingly more utility when their income decreases, thus they have a greater level of sacrifice. | Taken into account, this will be clarified. |
| 12760 | 4 | 67 | 29 | 67 | 35 | See Comment 6. | Cannot access. |
| 12761 | 4 | 68 | 18 | 68 | 18 | It may be worthwile to consider addings, whether within a contraction and convergence approach (see p. 70, line 38), developing countries might continue a developing path based on fossil fuels etc. This would mean to exclude developing countries from binding reduction targets until they reach a certain wealth level. Only when achieving a wealth level comparable to developed countries they shoul have to reduce green house gases. Another approach would try to integrate developing countries into the climate regime as early as possible, at least through negative reduction aims as we know it from the European "bubble sytem" (article 4 of the Kyoto Protocol). This second approach changes the path of unsustainable development early and therfore could minimize transaction costs for the developing countries in comparison to a later turn (see Section 4.5). As developing countries did not cause the existing climate change problem financial transfers should be integrated into this second mitigation concept (cf. Chapter 16). | See CDC.<br><br>Perhaps this is talked about as distinction between "delayed participation" meaning no mitigation, versusus meaning mitigation with support. |
| 5489 | 4 | 68 | 22 | 68 | 28 | Important points and paragraph- could be expanded | Noted. Will elaborate. |
| 6323 | 4 | 68 | 3 | 68 | 28 | It may be useful to note here that there are difficulties that have arisen in the field of environmental ethics in attempting to use traditional rights-based language when dealing with issues of sustainable development. For instance, regarding future generations, it is difficult to accord rights to non-existent people. Similarly, it becomes awkward to talk about the "rights" of ecosystems or plants (and perhaps even animals), so the rights-based approach, while appropriate in some areas, is difficult to apply generally to all discussions of sustainability. This point is raised in chapter 3 of the IPCC draft report. | Noted. Will elaborate. |
| 7304 | 4 | 69 | | | | Please, feel the Table 4.1, otherwise exclude it from the Chapter 4. | Will fill. |
| 6896 | 4 | 69 | 10 | 69 | 12 | This sentence is mixing GHG sink capacity with global carbon budget, both of which can't be aimed at with ethical principles directly... | Taken into account, this will be clarified. |
| 5490 | 4 | 69 | 4 | | | Section 4.7.3.3- this list is likely included as it provides a potential framework or basis for evaluating the sustainability frameworks that are discussed immediately after this. However- it is long, takes up room and could likely be replaced by a table that summarizes the different accounting methods with only a few described in detail in the text | Agreed. Will present in synthesis. |
| 13660 | 4 | 69 | 4 | 72 | 46 | The categorization of the approaches is according to the framework followed by the approach -i.e. 'effort sharing' or 'resource sharing'. This however may be an incorrect way to categorize the approaches as the resource sharing approach also in effect places a burden on some countries to limit their emissions within a budget specified by agreed climate goals. On the other hand, effort sharing goals are almost always based on 'flows of emissions' as opposed to stocks of emissions. So the categories of flow based vs. stock based approaches may be more suitable. In specifying target emissions in specific years, flow based approaches cannot account for the total cumulative emissions of a country between the target years, which is the parameter that is most important to check climate change, whereas stock based approaches can do so. | Taken into account, this will be clarified. |
| 3953 | 4 | 7 | 11 | 4 | 11 | This sentence is unclear. Does it refer to a voluntary cooperative solution or a solution enforced on all using the coercive powers of the state? The distinction is critical from a moral perspective. | Not relevant. Both are possible. |
| 3209 | 4 | 7 | 12 | 7 | 14 | Equity has been reflected in international agreements that produce statements on how to address climate change in the future. Has there been any effective (in the sense of reducing GHG emissions) international agreement, and are future ones likely to reflect equity? | This is a positive statement about existing agreements. |
| 3954 | 4 | 7 | 15 | 7 | 16 | What needs to be discussed here is the morality of forcing a political minority to bow to the will of a political majority. The entire executive summary seems to be turning a blind eye to the elephant in the room - the propriety of using the power of the state to over-ride dissenting viewpoints. | Dissenting viewpoints must be respected, but for "public good" issues (i.e., one cannot have a different climate policy for different people) some decision |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 3210 | 4 | 7 | 17 | 7 | 27 | The structure of this paragraph is unclear. | Taken into account, this will be clarified. |
| 18298 | 4 | 7 | 18 | | | This section on principles and norms is too brief and misses some of the important nuances about and associations between the terms used. It therefore becomes confusing when it mixes rights with principles relating to responsibilities. Perhaps put the 'rights' first, as these are generally regarded as the drivers. It can be argued that sustainable development can be achieved without equity. In other words, there is a slide underway here, which is introducing a specific version of SD (which I support). This slide is made evident by the way that 'equitable development' and 'sustainable development' are offered seprately in the par beginning line 33. 'Capacity' is not a principle but rather a means... Is this 'Beneficiary pays'? There are also other principles of considerable importance here - for instance relating to 'harm avoidance', 'representation and participation' 'preservation of biodiversity - which need to be introduced in relation to 'equity'. | 1. Clarify relationship between equity and SD.<br><br>2. Clarify rights vs principles<br><br>3. Capacity as "ability to pay"<br><br>4. rep and Part: procedural equity<br><br>5. Harm avoidance: link to PPP? |
| 17075 | 4 | 7 | 18 | | | the statement “responsibility for GHG emissions” is not scientifically correct, and it should read “responsibility for concentrations of GHGs”. Climate change is caused by the concentration of GHG’s. | See 4.7.3 on responsibility for emissions |
| 10858 | 4 | 7 | 23 | | | "sinks, as they are common resources"! Not sure many soverign nations would agree with that. Sure, this could be applied to oceans, but certainly not the land sink. If a "sink" is a common resource, then so is the forest that makes the sink and thus everyone would have equal right to harvest the forest? | This is a misunderstanding. A sink is a common resource for all who emits…! Not that they do what they want with the |
| 17076 | 4 | 7 | 24 | | | the statement “equal right to the natural carbon sinks, as they are a common resource, and thus an equal right to emit” is not correct. As an equal right to the carbon sinks does not equal to an equal right to emit, it confuses stocks and flows and is mathematically incorrect. The words “and thus an equal right to emit” should be deleted, and if a clarification is needed, the words “equal right to the global carbon budget” be added | Agreed. |
| 18299 | 4 | 7 | 28 | | | It can be argued - strongly - that in the current context of deepening ecological crisis, sustainability concerns bear on the short term as much as the long term. The dissociation from the present context and the sense that SD embodies ong term goals is, arguably, what is making SD so hard to realise. Discussion of the work on 'overshooting' (Meadows et al) is critical in for injecting a sense of urgency and focus here. Moreover, as the chapter later acknowledges - intragenerational equity is a SD consideration. Perhaps 'bear on both the long and short term'. | Important point. Need to assess ES (and chapter) for "long-term bias". Perhaps even more important for Ch 6 |
| 3955 | 4 | 7 | 28 | 4 | 7 | A key problem for the policy advisers is that politicians have to concentrate on the very short term - winning the next election. What is the use of developing a long-term policy if there is no mechanism for making it in the interests of politicians to adopt it? The executive summary also seems to be ignoring the problem of political incentives. | Discuss in 4.3.4, and political economy section? |
| 14003 | 4 | 7 | 3 | | 7 | Is this not contested? Framing climate change as an externality and a commons problem has large implications on how climate change is dealt with, both practically and politically, and some argues that it is a barrier to social change and transformation. | Not relevant. That it is a commons problem is a fact, not a judgment or a framing strategy. |
| 3211 | 4 | 7 | 31 | 7 | 31 | What about the feasibility of such a direct assessment? | It is always possible to make a forecast. At any rate, standard indicators require at least as much if applied properly. |
| 18300 | 4 | 7 | 33 | 7 | 35 | The growing scientific emphasis on 'the critical decade' for action suggests that the line about 'effective, robust and long term response' - while acknowledging that we will need to respond for centuries, perhaps millenia, fails to consider the importance of rapidityof action for effectiveness - with substantial challenges for political and social legitimacy, and technical capacity. Suggest delete 'long-term', to read: 'effective and robust' | Accepted. |
| 2936 | 4 | 7 | 33 | 7 | 44 | I agree strongly with this key conclusion about the link between adaptation, mitigation and SD. | Noted. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 18301 | 4 | 7 | 35 | 7 | 37 | The comment that both mitigation and adaptation rely to a 'profound extent' (etc...) is an unsubstantiated assertion. Effective global mitigation may occur without equity or SD principles being met in the short or even longer term. This point is made later on (Sect 4.2). The unilateral use of geoengineering is one example. Collusion between the 20 major national emitters is another. Adaptation is quite another matter - and this does depend on equity principles being realised. This chapter unconvincingly overstates the necessary links between CC action and SD. 'Can' dos not equal 'must'. The moral case needs to be made more robustly. | To be taken into account. |
| 3212 | 4 | 7 | 36 | 7 | 36 | On the contrary, one can argue that adaptive capacity is defense against climate change by the strongest, for the strongest, which does not lead to equitable development. | That is not adaptation for all. |
| 3213 | 4 | 7 | 38 | 7 | 44 | Paragraph is unclear. Also, typo: "… measures and measures …" | copy edit |
| 3952 | 4 | 7 | 4 | 7 | 7 | This sentence sets up a straw argument. What we are observing instead is a great deal of spontaneous cooperative action (eg NGOs) that is not based on the posited self-centred individualist thinking. This should surely be acknowledged and its implications considered. | Not relevant. |
| 17637 | 4 | 7 | 40 | 7 | 41 | Regarding of alternative framework for implication of measures, "well-being" is categorized one of "social capitals." Please discuss the classification of this framework | This is a misunderstanding. |
| 17077 | 4 | 7 | 40 | | | the statement “equal right to the natural carbon sinks, as they are a common resource, and thus an equal right to emit” is not correct. As an equal right to the carbon sinks does not equal to an equal right to emit, it confuses stocks and flows and is mathematically incorrect. The words “and thus an equal right to emit” should be deleted, and if a clarification is needed, the words “equal right to the global carbon budget” be added | Accepted. |
| 4756 | 4 | 7 | 41 | 7 | 42 | "As risk is a central aspect of sustainability". Could you please explain this statement? | Accepted. |
| 14007 | 4 | 7 | 42 | | 42 | Suggest adding "…the analysis of mitigation measures and ADAPTATION measures should not…" | Accepted. |
| 14006 | 4 | 7 | 42 | | 44 | Not clear what is meant by "…examine likelihood of potential impacts". Assume that this referes to the consequences of climate change responses and that these has impacts, but what impacts are we talking about beyond those for SD and equity (which would cover consequences across time and space). | Just that indeed (SD and equity). Will rephrase. |
| 7755 | 4 | 7 | 42 | 7 | 44 | This sentence does not read clearly, I am not sure what is meant | See 217. |
| 4755 | 4 | 7 | 9 | 7 | 9 | I think that "inter-generational nature of the problem" is also very important | This was a typo. |
| 12679 | 4 | 7 | 12 | 7 | 13 | The definition of equity mentioned in this line does not include sovereignty. According to the definition of equity as a proportional distribution (see Ringius, Lasse; Torvanger, Asbjorn; Underdal, Arild (2002): Burden Sharing and Fairness Principles in International Climate Policy. In: International Environmental Agreements: Politics, Law and Economics (2), pp. 1–22; p. 6), the sovereignty principle is a special case of equity (see Kverndokk, Snorre; Rose, Adam (2008): Equity and Justice in Global Warming Policy (2), p.149f). | Refer and clarify relationship between equity and sovereignty. |
| 15106 | 4 | 7 | 22 | 7 | 24 | In these lines ¨In one perspective, this moral equality is interpreted to imply an equal right to the natural carbon sinks, as they are a common resource, and thus an equal right to emit. ¨, the ideas are very confusing taking into account the national sovereignty over natural resources in one sense, and the equal right to emit maybe suppose one spiral of increment of GHG emissions, I suggest the convenient clarification. | Taken into account, this will be clarified. |
| 12681 | 4 | 7 | 26 | 7 | 27 | This passage or line only mentions burden-sharing but not benefit sharing. The differentiation between burden sharing and benefit sharing depends on the question whether ther is a right to be protect or a right to pollute. This distinction can also be found in Kverndokk, Snorre; Rose, Adam (2008, Equity and Justice in Global Warming Policy (2), p.150) or in Ringius, Lasse; Torvanger, Asbjorn; Underdal, Arild (2002; Burden Sharing and Fairness Principles in International Climate Policy. In: International Environmental Agreements: Politics, Law and Economics (2), pp. 1–22; p. 5). You may like to check at wich places in the chapter this distinction is important. | Taken into account, this will be clarified and sources assessed. |
| 2912 | 4 | 7 | 33 | 7 | 37 | probably as a first sentence 'Chapter 4 focus on…'.? | copy edit |
| 15107 | 4 | 7 | 38 | 7 | 38 | In: ¨ Likewise, mitigate and adaptation measures can strongly affect broader SD and equity objectives,¨ I propose to change any words as:¨ Likewise, mitigate and adaptation measures can HAVE BROAD INFLUENCES OVER SD and equity objectives,¨ | Accepted. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 12680 | 4 | 7 | 20 | 7 | 20 | "A right to sustainable development" is not the same as the sustainability principle. To create a right to sustainable development must be discussed in jurisprudential terms. Here, a right is considered to be more concretized than a principle. A right must have a sufficiently concrete consequence while a principle depends on a weighing process in order to find the optimal balance between several rights that the principle includes. Šušnjar describes the difference between rights and principles as follows: "Principles are defined as optimization commands that only make prima facie prescriptions in contrast to rules, which are definite in nature," Šušnjar, Davor, Proportionality, Fundamental Rights, and Balance of Powers, Leiden/Boston 2010, p. 75; see also Alexy, Robert, Constitutional Rights, Balancing and Rationality, in: Ratio Juris 2003, pp. 131-140. The jurisprudential definition leads to the conclusion that the "sustainability principle" is the better word here. | This is not a legal right, it is defended as a moral right. |
| 13690 | 4 | 70 | 37 | 70 | 37 | Better use peer reviewed reference Meyer, A. (2004): Briefing: contraction and convergence, in: Engineering Sustainability, 157, p. 189–192 | Will add references. |
| 3274 | 4 | 71 | | 72 | | Effort sharing approaches picked up here seem not be fully covered. For example, "equal MAC" and "cost per GDP" can be important approahces as discussed den Elzen (2010) and Wada (2012). Furthermore, this section is overlapped with 13.4.1.2. It seems that this issue fits international cooperation, rather sustainable development.<br><br>den Elzen, Höhne, Niklas, Hagemann, Markus, Vliet, Jasper and Vuuren, Detlef, (2010), Sharing developed countries' post-2012 greenhouse gas emission reductions based on comparable efforts, Mitigation and Adaptation Strategies for Global Change, 15, issue 5, p. 433-465<br>Kenichi Wada, Fuminori Sano, Keigo Akimoto, Takashi Homma, Assessment of Copenhagen pledges with long-term implications, Energy Economics, Available online 13 January 2012, ISSN 0140-9883, 10.1016/j.eneco.2012.01.001. | Noted, this has been coordinated with Chapter 13.<br><br>Will also discuss equial MAC and equal % GEP |

|---|---|---|---|---|---|---|---|
| 4685 | 4 | 73 | 39 | 75 | 34 | The text is well written within a limited space; however, most of the descriptions point out limitations (weaknesses) of the sustainability indicators. Descriptions of their usefulness should be explained in more detail in the text. For example, please see:<br>- Atkinson, Dietz, & Neumayer (2007) Edward Elgar<br>- Lawn (2006) Edward Elgar | Not fair, the attraction of GS is described, with relevant references. |
| 15124 | 4 | 73 | 26 | 73 | 29 | There is similarity with the Latin American “BuenVivir” or "Vivir bien" approaches that pursues the goal of material,social and spiritual satisfaction among all members of a society, but not at the cost of the other living beings or natural resources. BuenVivir has been adopted in the constitution of Ecuador (2008) and Vivir bien in Bolivia (2009) and Peru (I´m not sure on Peru please check it). | Noted. |
| 5491 | 4 | 73 | | | | Section 4.7.4- 4.8 this is the heart of the chapter- this is the section that provides the clearest discussion of sustainability as well as interactions between sustainable practices and climate change. Different methodologies for measuring sustainability are also described. For this reader- as the above comments indicate, much of the preceeding discussion can be edited and shortened. This section can use expansion and clarification. Some discussion of how LCA or the triple bottom line approach could be integrated into this system or has provided a more manageable approach would be appreciated. Some discussion on how expanding accounting of emissions using a full life assessment could also be applied to sustainabiltiy indicators would be helpful as well | Noted. |
| 12763 | 4 | 73 | 17 | 73 | 30 | This is also part of Chap.3. So you might like to shorten. | Noted. This will be coordinated with |
| 8813 | 4 | 73 | 39 | 77 | 7 | This section although recognising the difficulties associated with indicators does not question whether indictors are an appropriate tool for climate change and sustainable development; the section also tends to make simplistic normative ethical utilitarian assumptions. Charlesworth M & Okereke C (2010, Policy responses to rapid climate change: An epistemological critique of dominant approaches, Global Environ. Change, 20:121-129, doi:10.1016/j.gloenvcha.2009.09.001) calls into question numerical approaches to aiming at, measuring or determining policy - numbers (e.g. ppm CO2e) can inform policy but anything beyond this makes gross unwarranted assumptions. | This again seems to rely on a narrow reading of the approaches described here. |
| 4686 | 4 | 74 | 11 | 74 | 40 | The authors stressed the limitations of Genuine Saving by referring to Fleurbaey (2009) and Pezzey (2004), but do not mention the useful nature of Genuine Savings. Indeed, it could be considered to be the best among the indicators for sustainable development. Its usefulness should be described in more detail by referring to Dasgupta (2001). | A message of this section is that belief in GS is partly based on a lack of understanding of its shortcomings. |
| 3243 | 4 | 74 | 23 | 74 | 26 | Note that this interesting possibility is not compatible with discounted utilitarianism. | Not clear. The marginal utility or productivity of a dwindling stock can |
| 4687 | 4 | 74 | 27 | 74 | 40 | Although the authors described the qualifications of GS, which is regarded as the best indicator of sustainable development, among those belong to the weak sustainability. GS can provide information that consumption and utility cannot. It is useful for improving the methodology to measure GS, which the authors criticize. For example, reductions from Gross Saving to Genuine Saving in 10 world regions up to the year 2100 is indicated by environmental impacts and by resources under an optimal run in SRES-B2 and by using an integrated assessment model that incorporates various mineral resources and environmental impacts (Tokimatsu et al., Env.Dev.Sustain 13(2011)703-725. Such analyses cannot be carried out by using consumption as well as utility. Tokimatsu et al. Env.Dev.Sustain 2012 (in Print) measured the future path of GS using endogenously obtained shadow prices from the model, without using market prices. This attempt can be appreciated as an improved methodology to measure GS, referring from Arrow (2010). The paper provides future paths under the cases of optimal and CO2 constraints in SRES-B2 and B1. | Add references. |
| 3244 | 4 | 74 | 28 | 74 | 30 | The results here hold under DU, not necessarily otherwise. | Taken into account, will be noted. |
| 3242 | 4 | 74 | 3 | 74 | 5 | Comparing the current level of consumption to the evel of adjusted (or green) net national product is identical to the genuine savings indicator. This connection should be pointed out. | This is done as they are in the same paragraph. Note that "is identical" is |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 3245 | 4 | 74 | 30 | 74 | 31 | ... nor does it guarantee that it is feasible to do so. | Taken into account, will be noted. |
| 3246 | 4 | 74 | 35 | 74 | 37 | In a perfectly managed economy GS measures the PV of future changes in consumption. But GS does not perfectly indicate sustainability even then, unless sustainability is a goal for the management. | Not so relevant. We have short space and focus on realistic situations. |
| 3247 | 4 | 76 | | 76 | | The statement in footnote 17 is Pezzey's (2004) main result under DU. Asheim et al (2003) show that along efficient paths, which may not be DU optimal, GS can be positive and current wellbeing unsustainable (as an answer to the second question), and GS can be negative and current wellbeing sustainable (as an answer to the second question). | Good, the footnote will be corrected. |
| 12764 | 4 | 76 | | 76 | | The numbers in the figure lack a basis in the text. If it is only illustrative this should be mentioned in the caption. | Noted. |
| 4688 | 4 | 76 | 15 | 76 | 29 | Although the authors propose a method to measure future paths of well-being directly with probability, they do not include a concrete methodology for the measurement. Such proposals are useless for climate policy if the methodology cannot be described clearly. It could be that future paths of Genuine Savings with mitigations for climate change are more useful and practical in policy making for climate change than the authors' proposal, because no one knows how to measure well-being in the present day. | The problem is that GS requires more information, not less (which is often misunderstood). |
| 12766 | 4 | 77 | | 77 | | The figure lacks a basis in the text. | Noted. |
| 3248 | 4 | 77 | 10 | 77 | 12 | This sentence is unclear; what does it really say; what is its content and message? | Taken into account, will be clarified. |
| 12765 | 4 | 77 | 12 | | | It should be made clear in which sense you focus on equity and sustainability, here. | Should be clear from chapter context. |
| 3249 | 4 | 77 | 13 | 77 | 15 | The question posed in this sentenced has not been answered. | Must sharpen (and redefine?) narrative. |
| 3250 | 4 | 77 | 15 | 77 | 17 | This is a claim, which has not been supported empirically or otherwise in this chapter. | Must sharpen (and redefine?) narrative. |
| 3251 | 4 | 77 | 22 | 77 | 24 | Should not the converse be the focus here. The issue is avoiding climate change, and the question is whether aiming for sustainability at the same time is helpful or counterproductive. | Must sharpen (and redefine?) narrative. |
| 9818 | 4 | 77 | 27 | | | As mentionned above time is an important issue and should be considered in this and thus in subsequent chapter. In many of the chapters infrastructure plays an important role, causing lock-in effects and path dependencies. | Noted. Urgency to be discussed further. |
| 14326 | 4 | 77 | 8 | | | This section seems to be more of a summary than in pointing out implications for subsequent chapters. | Noted |
| 10434 | 4 | 77 | 27 | 79 | 13 | I question the relevance of this section | Not relevant |
| 12767 | 4 | 77 | 30 | 78 | 2 | The attention should not only be drawn to biodiversity in the environmental sphere since the review is on climate chage. Maybe it should also be mentioned here that the three pillar model is only one model. If the basis of sustainability would be the Brundtland report (pp. 11-12, see also comment 1, 21) prerequisites of sustainable development would be superior to economic and social concerns. | Discuss in 4.2 relation between 3 pillars and Brundtland? |
| 12768 | 4 | 78 | 1 | 78 | 2 | The focus should not be on biodiversity only, respectively, there should at least be made the link to climate change. | OK, add explicit mention of climate. |
| 16009 | 4 | 78 | 34 | 79 | 13 | The methodology described do not reflect the complexity of sustainability and in addition to follow the three pilar concept is easy but in praxis has problems within implementation. For example is it in real projects very difficult to discuss the "economicaly sustainable solution" against the "ecologiclay sustainable solution" against the "social sustainable solution". To avoid this there is the methodology of the "Integrative Concept of Sustianable Development" developed and used in various projects (Kopfmüller, J.; Barton, J.; Salas, A.<br>How sustainable is Santiago? In: Heinrichs, D.; Krellenberg, K.; Hansjürgens, B.; Martínez, F. (Hrsg.): Risk Habitat Megacity. Heidelberg, Dordrecht, London, New York: Springer 2012, S. 305-326; Kopfmüller, J.<br>The integrative sustainability concept of the Helmholtz Association. The "Risk Habitat Megacity" Project as a case of application. In: Banse, G.; Nelson. G. L.; Parodi, O. (Hrsg.): Sustainable development - The cultural perspective. Concepts - aspects - examples. Berlin: edition sigma 2011, S. 137-149 ). | Thank you for these useful references. |
| 3252 | 4 | 78 | 46 | 79 | 13 | The structure here does not take into account earlier parts of the chapter. Valuing the different kinds of capital depends on their effect on wellbeing (or on other objectives that the evaluator considers important). | Discuss: these are presented as orthogonal approaches (pillars, capacities, well-being) but an alternative is to present as complementary, and |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 8814 | 4 | 78 | 1 | 78 | 2 | This description of environmental sustainability barely includes climate change which is surprising given the nature of the report. This indicates the paucity of the definition and the tendency of much work on sustainable development to put industrial and economic output ahead of the natural basis of industry and economic growth. This is the flavour of much of section 4.8. | Certainly not the intent. Must clarify. |
| 12769 | 4 | 78 | 25 | 78 | 26 | The utility of non-human beings does not belong to the anthropocentric perspective. If the IPCC wants to depart from the anthropohenic perspective and turn to an ecocentric perspective this should be made explicitely clear at this place. (cf. comment 72) | The IPCC has neither an anthropocentric nor an ecocentric perspective. It can mention the various |
| 17915 | 4 | 78 | 31 | 78 | 33 | In the context of AR5, this assessment of relative priorities could be based on the co-benefit/co-cost discussions in chapters 3, 5-12 and 15. To inform this assessment with the important SD context, please liaise with the relevant chapters in the cross-cutting meeting to determine a viable labor division and synthesis of results with respect to the co-benefits/co-cost assessment across chapters. | OK, refer to cobenefits here. |
| 12770 | 4 | 78 | 33 | 78 | 33 | An overall well-being aim is not equal to the sustainability aim for it may not be bearable in the long-run nor may it be transmittable to all countries worldwide (p. 78, line 41; cf. comments 1, 21). | Misunderstanding? Sustaining well-being over time is SD (in one view of it). |
| 17347 | 4 | 79 | 18 | 79 | 31 | There is a specific take of sustainable development that has evolved for transport in particular. This discussion needs to acknowledge this. It appears to dismiss this possibility. Please coordinate with chapter's definition or use of sustainable development. At least Chapter 8. | Accepted (new table). |
| 12774 | 4 | 79 | 34 | | | Is not well-being referring to all the pillars? I do not understand why well-being and the three pillars are separated, here. | These are different approaches. Well-being is more synthetic, 3 pillars looks at |
| 12773 | 4 | 79 | 8 | | | Where is the climate issue? | Everywhere! The point here is to put it in the broader context of policymakers' |
| 12772 | 4 | 79 | 4 | 79 | 13 | It might be worthwile to consider merging "well being" with the economic performance pillar (at least if the three pillar model should be the guiding model). | This would be a big mistake. The whole point of the well-being perspective is to encompass all dimensions of life that |
| 12771 | 4 | 79 | 4 | 79 | 8 | See comments 1, 21, 96. | Not clear. |
| 9296 | 4 | 79 | 18 | 79 | 22 | Toward sustainable development, the cement sector developed several sustainability indicators (so called key performance indicators) linking to local society. Main areas are alternative fuels, biodiversity, employment safety, water as well as climate. (http://wbcsdcement.org/pdf/csi_progress_report_2005.pdf and http://www.csiprogress2012.org/CSI_ProgressReport_FullReport.pdf) | Discuss: We must decide whether we are supposed to list/discuss/evaluate a set of indicators. See TSU letter. |
| 5462 | 4 | 8 | 8 | | | Sentence 'While FAR… can be deleted- prior sentence '… climate policy, squarely and sxplicitly placing the imminent…' Much of this paragraph can be similarly edited- as can remainder of this discussion Key paragraphs are summary of SRES and SRREN- other paragraphs while describing outcomes of the reports primarily focus on language to differentiate or tie SD from equitable development- | See 219. |
| 2913 | 4 | 8 | 1 | 9 | 43 | to much in detail? - proposal is to start in 2011 and to describe in less detail from 2007 - 1995 report | Will shorten as part of overall shortening. |
| 7302 | 4 | 8 | 1 | 9 | 44 | To reduce the length of Chapter 4, it is proposed to drop Section 4.1, because key messages from the previous reports are well known to scientific community and general public. | See 219. |
| 14312 | 4 | 8 | 2 | | | Good summary of previous IPCC report SD messages | Noted (thank you). |
| 6889 | 4 | 8 | 2 | | | Specific references to WG reports and even Chapters is encouraged; Section leaves out the SREX, which had a dedicated Chapter on Sustainable Development. | Accepted. |
| 15661 | 4 | 80 | 19 | | 20 | Here's a reference for progressivity of an airline levy: see Hepburn, C., and B. Müller. 2010. International Air Travel and Greenhouse Gas Emissions: A Proposal for an Adaptation Levy. World Economy 33 (6):830-49. | Helpful reference. |
| 8934 | 4 | 80 | 26 | 80 | 31 | For a quantitative discussion of this topic see B. J. van Ruijven, J. Schers, D. P. van Vuuren, Model-based scenarios for rural electrification in developing countries. Energy 38, 386 (2012). | Helpful reference. |
| 2562 | 4 | 80 | 32 | 80 | 33 | Needs balance - in special to avoid problems in the Plenary. For instance, unconventional fossil fuels extraction may contaminate water and degrade land (fracking, tar sands, deepwater drilling). Disputes for oil escalate military expenditures | Will not appear in SPM. Also, the purpose is not perfect balance, but selective illustrative examples. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 12775 | 4 | 80 | 37 | 80 | 38 | The role of women is unclear. Under which circumstances are women key agents? (see also comment 20) | Not to be elaborated here, but more discussion of gender is needed. |
| 12162 | 4 | 80 | 9 | 80 | 40 | I think that it's not necessary to mantain the section 4.8.3.1. It's not a so relevant information. | Will shorten while overall shortening. |
| 4757 | 4 | 80 | 12 | 80 | 15 | The sentence "Habitat loss induced by hydropower dams" is too restrictive and doesn't address the whole hydropower cases. | It is not intended to. |
| 3253 | 4 | 81 | 16 | 81 | 18 | Where explained? What does the sentence means? ("the speed ... is important to assess ...") | Must clarify. |
| 3254 | 4 | 81 | 24 | 81 | 25 | Should not avoiding climate change be the focus? And then ask whether avoiding climate change is necessary and sufficient for sustainability. | That is indeed the idea. No change seems needed. |
| 3255 | 4 | 81 | 28 | 81 | 28 | Elsewhere in the chapter it is argued that sustainable development is necessary for avoiding climate change, which is equivalent to avoiding climate change is sufficient for sustainable development. | Will sharpen this issue. |
| 3256 | 4 | 81 | 31 | 81 | 31 | "... fits the general outlook." What is meant? | Noted. Will be clarified. |
| 3257 | 4 | 81 | 31 | 81 | 33 | What is the time horizon for such a move? | Noted. Will be clarified. |
| 3258 | 4 | 81 | 34 | 81 | 44 | So what is the answer to the responsibility question and what is the relevance for the topic of this chapter. | Address earlier (4.7.3) and recap here. |
| 12163 | 4 | 81 | 6 | 81 | 19 | I think that it's not necessary to mantain the section 4.8.3.2. It's not a so relevant information. | Not agreed. |
| 17348 | 4 | 81 | 6 | 81 | 19 | Democratic transition. This issue is coming too loosely in the end, it needs to be better tight with the concept of procedural justice for example in chapter 3. With people's lack of acceptance that trade offs are necessary as explained in Chapter 2. When values are incommensurable for example Chapter 3. There are many fundamental reasons presented in previous chapters why democratic engagement needs to be at the center of the transition. So, this session even if short could cross-reference to those key factors and this will make it stronger. | Agreed. Section should be strengthened and more consistenty carried through chapter. |
| 7756 | 4 | 9 | | 31 | | While this section is an intersting read about the history of sustainable development, the legacy of colonialism, and sustainability indicators, it is: i) far too long; ii) not directly relevant to mitigation. I now make various suggestions below how to address issues within this section. | Noted. |
| 7758 | 4 | 9 | | 31 | | 2. the main suggestion is to try to reduce these 24 pages into 9. I assume that this chapter should be 25 pages long (or thereabouts), that leaves about 3 pages per sub section. I think that this can be easily done, and this is the focus of most of my comments below. | Will take into account. |
| 7769 | 4 | 9 | | 31 | | No focus on mitigation in these pages, which I think, significantly weakens this section. Also it results in a lot of superfluous text. Much of this section could be deleted and replaced with many of the comprehensive reviews of sustainable development, or e.g. population change | Will shorten |
| 12682 | 4 | 9 | 26 | | | Please proof "due to higher risk aversion" by literature. | Review and clarify. |
| 7757 | 4 | 9 | 44 | 10 | 24 | 1. start the section with an explanation of what is low carbon climate resilient development and immediately equate this with sustainability, e.g. links with production, consumption, population and demography etcc.. | Noted. |
| 7760 | 4 | 9 | 44 | 10 | 24 | This section has no punch, and could really do with setting out the big points early on, at present you lose the reader, there is no clear focus on the big themese running through this chapter - what are they? There is mention of Rockstrom's work but little else - is this the only big theme? | Define narrative more clearly. |
| 3214 | 4 | 9 | 46 | 9 | 47 | What is the meaning of "It recognizes that climate change is in fact inextricably linked with sustainable development and equity". Does it point to an empirical fact? | Noted. Will be clarified. |
| 17638 | 4 | 9 | 46 | 9 | 47 | "It recognizes that climate change is in fact inextricable linked with sustainable development and equity." - from which perspective this situation is recognized, from scientific perspective, from social science perspective, or other perspectives? | See 230. |
| 7759 | 4 | 9 | 47 | 9 | 49 | Final sentence doesn't say anything - delete | Accepted. |
| 14008 | 4 | 9 | 48 | | | Suggest replacing "…promising responses to climate change." with "…sustainable and equitable responses to climate change." Consider defining what is meant by responses to climate change in this chapter. | Accepted. We should be more precise and also distinguish between mitigation |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 17089 | 4 | 9 | 6 | | 9 | factually incorrect on two counts. First, “global emissions peaking by 2020” is the EU position and not a global consensus. The global consensus, as you have acknowledged, is that this goal has to be seen in conjunction with ensuring equitable access to sustainable development, as agreed at Cancun, to which reference must be made.<br><br>Second, how do you say that the “most promising response is “requiring humanity to think like a society of people, and not like a collection of individual states”. This is a reference to a paper written in 1998, and has been overtaken by recent science. The most promising response in the context of this chapter could well be equal rights to the global commons or carbon budget – see my peer reviewed articles in ‘Climate and Development’.<br><br>Recent analyses are now arguing that what really matters is the total greenhouse gas budget we allow ourselves, because of the scientific uncertainty associated with emission rates and concentration targets*, which cannot be accurately inferred from quantities we can observe . The United Kingdom already has legislation establishing a national carbon budget , and the National Academy of Sciences of the United States concludes that the “policy goal must be stated as a quantitative limit on domestic GHG emissions over a specified time period – in other words a GHG emissions budget …… national shares of global emissions need to be agreed at the multilateral level as the basis for developing and assessing domestic strategies” . The scientific analysis notes that its efforts are “based on ‘global least cost’ economic efficiency criteria for allocating global emissions among countries, and using other criteria, different budget numbers could be suggested; for instance, based on global ‘fairness’ concerns, a more aggressive U.S. emission reduction effort is warranted – and this is what equity is all about. | This refers to page 11:6-9 and not page 9. It is a matter of taste what to cite at this very general level. The quote form Victor is indeed a bit old but it is genral . enough that I consider it still valid today We clearly have to make sure we differentialte between the EU goals and the globally agreed goals. |
| 6472 | 4 | 9 | 14 | 9 | 27 | Cosst -benefit analsyses as a prescriptive tool for climate change policy formation not only neglects equity arguments but also often conflicts with rights and deontolically based claima about justice and fairness, including distributive, procedural justice claims and human rights based articulations of duties and responsibilities. This section should be modified to say on line 19. Cost-benfit analyses based policy prescriptions often ignore duties entailed by human rights and deontolobical arguments. | Will take into account, but the comment assumes a narrow understanding of CBA. |
| 6890 | 4 | 9 | 40 | 9 | 42 | IPCC SREX and the Chapter on Sustainable Developments is missing here. | Accepted. |
| 4123 | 5 | | | | | Please review chapter 4 section 4.3. If you feel that this section contains redundant and/or inconsistent duplications of chapter 5 discussions, please advice chapter 4 authors on how to revise their section. | Noted |
| 4126 | 5 | | | | | It would be useful to prioritize more and carve out key insights. Some sections seem almost encyclopedic, some sections are skin, not all pieces of information seem relevant. | Accepted: We are now working on prioritizing and streamlining the texts as well as making them more homogenious among sections and subsections when |

| 4151 | 5 | | | | | It would be useful to highlight the relation of your chapter to the AR4. What has happened since? How were trends and drivers treated in the AR4 and how do you expand on this assessment? | Accepted: We are trying to refer to AR4 everytime such a reference is needed to assess the evolution of trends and |
| 8427 | 5 | | | | | The assessment of resources is very uncertain, so 4 significant figures are too much. I believe that 2 are enough. | Accepted in principle. After discussions with Chapter 7 authors, table has been removed from Chapter 5 as it is already |
| 8429 | 5 | | | | | The assessment of these emissions is very uncertain, so 6 or 7 significant figures are too much. I believe that 2 are enough. | Accepted. Revised. |
| 5736 | 5 | | | | | This figure is very relevant and quoted very often in the past. It would be good to see an updated version. | Figure shown elsewhere |
| 3526 | 5 | | | | | This figure is not clear. In Y-axis, what does it mean 'Emissions relative to 1895'? The caption of the figure is not clear; what is 'open burning'? What is 'normalized to 1985 values'. Please improve the figure. Improve also consistency between section 5.2.1 and 5.2.2: the analysis covered the period 1970-2008 for section 5.2.1 whereas it covered the period 1970-2010 in section 5.2.2 (see figure 5.2.6). | Point 1: Figure and caption clarified. Unfortunately, conssitent data is not available in the literature for the same periods for GHGs and pollutant |
| 13767 | 5 | | | | | This figure uses a different nomenclature than the text. It cannot be understood without referring to the original reference. Please adopt the language of Raupach or change the figure! | Figure eliminated |
| 12539 | 5 | | | | | The data for conventional oil appears to be incorrect, with reserves at 4 900 - 7 610 and reserves at a lesser range of 4 170 - 6 150 EJ. | Rejected. The ranges are from GEA (2012), which is the most recent, peer-reviewed assessment of reserves and resources. However, we will make sure |
| 16206 | 5 | | | | | legend has lots of jargon/abbreviations that are not defined: F=Pgef=Pgh; these are not the exact same as in the intro to this chapter or the big introductory chapter. Harmonize. | Figure has been elimated |
| 16207 | 5 | | | | | 1895 on Y axis should be 1985 | Typo been corrected |
| 17473 | 5 | | | | | I think this table is still to be completed (?) so I have not included full comments but here are a couple: 1) Will sources supporting each entry be given? 2) what is FE? 3) could be better described as carbon rater than system efficiency? 4) is the entry for CHP is the wrong row? | noted. Table deleted. However, the points are taken. |
| 17466 | 5 | | | | | source needed | Editorial: The data is from standard sources provide by the IPCC TSU and will be fully referenced in the final |
| 17467 | 5 | | | | | source needed | Editorial: The data is from standard sources provide by the IPCC TSU and will be fully referenced in the final |
| 17468 | 5 | | | | | source needed | Editorial: The data is from standard sources provide by the IPCC TSU and will be fully referenced in the final |
| 17469 | 5 | | | | | source needed | Editorial. The sources for the data are being included, but reference for common data sources used in multiple |
| 17470 | 5 | | | | | source needed | Editorial: The data is from standard sources provide by the IPCC TSU and will be fully referenced in the final |
| 17471 | 5 | | | | | source needed | Editorial: The data is from standard sources provide by the IPCC TSU and will be fully referenced in the final |

|---|---|---|---|---|---|---|---|
| 17806 | 5 | | | | | In particular - the chapter of Haines et al - and the numbers mentioned in the executive summary or in other summaries would be important. Similar arguments have been brought up again in Lancet 2012 by Haines and Dora. There are also a plentitude of examples in the housing sector (e.g. refer to WHO Euro the burden of disease of housing ) and the transport sector - refer to UNECE/WHO transport co-benefits and green jobs. | noted and text redrafted |
| 10792 | 5 | | | | | Figure is very confusing, therefore meaningless. Either replace it with text or redesign. Avoid pastel collors. | Rejected. Figure 5.6.4 has been reviewed positively in other comments (e.g. see Comment xxxx). However, |
| 18141 | 5 | | | | | a) There is no text relating to this figure.<br>b) Figure 5.2.2 depicts the information for 2000 for 5 sectors (Energy, Industrial Processes, Land use change, Agriculture and Waste) which are the commonly used sectors. Figure 5.2.3 shows time series from 1970-2008 for different sectors (AFOLU, Energy, Transport, Industry and Buildings). For ease of comparison, it would be best to use the sector classifications as per Figure 5.2.2 which is also the more common classification. Additionally, as mentioned previously, the sector Buildings needs definition and the waste sector does not appear to be depicted in Fig 5.2.3 while energy seems to be broken into energy, transport and possibly buildings? Furthermore, it is mentioned in section 5.7.2, pg 50 (lines 14-15) that most GHG emissions from buildings come from electricity use - how is this different from the emissions from the energy sector (which would also include electricity)? Likewise, in section 5.7.3, industry emissions include energy use emissios apart from production process emissions. Again what is the distinction between energy use industry emissions and energy emissions?<br>c) Source of data required for this figure. | Figure eliminated |
| 18142 | 5 | | | | | a) REF, LAM and MAF can be more precisely defined rather than stating where they primarily refer to.<br>b) Source of data required. | See reference |
| 18143 | 5 | | | | | What does Gpi stand for? | Figure has been elimated |
| 18144 | 5 | | | | | Y axis title should be changed to Emissions relative to 1985 (rather than 1895). | Agreed. |
| 18147 | 5 | | | | | Data source missing. | Accepted. Data source provided. |
| 18151 | 5 | | | | | Figure is missing some of the legends and the years in the x-axis are unclear. | replotted |
| 15989 | 5 | | | | | where does the literature (claimed to be around 40 sources) come from? Is that table taken from some source? Remains unclear, please specify | Considered. The table removed. |
| 15986 | 5 | | | | | The AR5 will be published in 2014, that's 14 years ... graph needs an update if it's supposed to be published; also, check whether this graph was not already published in AR4 | Datat being updated |
| 15987 | 5 | | | | | if it's possible by IPCC statutes authors might want to update this figures by Raupach (which should be easily manageable) with most recent data (latest IEA publications cover 2009, that's four additional years!) | Figure being removed |
| 16002 | 5 | | | | | in my opionion illumination might be a little "biased" example, as it is particular energy wasting; on the other hand, it's only a small fraction of total PE; the latter should be mentioned in the text | Accepted and the share of less than 7 percent worldwide will be included in the text. However, there are other similarly “biased” examples that are |
| 5922 | 5 | | | | | Biased and untrue for CHP: In countries with cold climate, building extensive, large-scale CHP systems in cities has replaced traditional house-size or block-size heating systems, using coal, oil or wood. Thus CHP has resulted in dramatically improved air quality ! Today, large CHP plants in Europe mostly have very efficient flue gas cleaning systems, required by EU LCP directive and national legislation. A hypothetical shifting to e.g. smaller-size biomass-based systems as a climate change mitigation measure would significantly damage air quality in these cities. | rejected. The overall mood is positive with CHP and a caveat is put on incease in local emissions. This does not mean that smaller biofuel boilers are better for local air quality. |
| 5918 | 5 | | | | | Are D1, D2,D3 countries defined somewhere in the report ? | Figure eliminated |
| 8937 | 5 | | | | | The figure might be correct, but seems strange to me. What is the source of these data? There must (for many countries) be beter data available. Why is only refrigeration and air conditioning singled out? And it's share seems very small (maybe due to the lumping of residential and "other" sectors? | source added in replotted figure |

|---|---|---|---|---|---|---|---|
| 10388 | 5 | | | | | it is not clear what the word '2' at the end of the caption means | Editorial. The table has been removed |
| 10389 | 5 | | | | | it is not clear what the word '2A' at the end of the caption means | Editorial. The table has been removed |
| 10381 | 5 | | | | | the caption of this figure is missing | Editorial: Caption has been added |
| 10382 | 5 | | | | | This figure needs to redraw since it miss some information. Still it contains some unnecessary information as emissions from refrigeration and air conditioning while the caption of this figure is emission from transport | Figure REDrawn |
| 15982 | 5 | | | | | I do not totally understand the split between global and regional trends that have been announced before ... are regional trends supposed to be discussed here, in this case I'm missing a couple of studies wrt CO2 and e.g. China | Regional trends are discussed here but in more detail in Chapter 6 (for future) |
| 15994 | 5 | | | | | could be shortened | Noted |
| 14457 | 5 | | | | | This chapter will need quite a bot of redrafting. It is confusing and does not represent a clear scientific storyline. The chapter does not follow a sound scientific reasoning.<br><br>It took me much more time to comment on than I expected. This also limited my ability to review other chapters. I feel that, if indeed this chapter is considerably improved, this will also lead to adaptations in the chapters following it.<br><br>My comments below will hopefully underpin this general comment. | Noted |
| 4127 | 5 | | | | | It would be useful for the reader to understand how your chapter relates to chapter 6. | Taken into account - connection to Ch6 |
| 3510 | 5 | | | | | Please avoid to personalize the text by using terms such as "we assess", "we present", "our chapter", "the section tells us". This comment is applicable to the whole chapter. | Editorial. Proceeded as suggested |
| 3511 | 5 | | | | | This chapter is about "Drivers, Trends and Mitigation of GHG emissions and removals". In the current version of the introduction, there is no history to read. The text in the introduction should address questions like: why do we need to know drivers, trends of emissions/removals, what are the causes of changes in emissions/ trends, why mitigation? etc. and build and history in a logical order around these concepts. I don't think the first sentence in the introduction is necessary. Please justify the use of 40 years (1970 - 2010) for the analyses. | Taken into account - Section 5.1 rewritten. |
| 3512 | 5 | | | | | For inventory compilers, the equation in the introduction section is never used to estimate CO2 emissions; the eq. would be applicable only to energy sector and not to AFOLU (for exemple) which generates also CO2 emissions. The statement by the authors that "One cannot conclude from the equation that population growth as such increases emissions, nor does income growth necessarily lead to higher emission levels", weakens the approach (i.e. the equation). Please include a robust approach, otherwise delete the equation. The introduction can be better drafted without using this "Kaya identity". I would suggest that when building the history in the introduction section, that the authors add the sectors covered and the drivers assessed. I agree to describe the structure of the chapter at the end of this section, but this should be brief. | Taken into account - Section 5.1 (and Fig 5.1) now better explains the conceptual set up of the chapter, while Section 5.3 explains the use of the decomposition. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 14458 | 5 | | | | | I have some conceptual difficulty with the way the story line in this chapter is constructed.<br><br>I can understand that for the applications in scenarios and projections the Kaya "identity" (see also my comment on lines 13 -16 on this page) might be helpful: if changes over historic times in the per capita gross production, the per gross production energy use and the CO2 emission per energy use are better understood, this understanding could be used in projecting emissions for future years in alternative scenarios with various possible measures, using the Kaya approach.<br><br>Following this the Kaya approach is used for the application of the results of this chapter. It does not necessarily need to be the framework of the analyses herein. I would expect that the chapter would try to derive the dependence of the three different parameters (see my comment on lines 13 - 15 below) on historic variables that could be projected towards future years or as a minimum a proxy for that. This chapter then would need to search for correlations (whether or not these are reflecting causality) with other parameters and variable that would explain the relations between respectively population and gross world production, between gross world production and energy requirement and between energy requirement and CO2 emissions.<br><br>As it is now, the search for such relations and explanations and its application in the Kaya approach is too much mixed up and interlinked. Itis rather confusing!<br><br>I do acknowledge that the Kaya "identity" has been used before by IPCC. Nevertheless, I feel that this use is quite confusing for many scientific disciplines outside the climate science community and might contribute to some of the scepticisms towards the IPCC assessments. To increase the impact and profile of the IPCC assessments it could therefore be a good idea to apply a bit more rigorous formalism from the mathematical point of view, avoiding "identities", since in mathematics (and in physics) these identities do not mean anything, simply because they are identities. When the formalism is given in a slightly different way, applying "parameters" that might be time dependent, the identity disappears and the mathematics becomes understandable for people from other disciplines. At the same time the distinction between identifying (cor)relations from historic information and applying them in projections will help to make the assessment more clear and transparent. (see also my comment on page 19, line 23) | Taken into account - the chapter is revised and the overview presented in the introduction makes clearer what the contributions are of each section to understanding the emission trends. |
| 15996 | 5 | | | | | Even though it can be somehow interpreted from the graph i suggest to also include EI explicitly | Rejected. Comment not understood |
| 4125 | 5 | | | | | Please discuss your definition of 'co-benefit' with chapter 3 authors who are responsible for framing this important concept for the WGIII report. | Accepted: A definition of co-benefits was discussed and agreed for all chapters in WGIII. We will use this definition in |
| 3091 | 5 | | | | | no mention in text (only briefly in table) of the link between energy efficiency and affordability - this is becoming increasingly important with even developed countries having large numbers of households in fuel poverty (e.g. UK around 20%). With rising fuel prices, energy efficiency measures can help reduce fuel poverty. Also relevant for transport as with rising petrol/diesel prices, sales of efficient cars have increased to maintain transport affordability. | taken into account: covered in ch. 4 on equity & poverty issues. Also this is more complicated: such poverty alleviation impact would mean rebound effect: higher efficiency, more |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 17917 | 5 | | | | | The literature and details covered in this section are very interesting, but might or should be covered in the respective sector chapters. In my eyes, the role of chapter 5 in the context of the co-benefits/co-cost discussion should synthesize the individual sector chapter assessments (possibly building on Table 5.10.1 and other ways to synthesize quantitative results) and provide an overview of methodological challenges rather than duplicating the detailed examples provided in this section now. Please liaise with the relevant chapters in the cross-cutting meeting to determine a viable labor division and synthesis of results with respect to the co-benefits/co-cost assessment across chapters. | Accepted: A definition of co-benefits was discussed and agreed for all chapters in WGIII. We will use this definition in Chapter 5. |
| 8900 | 5 | | | | | There is more literature on co-benefits that should be referenced here. Also reductions in surface ozone are worth mentioning here and the impacts on plants and their productivity. Some of the health benefits are listed in 5.10.1.2. | partially accepted. More literature is added. Owever, on surface ozone, no literature is provided and no such |
| 12541 | 5 | | | | | Suggest adding a short discussion of health spillover benefits from building energy efficiency. An important recent study is Lucy Telfar Barnard, Nick Preval, Philippa Howden-Chapman, Richard Arnold, Chris Young, Arthur Grimes, Tim Denne, 2011. The impact of retrofitted insulation and new heaters on health services utilisation and costs, pharmaceutical costs and mortality: Evaluation of Warm Up New Zealand: Heat Smart, report for<br>the Ministry of Economic Development. http://www.healthyhousing.org.nz/wp-content/uploads/2012/03/NZIF_Health_report-Final.pdf | noted. Very relevant and valuable information though it is a grey literature. As this is more sector specific, the buildings chapter is a better place to make an assessment. |
| 8901 | 5 | | | | | this section does not include any economic co-benefits | rejected. The discussion of this entire section is about co-benefit and everything is with economic implications. Health, social like employment etc are all economically measurable but quantitative numbers |
| 17918 | 5 | | | | | The use of the term trade-off (to describe adverse side-effects) is inconsistent with the agreements made in Wellington (p.35) whereby the term 'trade-off' might convey the impression "that a balancing of positive and negative side-effects of mitigation measures is being carried out... Such decision-making aspects" should be left to the policy chapters. Please liaise with the other chapters during the cross-cutting meeting to ensure consistent usage of the relevant terms across chapters. Since the term also shows up in the first-level heading, a potential change to achieve consistency across chapters needs to be discussed with the TSU.<br>Please see my comment on Section 5.10.1 that also applies to Section 5.10.2. | noted. Communication with the TSU and other chapters will be made with regard to the use of the terms. However, change has been made using the TUS guidance in the revised text as risk tradeoff as compared with the earlier single term tradeoff. |
| 3627 | 5 | | | | | Delete the summary to save space. | Taken into account - we substantially shortened the ES, introduction and final |
| 3514 | 5 | | | | | Greenhouse gases' and 'GHG' are used interchangeably. Please write 'greenhouse gases (GHG)' for the first time and 'GHG' in subsequent text. | Okay |
| 16250 | 5 | | | | | The title of this section suggests a discussion of stocks and flows of GHG emissions…, however, the section only covers flows. | Title will be revised accordingly |
| 3523 | 5 | | | | | You state at the beginning of this section 'We begin by focusing on the trends in GHG emissions from 1970 through 2008'; but nowhere in the section, nothing is said on the situation after 2008? Please add a text describing the situation after 2008 to improve the completeness of the section. If this has not been assessed, explain why and make reference to section on drivers and explain how the situation is likely to be after 2008. In this section 5.2.1, clarify what is non-CO2 GHG and make reference to section 5.2.2 for the other non-CO2 gases. Please improve the cohesion between sections by making reference between them. | The data base has been extended through 2010. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 14470 | 5 | | | | | I believe this section can be considerably condensed, if it were built on the understanding that the time series of emissions (aggregated using GWP) is based on a set of data giving emissions per GHG, per source category, per region and per year. Figures 5.2.1, 5.2.3 and5.2.4 are different aggregations of this same data set (by GHG, by source and by region respectively). Between each couple of these three and for any year in the time series a graph like 5.2.2 could be produced. However, such figures do not add too much understanding, although they look very nice.<br><br>The current text uses 3.5 pages to show the same information in different forms. This could be condensed.<br><br>Figure 5.2.5 is a bit strange here. Does it correspond with a multivariate analysis of the data presented in figures 5.2.1 - 5.2.4, using the Kaya equation as the model under analysis? If not, on what data is this figure 5.2.5 based? Are these consistent with the data presented in the other graphs?<br>The figure does not seem to be used here, so as far as I am concerned it could be deleted. If it is to remain, please consider whether or not it fits in this section and add more explanation on what it means and where it is coming from. | The section has been condensed and two figures have been removed (5.3 and 5.5). However, the writing team agrees that the remaining figures are useful as is. |
| 14477 | 5 | | | | | Is this section needed here? For the purpose of this report it could be sufficient to integrate the analyses of these indirect greenhouse gases together with the direct ones in section 5.2.1 into one section, using the (be it uncertain) effective GWP as derived from the latest versions of the WG I report. | We willl refer to AR% new radiative forcing digram to integrate |
| 18348 | 5 | | | | | The discussion of drivers needs to be coordinated with Chapter 4 (section 4.2) to sharpen chapter-specific focus. | Accepted. 4.2 has been reviewed and no clear overlap found. Further conversation |
| 16208 | 5 | | | | | Again, PPP, GWP100 not defined yet. | Accepted. Removed. |
| 13752 | 5 | | | | | In this section, I miss the role of knowledge as a driver of emissions. It could be important in both ways, either as a driver for more emissions of countries with high-income and high know ledge standards and as a source for reduction strategies e.g. through innovation or efficiency strategies. | Rejected. Not all drivers can be discussed within the limited space. |
| 15999 | 5 | | | | | I disagree with the main message and first sentence here: the causality that is implied here is wrong; see e.g. Jakob and Marschinski, in press Nature Climate Change | Rejected. As it was clearly stated, no causality is implied. |
| 13771 | 5 | | | | | I can see that what is attempted here is worthwhile. However, the present text is rather preliminary and incomplete. No specific results are offered. Please either supplement specific findings or delete this. | Considered. The methodology part has been completely rewritten focusing only |
| 12536 | 5 | | | | | I strongly support the addition of a full consideration of the consumption-based approach within emissions analysis. As the summary shows there have been considerable advances in research since AR4. | Accepted. The text revised accordingly. |
| 14512 | 5 | | | | | Only placeholders here? | Noted. Section has been revised. |
| 13772 | 5 | | | | | This section can be reduced in volume. It does not offer very significant conclusions. | Accepted. Section reduced in volume; conclusions are based on the reviewed |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 14513 | 5 | | | | | I wonder whether the authors understand the mathematics of what they are doing. I'll provide a few examples below to show that they don't!<br><br>I feel that this section should be reritten. It does not link at all to the framework of the Kaya approach and copnfuses everything with everything. I do not see any need to show GHG emissions in graphs showing population etc.<br><br>What I would expect is<br><br>1) graphs (global, regional, sectoral, fuel) of Gross Production versus population size to show what happens with (G/P) in the Kaya approach<br><br>2) graphs (global, regional, sectoral, fuel) of gross production versus energy use (E/G) in the Kaya approach<br><br>3) graphs (global, regional, sectoral, fuel) of energy uses versus emissions (CO2/E) in the Kaya approach.<br><br>These curves would be investigated as to the influence on them from a broad range of other parameters that might change over time and of course, if possible, underlying explanatory variables and parameters.<br><br>I will not provide further detailed comments on this section, since i believe it needs a major revision in the light of my earlier comments. | Accepted: Population as factor and the related demographic drivers are better explained. |
| 18363 | 5 | | | | | The treatment of trade and embedded emissions is a very sensitive issue and a clear vision of its coverage should be developed in cooperation with Chapters 4, 13 and 14. | Noted. Coordination has started. |
| 13775 | 5 | | | | | There is an overlap with Ch. 7. Think about how to avoid this by coordinating it. Also, harmonize analysis. | Accepted. The overlap must be avoided. I will try to make suggestions next week |
| 12538 | 5 | | | | | This section could benefit from discussion of the relationship between energy price stability/volatility on the structure of energy demand and related policy aspects, viz. the provision of consumer energy subsidies. | Accepted: Added a mention of the effects of the oil price shocks in 1973, |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 14518 | 5 | | | | | This section should be rewritten by somebody understanding the first and second laws of thermodynamics.<br><br>What we would need to be looking for here is a relation between Gross Production and preferably physical energy use, if possible by fuel type to be able to decompose the trends in global emissions into a part that is related to energy use.<br><br>The example of the light bulb is a bit overexposing the issue here. Ene4rgy for lighting is only a small fraction of total energy use. And, yes, an incandescent light bulb produces more heat than light. Since light bulbs are in many cases used in winter evenings, this heat is not necessarily a loss, since it will decrease (slightly) heat demand from other energy carriers. LEDs, fluorescent or other high efficiency light sources obviously produce less heat relative to light. The effect on the total energy balance of a building is more complicated. In the case of street lights etc it is more simple.<br><br>Thermal power plants is another issue here: the second law of thermodynamics states that it is impossible to run a thermal power plant without a cooling system. The maximum efficiency of the power plant is determined by the highest (combustion in the boiler) and the lowest temperatures (in the condenser). One could therefor also say that the energy dissipated in the cooling water or cooling tower is basically used to convert high entropy heat into low entropy electric energy. One could try to find a useful application of the even lower entropy (because of lower temperature) "waste" heat, but it can not be avoided. By bringing this into a graph like figure 5.6.2 the reader might think that indeed the major red flow could be avoided. It cannot.<br><br>Also figure 5.6.3 is a bit confusing in energy terms. What does the red and yellow arrows mean? It seems to show that energy never gets lost, but is fully converted into low entropy heat at the end. That is true. Translating this into energy efficiencies however might brake down, not only on the basis of the above entropy reasoning for power plants. Also because for instance because the kinetic energy in transport is basically a loss, since it is fully compensated by the heat energy in the brakes of the vehicle. The energy use in a vehicle is only used to overcome air resistance (road, air, water transport) and rolling resistance (road, trains, etc) or water resistance (navigation). For light my comment above applies. | Noted. Indeed, this has been the intention of the writing team that includes expertize on thermodynamics and will be improved in the next draft. 2. The example of the light bulb will be kept, but better explained including the caveats |
| 3039 | 5 | | | | | Completely agree that energy intensity is a poor measure of energy efficiency. In addition to the considerations mentioned, energy intensity depends on factor price movements (capital, labor, energy, materials), factor substitution elasticities, and factor technology gains. Intensity trends hide a multiplicity of important influencing variables, and depart too far from the concrete engineering efficiency gains that actually underlie intensity trends.<br>Instead defining energy efficiency gains as energy-augmenting technical change [see Stern and Kander 2012 referenced in a comment below; also Saunders 1992 referenced below] gets us much closer to the"bottom-up" language of the engineer and is more consistent with microeconomic theory, at least for the productive side of the energy economy. [for detail on obtaining engineering assessments of energy-augmenting technical change see also H. D. Saunders. "Specifying technology for analyzing rebound" in: Energy efficiency and Sustainable Consumption: Dealing with the rebound effect. Ed. H. Herring and S.Sorrell. Palgrave Macmillan, 2009. link available at: http://works.bepress.com/harry_saunders/12/] | Accepted, further examples of energy intensity factors will be mentioned. Suggestion of including text and references on energy-augmenting technical change is rejected as the text is too long as is. Perhaps, this could be included in sec |
| 4124 | 5 | | | | | Please state at the beginning of this section how the sectoral break down you are using relates to the sectoral break down of chapters 7 to 11. A conceptual visualization might be helpful. | Taken into account: Peter Z addressed this issue |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 8428 | 5 | | | | | There is a clear overlapping between this paragraph and the paragraph in the specific Chapters of every sector. As an example Figure 5.7.1 is equivalent to Figure 8.1.2.a. I suggest to leave all the sector specific issue in the detailed chapters and discuss here the broad picture, but not the possibilities to reduce emissions. In this way we can avoid some inconsistencies; as an example in 5.7.1 line 14-27 are proposed some options to reduce emissions, but the importance of behavioural and structural changes are less evident than in the executive summary of Chapter 8 (pag 5, line 14-20). | Noted |
| 8816 | 5 | | | | | The analysis of behavioural change is very shallow, lacking good social science practice of tracing a whole range of causal factors to try to identify the most significant and those that can be effectively addressed. Literature suggested in my previous comment presents a range of factors that should be added to the analysis. | Accepted (added section on factors affecting behaviour change) |
| 3040 | 5 | | | | | The end-use/production distinction is handled better here. But again, globally, only one-third of energy is consumed by households and for personal transportation, while two-thirds is consumed in the productive part of the economy ("embedded" energy), which provides goods and services [ref: ExxonMobil, The outlook for energy: a view to 2030, (2009) available at http://www.exxonmobil.com/Corporate/energy_o_view.aspx. ]. In the U.S., productive energy use is about 60% and end-use 40%. | Noted |
| 3042 | 5 | | | | | Technological change is defined here too narrowly. Technology gains affect other factors of production besides energy (i.e., capital, labor, and materials). Non-energy technology gains have an enormous impact on energy use (increasing it) and also on energy intensity [Saunders H.D. (1992). The Khazzoom-Brookes Postulate and Neoclassical Growth. The Energy 17 Journal 13. (DOI: 10.5547/ISSN0195-6574-EJ-Vol13-No4-7). Available at: 18 http://www.iaee.org/en/publications/ejarticle.aspx?id=1091. (cited in WGIII AR5 FOD report)]. | Reject. Although we don't disagree with the comment, the points made in the comment are already addressed in the FOD text. |
| 3625 | 5 | | | | | Delete or massively reduce as explained in Chapter 3.12. | Accepted, will be coordinated with |
| 6380 | 5 | | | | | This section relies primarily on 10-30 year old literature, despite numerous recent studies (in the last 3 years alone.) Indeed there are only 2 references newer than 12 years old. See several papers by Sorrell et al. (2008, 2009, 2011); David Greene (2007); Winebrake et al. 2012 (good review of recent rebound literature); York 2012 in Nature Climate Change. Rebound effects from production are mentioned, but no examples are given. Several recent economic studies of biofuels discuss rebound effects in global fuel markets resulting from biofuel expansion (Chen and Khanna, 2012, Drabik and De Gorter 2011; Rajagopal et al. 2011; Thompson et al. 2011). An important factor that should be addressed is the difference between rebound in production and consumption: reducing consumption starts produces 0 emissions plus some (10-30%, typically) rebound effect, whereas for production (i.e., fuel switching) net GHG accounting starts with a generally uncertain quantity of GHG emissions (esp. for biofuels), to which a rebound must be added. In the latter case, the potential for backfire is much greater because of the non-zero and uncertain emissions from the alternative fuel/energy system. | Accepted. The rebound effect section has been updated considerably yo take account of developments in the past 5 years. Notably this the section now includes evidence from a substantial review by Sorrell that includes many of the references you mention. Additionally, the figure of 10-30% is also included in relation to direct rebound effects. |
| 2339 | 5 | | | | | It seems that, the ordering of paragraph in the Executive Summary and other sections should be re ordered again. For instance, in the Executive Summary, the factors in the Kaya identity can be summarized. | Accepted: We are rewriting the ES of Chapter 5 following this suggestion, |
| 8902 | 5 | 0 | | | | This chapter represents well the past trends and drivers of GHGs, but the mitigation aspect of the chapter is not properly covered - especially in terms of mitigating future GHG emissions | Rejected - We can not say much about the future in Ch5, but we can say |
| 10747 | 5 | 0 | | | | My impression is that GWP for a 100 year time horizon is used without any indication that the GWP has been subject to critisism and assessment. It could be noted that there are other time horizons than 100 years and that several implicit choices have been made in the application of GWP100 (see WGI Chapter 8 and WGIII chapter 3). It could also be noted that the contributions calulated would look different if a different time horizon was used or if a different metric was used; see figure 8.31 in WGI. | Agreed. The reader will be referred to chapter 3 which deals with this issue in detail. To discuss the issue in detail again would be redundant. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 16941 | 5 | 0 | | | | This is a very data-rich chapter, with rigorous analysis. It might be useful for the authors to step back and try to think about the important "so what" messages.<br>Curiously, amidst all the data, I think the chapter misses out a fundamentally important diagram (and associated set of issues), namely the data captured in a very aggregated form in the FOD Chapter 14 Figure 14-12 on trends in per-capita emissions vs per-capita GDP. I think this format captures several important points, but they are somewhat obscured by the nature and level of aggregation in Chapter 14. The issues are clearer looking at sub-regional breakdowns. One example of both data at this level and interpretation of possible implications is in Grubb, Hourcade and Neuhoff, Planetary Economics: the three domains of sustainable development, Chapter 1 (Figure 1.7). I have sent this chapter to the Secretariat. □ | This is not the section to deal with this issue |
| 9312 | 5 | 0 | | | | The chapter is very well organized, well-written, reader-friendly and takes into account holistic view of drivers, trends and mitigation strategies of greenhouse gas emissions. | Noted |
| 18616 | 5 | 0 | | | | Technological change and individual behaviour become key aspects for future efforts on climate change mitigation. | Noted |
| 18617 | 5 | 0 | | | | "From an economic theory point of view, however, international trade contributes to a more effcient allocation of resources, which may help mitigate GHG emissions." | Rejected: comment not understood |
| 18618 | 5 | 0 | | | | Not handled (from what I can see) –relation between investments and consumption. | Noted. The aim of the section on consumption was to consider the trends in the growth of consumption and its relationship with GHG emissions. With 400 words available it the trend and |
| 18619 | 5 | 0 | | | | Most of the mitigation alternatives (efficiency, RES, CCS and nuclear) build on upfront investments; high CAPEX, substantially lower OPEX. Power systems perhaps a shift from 50/50 to 90/10 in the long run. Savings need to be up (and direct consumption down). Short and long term effects? | Rejected: Outside the scope of Chapter 5 |
| 18620 | 5 | 0 | | | | Parts of the material very theoretical and probably unreadable to a wider audience – share results, not formulas! | Accepted. The part removed. |
| 18623 | 5 | 0 | | | | Also in this chapter the most substantial conclusions are found in the FAQs. To be extended?<br>(As such depressing, the emissions will continue to grow….) | Noted. Partly effectuated |
| 9025 | 5 | 0 | | | | Methdologically, this chapter relies on two approaches which are biased against discussions of historical responsibility and equitable access to development: (1) Reliance on the Kaya identity as a way of decomposing the sources of current emissions, which does not reflect differences in development levels, population, economic structure between developing and developed countries; and (2) Use of standardized comparison of emission flows, which emphasizes recent growth in emissions of developing countries and obscures the role that the stock of the long-lasting emission that had been originated from the developed countries | Taken into account - we try to present our data in various units that provide multiple perspectives, e.g. CO2e/cap as well as total CO2e/yr emissions. |
| 9026 | 5 | 0 | | | | In its data analysis, the Chapter consistently uses 1970 as a starting point, which obscures the role of historical emissions. | Taken into account - we include historic emissions before 1970 in the SOD |
| 9027 | 5 | 0 | | | | The country-by-country comparisons treatment obscures the nature of emissions in production and consumption. Developed country per capita consumption levels are not only much higher than those of developing countries, developed countryper capita production emissions are also much less. However, developed country consumption is dependent on developing country production of goods produced in higher emission production processes. International trade has carbon embedded in it and emissions are unduly associated with developing country economic activity. | Accepted: We are preparing a figure to better show the issue raised. |
| 9028 | 5 | 0 | | | | The Chapter should at a minimum recognizeand state the agreed principles under the Convention. Under the principles of the Convention, developing countries have a right to pursue their development and developed countries have the responsibility to provide the technology and finance to decouple this development from emission increases. | Rejected - Chapter 5 does not assess rights, but trends and drivers. The comment is better suited for the framing chapter. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 16247 | 5 | 0 | | | | This chapter points out well the interdependence of different drivers within different sectors, however, it does not mention the linkages of the sectors themselves through material flows. The sectors are treated as if they were independent from each other. In reality, changes in the building and transport infrastructures are key drivers for industry production, and waste flows are the result of past production activities. A logical consequence of these physical linkages between the different sectors is that mitigation efforts should aim at transforming entire socio-metabolic systems... | Rejected - Chapter 5 does not assess future mitigation options, but past trends and drivers. |
| 13214 | 5 | 0 | | | | This chapter is very factual and highly policy relevant. Its pages number allocation should be increased accordingly. | Noted |
| 12946 | 5 | 0 | | | | For a chapter on mitigation there is strong focus on the engineering/practical needs for technology to achieve the mitigation measures, but not very much at all on the economic conditions needed to make those technological solutions commerically realistic. In particular further discussion of the importance of carbon pricing seems to be lacking. | Accepted - we pay more attention to pricing in the SOD |
| 18523 | 5 | 0 | | | | As agreed in Wellington, Chapter 5 should include some mention of tourism, deliniating the different components, and how those components are addressed across the different AR5 chapters. This has not been included in the FOD. | Accepted: We are working with TSU and CLAs in Chapter 10 on how to deal with the tourist sector. |
| 11285 | 5 | 0 | | | | The entire chapter deals with comparisons, calculations, and various quantification models. It would be interesting (and probably necessary) to reflect also the changes attributable to, or at least within the scope of, the range of existing international covenants, agreements, standards, etc not least of which would be commitments by member states made in Rio at the Rio +20 conference in June 2012. | Taken into account - the issue is touched upon at various occasions in the SOD, but there is not much evidence in the literature, however. |
| 8601 | 5 | 0 | | | | There is not enough information on Fisheries and Aquaculture as to consider the acronym AFOLUFA instead of AFOLU. Evenmore, in the FOD WGIII AR5-IPCC the Fisheries and Aquaculture activities are barely discussed. | Accepted |
| 3144 | 5 | 0 | | | | This chapter is the logical place for all the core discussion of drivers. I suggest that chapter 1 have the figure on Kaya (which already exists—see figure 1.6) and this chapter unpack the drivers in a lot more detail. TSU needs to help steer how other chapters address drivers as this discussion also exists in chapter 4, 6 and 7 among others.<br><br>Depending on what is done with the regional chapter (#14, I think) a lot of the regional discussion might be trimmed back from this chapter.<br><br>it would help if the executive summary were more empirical. Which of the drivers is most important?<br><br>It is possible that some of the more detailed discussion of allocation among industrial sectors (which sets up the later chapters that look sector by sector) belongs here as well. TSU has a note in chapter 10 saying that this kind of introduction is neded. maybe it belongs a bit in chapter 1 and mostly in chapter 5? | Noted |
| 10377 | 5 | 0 | | | | the section 5.6 about the sectoral emission sames irralevent to this chapter, given the excess pages, it may be appropriate to abridge it or move it the according chapters through 7-10. | Taken into account - the section is entirely rewritten. |
| 10379 | 5 | 0 | | | | In discussing the driver of carbon content and the energy substitution, the nuclear security and hence the supersede pertential of nuclear energy should be reconsidered. | Accepted. This point is included in the response to Comment 15978/222. |
| 11527 | 5 | 0 | | | | In my view to much attention is paid to the Kaya formula, while it would we worthwhile to spend more attention to the causal relationships that explain the level of emissions. | Taken into account: Section 5.3 is being rewritten. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 11528 | 5 | 0 | | | | It is striking that hardly any reference is made to the impact of energy prices as a driver for trends in emissions. I would expect explicit reference in the executive summary, in paragraph 5.6 and other places. When one analyses long term trends in energy use it is clear that prices hikes have triggered energy consumption to decrease or to grow more slowly. A clear example is the effect of the escalation of oil prices during the last7 to 8 years. | Taken into account - we have included a discussion of major oil price shocks in section 5.6.1. |
| 11415 | 5 | 0 | | | | The chapter looks at historical trends and drivers of stocks and flows of greenhouse gases only from the period 1970 to 2008. Nowhere in the chapter, however, is there any explanation for why only this particular period is selected. In doing so, the chapter presents an incomplete picture of the long-run historical responsibility for GHG emissions. It essentially disregards the fact that the fact that the bulk of historical emissions since the Industrial Revolution (e.g. 1850) or even at least since the start of the 20th century (1900) to the present came from developed countries. In doing so, no adjustment in terms of the attribution of future responsibility therefore needs to be made to reflect the disregagrded historical responsibility. What the chapter tends to highlight as "historical trends", therefore, is that in the 40-year timeframe used, an increasingly larger share of emissions have come from non-OECD countries, thereby creating an implicit conclusion that an increasingly larger share of the mitigation burden will also need to be borne by non-OECD countries. This approach essentially absolves OECD countries of their long-run historical responsibility for anthropogenic emissions and ignores an important element of what should be considered as scientific fact when it comes to correctly attributing long-run responsibilities for historical emissions. It biases the attribution of historical trends in favor of OECD countries and against developing countries but focusing only on the period when most OECD countries had finished their industrialization process (and hence had more or less stabilized their emissions levels) while developing countries by and large were still embarking on the initial stages of their industrialization and development process (and hence would be increasing their emissions). | Taken into account - we have revised Section 5.2 to also include emissions before 1970. We are careful not to suggest that developing countries must take more action vis-a-vis developed countries. |
| 5295 | 5 | 0 | 0 | | | While mentioned in the introduction, the social acceptability factor is sorely missing from the chapter. While less sociology and political science research on enerngy exist, it is an emerging field and some results are available, especially on the rebound effect and experimetns such as the EU wide program Postive energy neighborhoods or families, who, through change in behaviours alone reach an average decrease of -15% in energy consumption in France. My comments attempt to contribute to this point. | Noted/Accepted (Text to be included with inputs from Michael) |
| 3620 | 5 | 0 | 0 | | | Abbreviations should all be explained (esp. in the figures) | Editorial |
| 3621 | 5 | 0 | 0 | | | Is more recent data after 2008 available? Please update. | Taken into account - data are updated |
| 7389 | 5 | 0 | 0 | 0 | 0 | It would be extremely helpful and policy relevant if the chapter could present, for some selected figures, emissions trends and sectoral contributions if GHGs are weighted not by 100-year GWPs but by other metrics discussed in the scientific literature (see section 3.10.3 of this report, and chapter 8 of WGI report). This would help policymakers understand that the relative contributions of sectors to overall emissions depend significantly on their own choice of metric (noting that the IPCC does not recommend using GWPs over any other metric, it simply follows the de-facto use of GWPs by the policy community). At a minimum, you could do this for Figures 5.2.1 and 5.2.3, and show a pie chart of the contributions from different sectors in 2008, using e.g. GWPs with 20, 100 and 500-year time horizons, or using 100-year GWPs and 100-year GTPs. | Accepted: We are working on a figure containing the information suggested |
| 16010 | 5 | 1 | | 89 | | A lot of blanks are missing, a lot of brackets are double | Editorial |
| 13559 | 5 | 1 | | | | In general I would recommend much more robust referencing of particularly figures and tables with regard to data sources, whereas some sections as indicated above could benefit from a somewhat wider use of references as as specific cluster now often used. It is however a reasonable first draft. | Accepted: We prepared a new set of figures based on the adopted databases for WGIII. |
| 5761 | 5 | 1 | 1 | 89 | | I suggest a change of style to shorten the text. You often describe what you want to do next, e. g. page 11, line 22: "We begin by … ". Please avoid such prosaic phrasings. In addition, you use abbreviations quite extensively, so why do you always write "greenhouse gas" instead of "GHG"? | Accepted: The language in the SOD have been change and the whole chapter shorten. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 5762 | 5 | 1 | 1 | 89 | | This chapter needs a thorough copy-editing. There are too many articles missing, and, quite too often, blanks between words are also missing. | Editorial |
| 14465 | 5 | 10 | 1 | | 2 | The difference must be international trade: some or many products are produced in different locations and regions than where they are used. This also means that the effects on the regional distributions of emissions will depend on the method of distribution. It does not necessarily add to the understanding of the system. | Taken into account - we now have an explicit accounting of the effect of trade on emissions in Section 5.5.3 and 5.5.4. |
| 12296 | 5 | 10 | 28 | 10 | 28 | Please explain "green paradox literature" | Noted - Section is rewritten. |
| 14467 | 5 | 10 | 37 | | 40 | In line with my remarks, this could probably better be formulated as a search for joint underlying variables and processes that influence more than one of the three parameters in the Kaya approach. | Taken into account - Section rewritten. |
| 14859 | 5 | 10 | 7 | 10 | 9 | As mentioned later in this chapter (page 34, lines 2-3) the Kaya identity is an accounting identity in which all terms are proportional to CO2 emissions. Therefore, the identity does not imply any elasticity as it would be in the context of an econometric analyis. | Noted |
| 14466 | 5 | 10 | 8 | | 8 | This is already excluded by the Kaya identity, isn't it? This identity uses three steps to gert from Population to Emissions: (G/P), (E/G) and (CO2/E). so the sentence is obvious from the previous text. | Noted |
| 4161 | 5 | 11 | | | | I would ask to reconsider the color design. It is slightly hard to distinguish the border of the areas due to the low contrast. | Will do. |
| 15058 | 5 | 11 | 1 | | | there are two "direction". Maybe remove one? | Noted |
| 10875 | 5 | 11 | 14 | | | Any reason to reference TAR instead of AR5. Chapter 8 in WGI will use some slightly different definitions and terms, so should be familiar with this | Agree |
| 14469 | 5 | 11 | 14 | | 18 | The understanding of this from a mechanistic point of view is a bit different:<br><br>Radiative forcing is a property of the atmosphere, that can be changed due to changes in concentrations of greenhouse gases in the atmosphere. These changes in concentrations are at least partly due to emissions caused by human activities. So in my view, emissions can be anthropogenic. Not the GHG concentrations, nor the radiative forcing. Moreover, CO2 absorbs infrared radiation, which is manily "outgoing" rather than "incoming".<br><br>So a more precise way of saying this would be something along the following lines:<br>The term "radiative forcing" is used to denote a change in the radiative balance of the atmosphere. A positive forcing leads to a more energetic, and hence warmer, atmosphere, whereas a lower forcing leads to less energetic, hence cooller, atmosphere. Radiative forcing is influenced by changes of concentrations of greenhouse gases, aerosols and troposheric ozone, partly due to anthropogenic emisisons.<br><br>The reference to AR4 would probaly better fit immediately after this modified sentence. | Text edited to remove language on incoming and outoing radiation and clarify meaning. Otherwise, the current text is consistent with the more detailed discussion in AR5 WG I, and the reader is now refered there for a more nuanced discussion of |
| 15983 | 5 | 11 | 15 | | | probably also possible to quote WG I AR5 here | Done |
| 10876 | 5 | 11 | 17 | | | Don't forget that land use change, via albedo and energy balances, also effects climate. Not just emissions. | Yes |
| 14468 | 5 | 11 | 2 | | 5 | This is clearly one of the examples where the different parameters in the Kaya approach are mutually dependent. | Noted |
| 15984 | 5 | 11 | 20 | | | contact WG I people whether there is an equivalent in AR5 | Done |
| 14471 | 5 | 11 | 22 | | 29 | "aggregated" would be a more precise term than "converted". | Text edited to clarify. |
| 14860 | 5 | 11 | 22 | 11 | 23 | You need to be more specific on the GWP values used. On which Assessment Report are they based? | Will try to be so. |
| 12856 | 5 | 11 | 25 | | | It would be good for this figure to portray the uncertainty bounds (ranges of the estimates) for each gas. The text on page 12 describes these uncertainty bounds, but the figure would more effectively show the ranges of the estimates. | Extremely difficuly to do in Figure. |
| 3513 | 5 | 11 | 12 | 11 | 13 | Change the title to "Global trends in flows of greenhouse gases and short-lived species" | Rejected: Titles of section were adopted |
| 6898 | 5 | 11 | 12 | | | Please ensure consistency with corresponding WGI Chapters and use latest data available. | Agree |
| 6899 | 5 | 11 | 18 | 11 | 20 | Update reference to WGI AR5, e.g., Chapter 8. | Done |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |

| 6900 | 5 | 11 | 22 | 11 | 22 | Not trends, but emissions of GHGs. Please correct. | Corrected. |
| 8944 | 5 | 12 | 1 | | | C02 emission increased 80% but atmospheric concentrations did not. This is about 18% | Not clear about purpose of this comment. Increase in concentrations is |
| 10877 | 5 | 12 | 1 | 12 | 4 | I presume you have used a GWP with 100 year time horizon. Should state this, and also mention that this is one choice of many (see Ch8 WGI) | Yes |
| 10878 | 5 | 12 | 10 | 12 | 13 | Check chapter 6 in WGI as this might be updated now. Also see Andres, R.J., Boden, T.A., Bréon, F.M., Ciais, P., Davis, S., Erickson, D., Gregg, J.S., Jacobson, A., Marland, G., Miller, J., Oda, T., Olivier, J.G.J., Raupach, M.R., Rayner, P., Treanton, K., 2012. A synthesis of carbon dioxide emissions from fossil-fuel combustion. Biogeosciences 9, 1845-1871. | Done |
| 15985 | 5 | 12 | 10 | | 14 | I understand (hope) that this is supposed to be a comparison/update to the AR4 rather than just a quote ... if so, the statement is not totally clear | Yes, Done. |
| 10879 | 5 | 12 | 14 | 12 | 24 | For the CH4 and N2O budgets, you shuld read and review WGI text which have specific sections on this. | Done |
| 14472 | 5 | 12 | 14 | | 16 | Tinus Pulles and André van Amstel (2010), An overview of non-CO2 greenhouse gases, Journal oif Integrative Environmental Sciences, vol 7 sup1 pp. 3-19 doi: 10.1080/1943815X.2010.505241 provide a recent overview of antropogenic emissions in relation to changing atmospheric conentrations. | Do not have access to Journal |
| 11841 | 5 | 12 | 14 | | | Here you could mention that methane is the second most important anthropogenic GHG, to be consistent with the paragraph before (co2 is most important) and after (n20 is third abundant…). | This is a good idea, but for interests of space, we did not do this. A new figure, however, does show the relative |
| 7319 | 5 | 12 | 20 | 12 | 22 | These lines state that "The third most abundant source of anthropogenic emissions comes from nitrous oxide (N2O) which is emitted during agricultural and industrial activities, as well as during combustion of fossil fuels and solid waste." For the last part of this sentence only ("combustion of fossil fuel and solid waste"), I would suggest that the authors perhaps meant NO2/NOx, rather than N2O. | Text edited to clarify. |
| 14473 | 5 | 12 | 20 | | 20 | … source ... should read ... greenhouse gas related to … | Done |
| 17430 | 5 | 12 | 23 | 12 | 23 | Why is it a given that uncertainty for CH4 and N2O will be larger? | Because fossil CO2 emissions are primarly dependent on the carbon content of fuel, which is relatively well known. CH4 and N2O emissions are highly process dependent and are, |
| 14474 | 5 | 12 | 25 | | 27 | Please be careful:<br>F-gases are long lived. CO2 is long-lived. CH4 and N2O can be considered as short lived.<br>The distinction here should therefore be made on a different parameter than "life time". | Agreed. Text edited. |
| 10749 | 5 | 12 | 3 | 12 | 3 | It should also be mentioned which time horizon that is used. | yes |
| 10880 | 5 | 12 | 31 | | | I have never heard them called "high GWP gases" before. Where does this come? I suggest use more standard terms. See WGI. | This is a term commonly used in economic and energy modeling. |
| 9316 | 5 | 12 | 34 | | | GHG may be changed to 'GHGs' and the following word 'emission' is suggested to be deleted. | Done |
| 6459 | 5 | 12 | 36 | 12 | 37 | “By far” should be deleted, because other sources & activities, such as transportation, show not-so-small emissions. | Text edited to clarify |
| 6519 | 5 | 12 | 37 | | | Delete "by far", as the other sources and activities are considerably large and important. | Text edited to clarify |
| 14863 | 5 | 12 | 37 | 12 | 37 | Add "production and" after Energy. If GHG emissions analysis is to be based on a consumption based approach, then this should be explicitly mentioned. | Text edited to clarify |
| 14475 | 5 | 12 | 38 | | 39 | This is fine to mention here. However care must be taken that this does not lead to double counting. The indirect emissions do not add to those in figures 5.2.1 and 5.2.2 and 5.2.3 and 5.2.4! | Care has been taken not to double count emissions. |
| 9315 | 5 | 12 | 4 | | | The word 'since' seems to be superfluous and suggested to be deleted. | Done. |
| 12297 | 5 | 12 | 5 | 12 | 24 | Please be consistent when referring to the anthropogenic part of the various GHG emissions. | Not quite sure what the comment refers to, but the chapter has been edited for |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 14862 | 5 | 12 | 7 | 12 | 8 | If it is necessary to explain the "combustion of fossil fuels" then you have to add additional (to the power plants and transportation already mentioned) sources (e.g. boilers/furnaces in industry, boilers and other stationary equipment in residential/commercial sectors). I suggest deleting this sentence. | Agreed text deleted |
| 17429 | 5 | 12 | 8 | 12 | 8 | Combustion of fossil fuels takes place in buildings as well as power plants and transport | deleted |
| 12298 | 5 | 12 | 9 | 12 | 9 | This sentence should be balanced including both removal by sinks and emissions related to LULUCF. | sentence deleted |
| 3516 | 5 | 12 | 10 | | 13 | I would suggest to reformulate the paragraph as followed: 'In the 1990s, CO2 emissions originating from fossil fuel were estimated at 6.4 +/-0.4 Gt per year and that associated with land use changes ranged from 0.5 to 2.7 Gt per year with an average estimated at 1.6 Gt per year (IPCC 2007; Smith et al. 2011)'. | edited alomg these lines |
| 3524 | 5 | 12 | 17 | | | Replace 'human-related activities with 'human activities' | Yes |
| 3517 | 5 | 12 | 20 | | 24 | Please add a reference in the paragraph. | Reference added |
| 3518 | 5 | 12 | 26 | | | But, nothing is said before on the Kyoto Protocol. | Text edited to clarify. |
| 7709 | 5 | 12 | 28 | | | Fluorinated gases are sometimes used as….' should be replaced by 'Hydrofluorocarbons are mostly used as…..' because HFCs have been developed as alternatives to ozone depleting substances. | yes |
| 3515 | 5 | 12 | 5 | | | By using the term 'most important', do you mean 'CO2 is the most abundant anthropogenic GHG emissions'? | Text edited to claiify |
| 6901 | 5 | 12 | 5 | 12 | 5 | Please add the reference to WGI AR5 Ch8 for summary figure on present-day radiative forcing estimates for Anthropogenic and Natural Climate Forcings. | Done |
| 8420 | 5 | 13 | | | | figure 5.2.3 is not quoted in the text | Figure eliminated |
| 8419 | 5 | 13 | | 13 | | These data are too old (year 2000). I suggest to insert in the Chapter 5 the Box now in Chapter 10 – pag. 8-10, and use only the Sankey diagram now in Figure 10.2. | Data being updadte |
| 15059 | 5 | 13 | | | | Is other fuel combustion a sector? it looks confusing how the sectors are distinguished. is coal mining a end user? | Figure moved to Chapter 1 |
| 15555 | 5 | 13 | | | | This is a nice summarizing Figure regarding the sources of gaseous emissions, but it would become much clearer, when the Key Sectors in Section 5.7 (i.e. 7.7.1 to 5.7.5), namely Transport, Buildings, Industry, Agriculture+Forestry+…, Waste) would be referred to | Figure moved to Chapter 1 |
| 7459 | 5 | 13 | | | | Harvest management contributes 2.5% to GHG emissions. Some harvest management can lead to carbon sequestration. This is discussed in Chapter 11. Therefore, I think the 'negative', practices should be spelled out. | Needs to be dealt with by Chapter 1 where figure is now located. |
| 10881 | 5 | 13 | | | | Are these values consistent with WGI? Why use the metric values from SAR and not AR5 (at least AR4). I suggest to refer to the relevant section of WGI Ch8 for updated metric values. Note, AR4 GWPs will be used in climate policy from 2020 onwards and SAR ones are very old. | Because for the UNFCCC and other policy purposes, SAR GWPs are always used. So thoe are also used here for consistency. Because we are discussing |
| 14861 | 5 | 13 | | | | See comment No. 2 | See response above |
| 16018 | 5 | 13 | | | | very old data | Data being updated |
| 6902 | 5 | 13 | | | | GWPs have been updated since then in a number of IPCC reports, Ozone Assessment, WGI AR4, etc. | This is true, however SAR GWP values are still used for policy purposes, so |
| 12857 | 5 | 13 | 1 | | | This is a very good figure and should even be in the Summary for Policymakers and Technical Summary, but it currently is not legibile. It would be good to somehow enlarge the text labels, although the thin arrows will require work to keep the labeling clear and accurate. | Figure has been eliminated |
| 8346 | 5 | 13 | 1 | | | How about replacing world greenhouse gas emissions in 2000 with emission in 2005? Reference is as follows. Herzog T. (2009). World Greenhouse Gas Emission in 2005. World Resources Institute. http://pdf.wri.org/working_papers/world_greenhouse_gas_emissions_2005.pdf | Figure Moved to another Chapter |
| 13548 | 5 | 13 | 1 | | | Add reference to figure | Okay |
| 9062 | 5 | 13 | 2 | | | Figure 5.2.2. All data is for 2000. Be great if the data is more recent ( 2010 onwards) | Data being updated |
| 15928 | 5 | 13 | 7 | 13 | 9 | the last varifiable data set is from 2008 (?) I am sure several peer-reviewed publications carry more recent data (2009-2010-2011) / Using 2008 for a report that will be published in 2013 allows for a tremedous lag and may not provide the best available scientific viewpoints on stocks or trends for GHGs. | Changes are planned including data through 2010 |
| 5349 | 5 | 13 | | 13 | | Cant this figure be updated? This figure would be far more impactful if wasn't showing 14 year old data | Figure deleted |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 3519 | 5 | 13 | | | | Figure 5.2.2 shows data that is 12 year old. Is there any updated version that shows recent situation? Please add a text to explain whether the situation has changed or not since 2000. Replace 'absorptions' with removals' | Figure deleted |
| 3520 | 5 | 13 | | | | Please add the source of the figure. | Okay |
| 4371 | 5 | 13 | | 13 | | some figures in this flow chart are contradictory with numbers appearing in the text in different instances | Please be more specific. 2 charts have been removed (5.3 and 5.5) |
| 4372 | 5 | 13 | | 13 | | same fig as 1.4, excep mentionned time span is different | Figure eliminated |
| 8421 | 5 | 14 | | | | Usually REF means Economies in Transition; the term “Central Europe” is unclear. MAF is Middle East and Africa, not only Africa. | Yes |
| 4162 | 5 | 14 | | | | Definition of the regions should be more clearly documented or the literature should be refered. | Yes |
| 10435 | 5 | 14 | | | | This figure has potential to generate controversy | Yes? |
| 14864 | 5 | 14 | | | | See comment No. 2 | Yes |
| 7646 | 5 | 14 | | | | Explain or write out country/region akronyms. | Yes |
| 12303 | 5 | 14 | 13 | | | The regions need to be described. For instance is REF not explained in this chapter. | Yes |
| 9317 | 5 | 14 | 4 | | | Please add '(2007)' after Raupach et al. | Figure eliminated |
| 16205 | 5 | 14 | 4 | | 7 | Rapupach's abbreviations are not the same as the ones used in the text; harmonize figure and text | Figure eliminaterd |
| 3521 | 5 | 14 | | | | Include the share of North America in the figure. | However, such information can be extracted fom primary source. |
| 3522 | 5 | 14 | 3 | | 4 | Include data on 'growth rates' and clarify 'recently' (what is time period?) | See original reference |
| 15060 | 5 | 15 | | | | It would be nice if more up-to-date data and result was included. | Data being updated |
| 8945 | 5 | 15 | | | | Not clear. Factors not clearly explained in caption. | Accepted. The text has been revised. |
| 4163 | 5 | 15 | | | | Definition of the regions should be more clearly documented or the literature should be refered. | Figure eliminated |
| 14476 | 5 | 15 | | | | I have no idea what this figure legend means. Must be explained. | Figure eliminated |
| 5765 | 5 | 15 | | | | It is not clear what this figure relates to at this place as you do not work with what is shown here. A decomposition of the Kaya Identity, but what is the message associated with this, or is this figure only given for "decorative" purposes? Please delete or at least amend text and explain abbreviations. For example, what does "Pgef" mean? Gpi (PPP) is unclear, FSU too. Please keep in mind that this text is to be read not only by specialists familiar with your lingo! | Figure deleted |
| 14865 | 5 | 15 | | | | I suggest deleting Figure 5.2.5 (at least from this part of Chapter 5) as it is based on indicator analysis that appears later in this chapter | Agree |
| 7647 | 5 | 15 | | | | What is F = Pgef = Pgh? If explained in the text pls include ref to place in text. | Figure eliminated |
| 12304 | 5 | 15 | 2 | | | The figure caption needs to be extended with explanations of F, P etc. What is the relation between e.g. D1 and UAS, EU and Japan? Are the latter included in D1? Is it all the countries included? | Figure eliminated |
| 14478 | 5 | 15 | 20 | | 20 | The data reported by Annex I Parties on "indirect greenhouse gases" to UNFCCC have never been reviewed and might be quite incomplete and incomparable between these countries. I feel it a bit dangerous to cite these data and not use the data on direct greenhouse gases from the same source. These have been reviewed and the quality of those direct GHG emission data is quite high. | Peer revieweed literature along with other data soruces are cited to support the statements in the text. Given that the UNFCCC submitted emissions are also, in general, the emissions used for policy |
| 2219 | 5 | 15 | 6 | 16 | 24 | SOD should also review a key report which I could not find in the references so far: "Project Catalyst: Abatement opportunities for non-CO2 climate forcers, May 2011". It has BAU estimates by non-CO2 climate forcer (CH4, N2O, f-gasses, and notably Black Carbon. Also it has a detailed set of MACurves for each of the non-CO2 forcers, which would be relevant to include in AR5. Project Catalyst/ClimateWorks may be willing to share underlying details of the analysis and results. | Report needs to be peer reviwed. Appears to be a briefing paper not primary research |

|---|---|---|---|---|---|---|---|
| 15557 | 5 | 15 | 7 | 16 | 24 | Generally Section 5.2.2: The important differences between aerosols and GHGs should be made clearer. They are considered more or synonymously, but aerosol increases may cause cooling effects and the net effects seems to be small or even negative. The cited Figure SPM 2 (IPCC, 2007, p. 4), cited on page 11, line 20 Fig. clearly shows this finding. | Good points, intro text edited to make this point. |
| 12299 | 5 | 15 | 8 | 15 | 9 | Please be consistent, climate forcing or radiative forcing | Richard R (could not find, may be in |
| 15558 | 5 | 15 | 8 | 15 | 9 | Trends in aerosol consist not only of trends on secondary organic aerosols (SOCs) but also of changes in direct aerosol emissions (mineral dust, sea salt, pollen, vegetation fire, combustion processes, volcanic eruptions). Thus almost all GHG emissions also correspond to changes in aerosol emissions. This is also reflected by Fig. 5.2.6 regarding BC and OC. Both climate changes (wind climate, resulting vegetation changes) and direct land surface changes cause feedbacks on aerosols, which is particularly important since aerosols may either cool OR heat the lower atmosphere. | Text edited to note the influece of climate and land-use changes. |
| 4373 | 5 | 15 | | 15 | | legend does not explin acronyms and symbols | Figure eliminated |
| 6520 | 5 | 15 | | | | Explain the abbreviations in figure's legend. | Figure eliminated |
| 10882 | 5 | 15 | | | | Should be reference to WGI which covers this topic in detail | We are not aware that WG I discusses reactive gas and particulate emissions in detail. We reference here, however, the |
| 3525 | 5 | 15 | 7 | | 20 | Include in brackets the chemical formulae of gases, for e.g. carbon monoxide (CO). | Done |
| 6903 | 5 | 15 | 8 | 15 | 11 | Add reference to WGI AR5 Chapter 2, 6, 8 for the most up-to-date IPCC assessement of changes in atmospheric composition. | This section focuses on anthropogenic emissions of reactive gases not concentrations. As discussed by WG I, the relationship between anthropogenic emissions and ozone and particulate |
| 8422 | 5 | 16 | | | | I suggest to normalize data to the year 1990 (not 1985 – in the graph there is 1895…) | Noted: Figure has been re-drawn |
| 4029 | 5 | 16 | | | | the y-axis should read "1985" | Noted: Figure corrected |
| 8946 | 5 | 16 | | | | Not clear. Caption requires explanation of all the peaks, etc. | Noted: caption text edited to note that short-term variability is due to open- |
| 7460 | 5 | 16 | | | | CO should be CO2? | Rejected: Figure is correct and refers to |
| 10883 | 5 | 16 | | | | Perhaps there is a good reason, but why are there spikes in the CO and NMVOC emissions | Noted: caption text edited to note that short-term variability is due to open- |
| 9318 | 5 | 16 | 12 | | | It is suggested to add another factor 'and emission reduction regulations' after emission reduction technologies. | Rejected. Not all factors can be dealt with. |
| 12301 | 5 | 16 | 25 | 20 | 7 | Readability of section 5.3 is good due to the use of subtitles. Please consider the use of subtitles in other sections. | Editorial. This is part of the ongoing discussion between the editors. |
| 12300 | 5 | 16 | 25 | 26 | 2 | Most of section 5.3 could be placed in an Annex. You then get rid of close to 10 pages out of the 15 that you need to cut. | Considered. The part removed. |
| 15559 | 5 | 16 | 4 | 16 | 18 | An important finding should be mentioned, that regards unexpected climate side-effects of modern power-plants, which try to reduce coarse aerosols emissions (for health issues), but emit more ultrafine particles, which have a significant effect o clouds. Literature: "The climate penalty for clean fossil fuel combustion" W. Junkermann, B. Vogel, and M. A. Sutton, Atmos. Chem. Phys. Discuss., 11, 24567–24589, 2011; www.atmos-chem-phys-discuss.net/11/24567/2011/; doi:10.5194/acpd-11-24567-2011 | Rejected. The issue is too specific and detailed to be dealt with in this general section. |
| 6521 | 5 | 16 | | | | Explain the abbreviations in figure's legend. | Will do |
| 3527 | 5 | 16 | 19 | | 24 | As tropospheric O3 results from photochemical reactions of precursurs, it may be useful to include this in the section or to make reference to the chapter of the AR5 where this is addressed. | Text edited to note this and to refer to Myhre et al. (AR5). |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 14479 | 5 | 16 | | | | As indicated above, I have some difficulty in the story line of the chapter.<br><br>Since the chapter aims at identifying the (in my words) parameters of the Kaya approach, I would expect sections on the relation between population (growth) and gross production values, between gross production values and energy requirements etc.<br><br>The Kaya approach is telling the reader that these drivers are changes in these parameters. What this section then could look for is how all kind of "drivers" identified in the literature fit into the Kaya approach. Which ones do influence the per capita Gross Production, which ones the energy requirement per gross production and which ones the emissions per energy use.<br><br>As it is now, this section confuses and does not add value to the understanding of the changes in the parameters of the Kaya approach. | Accepted: The whole Chapter 5 is being rewritten in order to improve clarity in the relationship among factors of the decomposition and underlying drivers. |
| 11200 | 5 | 17 | | 18 | | There is an argument for including a new additional category here with the subtitle: "Governance and political ecology" (or just 'governance') and inserting a paragraph with references linked to the work of scientists like Agrawal showing how community forest governance and secure rights are positively correlated with intact and healthy ecosystems and low(er) emission levels when compared to other governance types and land uses. The need for much greater regulation of land acquisition could also be made in this additional sub-section under the same heading.<br><br>See refs: Persha L, Agrawal A, and Chhatre A (2011) Social and Ecological Synergy: Local Rulemaking, Forest Livelihoods, and Biodiversity Conservation Science 25 March 2011: Vol. 331 no. 6024 pp. 1606-1608<br><br>and Nepstad D, Schwartzman S, Bamberger B, Santilli M, Ray D, et al. (2006) Inhibition of Amazon deforestation and fire by parks and indigenous lands. Conserv Biol 20: 6573.<br><br>and Hayes, T M and Murtinho, F (2008) "Are indigenous forest reserves sustainable? An analysis of present and future land-use trends in Bosawas, Nicaragua" International Journal of Sustainable Development & World Ecology, Volume 15, Issue 6, 2008: 497-51 | Noted. Unfortunately we don't have the space available to include all literature deemed relevant |
| 10750 | 5 | 17 | 1 | 17 | 1 | Re: "….emission in GWP100 has increased...". again, rewording is needed. The emissions are weighted by GWP-100. | Noted: Chapter substantially revised, text phrase no longer exists. |
| 9466 | 5 | 17 | 13 | | 19 | This conflicts with page 4, lines 2-4. Are drivers strictly causes or are they associative? It would be helpful to pick a stable definition and ensure that the literature reviewed meets the standard. | Considered. It is clearly stated that they are not about cause-effect relationship. |
| 12858 | 5 | 17 | 23 | 17 | 35 | Here, the text should clearly identify consumption per capita as important as total consumption. | Considered. Per capita consumption is deal with in the text in following sections |
| 15988 | 5 | 17 | 23 | 18 | 9 | I am not sure whether the literature cited here is not misinterpreted or even worse there might be a conceptual error in the literature. There is no causality between increasing imports of GHG and consumption - I'd argue that a fair share of that is due to a higher carbon intensity of exporting countries (see e.g. Jakob and Marschinski, forthcoming in Nature Climate Change for a discussion) | Considered. The text asserts no causality. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 14481 | 5 | 17 | 26 | | 27 | This is an accounting system indeed. It has nothing to do with understanding changes in GHG emissions over time. On the contrary: the accounting systems use information on emissions and allocates these following a specific set of accounting rules:<br>- aggregates geographically (as in UNFCCC and the Kyoto Protocol<br>- following a series of consecutive production steps<br>- following a specific material<br>etc.<br><br>In the Kaya approach I would say that "consumption" is one of the drivers of (gross) production (no economically functioning unit will produce significant numbers of products without a consumer needing it!). | Considered. No contradiction is identified. |
| 5766 | 5 | 17 | 3 | 17 | 6 | Please reverse order. Scientifically sound methodology would be to identify drivers as such first, and then weigh them to identify "major" drivers. | Rejected. The section is limited to talk about 3-4 preidentified factors. |
| 9319 | 5 | 17 | 32 | | | Please see if the word 'of' can be replaced with 'by'. | Accepted. The part removed. |
| 14482 | 5 | 17 | 36 | 18 | 9 | Apart from the emissions from the transport equipment itself (trucks, ships, airplanes, etc), international trade only influences the location of the emisisions. In the Kaya approach it will be mainly influencing the regional distribution of emissions | Considered. No contradiction is identified. |
| 10884 | 5 | 17 | 39 | | | I note the use of "driver or enabling factor", which may be sufficient, but studies currently just quantify the emission flows and not the drivers or enabling factors. As reviewers often say to me "if there is trade, there will be emissions embodied in trade" and it does not mean much more than displacing emissions. If the displaced emissions causes the global emissions to be higher than otherwise, then there is more relevance to trade. | Accepted. The chapter has now ensured a more consistent use of the terms "factors" and "drivers". You are correct that we are many explaining what has happened and not implying cause. An |
| 14480 | 5 | 17 | 5 | | 5 | I have understood that his framework is the Kaya approach. | Considered. No specific action is |
| 9465 | 5 | 17 | 7 | | 12 | However, in the land change science literature there has been little consensus on how to distinguish proximate vs. ultimate factors and whether drivers are causal. | Considered. The text discusses the difficulty of distinguishig them. |
| 6522 | 5 | 17 | 20 | | 22 | Make the description consistent with Table 1 (which should be Table 5.3.1.), as the text here deals very little with correlations between drivers, while Table 5.3.1 does not evaluate individual drivers at all. | Considered. Removed. |
| 18154 | 5 | 17 | 37 | 20 | 7 | Some references to studies from Statistics Norway may be added to the literature review: 1) Bruvoll, A., T. Fæhn and B. Strøm (2003): Quantifying central hypotheses on environmental Kuznets curves for a rich economy: A computable general equilibrium study, The Scottish Journal of Political Economy 50(2), 149-173. This study decomposes emission changes to study driving forces, including leakage effects and policy effects. See also 2) Fæhn, T. and A. Bruvoll (2009): Richer and cleaner – at others' expense?, Resource and Energy Economics 31(2), 103-122. | Considered. The part removed. |
| 7324 | 5 | 18 | 1 | 18 | 2 | MRIO studies can estimate consumption-based CO2 emissions but you can't lead this sentence. | Accepted. Understood as a comment. |
| 7325 | 5 | 18 | 1 | 18 | 2 | Other studies such as Cole and Elliot (2003) and Mangi et al. (2009) found international trade could have a both beneficial and detrimental effect on the environment varies and it depends on the pollutant and the country. http://dx.doi.org/10.1016/S0095-0696(03)00021-4 http://dx.doi.org/10.1016/j.jeem.2009.04.008 | Considered. The issue should better be discussed in 5.5. |
| 10885 | 5 | 18 | 1 | | | Maybe worth drawing on the "carbon leakage" literature and alternative definitions. See Peters, G.P., 2010. Managing Carbon Leakage. Carbon Management 1, 35-37.; Peters, G.P., Hertwich, E.G., 2008. CO2 Embodied in International Trade with Implications for Global Climate Policy. Environmental Science and Technology 42, 1401-1407. | Considered. The issue should better be discussed in 5.5. |
| 12859 | 5 | 18 | 10 | 18 | 15 | Here, the text should clearly identify per capita intensity as important as total population. | Considered. Everything is important. Per capita intensity is discussed in 5.4. |
| 14483 | 5 | 18 | 10 | | 15 | Main variable in the Kaya approach. Should be mentioned first! | Accepted. I hope that the new text is |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 16251 | 5 | 18 | 16 | 18 | 20 | It is unclear what the authors mean with "urbanization": Is it the actual growth of cities due to migration (this always leads to an increase in emissions compared to when the city is stable), or is it include the use-phase of cities (emissions once the infrastructure stock have been built)? Emission data are usually only available for direct emissions from cities or rural areas. Drawing conclusions from such comparison regarding the impact of urbanization can be problematic, because it neglects the build-up of urban infrastructures, which is extremely emission-intensive, and even more confusing, because these emissions from the physical expansion of cities often occur in rural areas (steel and cement factories are often not located within urban areas). | Considered. See 5.4. |
| 14484 | 5 | 18 | 16 | | 20 | Probably influences both the per capita gross production and the consumption | Considered. That was the intention. |
| 7648 | 5 | 18 | 16 | 18 | 20 | There should be a reference to indirect emissions from cities (not just territorial emissions).<br>There is a recent review which summarises the current discussion: Baynes T & Wiedmann T, "General Approaches for Assessing Urban Environmental Sustainability", Current Opinion in Environmental Sustainability, forthcoming. | Rejected. The section is by design limited to regional and global assessment. |
| 4165 | 5 | 18 | 20 | 18 | 20 | Reference is needed here although it is commonly recognized that the "compact city" shows higher effeiciency in energy use. However, in the gigantic city, heat-island and water and waste management issues become barrier to achieve the high efficiency. | Rejected. The section is by design limited to regional and global assessment. |
| 8947 | 5 | 18 | 21 | | 25 | Human behavior is most fundamental but this analysis is short and vague. Some narrative examples of behavioral change would help. | Rejected. We have a behaviour section separately handling it. |
| 12038 | 5 | 18 | 26 | 18 | 46 | It is very important to stress the connection between economic growth and GHG emissions. Don't overemphasize mitigation potential of economic growth. See Jackson 2009 ("Prosperity without growth") | Accepted. I hope that the new text is more clearly describe it. |
| 13768 | 5 | 18 | 27 | 18 | 43 | I don't understand why the EKC literature is discussed here. It was not introducted for GHGs and does not apply to them. Is there any study that provides credible support for an EKC for CO2? Consumption is discussed above, and increase consumption leads to increased emissions. You can drop this section and replace it by the simple statement that there is no support for a reduction of CO2 emissions with growth at any level of wealth. | Accepted. Removed. |
| 14485 | 5 | 18 | 27 | | 27 | Please be aware that these are time derivatives: they represent changes and hence are of another order than the "drivers" mentioned earlier in this section | Considered. But not sure what it was meant. |
| 4164 | 5 | 18 | 3 | 18 | 4 | This contribution holds only if both import and export countires want to reduce GHG emissions. It seems to me, this is a part of the side-effects of economic growth. | Considered. No particular action is required. |
| 10887 | 5 | 18 | 30 | 18 | 43 | This section misses a lot of the relevant literature. EKC's are generally found (acknowledging the issues you raise) for local pollutants. I am not sure if anyone has found an EKC with a realistic turning point for energy or co2. Even so, disregarded whether GDP drives the EKC shape, if we reach ambitions of 80% reductions by 2050, all countries will follow an EKC. Thus, GDP may not cause an EKC, but we need to have an EKC! Also, there are several studies which show that if trade is include, then the EKC may not exisit. Suri, V., Chapman, D., 1998. Economic growth, trade and energy: Implications for the environmental Kuznets curve. Ecological Economics 25, 195--208: Rothman, D.S., 1998. Environmental Kuznets Curves - real progress or passing the buck? A case for consumption-based approaches. Ecological Economics 25, 177-194.; Aldy, J.E., 2005. An Environmental Kuznets Curve Analysis of U.S. State-Level Carbon Dioxide Emissions. Journal of Environment and Development 14, 48--72.; Peters, G.P., Hertwich, E.G., 2008. CO2 Embodied in International Trade with Implications for Global Climate Policy. Environmental Science and Technology 42, 1401-1407. | Considered. The EKC literature is taken out per other comments. |
| 10886 | 5 | 18 | 36 | | | Do you have a reference for this statement? | Considered. The EKC literature is taken out per other comments. |
| 12860 | 5 | 19 | 1 | 19 | 11 | Here, the text should clearly identify energy use per capita and energy intensity per unit of PPP-adjusted GNP as important as total energy use. | Accepted. The text revised to include them. |
| 14486 | 5 | 19 | 1 | | 11 | In the Kaya approach this is<br>G x (E/G)<br>and hence again something quite different than the earlier "drivers. | Considered. See the revised description. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 14487 | 5 | 19 | 12 | | 12 | This could be a new section at a higher level in the outline. | Rejected. The section structure has |
| 14488 | 5 | 19 | 13 | | 22 | Is there any reason to prefer the one over the other?<br><br>To me it seems that these two (IPAT and Kaya) only use different "proxies" to try to correlate the emissions in time with changing major societal and economic variables. The application than in this chapter would be to extrapolate ("project") the future emissions, using projected values of these proxies.<br><br>Would there be any theoretical preference for the one or for the other? I don't see a reason for that, so it might be similar and the choice for Kaya in this chapter might be "accidental". The introduction states that the one is a refinement of the other. I would expect that energy intensity of the production process would be one of the proxies in IPAT, needed to understand the changes in the "efficiency of technology (T) used to generate 8 income" (page 9).<br><br>Given the international trade, the difference could also be on how production in one country/region of products, used in another is taken into account. At the global level this would not make any difference, unless a significant number of products would be produced that is never used. This would be rather surprising. | Accepted: The text is being revised and a new approach of the decomposition is being introduced. |
| 5767 | 5 | 19 | 13 | 19 | 31 | Please consider placing all three decomposition approaches in one box and refering to this box from the text. This here is the third or forth time the Kaya Identity is explained and this is, frankly, two or three times too often. | Considered. The space limitation does not make it possible. |
| 14489 | 5 | 19 | 23 | | 23 | This is the first time the "input-output framework" is mentioned in this chapter. I understand that this basically macro-economic approach is underlying the thinking of the authors of this chapter. My understanding so-far was a more technical one, where I was expecting the chapter to find (correlational, not necessarily causal) explanations for changes in greenhouse gas emissions in the past with a view of extrapolating those into a future where possible measures can or could be taken. | Rejected. The space is limited to explain it but references are provided in the text. |
| 14490 | 5 | 19 | 25 | | 28 | This in many other scientific disciplines could be seen as a multivariate analysis. | Considered. Could be. No particular |
| 13769 | 5 | 19 | 31 | | | Please see also Yamakawa, A., Peters, G.P. (2011) Structural decomposition analysis of greenhouse gas emissions in Norway 1990-2002. Economic Systems Research 23, 303-318. I wonder whether you could provide a brief summary of the findings. My understanding is that structural effects are difficult to identify, not because the structure is not changing but because the effect of structural change is not uniform. In additon, there may be problems with the data and the technique is very sensitive to small error in the data. | Considered. SDA part has been reduced due to the mandate to discuss Kaya identity in more detail. No room to expand on SDA, unfortunately. |
| 13770 | 5 | 19 | 32 | 20 | 7 | This section does not offer any insight. Of course there is an interaction. I think it would, in this connection, also be necessary to introduce the STRIPAT approach: Dietz, T., Rosa, E.A. (1994) Rethinking the environmental impacts of population, affluence and technology. Human Ecology Review 1, 277-300. Please note that this approach does not present an index decompostion but rather a multivariate regression analysis as it is common in social sciences. In many ways, it provides a more valid insight into how variables are connected. Elasticities as derive by Hertwich&Peters (2009) conform rather to this approach. | Considered. The mandate of the section is now to discuss the Kaya identity in more detail. |
| 14491 | 5 | 19 | 37 | | 41 | In multivariate analyses it is not unusual that explaining variables correlate. There is a range of statistical methods that can deal with such correlations.<br><br>The link to "causality" here is a bit confusing. There is or there is not a causality. The problem is whether or not the analyses can correctly find and identify such causality.<br><br>In my view this, and many similar sentences in this draft, confuse the (quantitative) analysis and the interpretation thereof too much. | Considered. Much of the sentences are removed. Again, this section cannot perform correlation or multivariate analysis. It is simply out of the scope of the section. |

|---|---|---|---|---|---|---|---|
| 5768 | 5 | 19 | 39 | 19 | 41 | Ethics and responsibility are terms that imply justification or weighing of emissions. From a natural sciences point of view: an emission is an emission is an emission. The circular network thus has a starting point (the anthroposphere - atmosphere - boundary). Please do not intermingle "ethics" with "valuation" or "norm". | Considered. The part revised. |
| 8948 | 5 | 19 | 41 | | | Lip service to ethics and responsibility. Again reader needs more examples perhaps of virtuous behavior. | Rejected. This section does not deal with ethics and responsibility. The two |
| 14492 | 5 | 19 | 42 | | 45 | This paragraph is conceptually problematic for two reasons, partly due to the mathematical Kaya identity, being an identity:<br><br>1) I understand that with "driver" the authors refer to the decomposition of the trends in CO2 emissions as expressed in the "Kaya identity". So "energy consumption" in this paragraph would be Energy Consumption per Gross Production (E/G). It is quite unclear what exactly is meant in this confusing paragraph.<br><br>2) In the "Kaya identity", but also the IPAT approach, the population size is explicitly "decomposed" and therefore should not be included in the explanatory decomposition of the Energy Consumption driver. | Considered. The part revised. |
| 16019 | 5 | 19 | 5 | | | thats not true. CO4 and N2O-emissions are much more often releated to land use and deforestation. | Considered. No disagreement. The text only says that they are ALSO associated |
| 4374 | 5 | 19 | 39 | 19 | 41 | I cannot make sens of that statement | Considered. Revised and hope that it better addresses the issue. |
| 14493 | 5 | 20 | 1 | | 2 | A similar remark could be made here. Population should not be separated her, since it is already separated out in the top level decomposition. The "GHG emisison intentsity of each fuel type" is also separated out separately in the Kaya identity and should not show up here.<br><br>Furthermore, I assume that "transport" is mainly of interest as it adds to the energy requirement per gross production in the Kaya approach. Indeed parameters/variables that influence energy use in transport are modal shifts and fuel efficiency of the equipment. Another very important parameter here will be transport distance. Maybe that is meant by "transport requirement" here. But then: not per capita but per Gross Product. | Considered. The part removed. |
| 14494 | 5 | 20 | 5 | | 7 | ... but should always be answered within a well defined frame of mind. The chapter chooses the Kaya appraoch as such, but seems to forget about this in many instances. This does not help in answering the question:<br><br>"What is driving global GHG emissions" (please see the slight, but important difference in my sentence as compared to the one in the draft. | Considered. Not clear what was really meant by the comment. |
| 14495 | 5 | 21 | | | | To be useful in this chapter, this table would need some link to the analysis framework chosen: the Kaya approach. | Considered. The part removed. |
| 5769 | 5 | 21 | | | | Please consider giving the sources, e. g. numbered (see tables in IPCC 2003 GPG LULUCF for an example) with the table. | Considered. The part removed. |
| 7326 | 5 | 21 | 1 | | | Other studies such as Cole and Elliot (2003) and Mangi et al. (2009) found international trade could have a both beneficial and detrimental effect on the environment varies and it depends on the pollutant and the country. http://dx.doi.org/10.1016/S0095-0696(03)00021-4 http://dx.doi.org/10.1016/j.jeem.2009.04.008 | Accepted. These aspects have been incorpoated in the new version. |
| 6523 | 5 | 21 | | | | Table 5.3.1. should be symmetric. | Considered. Not clear what was really meant by the comment. |
| 8949 | 5 | 22 | | 24 | 4 | Delete all tjhis material or put in technical appendix. There is too much math and too much uncertainty. | Accepted. The part removed. |
| 10889 | 5 | 22 | | | | This will need much more explanation, as I do not even understand it. Is this a SDA type approach using a tierwise expansion? The text does not explain so much either. | Accepted. The part removed. |
| 15990 | 5 | 22 | | 25 | | Not sure whether the formal description always helps to understand the argument | Accepted. The part removed. |
| 10378 | 5 | 22 | | 22 | | equation (3) which is take the log form from equation (2) sames wrong, the log operation should take on the absolute variables instead of the change rate of the variables. | Accepted. See the earlier response |

|---|---|---|---|---|---|---|---|
| 10888 | 5 | 22 | 1 | 22 | 26 | Is this an assessment of the literature? It seems this is getting more into research? | Accepted. The part removed. |
| 14497 | 5 | 22 | 22 | | 26 | Do, in this framework, any other activities than "productive activities" occur? Are emission from product use (driving your private cars etc) not included?<br><br>Any of the terms "can be cancelled out". If you do so, what is the reason that the Kaya identiy had it originally? What are you loosing?<br><br>This is not so much a simplification as well a choice to not take into explicitly account the "Energy Use per Gross Production". I am not sure whether this would be a good idea. To me this parameter and the changers therein seems to be a major driver for changes in GHG emissions! | Considered. The simplified method has been published and was also used in previous AR. The section refers to the literature. |
| 14496 | 5 | 22 | 8 | | 11 | An explanation of what is meant by "zero order", "first order", etc is needed. | Accepted. The part removed. |
| 5770 | 5 | 22 | ? | 22 | ? | The equation given at the top of figure 5-1 is eq. (2), not (1). Please correct. | Considered. The part removed. |
| 4167 | 5 | 22 | | | | This subsection can be reduced, since most of the equations are very similar and well known. | Considered. The part removed. |
| 6524 | 5 | 22 | | | | Check if the equation (3) is correct. | Considered. The part removed. It shoud be deltaX+1. The equation editor is somehow not working and I am having |
| 14866 | 5 | 22 | | | | This section presents an overview of methodological issues regarding decomposition analysis. However, such an analysis is not really applied in the current version of the chapter. Even if the results of an index decomposition analysis are to be presented in later versions of the report, interested readers should be directed to the relevant literature. Therefore, I suggest deleting this section (that would reduce the size of the chapter by about 3 pages) | Accepted. The part removed. |
| 7710 | 5 | 22 | | 26 | | The description here are too much complicated and could be made shorter by skipping the intermediate calculation and by approaching only the results of the calculation. | Considered. The part removed. |
| 14498 | 5 | 24 | 1 | | 6 | From the mathematical point of view, this is rather unusual.<br><br>I could understand that at the highest level of detail, the mathematical formalism would take into account different values for the intensities g and h for different regions, different sectors and different fuels (your "third order"). The system then could be aggregated to decrease the demand for input data by either summing up over all fuels (your "second order") and subsequently over all sectors (your "first order"). The final step would be to aggregate over all regions, leading to your "zero order".<br><br>When you present it like this it is obvious that the correlations that could be found will be more coarse and probably have lower explanatory power, when going to the "lower order" approaches. this then simply is because less data are fed into the approach. So, in principle a higher "order" provides more insight, but has a higher data requirement.<br><br>In GHG Emisison Inventories these are not called "orders" but "tiers". it could be helpful to do the same in this chapter. | Considered. The part removed. |
| 14500 | 5 | 24 | 15 | | 18 | A similar remark here:<br><br>The sentence seems to confuse "energy use"and "fossil energy use". The problem here is rather the difficulty in getting reliable data on biomass fuel use as compared to fossil fuel use and has nothing to do with the mathematical formalism.<br><br>In other words: On "energy" the approach would work. Since data on non-fossil energy use are difficult to find. Therefore their influence on the "Gross World Product" would be difficult to find too. | Accepted. Fossile energy use is used. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 14501 | 5 | 24 | 17 | | 17 | Only here I understand that in the Kaya identity Gross Production is understood by what economists measure as "GDP". If that is the case than the reasoning should be that GDP is not a perfect measure for what is believed to drive GHG emissions. This would be a similar remark as "the correlations are not perfect" or "we do not understand it all". This would be hardly a problem for the analyses, as long as there is a reasonable level of covariance. | Rejected. Not sure what exactly was suggested. |
| 14502 | 5 | 24 | 21 | | 21 | In my view this is mainly because economic input-output modelling does not see this transport. In a correlational study it might be very well possible to correlate passenger transport to wealth and/or private income as a first order approach. | Considered. No particular action is required. |
| 14503 | 5 | 24 | 23 | | 23 | "GDP is becoming a worse measure", rather than "the decomposition does no longer work". | Considered. No particular action is |
| 4168 | 5 | 24 | 28 | 24 | 28 | It should be noted that the equation (3) cannot be directly applied to the formulations in Figure 5.3.1 and equation (4), since equation (3) is not additive. | Considered. The part completely removed. |
| 8950 | 5 | 24 | 30 | | | IPAT does not get the same emphasis as Kaya -- should it? | Accepted. The text revised. |
| 10891 | 5 | 24 | 30 | 24 | 33 | "Here we propose", would be much better for an aritlce to be submitted and reviewed so that you can assess the literature instead of starting new research. | Accepted. The part removed. |
| 14504 | 5 | 24 | 33 | | 33 | Does this mean "... do explain the same reality, but use different variables in the decomposition"? Or does it mean something else? | Considered. The part is rewritten. |
| 4166 | 5 | 24 | 7 | 24 | 28 | It seems to me that the two issues listed here too much emphasize the factor (E/G) or (F/G) as the causal driving source of the emission. Kaya identity is no more than a decomposition experssion of the definition equation without the causality hypothesis but is sill convenient to understand the changes in the economy or energy demand and supply strucutre by looking the changes of these factors. | Accepted. The part revised. |
| 10890 | 5 | 24 | 7 | 24 | 14 | I do not see that Kaya only applies to energy? http://www.pnas.org/content/early/2012/04/10/1117054109.abstract And I think a look at the broader Kaya literature (IPAT also) will find lots of non-energy examples. | Considered. The literature mentioned uses the idea of decomposition. The original proposition of Kaya identity indeed deals only with energy related |
| 14499 | 5 | 24 | 7 | | 9 | This is not necessarily true. It would be if the aim was an understanding of causality, which the authors do not seek. There might be quite strong correlations to a country's (or the globe's) energy use and, fopr instance, the sizes of life stock kept in farms. | Considered. The part removed. |
| 4375 | 5 | 24 | 30 | 24 | 30 | I=PAT: explain those symbols, may be use more consistent symbols throughout, fig. 5.3.1 looks more consistent in that regard | Accepted. |
| 14505 | 5 | 25 | 1 | | 1 | Is this indeed, "only" a difference in allocation? What is the index "i" in the summation standing for in the formula on the bottom line of page 24? | The part removed. |
| 14507 | 5 | 25 | 16 | | 17 | Since "products" seem to play the role that "sectors" are playing in the production based approach, I would expect that the parameters/data her would need to be collected and used at the different products in the most detailed approach (a "third order" would also see that fuels might be different for different products). | The part removed. |
| 14508 | 5 | 25 | 17 | | 18 | Not "better represent" but "make better visible". I hope the authors are aware that the two approaches should never be added, nor even in part, since both of them are supposed to include all emissions. But all activities should always be included to estimate "global emissions"!<br><br>The difference is that some human activities can more easily be separated out in the one and others in the other. | The part removed. |
| 14867 | 5 | 25 | 23 | 25 | 25 | I think that a justification of the method applied is necessary | The part removed. |
| 15061 | 5 | 25 | 24 | | | typo | The part removed. |
| 14509 | 5 | 25 | 24 | | 24 | Why logarithmic ? Is this because the underlying variables cannot be negative? Or are lognormal distributions assumed? | The part removed. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 14510 | 5 | 25 | 26 | | 33 | Please explain. Why would "population" not be further specified in for instance age groups? Urban/ non-urban? Income groups? Such further detail couldadd to the explanatory power of the approach.<br><br>So why do you need equations 8 and 9 and what is the essential difference? | The part removed. |
| 8951 | 5 | 25 | 3 | | 30 | Omit or put in a technical appendix. | The part removed. |
| 5771 | 5 | 25 | 3 | 25 | 7 | Please check. If "F(c)" on the left side of the equals sign is "emissions / expenditure" and "Y := expenditure", then "F(c) / Y" would be "(emissions / Y ) / Y". | The part removed. |
| 14511 | 5 | 25 | 34 | | 34 | "Added"? These probably are not always additive, especially when ther might be correlations between these different separations! | The part removed. |
| 14506 | 5 | 25 | 7 | | 7 | Why "life cycle"? What is happening with half products?<br>How would this work for instance with emissions from energy transformation (refineries, gas works etc) if the refinery produces different products from the same crude using a fraction of the crude as fuel? To what product would the fuel use be attributed? | The part removed. |
| 6526 | 5 | 25 | 26 | | 29 | Check if the equation (8) and (9) are correct. | The part removed. |
| 6525 | 5 | 25 | 9 | | | Check if the equation (4) is correct. | The part removed. |
| 15062 | 5 | 26 | | | | So far it is not clear where the life-cycle emissions come from. | The part removed. |
| 15991 | 5 | 26 | 4 | | 6 | With respect to the illustrative example shown: As the AR5 is supposed to be an assessment, I recommend to think again how to present your points here | The part removed. |
| 8347 | 5 | 26 | 7 | | | How about deleting Figure 5.3.1 because of duplication with 5.3.2 and shortening the volume? | The part removed. |
| 8952 | 5 | 27 | 1 | | | Does report have anything to say about reducing poplulation growth rate? | Rejected because this is beyond scope. This is a chapter about factors (and drivers) of GHG emissions, one being population; not about factors and drivers |
| 4030 | 5 | 27 | 13 | | | "per capita emissions between the highest (USA)" I wrong stetment. The highest per capita emission is in Qatar, eg see http://data.worldbank.org/indicator/EN.ATM.CO2E.PC | Rejected - Qatar is not a region in Raupach et al. reported here. |
| 18145 | 5 | 27 | 16 | | | RCP needs to be defined. | Accepted, revised; it is now defined. |
| 14514 | 5 | 27 | 2 | | 4 | This sentence confuses not only the reader, but apparently also the authors of the chapter.<br><br>In the Kaya approach there is only one term describing the population (P). Affluence is used in the IPAT (page 9), not in Kaya. In the Kaya approach an explicit choice is to try to model per capita production separately as the first "decomposition" step. This can only be done, while keeping the population size as independent variable by defining a per capita gross production. This term is then not related anymore to (the size of) the population. | Taken into account - Sentence rephrased based on the newly agreed terminology and Kaya explanation. |
| 18146 | 5 | 27 | 20 | 27 | 22 | While it is true to say that per capita emissions have doubled in Asia, for the sake of balance, it should also be stated that despite this, a) emissions per capita in Asia is still the lowest of all 5 regions and b) the OECD 90 and REF regions are still more than double and almost triple (OECD 90) the levels of Asia. | Rejected - This is explained later and clear from Figure 5.4.2. |
| 14515 | 5 | 27 | 4 | | 5 | No it does not. On page 9 it was implicitly and explicitly assumed that the terms in the Kaya approach (in my language parameters; the g, e and f in equation 1 on page 22) are time dependent and can change. With such changes the proportionality disappears! | Taken into account - Sentence rephrased based on the newly agreed terminology and Kaya explanation. |
| 14868 | 5 | 27 | 4 | 27 | 7 | See comment No. 1 | Rejected - Not clear what is comment |
| 14516 | 5 | 27 | 6 | | 6 | "… are at work behind ...": no... these are changing the average over time! | Accepted, text revised to changing |
| 7711 | 5 | 27 | 1 | 32 | 28 | This chapter might be lengthy and tedious and coule be much more compact and simple to reduce pages. | Taken into account. Reduced length, but assessment of key literure is needed to |
| 4377 | 5 | 27 | | 27 | | Fig somewhat redundant with fig 5.2.5 | Accepted - Figures revised and included as per instructions of CLAs. |
| 4376 | 5 | 27 | 16 | 27 | 24 | Missing definitions for acronyms (MAF, REF...) | Accepted - Provided. |

|---|---|---|---|---|---|---|---|
| 10436 | 5 | 28 | 4 | 28 | 26 | This has to be rewritten eliminating the elasticity comparisons because for a technical, non economist audience, understanding this section would be problematic | Rejected. Elasticities are clearly explained and presenting them is |
| 14517 | 5 | 28 | 6 | | 7 | on page 27, lines 4 to 6 the contrary is stated! | Rejected because both pieces of text say: population size is proportional but |
| 4378 | 5 | 28 | 24 | 28 | 24 | definition of “transmission channels” ? | Taken into account - Revised according to the new chapter terminology. |
| 4169 | 5 | 29 | 13 | 29 | 19 | The income inequity between the rural and the urban area should be touched upon besides the policy issues. | Rejected - Income inequality discussed two paragraphs below. |
| 15992 | 5 | 29 | 20 | | 31 | Might want to think about infrastructure stocks here | Taken into account but: Literature checked/rechecked but infrastructure |
| 9087 | 5 | 29 | 26 | 29 | 28 | What is the definition of words "local or regional nuclear power" ? (small module reactor or something ?) | Accepted, text revised and Specified |
| 17431 | 5 | 29 | 32 | 30 | 1 | Did not understand paragraph | Accepted - text Rephrased to make it |
| 10892 | 5 | 29 | 32 | | | There should be a strong link to the chapter on urbanisation, and also, on system boundaries, this is a good paper Lenzen, M., Peters, G.M., 2010. How City Dwellers Affect Their Resource Hinterland: A Spatial Impact Study of Australian Households. Journal of Industrial Ecology 14, 73-90. | Rejected. Content of proposed publication not directly related to subject. |
| 15993 | 5 | 29 | 32 | | 33 | Not clear to me | Accepted - text revised -Provided |
| 12302 | 5 | 29 | 6 | 29 | 9 | This sentence is hard to understand. And to us the decline mentioned in the last part is only true for the REF Region. | Accepted - REF was dropped in the assembly process. Included now. |
| 6527 | 5 | 29 | 9 | | | REF seems missing at the end of the sentence. | Accepted - REF was dropped in the assembly process. Included now. |
| 18254 | 5 | 30 | | | | So, 1) a definition is needed to grasp the interrelationship between Science, Technology, Innovation and Diffusion and then using the concepts properly in the whole text. 2) An explicit description of an interdependent variables processes; that is to say, policies are not based only based on a linear model (from science to technology) ,but there are interrelated. 3) Another aspect which is becoming more important is that innovation is not only technological but also non-technological (organization, marketing, services). | Accepted, references will be added. 1) See chapter 3; 2) see chapter 3 and 5.1; 3) see chapter 3 |
| 5919 | 5 | 30 | 1 | | 4 | This could be added: Monni, S. and Syri, S. 2011. Weekly greenhouse gas emissions of municipalities: methods and comparisons. Energy Policy 39, 4755-4765. This article shows that in largest Finnish cities, per-capita GHG emissions were considerably below national average, mainly due to lower transportation emissions and efficient CHP heating. | Rejected. Content of proposed publication not directly related to subject. |
| 4170 | 5 | 30 | 20 | 30 | 27 | The authors should also touch upon the cases in African countries, since China and India have already grown up. See Karen Rajaona Daka and Jerome Ballet, "Children's education and home electrification: A case study in northwestern Madagascar", Energy Policy 39 (2011) 2866-2874 | Rejected - Considered but the paper says nothing about emissions. |
| 13551 | 5 | 30 | 3 | | | "Initial findings suggest that the level and structure of trade in 2004 reduced global emissions by 6%.". Not referenced or founded. Who calculated and used GTAP7 for this? Usin the DTA as a reference is very dangerous since the structure of the economy may differ significantly as from what is imported. Dangerous section - do what an AR is supposed to do, review sound scientific work and do not additoinal analyses yourself as author. | Accepted - this section has been deleted and replaced with a more comrpehensive discussion of causality. |
| 17432 | 5 | 30 | 5 | 30 | 6 | I'd suggest explaining the system boundary problem | Accepted - it is Explained. |
| 4379 | 5 | 30 | 28 | 30 | 50 | is there any reason to detail the Chinese case more than any other ? | Rejected because China has the Largest population and major changes in demongraphic drivers, such as urbanization. Ample literature relative to |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 3259 | 5 | 30 | | 31 | | 1. At the beginning of the chapter, the authors could state that behaviour as driver of GHG emission is very defendant to the various aspects of conceptual framework (function, scale, roots and context)<br>2. Therefore the Kaya identity can perform well at global scale but will be more challenging to apply it at individual scale because of a different influence of various set of drivers and contextual underpinnings.<br>3. In paragraph 2-3: it might be good to address the issue of GHG offsetting through social corporate responsibilities. This is indeed a new trend in behaviour consisting of investing in carbon projects rather than reducing emission internally (e.g. Air transport companies, big firms etc.). Hence the companies maintain their own production attitude but concur to green activities. The chapter authors can take stock from carbon trust funds and emerging VCS for communities PES as part of the picture.<br>4. The paragraph 4 is a rather philosophical section where it is opportune (maybe) to mention the fuzziness of behaviour when it ties to qualitative aspects such as awareness, concerns, willing (good will). Assessing those variables are difficult and monitoring them through time at individual level very puzzling as individual behaviour change over time and depending to the social and economic context. This raises indirectly the issue of identity. Every person is a moving identity depending to the context (adjustment in behaviour influenced by many contextual factors including culture) the use of the conceptual framework can help.<br>5. The paragraph 5 could mention the opportunistic character of behaviour at organisational and personal level. Some changes or adoption of behaviour are related back to awareness or perception (also to incentives or penalties). An example is the handling of waste in developing countries vs. low income countries.<br>6. In Paragraph 6 it is proven that some changes of behaviour are imposed by a co-evolution of knowledge, information sharing, economy, demography, governance, policy, etc. An increase population density requires necessary changes in habitats, consumption, transportation, communication etc. This might be a place to address the regional differences of behaviour based on co-variation of many drivers. | Noted |
| 15995 | 5 | 31 | 21 | | 36 | could be interesting to also combine the argument with demographic trends in developed countries a little clearer | Rejected because the topic is Included in the studies assessed here. No change. |
| 9320 | 5 | 31 | 31 | 31 | 33 | How the same population can be ageing and without ageing? | Accepted, text revised - Explained. |

| 9321 | 5 | 31 | 35 | | | Please replace 'what' with 'which'. | Accepted - Text redrafted. |
| 9088 | 5 | 31 | 5 | 31 | 7 | How is the impact of Fukushima nuclear disaster on CO2 mitigation by nuclear energy over the world ? | Rejected - Beyond the scope of this |
| 4171 | 5 | 31 | 8 | | | "Aged society" should be discussed together with the "low fertility society". | Rejected. Low fertility is a crucial determinant of aging. Yet population dynamics is beyond the scope of this |
| 6528 | 5 | 31 | 33 | | 36 | Check if "cohorts born before 1960" instead of "cohorts born after 1960" is correct, as the first half of the sentence seems contradicting with the second half of the sentence. | Accepted - Checked and corrected. |
| 17434 | 5 | 32 | 25 | 32 | 27 | Not clear if "lifestyle and popoulation density" belong to the start or end of the sentence (presumably the former?). House type is a nominal variable so not clear how it has a directional effect on energy use (also house type is mentioned here in the concluding paragraph but is not discussed earlier in the sub-section...) | Accepted - Sentence fixed. |
| 10893 | 5 | 32 | 30 | 32 | 38 | This paragraph needs some references, particularly considering you call it "controversial" | Editorial: This is the headline paragraph that summarizes the content of the |
| 9322 | 5 | 32 | 36 | | | The phrase 'actual such catch up growth in developing countries may be more capital and resource --' is not clear; it neede to be rephrased. | Accepted: Agree that this was badly phrased and it has been rewritten. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 3092 | 5 | 32 | 7 | 32 | 10 | is this really an unexplored area? In the UK, this has been looked at e.g. in the evaluation of energy efficiency policy measures. See e.g. [http://www.decc.gov.uk/assets/decc/11/funding-support/3339-evaluation-of-the-delivery-and-uptake-of-the-carbo.pdf]. This directly contradicts the finding of the Greek study - e.g. page 29 in the priority group of the over 70s, it was easy to get people to opt for energy efficiency measures, whereas younger age groups (often living in rented, short-term accomodation) were less interested. Hence, the statement (based on just one Greek study) that 'the elasticity of demand is lower in an ageing society than in a young society' is totally unsupported and probably wrong. | Considered but related Paragraph was deleted. |
| 16942 | 5 | 32 | | | | See my opening remark about per-capita GDP versus per-capita emissions. This section would seem the natural place to include a more disaggregated version of the Figure 14-12, and that would start to give a "story" to accompany the mass of data already here. Whether or not the interpretation in our book (Chapter 1) is right, or the somewhat more negative view in the FOD Chapter 14 (see my comments to Ch.14), is for the authors to judge.<br>Since production vs consumption is also included in this section, this might be the place to try and also produce an alternate version of the diagram, in terms of consumption. This would help to illuminate to what extent the apparent reductions in Annex I are actually due to trade effects and how closely tied this is to time & wealth.<br>Such development would need to be dovetailed with Chapter 14 and maybe Chapter 4 on similar issues. □ | Taken into accoutn: Figure 5.5.2 will be revised to have GDP per capita on the X axis in line with this comment. Section 5.5.3. Deals with the consumption based accounting. The book referred to is still unpublished so we can't comment on that. |
| 14874 | 5 | 32 | | | | Productivity is mentioned in various parts of this section mainly as a potential way to increase incomes with little emissions impact. It would be useful to provide the readers with the definition of productivity used in the context of this chapter including parameters affecting productivity (following the example of energy intensity later on chapter 5). Productivity changes, at least in the shorter term, could be related to innovations, products of high quality and value, prices of production factors including human resources, etc. | Accepted: We have added a description of what we mean by producitvty and technological change. |
| 15133 | 5 | 32 | 34 | 32 | 34 | Productivity is lower in developing countries than in the developed world | Editorial: The statement is repeated intentionally as the first paragraph of each section serves as a kind of headline |
| 14875 | 5 | 33 | | | | In the figure legend you should specify whether emissions from biomass are excluded. | Noted: The data include all sources of greenhouse gases including from agriculture and land-use change. In general the report includes all sources unless otherwise stated. We will discuss |
| 13549 | 5 | 33 | 1 | | | Add references for data sources, fully unclear on what based | Editorial: This comment appears to refer to Figure 5.5.1 - the data is from standard sources provide by the IPCC TSU and will be fully referenced in the |
| 15997 | 5 | 33 | 2 | | | Abbreviations are not straight-forward to me - explain | Accepted: we have expanded the |
| 5772 | 5 | 34 | | | | Please explain whether you show general features or emissions etc. related to energy only, as indicated in the text (p. 33, lines 4 - 7). | Taken into account: Text was confusing and has been revised for clarity. |
| 8953 | 5 | 34 | 1 | | 3 | Accounting model vs. need for a dynamic model. Will IPCC address this? | Noted: We are covering it to the degree that literature provides information on causal effects. Kaya is simply a way of |

|---|---|---|---|---|---|---|---|
| 17436 | 5 | 39 | 12 | 39 | 12 | I think the words "the growth in" should be deleted? | Noted |
| 14870 | 5 | 39 | 18 | 39 | 23 | Add carbon to weak and strong leakage in order to be more precise. | Accepted- new text box added to explain |
| 10895 | 5 | 39 | 22 | 39 | 23 | I think it would be good to refer to the "carbon leakage" section in WGIII and include non-IOA references on this point | Accepted- new text box added to explain difference |
| 13773 | 5 | 39 | 34 | 39 | 39 | Please note that the paper by Hertwich&Peters 2009 which you already cite elsewhere quantifies total GHG emissions embodied in trade (Kyoto gases including CH2, CH4, N2O and F-gases). The emissions fall in the range identified here. | Accepted- new references added |
| 7330 | 5 | 39 | 40 | 40 | 7 | Which reference discuss about these findings? You mentioned GTAP 7 but don't cite any peer reviewed papers. I think Peters don't discuss about such results. | Noted - new figure is introduced and fully referenced |
| 17438 | 5 | 39 | 40 | 40 | 7 | Not my area of expertise; however I suspect this finding will attract some scepticism / may not apply in more recent years (e.g. given Chinese exports). Not sure I wholly agree with the conclusion that "countries will trade with those able to produce products more [energy] efficiently.." as many other factors (labour costs etc) will affect trade (unless these factors are accounted for in the methodology?) | Noted - the causes of international trade emissions transfer is now discussed more comprehenisively |
| 4175 | 5 | 39 | 40 | 39 | 41 | Why no reference on GTAP results is attached here? | Noted - new figure is introduced and |
| 9126 | 5 | 39 | 44 | | | If "the ratio of emissions embedded in exports to the emissions embedded in imports" is larger than one, it means that region is net exporter of the trade embedded CO2. In this context, It is difficult to understand why "larger than one ratio implying "their consumption base emission accounts would be lower if they were domestically self-sufficient". | Accpeted- this section as been re-worded |
| 5776 | 5 | 39 | 46 | 39 | 48 | The sentence is not clear. What does "this ratio" mean here? | Sentence deleted |
| 4176 | 5 | 39 | 47 | 39 | 48 | "(imports + exports )/2 " sounds too ad-hoc. Is there any literature to give rationale? | Sentence deleted |
| 6529 | 5 | 39 | 44 | | 48 | Give a reference paper or numerical calculations for Scandinavian regions and for China, as the description here is not clear enough. | References added |
| 4758 | 5 | 4 | | 4 | | I assume that "CO2" should be read as "CO2eq" | Accepted: The ES is being revised. |
| 12283 | 5 | 4 | 1 | 5 | 4 | Please apply the same sturcture for all sectors decribed, e.g. percent of global emissions, increase in absolute terms, etc. | Accepted: Sectoral sections are being reestructure following the same structure. |
| 12285 | 5 | 4 | 1 | 8 | 42 | Please consider to use subtitles to increase readability in the executive summary | Accepted: The ES of Chapter 5 is being revised and subtitles will be considered. |
| 2216 | 5 | 4 | 1 | 5 | 4 | This text comes across as incomplete. It should start in line 12 with stating a trend of total global GHGs and then a systematic (100%) breakdown of all emitting sectors. Hence, it should start with power (electricity generation) or energy generation more broadly (incl. extraction/transport), then the ones whcih are listed. The omission of energy is not explained, and thus energy should be included. | Accepted: The text is being revised. |
| 2217 | 5 | 4 | 1 | 5 | 4 | The listing of mitigation options is inconsistent. A) Either you talk about "technology options" like in the transport sentences (biofuels, fuel efficiency, etc.) OR you talk about policies like in buildings OR both (techs AND policies) in all sector descriptions consistently. | Accepted: The text is being revised, although mitigation options are not part of our chapter. Mitigation options are mentioned as examples and the list do not pretend to exhaustive. Please, refer |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 7162 | 5 | 4 | 1 | 71 | 26 | I agree that this chapter is too long. I personally also found it very unpleasant to read. Some of the problem with the chapter is the intended audience. For example, section 5.3 seems to be intended primarily for specialists. It seems to me that it qualifies more as a genuine research article than as a summary of recent research. I think it could be shortened considerably. It also seems to me that more effort is expended on the Kaya identity than seems warranted. But I admit that it is helpful as a means of organizing and structuring the subject matter contained in the chapter. So the use of the Kaya identy in the Exectuive Summary is probably justified. But, how common is the Kaya identity for this type of analysis? Are there other models and if so how do their results differ or amplify the results shown in the present chapter? In other words I am not sure how robust the present results really are. Maybe I missed the discussion on this point, but if they are fairly robust, then it should be possible to remove some of the details concerning the Kaya identity and its role in (or contribution to) the analysis and just focus on summarizing the results. The main conclusion of this section is clearly stated in lines 41 and 42 on page 8 (last paragraph of the Executive Summary), which suggests that technological change and individual behavior are key to climate change mitigation efforts. This is a clear and simple statement (and one that I am convinced is correct, but may, quite frankly, not be achievable on the ever shortening time scale needed to accomplish the urgent and necessary changes to society). As such I recommend that any material that does not support this simple conclusion (either directly or indirectly - by eliminating other possible mitigation strategies) be reduced or eliminated. Or if it is possible it could be moved to a supplementary materials section within the larger report. I think this chapter needs some ruthless editing, preferably by a non-author who is more familiar with the subject than I. | Accepted: The full text has been revised for the SOD and Chapter was shorten. |
| 7844 | 5 | 4 | 1 | 8 | 42 | It is suggested to check on coherence with the assessment of WG I. | Noted |
| 11835 | 5 | 4 | 1 | | | Executive summary: would it not be possible to give some uncertainty estmate for number such as "5GtCO2/yr" (Page 4, Line 20)? | Accepted: The text in the ES is being revised. |
| 11839 | 5 | 4 | 1 | | | Executive summary: the whole ES seems very long, could maybe shortened. | Accepted: The ES has been shorten |
| 5763 | 5 | 4 | 1 | 8 | 42 | The executive summary lacks references. The statements are neither backed by citations of literature, nor are they related to other sub-chapters of this chapter. I personally do not find this scientifically acceptable because there is no "proof" for the statements you make. | Accepted: The text in the ES is being revised. |
| 14854 | 5 | 4 | 12 | 4 | 13 | This paragraph does not add meaningful content. The ExecSum should mention what was learned, not what was done. | Accepted: The ES is being rewritten. |
| 11834 | 5 | 4 | 12 | 4 | 14 | This sentence is very general and unspecific, could be removed? | Accepted: The text is being revised. |
| 5230 | 5 | 4 | 12 | 5 | 4 | Energy demand and supply is not considered in executive summary although it has a special chapter 5.6 later in the text. I think the logics of the ordinary text part of the chapter should be followed also in the executive summary or very clear statement on differences in emission allocation logics should be given. | Accepted: The ES is being rewritten. |
| 4157 | 5 | 4 | 15 | 4 | 30 | GtCO2 (carbon only) or GtCO2e (equivalent)? Both transportation and industry sectors are the sources of non-carbon GHGs. | Accepted: The text, including the unit system used, is being revised. |
| 2218 | 5 | 4 | 17 | 4 | 17 | "vehicle materials" is not a mitigation option itself, it is a subpart of "fuel efficiency" - thus, those two elements should not be in the same list together. | Accepted: The sectoral sections of Chapter 5 are being revised and |
| 9464 | 5 | 4 | 2 | | 4 | It is important to verify that the studies you reference all define drivers this same way. It is not uncommon for the term drivers to refer to correlational relationships and not causal relationships. | Noted |
| 8940 | 5 | 4 | 2 | | | A 40-year history is too short. The data since about 1970 have to be compared with data from at least 100 years past. | Taken into account: Pre 1970 was included for the SOD for global emission |
| 2249 | 5 | 4 | 2 | 5 | 4 | Still this curious obsession with emissions. The greenhouse theory, for which no evidence has been found, is dependent on greenhouse gas CONCENTRATIONS, and since there is no scientifically established relationship between emissions and concentrations what possible relevance can there be in this constant concern for emissions? | Rejected: Please, refer to WGI for detail explanation. |
| 4759 | 5 | 4 | 20 | 4 | 25 | Could you also provide the share (%) of industry as the other sectors? | Accepted: The sectoral sections of Chapter 5 are being revised and |

|---|---|---|---|---|---|---|---|
| 9422 | 5 | 4 | 20 | 4 | 25 | ・ Addition is needed for the description of the use of nuclear energy and for voluntary actions.<br>・ It would be appropriate to add, to the list of potential mitigation measures, the use of nuclear energy that has an effect similar to or greater than that of measures which use renewable energy as described in FOD.<br>・ The draft stipulates that the technological options for GHG mitigation can be coupled with policies. However, voluntary actions should be treated equally to policies and added, since there are cases of voluntary actions of the industry achieving significant effects as reported in Japan.<br>・ Refer to the following documents.<br><br>Okazaki et al. [1] showed that the Japanese steel industry responded to the Kyoto target by launching a voluntary action plan in 1996 a year prior to the adoption of the Kyoto Protocol with challenging quantitative target: 10% reduction of energy consumption in 2010 compared to 1990. Since then, the steel industry has made stead progress toward achieving these goals. As a result, the energy consumption in 2008 was 11.5% less in comparison to the 1990 level (equivalent to 12.1% reduction in CO2 emissions).<br>[1]Teruo Okazaki, Mitsutsune Yamaguchi (2011)<br>Accelerating the transfer and diffusion of energy saving technologies steel sector experience—Lessons learned Original Research Article<br>Energy Policy, Volume 39, Issue 3, March 2011, Pages 1296-1304<br>http://www.sciencedirect.com/science/article/pii/S0301421510008827<br><br>[1]page 1296 right column line15-23 | Rejected: Chapter 5 does not deal with mitigation options. Please refer to the Sectoral chapters in WGIII for detail information about mitigation options. |
| 9779 | 5 | 4 | 21 | 4 | 21 | suggest to delete "realized from 2002 attributed to industry growth in China" | Accepted: The sectoral sections of Chapter 5 are being revised and |
| 11734 | 5 | 4 | 22 | 4 | 25 | Nuclear power should be put into example of potential mitigation measures. | Rejected: Chapter 5 does not deal with mitigation options. Please refer to the Sectoral chapters in WGIII for detail |
| 16011 | 5 | 4 | 23 | | | renewable energy, local energy, feedstpcl change | Accepted: The sectoral sections of Chapter 5 are being revised and |
| 4760 | 5 | 4 | 24 | 4 | 24 | What is behind "energy pricing"? | 0.0 |
| 4761 | 5 | 4 | 26 | 4 | 30 | The statement assumed that "public measures" could trigger the phenomenom. Have you got evidence of this statement? | Accepted: The sectoral sections of Chapter 5 are being revised and |
| 14384 | 5 | 4 | 26 | | | Buildings 4GtCO2 sounds considerably lower than chapter Chapter 9's "30 percent" of energy-related emissions. Here (and there) may need to sort out direct versus indirect and attribution to "energy sector" or "building" for heating and cooling. | Accepted: The sectoral sections of Chapter 5 are being revised and coordinated with the sectoral chapters. |
| 14855 | 5 | 4 | 30 | | | Can you characterize the confidence In this statement? | Accepted: The sectoral sections of Chapter 5 are being revised and |
| 14385 | 5 | 4 | 31 | | | 11.5% for agriculture and 11.3% for forestry and land use looks very different from figure 11.1, where agriculture is much smaller relative to deforestation. May depend in part on whether "fires" are included in agriculture; would seem doubtful. | Taken into account: The Nos. will be varified with that in Ch 11 |
| 12850 | 5 | 4 | 31 | 4 | 40 | Due to uncertainties in quantification of greenhouse gas emissions and removals, use appropriate precision by reporting results with only two significant figures. For example, say "25%" rather than "25.3%." Otherwise, the results imply a precision of measurement that current estimation methods cannot reach. | Noted, all the Nos. have been rounded to significant figures. |
| 12851 | 5 | 4 | 31 | 4 | 40 | Due to uncertainties in quantification of greenhouse gas emissions and removals, use appropriate precision by reporting results with only two significant figures. For example, say "25%" rather than "25.3%." Otherwise, the results imply a precision of measurement that current estimation methods cannot reach. | Noted, all the Nos. have been rounded to significant figures. |
| 13762 | 5 | 4 | 31 | 4 | 37 | The emissions from FOLU are quite uncertain. The level of precision suggested by the numbers here is not justified. | Noted, all the Nos. have been rounded to significant figures. |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 14856 | 5 | 4 | 31 | 4 | 37 | Can you characterize the confidence In this statement? | Taken into account: The first sentence is based on the emission data provided by IPCC. The second sentence has been |
| 7457 | 5 | 4 | 31 | 4 | 32 | “Agriculture contributed 11.5% to total global emissions in 2008, whereas forestry and other land uses (FOLU) contributed 11.3%“. I contend that the ‘forestry’ contribution is mainly caused be cutting down trees for pastoral and arable land use purposes. Most wood for productive use is harvested, causing little if any reduction in the growing stock. Therefore, this statement about ‘forestry’ should be amended. | Taken into account: The sentence has been modified |
| 11836 | 5 | 4 | 31 | 4 | 37 | Would be good to also get the emissions not only as percentage but also as absolute numbers (GtCO2/yr) as in the sections before | Accepted |
| 16012 | 5 | 4 | 31 | 4 | 40 | Why only relative numbers? | Accepted |
| 8417 | 5 | 4 | 32 | 4 | 33 | I suggest to add data on the emission trend in the forestry sector. | Accepted |
| 12287 | 5 | 4 | 34 | 5 | 5 | Please use same accuracy when referring to increase in global poplulation (doubled or 82,7%) | Noted. The figure has been rounded uo |
| 8941 | 5 | 4 | 34 | | | Does the word breeding imply any support for Genetic Modification of crops? This may be contentious. | Taken into account: The sentence is |
| 17414 | 5 | 4 | 34 | | | "An increase in food production can be reached through breeding of stress tolerant cultivars/breeds of crops, livestock, fish and forest trees that will increase food, feed and fuel production without enhancing GHG emission." This seems like a highly optimistic statement and is notably provided without a citation. Recommendation dropping this blanket statement and replacing with a much more sophisticated discussion of the interactions among agricultural production, adaptation strategies (of which breeding is just one of many) and mitigation potentials. Same comment for Ch 5, p-53. | Taken into account: The sentence is deleted |
| 10790 | 5 | 4 | 35 | 4 | 37 | This is counterintuitive and should be substanciated; actually, agriculture will expand into poorer and less productive lands, therefore increasing emissions | Taken into account: The sentence is deleted |
| 12852 | 5 | 4 | 37 | 4 | 37 | Because of the importance of global forest emissions, it would be good to mention here that tropical deforestation causes most greenhosue gas emissions in the forest sector, with additional periodic pulses from wildfire in temperate and boreal forests. | Taken into account: The sentence has been modified |
| 7318 | 5 | 4 | 38 | 4 | 40 | Executive summary for Chap 5 states the following: "Waste GHG emissions represented in 2008 the 2.9 % of global GHG emissions, compared with 2.6 % in 1970 year (medium agreement, robust evidence). Waste related GHG emissions increased by 193.5 % in the same period (medium agreement, robust evidence)." It would be helpful to state the actual numbers rather than just the %'s. | Accepted: The section on waste and the ES are being revised. |
| 12286 | 5 | 4 | 38 | 4 | 40 | Please clarify if " waste GHG emissions" and "waste related GHG emissions" is the same. | Accepted: The section on waste and the ES are being revised. |
| 13218 | 5 | 4 | 40 | 4 | 40 | 193.5% should be replaced by 90 % : see comment on page 53 line 21 | Accepted |
| 14857 | 5 | 4 | 41 | | | Is there an objective definition of 'significant contributor?' Given how small waste GHG total is (2.9%) the level required to make something a 'significant contributor' must be small indeed. Many other things must also be significant contibutors that are not called out. | Accepted: We are removing all adjectives from the text and replacing them by actual numbers, percentages, |
| 14858 | 5 | 4 | 42 | 5 | 4 | Useful information here would be the effectiveness of these methods, not just a listing. | Noted |
| 8418 | 5 | 4 | 43 | 4 | 44 | "Municipal solid waste is a significant contributor to greenhouse gas emissions". The contribution is 3%, I would change significant with “not negligible” | Accepted: We are removing all adjectives from the text and replacing |
| 12284 | 5 | 4 | 5 | 4 | 5 | Please include definition of short-lived species | Figure eliminated |
| 2250 | 5 | 4 | 5 | 4 | 8 | There is no doubt whatsoever that the most important greenhouse gas is water vapour. The question is, is its changes anthropogenic?. Human acivities undoubtedly have a major influence on the presence of water vapour in the atmosphere, so you must admit it. | Rejected - water vapor is the most important greenhouse gas but its concentration is mainly driven by the concentration of the non-condensing greenhouse gases - CO2, CH4 etc. While changes in land use etc. might have an effect on humidity and hence the greenhouse effect we don't know of |

| Comment No | Chapter | From Page | From Line | To Page | To Line | Comment | Consideration |
|---|---|---|---|---|---|---|---|
| 11837 | 5 | 4 | 6 | | | This abreviation (PPP) is mentionned several times but only introduced later. I think this is also the case for other abreviations. Would be more appropriate to introduce acronyms at the first time of use. | Editorial |
| 4156 | 5 | 4 | 9 | 4 | 11 | Increased percentage seems misleading. Fraction in GWP or carbon equivalent values should be refered, since these are already used in the past IPCC reports. | Accepted: The text is being revised. |
| 4519 | 5 | 4 | | | | 5 pages is too long for an executive summary. Suggest shortening and focusing only on key insights. | Taken into account - shortened |
| 6897 | 5 | 4 | 5 | 4 | 8 | This statement in the Executive Summary seems misplaced here. This Chapter does not (and it should not!) provide an assessment of the relative importance of individual GHGs in terms of concentrations and/or radiative forcing. This is assessed in the WGI AR5 contribution, Ch2 and 8. Please make sure to refer to the WGI AR5 in the underlying text supporting the statement "CO2 continues to be the most important ....". | Rejected: We are informed by WGI to include this statement. |
| 10791 | 5 | 4 | | | | the executive summary needs rewriting in style of an assay, with logical conclusions and not a mere sequence of sentences, with only a weak link among them. | Editorial |
| 4027 | 5 | 4 | | 4 | | Use of terminology: "CO2 emissions" and "GHG emissions" seem not to be consistently used. Sometimes it seems to be CO2eq not CO2 e.g. lines 20-25, 31-40 on p.4. Suggest double checking. | Taken into account - consistency improved |
| 2338 | 5 | 4 | | | | Some points in the Executive Summary can be summarized. For instance, the analysis based on the data about the sector based emission (Industry GHG emission, Waste GHG emissions and Agriculture GHG emission- page 4) are more detailed in the Executive Summary. | Taken into account - ES shortened |
| 12282 | 5 | 4 | 1 | | | Please shorten the Executive Summary by focusing on the most important key findings. The summary shouldbe no more than two pages. | Taken into account - shortened |
| 4369 | 5 | 4 | 20 | 5 | 20 | I am puzzled by the use of the word “moderately” to characterize an increase of 60% !!! | Taken into account: we are removing most adjectives and repalcing them with concrete figures (i.e. numbers, |
| 17437 | 5 | 40 | 1 | 40 | 1 | What "country differences" are being referred to? | Noted. This section has been reworked so that this sentence no longer forms |
| 13552 | 5 | 40 | 1 | 46 | 1 | On various places in the document I have the feeling authors are a bit biased to papers they know or have written. Section 5.6 is a bit too much dependent on work of Grubler, where without denying his quality, there must be more of such work out. | Noted: This seems ineviatble though. It's the role of reviewers to make us aware of additional papers that we should cover. |
| 4177 | 5 | 40 | 12 | 40 | 12 | Is "energy consumption" a "final energy consumption" ? | Taken into account: Added "primary" to |
| 18150 | 5 | 40 | 13 | 40 | 16 | a) The manner in which the percentages were derived from Fig 5.6.1 requires explanation.<br>b) It should be noted that despite the high percentage increases in energy consumption/capita in non-REF/OECD 90 region over the last 40 years, total consumption is still many times lower (about 400%? in OECD 90 case) thatn in the REF/OECD-90 regions. The high percentage increases were likely necessary to meet basic needs and in some instances further growth may be necessary to assure that these needs are met. | Noted/Accepted: The percentages are simply the increase from 1970 to 2010. Added a statement that per capita energy use in developing countries is still only a quarter of that in developed |
| 16001 | 5 | 40 | 14 | | | Please be more explicit: which countries do you consider to be transition economies; transition economies = EIT? | Taken into account: We have changed this to "Reforming Economies" These are the former USSR and formerly |
| 16020 | 5 | 40 | 15 | | | same %-numbers for "Latin America" and "Middle East and Africa"??????? | Accepted: Data revised |
| 5777 | 5 | 40 | 20 | 40 | 25 | First, this information here is redundant. Second: What does this imply? Why is the outcome of the analysis influenced by the choice of how "income" is measured and compared? | Accepted: Deleted these references to market exhange rates |
| 3622 | 5 | 40 | 28 | 40 | 28 | Please add for the source of Granger causality and co-integration "(Granger (1969, 1986, 1988))". Please cite as: Granger, C.W.J. (1969). Investigating causal relations by econometrics models and cross spectral models. Econometrica 37, 424-438. Granger, C.W.J. (1986). Developments in the study of co-integrated economic variables. Oxford Bulletin of Economics and Statistics 77, 213-228. Granger, C.W.J. (1988). Some recent developments in a concept of causality. Journal of Econometrics 39, 199-211. | Accepted - added some references to Granger's papers |
| 10897 | 5 | 40 | 3 | 40 | 7 | References for this? | Noted. Reference has now been |
| 10898 | 5 | 40 | | | | This reference may be relevant at several stages in this paper, relating to fossil fuel trade and further linking to consumption of goods and services Davis, S.J., Peters, G.P., Caldeira, K., 2011. The supply chain of CO2 emissions. Proceedings of the National Academy of Sciences 108, 18554-18559. | Noted: This paper might be relevant to the energy supply section below |

|---|---|---|---|---|---|---|---|
| 4380 | 5 | 40 | 13 | 40 | 13 | Again the term “fairly moderate” reflects more subjectivity than objectivity, what is considered an acceptable increase in GHG emission per capita ? | Rejected: It's moderate relative to growth in energy use in developing |
| 18622 | 5 | 41 | | | | Discussion on energy efficiency (page 41) is a little bit shaky, there are process limitations (as well as economic limitations) to take into consideration.<br><br>(Also important to sort out if discussing economy, energy or carbon efficiency)<br><br>Just using the most efficient technology would lead to improvements even for coal but builds on pricing resources including externalities.<br><br>Partly also depending on how things are calculated (statistical methods). Conventional nuclear fission extremely inefficient from a pure energy content perspective but is that interesting? Interesting to compare gas and coal as such? | Accepted. There are many considerations and limitations. It is still correct as indicated in the comment that using most efficient technology would improve energy system for all conversion chains. Text revised accordingly. However, the st |
| 16022 | 5 | 41 | 10 | 41 | 11 | to much sources | Editorial. We think these references can be useful to the reader. |
| 3038 | 5 | 41 | 21 | | 29 | See above comment specific to lighting. Even though "abundant opportunities for improving energy efficiency exist at every link in the energy chain," for lighting specifically history shows such efficiency gains do not lead to lowered energy use [Tsao, J.Y., Saunders, H.D., Creighton, J.R., Coltrin, M.E., Simmons, J.A., 2010. "Solid state lighting: an energy-economics perspective." Journal of Physics D: Applied Physics 43 (35), 354001; also Saunders, H.D. and Tsao, J.Y. "Rebound effects for lighting," Energy Policy, 49(2012): 477-478] | Accepted. Rebound effect will be mentioned here but also the point that energy use would have increased more rapidly without efficiency improvement. Thus, the net effect is still one of saving; |
